**Problem Determination:** Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.
DSNU500I  csect-name RECOVERY COMPLETE, ELAPSED TIME = hh:mm:ss

Explanation: This message is issued at the normal completion of the RECOVER utility. The time that elapsed since the beginning of the RECOVER utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0/4 (informational/warning)

System Action: This message indicates the normal completion of the RECOVER utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

User Response: The recovered data is now available for further processing.

Operator Response: The recovered resources are available for further processing.

DSNU501I  csect-name A PAGE HAS BEEN STOPPED DURING RECOVERY. SEE PREVIOUS DSN1012 MESSAGE

Explanation: This message is issued at the normal completion of the RECOVER utility if the data manager subcomponent cannot apply all the log records for the page because of an inconsistent DB2 log.

Severity: 8 (error)

System Action: This message indicates that the RECOVER utility completed normally except for the page (or pages) that was indicated by the previous DSN1012 messages. The data manager subcomponent marked the pages as broken. All other pages were recovered successfully. Log apply was stopped at the point of the inconsistency in the DB2 log for that page.

User Response: For information about using the REPAIR utility to apply changes that should have been made by the log record in error, refer to [DB2 Utility Guide and Reference]. If you were recovering to the current point in time, resubmit the RECOVER job, and specify 'PAGE(page-number) CONTINUE'. This causes DB2 to retrieve the page from DASD, and apply log records starting after the faulty one.

DSNU502I  csect-name PAGE page number was NOT FOUND IN ANY IMAGE COPY DATA SET

Explanation: The page specified for 'RECOVER page' was not found in any image copy data sets.

This is an informational message only. It does not indicate termination of processing.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing. The assumption is that the page was inserted after the last image copy was made. The page is reset and recovered from the log, starting at the log RBA recorded in the SYSCOPY record for the last image copy data set.

DSNU503I  csect-name PAGE page-number IS WITHIN PHYSICAL ERROR RANGE

Explanation: The page specified for 'RECOVER page' is within the physical error range of the table space partition, index space partition, or data set. 'RECOVER page' cannot be effective in this case, because the page would still be within the physical error range and therefore inaccessible to the user.

Severity: 8 (error)

System Action: The RECOVER utility terminates with return code 8. No changes are made to the table space.

User Response: Resubmit the RECOVER utility specifying 'error range'.

DSNU504I  csect-name MERGE STATISTICS FOR obj-type obj-qual.obj-name - NUMBER OF COPIES = cc, NUMBER OF PAGES MERGED = nnnnnn, ELAPSED TIME = hh/mm:ss

Explanation: This message is issued at the completion of the MERGE process for the MERGECOPY or RECOVER utility. The message indicates the number of image copies currently processed ('cc') and the total number of pages that were merged ('nnnnnn'). The same page can be obtained from more than one incremental image copy. MERGE is repeated for MERGECOPY if all of the input image copy data sets cannot be allocated and a temporary work data set has been specified.

For the RECOVER utility, MERGE is executed whether or not there are incremental image copies participating. In this case, the number of copies ('cc') is one.

The elapsed time of the MERGE is 'hh:mm:ss', hours, minutes, and seconds, respectively.

System Action: The MERGECOPY or RECOVER utility continues processing; this message is for information only.

User Response: The statistics are indicative of the processing required. For MERGECOPY, it could indicate that next time more input image copy data sets should be allocated. For example, if there was more than one MERGE pass then this message will be issued more than once. For both MERGECOPY and RECOVER, it could indicate that more frequent invocation of MERGECOPY is appropriate.
**DSNU505I**  csect-name PAGE page-number IS BEYOND END OF obj-type

**Explanation:** A page number was found to be beyond the end of the table space, index space, or the current data set.

**Severity:** 8 (error)

**System Action:** The RECOVER utility terminates with ABEND 04E reason code 00E40100. If RECOVER PAGE was specified, then the utility terminates with return code 8 and no changes are made to the object.

**User Response:** Check that the image copy data set(s) in use during the RECOVER contain valid pages. If running RECOVER with the PAGE option, then resubmit the utility with the correct page specified.

---

**DSNU506I**  csect-name OBJECT obj-qualifier.obj-name DSNUM dsnum IS IN REORP PENDING STATE

**Explanation:** This message is issued at completion of a utility when an object has the REORP state set.

The utility can set the REORP state if the table space contains a table that includes an identity column. It can also set the REORP state when a partitioned table space, which has had its limiting keys altered, is recovered to a point in time.

**Severity:** 0 (informational)

**System Action:** The utility continues processing.

---

**DSNU507I**  csect-name NO USABLE BACKUP FOR RECOVER

**Explanation:** The RECOVER utility determined that a backup was required but not found. The utility encountered one of the following situations:
    • An error occurred while processing the oldest available full image copy data set. This might be the only full image copy data set available.
    • While scanning backward through the SYSCOPY table, a LOAD LOG(NO) or REORG log(NO) record type was found.

Any of the following is acceptable as a backup:
    • A full image copy.
    • A LOAD LOG(YES).
    • A REORG LOG(YES).
    • For RECOVER PAGE, an incremental image copy that contains the specified page.
    • A 'no record found' return from the first request for a SYSCOPY record indicates that the object was entirely populated by 'inserts'. The object will be recovered from the DB2 log if its entire history lies within the scope of the log, that is, archive log data sets containing updates for the object have not been deleted.

---

**DSNU508I**  csect-name IN FALL BACK PROCESSING TO PRIOR FULL IMAGE COPY

**Explanation:** One of the following occurred:
    • The RECOVER utility could not allocate the most recent full image copy data set. The prior full image copy is used. Accompanying messages indicate why the image copy data set could not be allocated.
    • PAGE or ERROR RANGE was specified and the recoverable point identified an image copy that was created by the DFSMSdss DUMP command with the CONCURRENT option. Such an image copy cannot be used to process PAGE or ERROR RANGE. A prior recoverable point is located.

**System Action:** The RECOVER utility continues processing, searching for the prior image copy.

---

**DSNU509I**  csect-name - NO ERROR RANGE TO RECOVER

**Explanation:** The RECOVER utility was invoked to recover the existing ERROR RANGE. However, no ERROR RANGE was found.

**Severity:** 4 (warning)

**System Action:** This message indicates the completion of the RECOVER ERROR RANGE utility. Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated.

---

**DSNU510I**  csect-name NO GOOD FULL IMAGE COPY DATA SET FOR RECOVERY OF obj-type obj-qual.obj-name

**Explanation:** It is not possible to locate a good image copy data set from which to recover. Either no back level image copy exists, an I/O error occurred while reading the back level image copies, or DB2 was unable to locate a suitable image copy. The return code that accompanies this message is 0 or 8 under the following conditions:
    • The return code is 0 if a full image copy is not found in the SYSCOPY table during RECOVER initialization or during fall back processing. However, a LOG(YES) event was detected and recover continues from the log. Note that if you have performed a REORG after your last image copy, then no full image copy may be found in the SYSCOPY table.
    • The return code is 8 if the RECOVER utility is in full back mode and no base recoverable point (a full
image copy or LOG(YES) event) was found in the SYSCOPY table. Further utility processing is terminated.

Severity: 0 ( informational) or 8 (error)

System Action: If the return code is 0, processing continues. If the return code is 8, further utility processing is terminated.

User Response: Notify the system programmer if the return code is 8. If the return code is 0, no action is required.

Operator Response: If the return code is 8, the object in question should be started for utility-only processing (if it is not in this state already) until corrective action is taken. If the return code is 0, no action is required.

System Programmer Response: If the return code is 8 and the object being recovered is a table space, the data must be repaired so that an image copy can be taken. An internal error might be involved, and system support might be required. If the return code is 8 and the object being recovered is an index space, then the REBUILD INDEX utility can be used to rebuild the index from the data. If the return code is 0, no action is required. Refer to Part 4 (Volume 1) of DB2 Administration Guide for a discussion of database recovery procedures.

RECOVER utility with the TORBA or TOLOGPOINT option.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSNU512I csect-name DATA SET LEVEL RECOVERY IS REQUIRED FOR obj-type obj-qual.obj-name

Explanation: Recovery was requested for an entire object. However, there is an image copy made for a specific data set associated with the object. Hence, the object must be recovered by data set.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Terminate the current RECOVER job. Then, submit a RECOVER job by specifying 'DSNUM(data set number)' for each data set for which recovery is required. Refer to DB2 Utility Guide and Reference for a discussion of RECOVERY utility constraints.

DSNU513I csect-name RECOVER UTILITY LOG APPLY RANGE IS RBA xxx LRSN xxx TO RBA yyy LRSN yyy

Explanation: The RECOVER utility issues this message one or more times to display the entire log range before applying updates. The RBA and LRSN values are equal in a non-data sharing environment. The RBA values will be zero in a data sharing environment for the catalog and directory objects that do not have DSNDB01.SYSLGRNX entries. This includes catalog table spaces DSNDB06.SYSCOPY and DSNDB06.SYSGROUP and all of their indexes, and all of the directory objects.

Severity: 0 ( informational)

System Action: The RECOVER utility continues processing.

DSNU514I csect-name RECOVERY DATA DOES NOT PERMIT DSNUM(ALL) RECOVERY OF obj-type obj-qual.obj-name

Explanation: Recovery was requested for an entire object. If the object is a table space, then the latest activity on the entire table space was a REORG LOG (NO) or a LOAD LOG (NO). If the object is an index space, then the latest activity on the entire index space was a REORG INDEX or REBUILD INDEX. If full image copies have been taken at the data set level since then, recover the object on the data set level.
DSNU515I - DSNU519I

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Submit a recover job by specifying DSNUM (data set number) for each data set requiring recovery. If the object is an index space, then the REBUILD INDEX utility may be used to rebuild the index. Refer to "DB2 Utility Guide and Reference" for a discussion of RECOVERY utility constraints.

---

DSNU515I  csect-name THE IMAGE COPY DATA SET dsn WITH DATE=date AND TIME=time IS PARTICIPATING IN RECOVERY OF obj-type obj-qual.obj-name

Explanation: This message is issued by the RECOVER utility for each participating image copy data set before it opens the data set and begins the restore process. If an error occurs while processing, the utility searches for a new recoverable base. This message is routed to SYSSOUT.

Severity: 0 (informational)

System Action: RECOVER processing continues.

User Response: Refer to "DB2 Utility Guide and Reference" for a discussion of RECOVERY utility constraints.

---

DSNU516I  csect-name NO FULL IMAGE COPY AFTER LOAD OR REORG LOG(NO) OF obj-type obj-qual.obj-name

Explanation: RECOVERY was requested for a data set of an object. If the object is a table space, then a full image copy was not taken after or during a LOAD or REORG without logging. The table space is in an unrecoverable state. If the object is an index space, then a full image copy was not taken after a REORG INDEX or REBUILD INDEX.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: If the object is a table space, the data set is in an unrecoverable state. If the object is an index space, then the REBUILD INDEX utility may be used to rebuild the index. Notify the system programmer for corrective action.

System Programmer Response: The data should be repaired before a full image copy is taken. The recovery information for the object (use the REPORT RECOVERY utility) should be scrutinized. Refer to Part 4 (Volume 1) of "DB2 Administration Guide" for information on identifying and reporting the problem.

---

DSNU517I  csect-name - SYSCOPY RECORD DELETED BY MODIFY UTILITY.
DSN=dsn, VOL=SER=nnn, FILESEQNO=fff

Explanation: This message is repeated for each volume of a multivolume data set that is deleted.

The variables have the following meanings:

dsn  The name of the image copy data set whose record was removed from the SYSCOPY table by the MODIFY utility.

nnn  The serial number of the volume containing the data set.

fff  The tape file sequence number. It will be zero for DASD data sets.

Severity: 0 (informational)

System Action: The MODIFY utility continues its termination processing.

System Programmer Response: Because DB2 no longer has any knowledge of the image copy data set, you may delete it and reuse the space. If the last full image copy was deleted, ensure that another one is taken as soon as possible.

---

DSNU518I  csect-name object-type object-qualifier.object-name CONTAINS BROKEN PAGE page-number, ERROR CODE error

Explanation: A broken page, page number, was detected during execution of an image copy utility job. The copy step is terminated and the broken page is not copied to the output data set.

Severity: 8 (error)

System Action: COPY utility ends with a return code of 8.

User Response: The associated data set has not been copied. If the object is in the COPY-pending status, it is in an unrecoverable state. Notify the system programmer for corrective action.

System Programmer Response: Use either the RECOVER, RECOVER PAGE, or REPAIR utility to correct the broken page. Refer to Part 4 (Volume 1) of "DB2 Administration Guide". If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

---

DSNU519I  csect-name TOCOPY DATA SET NOT FOUND

Explanation: The data set specified with the keywords TOCOPY, TOVOLUME, or TOSEQNO cannot be found in the SYSCOPY table for the object to be recovered.

This may be caused by a mismatch in granularities. If the RECOVER specifies a particular DSNUM, the data
set specified with the TOCOPY keyword may be for an image copy of this DSNUM or of the entire table space or index space. However, if the RECOVER is for the entire table space or index space, the specified data set must be for an image copy of the entire table space or index space.

This message may also be issued if TOVOLUME is specified for a cataloged data set.

RECOVER TOCOPY can issue DSNU5191 even if the data set information was correct but the data set was not for this site. For example, if the DB2 subsystem is specified as LOCALSITE, but the TOCOPY data set information is for a RECOVERYSITE data set, this message will be issued.

Severity: 8 (error)

System Action: RECOVER processing is terminated.

User Response: Correct the input and resubmit the RECOVER job.

---

**Explanation:**

RECOVER DSNUM to a previous point in time (for example, using the TOLOGPOINT option) was specified for a nonpartitioned table space. You might have recovered a data set that has different compression characteristics than the replaced data set. For example, the data set to which you recovered might have been compressed with a different dictionary.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The table space might be in an inconsistent state. If the dictionary was not built with the data set that was just recovered, the results are unpredictable and might jeopardize all the data in the entire table space.

Recover all of the data sets in the table space to the same point in time. Do not ignore this message unless all data sets in this table space were recovered to the same point in time. Otherwise, the state of this nonpartitioned table space is inconsistent and unpredictable.

---

**Explanation:**

Recovery was requested for a table space, index space, or data set. An attempt was made to apply changes from the DB2 log, but the necessary log records could not be read from the log data set. This message is accompanied by message DSNI007I.

Severity: 8 (error)

---

**System Action:** The RECOVER utility completes unsuccessfully with return code 8.

**User Response:** Consult the system programmer for corrective action.

**Operator Response:** Provide the console listing of the DSNI007I message for the system programmer.

**System Programmer Response:** Run the print log map (DSNJU004) utility. Find the data set that contains the requested RBA or LRSN from the output of the utility.

**Problem Determination:** If no listed data set contains the required RBA or LRSN, one of the following might have occurred:

- The data set was deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Rerun the utility to insert the missing data set name. DB2 must be stopped to run this utility.
- The BSDS was damaged. The BSDS can be restored using the dump and the most recent archive log data set. Run the change log inventory (DSNJU003) utility to supply changes that occurred during and after the last offload operation. Changes can be determined from the operator’s console listing.

If a listed log data set contains the required RBA or LRSN, this message is preceded by one or more DSNJxxx error messages. See the explanation of those messages for the appropriate action.

---

**Explanation:** Recovery was requested for an index, but activity on its table space (identified by the SYSIBM.SYSCOPY columns) prohibits recovery. The use of an index’s full image copy by recovery is prohibited by a REORG or LOAD on its underlying table space.

Severity: 8 (error)

System Action: Utility processing is terminated. All objects in the RECOVER statement are left in the same state as before the RECOVER utility was invoked.

User Response: Use the REBUILD INDEX utility to rebuild the index from the table space. For more information about the recoverability of this index, run the REPORT RECOVERY utility on both the index and its table space.
DSNU523I  csect-name - RECOVER UTILITY FAILED. NO FULL IMAGE COPY WAS AVAILABLE AND THE FIRST LOG RECORD WAS NOT THE REQUIRED INITIALIZATION RECORD.

**Explanation:** RECOVER was requested for a table space or a data set of a table space and no image copy was available. Recovery was attempted from the log and failed due to missing data set initialization records. Specifically, the log records which format space map and header pages were missing.

**Severity:**  8 (error)

**System Action:** RECOVER completes unsuccessfully with a return code of 8.

**User Response:** The associated data set has been reset to an empty state. Notify system programmer for corrective action.

**System Programmer Response:** Use the problem determination information given below to determine if a user error has occurred. If possible, correct the error and resubmit the RECOVER utility job for this table space or data set. Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for a discussion of possible recovery procedures.

**Problem Determination:** This message was preceded by message DSNU513I which identifies the log RBA range being applied. Run the print log map (DSNJU004) utility for the table space in question over the indicated log RBA range.

This will show what log records are present and may assist in determining if a log data set has been damaged or deleted, or if the BSDS has been damaged. If damage to table space DSNU523I.SYSLGRNX is suspected, recover it and attempt the earlier failing recovery again.

DSNU524I  csect-name INVALID DATA SET OR PARTITION NUMBER num SPECIFIED FOR obj-type obj-qual.obj-name

**Explanation:** An invalid number was specified for the data set or partition of the object named in the utility statement.

**Severity:**  8 (error)

**System Action:** Further utility processing terminates.

**User Response:** Correct the data set/partition number, or verify that the object name is specified correctly. Then resubmit the utility statement in a new utility job step. Refer to [DB2 Utility Guide and Reference](#) for a description of the particular utility options.

DSNU525I  csect-name RECOVERY DATA DOES NOT PERMIT DSNUM(ALL) RECOVERY OF obj-type obj-qual.obj-name

**Explanation:** Recovery was requested for an entire object. However, the object is not recoverable at that level for one of the following reasons:

- The object was recovered to a point in time (for example, TOLOGPOINT was specified), which required fall back processing. However, no subsequent image copy was taken to establish a base for recovery.
- A partition of the object was recovered to a point in time after the last full image copy of the object was taken.

**Severity:**  8 (error)

**System Action:** The RECOVER utility completes unsuccessfully with return code 8.

**User Response:** Submit the RECOVER job with DSNUM specified for each data set for which recovery is required. Refer to [DB2 Utility Guide and Reference](#) for information about the RECOVER utility.

DSNU526I  csect-name - NO FULL IMAGE COPY AFTER PARTIAL RECOVERY OF obj-type obj-qual.obj-name

**Explanation:** Recovery was requested for a data set of an object. However, an earlier point-in-time recovery (for example, using the TOLOGPOINT option) was specified and no subsequent image copy was taken to establish a base for recovery. The object is in a nonrecoverable state.

**Severity:**  8 (error)

**System Action:** The RECOVER utility completes unsuccessfully with return code 8.

**User Response:** The associated data set is in a nonrecoverable state. Consult the system programmer for corrective action.

**System Programmer Response:** You can use the RECOVER utility with the TOCOPY, TORBA, or TOLOGPOINT option to force recovery to an earlier point in time. You can use the DSNUM Utility to restore the data set to an earlier image copy. Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for a discussion of database recovery procedures.

DSNU527I  csect-name DB2 OBJECT REBUILT TO AN INDETERMINATE POINT

**Explanation:** The image copy data set specified with the TOCOPY keyword of the REBUILD utility was one of the following:

- An image copy dataset made with the SHRLEVEL CHANGE option. In this mode, changes might have been made to the object while image copy was in
progress. If a change was made to a page before image copy processed the page, the update will be in the copy data set. If a change was made to a page after image copy processed it, the change will not appear in the copy data set. The data set may contain partial updates from some transactions.

- An image copy dataset made during the LOAD REPLACE utility. An image copy produced during LOAD REPLACE will not contain updates made to the table space to correct unique index violations during the INDEXVAL phase or referential constraint violations during the ENFORCE phase. Therefore, it is not recommended as a REBUILD y point.

If the object REBUILT is a table space, then indexes on the table space are placed in REBUILD pending status and dependent table spaces, if any, are placed in check pending status. The indexes placed in REBUILD pending are identified by message DSNU557I, and the dependent table spaces placed in check pending are identified by message DSNU563I.

**Severity:** 4 (warning)

**System Action:** The utility terminates normally.

**User Response:** Based on the explanation above, determine if the REBUILD y is satisfactory. Rebuild the indexes identified by message DSNU557I in the job output. Run CHECK DATA on the table spaces identified by message DSNU563I to correct any referential constraint violations.

Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for a discussion of database REBUILD procedures.

---

**DSNU528I**

**Explanation:** Recovery was requested for a table space or a data set of a table space and no image copy was available. If dsnum is 0, then recovery was requested at the table space level. Recovery was attempted from the log, but no log records were applied because no SYSLOGRNX records corresponding to the recovery scope were found.

**Severity:** 8 (error)

**System Action:** The associated data set was reset to an empty state and the data set was placed in REBUILD PENDING status. If REBUILD was processing a TABLESPACE list, only the associated data set was reset to an empty state but all data sets in the list were placed in REBUILD PENDING status.

**User Response:** If the TORBA or TOLOGPOINT option was specified, use the information in the problem determination section to verify that it is a valid RBA or LRSN. Correct the error and resubmit the REBUILD utility for the table space.

**System Programmer Response:** Use the information in the problem determination section to determine if a user error occurred. Correct the error and resubmit the REBUILD utility for the table space. Also refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for a discussion of possible recovery procedures.

**Problem Determination:** Execute the REPORT RECOVERY utility for the table space at the appropriate table space or data set level (that is, DSNUM). The output shows the recovery points (SYSCOPY records) and the update log ranges (SYSLOGRNX records) that exist for the table space.

---

**DSNU529I**

**Explanation:** ‘xxx’ is the log RBA specified for the RECOVER utility TORBA keyword. The RBA is not within the scope of the log.

**Severity:** 8 (error)

**System Action:** The RECOVER utility terminates with a return code of 8 without making any changes to the object to be recovered.

**User Response:** Correct the input and resubmit the job. Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) for a discussion of database recovery procedures.

---

**DSNU530I**

**Explanation:** DB2 issues this message during the RECOVER or COPYTOCOPY utility when the specification of the input image copy dataset is ambiguous and does not uniquely identify an image copy. Multiple image copies were found in SYSIBM.SYSCOPY for the object with the same data set name.

**Severity:** 8 (error)

**System Action:** Processing halts for this object.

RECOVER completes unsuccessfully with a return code of 8.

For the COPYTOCOPY utility, if the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the utility will process the next item in the list.

**User Response:** Two or more DSNU531I messages will follow this message providing more information about each duplicate data set. Select the correct data set from the DSNU531I messages.

Rerun the RECOVER job, specifying a unique
DSNU533I  csect-name - obj-type obj-qual.obj-name
IS A DUPLICATE OF  obj-type
obj-qual.obj-name

Explanation:  The utility found a duplicate object in the list. The object name may indicate a partition or piece number.

Severity:  8 (error)

System Action:  The utility job terminates processing.

User Response:  Correct the object list. Resubmit the job if needed.

DSNU534I  csect-name TARGET RECOVERY POINT
IS NOT A QUIESCE POINT

Explanation:  The RECOVER utility attempted to recover to a point in time (for example, using the TOLOGPOINT option) and one of the following conditions has been detected:

- The table space set is not being recovered to a quiesce point or to a common image copy SHRLEVEL(REFERENCE) point.
- Not all table spaces in the table space set have the same quiesce point.
- A table space in the set contains a dependent table with a referential constraint that was defined after the specified quiesce point.

A table space set is a group of table spaces that are referentially related or it can be a base table space and its associated LOB table spaces.

Severity:  4 (warning)

User Response:  If possible, recover the table space set to a quiesce point or a common image copy SHRLEVEL(REFERENCE) point. Otherwise, use the CHECK DATA utility to check and correct referential violations. Use the CHECK DATA utility on the base table space and the CHECK LOB utility on the LOB table space(s) to validate the LOB columns.

DSNU535I  csect-name - obj-type obj-qual.obj-name
START

Explanation:  This message is issued when there is more than one object in the list. It indicates that the recover of a particular object is starting. If the PARALLEL keyword has been specified, then the restore phase messages for different objects in the list may be intermingled.

This message is routed to SYSPRINT.

Severity:  0 (informational)

System Action:  RECOVER processing continues.

DSNU536I  csect-name - obj-type obj-qual.obj-name
TABLESPACES RECOVERED TO A
CONSISTENT POINT

Explanation:  This message will be issued by the RECOVER utility when it determines that a table space set (a group of referentially related table spaces or a base table space and its lob table spaces) were recovered to a quiesce or to a common image copy SHRLEVEL(REFERENCE) point. All table spaces in the table space set will be listed after this message heading.

Severity:  0 (informational)

System Action:  No action is taken.
**DSNU536I**  
**csect-name - RELATIONSHIP r ON TABLE t CREATED AFTER QUIESCE POINT**

**Explanation:** The relationship named 'r' was created on the dependent table, 't', after the quiesce point used for recovering to a point in time. The table space in which 't' resides is set to check pending beginning with the first record of 't'.

**Severity:** 4 (warning)

**System Action:** No action is taken.

**User Response:** Refer to Part 2 (Volume 1) of [DB2 Administration Guide](#) for the failure analysis procedure for the check pending state.

---

**DSNU537I**  
**csect-name obj-type obj-qual.obj-name IS NOT ALLOWED IN THE LIST**

**Explanation:** The RECOVER or COPY utility found a directory or catalog table space in a list with other table spaces or with user-defined indexes.

The table spaces that the COPY utility will not allow in a list with other table spaces are DSNDB01.SYSUTILX, DSNDB06.SYSCOPY, and DSNDB01.SYSLGRNX. However, these table spaces may be specified with their IBM-defined indexes in a list.

You cannot recover more than one directory or catalog table space in a list. Directory and catalog table spaces must be recovered individually in a particular order because the recovery of some objects depends on information derived from others. The correct order is documented in Part 4 (Volume 1) of [DB2 Administration Guide](#). IBM-defined indexes may be specified with their associated directory or catalog table space in a list.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** Remove the directory and catalog object names from the list. Then submit the COPY or RECOVER job again.

---

**DSNU538I**  
**RECOVER ERROR RANGE OF**  
**DSN=dataset name ON**  
**VOLUME=volser FROM**  
**CCHH=X’ccccchhhh’ TO**  
**CCHH=X’ccccchhhh’ CONTAINS PHYSICAL ERROR**

**Explanation:** This message indicates that the error range involved in the error range recover 'dataset name' is the data set which has the physical error. The data set resides on DASD volume 'volser' and the error range is from track address X'ccccchhhh' to track address X'ccccchhhh'.

If the error range of a data set covers more than one extent or more than one volume, then there will be one message per extent per volume.

---

**DSNU539I**  
**csect-name - RECOVER PROCEEDS AT THE site-type SYSTEM**

**Explanation:** The RECOVER process continues at the RECOVERY SITE system, and/or the TRACKER SITE system. DB2 issues this message for informational purposes only.

**Severity:** 0 (informational)

**System Action:** The utility continues.

---

**DSNU540I**  
**csect-name DYNAMIC ALLOCATION FOR DATA SET data-set-name WILL WAIT FOR UNIT TO BECOME AVAILABLE**

**Explanation:** A request to dynamically allocate a data set for a BATCH UTILITY job was refused because a unit was not available. The request was repeated after setting an indicator in the dynamic allocation parameter list to cause the job to wait until a unit becomes available.

**Severity:** 0 (informational)

**System Action:** Processing continues after a unit becomes available and is allocated.

---

**DSNU541I**  
**UNABLE TO ALLOCATE THE PRIMARY COPY DATASET data-set-name, BACKUP COPY IS USED**

**Explanation:** If RECOVER or MERGECOPY has an allocation error on the primary copy data set, it will locate the backup copy data set for the same system (local or recovery). The utility continues.

**Severity:** 0 (informational)

---

**DSNU542I**  
**csect-name - UNABLE TO OPEN THE PRIMARY COPY DATASET dataset-name, BACKUP COPY IS USED**

**Explanation:** If RECOVER or MERGECOPY has an open error in the primary copy data set, it will deallocate that copy data set and try to allocate the backup copy.
DSNU543I - DSNU547I

DSNU543I  csect-name - I/O ERROR READING PAGE page_number IN THE PRIMARY COPY DATASET dataset-name, BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an I/O error when reading a page, with the specified page number, from the primary copied data set, it will locate the backup copied data set in that same system (local or recovery) and continue reading pages starting from the page number in error.

Severity: 0 (informational)

DSNU544I  csect-name - UNABLE TO OPEN THE COPY DATASET dataset-name FOR THE RECOVERY OF obj-type obj-qualifier.obj-name, RC= reason-code

Explanation: RECOVER was unable to open the data set 'dataset-name'. Because of 'reason-code' from the open abend. The 'reason-code' is taken from field SDWAABCC in the SDWA.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU545I  csect-name - I/O ERROR READING PAGE page_number IN THE COPY DATASET dataset-name DURING RECOVERY OF obj-type obj-qual.obj-name

Explanation: An I/O error was detected while reading page 'page-number' from copy dataset 'dataset-name'. The message is issued when 1) The data set is the primary copy data set and there is no backup data set. 2) Open error is from the backup copy data set.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU546I  LOGONLY RECOVER CANNOT PROCEED BETWEEN BEGINNING RBA 'xxxxxxxxxxxx' AND ENDING RBA 'yyyyyyyyyy' ON DSNUM dsnum

BECAUSE A NON-RECOVERABLE EVENT HAS BEEN ENCOUNTERED FROM SYSIBM.SYSCOPY WHICH HAS

DBNAME=database-name
TSNAME=space-name DSNUM=dsnum
ICTYPE=x
START_RBA=X'zzzzzzzzzzz'.

Explanation: A nonrecoverable event (for example, LOAD LOG(NO), REORG LOG(NO)) occurred within the log range between the beginning log RBA or LRSN and ending log RBA or LRSN for the RECOVER LOGONLY utility.

This message is issued by the following CSECT: DSNUCASA

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

System Programmer Response: Find a proper prior point in time as a target recovery point and rerun the RECOVER utility job with the TORBA, TOCOPY, or TOLOGPOINT option. For a discussion of database recovery procedures, refer to Part 4 (Volume 1) of [DB2 Administration Guide].

DSNU547I  LOGONLY RECOVER CANNOT PROCEED BECAUSE THE STARTING RBA=X'xxxxxxxxxxxx' IN THE HEADER PAGE PGNO=X'xxxxxxx' FOR obj-type obj-qual.obj-name IS INVALID.

Explanation: One of the following occurred:

• The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.

• The TORBA or TOLOGPOINT option is specified to an RBA or LRSN that is lower than the starting RBA or LRSN in the header page.

Severity: 8 (error)

System Action: The RECOVER utility job terminates with return code 8.

System Programmer Response: Use the RECOVER utility without the LOGONLY option, if possible, or change the RBA or LRSN of the TORBA or TOLOGPOINT option to a valid RBA or LRSN value.
**DSNU548I**  DBID=X'xxxx' and PSID=X'xxxx' IN THE HEADER PAGE OF obj-type obj-qual.obj-name DO NOT MATCH THE DB2 CATALOG.

**Explanation:** The DBID and PSID in the header page do not match the DB2 catalog. It is likely that the wrong data sets were restored.

**Severity:** 8 (error)

**System Action:** The RECOVER utility job terminates with return code 8.

**System Programmer Response:** Find the correct data sets and rerun the job.

**DSNU549I**  RECOVER obj-type obj-qual.obj-name dsnum USES ONLY DB2 LOGS STARTING FROM LOGPOINT=X'xxxxxxxxxxxx'.

**Explanation:** The RECOVER utility issues one message for each DB2 object that uses only DB2 logs to recover. In a non-data-sharing environment, the LOGPOINT value is specified by an RBA; in a data sharing environment it is specified by an LRSN.

**Severity:** 0 (informational)

**System Action:** RECOVER utility processing continues.

**DSNU550I**  csect-name INDEX NAME= index-name IS EMPTY

**Explanation:** While attempting to REBUILD the indicated index, it was determined that the table upon which the index is based is empty.

**Severity:** 4 (warning)

**System Action:** Utility processing proceeds to the next utility request, if any.

**DSNU551I**  csect-name INDEX NAME= index-name PART=part-num IS EMPTY

**Explanation:** While attempting to REBUILD the indicated index partition, it was determined that the partition upon which the specified index partition is based is empty.

**Severity:** 4 (warning)

**System Action:** Utility processing proceeds to the next utility request, if any.

**DSNU552I**  csect-name RECOVER CANNOT PROCEED BECAUSE THE starting/ending LOGPOINT xxx IS NOT WITHIN THE RECOVERY RANGE OF xxx AND xxx FOR obj-type obj-qual.obj-name

**Explanation:** The starting or ending LOGPOINT found for this recovery job is outside the available recovery information. A LOGPOINT value is an RBA or LRSN. The RECOVER utility cannot process this request.

**Severity:** 8

**System Action:** The RECOVER utility terminates.

**User Response:** Use the recovery information that is available from the REPORT utility. Execute the RECOVER utility within the available recovery range.

**DSNU553I**  csect-name INVALID PARTITION NUMBER=nnnn SPECIFIED FOR INDEX NAME=iii

**Explanation:** An invalid partition number nnnn was specified for index iii in the utility statement.

**Severity:** 8 (error)

**System Action:** Further utility processing is terminated.

**User Response:** Correct the partition number or verify that the index name is specified correctly, and resubmit the utility statement in a new utility job step. Refer to the [DB2 Utility Guide and Reference](https://www.ibm.com/support/knowledgecenter/SSECG2_12.1.0/part/part1007.htm) for a description of the particular utility options.

**DSNU554I**  csect-name - DUPLICATE INDEX NAMES EXISTS IN THE SPECIFIED INDEX NAME LIST

**Explanation:** When attempting to CHECK or REBUILD the indicated indexes, it was determined that duplicate index names were specified in the index name list.

**Severity:** 8 (error)

**System Action:** The utility job terminated.

**User Response:** Correct the index-name(s) in the index name list and resubmit the job.

**DSNU555I**  csect-name UNLOAD PHASE STATISTICS, NUMBER OF RECORDS=xxxx

**Explanation:** This message is issued at the normal completion of the UNLOAD phase of the REBUILD INDEX utility. It gives the number of records that were unloaded (xxxx) for the specified table space.

**Severity:** 0 (informational)
DSNU556I  csect-name RECOVER CANNOT PROCEED FOR obj-type obj-qual.obj-name BECAUSE A SYSCOPY RECORD HAS BEEN ENCOUNTERED WHICH HAS DBNAME= dbname TSNAMe= tsname DSNUM= dsnnum ICTYPE= ictype STARTRBA=X′rba′ LOWDSNUM= lowdsnunm HIGHSNUM=highdsnunm.

Explanation: A SYSCOPY record has been encountered that prohibits recovery processing. If the ICTYPE column is a:

R,S,W, or X

Then a SYSCOPY record for a REORG or LOAD REPLACE that redistributed data across partitions has been encountered. The partitions that were affected by the ALTER INDEX that changed the limit keys must be recovered in the same list. An STYPE=S indicates that the CATENFM Utility was run, and a point-in-time recovery prior to the CATENFM process is not allowed unless the entire system (including the DB2 catalog and directory) are recovered to the same point.

A

An attempt has been made to recover an index to a point in time prior to a first ALTER Table Column that altered the index key column. This is not allowed.

- An STYPE=R indicates that a table space partition was rotated and a point in time recovery prior to the rotation is not allowed. If the object being recovered is an index partition or a LOB table space belonging to the rotated partition, then those objects cannot be recovered prior to the rotation.
- An STYPE=V indicates that an ALTER TABLE COLUMN occurred on an indexed column for a numeric data type change. The index should be rebuilt rather than recovered.
- An STYPE=C indicates that an ALTER took place that added a column to a table and the column was not added to the index in the same commit scope. The index should be rebuilt rather than recovered.
- An STYPE=P indicates that the index was ALTERed to have the PADDed attribute. The index should be rebuilt rather than recovered.
- An STYPE=N indicates that the index was ALTERed to have the NOT PADDed attribute. The index should be rebuilt rather than recovered.

F

An attempt has been made to recover an index to a prior point in time and more than sixteen Alter Table Columns have been done that altered the index key since that time. This is not allowed.

Severity: 8 (error)

User Response: Run the REPORT RECOVERY Utility, and analyze the report of the recovery information for the object.

If rev=“tech” a SYSCOPY record for a REORG or LOAD REPLACE that redistributed partition data was encountered, then add the missing partitions to the recover list using the LOWDSNUM and HIGHSNUM values as a guide.

DSNU557I  csect-name - obj-type obj-qual.obj-name IS IN REBUILD PENDING STATE

Explanation: If the REBUILD utility issued this message, the corresponding table space to this index was REBUILDed to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. Thus, the index was placed in REBUILDy pending status.

If the REBUILD INDEX utility issued this message, the index is in REBUILD pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to REBUILD the index and remove the index from REBUILD pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, the index is in REBUILD pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the REBUILD or REORG utility (or -TERM UTILITY) issued this message, use the REBUILD INDEX utility to REBUILD this index.

If the REBUILD INDEX utility issued this message, take one of the following actions:

- Resolve the duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the REBUILD pending status. However, these two options will not correct the index.
DSNU558I  csect-name ALL INDEXES OF TABLESPACE= table space-name ARE IN REBUILD PENDING

Explanation: The REBUILD TORBA, TOLOGPOINT, or TOCOPY utility issues this message to inform the user of the state of all indexes belonging to the REBUILDed table space. All indexes were put in REBUILD pending status to prevent data and index inconsistency. All indexes should be REBUILDed before they are used.

System Action: The REBUILD utility completed successfully.

Severity: 4 (warning)

User Response: REBUILD or rebuild all indexes of the REBUILD table space.

DSNU559I  csect-name - obj-type obj-qual.obj-name PARTITION partition number IS IN REBUILD PENDING STATE

Explanation: If the REBUILD utility issued this message, one partition of a partitioned table space is being rebuilt to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. The corresponding index for that partition was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index or the partition of a cluster index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX or INDEX PART, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, one partition of a partitioned index was placed in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the REBUILD or REORG utility (or -TERM UTILITY) issued the message, rebuild this index with the REBUILD INDEX utility.

If the REBUILD INDEX utility issued this message, take one of the following actions:
- Resolve duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or START DATABASE FORCE command to reset the rebuild pending status. However, these two options will not correct the index.

DSNU560I  csect-name - TABLESPACE= database.tablespace PART= partition number IS IN RECOVERY PENDING STATE

Explanation: The table space partition of a table space on which the utility was running is in recovery pending state. A RECOVER TABLESPACE at the partition level is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:
- Run the RECOVER TABLESPACE utility on the table space partition.
- Run the LOAD REPLACE utility on the table space partition.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

DSNU561I  csect-name - obj-type obj-qual.obj-name PARTITION part-number IS IN CHECK PENDING

Explanation: This message is issued to report the check pending state of the specified partition.

Severity: 4 (warning)

User Response: If the object is a table space partition with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space partition, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is an index space partition, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space partition.

Correct all errors before attempting to use the object again.

DSNU562I  csect name - TABLESPACE database.tablespace IS IN RECOVERY PENDING

Explanation: The table space against which the utility was running is in recovery pending status. A RECOVER TABLESPACE is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:
- Run the RECOVER TABLESPACE utility on the table space.
- Run the LOAD REPLACE utility on the table space.
• Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

**DSNU563I**  
csect name- obj-type obj-qual.obj-name IS IN CHECK PENDING  

**Explanation:** This message is issued to report the check pending state of the specified object.  
**Severity:** 4 (warning)  
**User Response:** If the object is a table space with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.  
If the object is a base table space with LOB columns, then run the CHECK DATA utility to validate the auxiliary columns.  
If the object is a LOB table space, then run the CHECK LOB utility to validate the structure of the LOB table space.  
If the object is an index space, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space or table space partition.  
Correct all errors before attempting to use the object again.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**DSNU565I**  
csect-name CHECK CONSTRAINT  
constraint-name ON TABLE table-name WAS CREATED AFTER THE TARGET RECOVERY POINT  

**Explanation:** The check constraint constraint-name was created on table table-name after the target recovery point. The target recovery point is the specified time or RBA in the point-in-time recovery. The associated table space was placed in check pending status because the RECOVER utility cannot determine whether check integrity was maintained. Data in the table might have constraint violations.  
**Severity:** 4 (warning)  
**System Action:** RECOVER processing continues.  
**User Response:** Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for information about resolving the check pending status.

**DSNU566i**  
csect-name RESTORE OF obj-type obj-qual.obj-name FROM DATA SET data-set-name COMPLETED, ELAPSED TIME = hh:mm:ss  

**Explanation:** This message is issued at the successful completion of the RESTORE phase of the RECOVER utility when the DFSMSdss RESTORE command is issued. The data-set-name identifies the DFSMS concurrent copy that was being restored. The elapsed time of the RESTORE is shown in hours, minutes, and seconds.  
**System Action:** RECOVER utility processing continues.  
**User Response:** No action is required.

**DSNU567I**  
csect-name TABLESPACE dbname.1snme PART NUMBER = partition number IS IN REORG PENDING STATE  

**Explanation:** A SYS COPY record for a range of partitions has been encountered. The RECOVER TABLESPACE utility was executed against an object which was the target of a partition rebalancing. The RECOVER utility will set all of the partitions involved in the partition rebalancing to REORG PENDING for one of the following reasons:  
• Recovery of a table space to a point in time prior to the resetting of the REORG PENDING state by the REORG utility.  
• Recovery of a table space to currency, when the table space is in REORG PENDING state.  
**Severity:** 4 (warning)
System Action: The RECOVER utility completed successfully.

User Response: Execute REORG with SHRLEVEL NONE on the partitions in REORG PENDING status to rebalance the partitions and to remove the REORG PENDING state.

DSNU568I csect-name obj-type obj-qual.obj-name IS IN INFORMATIONAL COPY PENDING

Explanation: An image copy of the index is required to establish a new base from which the index can be recovered. This is an advisory state, so the index is available for read or write access.

Severity: 0 (informational)

User Response: Take an image copy of the index.

DSNU569I csect-name RESTORE OF obj-type obj-qual.obj-name FROM DATA SET data-set-name FAILED WITH RETURN CODE return-code

Explanation: This message is issued in the RESTORE phase of the RECOVER utility. The DFSMSdss RESTORE command was issued to restore the DFSMSdss concurrent copy named data-set-name. The return code is from DFSMSdss RESTORE.

Severity: 4 (warning)

System Action: The RECOVER utility searches for the next recoverable point. DFSMSdss issues ADR messages to the job output to indicate the reason for the return code.

User Response: You might want to investigate why this DFDSS RESTORE command failed. Collect any console messages. Look up the return code and any ADR messages in the appropriate DFSMSdss manual.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: [1]

85

DSNU570I csect-name obj-type obj-qual.obj-name PARTITION part-num IS IN INFORMATIONAL COPY PENDING

Explanation: An image copy of the index partition is required to establish a new base from which the index partition can be recovered. This is an advisory state, so the index is available for read or write access.

Severity: 0 (informational)

User Response: Take an image copy of the index partition or of the entire index, depending on your backup and recovery procedures.

DSNU571I csect-name ALL site SYSCOPY RECORDS FOR obj-type= obj-qual.obj-name PARTITION=part-num HAVE BEEN DELETED

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space or index space partition. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The ‘part-num’ of specified table space or index space is no longer recoverable at the ‘site’. The ‘site’ can be ‘LOCALSITE’ or ‘RECOVERYSITE’.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The ‘part-num’ of specified table space or index space is no longer recoverable at the ‘site’ after this message is received. Use the COPY utility to create one or more copies for the ‘site’ to establish a base for future recovery.

DSNU572I csect-name ALL site SYSCOPY RECORDS FOR obj-type= obj-qual.obj-name HAVE BEEN DELETED

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space or index space. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The table space or index space is no longer recoverable at the ‘site’. The ‘site’ can be ‘LOCALSITE’ or ‘RECOVERYSITE’.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The table space or index space is no longer recoverable at the ‘site’ after this message is received. Use the COPY utility to create one or more copies for the ‘site’ to establish a base for future recovery.

DSNU573I csect-name NO BACKUP COPIES FOUND FOR THIS TABLESPACE OR DATASET

Explanation: The MODIFY RECOVERY utility was unable to locate any SYSCOPY records older than the specified AGE or prior to the specified DATE. No records have been deleted.

Severity: 4 (warning)

System Action: Processing completes normally.
**DSNU575I**  
* csect-name - MODIFY COMPLETED SUCCESSFULLY

**Explanation:** This message reports the successful completion of the MODIFY utility. The requested cleanup of old SYSIBM.SYSCOPY entries was completed.

**Severity:** 0 (informational)

**System Action:** The MODIFY utility completed normally.

---

**DSNU577I**  
* csect-name MODIFY HAS NOT DELETED ALL SYSCOPY RECORDS AS REQUESTED.

**Explanation:** If MODIFY RECOVERY is invoked with a partition-number (DSNUM), and the table space level recoverable point is older than the user specified DATE or AGE, all SYSCOPY records after the table space level recoverable point cannot be deleted.

**Severity:** 4 (warning)

**System Action:** Processing continues normally.

---

**DSNU578I**  
* csect-name SYSLGRNX INFORMATION FOR MEMBER member-name

**Explanation:** In the data sharing environment, the SYSLGRNX records reported with DSNU513 are grouped by the respective member name. Each group member has header message DSNU578 to identify the member. This message precedes DSNU513.

**System Action:** The RECOVER utility continues with the LOGAPPLY phase.

---

**DSNU579I**  
* csect-name RECOVER UTILITY LOG APPLY AT LOGPOINT xxx

**Explanation:** This message shows the progress of the LOGAPPLY phase of the RECOVER utility. The highest LOGPOINT that was applied is xxx. The value of logpoint is RBA in a non data-sharing environment and LRSN in a data sharing environment.

**System Action:** The LOGAPPLY phase continues normally.

---

**DSNU580I**  
* csect-name REPORT UTILITY COMPLETE, ELAPSED TIME=hh/mm/ss

**Explanation:** The message is issued at the normal completion of the REPORT utility. The time that elapsed since the beginning of the REPORT utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

**Severity:** 0 (informational)

**System Action:** This message indicates the normal completion of the REPORT utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

---

**DSNU581I**  
* csect-name REPORT RECOVERY obj-type obj-qual.obj-name

**Explanation:** This message indicates the beginning of the recovery information report for a table space or index space.

**Severity:** 0 (informational)

**System Action:** Utility processing continues.

---

**DSNU582I**  
* csect-name REPORT RECOVERY obj-type obj-qual.obj-name SYSCOPY ROWS

**Explanation:** This is the header message for the SYSCOPY section of the REPORT RECOVER output. This section displays the SYSCOPY rows for the table space or index space. Whether the information is displayed at the partition level is determined by the DSNUM specification in the REPORT RECOVERY input statement. The fields in the SYSCOPY row are:
- **TIMESTAMP**
- **ICTYPE**

The following delimiters may be present around the ICTYPE value:
- * - Non image copy syscopy entry
- < - Image copy prior to rebalancing of table space partitions
- > - Image copy prior to LOG(NO) event.

Note that for image copies of indexes, the LOG(NO) event may have occurred on its underlying table space.
- **DSNUM**
- **FILESEQNO**
- **START_RBA**
- **SHRLEVEL**
- **DEVTYPE**
- **ICBACKUP**
- **DSNAME**
- **STYPE**
- **PIT_RBA**
- **DSVOLSER**
- **HIGHDSNUM**
- **LOWDSNUM**

For description of the fields, see SYSIBM.SYSCOPY table in Appendix C of [DB2 SQL Reference](#).

**Severity:** 0 (informational)

---

**DSNU583I**  
* csect-name SYSLGRNX ROWS FROM REPORT RECOVERY FOR obj-type obj-qual.obj-name

**Explanation:** This is the header message for the SYSLGRNX section of the REPORT RECOVERY output. This section displays the SYSLGRNX rows for
the table space, index space, or partition as specified in the REPORT RECOVERY input statement. The fields in the SYSLGRNX row are:

- UDATE - Modification date
- UCTIME - Modification time
- START RBA - Starting RBA
- STOP RBA - Stopping RBA
- START LRSN - Starting LRSN
- STOP LRSN - Stopping LRSN
- DSNUM - Partition number
- MEMBER - Data sharing member

An invalid SYSLGRNX record is marked with "***" at the end. The invalid SYSLGRNX record cannot be used for recovery because the range is outside recovery. If records are marked with "***", then a DSNU594 message should have been issued prior to this.

A SYSLGRNX record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with "**" at the end.

Severity: 0 (informational)
System Action: Processing continues normally.

DSNU584I csect-name REPORT RECOVERY
obj-type obj-qual.obj-name BSDS VOLUMES

Explanation: Message for the BSDS VOLUMES section of the REPORT RECOVERY output. This section contains BSDS volumes for the archive log (1 or 2) records associated with the table space or index space specified in the REPORT RECOVERY input statement. The output contains the following information:

START TIME END TIME START RBA END RBA UNIT VOLSER DATA
start end rba rba device volume data
timestamp timestamp

An archive log record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with "**" at the end.

System Action: Processing continues normally.

DSNU585I csect-name REPORT RECOVERY
obj-type obj-qual.obj-name CURRENT

Explanation: The message is issued in response to the CURRENT option of REPORT RECOVERY utility. It indicates that only the information since the last recoverable point for the specified table space or index space is reported.

Severity: 0 (informational)
System Action: Normal utility processing continues.

DSNU586I csect-name REPORT RECOVERY
obj-type obj-qual.obj-name SUMMARY:

Explanation: This is the header message for the SUMMARY section of the REPORT RECOVERY utility. All the volumes to be used by the RECOVER utility are summarized.

The volume name is marked with "*" at the end if any archive log record in the volume was created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES.

System Action: Processing continues normally

DSNU587I csect-name REPORT TABLESPACE SET
WITH TABLESPACE dbname.tsname

Explanation: Header message for the REPORT TABLESPACE SET output. The output contains all table spaces, tables, and dependent tables associated with the table space specified in the REPORT TABLESPACE SET input statement.

Severity: 0 (informational)
System Action: Utility processing continues normally.

DSNU588I csect-name NO DATA TO BE REPORTED

Explanation: The message is issued when no data can be found for a section of the REPORT output.

Severity: 0 (informational)
System Action: Utility processing continues.

DSNU589I csect-name REPORT RECOVERY
SET NAME
obj-type obj-qual.obj-name COMPLETE

Explanation: The message is issued at the normal completion of reporting the RECOVERY information for the table space or index space by the REPORT RECOVERY utility.

Severity: 0 (informational)
System Action: This message indicates the normal completion of the REPORT RECOVERY utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse. The output from REPORT RECOVERY is now available for RECOVER utility use.

DSNU590I csect-name object RESOURCE NOT AVAILABLE - object-name reason = 'X'reason-code'

Explanation: A required object object-name could not be accessed for the reason shown in reason-code. The
required object can be a database, table space, or index space. If the object is in a stopped state and has partitions, then the stopped state applies to one or more of the partitions.

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing is terminated. If the return code is 4, utility processing continues to the next request.

User Response: Determine the cause for unavailability. The -DISPLAY DATABASE command can be used to determine the status. After ensuring the object is available, resubmit the job.

**DSNU591I** csect-name AN UNSUCCESSFUL COMPLETION OF A LOG READ, REASON=X’reason-code’

Explanation: The log manager subcomponent of DB2 detected an error during a LOG READ of SYSCOPY record for DSNDB06.SYSCOPY, DSNDB01.DBD01 or DSNDB01.SYSUTIL.

Severity: 4 (warning)

System Action: Processing continues.

**DSNU592I** csect-name REPORT RECOVERY INFORMATION FOR DATA SHARING MEMBER member-name

Explanation: The REPORT RECOVERY utility displays this message as the heading for SYSLGRNX and BSDS records or BSDS summary information for each data sharing member. Records for this member follow, if there is data to report.

Severity: 0 (Informational)

System Action: Utility processing continues.

**DSNU593I** csect-name REPORT RECOVERY ENVIRONMENT INFORMATION
MINIMUM RBA: rba1 MAXIMUM RBA: rba2 MIGRATING RBA: rba3

Explanation: The REPORT utility issues this message to display recovery environment information used by the RECOVER utility. The maximum and minimum RBAs give the range of possible recovery points on the log before the start of data sharing. The migrating RBA is the RBA at the time of migration from DB2 Version 3 to Version 4. If there is data to report, other messages from the REPORT utility follow to display SYSCOPY, SYSLGRNX and BSDS records.

Severity: 0 (Informational)

System Action: Utility processing continues.

**DSNU594I** csect-name DB2 ENCOUNTERED SYSLGRNX RECORDS THAT CANNOT BE USED FOR RECOVERY.

Explanation: The utility found one or more SYSLGRNX records that cannot be used for recovery because the range is outside recovery. Invalid SYSLGRNX records are marked with ‘**’ at the end of the record under message DSNU583I.

Severity: 4 (REPORT - warning) or 8 (RECOVER - error)

System Action: REPORT utility processing continues. RECOVER utility terminates.

System Programmer Response: Run the RECOVER utility with the TOCOPY option.

**DSNU595I** csect-name ERROR IN GETTING THE HIGHEST MEMBER ID IN DATA SHARING.

Explanation: The REPORT utility could not find a valid highest member ID. The highest member is the last member to join a data sharing group. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be an internal DB2 problem. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**DSNU596I** csect-name ERROR IN GETTING THE MEMBER NAME FOR MEMBER ID

Explanation: The REPORT utility could not find a valid member name for the member ID, or the member ID supplied is invalid. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be a DB2 internal problem. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**DSNU597I** csect-name INVALID SYSLGRNX INFORMATION FROM REPORT RECOVERY

Explanation: This is the header message for the invalid SYSLGRNX records section of the REPORT RECOVERY output. This section lists SYSLGRNX records containing information that is invalid for recovery purposes.

Severity: 0 (Informational)
System Action: Utility processing continues.

User Response: Examine the invalid SYSLGRNX records with a zero member ID which were generated before enabling data sharing. The MODIFY utility can be used to delete the invalid SYSLGRNX records.

Explanation: This message is issued when an index and its underlying table space have been recovered to a consistent point in time. A consistent point in time is a common QUIESCE point or a common SHRLEVEL REFERENCE copy set (objects were copied in the same list with SHRLEVEL REFERENCE specified). The index is available for read and write access when the recover completes.

Severity: 0 (informational)

System Action: Recover processing continues.

---

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to tables in the targeted table space and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. Using the table-name found in SYSIBM.SYSINDEXES, refer to catalog table SYSIBM.SYSTABLES to determine the containing table space.

Severity: 8 (error)

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to the same database and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. This table must be in the database and table space targeted by the RUNSTATS utility.

Severity: 4 (warning)

System Action: This message will be issued for each nonpartitioned index, when INDEX ALL is specified.

User Response: Run the runstats utility on the object.

Explanation: The identified object (TABLE or TABLE SPACE) does not have a complete definition. This can be caused by one of these errors:

- Not defining any tables in the table space (RC=4).
- Not creating the accompanying partitioned index if the table space is partitioned (RC=8).

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing terminates. If the return code is 4, utility processing continues to the next request.

User Response: Complete the table space definition by creating at least one table in the table space, or create the accompanying partitioned index if the table space is partitioned.

Problem Determination: Issue an SQL SELECT statement on the catalog to determine if the tables or a partitioned index was not created for the table space.
**DSNU604I**  

csect-name object IS EMPTY  

**Explanation:** The object currently to be scanned by the RUNSTATS utility contains no records. The 'object' can be TABLESPACE or INDEXSPACE.  

**Severity:** 0 (informational)  

**System Action:** The object currently to be scanned is recorded in the catalog as empty. The statistics for the object are updated and RUNSTATS continues to the next object, if there is one.  

---  

**DSNU605I**  

csect-name ERROR OCCURRED IN ACCESSING TABLESPACE  

database-name.tablespace-name  

**Explanation:** A previous error makes it impossible for RUNSTATS to scan TABLESPACE 'creaor.tbspname'.  

**Severity:** 8 (error)  

**System Action:** The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.  

**User Response:** Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step.  

**Problem Determination:** Prior messages identify this error. See the documentation for these messages in this manual for additional problem determination.  

---  

**DSNU606I**  

csect-name USER NOT AUTHORIZED TO ACCESS TABLESPACE  

database-name.tablespace-name  

**Explanation:** This user is not authorized to execute the RUNSTATS utility against TABLESPACE 'creator.tbspname'.  

**Severity:** 8 (error)  

**System Action:** The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.  

**User Response:** Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.  

---  

**DSNU607I**  

csect-name ERROR OCCURRED ACCESSING INDEXSPACE  

creator.indexspacename  

**Explanation:** A previous error makes it impossible for RUNSTATS to scan INDEXSPACE 'creator.indexspacename'.  

**Severity:** 8 (error)  

**System Action:** The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.  

**User Response:** Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step.  

**Problem Determination:** Prior messages identify this error. See the documentation for these messages in this manual for additional problem determination. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg27046240) for information on identifying and reporting the problem.  

---  

**DSNU608I**  

csect-name USER NOT AUTHORIZED TO ACCESS INDEXSPACE  

creator.indexspacename  

**Explanation:** This user is not authorized to execute the RUNSTATS utility against INDEXSPACE 'creator.indexspacename'.  

**Severity:** 8 (error)  

**System Action:** The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.  

**User Response:** Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.  

---  

**DSNU609I**  

csect-name TABLE table-name IS IN A DIFFERENT TABLESPACE  

**Explanation:** A table listed in the table name list of the RUNSTATS TABLE keyword was not found in the specified table space.  

**Severity:** 8 (error)  

**System Action:** The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained by the system; therefore it cannot be restarted.
User Response: Ensure that all tables in the list are in the specified table space and resubmit the utility.

Problem Determination: Refer to the catalog table SYSIBM.SYSTABLES to determine the table space in which the table is located.

DSNU610I  csect-name catalog-table-name
           CATALOG UPDATE FOR object-name SUCCESSFUL

Explanation: This message indicates that the updating of the statistics columns in the CATALOG TABLE 'catalog-table-name' was successful.

Severity: 0 (informational)

System Action: Processing continues with the next catalog table.

DSNU611I  csect-name COLUMN column-name NOT FOUND FOR TABLE creator.table-name

Explanation: A column name, given as an operand of the COLUMN keyword, was not found in the specified table.

Severity: 8 (error)

System Action: Validation of the utility invocation statement is completed and the executing utility job step is terminated.

User Response: Ensure that the column name given in the message is correct for the table specified.

Problem Determination: Check that the column name specified in the utility invocation statement is identical to that found in the SYSIBM.SYSCOLUMNS catalog table. Correct any errors and reissue the utility job.

DSNU612I  csect-name SYSTABLESPACE
           CATALOG STATISTICS FOR tspace-name NACTIVE = nactive
           NACTIVEF = nactive

Explanation: The RUNSTATS utility issues this message to report the statistics collected for table space tspace-name.

nactive: The number of active pages in the table space

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to [DB2 Utility Guide and Reference](#) for information about RUNSTATS statistics.

DSNU613I  csect-name SYSTABLEPART CATALOG STATISTICS FOR table-space-name PARTITION part-num:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CARD</td>
<td>cardinality</td>
</tr>
<tr>
<td>CARDF</td>
<td>cardinality</td>
</tr>
<tr>
<td>NEARINDREF</td>
<td>nearindref</td>
</tr>
<tr>
<td>FARINDREF</td>
<td>farindref</td>

</tr>
<tr>
<td>SQTY</td>
<td>sqty</td>
</tr>
<tr>
<td>DSNUM</td>
<td>dsnum</td>
</tr>
<tr>
<td>EXTENTS</td>
<td>extents</td>
</tr>
</tbody>
</table>

Explanation: The RUNSTATS utility issues this message to report the statistics collected. If the `part-num` equals 0, the statistics apply to the entire table space. If the `part-num` is not 0, the statistics apply to the specified partition of the table space.

cardinality: The number of rows in the reported partition number

nearindref: The number of rows that were relocated near their original page

farindref: The number of rows that were relocated far from their original page

peractive: The percentage of space occupied by actual data from active tables

percdrop: The percentage of space occupied by rows of data from dropped tables

pagesave: The percentage of pages saved in the table space or partition by using data compression

space: The space currently allocated for all extents, measured in kilobytes.

pqty: The primary space allocation for the dataset in 4K blocks.

sqty: The secondary space allocation for the dataset in 4K blocks.

dsnum: The number of data sets.

extents: The number of extents for the last data set of the object.

This message is routed to SYSPRINT.
DSNU614I  csect-name SYSTABLES CATALOG
STATISTICS FOR  table-name

:  
CARD = cardinality
CARDF = cardinality
NPAGES = npages
NPAGESF = npages
PCTPAGES = pctpages
PCTROWCOMP = pctrowcomp
AVGROWLEN = avgrowlen
SPACEF = space

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the specified table. The statistics follow:

**cardinality**
The number of rows in the table.
For a LARGE table space, the value of CARD is set to -1.

**npages**
The number of pages on which rows of the table appear.

**pctpages**
The percentage of total pages of the table space that contain rows from this table.

**pctrowcomp**
The percentage of rows compressed within the total number of active rows in the table.

**avgrowlen**
The total number of bytes divided by the number of rows.

**space**
The space currently allocated for all extents, measured in kilobytes.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

---

DSNU615I  csect-name SYSCOLUMNS CATALOG
STATISTICS FOR  column-name

:  
COLCARD = cardinality
COLCARDF = cardinality
LOW2KEY = low2key
HIGH2KEY = high2key

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column 'column-name'. Message DSNU615I is issued to identify the table.

**cardinality**
The number of distinct values in the column

**high2key**
The second highest value of the column

**low2key**
The second lowest value of the column

If the values for 'high2key' and 'low2key' are null, the invoker of RUNSTATS is not authorized to read the table.

For a LARGE table space, the value of COLCARD is set to -1.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

---

DSNU616I  csect-name SYSCOLDIST CATALOG
STATISTICS FOR  column-name, column-name ...

:  
CARDINALITY = cardinality

<table>
<thead>
<tr>
<th>FREQUENCY</th>
<th>COLVALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>frequency</td>
<td>X &quot;hex_string&quot;</td>
</tr>
<tr>
<td>frequency</td>
<td>X &quot;hex_string&quot;</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>frequency</td>
<td>X &quot;hex_string&quot;</td>
</tr>
</tbody>
</table>

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column 'column-name'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct
values for the listed columns. This statistic appears only if
the KEYCARD option was specified.

The values under FREQUENCY are the same as those
that are inserted into the DB2 catalog. Consider each
'frequency' as a four-digit number with an implied
decimal point two places to the left of the final digit. The
resulting number is the percentage of total rows in the
table that contain a particular value for the named index
columns.

Frequency is associated with the occurrence of a single
value which is listed under COLVALUE.

Frequencies for the most frequent values are collected
by default, or if the FREQVAL option is specified and
given a COUNT value greater than zero. If the default is
taken, then the ten most frequently occurring values are
reported in descending order of frequency.

If fewer than ten values appear, then there are fewer
than ten distinct values in the index.
If no values appear, then the values are uniformly
distributed.
If frequencies appear but column values do not, then
the invoker of RUNSTATS is not authorized to read
the table. Message DSNU619I is issued to identify
the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to DB2 Utility Guide and
Reference for a description of RUNSTATS statistics.

DSNU617I  csect-name SYSINDEXES CATALOG
STATISTICS FOR index-name

:  

CLUSTERED = clustered
CLUSTERRATIO = clusterratio
CLUSTERRATIOF = clusterratio
FIRSTKEYCARD = firstkeycard
FIRSTKEYCARDF = firstkeycard
NLEAF = nleaf
NLEVELS = nlevels
SPACEF = space

Explanation: The RUNSTATS utility issues this
message to report the statistics collected for index
'index-name'.

clustered
Whether the table is actually clustered by this
index (YES or NO)

cluster-ratio
The percentage of data rows that are in
clustering order for this index

float-cluster-ratio
A number between 0 and 1 that when
multiplied by 100 gives the percentage of data
rows in the partition that are in clustering order
for this index

first-key
The number of distinct values of the first key
column

full-key
The number of distinct values of the key

nleaf
The number of active leaf pages in the index

nlevels
The number of levels in the index tree

space
The space currently allocated for all extents,
measured in kilobytes.

For a LARGE table space, the values of
FIRSTKEYCARD and FULLKEYCARD are set to -1.
RUNSTATS uses floating point fields to report these
statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to DB2 Utility Guide and
Reference for a description of RUNSTATS statistics.

DSNU618I  csect-name SYSINDEXPART CATALOG
STATISTICS FOR index-name
PARTITION part-num

:  

CARD = cardinality
CARDF = cardinality
NEAROFFPOS = near-off
NEAROFFPOSF = near-off
FAROFFPOS = far-off
FAROFFPOSF = far-off
LEAFDIST = leafdist
SPACEF = space
DSNUM = dsnum
EXTENTS = extents
LEAFNEAR = leafnear
LEAFFAR = leaffar
PSEUDO_DEL_ENTRIES = pseudo_del_entries

Explanation: The RUNSTATS utility issues this
message to report the statistics collected for index
'index-name'. If 'part-num' equals 0, the statistics apply
to the entire index. If 'part-num' is not 0, the statistics
apply to the specified partition of the index.

cardinality
The number of rows in the partition or index.
near-off
The number of rows pointed to that are near but not at their optimal positions.

far-off
The number of rows pointed to that are far from their optimal positions.

leafdist
100 times the average distance in page IDs between successive leaf pages during a sequential access of the index.

space
The space currently allocated for all extents, measured in kilobytes.

dnum
The number of data sets.

extents
The number of extents for the last data set of the object.

leafnear
The number of leaf pages physically near the previous leaf page for successive active leaf pages.

leaffar
The number of leaf pages located physically far away from the previous leaf pages for successive active leaf pages accessed in an index scan.

pseudo_del_entries
The number of entries that are logically deleted.

For a LARGE table space, the values of CARD, NEAROFFPOS, and FAROFFPOS are set to -1. RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 ( informational)

System Action: Processing continues.

User Response: Refer to [DB2 Utility Guide and Reference] for information on identifying and reporting the problem.

---

DSNU620I  csect-name RUNSTATS CATALOG
STATISTICS STATSTIME = timestamp

Explanation: The RUNSTATS utility issues this message to report the timestamp value when statistics were collected. The value ‘timestamp’ is common to all of the statistic tables that were updated.

Severity: 0 ( informational)

System Action: Processing continues.

---

DSNU621I  csect-name RUNSTATS
COMMIT/ROLLBACK FAILED

Explanation: The RUNSTATS utility updated the catalog with gathered statistics and has tried either to commit those changes or to perform rollback processing to remove them following an error. The commit or rollback failed.

Severity: 8 ( error)

System Action: RUNSTATS processing is terminated. Subsequent utility control statements in the utility job step are executed.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

---

DSNU622I  csect-name CATALOG ACCESS FOR
object-name NOT SUCCESSFUL,
REASON=reason-code

Explanation: Due to catalog access error for object object-name and reason code reason-code, the catalog update, insert, or select was not successful for the object when inline statistics was employed.

Severity: 4 ( warning)

User Response: Run the RUNSTATS utility against the object.

---

DSNU623I  csect-name - catalog-table-name
CATALOG NOT UPDATED WITH AGGREGATE STATISTICS FOR
object-name BECAUSE SOME PARTITIONS HAVE NO VALID STATISTICS

Explanation: Aggregate statistics were requested, but partition statistics do not exist for every partition. Without partition statistics, the aggregate statistics cannot be calculated. The statistics for ‘object-name’ are not updated in the specified DB2 catalog table.

One possible cause for this message is that someone
altered the length of a varying-length column and then tried to run RUNSTATS with the PART option.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Run the RUNSTATS utility to collect statistics for:
- The entire table space, table, column or index, or
- Every partition.

**DSNU624I**

csect-name SYSTABSTATS CATALOG STATISTICS FOR table-name PARTITION part-num

: 

CARD or CARDF = cardinality
NPAGES = npages
PCTPAGES = pctpages
NACTIVE = nactive
PCTROWCOMP = pctrowcomp

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column 'column-name' partition 'part-num' of a table. Message DSNU619I is issued to identify the table.

cardinality
The number of distinct values in the column for the partition

highkey
The highest value of the column in the partition

high2key
The second highest value of the column in the partition

low2key
The second lowest value of the column in the partition

lowkey
The lowest value of the column in the partition

If the values for 'highkey', 'high2key', 'low2key', and 'lowkey' are null, the invoker of RUNSTATS is not authorized to read the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

**DSNU626I**
csect-name SYSCOLDISTSTATS CATALOG STATISTICS FOR column-name, column-name, column-name ... PARTITION part-num

: CARDINALITY = cardinality

FREQUENCY | COLVALUE
---|---
frequency | X “hex_string”
... | ...
frequency | X “hex_string”

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column 'column-name' partition 'part-num'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct values for the listed columns. This statistic appears only if the KEYCARD option was specified.

The values under FREQUENCY are the same as those
that are inserted into the DB2 catalog. Consider each
'frequency' as a four-digit number with an implied
decimal point two places to the left of the final digit. The
resulting number is the percentage of total rows in the
table that contain a particular value for the named index
columns.

Frequency is associated with the occurrence of a single
value which is listed under COLVALUE.

Frequencies for the most frequent values are collected
by default, or if the FREQVAL option is specified and
given a COUNT value greater than zero. If the default is
taken, then the ten most frequently occurring values,
plus the lowest and highest values in the partition (if not
already included in the ten greatest frequencies), are
reported in descending order of frequency.

If fewer than ten values appear, then there are fewer
than ten distinct values in the index.

If no values appear, then the values are uniformly
distributed.

If frequencies appear but column values do not, then
the invoker of RUNSTATS is not authorized to read
the table. Message DSNU619I is issued to identify
the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to [DB2 Utility Guide and
Reference] for a description of RUNSTATS statistics.

---

DSNU627I  csect-name SYSINDEXSTATS CATALOG
          STATISTICS FOR index-name
          PARTITION part-num

:  

CLUSTERRATIO or CLUSTERRATIOF = cluster-ratio
FIRSTKEYCARD or FIRSTKEYCARDF = first-key
FULLKEYCARD or FULLKEYCARDF = full-key
NLEAF = nleaf
NLEVELS = nlevels
KEYCOUNT or KEYCOUNTF = keycount

Explanation: The RUNSTATS utility issues this
message to report the statistics collected for partition
part-num of index index-name.

cluster-ratio
The percentage of data rows in the partition
that are in clustering order for this index

first-key
The number of distinct values of the first key
column in the partition

full-key
The number of distinct values of the key in the
partition

nleaf
The number of active leaf pages in the index
partition

nlevels
The number of levels in the index tree in the
partition

keycount
The number of index keys (entries) in the
partition

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to [DB2 Utility Guide and
Reference] for a description of RUNSTATS statistics.

---

DSNU628I  csect-name STATISTICS WILL NO
          LONGER BE COLLECTED ON
          RESTART

Explanation: Since inline statistics is not restartable,
Statistics will not be collected on restarting the
LOAD/REORG utility. The error message will be issued
on restart of a LOAD/REORG utility with STATISTICS
keyword specified.

Severity: 4 (warning)

User Response: Run the runstats utility on the object
after the utility execution.

---

DSNU629I  csect-name INLINE STATISTICS IS NOT
          SUPPORTED FOR object-name

Explanation: The collection of inline statistics is not
supported on the following directory and catalog
tablespace: DSNDB06.SYSDBASE,
DSNDB06.SYSDBAUT, DSNDB06.SYSGROUP,
DSNDB06.SYSPLAN, DSNDB06.SYSVIEWS,
DSNDB06.SYSSTATS, and DSNDB01.DBD01

This error message will be issued on execution of a
REORG or REBUILD INDEX utility on a catalog object
when the STATISTICS keyword is specified.

Severity: 4 (warning)

User Response: Remove the keyword STATISTICS
from the utility job statement and rerun the utility. Run
the RUNSTATS utility afterwards.

---

DSNU630I  csect-name - SYSLOBSTATS CATALOG
          STATISTICS FOR LOB table space
          AVGSIZE = avgsiz e FREESPACE =
          freespace ORGRATIO = orgratio

Explanation: The RUNSTATS utility issues this
message to report statistics collected for the LOB table
space.

AVGSIZE
Average size of a LOB in the LOB table space.
**FREESPACE**

Amount of free space in the LOB table space.

**ORGRATIO**

The ratio of organization in the LOB table space. A value of 1 indicates perfect organization of the LOB table space. The greater the value exceeds 1, the more disorganized the LOB table space.

**System Action:** RUNSTATS processing continues.

---

**DSNU631I**

csect-name - catalog-table-name

CATALOG NOT UPDATED WITH AGGREGATE STATISTICS FOR object-name BECAUSE ERROR FROM SORT COMPONENT RC=n

**Explanation:** The aggregate statistics cannot be calculated because of an error from the SORT routine. An MVS sort returned a non-zero return code n.

The statistics for object-name are not updated in the DB2 catalog table that was specified.

**Severity:** 4 (warning)

**System Action:** Processing continues, but the statistics for object-name are not updated in the DB2 catalog table that was specified.

**User Response:** Determine the cause of the error from the SORT routine. Run the RUNSTATS utility to collect statistics for:

- The entire tablespace, table, column, or index, or
- Every partition

---

**DSNU638I**

csect - UTILITY NOT ALLOWED TO RUN ON TABLESPACE = ttttttt IN ROSHARE READ DATABASE = dddddddd

**Explanation:** An attempt to execute STOSPACE utility on a table space defined in a ROSHARE READ database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or nonshared database.

**Severity:** 4 (warning)

**System Action:** Processing continues to the next table space or index space in the storage group, if any.

**User Response:** Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

---

**DSNU639I**

csect - UTILITY NOT ALLOWED TO RUN ON INDEX SPACE = iiii IN ROSHARE READ DATABASE = dddddddd

**Explanation:** An attempt to execute STOSPACE utility on an index space defined in a ROSHARE READ database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or nonshared database.

**Severity:** 4 (warning)

**System Action:** Processing continues to the next table space or index space in the storage group, if any.

**User Response:** Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

---

**DSNU640I**

csect-name DATA SET= nnn OF TABLESPACE= ttttttt IN DATABASE= dddddddd HAS BEEN MIGRATED BY HSM

**Explanation:** The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of TABLESPACE 'tttttt' in DATABASE 'ddddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

**Severity:** 0 (informational)

**System Action:** Processing continues to the next data set in the storage group, if any.

**System Programmer Response:** If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

---

**DSNU641I**

csect-name DATA SET= nnn OF INDEXSPACE= iiii IN DATABASE= dddddddd HAS BEEN MIGRATED BY HSM

**Explanation:** The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of INDEXSPACE 'iiii' in DATABASE 'ddddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

**Severity:** 0 (informational)

**System Action:** Processing continues to the next data set in the storage group, if any.

**System Programmer Response:** If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

---

**DSNU642I**

csect-name UNABLE TO ACCESS DBD FOR DATABASE = dddddddd, TABLESPACE = ttttttt

**Explanation:** A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate
ICF catalog. Storage space used by table space 'tttttt' in database 'ddddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the Chapter 18, “DSNT... Messages,” on page 415.

**DSNU643I**  
*csect-name* UNABLE TO ACCESS DBD  
FOR DATABASE = dddddd,  
INDEXSPACE = ttttttt

Explanation: A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate ICF catalog. Storage space used by index space 'ttttttt' in database 'ddddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the Chapter 18, “DSNT... Messages,” on page 415 section.

**DSNU644I**  
*csect-name* USER user-name NOT AUTHORIZED FOR STOSPACE UTILITY

Explanation: Utility processing for the user indicated on the job statement failed, because the user is not authorized to execute the STOSPACE utility.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the systems programmer for assistance with your security classification.

System Programmer Response: If the USER specified on the job statement is incorrect, correct it, and resubmit the job. To run the STOSPACE utility, the user must either have SYSADM authority or have been granted the STOSPACE privilege. Use the SQL GRANT command to give the user the desired authority.

**DSNU645I**  
*csect-name* NO STORAGE GROUPS NAME FOUND

Explanation: You requested the STOSPACE utility to report on all storage groups, but no storage group was found.

Severity: 4 (warning)

This condition does not prevent subsequent processing.

System Action: This message indicates completion of the STOSPACE utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated. Resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: This message indicates that there are no storage groups defined. Consult the system programmer to determine the reason for this condition.

System Programmer Response: This message indicates either that no storage groups were defined by the installation process (or by subsequent SQL procedures) or they have all been dropped. If this is an error, the required storage groups must be re-created with the CREATE STOGROUP SQL statement.

**DSNU646I**  
*csect-name* STORAGE GROUP NAME nnnnnnn NOT FOUND

Explanation: This message is issued by STOSPACE when one of the requested storage groups is not found.

The following circumstances may exist:

1. When an inconsistency occurs between SYSIBM.SYSSSTOGROUP at the beginning of STOSPACE execution and SYSIBM.SYSSSTOGROUP during or at the end of processing. The inconsistency may be due to a storage group being dropped during the processing of STOSPACE utility.

2. The storage group name is misspelled.

Severity: 4 (warning)

System Action: Processing proceeds normally to the next storage group if any.

User Response: Verify the existence or spelling of the storage group names by referring to SYSIBM.SYSSSTOGROUP. Submit another request with the correct storage group designated.
**DSNU647I** csect-name UNAVAILABLE REASON X reason-code UNAVAILABLE TYPE X type-code, TABLESPACE NAME=table-space-name NOT FOUND

**Explanation:** The indicated table space was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSTABLESPACE and SYSIBM.SYSTABLEPART has been detected. The inconsistency may be due to a table space being dropped during the processing of the STOSPACE utility.

**Severity:** 4 (warning)

**System Action:** Processing continues to the next table space in the storage group, if any.

**User Response:** Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

**System Programmer Response:** Determine if the 'reason-code' and 'type-code' require system corrective action.

**Problem Determination:** See the Problem Determination section for message DSNT500I on page 466.

---

**DSNU648I** csect-name UNAVAILABLE REASON X reason code, UNAVAILABLE TYPE X type-code, INDEX NAME=index-name NOT FOUND

**Explanation:** The indicated index was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSINDEXES and SYSIBM.SYSINDEXPART has been detected. The inconsistency may be due to an index being dropped during the processing of the STOSPACE utility.

**Severity:** 4 (warning)

**System Action:** Processing continues to the next index in the storage group, if any.

**User Response:** Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

**System Programmer Response:** Determine if the 'reason-code' and 'type-code' require system corrective action.

**Problem Determination:** See the Problem Determination section for message DSNT500I on page 466.

---

**DSNU650I** csect-name control-statement-text

**Explanation:** Each control statement is returned to the invoker as a part of the normal output. If an error occurred while processing the statement, a separate error message follows this message.

**Severity:** 0 (informational)

**System Action:** The processing of the utility request continues normally.

---

**DSNU651I** csect-name SET NOCOPYPEND

**Explanation:** This message reports the successful completion of the REPAIR SET TABLESPACE NOCOPYPEND utility operation. The COPY PENDING restriction has been removed from the specified table space.

**Severity:** 0 (informational)

**System Action:** The REPAIR SET statement has completed normally.

---

**DSNU652I** csect-name VERIFY OPERATION SUCCESSFUL

**Explanation:** This message is issued during REPAIR utility processing in response to a VERIFY control statement. It indicates the verification requested was successful, permitting a subsequent REPLACE request to take effect.

**Severity:** 0 (informational)

**System Action:** The requested verification was successful. If this is the only verification required for the subsequent REPLACE control statement, the REPLACE control statement takes effect. If there are other verification control statements, they must also complete successfully before the subsequent REPLACE control statement takes effect.

---

**DSNU653I** csect-name REPLACE OPERATION AT OFFSET hex-data WITH DATA hex-data FAILED. ATTEMPTED TO REPLACE CRITICAL NON-DATA INFORMATION ON THE PAGE page-num WITH INCORRECT INFORMATION.

**Explanation:** The REPAIR utility job with the LOG YES option was unable to replace certain critical, nonda data information in the page for one of these reasons:

- Some critical information on any page at the indicated offset cannot be replaced by this method.
• The page is a header page and some of the information at the indicated offset cannot be replaced by this method.
• The information can be replaced only by using the LOG NO option.

Severity: 8 (error)

System Action: REPAIR resumes executing at the next LOCATE statement. Later control statements in the same LOCATE block are not executed.

User Response: Correct the REPAIR control statements and resubmit the request in a new utility job step.

User Response: Check the OFFSET option on the REPLACE statement to be sure it does not cause critical information to be replaced. If the replacement is intentional, use the LOG NO option.

---

**DSNU654I**  
csect-name VERIFY OPERATION FAILED, DATA IS hex-data

Explanation: The verify operation requested on the control statement failed. The actual data is given as 'hex-data'.

Severity: 4 (warning)

System Action: All REPAIR REPLACE actions subject to the current LOCATE scope are ignored. Processing continues at the next LOCATE request, if any.

User Response: Determine why the data (as reported in the message) does not match the expectations of VERIFY option. Make the appropriate correction, and resubmit the REPAIR request in a new utility job step.

Problem Determination: The REPAIR DUMP option can help you determine the correct verification data. Refer to [DB2 Utility Guide and Reference](#) for REPAIR processing constraints.

---

**DSNU655I**  
csect-name DELETE OPERATION SUCCESSFUL

Explanation: This message is issued during the REPAIR utility in response to a DELETE control statement.

Severity: 0 (informational)

System Action: The data record specified on the previous LOCATE statement and all of its related INDEX entries have been deleted from the system. Processing continues.

---

**DSNU656I**  
csect-name REPLACE OPERATION SUCCESSFUL, DATA WAS hex-data

Explanation: This message is issued by the REPAIR utility in response to a REPLACE control statement request. The message indicates that replacement of the data occurred and that the replaced data had the indicated hexadecimal value ('hex-data').

Severity: 0 (informational)

System Action: The REPAIR utility located the indicated record, performed all requested verifications, and replaced the data in the record at the indicated offset with the new data as defined by the REPLACE control statement.

System Programmer Response: If a changed record is recovered before an image copy is made, and the REPAIR utility was run with LOG NO, the repair must be reapplied. If the REPAIR utility was run with LOG YES, no image copy is required before recovering the data after the repair.

---

**DSNU657I**  
csect-name REPLACE RESET OPERATION SUCCESSFUL

Explanation: This message is issued by the REPAIR utility in response to a REPLACE RESET control statement request. The message indicates that the broken page indicator has been reset.

Severity: 0 (informational)

System Action: The REPAIR utility has reset the broken page indicator for the specified page. Although the reset indicator has been committed, it has not been logged. If the page is recovered before an image copy is made, the REPAIR RESET must be reapplied. However, to make the repair persist across subsequent RECOVER operations, an image copy should be taken subsequent to the completion of the REPAIR utility.

---

**DSNU658I**  
csect-name MULTIPLE RECORDS FOUND WITH SPECIFIED KEY

Explanation: The specified key is not unique. Several DSNU660I messages, giving possible RID values for this KEY, follow this message.

Severity: 8 (error)

System Action: Processing continues normally.

User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step.

---

**DSNU659I**  
csect-name REPAIR LEVELID OPERATION DISALLOWED.

Explanation: The REPAIR utility with the LEVELID clause is not allowed. Possible reasons are:

• The data set was in use at the time the REPAIR utility was run.
• The page set has outstanding log apply activity (an indoubt UR has interest in the page set or the page set has pages in the logical page list (LPL)).

Severity: 8 (error)
System Action: Processing ends with this operation.

User Response: The REPAIR LEVELID operation for the given index space or table space cannot continue at this stage. If the page set is in use, you should not attempt to run REPAIR LEVELID. If the page set has log apply activity outstanding (in-doubt UR or pages in LPL), the log apply activity must complete before using REPAIR LEVELID. Submit other REPAIR control statements in a different job step.

DSNU660I  csect-name POSSIBLE RID rid
Explanation: 'rid' is one of several records that map to the specified KEY.
Severity:  8 (error)
System Action: Other records also mapping to the specified KEY are identified by other DSNU660I messages. This message is preceded by message DSNU658I. Processing continues normally.
User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNU661I  csect-name RECORD NOT FOUND IN PAGE, MAXID= hex-data
Explanation: A RID was either specified or obtained from the clustering index via the specified KEY. The PAGE indicated in the RID did not contain the RECORD indicated in the RID.
Severity:  8 (error)
System Action: Processing proceeds to the next LOCATE statement, if there is one.
User Response: Either change the LOCATE statement to locate a valid RID or KEY, or use LOCATE PAGE and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNU662I  csect-name NO RECORD FOUND WITH SPECIFIED KEY
Explanation: A KEY was specified on the LOCATE statement, but no entry exists in the clustering index for that KEY.
Severity:  8 (error)
System Action: Processing begins at the next LOCATE statement, if there is one.
User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU663I  csect-name PAGE hex-page-number NOT FOUND
Explanation: The page identified a record identifier (RID) or KEY does not exist in the specified table space.
Severity:  0 (informational) when issued by DUMP PAGES(n). 8 (error) when issued by LOCATE PAGE(n).
System Action: Processing begins at the next LOCATE statement, if there is one.
User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU664I  csect-name INVALID OFFSET OR LENGTH FOR xxxx
Explanation: 'xxxxx' is 'RECORD' or 'PAGE'. The specified or default values for OFFSET and LENGTH combine to extend beyond the specified record or page.
Severity:  4 (warning)
System Action: Processing continues at the next LOCATE statement, if there is one.
User Response: Correct the OFFSET and/or LENGTH specification, and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSNU665I  csect-name NO RECORD ASSOCIATED WITH SPECIFIED RID
Explanation: A record identifier (RID) was specified on the LOCATE statement, but that RID is not associated with any record in the specified table space. If DELETE processing returns this message, the RID may exist but be invalid for DELETE.
Severity:  8 (error)
System Action: Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.
User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

Problem Determination: REPAIR DELETE will issue this message for RIDs which are internal and do not directly represent user data. The DUMP keyword may be used to view the RID, if it exists. These internal records may only be repaired using the REPLACE keyword.
**DSNU666I  csect-name NO INDEX EXISTS**

**Explanation:** The key for this table space is not a full clustering key. The statement is invalid.

**Severity:** 8 (error)

**System Action:** Processing continues at the next LOCATE statement, if there is one.

**User Response:** Correct the LOCATE statement to use the clustering index, or change LOCATE by PAGE or RID. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**DSNU668I  csect-name UNABLE TO CONVERT KEY TO format**

**Explanation:** "format" specifies the data type to which the KEY specification must be converted. The conversion has failed.

**Severity:** 8 (error)

**System Action:** Processing begins at the next LOCATE statement, if there is one.

**User Response:** Correct the LOCATE statement to specify a KEY either of the indicated data type or of a compatible data-type. Then resubmit the REPAIR statements in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a discussion of conversion constraints.

---

**DSNU669I  csect-name INDEX NOT FOUND FOR SPECIFIED TABLESPACE**

**Explanation:** An index was specified on the LOCATE KEY statement via the INDEX keyword, but no index by that name was found related to the specified TABLESPACE.

**Severity:** 8 (error)

**System Action:** Processing begins at the next LOCATE statement, if there is one.

**User Response:** Correct the LOCATE statement and resubmit the REPAIR statements in a new utility job step.

**Problem Determination:** Valid index names can be found in the SYSEB.SYSINDEXES catalog table.

---

**DSNU670I  csect-name PAGE X page-id IS A BROKEN PAGE**

**Explanation:** The indicated page located by the REPAIR utility has been marked broken by the data manager. The 'page id' is given in hexadecimal. This page is not accessible until the broken page indicator is reset by the REPAIR REPLACE RESET option.

**Severity:** 4 (warning)

**System Action:** The message reports that the page in which the REPAIR utility is requested to REPLACE some data is broken.

**User Response:** Determine the cause of the broken page with the assistance of the system programmer. When it is repaired, use the REPAIR RESET option.

**System Programmer Response:** Determine the cause of the broken page. It could be an internal error and require support center assistance. The REPAIR DUMP option can be used to determine the contents of the page for failure analysis. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**DSNU672I  csect-name INDEX USED HAS MULTIPLE-FIELD KEY**

**Explanation:** A REPAIR LOCATE KEY operation was attempted against a table space using an index that has a multiple-field key. LOCATE KEY does not support multiple-field keys.

**Severity:** 8 (error)

**System Action:** Processing begins at the next LOCATE scope, if any.

**User Response:** Change the LOCATE statement to specify PAGE and RID, and resubmit the REPAIR statements in a new utility job step.

---

**DSNU673I  csect-name REPAIR LOCATE RID LOCATED A NON-DATA PAGE**

**Explanation:** The LOCATE RID option of the REPAIR utility was used to process a nondata page.

**Severity:** 8 (error)

**System Action:** Processing continues at the next LOCATE statement. Otherwise, processing stops.

**User Response:** To process nondata pages, use the LOCATE PAGE option in the REPAIR control statements and resubmit the new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**DSNU676I  csect-name - ROWID=rowid VERSION=version IS NOT FOUND IN AUXILIARY INDEX**

**Explanation:** The REPAIR utility was unable to locate the ROWID rowid and VERSION version in the index on the auxiliary table.

**System Action:** Utility returns completion code=8.

**Programmer Response:** Correct the ROWID or VERSION. Only ROWID and VERSION values previously generated by DB2 can be used. The most
likely source values of a ROWID and VERSION are messages DSNU743I, DSNU805I, and DSNU806I from the CHECK DATA or CHECK LOB utilities.

**DSNU678I**  csect-name VERIFY, REPLACE, DUMP, OR DELETE BEFORE LOCATE  
**Severity:** 8 (error)  
**Explanation:** The REPAIR utility was requested to VERIFY, REPLACE, or DUMP or DELETE a page or record and that page of record could not be located.  
**System Action:** Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.  
**User Response:** Correct the REPAIR control statements, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**DSNU679I**  csect-name MULTIPLE 'DELETE'S PER 'LOCATE' NOT ALLOWED  
**Severity:** 8 (error)  
**Explanation:** The REPAIR utility was requested to DELETE the same record more than once. Only one DELETE is allowed per LOCATE RID or LOCATE KEY.  
**System Action:** Processing begins at the next LOCATE scope, if any. Subsequent utilities in the same job step are not executed.  
**User Response:** Remove all but one DELETE control statement from each LOCATE scope which is intended to delete a record. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**DSNU680I**  csect-name PAGE hex-page-number  
**Severity:** 0 (informational)  
**Explanation:** This message is issued as an identifier at the top of each page dumped by the REPAIR DUMP PAGES facility. 'hex-page-number' identifies the page which is about to be dumped.  
**System Action:** Processing continues.

**DSNU681I**  csect-name SET NOCHECKPEND OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** This message reports the successful completion of the REPAIR SET TABLESPACE NOCHECKPEND utility operation. The check pending restriction has been removed from the specified table space.

**DSNU682I**  csect-name SET NORCVRPEND OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** This message reports the successful completion of the REPAIR SET NORCVRPEND utility operation. The RECOVERY PENDING restriction has been removed from the specified table space, from the specified index, or from all indexes of the specified table space.

**DSNU683I**  csect-name REPAIR LEVELID OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** The REPAIR utility with the LEVELID clause completed successfully.

**DSNU684I**  csect-name - SET NOAUXCHKP OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** This message reports the successful completion of the REPAIR SET NOAUXCHKP utility operation. The auxiliary check pending (ACHKP) state has been removed for the specified base table space.

**DSNU685I**  csect-name SET NORBDPEND OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** This message reports the successful completion of the REPAIR SET NORBDPEND utility operation. The three restrictions REBUILD PENDING, REBUILD PENDING STAR and PAGESET REBUILD PENDING have been removed from the specified index or from all indexes of the specified table space.

**DSNU686I**  csect-name - SET NOAUXWARN OPERATION SUCCESSFUL  
**Severity:** 0 (informational)  
**Explanation:** This message reports the successful completion of the REPAIR SET NOAUXWARN utility operation. The AUX WARNING state has been removed for the specified table space.
**Severity:** 586

**Explanation:** The LOB with the ROWID rowid and VERSION version was successfully deleted from the specified LOB table space.

**System Action:** Utility returns completion code=0.

**Programmer Response:** None.

**Severity:** 0 (informational)

**System Action:** Utility returns completion code=8.

**Programmer Response:** Either the ROWID is incorrect, or the index on the auxiliary table is broken. In the first case correct the ROWID as specified on the LOCATE ROWID statement. If the index on the auxiliary table is broken, execute the REBUILD INDEX utility to rebuild the index.

**Severity:** 0 (informational)

**Severity:** 8 (error)

**System Action:** Utility processing is discontinued.
Problem Determination: To CHECK or REBUILD ALL INDEXES in a table space, use the TABLESPACE keyword, but do not use the list option. This is one way to correct this error. If you want to correct the list of indexes specified in the index name list, the following procedure will locate the table space name related to the index iiii.

The index name iiii reported in the message is of the form 'creator.name'. Obtain the TBCREATOR and TBNAM columns from the DB2 catalog table SYSIBM.SYSINDEXES, where columns CREATOR and NAME have the values reported in the message. Obtain the DBNAME and TSNAM columns from the DB2 catalog table SYSIBM.SYSTABLES, where columns CREATOR and NAME have the values obtained from TBCREATOR and TBNAM of SYSIBM.SYSINDEXES.

The values for DBNAME and TSNAM must be the same for all indexes specified in the index name list and must be the same as the table space name specified on the TABLESPACE keyword if provided.

DSNU705I csect-name UNLOAD PHASE COMPLETE, ELAPSED TIME=tttt
Explanation: The unload phase of the CHECK or REBUILD INDEX utility is complete.
Severity: 0 (informational)
System Action: Processing continues.

DSNU706I csect-name ROW IS IN WRONG PARTITION RID=rrrr, INDEX=i iii, KEY=kkkk, CORRECT PART=pppp, WRONG PART=wwww
Explanation: The row at RID 'rrrr' resides in the wrong partition. The partitioning KEY 'kkkk' for partitioning INDEX 'i iii' indicates that the row at RID 'rrrr' should reside in partition 'pppp', however the rid indicates that the row contains partition 'wwww'.
Severity: 4 (warning)
System Action: Utility processing continues.
User Response: Run RECOVER TABLESPACE utility to recover the data or run REPAIR DELETE utility to delete the row 'rrrr' followed by CHECK INDEX and CHECK DATA utility if referential constraints are involved.

Problem Determination: The inconsistency between the table space partition number of a row and the index space partition number of the row's clustering key may be due to a DB2 internal error, but is most likely due to a user using the DSN1COPY service aid to populate a target table space with data from a source table space when the clustering key values on the source and target table spaces are not identical.

DSNU707I csect-name INDEX ENTRY POINTS TO WRONG TABLE. OBID=oooo, RID=rrrr, INDEX=i iii
Explanation: The CHECK utility CHECKIDX phase found that index 'i iii' contains an entry for key 'kkkk' that points to record at RID 'rrrr', but the record belongs to the table with OBID 'oooo'.
Severity: 4 (warning)
System Action: CHECK utility processing continues.
User Response: Run the REBUILD INDEX utility for index 'i iii'.

DSNU708I csect-name INDEX IS NOT UNIQUE. INDEX=i iii, KEY=kkkk
Explanation: The CHECK utility CHECKIDX phase found that unique index 'i iii' contains a nonunique key, 'kkkk'.
Severity: 4 (warning)
System Action: CHECK utility processing continues.
User Response: Drop the unique index, and delete the duplicate rows. Re-create the index.

DSNU709I csect-name NO INDEX ENTRY FOR ROW. RID=rrrr, INDEX=i iii, KEY=kkkk
Explanation: The CHECK utility CHECKIDX phase found that index 'i iii' is missing an entry for the row at RID 'rrrr' with key 'kkkk'.
Severity: 4 (warning)
System Action: CHECK utility processing continues.
User Response: Run the REBUILD INDEX utility for index 'i iii'.

DSNU710I csect-name INDEX ENTRY CONTAINS INVALID ZERO REPRESENTATION. RID=rrrr, INDEX=i iii, KEY=kkkk
Explanation: The CHECK utility CHECKIDX phase found that index 'i iii' has an entry that contains a negative zero. The index entry is for the row at RID 'rrrr' with key 'kkkk'.
Severity: 4 (warning)
System Action: CHECK utility processing continues.
User Response: Run the REBUILD INDEX utility for index 'i iii'.

DSNU711I csect-name NO ROW FOR INDEX ENTRY. RID=rrrr, INDEX=i iii, KEY=kkkk
Explanation: The CHECK utility CHECKIDX phase found that the index 'i iii' contains an entry that has no row. The index entry contained RID 'rrrr' and key 'kkkk',

Chapter 19. DB2 messages 587
but RID 'rrrr' is not a valid record.

**Severity:** 4 (warning)

**System Action:** CHECK utility processing continues.

**User Response:** Run the REBUILD INDEX utility for index 'iii'.

---

**DSNU712I csect-name INDEX OUT OF SEQUENCE. INDEX=iiii, KEY=kkkk**

**Explanation:** The CHECK utility CHECKIDX phase found that index 'iiii' is not in correct sequence.

**Severity:** 4 (warning)

**System Action:** CHECK utility processing continues.

**User Response:** Run the REBUILD INDEX utility for index 'iiii'.

---

**DSNU713I csect-name KEYS MISMATCH. RID=rrrr, INDEX=iiii, KEY=kkkk, DATA KEY=jjjj**

**Explanation:** The CHECK utility CHECKIDX phase found that index iii contains an entry for the row at rid rrrr that is inconsistent. KEY kkkk does not match DATA KEY jjj.

**Severity:** 4 (warning)

**System Action:** CHECK utility processing continues.

**User Response:** Run the REBUILD INDEX utility for index 'iiii'.

---

**DSNU715I csect-name MULTIPLE INDEX ENTRIES FOR ROW. RID=rrrr, INDEX=iiii, KEY=kkkk**

**Explanation:** The CHECK utility CHECKIDX phase found that index 'iiii' has multiple index entries for the row at RID 'rrrr' with key 'kkkk'.

**Severity:** 4 (warning)

**System Action:** CHECK utility processing continues.

**User Response:** Run the REBUILD INDEX utility for index 'iiii'.

---

**DSNU717I csect-name nnnn ENTRIES CHECKED FOR INDEX=iiii PARTITION=pppp**

**Explanation:** The CHECK utility completed checking index iii partition pppp and processed nnnn index entries. This message is issued once for each index partition checked.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**DSNU718I csect-name NO INDEXES FOUND FOR TABLESPACE tttt**

**Explanation:** A utility has been invoked with the TABLESPACE keyword specifying a table space containing tables that have no indexes.

**Severity:** 4 (warning)

**System Action:** This message indicates completion of the utility. Processing continues to the next utility statement in the job step, if any. If there are no utility statements following, the job step is terminated normally and the UTILID of the job step becomes available for reuse.

**User Response:** If the table space specification is in error, correct it and resubmit the utility. If the table space specification is correct, and the table space contains no indexed tables, this is a normal indication and no response is necessary.

---

**DSNU719I csect-name nnnn ENTRIES CHECKED FOR INDEX iii**

**Explanation:** The CHECK utility has completed checking index 'iii' and has processed 'nnnn' index entries. This message will be issued once for each index checked.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**DSNU720I csect-name CHECKIDX PHASE COMPLETE, ELAPSED TIME = tttt**

**Explanation:** The CHECK utility CHECKIDX phase is complete.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**DSNU721I csect-name - USER auth-id DOES NOT HAVE DELETE AUTHORITY ON TABLE**

**Explanation:** The CHECK DATA utility was run with DELETE YES, but user auth-id does not have authority to delete from a table specified in the utility statement or from one of its descendents.

**Severity:** 8 (error)

**System Action:** Further utility processing is terminated.

**User Response:** Obtain authorization to delete from the tables specified in the utility statement and any of its descendents that are affected.
**DSNU722I**  
**csect-name - USER userid DOES NOT HAVE INSERT AUTHORITY ON EXCEPTION TABLE**

**Explanation:**  The CHECK DATA utility was run with FOR EXCEPTION specified but user 'userid' does not have authority to insert into an exception table specified in the utility statement.

**Severity:** 8 (error)

**System Action:** Further utility processing is terminated.

**User Response:** Obtain authorization to insert into all of the exception tables specified in the utility statement.

**DSNU725I**  
**csect-name DUPLICATE TABLESPACE tsp NAMES EXIST IN THE TABLESPACE LIST**

**Explanation:** This message is issued by the CHECK DATA utility when a duplicate table space 'tsp' is found in the table space list. An entry in the list for the same table space with a partition specified is also considered a duplicate. This is because all partitions are the default when no partition is specified for a partitioned table space. The CHECK DATA utility proceeds and the duplicate entry is skipped.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**DSNU726I**  
**csect-name SCOPE PENDING IS ACTIVE, BUT THE ENTIRE TABLE SPACE tsp MUST BE CHECKED**

**Explanation:** This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space tsp is in check pending status, but the utility is checking all rows in dependent tables or tables defined with check constraints in that table space.

**Severity:** 4 (warning)

**System Action:** The utility continues processing.

**DSNU727I**  
**csect-name TABLESPACE tsp IS NOT CHECK PENDING**

**Explanation:** This message is issued when 'CHECK DATA TABLESPACE tsp SCOPE PENDING' is specified and the CHECK DATA utility finds that the table space is not in a check pending state. The CHECK DATA utility skips table space 'tsp' and will continue with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**DSNU728I**  
**csect-name INVALID EXCEPTION TABLE table2 FOR table1**

**Explanation:** This message is issued when the CHECK DATA utility finds an exception table is invalid. The exception table named 'table2' which was specified for rows from table, 'table1', is invalid. Either 'table2' was missing columns of 'table1' or 'table2' contained incompatible column attributes. The CHECK DATA utility will terminate processing after all exception tables have been examined.

**Severity:** 8 (error)

**System Action:** The CHECK DATA utility will terminate processing after all the exception tables have been examined.

**User Response:** Refer to Part 2 (Volume 1) of [DB2 Administration Guide](https://www.ibm.com) for a definition of the CREATE TABLE command with the LIKE operand to correct the invalid exception table.

**DSNU729I**  
**csect-name TABLE table-name NOT SPECIFIED IN THE 'FOR EXCEPTION' CLAUSE**

**Explanation:** The CHECK DATA utility did not find a required table listed in the FOR EXCEPTION clause. All tables with constraints in the table spaces being checked and their descendents must be listed in the FOR EXCEPTION clause of CHECK DATA utility.

**Severity:** 8 (error)

**System Action:** The CHECK DATA utility terminates processing after all the required tables are examined.

**User Response:** Examine the utility input statement to determine the reason for the missing table named in the message. Correct the input statement to include the missing table and resubmit the job. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com) for information about the FOR EXCEPTION clause of the CHECK DATA utility and use of exception tables.

**DSNU730I**  
**csect-name CHECKING TABLE tab**

**Explanation:** This message is issued when the CHECK DATA utility begins to process a table. The name of table being checked is 'tab'.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**DSNU731I**  
**csect-name EXCEPTION LIMIT REACHED**

**Explanation:** The EXCEPTION limit specified on the CHECK utility statement has been reached.

**Severity:** 8 (error)
DSNU732I  NO TABLE TO BE CHECKED FOR TABLESPACE tsp

Explanation:  The CHECK DATA utility determined that none of the tables in table space tsp has a constraint defined. Therefore, no table in that table space is checked.

This message is issued by the following CSECT: DSNUKINP

Severity:  4 (warning)
System Action:  Utility processing continues.

DSNU733I  csect-name ROW (RID=rrrrrt) HAS NO PARENT FOR rel

Explanation:  This message is issued when the CHECK DATA utility finds a row in a dependent table without a parent. The row with RID, 'rrrrrt', has no parent for the relationship named 'rel'. This message is always proceeded by a DSNU730I message that identifies the table in error.

Severity:  4 (warning)
System Action:  Processing continues.
User Response:  Refer to Part 2 (Volume 1) of DB2 Administration Guide for a discussion of the check pending operation.

DSNU735I  csect-name DUPLICATE TABLESPACE tsp PARTITION part NAMES EXIST IN THE TABLESPACE LIST

Explanation:  This message is issued by the CHECK DATA utility when a duplicate table space 'tsp' and partition 'part' is found in the table space list. An entry in the table space list with a partition specified is considered to be a duplicate when another entry for the same table space with no partition specified (defaults to all partitions for a partitioned table space) is found. In this case, the table space list entry with no partition specified has priority and the entry with a partition specified is skipped. The CHECK DATA utility proceeds and the duplicate entry is skipped.

Severity:  4 (warning)
System Action:  Processing continues.

DSNU736I  csect-name SCOPE PENDING IS ACTIVE, BUT THE ENTIRE TABLE SPACE tsp PARTITION part MUST BE CHECKED

Explanation:  This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space tsp partition part is in check pending status, but the utility is checking all rows in that table space partition.

Severity:  4 (warning)
System Action:  The utility continues processing.

DSNU737I  csect-name TABLESPACE tsp PARTITION part IS NOT CHECK PENDING

Explanation:  This message is issued when 'CHECK TABLESPACE tsp PART partition 'part' is not in a check pending state. The CHECK DATA utility skips table space 'tsp' partition 'part' and continues with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

Severity:  4 (warning)
System Action:  Processing continues.

DSNU739I  csect-name CHECK TABLE tab COMPLETE, elapsed time=t1

Explanation:  This message is issued when the CHECK DATA utility finishes processing a table. The elapsed clock time that the check of table 'tab' consumed is 't1'.

Severity:  0 (informational)
System Action:  Processing continues.

DSNU740I  csect-name CHECKING TABLE tab PARTITION part

Explanation:  This message is issued when the CHECK DATA utility begins to process a table of a partitioned table space in which a single partition was specified. The name of the table and the number of the partition being checked are identified in the message.

Severity:  0 (informational)
System Action:  Processing continues.

DSNU741I  csect-name nn ROWS DELETED FROM TABLE tab

Explanation:  This message is issued by the CHECK DATA utility when the DELETE YES option is specified. The number of rows deleted from TABLE tab is the number of rows that contain referential integrity violations or check constraint violations, plus their
descendent rows. The number of rows deleted from TABLE tab is equal to the number of rows inserted into the corresponding exception table.

Severity: 4 (warning)
System Action: Processing continues.

**DSNU742I**  
**csect-name** ROW (RID=rrrr) VIOLATES CHECK CONSTRAINT constraint-name ON TABLE table-name

Explanation: The CHECK DATA utility found that the row with RID=rrrr in table table-name violated check constraint constraint-name.

Severity: 4 (warning)
System Action: Processing continues

**User Response:** Refer to Part 2 (Volume 1) of [DB2 Administration Guide](http://db2admin.com) for a discussion of the check pending operation and recovery procedures.

**DSNU743I**  
**csect-name** - LOB WITH ROWID=rowid VERSION=version IS INVALID

Explanation: The CHECK LOB utility found that the LOB column with rowid ROWID and VERSION version was marked as invalid.

**Programmer Response:** The LOB column must be updated or the row containing the LOB column deleted using SQL to remove the invalid indication.

**DSNU745I**  
**csect-name** - ROWID=rowid VERSION=version RID=rid MISSING IN LOB TABLE SPACE=lob-table-space-name

Explanation: The CHECK INDEX utility found an index entry key with ROWID rowid and VERSION version in the index, but not in the LOB table space named lob-table-space-name.

System Action: The utility returns completion code=4. The index is set Recover Pending.

**Programmer Response:** Use REBUILD INDEX or RECOVER to correct the index on the auxiliary table.

**DSNU747I**  
**csect-name** - ROWID=rowid VERSION=version INDEX=index-name

Explanation: The CHECK INDEX utility found a LOB with ROWID rowid and VERSION version in the LOB table space but not in the index on the auxiliary table, index-name.

System Action: Utility returns completion code=4. The index is set Recover Pending.

**DSNU749I**  
**csect-name** CHECK DATA COMPLETE, ELAPSED TIME=t1

Explanation: This message is issued when the CHECK DATA utility is complete. The elapsed clock time that the CHECK DATA utility consumed is 't1'.

Severity: 0 (informational)
System Action: Processing ends.

**DSNU750I**  
**csect-name** CATMAINT operation PHASE phase-number STARTED

Explanation: The CATMAINT utility phase phase-number processing started for the indicated operation.

Severity: 0 (informational)
System Action: Utility processing continues normally.

**DSNU752I**  
**csect-name** CATMAINT operation PHASE phase-number COMPLETED

Explanation: The CATMAINT utility PHASE phase-number processing completed for the indicated operation.

Severity: 0 (informational)
System Action: Utility processing continues normally.

**DSNU756I**  
**csect-name** CATALOG TABLE IS EMPTY - table-name

Explanation: This message is issued when the named table is empty.

Severity: 0 (informational)
System Action: Utility processing continues normally.

**DSNU759I**  
**csect-name** INCORRECT UNLOAD DATASET HAS BEEN DETECTED

Explanation: This message indicates an inconsistency between the release level of the unloaded catalog and the DB2 release that is running the CATMAINT utility.

Severity: 8 (error)
System Action: Utility processing terminates.
**User Response:** Review the JCL for the job to ensure that the correct unload data set is specified. Verify that the correct level of DB2 is up.

**DSNU760I**

csect-name SPECIFIED USER NOT DEFINED WITH INSTALLATION SYSADM AUTHORITY

**Explanation:** The utility can be run only under a user defined with the installation SYSADM authority.

**Severity:** 8 (error)

**System Action:** Utility processing terminates.

**User Response:** Rerun the utility with the proper authorization.

**DSNU762I**

csect-name DUPLICATE RECORD DETECTED FOR TABLENAME -
    table-name SEQNO OF THE INPUT RECORD IS - seqno FOLLOWING IS UP TO 119 BYTES OF RECORD BEING INSERTED

**Explanation:** An object created in the target catalog has the same name as an object being migrated from the source catalog.

**Severity:** 8 (error)

**System Action:** Utility abends.

**User Response:** User data should not be in the target catalog before running the CATMAINT utility. Free or drop the object from the target catalog and rerun the CATMAINT utility.

**DSNU764I**

csect-name FOLLOWING IS UP TO 119 BYTES OF RECORD FOR TABLE-
    table-name, SEQNO seqno BEING PROCESSED AT THE TIME OF ERROR

**Explanation:** An abend occurred during the execution of the CATMAINT utility, during the processing of the table, 'table-name', with a sequence number of 'seqno'. The cause of the abend is one of the following:
- The record sequence number was invalid.
- An unexpected return code was received from DSNUEXLO.
- The table name was not found in the load table (DSNUELTB).
- The parent record could not be positioned.
- The position OBID was zero (DSNUELTB has incorrect value).
- The record action code is incorrect.

Following this message, up to the first 119 bytes of the record is displayed.

**Severity:** 8 (error)

**System Action:** Utility abends.

**User Response:** Verify that the record in the unloaded data set is correct.

**DSNU765I**

csect-name THE DB2 CATALOG IS NOT AT THE REQUIRED LEVEL. CATALOG NOT UPDATED

**Explanation:** The DB2 catalog is not at the proper catalog level to migrate the catalog. This error can occur due to the following reasons:
- Attempting to migrate the catalog from a DB2 release that does not support migration
- Attempting to migrate DB2 Stored Procedures prior to a catalog migration

**Severity:** 8 (error)

**System Action:** Utility processing terminates

**User Response:** Depending on the migration error, perform the necessary actions:
- If the catalog is not at the correct level for a migration, fall back to the previous release. Migrate only from DB2 releases that support migration.
- Prior to attempting a Stored Procedure migration, migrate the DB2 catalog to the current release. After migrating the DB2 catalog, then you can migrate the Stored Procedures.

**DSNU766I**

csect-name THE CATALOG HAS ALREADY BEEN MIGRATED. NO ACTION WILL BE TAKEN

**Explanation:** The catalog was already successfully migrated. There is no reason to rerun the catalog migration job. Therefore, no action is taken to update the DB2 catalog.

**Severity:** 0 (informational)

**System Action:** Processing ends.

**DSNU767I**

csect-name DB2 SYSTEM MUST BE STARTED ACCESS(MAINT)

**Explanation:** In order for the utility to execute, the DB2 subsystem must be started with ACCESS(MAINT). This message indicates that the subsystem was not started in this manner.

**Severity:** 8 (error)

**System Action:** -STOP DB2, and then -START DB2 with ACCESS(MAINT).

**DSNU768I**

csect-name CATMAINT CONVERT COMPLETE FOR INDEX index-name

**Explanation:** The conversion is complete for index index-name.

**Severity:** 0 (informational)
System Action: Processing continues with the next index.

---

**DSNU769I**

csect-name THE BUILD PHASE FAILED FOR INDEX index-name REASON reason

Explanation: The CATMAINT CONVERT build phase failed for index index-name. This message and others identify the actions that should be taken.

Severity: 8 (error)

Operator Response: Note the reason code and the index name. See the Problem Determination section for an explanation of the collected data.

System Action: Utility processing continues with the next index and will terminate with return code 8.

User Response: Correct the problem indicated by the reason code. Either resubmit the CATMAINT CONVERT job or recover the index that failed.

Problem Determination: The reason the build phase failed is identified by the reason code, which is described in Part 4, "Section 4. DB2 Codes," on page 771.

---

**DSNU770I**

csect-name - DBD type STARTED FOR DATABASE database

Explanation: This message marks the start of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

---

**DSNU771I**

csect-name - DBD type COMPLETE FOR DATABASE database

Explanation: This message marks the completion of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

---

**DSNU772I**

csect-name - THE object-type qualifier.object-name IS UNAVAILABLE IN THIS RELEASE

Explanation: This message indicates that the specified object has a dependency on a release from which fall back has occurred, and cannot be operated upon in the current release.

Severity: 8 (error)

System Action: Utility processing terminates.

---

**DSNU773I**

csect-name - database IS A SYSTEM DATABASE AND CANNOT BE PROCESSED

Explanation: The database indicated is not eligible for processing by the type of the REPAIR DBD utility involved.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the utility control statement specifies the correct database.

---

**DSNU774I**

csect-name - SPECIFIED DATABASE database NOT FOUND

Explanation: The database indicated by the utility control statement was not found in catalog table SYSIBM.SYSDATABASE.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the database indicated by the utility control statement exists in SYSIBM.SYSDATABASE.

---

**DSNU775I**

csect-name - DROP OF DATABASE dbname FAILED WITH SQLCODE = sqlcode

Explanation: An error was encountered while using the REPAIR DBD DROP utility to drop DATABASE 'dbname'. The SQL error code is indicated by 'sqlcode'.

Severity: 8 (error)

System Action: DATABASE 'dbname' is not dropped.

User Response: For a description of the SQL error code that was issued, refer to Part 2, "SQL return codes," on page 11.

---

**DSNU776I**

csect-name CATMAINT operation ERROR - error-text

Explanation: The CATMAINT utility halted because the catalog contains view(s) on the SYSIBM and/or SYSCOLDISTSTATS catalog tables.

Severity: 0 (informational)

System Action: Utility processing halts.

User Response: Remove the views on these catalog tables. Then retry the failing CATMAINT operation. This
message is followed by an abend04E RC00E40601. See the problem determination text of RC00E40601 for additional information.

**DSNU777I**  csect-name CATMAINT operation
**STATUS** status-msg

**Explanation:** The CATMAINT utility is processing CATMAINT operation. status-msg indicates where CATMAINT is in the operation process.

**Severity:** 0 (informational)

**System Action:** Utility processing continues normally.

**DSNU778I**  csect-name - ERROR PROCESSING
**SQL STATEMENT - SQL CODE IS:**
sql-code SQL MESSAGE TOKENS:
message-token(s) THE FOLLOWING IS
THE PROBLEM SQL STATEMENT:
sql-statement

**Explanation:** There was a utility abend in the DB2 database services address space (ssnmDBM1) during CATMAINT UPDATE processing. The message-tokens displayed are those found in the SQLERRMT field of the SQLCA, separated by commas, for the indicated SQLCODE sql-code. The problem SQL statement sql-statement is also displayed.

**Severity:** 0 (informational).

**System Action:** Utility processing abends.

**User Response:** This message is followed by an abend04E RC00E40601. The sql-code, message-tokens, and sql-statement listed in this message are probably sufficient to diagnose and correct the problem. See the problem determination text of RC00E40601 for additional information.

**DSNU780I**  csect-name DSNUTILB LEVEL rel1
**INVALID WITH SUBSYSTEM LEVEL rel2

**Explanation:** JCL has been submitted which executes level 'rel1' of DSNUTILB against a level 'rel2' DB2 subsystem. The levels must match.

**Severity:** 8 (error)

**System Action:** The utility terminates with a return code of 8.

**User Response:** Determine the DB2 subsystem against which you wish to execute. Determine which STEPLIB data set contains the corresponding DSNUTILB load module. Correct the JCL to specify the correct data set on the STEPLIB DD statement and the correct DB2 subsystem on the EXEC statement and resubmit the job.

**DSNU781I**  csect-name RESTART OF LEVEL rel1
**UTILITY AT LEVEL rel2 INVALID

**Explanation:** JCL has been submitted which attempts to RESTART a stopped utility. The utility began processing at level 'rel1' and cannot be restarted at level 'rel2'.

**System Action:** The utility job is abended with reason code X'00E40018'.

**User Response:** Either restart the utility at the same level it was originated or terminate the utility with the TERM command and resubmit it at the new level. Refer to [DB2 Command Reference](http://www.ibm.com/systems/db2) for special TERM command considerations.

**DSNU782I**  csect-name UNABLE TO RECOVER
**DUE TO ACTIVITY AT ANOTHER SYSTEM LEVEL

**Explanation:** The RECOVER utility is unable to recover the specified table space. Activity at another system level has left all image copies for this table space inconsistent with the DB2 LOG.

**Severity:** 8 (error)

**System Action:** The utility terminates with a return code of 8.

**User Response:** The table space, in its entirety can not be recovered. Individual data sets may be recoverable using the DSPNUM() keyword.

**DSNU783I**  csect-name INDEXES DSNST02,
DSNLUX01, DSNLUX02 and DSNLX02
**HAVE SUBPAGES VALUE GREATER THAN 1 AND CANNOT BECOME GROUP BUFFER POOL DEPENDENT

**Explanation:** CATMAINT CONVERT TO TYPE 1 DIRECTORY alters the indexes DSNST02, DSNLUX01, DSNLUX02, and DSNLX02 to type 1 with more than one subpage. In a data sharing environment, there cannot be inter-DB2 R/W interest on type 1 indexes with more than one subpage (they cannot become group buffer pool dependent). This means that any read or update request that causes inter-DB2 R/W interest on these directory indexes is denied with a 'resource unavailable' condition.

For directory indexes, only type 2 indexes can have full R/W sharing among data sharing members.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** With very few exceptions, indexes on the directory will have inter-DB2 R/W interest if there are two or more members in your DB2 data sharing group. Use CATMAINT CONVERT TO TYPE 2 DIRECTORY to convert the indexes to type 2 if you plan to have two or more DB2 members.
DSNU784I  csect-name CATMAINT operation -
CATALOG CONTAINS UNSUPPORTED
OBJECTS: error-text
OBJECT NAME -
object-name, CREATOR - creator

Explanation: The CATMAINT utility halted because
the catalog contains an unsupported object/item
(indicated by error-text):
• CATALOG CONTAINS TYPE 1 INDEXES

Severity:  8 (error)

System Action: Utility processing halts. No
SYSABEND dump or SVC dump is requested.

User Response: Any unsupported objects/items
should be removed from the DB2 catalog in the
previous release. The DSNTIJPM and DSNTESO jobs
can be used to identify any unsupported objects that
are found in a subsystem. Remove any unsupported
objects in the DB2 catalog and retry the failing
CATMAINT operation. This message is followed by an
abend 04E RC 00E40601.

DSNU785I  csect-name - PAGE=page-number IS
INVALID FOR REASON=reason-code,
EXPECTED VALUE=expected-value,
ACTUAL VALUE=actual-value

Explanation: The CHECK LOB utility found the LOB
table space page numbered page-number was invalid
for reason reason-code. reason-code can be in the
form: reason1, reason2. This reason code is supplied
for serviceability only.

LOB table space is set check pending.

Programmer Response: Notify the system
programmer.

System Programmer Response: Notify the IBM
Service Representative. Be prepared to provide the
message number and reason code.

DSNU790I  csect-name utility-name option IS NOT
ALLOWED WHEN THERE ARE
OUTSTANDING UTILITIES STARTED
FROM PRIOR RELEASES.

Explanation: The utility to be executed may have
conflicts with other outstanding utilities started from prior
releases.

utility-name is the name of the utility that detected the
conflict.

option is the option specified to the utility that detected
the conflict.

System Action: The request is rejected.

User Response: Use the DISPLAY UTILITY command
to see what utilities are outstanding. Issue the TERM
UTILITY command on the same release as the release
on which the outstanding utility was started.

DSNU795I  csect-name - CHECKLOB PHASE
COMPLETE - ELAPSED TIME=time

Explanation: The CHECK LOB utility CHECKLOB
phase was completed with the elapsed time of time.

Severity:  0 (informational)

System Action: The CHECKLOB phase is completed.

DSNU796I  csect-name - REPTLOB PHASE
COMPLETE - ELAPSED TIME=time

Explanation: The CHECK LOB utility REPTLOB
phase was completed with the elapsed time of time.

Severity:  0 (informational)

System Action: The REPTLOB phase is completed.

DSNU805I  csect-name - TABLE=table_name
COLUMN=column_name IS OUT OF
SYNCH ROWID=rowid VERSION=version

Explanation: The CHECK DATA utility found a base
table row with ROWID, rowid, in table, table_name. The
LOB column named column_name in the base table is
out of synch with the LOB table space. The version
reported is from the index on the auxiliary table.

System Action: If AUXERROR REPORT was
specified, this error is reported only. The base table
space is set to a Aux Check Pending state.

If AUXERROR INVALIDATE was specified, the LOB
column is set invalid. The base table space is set to an
Aux Warning state.
Utility returns completion code=4.

**Programmer Response:** CHECK DATA relies on information in LOB table space and in the auxiliary index being correct. Before running CHECK DATA to check auxiliary columns, first run CHECK LOB and then run REBUILD INDEX or CHECK INDEX. CHECK LOB ensures the validity of the LOB table space. REBUILD INDEX or CHECK INDEX ensures the validity of the auxiliary index.

If **AUXERROR REPORT** was specified, run the CHECK DATA utility with **AUXERROR INVALIDATE** to set the base table column invalid.

If **AUXERROR INVALIDATE** was specified, use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

---

**DSNU806I**

```
csect-name - TABLE=table_name
COLUMN=column_name WAS SET
INVALID ROWID=rowid
VERSION=version
```

**Explanation:** The CHECK DATA utility with **AUXERROR INVALIDATE** specified, set the LOB column named column_name invalid. The LOB column was in the row with ROWID, rowid in the table named table_name. The version for the LOB column was version.

**System Action:** Utility returns completion code=4. The base table space is set to a Aux Warning state.

**Programmer Response:** None

Use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

---

**DSNU807I**

```
csect-name - TABLE=table_name
COLUMN=column_name WAS SET
VALID ROWID=rowid VERSION=version
```

**Explanation:** The CHECK DATA utility with **AUXERROR INVALIDATE** specified, set the LOB column named column_name valid. The LOB column was in the row with ROWID, rowid in the table named table_name. The version for the LOB column was version.

**System Action:** Utility returns completion code=4. The base table space is set to a Aux Warning state.

**Programmer Response:** None. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.
The REPAIR utility can be used to reset the Aux Warning state.

**DSNU813I**  csect-name - LOB IN TABLE
SPACE=lob_table_space_name WITH ROWID=rowid AND VERSION=version
HAS NO BASE TABLE ROW

**Explanation:** The CHECK DATA utility found a LOB in the LOB table space named *lob_table_space_name* but did not find a row in the base table for this LOB. The LOB has a ROWID of *rowid* and version of *version*.

**System Action:** Utility returns completion code=4.

**Programmer Response:** CHECK DATA relies on information in the index on the auxiliary table and LOB table space being correct. Before running CHECK DATA to check auxiliary columns, first run CHECK LOB and then run REBUILD INDEX or CHECK INDEX. CHECK LOB ensures the validity of the LOB table space. REBUILD INDEX or CHECK INDEX ensures the validity of the auxiliary index.

The LOB can be deleted using the REPAIR utility. Specify LOCATE ROWID VERSION DELETE.

**DSNU814I**  csect-name - TABLE=table_name
COLUMN=column_name IS ZERO OR NULL BUT ENTRY IN INDEX index-name
FOUND ROWID=rowid VERSION=version

**Explanation:** The CHECK DATA utility found a record in the table named *table_name* in the row with a ROWID of *rowid*. The column named *column_name* was indicated null or zero length, but an index entry with the same ROWID was found in the index on the auxiliary table named *index-name*. The version for the LOB column was *version*.

**System Action:** This is an informational message only. The fact that a LOB column entry exists in the index on the auxiliary table when the LOB column is marked null or has a null length does not hinder LOB column processing.

If AUXERROR INVALIDATE was specified, the LOB column is not set invalid for this error.

Utility returns completion code=4.

**Programmer Response:** CHECK DATA relies on information in the index on the auxiliary table and LOB table space being correct. Both CHECK LOB, to ensure the validity of the LOB table space, and RECOVER INDEX or CHECK INDEX, to ensure the validity of the index on the auxiliary table, should be executed in that order prior to the execution of CHECK DATA with auxiliary column checking.

The LOB can be deleted from the LOB table space by using REPAIR LOCATE TABLESPACE ROWID DELETE

**DSNU815I**  csect-name - TABLESPACE
table-space-name IS IN AUX CHECK PENDING STATE

**Explanation:** The CHECK DATA utility found auxiliary check errors. AUXERROR REPORT was specified, so errors were left as found.

Auxiliary check pending is a prohibitive state.

Previous error messages report the errors found.

**System Action:** Utility returns completion code=8.

**Programmer Response:** Use the CHECK DATA with AUXERROR INVALIDATE. This will modify the auxiliary check errors so they can be corrected and set the state of the table space to auxiliary warning.

After running CHECK DATA with AUXERROR INVALIDATE, use SQL to update the LOB column or delete the base table row. Renrun the CHECK DATA utility with AUXERROR INVALIDATE specified. If all auxiliary check errors were corrected, auxiliary warning will be reset.

The auxiliary check pending state can also be reset using REPAIR with SET NOAUXCHKP. Resetting auxiliary check pending with REPAIR will have unpredictable results.

**DSNU816I**  csect-name - TABLESPACE
table-space-name IS IN AUX WARNING STATE

**Explanation:** The CHECK DATA utility found auxiliary check errors. AUXERROR INVALIDATE was specified, so LOB columns in error were marked invalid.

Auxiliary warning is a non-prohibitive state. Updating the LOB column or deleting the row containing the LOB column by SQL is permitted. Valid LOBs may be accessed, however any attempt to retrieve an invalid modified LOB column by SQL will result in a -904 return code.

Previous error messages report the errors found.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**Programmer Response:** Use SQL to update or delete the LOB columns in error. Use CHECK DATA with AUXERROR INVALIDATE to verify all errors were corrected and to reset the auxiliary warning state.

The auxiliary warning state can also be reset using REPAIR with SET NOAUXWARN.

**DSNU830I**  csect-name - INDEX= index-name IS IN REBUILD PENDING STATE

**Explanation:** If the RECOVER utility issued this message, the corresponding table space to this index was recovered to a point in time with keyword TOCOPY,
TOLOGPOINT, or TORBA. Thus, the index was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, the index is in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER or REORG utility (or -TERM UTILITY) issued this message, use the REBUILD INDEX utility to rebuild this index.

If the REBUILD INDEX utility issued this message resolve the duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.

---

**DSNU831I** csect-name ALL INDEXES OF TABLESPACE= table space-name ARE IN REBUILD PENDING

Explanation: The RECOVER TORBA, TOLOGPOINT, or TOCOPY utility issues this message to inform the user of the state of all indexes belonging to the recovered table space. All indexes were put in rebuild pending status to prevent data and index inconsistency. All indexes should be rebuilt before they are used.

System Action: The RECOVER utility completed successfully.

Severity: 4 (warning)

User Response: Use the REBUILD INDEX utility with the ALL option to rebuild all indexes over the recovered table space.

---

**DSNU832I** csect-name - INDEX= creator.index-name PART= partition number IS IN REBUILD PENDING STATE

Explanation: If the RECOVER utility issued this message, one partition of a partitioned table space is being recovered to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. The corresponding index for that partition was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index or the partition of a cluster index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX or INDEX PART, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, one partition of a partitioned index was placed in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER or REORG utility (or -TERM UTILITY) issued this message, use the REBUILD INDEX utility to rebuild this index with the REBUILD INDEX utility.

If the REBUILD INDEX utility issued this message resolve duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.

---

**DSNU833I** csect-name - UNABLE TO RECOVER object_type object_name DUE TO ALTER COLUMN

Explanation: RECOVER utility is unable to recover the index or index space as requested because an ALTER COLUMN VARCHAR has been performed. The current column definition is no longer consistent with the image copy and log records which would be used to perform the requested recovery.

Severity: 8 (error)

User Response: Use the REBUILD INDEX utility to rebuild the index from the tablespace.

---

**DSNU834I** csect-name - UNABLE TO RECOVER object_type object_name DSNUM dsnum DUE TO ALTER COLUMN

Explanation: RECOVER utility is unable to recover the index or index space partition as requested because an ALTER COLUMN VARCHAR has been performed. The current column definition is no longer consistent with the image copy and log records which would be used to perform the requested recovery.

Severity: 8 (error)

User Response: Use the REBUILD INDEX utility to rebuild the index partition from the tablespace.

---

**DSNU860I** csect-name DIAGNOSE UTILITY COMPLETE

Explanation: This message is issued in response to the normal completion of the DIAGNOSE utility.

Severity: 0 (informational)
**System Action:** This message indicates the normal completion of the DIAGNOSE utility. Processing continues to the next utility statement in the utility job step.

---

**DSNU861I**  
*csect-name DISPLAY MEPL*

**Explanation:** This is the header message for output of the DIAGNOSE DISPLAY MEPL function. The contents of the MEPL is dumped to SYSPRINT.

**Severity:** 0 (informational)

**System Action:** This message indicates the beginning of DIAGNOSE DISPLAY MEPL processing.

---

**DSNU862I**  
DISPLAY AVAILABLE UTILITIES. MAP: *bit-map*

**Explanation:** This message is the end-result of a DIAGNOSE DISPLAY AVAILABLE control statement. It displays the utilities that are available on this subsystem. The message contains a machine-readable bit-map, and precedes a table of utility names. They are two representations of the same information. An available utility is represented by the utility name that appears in the table and a "1" in the corresponding bit position in the bit-map. An unavailable utility is represented by a blank table entry and a "0" in the corresponding bit position in the bit-map.

Utilities may be unavailable if separately-priced features JDB771K and/or JDB771M are not installed, or installed improperly.

The table position and bit position are fixed for any given utility, and maintenance cannot alter them. Bit positions correspond to table entries when you read the table across each row, left to right, starting with the top row. For example, bit 1 corresponds to CATMAINT, bit 2 to CHECK, and bit 9 to OPTIONS.

The following example shows the partial output of this message. Due to space constraints, the sample has been truncated. The actual table contains eight columns of identity names:

```
DSNU862I DSNUDIAG - DISPLAY AVAILABLE UTILITIES.  
MAP: 1111111111111111111111111111111100000000000000

<table>
<thead>

```

**Severity:** 0 (informational)

**System Action:** The DIAGNOSE DISPLAY AVAILABLE utility control statement has completed normally.

---

**DSNU863I**  
*csect-name DISPLAY OBD*  
$dbname.tsname"

**Explanation:** This message is the heading message for DIAGNOSE DISPLAY OBD output.

**Severity:** 0 (informational)

**System Action:** This message indicates the start of the output for the DIAGNOSE DISPLAY OBD function.

---

**DSNU864I**  
*csect-name DISPLAY OBD, DBID=nn*  
*OBID=nn OBD TYPE=type"

**Explanation:** This message is the heading message for the OBD being displayed.

**Severity:** 0 (informational)

**System Action:** This message identifies the OBD being displayed.

---

**DSNU865I**  
*csect-name DISPLAY OBD*  
$dbname.tsname COMPLETE"

**Explanation:** This message is issued in response to normal completion of DISPLAY OBD processing.

**Severity:** 0 (informational)

**System Action:** This message indicates the end of DISPLAY OBD processing.

---

**DSNU866I**  
*csect-name DISPLAY SYSUTIL JOB INFORMATION"

**Explanation:** This message is the header message for the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the job information area of the SYSUTIL record and contains information which identifies the utility the SYSUTIL record is referencing.

**Severity:** 0 (informational)

**System Action:** This message identifies the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

---

**DSNU867I**  
*csect-name DISPLAY SYSUTIL*  
CHECKPOINT/RESTART INFORMATION"

**Explanation:** This message is the header message for the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the utility checkpoint/restart area of the SYSUTIL record and contains information pertaining to utility processing needed for the restart of the utility.

**Severity:** 0 (informational)

**System Action:** This message identifies the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

</table>
DSNU877I  event modulename+offset
Explanation: Event 'event' occurred at module 'modulename' plus 'offset'. The DIAGNOSE utility issues this message to aid in diagnosing utility problems.
Severity:  0 (informational)
System Action: Processing continues normally.

DSNU900I  csect-name - DBD X'xxxx' COMPARISON STARTING
Explanation: This message marks the start of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 Catalog is 'xxxx'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU901I  csect-name - OBD X'xxxx' obd-type HAS THE FOLLOWING DIFFERENCES
Explanation: This message marks the start of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed when a difference in the OBDs has been detected. The OBID of the OBD being compared against the DB2 catalog is 'xxxx'. The type of OBD being displayed is 'obd-type'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU902I  csect-name - EXISTING OBD AT OFFSET X'xxxxxxx' IN EXISTING DBD
Explanation: Following this message is a hexadecimal dump of the OBD as it exists in the DSNDB01.DBD01 page set. In the message, 'xxxxxxx' is the hexadecimal offset from the beginning of the existing OBD as it appears later in the REPAIR DBD DIAGNOSE output.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU903I  csect-name - REBUILT OBD AT OFFSET X'xxxxxxx' IN REBUILT DBD
Explanation: Following this message is a hexadecimal dump of the OBD that was rebuilt from the DB2 Catalog. In the message, 'xxxxxxx' is the hexadecimal offset from the beginning of the rebuilt OBD as it appears later in the REPAIR DBD DIAGNOSE output.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU904I  csect-name - EXISTING VALUE X'xx..xx'
Explanation: This message shows a hexadecimal string which is the value of a field in the OBD as it exists on the DSNDB01.DBD01 page set. The hexadecimal string is 'xx..xx'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU905I  csect-name - REBUILT VALUE X'xx..xx'
Explanation: This message shows a hexadecimal string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The hexadecimal string is 'xx..xx'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU906I  csect-name - EXISTING VALUE 'cc..cc'
Explanation: This message shows a character string which is the value of a field in the OBD as it exists on the DSNDB01.DBD01 page set. The character string is 'cc..cc'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU907I  csect-name - REBUILT VALUE 'cc..cc'
Explanation: This message shows a character string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The character string is 'cc..cc'.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU908I  csect-name - EXISTING OBD IS obd-type
Explanation: This message shows the OBD type of the OBD which exists on the DSNDB01.DBD01 page set.
Severity:  0 (informational)
System Action: DBD checking continues normally.

DSNU909I  csect-name - REBUILT OBD IS obd-type
Explanation: This message shows the OBD type of the OBD which was rebuilt from the DB2 catalog.
Severity:  0 (informational)
System Action: DBD checking continues normally.
DSNU910I  csect-name - EXISTING DBD
Explanation: Following this message is a hexadecimal dump of the DBD which exists on the DSNDDB01.DBD01 page set.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU911I  csect-name - REBUILT DBD
Explanation: Following this message is a hexadecimal dump of the DBD which was rebuilt from the DB2 Catalog.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU912I  csect-name - phase-completion-message
-- nn ERRORS WERE FOUND
Explanation: This message marks the end of a processing phase in the DBD comparison for a REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. In the message, 'nn' indicates the number of errors detected while processing. Informational and warning messages are not added into the error count.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU913I  csect-name - OBD 'xxxx'
COMPARISON COMPLETE -- nn ERRORS WERE FOUND
Explanation: This message marks the end of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed only when a difference has been detected. If there is no difference, this message will not be displayed. The OBID of the OBD being compared against the DB2 catalog is 'xxxx'. The number of errors in this OBD is 'nn'. Informational and warning messages are not added into the error count.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU914I  csect-name - DBD 'xxxx'
COMPARISON COMPLETE -- nn ERRORS WERE FOUND
Explanation: This message marks the end of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 catalog is 'xxxx'. The total number of errors found in this DBD is 'nn'.
Severity: 0 (informational)
System Action: DBD checking completed.

DSNU915I  csect-name - OBD X'obid' E-X'yyyyyyyy'
R-X'yyyyMMdd' obd-description
Explanation: This message is used when listing the OBIDs in the REPAIR DBD DIAGNOSE utility. The OBID of the OBD being listed is 'obid'. The offset to the OBD within the EXISTING DBD which is displayed later in the output is 'yyyyMMdd'. The offset to the OBD within the REBUILT DBD which is displayed later in the output is 'yyyyMMdd'. A short description of the state of the OBD is 'obd-description'.
Severity: 0 (informational)
System Action: DBD checking completed.

DSNU916I  csect-name - OBDS DIFFER AT OFFSET X'xxxxxxx' field-name - INFORMATION NOT IN DB2 CATALOG
Explanation: This message indicates the value of a field in the OBD differs from the DBD which exists on the DSNDDB01.DBD01 page set and the DBD rebuilt from the DB2 catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the OBD is damaged. The hexadecimal offset from the beginning of the OBD is 'xxxxxxx'. The name of the field is 'field-name'.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU917I  csect-name - DBDS DIFFER AT OFFSET X'xxxxxxx' field-name - INFORMATION NOT IN DB2 CATALOG
Explanation: This message indicates the value of a field in the OBD differs from the DBD which exists on the DSNDDB01.DBD01 page set and the DBD rebuilt from the DB2 catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the OBD is damaged. The hexadecimal offset from the beginning of the OBD is 'xxxxxxx'. The name of the field is 'field-name'.
Severity: 0 (informational)
System Action: DBD checking continues normally.

DSNU919I  csect-name - DBD X'xxxx' OBD X'yyyy' - details
Explanation: This message gives detailed information about the specified OBD. The DBID of the OBD is 'xxxx'. The OBID of the OBD is 'yyyy'. A description of the error is 'details'.
Severity: 0 (informational)
System Action: DBD checking continues normally.
**DSNU920I**  
```
csect-name - OBDS DIFFER AT OFFSET  
X'xxxxxxx' field-name
```

**Explanation:** This message indicates that the value of a field in the OBD differs from the DBD which exists on the DSNDB01=DBD01 page set and the DBD rebuilt from the DB2 catalog. The DB2 Catalog and DBD/OBD are inconsistent. The hexadecimal offset from the beginning of the OBD is ‘xxxxxxx’. The name of the field is ‘field-name’.

**Severity:** 4 (warning)

**System Action:** DBD checking continues normally.

---

**DSNU921I**  
```
csect-name - OBD 'xxxxx' MISSING IN EXISTING DBD
```

**Explanation:** This message indicates that an OBD which was rebuilt from the DB2 catalog does not exist in the DBD which exists on the DSNDB01=DBD01 page set. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is ‘xxxx’.

**Severity:** 4 (warning)

**System Action:** DBD checking continues normally.

---

**DSNU922I**  
```
csect-name - OBD 'xxxxx' MISSING IN REBUILT DBD
```

**Explanation:** This message indicates that an OBD in the DBD which exists on the DSNDB01=DBD01 page set does not exist in the DBD which was rebuilt from the DB2 catalog. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is ‘xxxx’.

**Severity:** 4 (warning)

**System Action:** DBD checking continues normally.

---

**DSNU923I**  
```
csect-name—OBDBTYPE FOR OBD  
X'xxxxx' DOES NOT MATCH — NO FURTHER CHECKING DONE FOR THIS OBD
```

**Explanation:** The object descriptor (OBD) that exists on the DSNDB01=DBD01 page set is different from the type of OBD that was rebuilt from the DB2 catalog. No further processing can be done because the fields of one OBD type are different from the fields of another. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is inconsistent is ‘xxxx’.

**Severity:** 4 (warning)

**System Action:** Checking for OBD X’xxxx’ stops. Checking of the DBD continues normally.

---

**DSNU924I**  
```
csect-name—DBDS DIFFER AT OFFSET  
X'xxxxxxx' field-name
```

**Explanation:** The value of a field in the database descriptor (DBD) differs from the value of the corresponding field in the DBD that exists on the DSNDB01=DBD01 page set and differs from the value of the corresponding field in the DBD that was rebuilt from the DB2 catalog. ‘xxxxxxx’ The hex offset from the beginning of the DBD. ‘field-name’ The name of the field.

**Severity:** 0 (informational)

**System Action:** Checking of the DBD continues normally.

---

**DSNU925I**  
```
csect-name—OBDDFILE AT OFFSET  
X'xxxxxxx' IN EXISTING DBD HAS OBID X'nnnn' WHICH IS NOT A FILE OBD
```

**Explanation:** The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that exists on the DSNDB01=DBD01 page set does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent. ‘xxxxxxx’ The hex offset from the beginning of the existing DBD. ‘nnnn’ The object identifier (OBID) of the OBD which should be a FILE OBD.

**Severity:** 4 (warning)

**System Action:** Checking of the DBD continues normally.

---

**DSNU926I**  
```
csect-name—OBDDFILE AT OFFSET  
X'xxxxxxx' IN REBUILT DBD HAS OBID X'nnnn' WHICH IS NOT A FILE OBD
```

**Explanation:** The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that was rebuilt from the DB2 catalog does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent. ‘xxxxxxx’ The hex offset from the beginning of the rebuilt DBD. ‘nnnn’ The object identifier (OBID) of the OBD that should be a FILE OBD.

**Severity:** 4 (warning)

**System Action:** Checking of the DBD continues normally.
DSNU927I  csect-name—OBD X'xxxx' IS A HOLE IN EXISTING DBD

Explanation: The object descriptor (OBD) that exists on the DSNDDB01.DBD01 page set has been logically deleted, OBDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU928I  csect-name—OBD X'xxxx' IS A HOLE IN REBUILT DBD

Explanation: The object descriptor (OBD) that was rebuilt from the DB2 catalog has been logically deleted, OBDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU929I  csect-name—OBD FIELD field-name HAS VALUE OUT OF RANGE AT OFFSET X'xxxxxxxx' IN OBD X'nnnn'

Explanation: The object descriptor (OBD) field 'field-name' has an unexpected value. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent.

field-name The name of the field in the OBD.

xxxxxxx The hex offset from the beginning of the OBD.

nnnn The object identifier (OBID) of the OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU930I  csect-name—INDEX index-name (OBD X'xxxx') MUST BE REBUILT

Explanation: The index 'index-name' must be either recovered or dropped and recreated to ensure that the index is consistent with the description in the INDEX FANSET OBD. The object descriptor (OBD) is not damaged. However, if the index is not either recovered or dropped and recreated, incorrect output can be produced when the index is used as an access path.

index-name The name of the index found in SYSlBM.SYSINDEXES.

xxxx The object identifier (OBID) of the OBD.

Severity: 8 (error)
exists on the DSNDB01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and DBD/OBD are inconsistent. The object identifier (OBID) of the OBD in error is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

---

DSNU939I  csect-name—DBD HEADER HAD DIFFERENCES WHICH WERE NOT IN A NAMED FIELD

Explanation: There is a difference between the DBD header in the DBD that exists on the DSNDB01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and database descriptor (DBD)/object descriptor (OBD) are inconsistent.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

---

DSNU940I  csect-name AUTHID OR LUNAME NOT BLANK FOR FOLLOWING SYSPROCEDURES ROW:

Explanation: A SYSPROCEDURES row contains an AUTHID or LUNAME value. AUTHID and LUNAME are not supported attributes for DB2 Version 6 stored procedures. DSNU944I messages follow that show the contents of the SYSPROCEDURES row.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

System Programmer Response: Execute a CREATE PROCEDURE statement to add the stored procedure definition. A schema name may be specified in place of AUTHID and LUNAME in the stored procedure definition.

---

DSNU941I  csect-name CREATE PROCEDURE FAILED WITH SQLCODE=sqlcode SQLSTATE=sqllstate

Explanation: The migration of a SYSPROCEDURES row has failed. The SQLCODE and SQLSTATE values indicate the type of error that occurred.

System Action: The SYSPROCEDURES row is not migrated. The SYSPROCEDURES migration continues with the next row.

System Programmer Response: Check the stored procedure attributes and parameters that are listed in the DSNU942I message, which follows this message. Execute a CREATE PROCEDURE statement with correct attributes and parameters to add the stored procedure definition.

---

DSNU942I  csect-name create_procedure_statement

Explanation: This message follows message DSNU941I when the migration of a SYSPROCEDURES row fails. This message contains the CREATE PROCEDURE statement that DB2 used for migration of the SYSPROCEDURES row.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

System Programmer Response: Use the CREATE PROCEDURE statement in this message and the SQLCODE and SQLSTATE information in message DSNU941I to diagnose the error.

---

DSNU944I  csect-name sysprocedures_column_name
 - sysprocedures_column_value

Explanation: This message lists a column value for a SYSPROCEDURES row that could not be migrated. This message follows message DSNU940I.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

---

DSNU945I  csect-name CREATE SUCCESSFUL FOR PROCEDURE procedure_name

Explanation: A SYSPROCEDURES row with a value of procedure_name. in column PROCEDURE has been successfully migrated.

System Action: SYSPROCEDURES migration continues normally.

---

DSNU971I  csect-name TABLESPACE dbname.tsname IS CHECK PENDING OR AUX CHECK PENDING CORRELATION-ID id1 CONNECTION-ID id2 LUW-ID id3

Explanation: This message is sent to the console when TABLESPACE tsname is set to CHECK pending or auxiliary CHECK pending state. The CORRELATION-ID id1 is the correlation identifier of the thread requesting CHECK pending or auxiliary CHECK pending status. Correlation IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents. The CONNECTION-ID id2 is the correlation identifier of the thread. The LUW-ID id3 is the logical-unit-of-work identifier of the thread. If the LUW-ID is an ' ', the thread has no LUW-ID. If it is not an ' ', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which

---
can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Refer to Part 2 (Volume 1) of DB2 Administration Guide for a discussion of the CHECK pending operation.

---

**DSNU972I  csect-name CATALOG UPDATING FAILURE WHILE SETTING OR RESETING CHECK PENDING CORRELATION-ID id1 CONNECTION-ID id2**

Explanation: When the check pending state is set on or off, the updating of the catalog tables (SYSTABLESPACE, SYSTABLES, and SYSTABLEPART) fails. The CORRELATION-ID, 'id1', is the correlation identifier of the thread associated with the application requesting that the check pending state be set on or off. The CONNECTION-ID, 'id2', is the correlation identifier of the application. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

Severity: 0 (informational) or 4 (warning)

System Action: Processing continues.

Problem Determination: The utility being processed requested the setting of check pending either on or off. The updating of the STATUS column of SYSTABLESPACE, and of the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART failed. Processing continues normally. However, those columns for the rows being updated now contain invalid values. Subsequent utility processing ignores these values, and the next setting or resetting of check pending for that table space corrects the error in one of the following ways:

- If the table space is set to check pending and the catalog fields are in error, the scope of check pending is escalated in the catalog. (The STATUS column of SYSTABLESPACE is set to 'P', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to 'C' and binary zeros.)
- If the table space is set to not check pending and the catalog fields are in error, the scope of check pending is set off in the catalog. (The STATUS column of SYSTABLES is set to an 'A', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to blanks.)

After the catalog fields are corrected, the setting or resetting of check pending continues as specified.

Usually message DSNT500I or DSNT501I is also issued, because the probable cause of the error is RESOURCE UNAVAILABLE. If the reason for the failure was not RESOURCE UNAVAILABLE, an SVC dump is requested and processing continues normally. To determine the cause of the failure, refer to the dump listing and the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNU973I  csect-name CHECK PENDING, AUX CHECK PENDING OR BOTH HAS BEEN RESET FOR TABLESPACE dbname.tspace CORRELATION-ID id1 CONNECTION-ID id2 LUW-ID id3**

Explanation: This message is sent to the console when CHECK pending, auxiliary CHECK pending or both states were reset for TABLESPACE tspace. The CORRELATION-ID id1 is the correlation identifier of the thread requesting that the CHECK pending state, the auxiliary CHECK pending state or both states be reset. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents. The CONNECTION-ID id2 is the correlation identifier of the thread. The LUW-ID id3 is the logical-unit-of-work identifier of the thread. If the LUW-ID is an "", the thread has no LUW-ID. If it is not an ";", the value is a logical-unit-of-work-id that is assigned to the thread followed by an ";=;" sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts a logical-unit-of-work-id as input.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to Part 2 (Volume 1) of DB2 Administration Guide for a discussion about clearing the CHECK pending status.

---

**DSNU993I  csect-name IMAGE COPY RESTORE TERMINATED**

Explanation: Catalog and directory initialization (image copy restore) did not complete successfully.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine other error messages associated with this job.

---

**DSNU994I  csect-name IMAGE COPY RESTORE COMPLETED SUCCESSFULLY**

Explanation: Catalog and directory initialization (image copy restore) completed successfully.

Severity: 0 (informational)

<tr>
<td>User Response:</td>
<td>Correcting the clause in error will eliminate this message in the future.</td>
</tr>
<tr>
<td>DSNU1002I</td>
<td>csect-name - INVALID KEYWORD SPECIFIED ON CLAUSE: clause-type object-type qualifier.name</td>
</tr>
<tr>
<td>Explanation:</td>
<td>An INCLUDE or EXCLUDE clause of a LISTDEF control statement has an invalid keyword specified.</td>
</tr>
</tbody>
</table>
| System Programmer Response: | Catalog and directory objects may only be specified via their TABLESPACE or INDEXSPACE names. DATABASE, TABLE and INDEX may not be specified. Catalog and directory object names may not contain pattern matching characters. They must be included or excluded explicitly using their complete names. Those
include or exclude clauses may not contain the keywords RI, BASS, LOB, ALL.

Severity: 8 (error)
System Action: Utility processing stops.
User Response: Correct the invalid LISTDEF clause and rerun the utility.

**DSNU1003I**  
**csect-name** - **INVALID LIST FOR**  
utility-name **UTILITY**

Explanation: The list name referenced on this control statement is not valid for the specified utility. The list either contains no objects or contains objects which cannot be processed by this specific utility.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1004I**  
**csect-name** - **DUPLICATE object-type**  
object-name **FOUND IN SYSIN** dd-name

Explanation: Duplicate LISTDEF or TEMPLATE statements (duplicate names) were detected in the SYSIN, listdef, or template dataset.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Eliminate the duplicate LISTDEF or TEMPLATE names and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1005I**  
**csect-name** - **UTILITY name NOT ALLOWED IN** dd-type DD dd-name

Explanation: The utility parser detected a control statement other than TEMPLATE in the SYSTEMPL data set or LISTDEF in the SYSLISTD data set.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Remove the invalid control statements and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1006I**  
**csect-name** - object-type object-name NOT FOUND

Explanation: A utility control statement used a LIST or TEMPLATE that was not found in SYSIN or either of the SYSTEMPL or SYSLISTD data sets. These DD names may vary if OPTIONS LISTDEFDD or OPTIONS TEMPLATEDDD were specified.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1007I**  
**csect-name** - **DATE/TIME VALUES MAY CHANGE BEFORE EXECUTION**

Explanation: PREVIEW processing has detected DSN date/time variables on a TEMPLATE control statement being used. These values may change before the actual utility execution, resulting in different data set names.

Severity: 4 (warning)
System Action: Preview processing continues normally.

**DSNU1008I**  
**csect-name** - **LISTDEF name CONTAINS NO OBJECTS**

Explanation: The indicated LISTDEF list definition expands to contain no objects.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the LISTDEF definition and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1009I**  
**csect-name** - **TEMPLATE name DSN= dataset-name**

Explanation: PREVIEW processing has expanded a referenced TEMPLATE data set name to the value shown. If the data set name contains date/time variables, the date/time values might change before actual utility execution.

Severity: 8 (error)
System Action: PREVIEW processing continues.
User Response: If the data set names shown are not acceptable, correct the TEMPLATE control statements, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.

**DSNU1011I**  
**WORKFILE NOT ALLOWED IN LISTDEF**

Explanation: A workfile database cannot be used in a LISTDEF list because utilities do not process them.

Severity: 8 (error)
System Action: Utility processing is not initiated.
User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg21672692) for the correct option specifications.
DSNU1012I  csect-name - LISTDEF MUST BEGIN WITH AN INCLUDE CLAUSE

Explanation: A LISTDEF control statement begins with an EXCLUDE clause. The LISTDEF control statement must begin with an INCLUDE clause.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to "DB2 Utility Guide and Reference" for the correct option specifications.

DSNU1013I  csect-name - dd-type DD CARD dd-name NOT FOUND

Explanation: An OPTIONS control statement specifies a DD name ‘dd-name’ that does not exist in the JCL.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the DD name on the OPTIONS statement or include the missing JCL DD card, and resubmit the utility job. Refer to "DB2 Utility Guide and Reference" for the correct option specifications.

DSNU1014I  csect-name - INDEXSPACE name NOT FOUND

Explanation: The specified INDEXSPACE does not exist.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand in error, and resubmit the utility job. Refer to "DB2 Utility Guide and Reference" for the correct option specifications.

DSNU1015I  csect-name - ERROR ALLOCATING DATA SET DSN=name CODE=X'reason-code'

Explanation: An error was returned by SVC 99 during TEMPLATE data set dynamic allocation. This message is followed by text which explains the reason-code shown.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Correct the error preventing dynamic allocation, and resubmit the utility job. In some cases, TEMPLATE dynamic allocation may not be possible and a JCL DD card may be required. See DYNALLOC (SVC 99) text unit documentation for limitations.

DSNU1016I  csect-name - TEMPLATE DSN VARIABLE var-name HAS NO VALUE

Explanation: A utility has attempted to build a data set name based on a TEMPLATE that specifies DSN variables. The variable shown has no value in this particular use. For example, PART when the object is not partitioned or ICTYPE when an image copy is not being allocated.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Correct the TEMPLATE DSN specification to eliminate the invalid variable or use a different TEMPLATE, and resubmit the utility job. Refer to "DB2 Utility Guide and Reference" for the correct option specifications.

DSNU1017I  csect-name - TEMPLATE DSN VARIABLE var-name TRUNCATED TO value

Explanation: While performing dynamic allocation of a TEMPLATE data set the DSN variable shown was truncated to the value shown.

Severity: 4 (warning)

System Action: Utility processing continues.

DSNU1018I  csect-name - USER user-id NOT AUTHORIZED TO ACCESS CATALOG TABLE qualifier.name

Explanation: The user executing the utility does not have the required authority to access the catalog table shown. This access is required to expand the LISTDEF control statement being used.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: GRANT the required authority to access the DB2 catalog to the user executing the utility. Refer to the LISTDEF section of "DB2 Utility Guide and Reference" for valid authorities.

DSNU1019I  csect-name - INVALID TEMPLATE NAME template-name

Explanation: A TEMPLATE control statement specifies an invalid TEMPLATE name. The names UTPRINT,
DSNU1020I  csect-name - OPTIONS EVENT
WARNING HAS SET RETURN CODE TO return-code

Explanation: Utility processing has ended with WARNING messages and a return code of 4. However, due to a previous OPTIONS EVENT WARNING control statement, the return code has been changed to the indicated return code.

Severity: 0 (informational) or 8 (warning)

System Action: Utility processing halts if WARNING RC8 was specified, or continues if WARNING RC0 was specified.

User Response: Use OPTIONS WARNING RC0 only on repetitive utility executions where WARNING messages are expected and acceptable.

DSNU1025I  csect-name - name IS A DD NAME

Explanation: PREVIEW processing has checked the current utility control statement for TEMPLATE dynamic allocation and has found the specified name refers to a JCL DD card, not a template. In all cases the presence of a DD card takes precedent over any TEMPLATE of the same name.

Severity: 0 (informational)

System Action: PREVIEW processing continues.

User Response: If a TEMPLATE and DD card have the same name, the DD card always takes precedence. If the indicated name should not reference a DD card, perform one of the following actions:
- Remove the DD card
- Change the TEMPLATE name on the TEMPLATE control statement and the utility control statement that refers to it

If the reference to the DD card is correct, no action is necessary. Refer to DB2 Utility Guide and Reference for the correct option specifications.

DSNU1026I  csect-name - LIST using-list REUSES LIST used-list

Explanation: A LISTDEF list is INCLUDING or EXCLUDING another list that has already been used in expansion of this clause. This “circular reference” is not allowed. For example, the following specification is not allowed: LISTDEF A INCLUDE LIST B LISTDEF B INCLUDE LIST A

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: Correct one or more LISTDEF control statements to eliminate the circular reference and resubmit the utility job. Refer to DB2 Utility Guide and Reference for the correct option specifications.
**DSNU1027I**  
`csect-name - PROCESSING CONTINUES DUE TO OPTIONS ITEMERROR SKIP`  

**Explanation:** An error has occurred during utility processing, indicated by previous error messages. However, because an OPTIONS ITEMERROR SKIP control statement is in force, processing continues.  

**Severity:** 8 (error)  

**System Action:** Utility processing continues on the current control statement only. Subsequent utility control statements in the same job step will not be processed.  

**User Response:** Correct the previous error, and resubmit the utility for the objects in error. If the utility experiencing an error is QUIESCE and a single quiesce point is required for the entire list, the entire list must be resubmitted.  

**DSNU1028I**  
`csect-name - INVALID KEYWORD kkkkkkk FOR DASD TEMPLATE`  

**Explanation:** A DASD TEMPLATE control statement cannot include the tape TEMPLATE keyword kkkkkkk.  

**Severity:** 8 (error)  

**System Action:** Utility processing does not initiate.  

**User Response:** DB2 uses the UNIT operand to determine the data set type. Either remove the tape keyword from the TEMPLATE control statement, or correct the UNIT operand to refer to a tape unit. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for the correct option specifications.  

**DSNU1029I**  
`csect-name - INVALID KEYWORD kkkkkkk FOR TAPE TEMPLATE`  

**Explanation:** A tape TEMPLATE control statement cannot include the DASD TEMPLATE keyword kkkkkkk.  

**Severity:** 8 (error)  

**System Action:** Utility processing does not initiate.  

**User Response:** DB2 uses the UNIT operand to determine the data set type. Either remove the DASD keyword from the TEMPLATE control statement, or correct the UNIT operand to refer to a DASD unit. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for the correct option specifications.  

**DSNU1030I**  
`csect-name - QUALIFIER qqqqqqqq TOO LONG`  

**Explanation:** The TEMPLATE DSN qualifier 'qqqqqqqq' is greater than eight characters.  

**Severity:** 8 (error)  

**System Action:** Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default execution will HALT.  

**User Response:** Correct the TEMPLATE DSN expression and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for the correct option specifications.  

**DSNU1031I**  
`csect-name - DSN name TOO LONG`  

**Explanation:** The TEMPLATE DSN operand results in a data set name 'name' that is too long for the type of data set being allocated.  

**Severity:** 8 (error)  

**System Action:** Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default execution will HALT.  

**User Response:** Correct the TEMPLATE DSN operand in error, and resubmit the utility job. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for the correct option specifications.  

**DSNU1032I**  
`csect-name - INVALID QUALIFIER qualifier IN TEMPLATE name`  

**Explanation:** The TEMPLATE DSN qualifier either contains invalid characters or does not start with an alpha character.  

**Severity:** 8 (error)  

**System Action:** Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.  

**User Response:** Correct the TEMPLATE DSN operand in error, and resubmit the utility job. A common cause of this error message is leaving the trailing period off of a TEMPLATE DSN variable name. All TEMPLATE DSN variable names are of the form &xyz. and must contain the trailing period. Refer to [DB2 Utility Guide and Reference](https://www.ibm.com/docs/en/db2) for the correct option specifications.  

**DSNU1033I**  
`csect-name - PROCESSING LIST ITEM: object-type qualifier.name`  

**Explanation:** While processing a LISTDEF list, utility processing has begun on the indicated object.  

**Severity:** 0 (informational)  

**System Action:** Utility processing continues.

DSNU1041I  csect-name - UNABLE TO CREATE GDG BASE name reason

Explanation: A TEMPLATE could not allocate a generation data group (GDG) data set, but the base GDG did not exist. The utility was unable to define the GDG base.

Severity: 8 (error)

System Action: Utility processing halts for the current object. If a list is in process, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Review the reason value to determine why the GDG base could not be defined. The possible reasons and suggested responses include:

- UNABLE TO LOAD IDCAMS PROGRAM. Ensure that the utility can invoke the IDCAMS program. Ensure that the utility can invoke the IDCAMS program.
- IDCAMS ABEND xxx. Use xxx, the abend code from the IDCAMS program, to determine why the IDCAMS program abended.
- ERROR IN IDCAMS. Review the IDCAMS message output that is listed between messages DSNU1042I and DSNU1043I to determine why the GDG base could not be defined.

DSNU1042I  csect-name - START OF IDCAMS MESSAGES

Explanation: This message indicates the beginning of the IDCAMS messages or other related non-DB2 messages. DSNU1043I indicates the end.

User Response: No action is required, but subsequent IDCAMS messages may require some action. See the z/OS MVS System Messages Volumes 1-10 or other appropriate documentation for more information.

DSNU1043I  csect-name - END OF IDCAMS MESSAGES

Explanation: This message indicates the end of the IDCAMS or other related non-DB2 messages. DSNU1042I indicates the beginning.

User Response: No action is required, but preceding messages may require some action. See the z/OS MVS System Messages Volumes 1-10 for more information.

DSNU1044I  csect-name - PROCESSING ddname AS EBCDIC

Explanation: The utility control statement input data set begins with an EBCDIC character and is assumed for the duration of this job step to contain only EBCDIC characters.

Severity: 0 (informational)

System Action: Processing of EBCDIC utility control statements continues.

User Response: If processing of utility control statements as EBCDIC is incorrect make sure the first character in the input data set is UNICODE, specifically UTF-8 CCSID 1208. This will cause the entire input data set to be processed as UNICODE.

DSNU1045I  csect-name - PROCESSING ddname AS UNICODE UTF-8

Explanation: The utility control statement input data set begins with a UNICODE character, specifically UTF-8 CCSID 1208, and is assumed for the duration of this job step to contain only UNICODE characters.

Severity: 0 (informational)

System Action: Processing of UNICODE utility control statements continues.

User Response: If processing of utility control statements as UNICODE is incorrect make sure the first character in the input data set is EBCDIC. This will cause the entire input data set to be processed as EBCDIC.

DSNU1050I  csect-name - INVALID SUBSTRING NOTATION IN EXPRESSION string ON TEMPLATE template name

Explanation: Invalid substring notation was detected on the TEMPLATE DSN operand. The portion of the DSN operand which is in error and the TEMPLATE name on which it occurred are shown.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the TEMPLATE control statement which is in error. Common causes of this error are incorrect syntax of the (s,l) clause and values of "s" or "l" which fall outside of the variable value at the time of execution.

DSNU1100I  csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO field-name CONVERSION ERROR FOR table-name

Explanation: The load utility found the input data provided for a field to be incorrect. The corresponding input data set record 'n' from the input data set specified for partition m will be placed in the DISCARDS data set.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

Chapter 19. DB2 messages  613
User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition m. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to [DB2 Utility Guide and Reference] for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU1103I csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO PART OR HIGH KEY VALUES SPECIFICATION(S)

Explanation: The discarded record does not belong to the partition m being loaded. For a LARGE table space, this might be because the key is higher than the high key value specified for the last partition.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition m. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to [DB2 Utility Guide and Reference] for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU1104I csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO WHEN SPECIFICATION(S)

Explanation: The discarded record does not satisfy the WHEN selection expression provided for partition m.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition m. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to [DB2 Utility Guide and Reference] for a description of the FORMAT UNLOAD option of LOAD.
DSNU1105I  csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO UNEXPECTED ERROR

Explanation: The LOAD of input data set record number 'n' for partition m was attempted but was not successful due to an unexpected error.

Severity: 8 (error)

System Action: If the error was caused because a resource was not available, a DSNT500I message will be issued.

The utility step will be abended with a system X'04E' and an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump will be requested. A SYSABEND dump of batch storage is also requested.

User Response: If a DSNT500I message was issued, refer to the description under that message number. If the unavailable resource becomes available, the utility step is restartable.

If there is no DSNT500I message, the error is an unexpected internal error and you should consult your system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources if that is necessary.

System Programmer Response: Refer to Command Reference for information about the TERM UTIL command. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

DSNU1106I  csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO INVALID field-name COLUMN SPECIFICATION FOR table-name

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record 'n' for partition m. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition m. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to DB2 Utility.

DSNU1107I  csect-name - UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED ROW AT RID rrr INDEX = index-name TABLE = table-name RECNO = input-dataset-record-number FOR PART m RID = duprid

Explanation: The input data set record indicated was loaded into table 'table-name', partition m, at RID 'duprid', but it causes a unique index violation for index 'index-name'. It duplicates the key value of a record already in the table at RID 'rrrr'.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID 'duprid'. The record will be deleted in a subsequent phase of processing.

DSNU1108I  csect-name UNIQUE INDEX KEY DUPLICATES KEY FROM INPUT DATASET RECORD iii FOR PART m LOADED AT RID rrr INDEX = index-name TABLE = table-name RECNO = recno RID = duprid

Explanation: Input data set record 'recno' was loaded into table 'table-name', partition m, at RID 'duprid', but it causes a unique index violation for index 'index-name'. It duplicates the key value of another record in the load job: the record loaded at RID 'rrrr' from input data set record 'iii'.

Severity: 4 (warning)

System Action: Processing continues. Index entries are not created for either record. Both records will be deleted in a subsequent phase of processing.

DSNU1109I  csect-name RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO CHECK CONSTRAINT constraint-name VIOLATION ON TABLE table-name

Explanation: The discarded record violates the check constraint named constraint-name defined on table table-name. The record is not loaded and is discarded during the DISCARD phase.

Severity: 4 (warning)

System Action: The LOAD utility continues to process additional records in the input data set.

User Response: After the LOAD utility completes, examine the record in the DISCARDS data set for partition m. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD job with the DISCARDS data set as the input data set.
DSNU110I  csect-name RECORD 'r'n' FOR 
PARTITION m VIOLATES CHECK 
CONSTRAINT constraint-name ON 
TABLE table-name

Explanation: The LOAD utility cannot load record n into table table-name partition m because the check constraint constraint-name would be violated. The record is not loaded.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error condition is corrected.

User Response: Find the failing record in the input data set for partition m, correct the condition that caused the check constraint to be violated, and restart the LOAD utility.

DSNU1111I  csect-name FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=r1 
INPUT RECORD NUMBER=nnnn, PART m, RID='r1r1'

Explanation: Input record 'nnnn' for partition m caused a row to be loaded into table 'table' at RID 'r1r1' with no primary key for the relationship with the name 'r1'.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required. The constraint violation described will be rectified later in processing.

DSNU1112I  csect-name DISCARD PHASE 
STATISTICS - nnn INPUT DATA SET 
RECORDS DISCARDED FOR 
PARTITION m

Explanation: Input data set records were rejected by the LOAD utility for one or several reasons. The rejected records have been placed in a discards data set. The number of records rejected for partition m is 'nnn'. Message DSNU399I summarizes the errors causing the records to be rejected.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Examine the LOAD error summary and decide which of the discarded records, if any, should be corrected and reapplied to the table space.

DSNU1113I  csect-name - LOAD UTILITY ERROR SUMMARY REPORT

Explanation: This message summarizes errors detected during the load job. Figure 2 shows the format of the report. It is issued only if unique index or referential constraint violations were detected.

Figure 2. LOAD Utility Error Summary Report

The report contains one line for each error. The errors are listed first by severity and within that by idsm.

The Discard Heading is either DISCARD RECORD or blank, depending on whether discard processing is in effect.

The report fields have the following meanings:

<table>
<thead>
<tr>
<th>Severity</th>
<th>Type of Error</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Primary</td>
<td>Primary referential integrity errors and all nonreferential integrity errors.</td>
</tr>
<tr>
<td>2</td>
<td>Secondary</td>
<td>Secondary referential integrity errors (that is, errors that result from a primary referential integrity error in an ancestor).</td>
</tr>
</tbody>
</table>

idsm The relative record number in the input data set, for the partition identified by pno, of the record causing the error reported on this line.

pno The partition number for the input data set of the record causing the error reported on this line.

ddsm The relative record number in the input data set of the record causing the error reported on this line, if discard processing is in effect. Otherwise, dddsm is blank.

type A description of the type of error reported on this line, as follows:

Conversion
Validation
Part Specification
Unexpected
Column specification
Referential integrity
Check constraint
Duplicate key.

name1 The name of the table for which the record causing the error was targeted, if this information is pertinent for the type of error reported on this line. Otherwise, name1 is blank. This field has nonblank values for the following error types:

Conversion
Validation

Messages and Codes
Severity: 4 (warning)
System Action: Processing continues.

DSNU114I csect-name (RE)LOAD PHASE STATISTICS NUMBER OF RECORDS LOADED = nnnn FOR TABLE table-name

Explanation: When the SHRLEVEL CHANGE option is selected, DB2 issues this message upon normal completion of the (RE)LOAD phase of the LOAD utility. It indicates the number of records loaded into TABLE table-name from the source record data set (that is, the data set identified by the JCL DD statement identified in the INDNN option for the LOAD). This message is repeated for each TABLE loaded by the current LOAD utility statement

Severity: 0 (informational)
System Action: Processing of the RELOAD phase continues.

User Response: Verify that the number of record loaded reported is consistent with expectations. For example, if four records are processed, the user should expect to see NUMBER OF RECORD LOADED = 4.

DSNU115I csect-name nnnn RESTART PHASE NOT ALLOWED IN THE (RE)LOAD PHASE, PHASE CHANGED TO CURRENT

Explanation: This message is issued when the RESTART PHASE is requested for a LOAD SHRLEVEL CHANGE utility. RESTART PHASE is not allowed for LOAD SHRLEVEL CHANGE.

Severity: 8 (error)
System Action: Utility operation is terminated with return code 8.
**User Response:** Complete the definition of the LOB table space before resubmitting the utility.

---

**Explanation:** When the SHRLEVEL CHANGE option is selected, DB2 issues this message upon normal completion of the (RE)LOAD phase of the LOAD utility. It indicates the number of records that were loaded into part m of table table-name from the source record data set. The message repeats for each INTO TABLE PART clause in the LOAD utility statement.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**User Response:** Verify that the number of records loaded reported is consistent with expectations.

---

**DSNU122I csect-name (RE)LOAD PHASE STATISTICS - NUMBER OF RECORDS LOADED = nnnn FOR TABLE table-name PART m**

**Explanation:** A utility with the RETRY option specified has been unable to drain a tablespace, tablespace part, or index. The utility will make another attempt to acquire the drain after a delay.

**Severity:** 0 (informational)

**System Action:** The utility job continues.

**User Response:** The utility job attempts to acquire a restrictive access to the referenced object, and will retry if unsuccessful. Optionally, the user may determine who has claims on the object via the -DIS DATABASE command with CLAIMERS option, and cancel or end those threads.

---

**DSNU123I LOGICAL PARTITIONS WILL BE LOADED IN PARALLEL, NUMBER OF TASKS = nnnn**

**Explanation:** This message is issued by the BUILD2 phase of the REORG utility. The message indicates that the REORG utility is able to update logical partitions in parallel. The number of utility tasks used to update logical partitions is indicated by :mv.nnnn:emv.. :p. This message is issued by the following CSECT(s): .*DSNURBD2

**Severity:** 0

**System Action:** Processing of the BUILD2 phase continues.

**Programmer Response:** You can verify that the number of tasks reported is consistent with expectations. For example, if 4 logical partitions are to be updated, the user might expect to see number of tasks = 4.

---

**DSNU124I csect-name - UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED RECORD AT RID rrr INDEX = index-name TABLE = table-name FOR PART = m**

**Explanation:** The input data set record indicated for PART m of table table-name causes a unique index violation for index index-name. It duplicates the key value of a record already in the table at RID rrr. The record was not loaded.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** None required.

---

**DSNU125I csect-name FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=r1 INPUT RECORD NUMBER=nnnn FOR PART m**

**Explanation:** Input record nnnn for PART m of table table has no primary key for the relationship with the name r1. The row is not loaded.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**User Response:** None required.

---

**DSNU126I csect-name PARTITION n IS SPECIFIED IN MORE THAN ONE INTO TABLE PART CLAUSE, PARTITION PARALLELISM IS DISALLOWED**

**Explanation:** LOAD partition parallelism was requested via INDDN or INCURSOR following INTO TABLE PART clauses. However, the same partition was specified on more than one INTO TABLE PART clause. Partition parallelism is not supported for this case.

**Severity:** 8 (error)

**System Action:** Utility operation is terminated with return code 8.

**User Response:** Correct the LOAD statement in one of the following ways:

- Specify a different partition number on each INTO TABLE PART clause
- Remove the parallelism by removing the INDDN or INCURSOR keywords from the INTO TABLE PART clauses.
**DSNU1128I** csect-name FEWER PAGES THAN PARTS FOR REBALANCE

**Explanation:** In attempting to rebalance partitions during REORG, it is estimated that there are fewer total pages than the number of partitions being rebalanced.

**Severity:** 8 (error)

**System Action:** Remove the REBALANCE keyword form the REORG until there is sufficient data to populate pages for every partition.

---

**DSNU1129I** csect-name - PARTITION RANGE NOT CONTIGUOUS - REBALANCE IGNORED

**Explanation:** The partition range that was specified on a REORG REBALANCE does not represent a set of contiguous logical partitions. Due to a series of ALTER TABLE ADD PART and ALTER TABLE ROTATE PART statements, the physical partition numbers do not match the logical partition numbers.

The physical partition numbers that were specified as the REORG partition range do not represent a contiguous set of logical partitions. For example, physical partitions 1 and 2 might represent logical partitions 2 and 4.

**Severity:** 8 (error)

**System Action:** The REORG terminates with return code 8.

**User Response:** Use the DISPLAY DATABASE command to identify a range of physical partition numbers that represent a contiguous set of logical partitions, and resubmit the REORG REBALANCE while specifying that physical partition range. Alternatively, omit the partition range on the REORG REBALANCE so that the entire table space is reorganized.

---

**DSNU1130I** csect-name - NOT ALL PARTITIONS POPULATED BY REBALANCE - PROCESSING TERMINATES

**Explanation:** The table space that is being reorganized has many rows with duplicate partitioning key values, and there were insufficient unique values to allow distributing rows across all partitions during a rebalance.

**Severity:** 8 (error)

**System Action:** The utility is terminated with return code 8. For REORG SHRLEVEL NONE, the table space is left in the recover pending restricted state.

**User Response:** If the REORG was REORG SHRLEVEL NONE, recover the table space to the point in time before the REORG.

---

**DSNU1141I** csect-name INVALID DELIMITER CHARACTER x

**Explanation:** The delimiter character x, which was specified as the operand of a COLDEL, CHARDEL, or DEPCT keyword, is not a valid delimiter.

**Severity:** 8 (error)

**System Action:** Utility processing is not initiated.

**User Response:** Review the rules for valid delimiters as stated in the [DB2 Utility Guide and Reference](#). Correct the keyword and resubmit the job.

---

**DSNU1142I** csect-name RECORD n DELIMITER MISMATCH FOR COLUMN colname

**Explanation:** A column or character delimiter character that marks the end of input for column colname was not found before the end of the record.

**Severity:** 8 (error)

**System Action:** Processing terminates. An abend is requested so that the LOAD can be restarted after the error is corrected.

**User Response:** Find the failing record in the input data set, correct the condition that caused the error, and restart the LOAD utility.

---

**DSNU1143I** csect-name RECORD n WILL BE DISCARDED DUE TO DELIMITER MISMATCH FOR COLUMN colname

**Explanation:** A column or character delimiter character that marks the end of input for column colname was not found before the end of the record. The record is not loaded, and is discarded during the DISCARD phase.

**Severity:** 4 (warning)

**System Action:** The LOAD utility continues to process records in the input data set.

**User Response:** After the LOAD utility completes, examine the records in the discard data set. Correct the errors in the discarded input data, and submit a LOAD RESUME YES job with the DISCARD data set as the input.

---

**DSNU1145I** csect-name FORMAT DELIMITED REQUIRES ONE INTO TABLE

**Explanation:** LOAD FORMAT DELIMITED supports loading only a single table. LOAD FORMAT DELIMITED was specified in a LOAD statement with more than one INTO TABLE clause.

**Severity:** 8 (error)

**System Action:** Processing terminates.
**DSNU1178I**  
**csect-name** - **SUM OF INPUT COLUMNLENGTHS FOR CURSOR** cursor-name IS TOO LARGE

**Explanation:** The size of the record that would be loaded for cursor cursor-name is greater than 32767 bytes.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**User Response:** Decrease the number of columns or the lengths of individual columns so the sum of the lengths of the columns (including 2 bytes for each nullable column) does not exceed 32767.

---

**DSNU1211I** csect-name - **INPUT DATA SET IS NOT AN IMAGE COPY**

**Explanation:** The input data set specified by the FROMCOPY or FROMCOPYDDN option of the UNLOAD utility was not identified as an image copy data set.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** Specify the correct image copy data set name to the FROMCOPY option, or to the DD-name that is referred to by the FROMCOPYDDN option.

---

**DSNU1212I** csect-name - **INVALID FIELD NAME**  
field-name FOR TABLE table-name

**Explanation:** The specified field name in the field specification list of the UNLOAD utility is:

- Not a column name of the specified table, or
- An existing column name for the CONSTANT option.

The field name is not valid.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** For a CONSTANT field, specify a non-existing field name. Otherwise, specify the field name as a column name of the indicated table.

---

**DSNU1213I** csect-name - **INVALID FIELD TYPE FOR FIELD** field-name FOR TABLE table-name

**Explanation:** The specified field type in the field specification list of the UNLOAD utility is incompatible with the base type of the corresponding column of the table.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** Specify only a compatible type allowed for the unload operation in the field specification list.

---

**DSNU1214I** csect-name - **INVALID FIELD POSITION**  
SPECIFICATION FOR FIELD field-name, TABLE table-name

**Explanation:** For a UNLOAD statement, specified field positions are not in ascending order in the field specification list of the indicated table.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** Specify the field positions in the ascending order in the field specification list. If a certain order of the output fields is desired, change the order of...
the field in the list so that the field positions are in the ascending order.

**DSNU1217I** csect-name - CONFLICTING FIELD POSITION AND/OR LENGTH SPECIFICATION FOR FIELD field-name, TABLE table-name

**Explanation:** For a UNLOAD statement, the specified field position for the indicated field caused a conflict with the previous field. This is caused either by
- The position value specified for the field is too small.
- The length specification for the previous field is too large.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**User Response:** Specify the correct position or length parameters in the field specification list so that there are enough space for the output fields.

**DSNU1218I** csect-name - LOGICAL RECORD LENGTH OF OUTPUT RECORD EXCEEDED THE LIMIT FOR TABLE table-name

**Explanation:** The maximum length of the output records exceeded the physical limit for the UNLOAD utility.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**Problem Determination:** This problem will most likely occur when BLOB, CLOB, or DBCLOB columns are selected from a table to be unloaded.

**User Response:** Consider one or more of the following options that can reduce the length of the output record, if possible:
- Use the NOPAD option.
- Unload only the necessary fields using the field specification options.
- Specify the LENGTH option with TRUNCATE and/or STRIP options for the applicable fields.

If the above options cannot be applied, you will have to use an application to unload the data from the table.

**DSNU1219I** csect-name - THE NUMBER OF RECORDS IN ERROR REACHED THE LIMIT nnnn

**Explanation:** For the UNLOAD utility, the number of records in error reached the specified MAXERR limit.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**Problem Determination:** This problem will occur when the number of errors in the output record formatting, including data conversion errors, detected by the UNLOAD utility reached the limit specified by the MAXERR option. For each record in error, the corresponding message has been issued. The records in error will not be unloaded to the output data set. This message is issued only once, even though there can be a situation in which the number of individual error messages exceeds the specified MAXERR value. This situation occurs only when the UNLOAD utility is running in the partition parallel mode and the multiple tasks have reached the MAXERR value concurrently.

**User Response:** Investigate the individual error message and determine the cause of the errors. The corrective action will differ by the type of the error. In certain situations, this condition may be anticipated. In this case, the total number of records unloaded before the job terminates can be adjusted by changing the MAXERR option value.

**DSNU1220I** csect-name - UNLOADING LOB COLUMNS FROM IMAGE COPY IS NOT SUPPORTED FOR TABLE table-name

**Explanation:** For the UNLOAD utility, one or more BLOB, CLOB, or DBCLOB columns are selected on the indicated table when the source object is an image copy data set.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**Problem Determination:** When the source object of the UNLOAD utility is an image copy, selection of a LOB column is not supported.

**User Response:** Specify a field selection list that does not include any BLOB, CLOB, or DBCLOB column from the indicated table.

**DSNU1220I** csect-name - UNLDDN IS NOT SPECIFIED OR SPECIFIED TEMPLATE template-name IS INVALID FOR MULTIPLE TABLE SPACES

**Explanation:** For the UNLOAD utility, the output data set specification is invalid when the source objects consist of multiple table spaces.

**Severity:** 8 (error)

**System Action:** The utility job terminates.

**Problem Determination:** When the source objects of the UNLOAD utility consist of multiple table spaces, an output data set corresponding to each table space is required.

**User Response:** Include an appropriate TEMPLATE statement in the unload job step that contains the table space name as a variable. If the table space is selected from different databases, the database name must also...
be included as a variable. Specify the template name to the UNLDDN option.

DSNU1222I  csect-name - TEMPLATE template-name
SPECIFIED FOR PUNCHDDN IS INVALID FOR MULTIPLE TABLE SPACES

Explanation: For the UNLOAD utility, the specification of output data set to store the generated LOAD statement is invalid when the source objects consist of multiple table spaces.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source objects of the UNLOAD utility consist of multiple table spaces, an output data set corresponding to each table space is required.

User Response: Include an appropriate TEMPLATE statement in the unload job step that contains the table space name as a variable. If the table space is selected from different databases, the database name must also be included as a variable. Specify the template name to the PUNCHDDN option. The TEMPLATE should be different from the one used for UNLDDN.

DSNU1223I  csect-name - TABLESPACE
SPECIFICATION IS MISSING FOR FROMCOPY OR FROMCOPYDDN

Explanation: For the UNLOAD utility, the FROMCOPY or FROMCOPYDDN option is used but the TEMPLATE specification is missing.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source objects of the UNLOAD utility are an image copy, the TABLESPACE option is required to specify the table space name of the image copy.

User Response: Add the TABLESPACE option in the UNLOAD statement to specify the table space name of the image copy.

Dropped tables are not supported by the UNLOAD utility.

User Response: Correct either the TABLESPACE or the FROM TABLE specification to select a table in the specified table space. If the table was dropped, remove the FROM TABLE option for the dropped table.

DSNU1225I  csect-name - TABLESPACE KEYWORD IS NOT SPECIFIED. AT LEAST ONE FROM TABLE SPECIFICATION IS REQUIRED.

Explanation: There is no TABLESPACE nor FROM TABLE specification in a UNLOAD statement. The source object for unloading can not be identified.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: If the TABLESPACE specification is omitted, specify at least one FROM TABLE option to identify the source object. Instead of a TABLESPACE specification, the LIST option can be used, if a LISTDEF statement defines a list of objects. When the LIST option is used, the FROM TABLE option can not be specified.

DSNU1226I  csect-name - THE NUMBER OF OBJECTS IS TOO LARGE

Explanation: The number of source objects for the UNLOAD utility is too large. Overflow in some of the internal data structures occurred.

Severity: 8 (error)

Problem Determination: This problem will most likely occur when the LIST option is used and the corresponding LISTDEF definition is expanded to a large number of objects.

System Action: The utility job terminates.

User Response: Divide the UNLOAD job step into two or more job steps and, in each job step, use a LISTDEF that expands to less number of objects.

DSNU1227I  csect-name - THE CONTENT OF THE IMAGE COPY DATA SET IS INCONSISTENT WITH TABLE SPACE

Explanation: For the UNLOAD utility, the data set specified by the FROMCOPY or the FROMCOPYDDN option is not corresponding to the table space.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify a correct image copy data set name for the table space, or specify the correct table space name for the image copy.
**DSNU1228I**  csect-name - A ROWID COLUMN
column-name, TABLE table-name IS
SELECTED FOR UNLOAD BUT THE
PAGE SET HEADER PAGE IS MISSING
IN THE SPECIFIED IMAGE COPY DATA
SET

Explanation: For the UNLOAD utility, a ROWID
column is selected for unloading from an image copy,
but the required information to form the ROWID can not
be retrieved because the page set header page is not
included in the specified image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: The problem will most likely
occur when a piece of copy data set, not the first one, is
specified to the FROMCOPY option.

User Response: Use the FROMCOPYDDN, instead of
FROMCOPY, to specify a DD name where the first
piece of copy that contain the page set header page is
concatenated to the source image copy data set.

---

**DSNU1229I**  csect-name - ERROR IN LOADING
DICTIONARY FOR TABLE SPACE
table-space

Explanation: For the UNLOAD utility, an error was
detected in loading the dictionary for decompression
while reading an image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: Possibly the image copy
data set is corrupted.

User Response: If the right image copy data set is
specified to the FROMCOPY or FROMCOPYDDN, it will
be required to take a new image copy for the table
space by running the COPY utility or using other
alternative methods.

---

**DSNU1230I**  csect-name - INCONSISTENT STRIP
CHAR LENGTH FOR FIELD field-name,
TABLE table-name

Explanation: An invalid strip character was specified
for the indicated field of the table.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: For an SBCS or MIXED
character field, the strip character, if specified, must be
an SBCS character; for a DBCS field, it must be a
DBCS character.

User Response: Specify the correct strip character
applicable to the field.

---

**DSNU1231I**  csect-name - LENGTH OF OUTPUT
RECORD IS TOO LONG FOR TABLE
table-name

Explanation: An output record for the indicated table
exceeded the physical limit.

Severity: 4 (warning)

System Action: The record in error will not be
unloaded to the output data set. The UNLOAD utility
continues until the total number of records in error
reaches the value specified by the MAXERR option (the
default is 1).

If the total number of records reaches the MAXERR
value, the UNLOAD utility issues the DSNU1219I
message and terminates with the return code 8.

Problem Determination: This message is issued only
when the NOPAD option is specified in the UNLOAD
statement and most likely when BLOB, CLOB, or
DBCLOB columns are selected for unload from the
table. It is also possible that, if the expansion of output
strings occurs due to the encoding scheme specified for
the output, the total length of some output records
becomes longer than expected.

User Response: Consider the following options to
reduce the size of the output records:

- Unload only the necessary fields using the field
  specification options.
- Specify the LENGTH option with TRUNCATE and/or
  STRIP options for the applicable fields.

If the above options can not be applied, you will have to
use an application to unload the data from the table.

---

**DSNU1232I**  csect-name - COMpressed ROW IS
IGNOREd BECAUSE THE DICTIONARY
IS NOT AVAILABLE FOR TABLE
table-name

Explanation: The UNLOAD utility encountered a
compressed row when unloading the data from an
image copy data set but the dictionary for
decompression has not been loaded for the table
space.

Severity: 4 (warning)

System Action: The record in error will not be
unloaded to the output data set. The UNLOAD utility
continues until the total number of records in error
reaches the value specified by the MAXERR option (the
default is 1). If the total number of records reaches the
MAXERR value, the UNLOAD utility issues the
DSNU1219I message and terminates with the return
code 8.

Problem Determination: This message is issued when
a copy of pieces (not the first piece) of a
compressed table space is specified in the FROMCOPY
or FROMCOPYDDN option of the UNLOAD utility.
User Response: To unload compressed rows from the copy of pieces, use COPYDDN option to specify a DD name under which the first copy of pieces that contains the compression dictionary is concatenated.

**DSNU1233I**  
**csect-name - DATA IS TOO LONG FOR FIELD field-name, TABLE table-name**

**Explanation:** The space for the field in an output record is not enough to unload the data from the corresponding column of a row in the indicated table.

**Severity:** 4 (warning)

**System Action:** The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1).

If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

**Problem Determination:** This message is issued when the space of a field in an output record is limited by the LENGTH specification for the field or the POSITION specification for the next field.

**User Response:** Apply appropriate values to the LENGTH and/or POSITION parameters in the field specification list to accommodate the data in the output records. Alternatively, specify TRUNCATE option to the field, if applicable. Specifying the STRIP option, if applicable, can also reduce the length of data if the data contains leading or trailing blanks.

**DSNU1234I**  
**csect-name - NUMERIC CONVERSION ERROR OCCURRED FOR FIELD field-name, TABLE table-name**

**Explanation:** The UNLOAD utility encountered an error when it tried to convert a data of one numeric type to another.

**Severity:** 4 (warning)

**System Action:** The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1).

If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

**Problem Determination:** This message is issued most likely when an overflow occurs in converting a data of one numeric type to another. For example, an attempt to convert an INTEGER 32768 to a SMALL INT causes an overflow.

**User Response:** To eliminate any numeric overflow error, specify the same numeric data type for the output as the base type of the columns in the table. Convert numeric types only when it is known that the range of the source data fits in the allowable range of the specified numeric type for the output.

**DSNU1235I**  
**csect-name - CCSID SUBSTITUTION IS ATTEMPTED WITH NOSUBS OPTION FOR FIELD field-name, TABLE table-name**

**Explanation:** While the UNLOAD utility is running with the NOSUBS option, a CCSID substitution is attempted in the CCSID translation process for the indicated field.

**Severity:** 4 (warning)

**System Action:** The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

**User Response:** If it is desired to eliminate any CCSID substitution, specify an appropriate CCSID that has the corresponding entries to the original CCSID, if available. To allow the default CCSID substitution, remove the NOSUBS option.

**DSNU1236I**  
**csect-name - POSITION SPECIFICATION CAUSES FIELD OVERLAP FOR FIELD field-name, TABLE table-name**

**Explanation:** For the UNLOAD utility, the space for an output field was overlapped by the indicated field to which the POSITION parameter is specified.

**Severity:** 4 (warning)

**System Action:** The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

**Problem Determination:** This message will be issued only when the NOPAD option is specified in the UNLOAD statement. The POSITION specification for the field caused a conflict with the positioning and/or the length of a previous field.

**User Response:** Consider the following options to eliminate this situation:
- Remove the POSITION specifications from the field specification list.
- Adjust the POSITION parameter for the field to preserve enough space for the previous fields.
• Adjust the LENGTH, possibly with the TRUNCATE option, of the previous fields, if applicable.

**STANDARD**

DSNU1237I csect-name - ERROR IN CCSID CONVERSION FOR FIELD field-name, TABLE table-name

**Explanation:** The CCSID translation process detected a code point or form exception while the UNLOAD utility was running.

**Severity:** 4 (warning)

**System Action:** The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

**User Response:** If the specified CCSID for output is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

**System Programmer Response:** Verify the contents of SYSSTRINGS. If necessary, insert a row into SYSSTRINGS for the translation. For an SBCS translation, the row must contain a translate table or the name of a user-provided translate procedure. For a DBCS translation, the row must contain the name of a user-provided translate procedure.

---

DSNU1238I TABLE table2 IS NOT IN SAME TABLESPACE AS TABLE table1

**Explanation:** All source tables for a single UNLOAD utility statement must be in the same table space.

**Severity:** 8 (error)

**System Action:** Utility processing terminates.

**User Response:** Remove the FROM TABLE control statement that specifies table2 from the current UNLOAD request. Create another UNLOAD utility statement that contains the FROM TABLE control statement for table2 so that all source tables in a single UNLOAD request are from the same table space. Resubmit the job.

---

DSNU1250I csect-name - ERROR IN CCSID CONVERSION FOR object-type. SOURCE CCSID=ccsid, TARGET CCSID=ccsid

**Explanation:** The CCSID translation process failed for object-type. The values of object-type and the cause of the error for each type are:

- SBCS PAD CHAR
- DBCS PAD CHAR
- VERIFICATION

**Severity:** 8 (error)

**System Action:** The utility terminates.

**User Response:** If the CCSID that is specified in the utility control statement is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

**System Programmer Response:** Check the SYSSTRINGS catalog table to determine whether a row exists for the CCSID conversion. If a row does not exist, and OS/390 V2R9 is installed, refer to z/OS C/C++ Programming Guide for additional conversions that are supported. If no conversions are available, contact your IBM service representative to request support for the conversion.

---

DSNU1251I csect-name - ERROR IN CCSID CONVERSION FOR object-type IN FIELD field-name OF TABLE table-name. SOURCE CCSID=ccsid, TARGET CCSID=ccsid

**Explanation:** The CCSID translation process failed for object-type. The values of object-type and the cause of the error for each type are:

- STRIP CHAR

**Severity:** 8 (error)

**System Action:** The utility terminates.

**System Programmer Response:** Check the SYSSTRINGS catalog table to determine whether a row exists for the CCSID conversion. If a row does not exist, and OS/390 V2R9 is installed, refer to z/OS C/C++ Programming Guide for additional conversions that are supported. If no conversions are available, contact your IBM service representative to request support for the conversion.

**User Response:** If the CCSID that is specified in the utility control statement is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

---

DSNU1252I THE PARTITION VARIABLE IN THE TEMPLATE DSN WAS SPECIFIED BUT PARTITION PARALLELISM IS NOT ACTIVATED

**Explanation:** A utility control statement for the UNLOAD utility contains a template name in the UNLDN option. The template contains a variable that represents a partition number. However, the source object is either a non-partitioned table space or an image copy that does not support partition parallelism.

**Severity:** 4 (warning)

**System Action:** UNLOAD processing continues. For
the indicated table space, a single output data set is
allocated, and the unloaded data is placed in that data
set.

**DSNU1254I**
csect-name FORMAT DELIMITED REQUIRES ONE AND ONLY ONE FROM
TABLE

**Explanation:** UNLOAD FORMAT DELIMITED supports unloading only from a single table. FORMAT
DELIMITED specifies either with:
- Multiple FROM TABLE specifications, or
- No FROM TABLE specifications, with a table space
  that contains more than one table.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**User Response:** Correct the UNLOAD statement and resubmit the utility.

**DSNU1300I**
csect-name MODIFY STATISTICS COMPLETED SUCCESSFULLY

**Explanation:** This message reports the successful
completion of the MODIFY STATISTICS utility operation.

**Severity:** 0 (informational)

**DSNU1301I**
csect-name n
SYSIBM.SYSCOLDIST_HIST ROWS WERE DELETED

**Explanation:** This message displays the number n of
SYSIBM.SYSCOLDIST_HIST rows that were deleted by
the MODIFY STATISTICS utility.

**Severity:** 0 (informational)

**DSNU1302I**
csect-name n
SYSIBM.SYSCOLUMN_HIST ROWS WERE DELETED

**Explanation:** This message displays the number n of
SYSIBM.SYSCOLUMN_HIST rows that were deleted by
the MODIFY STATISTICS utility. The rows were
deleted based on the AGE criteria or the DATE criteria
that the user specified.

**Severity:** 0 (informational)

**DSNU1303I**
csect-name n
SYSIBM.SYSINDEXES_HIST ROWS WERE DELETED

**Explanation:** This message displays the number n of
SYSIBM.SYSINDEXES rows that were deleted by the
MODIFY STATISTICS utility. The rows were deleted
based on the AGE criteria or the DATE criteria that the
user specified.

**Severity:** 0 (informational)
DSNU1309I  csect-name n
SYSBM.SYSTABSTATS_HIST ROWS WERE DELETED

Explanation:  This message displays the number n of SYSBM.SYSTABSTATS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity:  0 (informational)

DSNU1310I  THE IMAGE COPY FOR obj-type obj-qual.obj-name DSNUM dsnum RESIDES ON A TAPE VOLUME BUT IS NOT PREALLOCATED VIA JCL AND TAPEUNITS IS 0

Explanation:  The specification of TAPEUNITS=0 restricts the utility from using tape units that are not preallocated via JCL.

Severity:  8 (error)

System Action:  Processing stops for this object.

User Response:  Either change the value on the TAPEUNITS keyword and resubmit the job, or preallocate the image copy and resubmit the job.

DSNU1400I  csect-name - COPYTOCOPY UTILITY NOT SUPPORTED FOR obj-type obj-qual.obj-name DSNUM n

Explanation:  COPYTOCOPY cannot make copies of:
  - DSNDB01.SYSUTILX, DSNDB01.DBD01, or DSNDB06.SYSCOPY table spaces, or any of their indexes.
  - An image copy that was taken using the COPY utility with the CONCURRENT option.

Severity:  8 (error)

System Action:  Processing halts for this object. If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

User Response:  If the unsupported object is a restricted catalog or directory object listed in the explanation, use another method to make all image copies for this object. If the unsupported object is an image copy made with the CONCURRENT option, then make a primary local image copy by running the COPY utility without the CONCURRENT option. Rerun COPYTOCOPY to make additional image copies.

DSNU1401I  csect-name - UNABLE TO LOCATE IMAGE COPY FOR obj-type obj-qual.obj-name DSNUM n

Explanation:  One of the following conditions prompted this error code:
  - The COPYTOCOPY utility attempted to make additional image copies from the referenced object. However, SYSBM.SYSCOPY does not contain a record of the referenced object.
  - UNLOAD utility could not find a record in SYSBM.SYSCOPY for the image copy dataset that was requested.

Severity:  8 (error)

System Action:  Processing halts for this object.

User Response:  Make a primary local image copy by running the COPY utility, then run COPYTOCOPY to make additional image copies.

DSNU1402I  csect-name - copy-type FOR obj-type obj-qual.obj-name DSNUM n WITH START_RBA rba ALREADY EXISTS

Explanation:  COPYTOCOPY attempted to make an image copy that already exists.

Severity:  8 (error)

System Action:  The utility does not make the image copy for the specified object type. COPYTOCOPY makes the remaining types of image copies. If there is a list of objects to be copied, COPYTOCOPY processes the next object in the list.

User Response:  Run the REPORT utility to determine the image copy types that you need. Modify your COPYTOCOPY job, and rerun it as needed.

DSNU1403I  csect-name - copy-type DATA SET dsn WITH START_RBA rba IS IN USE BY COPYTOCOPY FOR obj-type obj-qual.obj-name DSNUM n

Explanation:  The COPYTOCOPY utility issues this message before it opens an image copy data set and begins the copying process.

Severity:  0 (informational)

System Action:  COPYTOCOPY processing continues.

DSNU1404I  csect-name - COPYTOCOPY PROCESSING COMPLETED FOR obj-type obj-qual.obj-name DSNUM n ELAPSED TIME = elapsed time NUMBER OF PAGES COPIED = n

Explanation:  COPYTOCOPY issues this message at the normal completion of an object. The time that elapsed since the beginning of processing the object to
its completion was $hh$ hours, $mm$ minutes, and $ss$ seconds.

**Severity:** 0 (informational)

**System Action:** The COPYTOCOPY utility completed normally for this object. Processing continues.

---

**DSNU1405I**

`csect-name - site-type SITE PRIMARY IMAGE COPY DOES NOT EXIST FOR obj-type obj-qual.obj-name DSNUM n`

**Explanation:** The COPYTOCOPY utility attempted to make a backup image copy for the site, but the primary image copy does not exist.

**Severity:** 8 (error)

**System Action:** The utility cannot make the site backup copy. If the utility job includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item on the list.

**User Response:** Modify your COPYTOCOPY job, COPYDDN or RECOVERYDDN option, to include the ddname for the primary copy.

---

**DSNU1406I**

`csect-name - COPYTOCOPY COMPLETED. ELAPSED TIME = elapsed_time`

**Explanation:** DB2 issues this message at the normal completion of the COPYTOCOPY utility. The time that elapsed since the beginning of the COPYTOCOPY utility to its completion was $hh$ hours, $mm$ minutes, and $ss$ seconds.

**Severity:** 0 (informational)

**System Action:** Processing continues to the next utility statement in the utility job step, if any. If not, the utility job steps halt, and the UTILID of the utility job step becomes available for reuse.

---

**DSNU1407I**

`csect-name - MISMATCH BETWEEN THE NUMBER OF PAGES READ=count AND THE NUMBER OF PAGES ORIGINALLY COPIED=count FOR INPUT DATA SET dsname OBJECT NAME obj-type obj-qual.obj-name DSNUM n`

**Explanation:** The COPYTOCOPY or RECOVER utility issues this message when it detects that the number of pages read from the input image copy does not match the original number of pages copied by the COPY utility. The utility retrieves the number of pages originally copied from the COPYPAGESF column of the SYIBM.SYSCOPY record for the input image copy data set.

**Severity:** 8 (error)

**System Action:** The COPYTOCOPY utility terminates processing of this object. The RECOVER utility attempts to continue by falling back to the previous full image copy, if any. If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

**User Response:** Report to IBM Center. Provide output of COPYTOCOPY job, the data set referenced in the message, and run REPORT utility on the object and provide its output.

---

**DSNU1408I**

`csect-name - SOURCE DATA SET dsname DOES NOT obj-type obj-qual.obj-name DSNUM n`

**Explanation:** The COPYTOCOPY or RECOVER utility issues this message when the DBID or PSID of the source data set does not match the DBID or PSID of the table space or index space for which the copy is made. This error can occur if the data set was reused.

**Severity:** 4 (warning)

**System Action:** RECOVER attempts to continue processing by falling back to the previous full image copy, if any.

COPYTOCOPY searches for the next available image copy data set with the same START_RBA value as the START_RBA value registered in SYIBM.SYSCOPY for dsname. If COPYTOCOPY finds a data set, it uses that data set. Otherwise, COPYTOCOPY issues message DSNU1401I.

If FROMCOPY is specified, processing of this object halts.

**User Response:** Determine why the data set was reused for the image copy data set that is registered in SYIBM.SYSCOPY.

If FROMCOPY is specified, correct the COPYTOCOPY utility control statement. Specify a source data set that is an image copy of the table space or index space for which you want additional image copies.

---

**DSNU1409I**

`csect-name - ttttt ERRORS ON DATA SET NAME=dsname obj-type obj-qual.obj-name DSNUM n`

**Explanation:** DB2 detected I/O errors on the named object. ttttt is either 'READ' or 'WRITE'.

**Severity:** 4 (warning)

**System Action:** If FROMCOPY is specified, processing is terminated. Otherwise, processing will continue. The utility will attempt to use the next available image copy data set that matches COPYTOCOPY job specification with the same START_RBA as the data set named in error. If it fails to find one, processing of this object is terminated.

**User Response:** There may be an IOS message on
the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the Problem Determination directions for the message.

**DSNU1410I**

csect-name - **INCREMENTAL IMAGE COPY DISALLOWED FOR obj-type**

**Explanation:** An incremental image copy is disallowed for the specified object type. The utility ignores the request, and creates a full image copy if available.

**Severity:** 4 (warning)

**System Action:** The system treats the request to copy an incremental image copy as a request to copy a full image copy.

**User Response:** The capacity of the target image copy data set may not be sufficient if its size was established assuming an incremental image copy. If this condition occurs, halt the utility and resubmit the job step with the appropriate size.

**DSNU1411I**

csect-name - ut_name DOES NOT SUPPORT RESTART(PHASE). PHASE CHANGED TO CURRENT.

**Explanation:** This utility does not support the RESTART(PHASE).

**Severity:** 0 (informational)

**System Action:** The utility overrides RESTART(PHASE) with RESTART(CURRENT).

**DSNU1450I**

csect-name - **CHARACTER CONVERSION FROM CCSID from-ccsid TO CCSID to-ccsid FAILED WITH ERROR CODE error-code FOR TABLE dbid.obid COLUMN column-number**

**Explanation:** A conversion error occurred during the conversion of a string to a different coded character set. The error occurred during the processing of the utility statement.

**from-ccsid**

identifies the coded character set of the string to be converted.

**to-ccsid**

identifies the coded character set to which it must be converted.

**error-code**

indicates the type of error as defined as follows:

8 Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).

12 Invalid code point.

16 Form exception (for example, invalid MIXED data).

20 Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).

24 the conversion services have not been setup correctly or the conversion is not supported.

dbid.obid
gives the database id and the table obid of the object with the conversion error. This could be either the target or the source of the conversion.

column-number
gives the column number of the failing object. This could be either the target or the source of the conversion.

**System Action:** The utility job is terminated.

**User Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. The user may generate a dump by adding the DIAGNOSE ABEND statement in the utility job and re-running the utility. If the error can be fixed, correct the error and resubmit the utility, else issue the TERM utility command to terminate the utility.

**DSNU1502I**

csect-name - **RECOVER OF obj-type obj-qual.objname dsnum n WILL PROCEED TO LOG POINT X'rb/lrsn'**

**Explanation:** DB2 issues this message if the RECOVER utility statement includes the TOLASTCOPY or TOLASTFULLCOPY keyword. The message provides information on the point in time that the object was recovered to. In a data sharing environment, the log point identified is an LRSN. Otherwise, the log point identified is an RBA.

**Severity:** 0 (informational)

**System Action:** The RECOVER utility statement continues processing.

**DSNU1510I**

csect-name - **LOG APPLY PHASE COMPLETE, ELAPSED TIME: HH.MM.SS**

**Explanation:** This message is issued at the normal completion of the LOG APPLY phase of the RECOVER utility. The time that has elapsed between the beginning and completion of this phase was:

| hh | hours |
| mm | minutes |

Chapter 19. DB2 messages 629
DSNU1511I  •  DSNU1606I

ss seconds

Severity:  0 (informational)
System Action:  Processing continues.

---

DSNU1511I  csect-name - FAST LOG APPLY WAS NOT USED FOR RECOVERY

Explanation: The RECOVER utility issues this message to notify the user that FAST LOG APPLY was not used. FAST LOG APPLY is not used for the following reasons:
- The ZPARM DSN6SYSYSP LOGAPSTG has 0 or insufficient storage specified.
- The storage that is used by currently active RECOVER jobs exceeds what was specified in the DSN6SYSYSP LOGAPSTG ZPARM.

Severity:  0 (informational)
System Action:  The RECOVER utility continues processing.

---

DSNU1606I  csect-name - BACKUP SYSTEM UTILITY STARTING, COPY POOL = copy-pool-name, TOKEN = X'token'

Explanation: Backup of the indicated object, either data or logs, to the indicated copy pool and with the indicated token is starting.

Severity:  0 (informational)
System Action:  Backup of the indicated object has started.
System Programmer Response:  None.

---

DSNU1601I  csect-name - BACKUP SYSTEM UTILITY IS NOT RESTARTABLE. RESTART IGNORED. A NEW BACKUP WILL BE INITIATED

Explanation: The BACKUP SYSTEM utility cannot be restarted. The restart is ignored and a new backup is done.

Severity:  0 (informational)
System Action:  The restart is ignored, and a new BACKUP SYSTEM request is initiated.
System Programmer Response:  None.

---

DSNU1602I  csect-name - BACKUP SYSTEM UTILITY COMPLETED, ELAPSED TIME = hh:mm:ss

Explanation: The BACKUP SYSTEM utility cannot be restarted. The restart is ignored, and a new backup is done.

Severity:  0 (informational)
System Action:  None.

---

System Programmer Response:  None.

DSNU1603I  csect-name - RESTORE SYSTEM UTILITY RESTART FAILED BECAUSE THE MEMBER-ID,member-id, ON WHICH THE RESTART HAS BEEN ISSUED IS DIFFERENT FROM THE MEMBER-ID, member-id, ON WHICH THE RESTORE WAS ORIGINALLY DONE

Explanation: A group RESTORE in a data sharing environment is already in the log apply phase. The RESTORE was originally issued and owned by a member other than the one that issued the restart, which is not allowed.

Severity:  8 (error)
System Action:  The restart fails.
System Programmer Response:  Issue the restart job from the member that was indicated in the message.

---

DSNU1604I  csect-name - RESTORE SYSTEM PHASE LOG APPLY STARTED AT LOG POINT = log-point-value

Explanation: The RESTORE SYSTEM utility has begun applying logs beginning at the log-point-value in order to arrive at the point in time indicated by the log point at which the logs were truncated via the SYSPI TR parameter on the conditional restart command, CRESTART CREATE.

Severity:  0 (informational)
System Programmer Response:  None.

---

DSNU1605I  csect-name - BACKUP SYSTEM UTILITY FAILED BECAUSE DB2 IS NOT IN VERSION 8 NEW FUNCTION MODE OR LATER

Explanation: The BACKUP SYSTEM utility can be run only when DB2 is in VERSION 8 ‘new function mode’ or later.

Severity:  8 (error)
System Action:  The utility is terminated.
System Programmer Response:  Complete the conversion of DB2 to ‘new function mode’ before attempting to run the BACKUP SYSTEM utility.

---

DSNU1606I  csect-name - RESTORE SYSTEM UTILITY STARTING, COPY POOL = copy-pool-name, TOKEN = X'token'

Explanation: Restore of the indicated copy pool with the indicated token is starting.

Severity:  0 (informational)
System Action:  None.
**DSNU1607I  csect-name - RESTORE SYSTEM Utility Requires Install SYSADM Authority to run. The Caller Has Insufficient Authority**

**Explanation:** The invoker of the RESTORE SYSTEM utility lacks the install SYSADM authority required to run the utility.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Ensure that the RESTORE SYSTEM utility is run by an administrator with install SYSADM authority.

---

**DSNU1608I  csect-name - System-Utility System Utility Failed. Required DFSMSHsm Services Not Available.**

**Explanation:** The system that attempted to run the BACKUP SYSTEM or RESTORE SYSTEM utility does not have the version of z/OS that contains the version of DFSMSHsm that is required by those utilities.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Ensure that the required version of the z/OS operating system is installed on the system on which the BACKUP SYSTEM and RESTORE SYSTEM utilities are to be run.

---

**DSNU1609I  csect-name - BACKUP SYSTEM Utility Requires SYSADM or SYSCtrl Authority to Run. The Caller Has Insufficient Authority**

**Explanation:** The invoker of the BACKUP SYSTEM utility lacks the SYSADM or SYSCtrl authority required to run the utility.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Ensure that the BACKUP SYSTEM utility is run by an administrator with SYSADM or SYSCtrl authority.

---

**DSNU1610I  csect-name - An Incomplete Backup System History Entry Has Been Found in the BSDS, Indicating There May Be an Invalid Data and Log Version in CopyPool = copy-pool-name For Token = X'token'. DFSMSHsm Will Be Called to Delete the Version**

**Explanation:** During Backup System processing, an incomplete backup history entry was found in the BSDS. For example, an incomplete entry can exist if DB2 or z/OS goes down before backup processing can complete. Such an entry indicates that a data and log version may exist in the indicated copy pool for the indicated token.

**Severity:** 0 (informational)

**System Action:** Backup System will invoke DFSMSHsm to delete the version of the data and logs before proceeding with the current backup.

**System Programmer Response:** None.

---

**DSNU1611I  csect-name - A Failure Has Occurred During Backup System Processing. DFSMSHsm Is Being Called to Delete the Incomplete Version in CopyPool = copy-pool-name For Token = X'token'**

**Explanation:** A failure that was previously indicated during Backup System processing has created an incomplete version. The copy pool and token with the incomplete version are indicated in the message text. This incomplete version must be deleted.

**Severity:** 0 (informational)

**System Action:** Backup System will invoke DFSMSHsm to delete the incomplete version.

**System Programmer Response:** None.

---

**DSNU1612I  csect-name - Restore System Utility Failed Because the System Is Not in System Recover-Pending State.**

**Explanation:** The RESTORE SYSTEM utility cannot be run unless the proper preparation has been made. That preparation includes truncation of logs and performing a conditional restart of the appropriate system(s) so as to place them in the System RECOVER-PENDING state. This procedure is detailed in the Part 4 (Volume 1) of [DB2 Administration Guide](http://example.com/db2admin) under 'System point in time recovery'.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Review the...
**Messages and Codes**

**DSNU1614I**  
csect-name - RESTORE SYSTEM UTILITY FAILED BECAUSE THERE ARE NO BACKUP SYSTEM HISTORY ENTRIES IN THE BSDS

**Explanation:** There are no BACKUP SYSTEM history entries in the BSDS. Without these records no Restore can be done. Backups of the target system(s) must be taken before any RESTOREs can be done.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** None.

---

**DSNU1616I**  
csect-name - THE CALL TO DFSMSHsm TO RESTORE SYSTEM FAILED. PLEASE SEE MESSAGE ARC1806E IN THE OUTPUT FOR DETAILS. COPY POOL = copy-pool-name, TOKEN = X'token'. A RETRY WILL BE ATTEMPTED IF AN APPROPRIATE BACKUP VERSION CAN BE IDENTIFIED.

**Explanation:** The call to DFSMSHsm to RESTORE SYSTEM with the indicated copy pool name and token failed during DFSMSHsm processing. DFSMSHSM will have issued message ARC1806E indicating the cause of the error. This message can be found in the job log of the RESTORE SYSTEM utility.

If this is the first attempt by the RESTORE SYSTEM utility to do the RESTORE, a second attempt will be made if there is another appropriate Backup version recorded in the BACKUP SYSTEM history BSDS record. An appropriate Backup version is one for which data backup completed before the log truncation point indicated in the SYSPITR parameter of the conditional restart command, CRESTART CREATE. Messages indicating the progress of a subsequent attempt will be issued, just as for the first attempt.

If the second attempt fails, no further attempts will be made and the request will be failed.

**Severity:** 8 (error)

**System Action:** If this is the first attempt to do the RESTORE and there is another appropriate Backup available, a second attempt will be made. Otherwise the utility will terminate.

**System Programmer Response:** Correct the problem identified in message ARC1806E and rerun the utility.

**Problem Determination:** The job log will contain the ARC1806E message that is issued by DFSMSHsm. This message will contain information indicating the cause of the failure in DFSMSHsm.

---

**DSNU1618I**  
csect-name - RESTORE SYSTEM UTILITY FAILED BECAUSE THERE ARE NO BACKUP SYSTEM HISTORY ENTRIES IN THE BSDS

**Explanation:** There are no BACKUP SYSTEM history entries in the BSDS. Without these records no Restore can be done. Backups of the target system(s) must be taken before any RESTOREs can be done.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** None.

---

**DSNU1621I**  
csect-name - RESTORE SYSTEM UTILITY FAILED BECAUSE THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE

**Explanation:** When the system is in RECOVER-PENDING state, no utility other than RESTORE is allowed to run. An attempt was made to run a utility while the system was in RECOVER-PENDING state.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Review the need to run the utility and, if appropriate, resubmit your job after the system has been restored.
### DSNU1623I  
**csect-name - THE TERM UTILITY REQUEST IS REJECTED BECAUSE THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE**

**Explanation:** The TERM request is rejected. The only utility that is allowed to run while the system is in the system RECOVER-pending state is the RESTORE utility.

**Severity:** 4 (warning)

**System Action:** The TERM request is ignored.

### DSNU1624I  
**csect-name - system-utility SYSTEM UTILITY FAILED BECAUSE ONE OR MORE NON-DORMANT MEMBERS ARE IN A FAILED OR NOT NORMALLY QUIESCED STATE. THOSE MEMBERS ARE: member-id**

**Explanation:** The BACKUP or RESTORE of the members of a data sharing group requires that all members be active or normally quiesced. If any members are found not to be in either of these states, the BACKUP or RESTORE cannot continue.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Determine why these systems are in a problem state, and whether they can be moved out of this state. Once all members have been returned to either the active or normally quiesced state, resubmit the job.

### DSNU1626I  
**csect-name - system-utility SYSTEM UTILITY FAILED BECAUSE RESTORE SYSTEM IS ALREADY RUNNING OR ANOTHER TASK IS PROCESSING IN A MANNER THAT PREVENTS THIS TASK FROM SERIALIZING PROPERLY**

**Explanation:** The attempt to acquire the serialization lock failed. In the case of RESTORE SYSTEM, this can only occur if RESTORE SYSTEM is already running. In the case of BACKUP SYSTEM, this can occur if any of the following events are in process:

- System checkpoint
- Data set extensions
- Writing 32K pages
- Writing close page set control log records (PSCRs)
- Creating data sets (for table spaces, indexes, and so on)
- Deleting data sets (for dropping tables spaces, indexes, and so on)
- Renaming data sets (for online reorganizing of table spaces, indexes, and so forth during the switch phase)

**Severity:** 8 (error)

### System Action:** The utility is terminated.

**System Programmer Response:** If it is the RESTORE SYSTEM utility that is being invoked, the only other utility that can be running is RESTORE SYSTEM. If it is the BACKUP SYSTEM utility that is being invoked, any system activity that provokes any of the processes listed in the Explanation above could be the cause of the failure. If possible, determine which utility is responsible and resubmit this job once that utility completes. You may also resubmit your job at a later, less busy time.

### DSNU1627I  
**csect-name - RESTORE SYSTEM PRE-LOG APPLY COMPLETED SUCCESSFULLY, COPY POOL = copy-pool-name TOKEN = X’token’ ELAPSED TIME = hh:mm:ss**

**Explanation:** Restoration of the data from the indicated copy pool with the indicated token has completed successfully.

**Severity:** 0 (informational)

**System Action:** Continue with log apply phase.

**System Programmer Response:** None.

### DSNU1628I  
**csect-name - RESTORE SYSTEM PHASE LOG APPLY COMPLETED, ELAPSED TIME = hh:mm:ss**

**Explanation:** The log apply phase of the RESTORE SYSTEM completed in the amount of time that was indicated.

**Severity:** 0 (informational)

### DSNU1629I  
**csect-name - DB2 PUT ONE OR MORE OBJECTS INTO THE RECOVER-PENDING STATE, REBUILD-PENDING STATE, OR LOGICAL PAGE LIST DURING THE LOG APPLY PHASE.**

**Explanation:** During the log apply process, objects were put into one of the exception states that is indicated in the message. Before these objects can be used, they must be processed again after the Restore completes.

**Severity:** 0 (informational)

**System Action:** None.

**System Programmer Response:** Process those objects in the RECOVER-PENDING or REBUILD-PENDING states with the REBUILD or RECOVER utilities as appropriate. See the Utility Guide and Reference for further details.

To recover pages from the LPL, use the -START DATABASE command with the SPACENAM option, the RECOVER utility, or the LOAD utility.
**Problem Determination:** Use the DISPLAY DATABASE command to identify which objects are in the exception states indicated in the message.

---

**DSNU1631I**

csect-name - BACKUP SYSTEM UTILITY FAILED BECAUSE THE DFSMShsm CALL FAILED WITH RC = X'hisn-rc'. PLEASE SEE THE JOB LOG FOR DFSMShsm MESSAGES INDICATING THE CAUSE OF THE ERROR.

**Explanation:** The call to DFSMShsm to perform the Backup failed with the return code indicated in the message. The job log will contain error messages issued by DFSMShsm that will indicate the cause of the error.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Review the output and, in particular, the DFSMShsm messages to determine the cause of the failure.

---

**DSNU1632I**

csect-name - DISPLAY REQUEST WITH MEMBER SPECIFICATION WAS MADE BUT THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE. THE MEMBER SPECIFICATION IS IGNORED AND ONLY THOSE UTILITIES RUNNING ON THE SYSTEM FROM WHICH THE DISPLAY COMMAND WAS ISSUED WILL BE DISPLAYED.

**Explanation:** When a system is in the system RECOVER-PENDING state it isn’t possible to determine which utilities are executing on members in a data sharing group other than the member on which the DISPLAY command is running. The MEMBER specification is ignored and only those utilities executing on the system on which the command is running are displayed.

**Severity:** 0 (informational)

**System Action:** Display any utilities running on the system on which the command is running.

---

**DSNU1633I**

csect-name - BACKUP SYSTEM UTILITY FAILED BECAUSE UNABLE TO WRITE BSDS RECORD DUE TO VSAM ERROR: RC = X'return code', RSN = X'reason code'

**Explanation:** The attempt to update or insert the BACKUP SYSTEM history BSDS record failed due to an error during VSAM processing. The VSAM return and reason codes are indicated in the message.

---

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** The return and reason code in the message will identify the VSAM error that occurred when attempting to write out the BSDS record. Correct the problem and resubmit the job.

---

**DSNU1634I**

csect-name - RESTORE SYSTEM UTILITY FAILED BECAUSE THE SYSTEM IS IN TRACKER MODE AND LOGONLY WAS NOT SPECIFIED.

**Explanation:** The RESTORE SYSTEM utility cannot be run on a tracker system unless the LOGONLY keyword is specified.

**Severity:** 8 (error)

**System Action:** The utility is terminated.

**System Programmer Response:** Change the RESTORE SYSTEM utility control statements to include the LOGONLY parameter.

---

**DSNU3330I**

csect-name - The utility-name UTILITY IS PART OF A SEPARATELY LICENSED FEATURE WHICH WAS NOT FOUND ON THIS SYSTEM.

**Explanation:** DB2 could not find the specified utility in the load library concatenation specified in the submitted JCL. The specified utility is part of an optional feature of DB2.

**Severity:** 8 (error)

**System Action:** Utility processing does not initiate.

**User Response:** Obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility you wish to execute.

---

**DSNU3331I**

csect-name - THERE ARE n DAYS REMAINING IN THE TRIAL PERIOD FOR THE utility-name UTILITY

**Explanation:** The specified utility is part of an optional feature of DB2, and it will remain active for a 90-day trial period. This message displays the number of days remaining in the trial period.

**Severity:** 0 (informational)

**System Action:** Utility processing continues.

**User Response:** To continue executing the utility after the trial period, obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility.
**Explanation:** The specified utility is part of an optional feature of DB2, and it has remained active for a 90-day trial period. The trial period has expired.

**Severity:** 8 (error)

**System Action:** Utility processing does not initiate.

**User Response:** Obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility you wish to execute.
Chapter 20. DSNV... messages

**DSNV029E** LOAD MODULE *module-name* DOES NOT HAVE AMODE(31) ATTRIBUTE

**Explanation:** During DB2 startup, Agent Services establishes the tasking structure for the control and resource manager address spaces. Three load modules, DSNVEUS3, DSNVEUS4, and DSNVRCT, are loaded and attached as the control programs for each subtask created. All three load modules must have been link-edited with the attributes AMODE(31) and RMODE(ANY). At least one of the modules did not have the 31-bit addressing attribute when it was loaded. The ‘module-name’ in the error message is the alias name of the first load module whose addressing mode was invalid.

**System Action:** DB2 startup is terminated.

**System Programmer Response:** Verify that all installation and maintenance activities against these modules were executed using SMP, that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link-edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

**Operator Response:** Notify the system programmer of the failure.

**Problem Determination:** A DB2 dump was requested to a SYS1.DUMP data set.

Load module names and aliases are as follows:

<table>
<thead>
<tr>
<th>Load module</th>
<th>Alias</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSNVEUS3</td>
<td>DSNVEUS3I</td>
</tr>
<tr>
<td>DSNVEUS4</td>
<td>DSNVEUS4I</td>
</tr>
<tr>
<td>DSNVRCT</td>
<td>DSNVRCTI</td>
</tr>
</tbody>
</table>

The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

**DSNV086E** DB2 ABNORMAL TERMINATION REASON=xxxxxxxx

**Explanation:** The DB2 subsystem is being abended, because an error that cannot be corrected has occurred. This message, which is not automatically deleted from the operator console, is issued during DB2 abnormal termination. ‘REASON’ is the subsystem termination reason code. If DB2 abnormal termination is invoked multiple times, the subsystem termination reason code that accompanies this message is the reason associated with the first invocation. For additional information, look up the reason code in Part 4, “Section 4. DB2 Codes,” on page 771.

**System Action:** Abnormal termination processing continues.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** This message is accompanied by one or more dumps. Obtain a copy of SYS1.LOGREC after DB2 completely terminates; also obtain a copy of the SVC dump(s). If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [15]

**DSNV400I** ARCHIVE LOG WITH MODE(QUIESCE) CURRENTLY ACTIVE

**Explanation:** An ARCHIVE LOG MODE(QUIESCE) command is currently active. This message follows the DSNV401I message as part of the -DISPLAY THREAD command report.

**System Action:** This message is issued as information only. The message indicates that the ARCHIVE LOG MODE(QUIESCE) command has not completed, and consequently, updates against DB2 resources have been temporarily suspended. This may result in active threads being suspended awaiting termination of the quiesce period. DB2 processing otherwise continues normally.

**DSNV401I** DISPLAY THREAD REPORT FOLLOWS

**Explanation:** This message is always generated as the title for the DISPLAY THREAD command report output. It precedes the other messages generated by this command.

**System Action:** Processing continues normally.

**DSNV402I** ACTIVE THREADS-

**Explanation:** This message precedes the listing of active threads.

The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when the status of active threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show distributed activity.

**System Action:** Processing continues normally.
**DSNV403I**  **NAME ST A REQ**  **ID AUTHID PLAN ASID TOKEN**

**Explanation:** This message displays the column headings for the list of threads generated by the -DISPLAY THREAD TYPE(ACTIVE) or -DISPLAY THREAD TYPE(INACTIVE) command.

The message number and subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

**DSNV404I**  **name status act-ind req-ct corr-id auth-id pname asid token**

**Explanation:** This message provides the status information on an active or inactive thread and is part of the response to the -DISPLAY THREAD command. Information provided is:

- **name** A 1- to 8-character variable representing the 'connection name' used to establish the thread. For distributed database access threads, this field contains the following:
  - For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
  - For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this variable displays the constant SERVER.
  - If the thread has a status of PT, the connection name contains blanks if the thread of the originating task is running on the same DB2. This helps to show that these parallel tasks are related to the originating task above. If the parallel task is running on a different DB2 for the originating task, then the connection name will be supplied and the entry will be followed by DSNV443I.

If the thread has a status of D, the connection name might be either the connection name for the allied address space or the DB2 subsystem name.

- **status** A 1- or 2- character connection status code with the following values:
  - **D** The thread is in the process of termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated allied task is placed in a wait state.
  - **DA** The database access thread slot is currently not associated with a remote connection and is available to be assigned to a type 2 inactive thread.

- **DI** The thread is disconnected from an execution unit. There is no TCB associated with the DB2 thread. This state is only valid when 'connection name' = RRSFA.

- **N** The thread is in either IDENTIFY or SIGNON status.

- **PT** A parallel task thread was established (plan allocated).

- **QD** The thread is queued for termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated allied task is placed in a wait state.

- **QT** The CREATE THREAD request was queued. The associated allied task is placed in a wait state.

- **R2** A distributed thread is performing a remote access on behalf of a request from another location. The thread is currently a type 2 inactive thread and is waiting for an agent to become available to process.

- **RA** The distributed thread is performing a remote access on behalf of a request from another location.

- **RK** A distributed thread is performing remote access on behalf of a request from another location. The thread is performing an operation that invoked Kerberos services. This status is displayed until Kerberos services returns control to DB2.

- **RN** A distributed thread is performing a remote access on behalf of a request from another location. The request actually accesses data at yet another (DB2) location, so the thread was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).

When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of
time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command (‘DISPLAY LOCATION(*) DETAIL’) shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

RQA distributed thread is performing a remote access on behalf of a request from another location. The thread is suspended because the maximum number of active database access threads (as described by the MAX REMOTE ACTIVE value of the DSN6SYSF macro in the DB2 startup parameter, usually DSNZPARMT) was reached. Database access agents (DBAAs) are queued until other DBAAs deallocate or go inactive, providing an available slot. The DBAA resumes when a slot becomes available, and the DBAA is next in the queue. Alternatively, you should consider increasing the MAX REMOTE ACTIVE value.

RX The distributed thread is executing an XA transaction on behalf of a request from another location.

SP A thread is executing within a stored procedure. This status is displayed until the stored procedure terminates and returns control to DB2.

SW A thread is waiting for a stored procedure to be scheduled. This status is displayed until the stored procedure begins execution.

T An allied, nondistributed thread was established (plan allocated).

TN An allied thread was distributed to access data at another DB2 location, but it was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).

When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command (‘DISPLAY LOCATION(*) DETAIL’) shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

TR An allied thread was distributed to access data at another location.

act-ind An asterisk if the thread is active within DB2; blank otherwise.

req-ct A wraparound counter to show the number of DB2 requests.

corr-id A 1- to 12-character variable representing the recovery ‘correlation-id’ associated with the thread.

For distributed database access threads, this field contains the following:

- While the thread is being created:
  - ‘028.DBAA nn’ - Where nn ranges from 01 to 99. This indicates that the DBAA is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user’s ID. Refer to the “Controlling Access to a DB2 Subsystem” chapter in Part 3 (Volume 1) of [DB2 Administration Guide] for descriptions of the authorization checks that might be performed.
  - RACF requests are serialized on one of the DB2 RACF service tasks, which might increase the validation time when multiple DBAAs are being created concurrently.

- After the thread is created:
  - For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation-id name of the thread at the requesting location.
  - For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

authorization ID

The authorization ID associated with a signed-on connection. If not signed-on, this field is blank.

pname A 1- to 8-character variable representing the
plan name associated with the thread. For distributed database access threads, this field contains the following:

- For threads using system-directed access and threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the plan name being executed at the requesting location.
- For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant DISTSERV.

For RRSASF connected threads that did not specify a plan name at connect time, the value "RRSAF" is displayed. If a thread was not established, this field is blank.

If you receive a system plan in this field, see the information about system plans in message DSN376I.

<table>
<thead>
<tr>
<th>asid</th>
<th>A 1- to 4-character hexadecimal number representing the ASID of the home address space.</th>
</tr>
</thead>
<tbody>
<tr>
<td>token</td>
<td>A 1- to 6-character number representing the thread token assigned to the thread. For threads with a status value of 'N', this value will be 0.</td>
</tr>
</tbody>
</table>

The message number and subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

**System Programmer Response:** If you have active threads with QD or D status codes, use the information in message DSN3201I to diagnose a possible DB2 problem.

---

**DSNV451 • DSNV480I**

**Explanation:** This message follows messages DSNV402I through DSNV404I augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show distributed activity. It indicates that the -DISPLAY THREAD TYPE(ACTIVE) report has completed successfully.

The message number and subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

---

**DSNV480I • DSNV480I**

**Explanation:** This message precedes the listing of indoubt threads.

The series of messages DSNV406I through DSNV409I, DSNV446I, DSNV449I through DSNV453I, DSNV457I through DSNV464I, DSNV466I, DSNV467I provides the formatted report for the -DISPLAY THREAD TYPE(INDOUBT) command when the status of indoubt threads is requested.

**System Action:** Processing continues normally.

---

**DSNV407I • DSNV407I**

**Explanation:** This message displays the column headings for the list of threads generated by the DISPLAY THREAD TYPE(INDOUBT) command, or for the list of Postponed Abort URs generated by the DISPLAY THREAD TYPE(POSTPONED) or DISPLAY THREAD TYPE(*) command.

The message number and the subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

---

**DSNV408I • DSNV408I**

**Explanation:** This message lists status information on an indoubt thread or for a Postponed Abort UR.

**Coordinator**

- The name of the two-phase commit coordinator.
  - If the thread is an allied thread, the coordinator name is either the IMS connection name, the CICS connection name, RRS (for Resource Recovery Services attachment facility connected threads) or the location name of the local DB2 (if it is not one of the above).
  - DSNV449I is displayed if the coordinator is IMS or CICS.
  - If the thread is a database access thread, the coordinator name takes one of four forms:
    - location:dbname -- where "location" is the coordinator's relational database name and "dbname" is the coordinator's SNA LU name.
    - location:port -- where "location" is the coordinator's relational database name and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
    - <dbname>:<dbname> -- where "dbname" is the coordinator's SNA LU name.
    - nnn.nnn.nnn.nnn:port -- where "nnn.nnn.nnn.nnn" is the coordinator's IP address and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
- If the thread is distributed, message DSNV467I is included in the display. This
message shows the logical unit of work id and the local token that identifies the distributed thread.

**status**

The status of the thread.

A status of ABORTED is not displayed unless DB2 believes a participant using PN protocols might be indoubt. If the status of a thread for a logical unit of work at a participant is INDOUBT, COMMITTED-H, or ABORTED-H, and the coordinator is a DB2 location that has not cold started, then the lack of any information about the thread in a DISPLAY THREAD(INDOUBT) report indicates that the decision at the coordinator was to abort the logical unit of work. In all other cases, a DSNV408I message for the thread is displayed.

- **INDOUBT**: The thread is indoubt and continues to appear in the display until all indoubt resolution responsibilities are complete. Additional detail lines that might appear in the report are:
  - DSNV450I and DSNV446I: The names of downstream participants who might be indoubt.
  - DSNV452I or DSNV453I: A heuristic action was taken at a downstream participant. DSNV452I or DSNV453I continues to appear in the display until DB2 resolves the indoubt status with the coordinator. If the coordinator decision is the same as the heuristic decision of the partner, then the detail line is no longer displayed. If the coordinator decision is COMMITTED and the heuristic decision of the participant is ABORTED, then the message continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.
  - DSNV466I: For a database access thread participant, the elapsed time that the thread was indoubt.

- **COMMITTED-H**: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision, and all downstream participants, if any, complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Additional detail lines that might appear in the report are:
  - DSNV451I is displayed if resolution with the coordinator is not complete. All database locks were released.
  - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator aborted the logical unit of work. This line continues to appear in the display until it is deleted with the RESET INDOUBT command.

- **ABORTED-H**: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision. Additional detail lines that might appear in the report are:
  - DSNV451I is displayed if resolution with the coordinator is not yet complete. All database locks were released.
  - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator committed the logical unit of work. This line continues to appear in the display until it is deleted with the RESET INDOUBT command.

- **ABORTED**: This is a coordinator status and DB2 has one or more downstream participants using the Presumed Nothing (PN) protocol that might be indoubt. The thread appears in the display until all downstream PN participants complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream
participants that have pending resolution. Database locks held for the thread were released.

If a participant resolved the indoubt thread with a heuristic decision, and the decision was COMMIT, detail line DSNV452I is displayed. This detail line contains the name of the participant and the heuristic decision that it made. Since the coordinator aborted and the participant committed, this indicates heuristic damage. This line continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

- **ABORT-P**: This line represents a Postponed Abort UR. Objects for which this UR has backout work pending are inaccessible (Restart Pending) until the abort is completed (for example, by means of the -RECOVER POSTPONED command).
- **ABORT-PSSTR**: This line represents a Postponed Abort UR that is currently undergoing -RECOVER POSTPONED processing or automatic DB2 backout processing (requested by restarting with system parameter LBACKOUT = AUTO).

Additional detail lines might appear in an indoubt thread report, as follows:

- **Cold Start**: When a coordinator cold starts, indoubt participants cannot achieve automatic resolution. A DB2 participant includes message DSNV463I in the display, indicating coordinator cold start and requesting heuristic resolution. Message DSNV458I is included in the display if the coordinator cold started. This message contains information that can be used to identify the thread. This information is provided by the coordinator. A DB2 coordinator provides the connection-name used to establish the thread at the DB2 coordinator and the correlation-id used by that connection.

When a participant cold starts, the coordinator cannot fulfill its indoubt resolution responsibility. A DB2 coordinator displays message DSNV462I indicating participant cold start. The thread continues to be displayed in the report, even after resolution with all other indoubt participants, if any. The RESET INDOUBT command must be used to purge this thread from the report. The reason for this is that the cold starting participant might have been coordinating downstream participants that are now indoubt. The database administrator at these participants might need to know the status of the thread at the coordinator so correct heuristic decisions can be made.

- **Protocol Errors**: A communications protocol error might occur during sync point processing and during indoubt resolution processing. These protocol errors are permanent and prevent completion of the automatic indoubt resolution process.

An indoubt display thread report shows these protocol errors, as follows:

- A DB2 coordinator detecting a sync point protocol error by a participant, such that the coordinator believes that the participant might be indoubt, adds this thread to the indoubt thread display, if the decision is to commit. Message DSNV460I is included in the display indicating the protocol error and the potential need for heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. If the participant is actually indoubt, the database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.

- A DB2 participant detecting a sync point protocol error by a coordinator when the participant is indoubt adds this thread to the indoubt thread display. Message DSNV459I is included in the display, indicating the protocol error and requesting heuristic resolution. The thread continues to be included in the report until the thread is resolved with the RECOVER INDOUBT command. The DBA at the participant might need to contact the coordinator to determine the status of the thread.

- If a DB2 coordinator detects an indoubt resolution protocol error by a participant, message DSNV457I is included in the indoubt report, indicating the error and requesting heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. The database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.

- If a DB2 participant detects an indoubt resolution protocol error by a coordinator, and the thread status is INDOUBT, message DSNV464I is included in the indoubt report, indicating the error and requesting heuristic action. The thread continues to be included in the report.
until the thread is resolved with the RECOVER INDOUBT command.

**reset**
This column contains YES if the RESET INDOUBT command must be used to purge this thread from the indoubt display.

**urid**
The RBA of the DB2 recovery log. This point is the beginning of recovery logging for this thread.

**authid**
The primary authorization-id associated with the thread.

**System Action:** Processing continues.

---

**DSNV409I**
**DISPLAY INDOUBT REPORT**
**COMPLETE**

**Explanation:** This message follows messages DSNV406I through DSNV408I and indicates that the -DISPLAY THREAD TYPE(INDOUBT) report was generated successfully.

The message number and subsystem recognition character are not included in this message.

**System Action:** Processing continues normally.

---

**DSNV410I**
**NO CONNECTION FOUND FOR**
**NAME=connection-name**

**Explanation:** The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to find any connection associated with 'connection-name'. This message is generated once for each requested connection name that was not found.

**System Action:** Command processing continues.

---

**DSNV411I**
**NO THREADS FOUND FOR**
**NAME=connection-name**

**Explanation:** The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to locate any threads associated with 'connection-name'. This message is generated once for each connection name for which no threads were found.

**System Action:** Command processing continues.

---

**DSNV412I**
**csect-name NO INDOUBT THREADS FOUND FOR NAME=connection name**

**Explanation:** In this message, 'csect-name' is the name of the command program CSECT that issued the message. 'NAME' is the connection name specified on the command.

The named command was unable to locate any indoubt threads associated with the 'connection name'. This message is generated once for each 'connection name' for which no threads were found.

**System Action:** Command processing continues.

---

**DSNV413I**
**csect-name verbname pkwname**
**TERMINATED, DEFAULT UNAVAILABLE**

**Explanation:** This message indicates that the command 'verbname' abnormally terminated because the command was entered from an MVS console and a required parameter was not supplied with the command.

**csect-name**
The name of the command program CSECT that issued the message.

**verbname**
The command verb as entered by the requester. The error depends on which command was entered.

- **DISPLAY THREAD** - neither the 'connection-name', LOCATION, nor LUWID was specified.
- **RECOVER INDOUBT** - neither 'connection-name' nor LUWID was specified.

**pkwname**
The command primary keyword as entered by the requester.

**System Action:** Command processing terminates.

**Operator Response:** Reenter the command specifying one of the required parameters.

---

**DSNV414I**
**THREAD xxx COMMIT SCHEDULED**

**Explanation:** In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

- **ID** = The recovery correlation-id specified with the command.
- **NID** = The recovery network-id specified with the command.
- **LUWID =**

  Luwid=token indicates the luwid and token that identify the thread specified with the command.

**System Action:** The thread specified on the -RECOVER INDOUBT command is scheduled for COMMIT recovery action.

---

**DSNV415I**
**THREAD xxx ABORT SCHEDULED**

**Explanation:** In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

- **ID** = The recovery correlation-id specified with the command.
- **NID** = The recovery network-id specified with the command.
- **LUWID =**

  The luwid=token indicates the luwid and token that identify the thread specified with the command.

Chapter 20. DB2 messages  643
The thread specified on the -RECOVER INDOUBT command is scheduled for ABORT recovery action.

**System Action:** Command processing continues.

---

**DSNV416I**  
**THREAD NID=net-node.number IS INVALID**

**Explanation:** In this message, 'net-node' is the recovery network-id specified with the command.

The -RECOVER INDOUBT command (NID=net-node.number) determined that the input format for the specified network-id is invalid.

**System Action:** Command processing continues.

**Operator Response:** Prior to reentering the command, ensure that the network-id entered is in the correct format as specified on the -RECOVER INDOUBT command.

---

**DSNV417I**  
**THREAD xxx NOT FOUND**

**Explanation:** In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

- **ID=** The recovery correlation-id specified with the command
- **NID=** The recovery network-id specified with the command
- **LUWID =** The luwid or token specified with the command

The -RECOVER INDOUBT command was unable to locate the specified thread to be scheduled for recovery. Either the thread identifier is incorrect, or the thread no longer is in an indoubt state.

**System Action:** Command processing continues.

**Operator Response:** Before reentering the command, ensure that the thread still is in an indoubt state.

---

**DSNV418I**  
**RECOVER INDOUBT REJECTED FOR ID= correlation-id**

**Explanation:** In this message, 'ID= correlation-id' indicates the recovery correlation-id specified with the command.

The -RECOVER INDOUBT command determined that more than one 'network-id' is associated with the specified correlation-id. No recovery action is taken against the indoubt threads associated with the correlation-id.

**System Action:** Command processing continues.

**Operator Response:** To indicate the specific indoubt thread to be scheduled for resolution, the network-id associated with the thread must be specified.

---

**DSNV419I**  
**NO CONNECTIONS FOUND**

**Explanation:** The -DISPLAY THREAD command found no active or inactive connections within the system. This message is generated when the command requests thread information for all (TYPE='*'), active (TYPE=ACTIVE), or inactive (TYPE=INACTIVE) connections within the system, but no active or inactive connections currently exist.

**System Action:** Command processing continues.

---

**DSNV420I**  
**NO INDOUBT THREADS FOUND**

**Explanation:** The -DISPLAY THREAD command found no indoubt threads within the system. This message is generated when the command requests information about all (*) threads currently residing within an indoubt state (TYPE=INDOUBT) within the system, but no threads currently exist within this state.

**System Action:** Command processing continues.

---

**DSNV421I**  
**DISPLAY TERMINATED WITH MAX LINES**

**Explanation:** This message indicates the -DISPLAY THREAD TYPE(ACTIVE) or the DISPLAY THREAD TYPE(INACTIVE) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

**System Action:** The truncated report is written to the MVS console.

**Operator Response:** Reissue the -DISPLAY THREAD request specifying a specific connection name, location, luwid, or a combination of these, as appropriate, to further reduce the display.

---

**DSNV422I**  
**DISPLAY INDOUBT TERMINATED WITH MAX LINES**

**Explanation:** This message indicates the -DISPLAY THREAD TYPE(INDOUBT) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

**System Action:** The truncated report is written to the MVS console.

**Operator Response:** Reissue the -DISPLAY THREAD request specifying a specific connection name.
**DSNV423I** DISPLAY THREAD MESSAGE POOL SIZE EXCEEDED  
**Explanation:** The virtual storage requirement needed to generate a -DISPLAY THREAD response display exceeded the maximum size of the message buffer pool.  
**System Action:** Processing is terminated.  
**User Response:** Reissue the -DISPLAY THREAD request specifying TYPE(INDOUBT), TYPE(ACTIVE), or TYPE(INACTIVE) and a specific connection name, location, luwID, or a combination of these, as appropriate, to further reduce the display.  
**Operator Response:** Refer to the User Response.

**DSNV424I** INACTIVE THREADS-  
**Explanation:** This message precedes the listing of inactive threads.  
The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) when the status of inactive threads is requested.  
The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show idle distributed threads.  
**System Action:** Processing continues normally.

**DSNV425I** DISPLAY INACTIVE REPORT COMPLETE  
**Explanation:** This message follows messages DSNV424I, DSNV403I and DSNV404I, which are augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show idle distributed threads. It indicates that the -DISPLAY THREAD TYPE(INACTIVE) report completed successfully.  
The message number and subsystem recognition character are not included in this message.  
**System Action:** Processing continues normally.

**DSNV426I** csect-name THREAD token HAS BEEN CANCELED  
**Explanation:** This message is issued in response to the CANCEL THREAD command. The thread is scheduled for termination.  
**System Action:** The specified thread is scheduled for termination. The termination of the thread does not occur unless processing is occurring within DB2.

**DSNV427I** csect-name INVALID THREAD token SPECIFIED  
**Explanation:** This message is issued in response to the CANCEL THREAD command. No thread with the specified token was found.  
**System Action:** The specified thread is not canceled.  
**User Response:** Determine the correct token of the thread you want to cancel and reissue the command. You can use the -DISPLAY THREAD command to display all thread activity.

**DSNV428I** csect-name THREAD token WAS PREVIOUSLY CANCELED  
**Explanation:** The thread with the specified token was previously canceled by either the CANCEL THREAD or CANCEL DDF THREAD command, or is already in the process of termination.  
The CANCEL command terminates the thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:  
- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.  
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.  
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. The thread does not terminate until VTAM returns to DB2. VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

**DSNV429I** V429 CALLING PROCEDURE=proc, LOAD MODULE=loadmod, PROC=jclproc, ASID=asid, WLM_ENV=wlmenv  
**Explanation:** This message appears in the output of the DISPLAY THREAD command when a thread is running a stored procedure.  
**proc** The name of the stored procedure the SQL application is running.  
**loadmod** The MVS load module associated with the stored procedure. This field will contain blanks until the load module name has been determined.  
**jclproc** The name of the JCL PROC used to start the address space where the stored procedure is running. This field will contain blanks until the stored procedure has been assigned to a specific stored procedure address space.
**DSNV431I • DSNV436I**

asid  The MVS ASID of the address space where the stored procedure is running. This field will contain 0000 until the stored procedure has been assigned to a specific stored procedure address space.

wlmenv  The name of the WLM application environment where the stored procedure is running. If it is running in the DB2-established stored procedure address space, this field will contain blanks.

**System Action:**  The DISPLAY THREAD command continues processing.

---

**DSNV431I • POSTPONED ABORT THREADS**

**Explanation:**  This message precedes the listing of Postponed Abort URs.

The series of messages DSNV431I, DSNV407I, DSNV408I and DSNV432I provide the formatted report for the -DISPLAY THREAD TYPE(POSTPONED) command. The series also provides a section of the formatted report for -DISPLAY THREAD TYPE(*)

**System Action:**  Processing continues normally.

---

**DSNV432I • DISPLAY POSTPONED ABORT REPORT COMPLETE**

**Explanation:**  This message follows messages DSNV431I and DSNV408I and indicates that the -DISPLAY THREAD TYPE(POSTPONED) report was completed successfully, or that the section of the -DISPLAY THREAD TYPE(*) report for Postponed Abort URs has been completed successfully.

**System Action:**  The command (or auto-resolution processing) completes normally.

---

**DSNV433I • NO POSTPONED ABORT THREADS FOUND FOR NAME = connection name**

**Explanation:**  The -DISPLAY THREAD command found no postponed abort URs for the named connection. This message is generated when the command requests information about threads for the given connection name currently residing within a postponed abort state, but none currently exist within this state.

**System Action:**  Command processing continues.

---

**DSNV434I • csect-name NO POSTPONED ABORT THREADS FOUND**

**Explanation:**  This message is issued by the RECOVER POSTPONED command, automatic online backout processing (invoked by restarting with system parameter LBACKOUT=AUTO), and also by the DISPLAY THREAD TYPE(POSTPONED) command. It indicates that no postponed abort threads were found to process. The 'csect-name' is the name of the command program CSECT that issued the message.

**System Action:**  The command (or auto-resolution processing) completes normally.

---

**DSNV435I • action OF POSTPONED ABORT URS HAS BEEN SCHEDULED**

**Explanation:**  This message is issued by the RECOVER POSTPONED command, and also by automatic online backout processing (invoked by restarting with system parameter LBACKOUT=AUTO). It indicates that postponed abort URs exist and their backout processing will proceed asynchronously.

**ACTION**

Description of request

**RESOLUTION**

Indicates that backout processing for the postponed units of recovery has been requested.

**CANCELLATION**

Indicates that the CANCEL option was specified on the RECOVER POSTPONED command and that the backout process will be canceled.

**System Action:**  The command (or auto-resolution processing) completes normally.

---

**DSNV436I • PGM=collection.package, SEC=section, STMNT=SQL statement**

**Explanation:**  This message appears in the output of a DISPLAY THREAD report when a detail display is specified. If DB2 is currently processing an SQL statement, this message identifies the program which contains that statement and displays the SQL statement being executed.

**collection**

The collection ID associated with package. If the SQL statement being executed is associated with a DBRM that was directly bound as part of the plan, and is not associated with a package, then collection is not applicable and is indicated by an asterisk (*).

**package**

The package or DBRM member.

**section**

The SQL section number associated with the package or DBRM.

**statement**

The SQL statement number associated with the package or DBRM.

The message number and subsystem recognition character are not included in this message. However, V436 is included in the message text to identify the message.
System Action: Command processing continues.

DSNV437I  V437-WORKSTATION=wsname, USERID=user-id, APPLICATION NAME =appl-name

Explanation: This message appears in the output of a DISPLAY THREAD report when a non-detail display is specified. If the appropriate information is provided by the client system, this message is issued and identifies more specific information regarding the identity of the end-user associated with this thread.

wsname
The client end-user workstation name.
If not provided by the client system, this field contains an asterisk.

user-id
The client end-user user-id.
If not provided by the client system, this field contains an asterisk.

appl-name
The client end-user application name.
If not provided by the client system, this field contains an asterisk.

This message number and subsystem recognition character are not included in this message. However, V437 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV439I  csect-name NOBACKOUT OPTION INVALID FOR THREAD 'token'

Explanation: This message is issued in response to the CANCEL THREAD command with the NOBACKOUT option. The NOBACKOUT option will not be honored because the canceled thread is part of a global transaction.

System Action: The specified thread is not canceled.

DSNV440I  V440-XID=xid

Explanation: The thread is managed by an XA transaction manager, such as Websphere, which identifies the transaction with an xid. The XID is provided to allow correlation with the XA transaction manager. DB2 uses both the logical unit of work identifier, luwid, and the XA transaction identifier, xid, to coordinate and recover transactions. DB2 is a participant in an XA transaction that is executing on behalf of an XA transaction manager.

The XID is provided in its hexadecimal representation, and consists of the following elements:

- A 4-byte Format ID.
- A 4-byte Global Transaction Identifier length (gtrid_length).
- A 4-byte Branch Qualifier length (bqual_length).
- Variable-length data that is composed of at most two contiguous components: A Global Transaction Identifier (gtrid), and a Branch Qualifier (bqual). The gtrid_length element specifies the number of bytes (1-64) that constitute gtrid, starting at the first byte of the data element. The bqual-length element specifies the number of bytes (up to 64) that constitute bqual, starting at the first byte after gtrid.

The message number and subsystem recognition character are not included in this message. However, V440 is included in the message to identify the message.

System Action: Command processing continues.

DSNV441I  V441-ACCOUNTING=ACCTNG

Explanation: This message appears in the output of the DISPLAY THREAD report when a detail display is specified. If the appropriate information is provided by the client system, this message is issued and identifies more specific information regarding the identity of the end-user that is associated with this thread.

acctng
The client end-user accounting information. If the appropriate information is provided by the client system, and if DB2 recognizes the client’s format of the information, DB2 will display the user provided portion of the accounting information.

The message number and subsystem recognition character are not included in this message. However, V441 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV443I  V443-PARALLELISM=COORDINATOR=member-name, ORIGINATING TOKEN=token

Explanation: This message follows a DSNV404I message for each parallel task thread that is running on an assisting DB2. This message gives the DB2 member name and the originating task’s thread token.

member-name
The coordinating DB2 member where the originating task thread is running.

token
The originating task thread token.

The message number and subsystem recognition character are not included in this message. However, V443 is included in the message text to identify the message.

System Action: Command processing continues.
DSNV444I  V444-<luwid=token> ACCESSING DATA AT.

Explanation: This message follows a DSNV404I message for each thread that was distributed to other locations when a nondetail display is specified. This message gives the logical-unit-of-work identifier for the distributed thread, followed by an equal sign (=) and a token, which can be used in place of luw-id in any DB2 command that accepts luw-id as input. Message DSNV446I follows with the names of the locations associated with this 'luw-id'.

luwid=token
The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

The message number and subsystem recognition character are not included in this message. However, V444 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV445I  V445-<luwid=token> ACCESSING DATA FOR location

Explanation: This message follows a DSNV404I message for a database access thread. This message displays the logical-unit-of-work identifier assigned to the database access thread.

luwid=token
The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

location
Identifies the requesting site. The value specified in location is one of the following:

- The relational database name of the requester or the VTAM LU name of the requester (<luname>), a colon (:) delimiter, and the LU name of the requester for SNA connections.
- The dotted decimal IP address of the requester (nnn.nnn.nnn.nnn) for TCP/IP connections.

The message number and subsystem recognition character are not included in this message. However, V445 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV446I  V446--location-i location-j ...

Explanation: This message is a continuation of message DSNV444I or message DSNV450I and provides a list of 'location-i'.

location-i
Identifies the name of a remote DBMS at which data is being accessed or where a thread is indoubt.

The location-i string includes two or three tokens delimited by a colon ("":"):

- The first token is the partner location name.
- The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The third token only appears if the second token is an IP address in which case the third token is a port number.

When the message appears after message DSNV450I, the port number represents a resync port number. Otherwise the message appears after a DSNV444I message in which case it represents an SQL port number.

A 'location-i' identifier is repeated for each DBMS where data is being accessed or where a thread is indoubt.

The message number and subsystem recognition character are not included in this message. However, V446 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV447I  V447--LOCATION SESSID A ST TIME

Explanation: This message forms the heading for the listing of distributed active or inactive threads in message DSNV448I. Items in this part of the heading are:

LOCATION
Heading for the associated location names

SESSID
Heading for the associated VTAM-defined session identifiers

A
Heading for the associated active indicators

ST
Heading for the associated status indicators

TIME
Heading for the associated time stamps

See message DSNV448I for descriptions of these items.
The message number and subsystem recognition character are not included in this message. However, V447 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**DSNV448I** V448—location sessid active status time

**Explanation:** This message follows the DSNV447I message for a database access thread or distributed allied thread when a detail display is specified. This message is displayed for each conversation connected to the thread. It lists detailed information about the conversations associated with the thread.

**location**
If displaying an allied thread, the location is the name of the server; otherwise, it is the name of the requester. The name can be any of the following: the relational database name of the partner, the VTAM LU name of the partner (<|luname|>), or the dotted decimal IP address of the partner (nnn.nnn.nnn.nnn).

**sessid**
There are two possible values for this field:
- For VTAM partners, this field contains the VTAM-defined session instance identifier of the session on which the conversation is executing. Zeros if the session identifier is not applicable.
- VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id as presented in this message is not acceptable in VTAM commands. The VTAM DISPLAY NET,ID=db2-luname,SCOPE=ACT command must be used to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the DB2 logical unit. Scan the DISPLAY NET output for the complete SID.
- For TCP/IP connections, this field contains the local DB2 TCP/IP port number, followed by the partner’s TCP/IP port number. The two port numbers are separated by a colon (e.g 5001:28191).

**active**
One of the following:
- V The conversation is active within VTAM or TCP/IP.
- W The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.

Blank, otherwise.

**status**
Status of the conversation.
- This information is presented as two characters, each of which has significance.

**First Character**

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Conversation in allocation.</td>
</tr>
<tr>
<td>C</td>
<td>Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.</td>
</tr>
<tr>
<td>D</td>
<td>Conversation in deallocation.</td>
</tr>
<tr>
<td>R</td>
<td>Receiving</td>
</tr>
<tr>
<td></td>
<td>- At the requesting site, this indicates that the conversation is receiving a response from a request.</td>
</tr>
<tr>
<td></td>
<td>- At the server site, this indicates that the conversation is receiving or waiting for a request.</td>
</tr>
<tr>
<td>S</td>
<td>Sending</td>
</tr>
<tr>
<td></td>
<td>- At the requesting site, this indicates that the conversation can send requests to the server.</td>
</tr>
<tr>
<td></td>
<td>- At the server site, this indicates that the conversation is sending or preparing to send a response.</td>
</tr>
<tr>
<td>X</td>
<td>Exchanging log name information with the partner before conversation allocation to determine if the partner supports protected conversations. If the thread remains in this status for an extended period of time, the DB2 service task that exchanges log names might be busy processing other requests. The DB2 DISPLAY LOCATION command (‘DISPLAY LOCATION(*) DETAIL’) shows you conversation activity for this (RESYNC) service task.</td>
</tr>
<tr>
<td></td>
<td>Blank, otherwise.</td>
</tr>
</tbody>
</table>

**Second Character**

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unprotected conversation using system-directed access is active.</td>
</tr>
<tr>
<td>2</td>
<td>Unprotected conversation using application-directed access is active.</td>
</tr>
<tr>
<td>3</td>
<td>Protected conversation using system-directed access is active.</td>
</tr>
<tr>
<td>4</td>
<td>Protected conversation using application-directed access is active.</td>
</tr>
<tr>
<td></td>
<td>Blank otherwise.</td>
</tr>
</tbody>
</table>

**time**
The time stamp (yydddhhmmssth) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, V448 is included in the message text to identify the message.

**System Action:** Command processing continues
DSNV449I  V449-HAS NID=nid AND ID=correlation-id

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report.

nid The network-id assigned by IMS or CICS or, if the connection type is RRS/ASF, the RRS unit of recovery ID (URID)

The message number and subsystem recognition character are not included in this message. However, V449 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNV450I  V450-HAS PARTICIPANT INDOUBT AT LOCATION location

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. This message is followed by one or more DSNV446I messages that name the ‘locations’ where indoubt participant threads are located. The ‘luuid’ of the indoubt thread is displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V450 is included in the message text to identify the message.

System Action: The thread remains indoubt and processing continues normally.

Operator Response: See message DSNL402E for more information.

DSNV451I  V451-RESYNC WITH COORDINATOR STILL PENDING

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. When an indoubt thread is manually resolved with the RECOVER INDUBT command, this message is included in the report if indoubt resolution with the coordinator was not complete. The ‘coordinator’ and the ‘luuid’ of the indoubt thread are displayed in the previous DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V451 is included in the message text to identify the message.

System Action: The thread remains indoubt and processing continues normally.

DSNV452I  V452-HEURISTIC COMMIT BY PARTICIPANT AT LOCATION location

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force the indoubt thread to commit without waiting for automatic resynchronization to be performed. The ‘luuid’ of the thread is displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V452 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL402E for more information.

DSNV453I  V453-HEURISTIC ABORT BY PARTICIPANT AT LOCATION location

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force an indoubt thread to abort without waiting for automatic resynchronization to be performed. The ‘luuid’ of the thread that was forced to abort is displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V453 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL403E for more information.
**DSNV454I**  
LOCATION OR LUWID KEYWORD INVALID WHEN DDF NOT STARTED

**Explanation:** The -DISPLAY THREAD TYPE( ACTIVE) command was issued with the keyword LOCATION or LUWID and it was found that the distributed data facility (DDF) was not started. The LOCATION or LUWID keyword can be used only if DDF is in operation.

**System Action:** Command processing is complete.

**DSNV456I**  
INVALID PARAMETER WITH LUWID KEYWORD luwid-parameter

**Explanation:** The -DISPLAY THREAD TYPE( ACTIVE), -DISPLAY THREAD TYPE(INACTIVE), or the -RECOVER INDOUBT command was issued with the keyword LUWID and its required parameter list. However, one of the parameters was syntactically invalid as a logical-unit-of-work identifier.

**System Action:** Command processing is complete.

**Operator Response:** The syntax of the DISPLAY THREAD and RECOVER INDOUBT commands is described in [DB2 Command Reference](#). Reenter the command specifying valid LUWID values.

**DSNV457I**  
V457-RESYNC PROTOCOL ERROR WITH PARTICIPANT location

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at the participant location might be required. A protocol error was detected during attempted automatic indoubt resolution with the participant. The 'luwid' of the thread that might require manual resolution at the participant is displayed in the preceding DSNV408I message.

**location**

The 'location' where manual resolution might be needed. The 'location' is either the relational database name (location-name) of the participant or the logical unit name (<luname>) of the participant.

The message number and subsystem recognition character are not included in this message. However, V457 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL414E for more information.

**DSNV458I**  
V458-CONNECTION-NAME connection-name CORRELATION-ID correlation-id

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. It is displayed only if message DSNV463I is also displayed.

**connection-name**

The connection-name assigned by the coordinator if the coordinator is another DB2 system. The constant SERVER if the coordinator is not a DB2 system.

**correlation-id**

The correlation-id assigned by the coordinator if the coordinator is another DB2 system. The first 12 characters of the EXTNAME parameter of the EXCSAT command sent by the coordinator if the coordinator is not a DB2 system.

The message number and subsystem recognition character are not included in this message. However, V458 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNV463I for more information.

**DSNV459I**  
V459-SYNCPART PROTOCOL ERROR WITH COORDINATOR

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. A protocol error was detected during sync point processing with the coordinator. The ' coordinator' and the 'luwid' of the thread that requires manual resolution are both displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V459 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL412I for more information.

**DSNV460I**  
V460-SYNCPART PROTOCOL ERROR WITH PARTICIPANT location

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at the participant location might be required. A protocol error was detected during sync point processing with the participant. The 'luwid' of the thread...
that might require manual resolution at the participant is displayed in the preceding DSNV408I message.

**location**

The 'location' where manual resolution might be needed. The 'location' is either the relational database name (location-name) of the participant or the logical unit name (<luname>) of the participant.

The message number and subsystem recognition character are not included in this message. However, V460 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL413I for more information.

---

**DSNV461I V461-RESYNC WITH COORDINATOR SHOWS HEURISTIC DAMAGE**

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Indoubt resolution with the coordinator completed. Heuristic damage was detected at this location because the heuristic decision made at this location is different than the decision made at the coordinator. The 'coordinator' and the 'luwid' of the thread are displayed in the previous DSNV408I message. The 'status' field in the previous DSNV408I message shows the heuristic decision made at this location. This message continues to appear until it is deleted with a RESET INDOUBT command.

The message number and subsystem recognition character are not included in this message. However, V461 is included in the message text to identify the message.

**System Action:** The thread remains indoubt and processing continues normally.

**Operator Response:** See message DSNL400E and DSNL401E for more information.

---

**DSNV462I V462-COLD START BY PARTICIPANT AT LOCATION location**

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. There was an indoubt thread at the participant whose 'luwid' is displayed in the preceding DSNV408I message. DB2 has coordinator responsibility for the indoubt thread and the participant informed DB2 that it performed a cold start operation and lost all knowledge of indoubt threads. There might be heuristic damage at the participant. The RESET INDOUBT command must be used to purge this message from the indoubt report. The reason for this is that the cold-starting participant might have been coordinating downstream participants that are now indoubt. The database administrator at these participants might need to know the status of the thread at the coordinator, so that correct heuristic decisions can be made.

**location**

The 'location' where the cold start was performed. The 'location' is either the relational database name (location-name), the logical unit name (<luname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.

The message number and subsystem recognition character are not included in this message. However, V462 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL420E for more information.

---

**DSNV463I V463-COORDINATOR HAS COLD STARTED**

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. The coordinator for a thread that is indoubt at DB2 was cold started and therefore lost all knowledge of indoubt threads. The 'coordinator' and the 'luwid' of the thread for which manual resolution is required are displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V463 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL411I for more information.

---

**DSNV464I V464-RESYNC PROTOCOL ERROR WITH COORDINATOR**

**Explanation:** This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. A protocol error was detected during attempted automatic indoubt resolution with the coordinator. The 'coordinator' and the 'luwid' of the thread that requires manual resolution are both displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V464 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**Operator Response:** See message DSNL404E for more information.
**DSNV465I**  V465-THREAD HAS REMAINED IN A PREPARED STATE FOR hh:mm:ss

**Explanation:** This message might be displayed with a DISPLAY THREAD TYPE (ACTIVE) report. The thread was 'prepared' for the specified period of time. This means that DB2 is the participant in the logical unit of work and completed the first phase of commit and is waiting for the commit or abort decision to be transmitted from the coordinator for the specified period of time. The thread is identified in the preceding DSNV404I message. This message does not appear in a report until the thread was in the prepared state for 60 seconds.

**hh:mm:ss** The length of time the thread was prepared (expressed in hours, minutes and seconds). The maximum number of hours reported is 65535, which is roughly 7.5 years. After this time period elapses, the count is reset to zero.

The following actions might be taken to resolve this thread by manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.

- Use the -CANCEL DDF THREAD command to force the thread from the prepared state to the indoubt state. When the thread is indoubt, it appears in the display generated by issuing the DISPLAY THREAD command for type indoubt threads.
- Determine the proper decision (commit or abort) by contacting the coordinator 'location' shown in the display of indoubt threads.
- Use the RECOVER INDOUBT command to heuristically commit or abort the thread.

The message number and subsystem recognition character are not included in this message. However, V466 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**DSNV467I**  V467-HAS LUID luwid=token

**Explanation:** This message is a detail line, which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report.

**luwid-token** The global logical unit of work id and the local token that identifies the thread.

The message number and subsystem recognition character are not included in this message. However, V467 is included in the message text to identify the message.

**System Action:** Processing continues normally.

**DSNV471I**  V471-luwid=token

**Explanation:** This message follows a DSNV404I message and indicates the agent is currently not associated with a remote location. The agent is available to be assigned to process;

- the completion of a queued receive request on a type 2 inactive thread, or
- a request that a new connection be established, after MAX REMOTE ACTIVE has been reached.

This message displays the logical-unit-of-work identifier assigned to the agent.

**luwid-token** The global logical unit of work id and the local token that identifies the agent.

The message number and subsystem recognition character are not included in this message. However, V471 is included in the message text to identify the message.
This message is issued by the following CSECT:
DSNVDTM

**System Action:** Command processing continues.

---

**DSNV473I**  
**ACTIVE THREADS FOUND FOR MEMBER:** memname-

**Explanation:** This message precedes the listing of active threads found on another member of a data sharing group as the result of the SCOPE(GROUP) keyword.

Message DSNV473I and the series of messages DSNV403I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) SCOPE(GROUP) when the status of active threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) SCOPE(GROUP) when LOCATION, LUWID, or DETAIL keywords are used to show distributed activity.

*memname*  
Member name for which thread information is being displayed.

**System Action:** Processing continues normally.

---

**DSNV474I**  
**INDOUBT THREADS FOUND FOR MEMBER:** memname-

**Explanation:** This message precedes the listing of indoubt threads found on member *memname* as the result of the SCOPE(GROUP) keyword.

Messages DSNV474I, DSNV403I, DSNV404I and DSNV409I provide the formatted report for the -DISPLAY THREAD TYPE(INDOUBT) SCOPE(GROUP) command when the status of indoubt threads is requested.

*memname*  
Member name for which thread information is being displayed.

**System Action:** Processing continues normally.

---

**DSNV475I**  
**INACTIVE THREADS FOUND FOR MEMBER:** memname-

**Explanation:** This message precedes the listing of inactive threads found on member *memname* as the result of SCOPE(GROUP) keyword.

Messages DSNV475I, DSNV403I, DSNV404I and DSNV425I provide the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) SCOPE(GROUP) when the status of inactive threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) SCOPE(GROUP) when LOCATION, LUWID, or DETAIL keywords are used to show idle distributed threads.

*memname*  
Member name for which thread information is being displayed.

**System Action:** Processing continues normally.

---

**DSNV476I**  
**POSTPONED ABORT THREADS FOUND FOR MEMBER:** memname

**Explanation:** This message precedes the listing of Postponed Abort units of recovery found on another member of a data sharing group as the result of the SCOPE(GROUP) keyword.

Messages DSNV476I, DSNV403I, DSNV404I and DSNV432I provide the formatted report for the -DISPLAY THREAD TYPE(POSTPONED) SCOPE(GROUP) command.

*memname*  
Member name for which thread information is being displayed.

**System Action:** Processing continues normally.

---

**DSNV478I**  
**SCOPE(GROUP) DISPLAY TERMINATED DUE TO IRLM TRUNCATION**

**Explanation:** This message displays as a result of the -DISPLAY THREAD command when the SCOPE(GROUP) keyword is specified and IRLM has truncated the responses gathered from other members. This is a DB2 internal error.

**System Action:** The -DISPLAY THREAD report is terminated and processing abnormally terminates.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

---

**DSNV479I**  
**SCOPE(GROUP) DATA UNAVAILABLE**

IRLM RETURN CODE: *retcode*  
REASON DATA: *reason*

**Explanation:** This message displays as a result of the -DISPLAY THREAD command when the SCOPE(GROUP) keyword is specified and the IRLM NOTIFY to other members has returned a bad return code.

*retcode*  
Return code from IRLM on the Notify request.

*reason*  
Reason code diagnostic information from IRLM on the Notify request.
**DSNV480I**  V480-DB2 IS PARTICIPANT FOR RRS  
**URID=rrs-urid**

**Explanation:** This message is a detail line that could be displayed with a DISPLAY THREAD TYPE(ACTIVE) report when the Recoverable Resource Services Unit of Recovery ID (RRS URID) keyword is specified on the command. The RRS URID=rrs-urid identifies the RRS URID of the RRS Unit of Recovery that this thread is a participant in.

The message number and subsystem recognition character are not included in this message. However, V480 is included in the message text to identify the message.

**System Action:** Command processing continues normally.

---

**DSNV481I**  V481-DB2 IS COORDINATOR FOR RRS  
**URID=rrs-urid**

**Explanation:** This message is a detail line that could be displayed with a DISPLAY THREAD TYPE(ACTIVE) report when the Recoverable Resource Services Unit of Recovery ID (RRS URID) keyword is specified on the command. The RRS URID=rrs-urid identifies the RRS URID of the RRS Unit of Recovery that this thread is a coordinator for.

This message is a detail line that also could be displayed with a DISPLAY TYPE(INDOUBT) report when the RRSURID keyword is specified on the command. The RRS URID=rrs-urid identifies the RRS URID of the RRS Unit of Recovery that this thread is a coordinator for. When this message appears in an INDOUBT thread report, the preceding DSNV408I message tells the status of the DB2 Unit of Recovery that contains the RRS Unit of Recovery. If manual recovery of the RRS Unit of Recovery is required, the outcome of the DB2 Unit of Recovery can determine whether to COMMIT or ROLLBACK the RRS Unit of Recovery.

The message number and subsystem recognition character are not included in this message. However, V481 is included in the message text to identify the message.

**System Action:** Command processing continues normally.
Chapter 21. DSNW... messages

**DSNW001I** ASYNCHRONOUSLY GATHERED DATA IS BEING FORMATTED IN THIS DUMP

**Explanation:** The subsystem formatting exit is not using DB2 summary dump records for formatting. The formatted control blocks may not contain the same values as they did at the time of the error.

**System Action:** Dump formatting continues.

**System Programmer Response:** If you want DB2 summary dump records to be used, do not specify the 'SUMDUMP=NO' operand on the dump control statement.

**DSNW002I** SUMMARY DUMP RECORDS ARE BEING FORMATTED IN THIS DUMP

**Explanation:** The subsystem formatting exit is using DB2 summary dump record information to format its control blocks.

**System Action:** Dump formatting continues.

**System Programmer Response:** If you do not want DB2 summary dump records to be used in formatting, specify the 'SUMDUMP=NO' and 'SUBSYS=subsystem name' on the dump control statement. Both operands are required.

**DSNW004I** ONE OR MORE INVALID OPERANDS WERE FOUND ON THE DSNWDMP CONTROL CARD. SUBSYSTEM FORMATTING TERMINATED

**Explanation:** An invalid operand was found on the dump control statement. The operand was not 'SG', 'LG', 'SA', 'AA', or 'ALL'.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** Correct the dump control statement operand specified by message DSNW007I.

**DSNW005I** DUMP FORMATTER WORK BUFFER (DSNWDDBUF) CANNOT BE LOCATED

**Explanation:** The subsystem formatting exit could not locate its work buffer.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** Increase the region size.

**DSNW006I** THE ERLY BLOCK CANNOT BE ACCESSED OR IT IS INVALID

**Explanation:** The subsystem formatting exit could not locate its anchor block.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** Specify 'SUBSYS=subsystem name', 'SUMDUMP=NO' on the dump control statement. The subsystem name should have between 1 and 4 characters.

**DSNW007I** THE FOLLOWING OPERAND SPECIFIED ON THE DSNWDMP CONTROL CARD IS INVALID: xxxx

**Explanation:** The specified operand was not one of the valid dump control statement operands.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** Check the dump control statement operands.

**DSNW008I** THE SCOM CANNOT BE ACCESSED OR IT IS INVALID

**Explanation:** An error was encountered while trying to retrieve the SCOM.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand, and resubmit the job. Otherwise, specify this operand on the dump control statement, and resubmit the job.

**DSNW009I** THE ADDRESS SPACE REQUESTED IS NOT AVAILABLE

**Explanation:** The DB2 control blocks for the address space specified on the 'SA=asid' dump operand could not be located.

**System Action:** Formatting continues if other dump operands were specified.

**System Programmer Response:** Check the ASID specified on the 'SA=' dump operand. The ASID must be specified in hexadecimal.

**DSNW010I** THE TRACE RMFT CANNOT BE ACCESSED OR IT IS INVALID

**Explanation:** The DB2 trace table could not be located.
**DSNW011I**  
**System Action:** Formatting of the DB2 trace table is bypassed, and formatting continues of any other requested dump segment.

**System Programmer Response:** If ‘SUMDUMP=NO’ was specified on the dump control statement, omit this operand. Otherwise, specify this operand on the dump control statement. In either case, resubmit the job.

---

**DSNW011I**  
**Explanation:** A larger region size is required for this job.

**System Action:** Subsystem formatting continues.

**System Programmer Response:** Rerun the job, specifying a larger region size in the JCL.

---

**DSNW013I**  
**Explanation:** The subsystem formatting exit was unable to locate the DMPW control block in the summary record portion of the dump data set. Because the DMPW provides the main anchor block for the dump formatter, processing is terminated.

**System Action:** Control returns to AMDPRDMP or IPCS to terminate the exit.

**System Programmer Response:** If this is not a DB2 dump data set, specify ‘SUBSYS=xxx,SUMDUMP=NO’ on the dump control statement (where xxx is the 1- to 4-character subsystem name), so that the subsystem formatting exit does not attempt to use summary dump data.

---

**DSNW014I**  
**Explanation:** Expected data could not be found in the summary dump. This message is issued for information only. Dump formatting continues. However, it will take longer, because a greater volume of data COMMAND PQUIT must be analyzed.

**System Action:** Dump formatting is attempted using the full dump instead of the summary dump.

**System Programmer Response:** Though processing continues, this message is an indication of a problem, and should be pursued as such.

---

**DSNW015I**  
**Explanation:** In a search through the SSCVT chain, a match of the subsystem name in the SSCVTs and the subsystem name on the control statement was not found.

**System Action:** Formatting for the named subsystem is not done.

**Operator Response:** Check the ‘SUBSYS=’ operand on the control statement.

**System Programmer Response:** Correctly specify the subsystem name on the control statement.

---

**DSNW016I**  
**Explanation:** The RMVT cannot be accessed or it is invalid.

**System Action:** Formatting of the DB2 trace table is bypassed, and formatting of other requested dump segments continues.

**System Programmer Response:** If ‘SUMDUMP=NO’ was specified on the dump control statement, omit this operand. Otherwise, try specifying this operand on the dump control statement. In either case, resubmit the job.

---

**DSNW017I**  
**Explanation:** This condition is usually caused by the DB2 control block formatter looping. The stack array is depleted and can no longer accommodate control blocks.

**System Action:** Dump formatting is terminated.

**System Programmer Response:** Examine the control block chains to see if they are looping. If those chains are not looping, increase the dimension of the stack array.

---

**DSNW018I**  
**Explanation:** The ‘SUMDUMP=NO’ option was specified, but either the ‘SUBSYS=’ option was missing, or it was incorrectly specified.

**System Action:** Dump formatting is terminated.

**Operator Response:** Run the dump printing job after the error has been corrected.

---

**DSNW020I**  
**Explanation:** The ‘ERLY’ control block could not be located in the dump.

**System Action:** Dump formatting is terminated.
Operator Response: Check that the 'SUBSYS=' operand was correctly specified, and rerun the job.

System Programmer Response: This message can mean that the 'ERLY' control block has been overlaid. Examine the full dump to determine whether the subsystem is present. If it is, you may be able to determine why the control block could not be located.

**DSNW022I** THE RESIDENT TRACE WAS NOT ACTIVE AT THE TIME OF DUMP

Explanation: Trace table formatting has been attempted, but no trace table existed at the time of the dump.

System Action: Dump formatting continues with any other control blocks that were to be formatted.

**DSNW023I** THE TRACE TABLE ENTRY IS OUT OF SEQUENCE OR OVERLAID

Explanation: A trace entry is overlaid by another trace entry of a different timestamp. This message is issued to flag an unrecognized trace entry. This can occur when the oldest entry in the table is the second half of a double entry.

System Action: Formatting of the trace table continues.

**DSNW024I** TRACE TABLE

Explanation: The trace table follows.

System Action: Trace table formatting follows.

**DSNW025I** DUMP ACCESS ERROR ACCESSING THE TRACE TABLE IN THE DUMP

Explanation: A nonzero return code was returned from the storage access routine when accessing the trace table.

System Action: Trace table formatting is bypassed.

System Programmer Response: Check the address and ASID of the trace table.

**DSNW026I** CONTROL BLOCK SUMMARY (ALL ADDRESS SPACES)

**DSNW027I** CONTROL BLOCK SUMMARY (SINGLE ADDRESS SPACE)

**DSNW028I** CONTROL BLOCK SUMMARY (LONG FORM GLOBAL)

**DSNW029I** CONTROL BLOCK SUMMARY (SHORT FORM GLOBAL)

Explanation: Messages DSNW026I through DSNW029I provide descriptive information regarding the type of formatting being produced.

System Action: Dump formatting continues.

**DSNW030I** DUMP ACCESS ERROR ACCESSING THE CONTROL BLOCK STRUCTURE TABLE IN THE DUMP

Explanation: The control block structure table cannot be accessed from the dump.

System Action: Control block formatting is terminated.

Operator Response: Notify the system programmer.

**DSNW031I** DUMP ACCESS ERROR ACCESSING ANCHOR CONTROL BLOCK

Explanation: The anchor control block cannot be accessed from the dump.

System Action: Control block formatting is terminated.

Operator Response: Notify the system programmer.

**DSNW032I** BEGINNING FORMATTING

Explanation: Formatting of DB2 control blocks is beginning.

**DSNW033I** TRACE TABLE AND GLOBAL BLOCKS ALREADY DUMPED

Explanation: An indicative dump is being requested. The DB2 trace table and the global blocks have already been dumped with first dump (full dump) for this abend dump (SNAP) invocation. These are, therefore, not dumped in the dump for this task.

**DSNW034I** WARNING – NO TASK RELATED CONTROL BLOCKS FOR THIS TASK

Explanation: The TCB for which the dump is being requested is not IDENTIFIED to DB2. Task-related control blocks are not dumped. The DB2 trace table and global blocks are dumped only if the 'SYSABEND' DD statement is present and only if this is the first of the dump(s) (full dump) for this abend dump (SNAP) invocation.
System Action: No DB2 formatting is done for the specified task.

**DSNW036I**  CONTROL BLOCKS FOR TASKS ASSOCIATED WITH THE ABOVE RECOVERY COORDINATOR TASK

Explanation: The formatted blocks following this message are associated with TCBS that have IDENTIFIED to DB2 with the 'recovery coordinator = no' option. These TCBS may not have invoked SNAP, but they are associated with the TCB that did.

System Action: Related control blocks are dumped.

System Programmer Response: Examine the control blocks for relevant information.

**DSNW037I**  TASK RELATED CONTROL BLOCKS FOR THIS TASK

Explanation: The formatted blocks following this message are associated with the TCB that is being dumped.

System Action: Relevant control blocks are dumped.

System Programmer Response: Examine the control blocks for relevant information.

**DSNW038I**  END OF Formatting

Explanation: Formatting of DB2 control blocks is completed.

**DSNW039I**  SUBSYSTEM Formatting COMPLETE FOR THIS DUMP

Explanation: The subsystem formatting routine has completed its processing for this dump data set.

**DSNW040I**  'VVV'CONTROL BLOCK FORMATTER ERROR FLAGS

- X'80': FIELD EXPECTED TO BE ZERO IS NONZERO
- X'40': LAST BLOCK IN CHAIN DOES NOT POINT BACK TO PARENT BLOCK
- X'20': BLOCK NOT FOUND IN DUMP
- X'10': BLOCK LENGTH INCORRECT
- X'08': VERIFICATION CODE INCORRECT
- X'04': BLOCK CHAINED FROM THIS BLOCK NOT FOUND IN DUMP
- X'02': BLOCK CHAINED FROM THIS BLOCK HAS WRONG VERIFICATION CODE
- X'01': VALIDATION CONSTANT DOES NOT MATCH EXPECTED VALUE

Explanation: The message DSNW040I appears at the beginning of a formatted dump. It defines the hexadecimal values associated with the 'VVV=XX' keyword. This keyword is provided on the title line of each control block selected for formatting. It indicates any unusual conditions encountered during the validation and format processing of the current control block structure.

System Action: Dump formatting continues.

System Programmer Response: All nonzero 'XX' values should be examined. If an error is indicated, the printout of the dump should be used for the problem documentation.

Problem Determination: Possible errors include:
- X'80'
- X'40'
- X'20'
- X'04'

The current state of the individual control block structures at the time of error might vary with the type of error involved. Examine control block structures with one of these 'XX' values based on the specific ABEND code.

Example: A X'04' associated with the referencing control block and the X'20' associated with the referenced control block may mean the ABEND occurred between the release of the referenced control block and re-initialization of the address within the referencing one.

DB2 validation errors include:
- X'10'
- X'08'
- X'02'
- X'01'

These values indicate that a validation error occurred while formatting the associated control block.

For example, an X'08' associated with the referenced control block indicates the storage area has been overlaid or the address in the referencing control block is incorrect. Subsequent examination of the values in this control block is not reliable.

**DSNW041I**  THE TAB CANNOT BE ACCESSED OR IT IS INVALID

Explanation: The DB2 trace table anchor block could not be located.

System Action: Formatting of the DB2 trace table is bypassed, and formatting of any other requested dump segment continues.

System Programmer Response: If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand. Otherwise, specify this operand on the dump control statement. In either case, resubmit the job.
If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSNW049I OLDEST SLOT ADDRESS INVALID, FORMATTING TRACE TABLE FROM FIRST ENTRY

Explanation: The next trace entry location is invalid.

System Action: Dump formatting continues.

System Programmer Response: The printout of the dump should be used for the problem documentation.

Problem Determination: The Trace Anchor Block has been initialized incorrectly, or overlaid during execution.

DSNW050I ssid.NO SDWA/LOGREC, ABND=comp-reason,U=user-id, M=module,C=XYR00.vrm.comp-function

Explanation: This message provides the default SVC dump title (SDUMP) associated with the SYS1.DUMP data set when an SDWA was unavailable during recovery processing. The variable fields are:

ssid 4-character DB2 subsystem name

comp-reason Abend completion code, followed by the abend reason code.

user-id Authorization-ID for the individual subsystem user.

module Functional recovery routine responsible for the dump.

vrm.comp-function Component-ID, as follows:

vrm DB2 version, release number, and modification level.

comp-function Component-ID function.

System Action: Dump processing continues.

System Programmer Response: Since the SDWA provides important diagnostic information to assist in problem determination, examine the recovery environment at time of error to determine why an SDWA was not provided for this abend.

In a nonrecovery environment, there may be valid reasons for the lack of an SDWA.

Problem Determination: In a recovery environment, functional recovery routines (FRRs) are guaranteed an SDWA by Recovery Termination Manager (RTM). Therefore, the recovery routine is most likely an ESTAE recovery routine. The primary reason for an SDWA not being provided to an ESTAE routine is insufficient storage available during recovery processing. Examine the region sizes allocated to the failing function to ensure that sufficient storage is available.

In a nonrecovery environment, no SDWA is provided because only RTM can create one.

DSNW051I ERROR DURING DUMP PROCESSING

Explanation: This message is generated by the ‘SDUMP dump data gathering service’ recovery routine when an error is encountered during dump processing.

System Programmer Response: This error is documented in a SYS1.LOGREC record. This message can be issued because of an error in the invocation of SDUMP, or because of an error in SDUMP itself, or during control block examination and access.

System Action: Processing of the ‘SULSTLA’ user storage areas is terminated, an SVC dump is requested, and control is returned to RTM.

DSNW052I ERROR ENCOUNTERED DURING LOAD OR VALIDATION OF A CONTROL BLOCK STRUCTURE TABLE MODULE

Explanation: The DB2 dump formatting facility cannot be used to format control blocks. An error occurred during the DB2 startup process while attempting to LOAD one of the Control Block Structures Table (CBDS) modules from the DB2 subsystem program library.

System Action: Subsystem startup processing continues.

Operator Response: If intervention is desired, notify the system programmer.

System Programmer Response: If intervention is desired, the DB2 subsystem can be terminated by either an MVS CANCEL command or a -STOP DB2 command. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The modules must reside in a DB2 program library named on the execution procedure used to start a DB2 subsystem address space.

The named modules prohibit the use of the DB2 dump formatting facility to format SVC dumps that occur during the current execution cycle of the DB2 subsystem. The named modules are not required for DB2 execution.

DSNW053I VRA DIAGNOSTIC INFORMATION REPORT

Explanation: All DB2 diagnostic information in the Variable Recording Area (VRA) at the time of the error
is extracted and displayed in this report.

The address of the SDWA, the contents of SDWARA, and SDWARA's hexadecimal offset into SDWA are also displayed. Individual diagnostic entries are identified by a hexadecimal VRA 'key', followed by the length of the subsequent data. Data fields are displayed in hexadecimal and EBCDIC formats. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

**System Action:** Dump format processing continues.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

---

**DSNW054I**

**NO VRA DATARecordED IN SDWA**

**Explanation:** The SDWA obtained from the SYS1.DUMP data set contained no diagnostic information in the VRA.

**System Action:** VRA report generation is bypassed, dump format processing continues.

**System Programmer Response:** If an error is indicated, the printout of the dump should be used for the problem documentation. If VRA data is needed, the abending DB2 subcomponent has failed to supply it. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

---

**DSNW055I**

**FORMAT ROUTINE UNABLE TO LOCATE SDWA**

**Explanation:** The MVS Summary Dump Data Access Service Routine (IEAVTFRD) was unable to locate the SDWA in the summary data portion of the SYS1.DUMP data set.

**System Action:** VRA report generation is terminated and dump format processing continues.

**System Programmer Response:** Take the appropriate action, as indicated in the next section. If an error is indicated, use the printout of the dump for problem documentation.

**Problem Determination:** The SDWA is placed in the summary data portion of the SYS1.DUMP data set by AMDPRDMP or IPCS. It indicates either CSA or Local Storage Residency.

If the SDWA is not in the dump data set, no error is indicated.

---

**DSNW056I**

**VRA DIAGNOSTIC REPORT COMPLETE**

**Explanation:** The VRA Diagnostic Report is done.

**System Action:** Dump format processing continues.

---

**DSNW060I**

**BEGIN SAVE AREA TRACE**

**Explanation:** This message identifies the start of the DB2 register Save Area Trace report which appears in the formatted section of a DB2 SVC Dump. The save areas for the current failing agent execution block (EB), and all associated Agent EBs, are traced from the point of error and displayed in order of invocation.

The format of this report is as follows:

**Save Area Identification**

The address and contents of each save area is displayed and identified by the invoking module.

<table>
<thead>
<tr>
<th>Module-name</th>
<th>Service-level-identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>SA</td>
<td>WD1, HSA, LSA</td>
</tr>
<tr>
<td>RET</td>
<td>EPA, R0</td>
</tr>
<tr>
<td>R1</td>
<td>R2, R3</td>
</tr>
<tr>
<td>R4</td>
<td>R5, R6</td>
</tr>
<tr>
<td>R7</td>
<td>R8, R9</td>
</tr>
<tr>
<td>R10</td>
<td>R11, R12</td>
</tr>
</tbody>
</table>

**Module-name**

Identifies the module responsible for obtaining the save area as indicated in the DB2 module entry point list (MEPL) at the time of the error.

If the MEPL does not contain an entry that corresponds to the module entry point address (EPA), this field is set to:

**MODULE INFORMATION UNAVAILABLE**

**Service-level-identifier**

The service level information associated with the module name is obtained from the corresponding module MEPL entry, and consists of the compilation-date and the PTF number of the latest maintenance applied.

If no maintenance has been applied for this module, this field defaults to the Function Modification Identifier (FMID).

**SA**

Identifies the address and contents of each word of the save area and is displayed using the format and register abbreviation conventions defined by MVS SNAP. All save area data references indicate the primary address space at the time of execution.

**Execution Environment**

Displays the current execution environment at the time of error for the save areas that follow. This information is repeated each time the current Agent execution EB changed during processing.
CURRENT EB=address JOBNAME=name
HASID=hasid PASID=pasid
EXECUTION MODE=mode

address  
Address of the associated Agent EB.

name  
The 8-character MVS jobname associated with the home address space.

hasid  
Home address space identifier.

pasid  
Primary address space identifier.

mode  
Agent EB MVS execution mode:
TCB    Task Control Mode
SRB    Supervisory Request Mode

Register Save Area Contents for Agent EBs

The contents of the register save area chains for the current failing Agent EB, and all suspended Agent EBs at the time of error, are displayed using the save area (SA) format.

REGISTERS IN (CB-name) AT TIME OF execution-status

CB-name  
Identifies the name of the control block from which the registers for the current Agent EB were obtained:
SDWA    MVS System Diagnostic Workarea (Failure).
TCB     MVS Task Control Block (Suspend).
STSV    MVS SRB Status Save Area (Suspend).

execution-status  
Indicates the current execution status of the Agent EB at the time of error:
Failure  Failing execution EB.
Suspend  Suspended execution EB.

Change of Primary Address Space

Since all register data references refer to the primary address space associated with the currently active execution EB, the following information is displayed each time the primary address changed during execution:

CHANGE OF ADDRESS SPACE, NEW PASID=pasid

pasid  Indicates the new primary address space identifier associated with the save areas that follow.

System Action:  save area trace format processing continues for the failing agent EB, and all associated agent EBs.

System Programmer Response:  See the Problem Determination section.

Problem Determination:  This report may be used to determine the register contents, module invocation sequence, and execution environments leading up to the point of error.

DSNW061I  SAVE AREA TRACE COMPLETE

Explanation:  This message indicates that the DB2 formatted save area trace report (DSNW060I) is complete.

System Action:  Dump format processing continues.

DSNW062I  R6 (R6-contents) DOES NOT CONTAIN A VALID EB ADDRESS

Explanation:  During dump format processing of the DB2 formatted Save Area Trace report (DSNW060I), register 6 (R6) did not contain the address of a valid Agent execution block (EB).

R6-contents:  The contents of register 6.

System Action:  save area trace format processing is terminated for the current Agent EB, and all prior EBs.

System Programmer Response:  The dump formatter expects the contents of register 6 to contain the address of a valid EB.

Problem Determination:  Register 6 does not contain the current EB address or a prior EB address.

Refer to the abend reason and completion codes associated with the original error to determine the use of register 6 prior to the failure.

DSNW063I  name (address) ASID (asid) NOT FOUND IN DUMP

Explanation:  During dump formatter processing of the save area trace report (DSNW060I), a control block or save area was not found in the dump data set.

Since the dump formatter utilizes the DB2 and MVS control blocks defined under the 'name' field of this message to locate individual register save areas, subsequent save areas located via the 'named' control block or save area will not be displayed in the report.

name  Identifies the name of the control block or save area that was not found in the dump data set:
SA     Indicates a Save Area
ASCE   DB2 Address Space Control Element
EB     DB2 Execution Block
TCB    MVS Task Control Block
RB     MVS Request Block
XSB    MVS Extended Status Block
PSA    MVS Prefix Save Area
SDWA   MVS System Diagnostic Work Area
STSV   MVS SRB Status Save Area
STKE   MVS Cross Memory Stack Element
DSNW108I • DSNW123I

address
The address of the 'named' control block or save area.

asid
The address space identifier associated with the control block or save area.

System Action: Register save area trace format processing for the current save area chains is terminated. Subsequent save area processing will vary depending on the specific control block or save area that was available, and the DB2 Agent execution environments at the time of the error.

System Programmer Response: Due to the execution structures and environmental restrictions of selected DB2 and MVS control structures, some control blocks and save areas associated with these execution environments will not be included in the dump data set.

Problem Determination: During MVS/RTM recovery processing, IFC Dump Services attempts to include all control blocks (both DB2 and MVS), and the pertinent DB2 save areas in the dump data set, regardless of the type of error. Control blocks and save areas associated with the following address spaces at time of error will be included in the dump data set:
- Primary, Secondary, and Home address spaces.
- DB2 System Services and Database Services address spaces.

DSNW108I UNABLE TO AUTOMATICALLY START type TRACE

Explanation: System parameters indicated that a DB2 trace should be started automatically during DB2 subsystem initialization, but the DB2 subsystem was unable to start the trace. A nonzero return code was received from the -START TRACE command.

System Action: Subsystem initialization continues.

Operator Response: Start the trace via the -START TRACE command after DB2 subsystem initialization is complete.

DSNW109I TRACE INITIALIZATION PARAMETERS UNAVAILABLE, DEFAULTS ASSUMED

Explanation: The trace function was unable to access the trace initialization parameters defined by the DSN6SYSP macro. Default values as defined by that macro are assumed for trace parameters.

System Action: Subsystem initialization continues.

Operator Response: Determine if the system parameters module DSNZPARM is missing or inaccessible. If not, determine if the CSECT DSN6SYSP is missing. Trace can be started with the -START TRACE command.

DSNW120I A SPECIFIED keyword VALUE IS INVALID FOR type TRACE

Explanation: A trace command has been entered, but a specified keyword value is not valid for the trace type requested.

System Action: Processing for the TRACE command is terminated.

Operator Response: If a -START TRACE command was entered, specify a valid destination for the trace. Otherwise, issue a -DISPLAY TRACE command to determine what traces are currently active. Refer to DB2 Command Reference for details about valid destinations.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW121I A SPECIFIED CLASS VALUE IS INVALID FOR type TRACE

Explanation: A trace command has been entered, but a specified class value is not valid for the trace type requested.

System Action: Processing for the TRACE command is terminated.

Operator Response: If a -START TRACE command was entered, specify a valid class for the trace. Otherwise, issue a -DISPLAY TRACE command to determine what options are currently active. Refer to DB2 Command Reference for details about valid classes.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW122I THE KEYWORD keyword IS NOT VALID FOR type TRACE

Explanation: A trace command has been entered, but 'keyword' is not valid for the trace type specified.

System Action: Processing for the TRACE command is terminated.

Operator Response: Either the named keyword must be omitted from the command, or a different type of trace must be specified. Refer to DB2 Command Reference for details about valid combinations of keywords and trace types.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW123I csect-name TRACE RECORDING HAS BEEN RESUMED ON dest

Explanation: 'dest' destination resumes acceptance of trace data after a failure.

System Action: Data recording is resumed.
**DSNW124I**  csect-name type TRACE TERMINATED
RC=code RMID=nn

**Explanation:** During processing 'type' trace, processing abended due to an error. A trace type of blank indicates all tracing has stopped. 'RMID', displayed in decimal, identifies the resource manager. 'RC', displayed in hexadecimal, specifies the return/reason/abend code associated with the action.

Further collection of the named trace is stopped. If it is necessary to resume collection of the trace, a -START TRACE command may be issued. However if another failure is experienced, the problem should be resolved before starting the trace collection again.

**System Action:** Processing for the named trace type is stopped. The message is not externalized by the functional recovery routine, but is outputted whenever a IFC event is driven at a later time. A trace type of blank indicates all tracing has stopped.

**User Response:** Investigate the reasons for the failure.

**Operator Response:** If necessary to collect the named trace, issue a -START TRACE command to resume processing.

**Problem Determination:** Obtain a copy of the system or terminal log to verify command entry.

---

**DSNW125I**  MULTIPLE ENTRIES NOT ALLOWED FOR keyword AND keyword

**Explanation:** The following matrix shows keywords which can have multiple entries and the valid combinations. If the row keyword has multiple values then the column keyword can have multiple (M) entries or a maximum of one (1).

Certain keywords are not allowed with some commands. Refer to [DB2 Command Reference](#) for additional information.

<table>
<thead>
<tr>
<th>Class</th>
<th>Dest</th>
<th>Plan</th>
<th>Auth. ID</th>
<th>RMID</th>
<th>TNO</th>
<th>IFCID</th>

<td>M</td>
<td>1</td>
<td>M</td>
<td></td>
</tr>
</tbody>
</table>

**System Action:** Processing for the TRACE command is terminated.

**Operator Response:** Reenter the command omitting the invalid keyword.

---

**DSNW126I**  type TRACE NOT ALLOWED, ACTIVE TRACE TABLE FULL

**Explanation:** The 'type' trace cannot be started because the active trace table is has reached the maximum number of active traces allowed.

This message is issued by the following CSECT: DSNWVCM1

**System Action:** Processing for the TRACE command is terminated.

**Operator Response:** Use the -DISPLAY TRACE command to see if an active trace could be stopped. An active trace must be stopped before any other start trace command will be processed.

**Problem Determination:** Obtain a copy of the system or terminal log to verify command entry.

---

**DSNW127I**  CURRENT TRACE ACTIVITY IS–

**Explanation:** This message is the title for the -DISPLAY TRACE command output. The DSNW127I message is followed by the DSNW128I message, one or more DSNW129I messages, and the DSNW147I message.

This message is issued by the following CSECT: DSNWVCM1

---

**DSNW128I**  TNO TYPE CLASS DEST QUAL

**Explanation:** This message is issued before any -DISPLAY TRACE responses. The message follows message DSNW127I. The title indicates the trace number that is active, the type of trace, the class within type, and the destination specified for the active trace entries. Whether the trace is qualified is also displayed. If QUAL=YES, the trace is qualified by authorization ID, plan, RMID, or location. If QUAL=NO, the trace is not qualified. Qualification information can be requested by specifying DETAIL(2) on -DISPLAY TRACE. Refer to messages DSNW143I, DSNW144I, DSNW145I, and DSNW148I for more information about -DISPLAY TRACE. The message number is not displayed to save space on the message line.

This message is issued by the following CSECT: DSNWVCM1

---

**DSNW129I**  tno type class dest qual

**Explanation:** This message is issued for -DISPLAY TRACE responses. The message indicates the trace number that is active, the type of trace, the class within type, and the destination specified for the active trace entries. Whether the trace is qualified is also displayed. If QUAL=YES, the trace is qualified by authorization ID, plan, RMID, or location. If QUAL=NO, the trace is not qualified. Qualification information can be requested by specifying DETAIL(2) on -DISPLAY TRACE. The message number is not displayed to save space on the message line.

This message is issued by the following CSECT: DSNWVCM1
plan, RMID, or location. If QUAL=NO, the trace is not qualified. Qualification information may be requested by specifying DETAIL(2) on -DISPLAY TRACE. Refer to messages DSNW143I, DSNW144I, and DSNW145I for trace qualification information.

The message follows message number DSNW128I or DSNW129I. If more information is available than can be displayed on one line, subsequent lines of information are displayed. The message number is not displayed to save space on the message line.

**DSNW130I** type TRACE STARTED, ASSIGNED TRACE NUMBER tno

**Explanation:** 'type' trace has been started and assigned the decimal trace number 'tno'. Multiple messages are possible when the start request specifies multiple plans or multiple authorization ids.

This message is issued by the following CSECT: DSNWVCM1

**System Action:** Processing for the -START TRACE command will continue.

**DSNW131I** STOP TRACE SUCCESSFUL FOR TRACE NUMBER(S) tno,...

**Explanation:** The trace number(s), 'tno,...', have been stopped. Up to five decimal trace numbers may be listed. If more than five traces have been stopped, then another DSNW131I message is sent.

**System Action:** Processing for the -STOP TRACE command will continue.

**DSNW132I** MODIFY TRACE SUCCESSFUL FOR TRACE NUMBER(S) tno,...

**Explanation:** The trace numbers, 'tno,...', have been modified. Up to five numbers may be listed. If more than five traces have been modified, then another DSNW131I message is sent.

**System Action:** Processing for the modify command will continue.

**DSNW133I** csect-name TRACE DATA LOST, dest NOT ACCESSIBLE RC=code

**Explanation:** The destination specified stopped accepting trace data during a trace. Some condition external to DB2 caused the data rejection. The reason for failure is defined by the return code (RC). The RC hexadecimal value can be:

- The hexadecimal return code from SMF. Refer to the appropriate MVS publication for the specific value.
- The hexadecimal return code from the GTF request.
- The hexadecimal return code from the OPn request.

**System Action:** Processing for the -START TRACE command will continue.

**DSNW135I** type TRACE ALREADY ACTIVE, TRACE NUMBER tno

**Explanation:** 'type' trace was already active with trace number 'tno'.

**System Action:** Processing for the -START TRACE command will continue.

**DSNW137I** SPECIFIED TRACE NOT ACTIVE

**Explanation:** The specified trace could not be found in the active trace table.

**System Action:** Processing for the -STOP or -DISPLAY TRACE command will continue.
Operator Response: You may wish to issue an unqualified -DISPLAY TRACE command to determine all the active trace entries. If no traces are active then an unqualified -DISPLAY TRACE command response message is a DSNW137I message.

DSNW138I IFCID icid-number IS INVALID

Explanation: The specified IFCID number is outside the range of valid IFCID numbers or is an IFCID number which is not allowed on a trace command as specified in Part 5 (Volume 2) of DB2 Administration Guide.

System Action: Processing of the trace command is terminated before any trace functions are performed.

Operator Response: Investigate the reason for the problem.

Problem Determination: Refer to DB2 Command Reference for the range of valid IFCID numbers.

DSNW139I AUTHORIZATION FAILURE BECAUSE authorization-privilege PRIVILEGE REQUIRED

Explanation: The user of the command does not have the required authorization privilege to execute the command.

System Action: Command processing is stopped.

User Response: Notify the security administrator.

Operator Response: Notify the security administrator.

Problem Determination: Obtain a copy of the command input and verify the user’s current authorization from the DB2 subsystem catalog.

DSNW140I ALL OPN DESTINATIONS ARE ASSIGNED

Explanation: The request could not be processed because destinations OP1 - OP8 were assigned.

System Action: Processing of the trace command is terminated before any trace functions are performed.

User Response: Investigate the reason for the failure.

Operator Response: Investigate the reason for the problem by doing a display trace to analyze the active traces.

Problem Determination: Analyze why all the OPn destinations are active after doing a display trace.

DSNW141I STORAGE NOT AVAILABLE FOR BUFFER SIZE size K BYTES

Explanation: The request could not be processed because storage cannot be obtained for the OPn destination storage buffer.

DSNW142I SPECIFIED BUFSIZE IS INCOMPATIBLE WITH ASSIGNED BUFFER

Explanation: The request could not be processed because the start trace command specified a BUFSIZE value for an OPn destination which has a buffer already assigned with a different BUFSIZE.

System Action: Processing of the trace command is terminated.

User Response: Investigate the reason for the failure.

Operator Response: Investigate the reason for the problem.

Problem Determination: The problem may be caused by one application program attempting to start a trace to a destination owned by another program. This is a site problem and can be solved by having application programs start traces to an OPX destination rather than a specific OPn destination. If only one application program is starting traces, then the program should either specify the same BUFSIZE for all requests or should not specify BUFSIZE.

DSNW143I CURRENT TRACE QUALIFICATIONS ARE -

Explanation: This message is issued before -DISPLAY TRACE responses when DETAIL(2) or DETAIL(*) is specified. Message DSNW143I is followed by the DSNW144I message, one or more DSNW145I messages, and the DSNW148I message.
**DSNW144I**  
**TNO AUTHID PLAN RMID LOCATION**

**Explanation:** This message is issued before -DISPLAY TRACE responses when DETAIL(2) is specified. The title indicates the trace number that is active, the authorization ID, the plan, the RMID, and the location specified for the active trace entries. The message follows message DSNW143I. The message number is not displayed to save space on the message line.

---

**DSNW145I**  
**tno authid plan rmid location**

**Explanation:** This message is issued for -DISPLAY TRACE responses when DETAIL(2) is specified. The message indicates the trace number that is active, the authorization ID, the plan, the RMID, and the location specified for the active trace entries.

The message follows messages DSNW143I or DSNW144I. If more information is available than can be displayed on one line, subsequent lines of information are displayed. The message number is not displayed to save space on the message line.

---

**DSNW146I**  
**MULTIPLE ENTRIES NOT ALLOWED FOR keyword, keyword AND keyword**

**Explanation:** The following matrix shows keywords that can have multiple entries and the valid combinations. If the row keyword has multiple values, the column keyword can have multiple (M) entries or a maximum of one (1).

<table>
<thead>
<tr>
<th>Class</th>
<th>Dest</th>
<th>Plan</th>

</tr>
</tbody>
</table>

Certain keywords are not allowed with some commands. Refer to [DB2 Command Reference](#) for additional information.

**System Action:** Processing for the TRACE command is terminated.

**Operator Response:** Omit the invalid keyword and reenter the command.

**Problem Determination:** Obtain a copy of the system or terminal log to verify command entry.

---

**DSNW147I**  
*****END OF DISPLAY TRACE SUMMARY DATA*****

**Explanation:** This message is produced when all summary information for the -DISPLAY TRACE command has been written. Summary information is written when the DETAIL keyword is specified as '1', '**

or not specified at all. Message DSNW147I follows one or more DSNW129I messages. The message number is not displayed to save space on the message line.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNW148I**  
*****END OF DISPLAY TRACE QUALIFICATION DATA*****

**Explanation:** This message is produced when all qualification data for the -DISPLAY TRACE command has been written. Qualification data is written when the DETAIL keyword of the -DISPLAY TRACE command is specified as '2', or '**. Message DSNW148I follows one or more DSNW145I messages. The message number is not displayed to save space on the message line.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNW149I**  
**STOP TRACE COMMAND WAS UNSUCCESSFUL BECAUSE MONITOR TRACE CLASS 6 IS ACTIVE FOR QUALIFYING TRACE NUMBER(S) tno,...**

**Explanation:** No traces were stopped by the -STOP TRACE command. Either -STOP TRACE(*) or -STOP TRACE(MON) CLASS(*) was issued when monitor trace class 6 was active. An asterisk (*) is not allowed for the TRACE and CLASS keywords when monitor trace class 6 is active. The trace numbers, 'tno,...', indicate the traces that met any other specified -STOP TRACE qualifying criteria (PLAN, AUTHID, RMID, LOCATION, TNO) and also activated monitor trace class 6, thereby preventing all qualifying traces from being stopped. This special handling of the asterisk on the -STOP TRACE command for monitor trace class 6 reduces the possibility of accidentally stopping monitor trace class 6, which enables and disables DB2 data propagation.

**System Action:** No traces are stopped. Processing of the -STOP TRACE command is terminated.

**User Response:** Reissue the -STOP TRACE command without using an asterisk for the trace type. You can use a asterisk for the CLASS keyword to stop all trace types except the monitor (MON) trace.

**Operator Response:** If you do not want DB2 data propagation capability, you can stop monitor trace class 6 to allow full use of the asterisk. First stop the traces.
indicated by the trace numbers, 'tno,...', and then reissue the command.

If you want DB2 data propagation capability, do not stop monitor trace class 6. You must specify the trace TYPE. You can stop traces without specifying the trace CLASS as long as the trace TYPE is not (MON). If the trace TYPE is (MON), then you must specify the CLASS keyword explicitly (for example, -STOP TRACE(MON) CLASS(1,2)).

Refer to [DB2 Command Reference] for information on restrictions to the -STOP TRACE command when monitor trace class 6 is active.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1 2 5]

  name IS NOT DEFINED

Explanation:  The indicated object is not defined in the DB2 catalog.

bind-type  Type of BIND subcommand that caused the warning: BIND, REBIND

authorization-id  Authorization ID used during the BIND process:
  for a BIND subcommand, indicates the authorization ID of the plan owner;
  for a REBIND subcommand, indicates the authorization ID of the owner specified by the
  subcommand, or the latest owner of the plan. If this is a remote rebind, and the OWNER was
  not specified in the subcommand, then “REMOTE OWNER” will be output.

plan-id  Name of the application plan specified in the BIND subcommand, blank if the application
  plan is not specified.

dbrm name  Name of the DBRM that contains the reference to the indicated object.

statement number  Statement number of the SQL statement referencing the name of the object.

object name  Name of the object that is not defined in the DB2 catalog.

System Action:  A valid plan is created if no errors are detected and VALIDATE(RUN) is in effect.

System Programmer Response:  Ensure that the indicated table is created before the statement is executed. Otherwise, execution of this statement results in an error.

This statement is bound dynamically on each execution of the statement. For better performance, REBIND the application program after the indicated object is created.

DSNX101I  bind-type SQL WARNING USING
  authority-id AUTHORITY
  PLAN=plan-id DBRM=dbrm name
  STATEMENT=statement number THE
  SPECIFIED AUTHORIZATION-ID DOES
  NOT HAVE THE PRIVILEGE TO
  PERFORM OPERATION op name ON
  OBJECT object name

Explanation:  The identified authorization ID does not have a privilege required for application plan execution.

bind-type  Type of BIND subcommand that caused the warning: BIND or REBIND

authorization-id  Authorization ID used during the bind process.  
  For a BIND subcommand, it is the authorization ID of the plan owner. For a
  REBIND subcommand, it is the authorization ID of the owner specified by the subcommand,
  or the latest owner of the plan. If this is a remote operation, and the OWNER was
  not specified in the subcommand, then REMOTE OWNER is output.

plan-id  Name of the application plan specified in the BIND subcommand. If the application plan is
  not specified, this field is blank.

dbrm name  Name of the DBRM that contains the unauthorized operation.

statement number  Statement number of the SQL statement containing the unauthorized operation.

System Action:  A valid plan is created if no errors are detected and VALIDATE(RUN) is in effect.

System Programmer Response:  You must take one of the following actions before the statement can be executed. Otherwise, the execution of the statement results in an error.

- Ensure that the appropriate authority is granted to the invoker of the latest BIND subcommand against this application plan
- Invoke the BIND subcommand again using an authorization ID with authority to perform all the operations in this application plan.

This statement is bound dynamically on each execution of the statement. For better performance, rebind the application program after the appropriate authority is granted to the invoker of the BIND subcommand against this application plan.
DSNX102I: Bind-type SQL WARNING USING AUTHORITY
PLAN=plan-id DBRM=dbrm name STATEMENT=statement number THE REQUIRED INDEX HAS NOT BEEN CREATED ON TABLE table name IN PARTITIONED TABLESPACE table space name

Explanation: There was an attempt to reference the table in the table space (both specified in the message) when the required index was not yet created.

bind-type Type of BIND subcommand that caused the warning: BIND or REBIND
authorization-id Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.
plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.
dbrm name Name of the DBRM that contains the reference to the indicated table.
statement number Statement number of the SQL statement referencing the indicated table.

System Action: A valid plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.
System Programmer Response: If you do not want table space locking, use isolation level UR, CS or RS.

DSNX104I: Bind-type SQL WARNING USING AUTHORITY
PLAN=plan-id DBRM=dbrm name STATEMENT=statement number THE RESULT OF DECIMAL MULTIPLICATION MAY CAUSE OVERFLOW

Explanation: An arithmetic expression contains a decimal multiplication that might cause an overflow condition when the statement is executed. The problem can be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression. Refer to Chapter 2 of the DB2 SQL Reference for the precision and scale of the decimal multiplication and division results.

bind-type Type of BIND subcommand that caused the warning: BIND or REBIND
authorization-id Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a...
remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id  Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

dbrm name  Name of the DBRM that contains the reference to the indicated table.

statement number  Statement number of the SQL statement referencing the indicated table.

System Action:  A valid plan is created if no errors are detected.

dsnx105i bind-type SQL WARNING USING authorization-id AUTHORITY PLAN=plan-id DBRM=dbrm name STATEMENT=statement number SQLCODE=sqlcode SQLSTATE=sqlstate TOKENS=token list

Explanation:  An SQL warning code was generated while processing an SQL statement.

bind-type  The type of subcommand that caused the warning: BIND or REBIND

authorization-id  Indicates the authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id  Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

sqlcode  A product specific code which identifies the particular SQL warning condition. The value and semantics of the code are the same as the SQL return codes documented in Part 2, “SQL return codes,” on page 11.

sqlstate  A common code which identifies the particular SQL warning condition.

dbrm name  Name of the DBRM that contains the problem.

statement number  Statement number of the SQL statement containing the problem.

token list  Sequence of one or more tokens separated by blanks. Refer to Part 2, “SQL return codes,” on page 11 for an explanation of tokens.

System Action:  A valid plan is created if no errors are detected.

System Programmer Response:  Refer to Part 2, “SQL return codes,” on page 11 for the particular SQL return code given in this message. If the reason code is negative, this statement is bound dynamically on each execution of the statement. For better performance, rebind the application program after correcting this statement or after the required object is created or altered.

dsnx106i ATTEMPTED REBIND OF PACKAGE pkg-id RESULTED IN A TOTAL OF number ERRORS

Explanation:  Errors have been detected during the remote REBIND process. Only the first REBIND error will produce a specific message. Additional errors will simply be totaled, and the number will be returned to the user.

pkg-id  Name of the package specified in the subcommand.

number  Total number of errors in the remote REBIND

System Action:  The package was not rebound.

System Programmer Response:  See previously output message to determine the initial error that caused the subcommand to be terminated unsuccessfully.

dsnx200i bind-type SQL ERROR USING authorization-id AUTHORITY PLAN=plan-id DBRM=dbrm name STATEMENT=statement number SQLCODE=sqlcode SQLSTATE=sqlstate TOKENS=token list CSECT=csect name RDS CODE=location code

Explanation:  An error has been detected while processing an SQL statement.

bind-type BIND | REBIND indicates type of BIND subcommand that caused the error.

authorization-id  indicates the authorization ID used during the bind process. For a BIND subcommand, indicates the authorization ID of the plan owner. For a REBIND subcommand, indicates the authorization ID of the owner specified by the subcommand, or the latest owner of the plan.
DSNX201I - DSNX203I

plan-id
Name of the application plan specified in the BIND subcommand. Blank if the application plan is not specified.

sqlcode
A product specific code which identifies the particular SQL error detected. The value and semantics of the code are the same as the SQL return codes documented in [Part 2, "SQL return codes," on page 11].

dbms name
Name of the DBMS that contains the error.

statement-number
Statement number containing the SQL error.

token list
Optional sequence of one or more tokens separated by blanks. These are the tokens that are to be substituted into the text of the error code as described at the beginning of [Part 2, "SQL return codes," on page 11].

csect
Name of the CSECT detecting the problem.

rds code
Unique code that identifies the location within the CSECT when the problem is detected.

System Action: No application plan is created.

System Programmer Response: Precompile the application program associated with the indicated DBRM. Reinvoke the BIND subcommand.

---

DSNX202I
INVALID AMODE ATTRIBUTE FOUND FOR DATE OR TIME INSTALLATION REPLACEABLE EXIT ROUTINE module-name

Explanation: During DB2 startup, the Relational Data System subcomponent loads the Date (DSNXVDTX) and Time (DSNXVTMX) exit routines. These routines must have the link-edited attributes AMODE(31) and RMODE(ANY). The module listed in the message 'module-name' did not have the correct addressing attributes. If the date and time LOCAL installation option is specified, DB2 will be unable to execute the date and time functions required by the exit routine that failed to load.

System Action: The load module is deleted. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: When DB2 is stopped, the date and time exit routine must be link-edited again with the correct AMODE and RMODE control statements. For more information, refer to Appendix B (Volume 2) of [DB2 Administration Guide].

---

DSNX203I
LOAD OF THE DATE OR TIME INSTALLATION REPLACEABLE EXIT ROUTINE module-name FAILED WITH MVS ABEND CODE = abend-code REASON CODE = reason-code DB2 STARTUP WILL CONTINUE

Explanation: During DB2 startup, the Relational Data System subcomponent loads the date (DSNXVDTX) and time (DSNXVTMX) exit routines. During the load of EXIT ROUTINE 'module-name', MVS issued the abend code and reason code that would cause abnormal termination of the task, but the abend was suppressed. If the date and time LOCAL option is specified, DB2 will be unable to execute the date and time functions required by the exit routine that failed to load.

System Action: The load failed. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: When DB2 is stopped, the date and time exit routine must be link-edited correctly. For more information, refer to Appendix B (Volume 2) of [DB2 Administration Guide].
**System Programmer Response:**

Use the same data definition control table object definitions and attributes for all members of the DB2 data sharing group. See Part 2 of *DB2 Installation Guide* for information about defining data definition control objects and attributes in DSNZPARM.

---

**DSNX204I**  
*csect-name ERROR LOADING THE DB2 CATALOG, REASON reason: DB2 STARTED ACCESS(MAINT)*

**Explanation:** The internal structure (DBD) for the catalog database (DSNDB06) was either not found or inconsistent when DB2 was started. See the appropriate reason for a more detailed description of the problem.

The *reason* is one of the following:

0  
An error occurred reading the DBD01 table space. Check the Console for messages and SYS1.LOGREC for abends.

1  
The expected level of the DBD for DSNDB06 is the previous release, but objects exist in the DBD for a current or later release.

2  
The expected level of the DBD for DSNDB06 is the current release, but objects exist in the DBD for a later release.

3  
The expected level of the DBD for DSNDB06 is a later release, but objects do not exist in the DBD for a later release.

4  
The level of the DBD for DSNDB06 is unknown to this version of DB2.

**System Action:** DB2 was started ACCESS(MAINT).

**System Programmer Response:** Do not run any CREATES, ALTERS, DROPS, GRANTS, REVOKEs or BINDs when in this state; it might corrupt your catalog and directory. Determine the problem with the DSNDB01.DBD01 table space. An improper REPAIR or RECOVER of the table space might have been run. Fix the problem while in ACCESS(MAINT) mode and then stop and start DB2. See Section 4 (Volume 1) of Administration Guide for more information on recovering the DSNDB01.DBD01 table space.

**Problem Determination:** If you suspect an error in DB2 or the table space is in an inconsistent state refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 1 2

---

**DSNX205I**  
*csect-name THE DATA DEFINITION CONTROL OBJECT DEFINITIONS AND ATTRIBUTES ON MEMBER member-name ARE NOT THE SAME.*

**Explanation:** One or more data definition control object definitions and attributes on member *member-name* and on this member are not the same. The data definition control object definitions and attributes are defined in the initialization parameter module DSNZPARM.

**System Action:** Processing continues.

---

**DSNX206I**  
LOAD OF THE ACCESS CONTROL AUTHORIZATION INSTALLATION REPLACEABLE EXIT ROUTINE  
module-name FAILED WITH MVS ABEND CODE = abend-code AND REASON CODE = reason-code DB2 STARTUP WILL CONTINUE

**Explanation:** During DB2 startup, the Relational Data System subcomponent loads the Access Control Authorization (DSNX@XAC) exit routine. During the load of EXIT ROUTINE *module-name*, MVS issued the abend code and reason code that indicates abnormal termination of the task. However, the abend was suppressed. DB2 will not use the Access Control Authorization (DSNX@XAC) exit to perform authorization checking. DB2 authorization checking will be performed.

**System Action:** The load failed. DB2 startup will continue.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** After DB2 has stopped, you must properly link-edit the Access Control Authorization exit routine. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.

---

**DSNX207I**  
INVALID AMODE ATTRIBUTE FOUND FOR ACCESS CONTROL AUTHORIZATION INSTALLATION REPLACEABLE EXIT ROUTINE  
module-name

**Explanation:** During DB2 startup, the Relational Data System subcomponent loads the Access Control Authorization (DSNX@XAC) exit routine. This routine must have the link-edited attributes AMODE(31) and RMODE(ANY). The module listed in the message *module-name* did not have the correct addressing attributes. DB2 will not use the Access Control Authorization (DSNX@XAC) exit to perform authorization checking. DB2 authorization checking will be performed.

**System Action:** The system deletes the load module. DB2 startup will continue.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** After DB2 has stopped, you must properly link-edit the Access Control Authorization exit routine with the correct AMODE and RMODE control statements. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.
DSNX208E  csect-name ATTEMPTING TO START DB2 WITH AN UN SUPPORTED CODE LEVEL. REASON CODE reason MISSING MAINTENANCE: maint CURRENT LEVEL current-code-level VALID LEVEL(S) valid-code-levels

Explanation: The DB2 member that is starting has a code level that is not compatible with the catalog or with some other component of DB2.

reason indicates the problem:

1  DB2 is attempting to start with a level of code that is not valid. The missing maintenance, maint, is unknown.

2  The level of code that is required by the catalog, which is indicated by current-code-level, is not a valid code level. The missing maintenance, maint, is unknown.

3  A preconditioning or toleration APAR has not been applied. The required APAR or level of code is specified by maint.

4  The preconditioning or toleration maintenance is on the DB2 subsystem, but maintenance to the catalog that is specified by maint, has not been applied.

maint is an APAR number or a token that indicates a level of code. The value of maint is UNKNOWN if DB2 cannot determine the missing maintenance level.

current-code-level and valid-code-levels are for the use of your IBM service representative.

This message can occur in the following situations:

- The starting DB2 fell back from a later release and does not have the proper maint applied.
- The starting DB2 does not have the proper coexistence SPE, specified by maint, to start in a data sharing group, which is at a later release level.
- The starting DB2 is at a release in which coexistence with the data sharing group is not supported.

System Action: DB2 terminates with reason code 00E7009D.

System Programmer Response: Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 1 2 16 69

DSNX209E  csect-name MEMBER member-name IS AT A CODE LEVEL WHICH IS NOT COMPATIBLE WITH THIS STARTING OR MIGRATING MEMBER. REQUIRED LEVEL: new-code-level KNOWN LEVELS: known-code-levels

Explanation: The DB2 member that is starting will update the DB2 catalog, but the code level of that DB2 member is not compatible with the code level of the DB2 member that has already started. The DB2 subsystem at the earlier code level requires the correct SPE. The code level information in this message is for the use of your IBM service representative.

System Action: DB2 terminates with reason code 00E7009D after detecting the DB2 members that cannot coexist.

System Programmer Response: Check the DB2 Program Directory and Preventive Service Planning updates (PSP) for more information about the SPE that is needed.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied to all active members in the group.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 1 2 16 69

DSNX900E  csect-name ILLEGAL VALUE DETECTED IN colname COLUMN OF SYSIBM.SYSPROCEDURES FOR PROCEDURE proname

Explanation: The colname column of the SYSIBM.SYSPROCEDURES catalog table contains an unsupported value in a row associated with PROCEDURE=proname.

colname
The name of the column of the SYSIBM.SYSPROCEDURES table that contains the illegal value.

proname
The name of the stored procedure being processed when the illegal value was detected.

System Action: The invalid row in the SYSIBM.SYSPROCEDURES table cannot be processed.

Operator Response: Contact the system programmer.

System Programmer Response: Use ALTER PROCEDURE or ALTER FUNCTION to correct the unsupported column value in the
Explanation: A stored procedure terminated abnormally while attempting to satisfy an SQL CALL statement for an SQL application.

name  The name of the stored procedure or function that terminated abnormally.

asid  The MVS ASID of the address space where the stored procedure executed.

wlmenv  The name of the WLM application environment where the stored procedure executed. If it
executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action:  The SQL CALL statement fails, and the SQL application is forced to roll back.

The abnormal termination count for procedure procname was reached. The procedure is stopped and further requests for the procedure are rejected.

System Programmer Response:  Correct the cause of the abnormal termination. If the correction requires the stored procedure to be linkedited again, then it might be necessary to cause the corrected MVS load module to be reloaded. Different commands must be used to cause this reloading depending on the environment in which the stored procedure was executed.

If it was run in a WLM-established stored procedures address space, issue the MVS VARY WLM,APPLENV=name,REFRESH command.

If it was run in the DB2-established stored procedures address space, issue the -START PROCEDURE command.

After the appropriate command has been issued to refresh the stored procedure load module, use the -START PROCEDURE command to activate the stored procedure.

Problem Determination:  Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

__DSNX905I__

| csect-name PROCEDURE OR FUNCTION name TERMINATED ABNORMALLY ASID= asid WLM_ENV= wlmenv |
|______________________________________________________________|

__DSNX908I__

| csect-name PROCEDURE OR FUNCTION name WITH LOAD MODULE module EXCEEDED CPU RESOURCE LIMIT SSN= ssn PROC= jclprocASID= asid WLM_ENV= wlmenv |
|______________________________________________________________|

Explanation: A stored procedure or function consumed more CPU service units than allowed by the ASUTIME column of the ALTER PROCEDURES catalog table. The stored procedure might be in a loop.

name  The name of the stored procedure or function being processed.

module  The MVS load module associated with the stored procedure.

ssn  The name of the DB2 subsystem that called the stored procedure.

jclproc  The name of the JCL PROC used to start this stored procedures address space.

asid  The MVS ASID of the address space where the stored procedure executed.

wlmenv  The name of the WLM application environment where the stored procedure executed. If it
executed in the DB2-established stored procedures address space, this field will contain blanks.

Chapter 22. DB2 messages 677
System Action: DB2 detaches the TCB associated with the stored procedure, which causes abnormal termination of the stored procedure.

Operator Response: Contact the system programmer.

System Programmer Response: If the stored procedure is looping, correct the stored procedure.

If the stored procedure is performing correctly, increase the ASUTIME value in the CREATE PROCEDURES row associated with the stored procedure.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**DSNX921I**

* csect-name SOME SQL CALL STATEMENTS CANNOT BE PROCESSED, BECAUSE REQUIRED RESOURCES ARE NOT AVAILABLE

**Explanation:** DB2 was unable to validate the attributes of the SYSIBM.SYSROUTINES catalog table and related objects because of an unavailable resource.

- reason: The DB2 reason code describing the unavailable resource
- type: The resource type
- name: The name of the resource

**System Action:** SQL CALL statements are rejected.

**System Programmer Response:** Resolve the unavailable resource problem. Then use the -START PROCEDURE(*) command to cause DB2 to accept SQL CALL statements.

**Operator Response:** Note the reason code, the type code, and the name. See the Problem Determination section for an explanation of the collected data.

**Problem Determination:** The reason code tells why the resource is unavailable. Reason codes are described in "Part 4, Reason Codes". Use the table defined for message DSNT500I to find the type of resource identified in the message.

---

**DSNX922I**

* csect-name BEGINNING DISCONNECTION OF STORED PROCEDURE ADDRESS SPACES

**Explanation:** This message is produced during -STOP DB2 processing. It indicates that DB2 SQL processing has been quiesced, and DB2 is now beginning the termination process for the stored procedures address spaces.

---

**DSNX923I**

* csect-name ALL STORED PROCEDURE ADDRESS SPACES ARE NOW DISCONNECTED.

**Explanation:** This message is produced during -STOP DB2 processing. It indicates that all of the stored procedure address spaces are now disconnected from DB2 and the stop of DB2 will continue.

WLM-established stored procedure address spaces are terminated by WLM after the disconnection from DB2.

---

**DSNX940I**

* csect-name - DISPLAY PROCEDURE REPORT FOLLOWS-

**Explanation:** This message is the title for the report output from the DISPLAY PROCEDURE command. It precedes messages DSNX941I and DSNX942I. Message DSNX943I might also be displayed. The final message for the report is DSNX945I.

**System Action:** The DISPLAY PROCEDURE command processing continues.

---

**DSNX941I**

* PROCEDURE MODULE STATUS

**ACTIVE QUEUED MAXQUE TIMEOUT WLM_ENV

**Explanation:** This message displays the column headings for the list of stored procedures generated by the DISPLAY PROCEDURE command. The definitions are:

- **PROCEDURE**
  - The name of the stored procedure

- **STATUS**
  - The status of the stored procedure

- **ACTIVE**
  - The number of DB2 agents that are currently running this stored procedure

- **QUEUED**
  - The number of DB2 agents that are currently waiting for this stored procedure to be scheduled

- **MAXQUE**
  - The maximum number of DB2 agents that have waited for this stored procedure to be scheduled since DB2 was started

- **TIMEOUT**
  - The number of times a request for this procedure timed out while waiting to be scheduled since DB2 was started

- **WLM_ENV**
  - The MVS Workload Manager environment name for this stored procedure

**System Action:** The DISPLAY PROCEDURE command processing continues.
**Explanation:** This message lists the DISPLAY PROCEDURE information for a given stored procedure. The definitions of the columns are:

- **procedure**: The name of the stored procedure.
- **module**: The MVS load module associated with the stored procedure.
- **status**: The status of the stored procedure. The status can be any of the following values:
  - **STARTED**: The stored procedure is able to accept SQL CALL requests.
  - **STOPABN**: The stored procedure was stopped because of the previous abnormal termination of the stored procedure application. SQL CALL requests for the stored procedure are rejected.
  - **STOPQUE**: The stored procedure was stopped. SQL CALL requests for the stored procedure are queued until the stored procedure is started or the installation-defined timeout interval expires.
  - **STOPREJ**: The stored procedure was placed in this status by the STOP PROCEDURE ACTION(REJECT) command. SQL CALL requests for the stored procedure are rejected.
- **action**: The action provided on the STOP PROCEDURE command.

**DSNX942I** procedure module status active maxact queued maxque timeout

The number of DB2 agents that are currently running this stored procedure.

The maximum number of DB2 agents that have run this stored procedure concurrently since DB2 was started.

The number of DB2 agents that are currently waiting for this stored procedure to be scheduled.

The maximum number of DB2 agents that have waited for this stored procedure to be scheduled since DB2 was started.

The number of times an SQL CALL statement timed out while waiting for a stored procedure to be scheduled since DB2 was started.

An SQL CALL statement can time out for several reasons:

- The procedure can be stopped by the STOP PROCEDURE ACTION(QUEUE) command, causing requests for the procedure to be queued until the installation-defined time interval expires.
- There might not be enough MVS TCBs in the DB2 stored procedures address space to satisfy the volume of SQL CALL statements.
- The MVS dispatching priority of the DB2 stored procedures address space might be too low to process the stored procedure requests in a timely manner.

**System Action:** The DISPLAY PROCEDURE command processing continues.

**DSNX943I** PROCEDURES begin - end STOP (act)

This message indicates a STOP PROCEDURE command was issued with an invalid procedure name, causing a range of procedure names to be stopped. This message follows the DSNX940I, DSNX941I, and any DSNX942I messages.

- **begin**: The first procedure name in the range of procedure names that are currently stopped.
- **end**: The last procedure name in the range of procedure names that are currently stopped.
- **act**: The action provided on the STOP PROCEDURE command.

**System Action:** The DISPLAY PROCEDURE command processing continues.

**DSNX944I** csect-name THE STORED PROCEDURE FUNCTION IS NOT AVAILABLE

This message is returned by the START, STOP, and DISPLAY PROCEDURE command when the stored procedure facility is not available. It can also be produced when an MVS START command is used to start the stored procedures address space.

The following conditions cause the stored procedure facility to be unavailable:
• The DB2 DSNZPARM module does not include a value for the stored procedure JCL procedure name. This prevents DB2 from starting the stored procedure function.
• DB2 was unable to start the stored procedures address space. This can be caused by a JCL error in the stored procedures JCL procedure.
• DB2 is running on MVS/XA, which does not support the stored procedure function.

**System Action:** If a START, STOP, or DISPLAY PROCEDURE command is in progress, the command terminates.
If an MVS START command is used to start the stored procedures address space, the stored procedures address space terminates.

---

**DSNX945I**
**DISPLAY PROCEDURE REPORT COMPLETE**

**Explanation:** The output from the DISPLAY PROCEDURE command is complete. This message follows the DSNX940I, DSNX941I, and any DSNX942I messages.

**System Action:** The DISPLAY PROCEDURE command processing continues.

---

**DSNX946I**
**csect-name** **START PROCEDURE SUCCESSFUL FOR** token

**Explanation:** The START PROCEDURE command completed successfully.

**token** The procedure name supplied on the START PROCEDURE command.

**System Action:** The START PROCEDURE COMMAND processing continues.

---

**DSNX947I**
**csect-name** **STOP PROCEDURE SUCCESSFUL FOR** token

**Explanation:** The STOP PROCEDURE command completed successfully.

**token** The procedure name supplied on the STOP PROCEDURE command

**System Action:** The STOP PROCEDURE command processing continues.

---

**DSNX950I**
**csect-name** **PROCEDURE procname HAS NOT BEEN ACCESSED**

**Explanation:** The procedure name supplied on the DISPLAY PROCEDURE command has not yet been accessed by any SQL CALL statement. The specified procname might not be present in the SYSIBM.SYSROUTINES catalog table.

**procname** The name of the stored procedure

**System Action:** Processing continues for any additional procedure names supplied on the command.

---

**DSNX951I**
**csect-name** A STORED PROCEDURE CANNOT ISSUE START/STOP PROCEDURE COMMANDS

**Explanation:** A stored procedure attempted to issue the START or STOP PROCEDURE command. This is not allowed because the START and STOP PROCEDURE commands might cause the stored procedures address space tasks to terminate.

**System Action:** The START or STOP PROCEDURE command is rejected.

---

**DSNX952I**
**csect-name** THE DB2-Established STOREDPROCEDURE ADDRESS SPACE IS ALREADY STARTED

**Explanation:** DB2 supports only one DB2-established stored procedure address space.

An MVS address space attempted to connect to DB2 as a DB2-established stored procedure address space, but another DB2-established stored procedure address space is already connected to DB2.

DB2 supports multiple WLM-established stored procedure address spaces.

**System Action:** The attempt to connect to DB2 is rejected.

---

**DSNX953E**
**csect-name** STORED PROCEDURE JOBNNAME OR STARTED TASK NAME DOES NOT MATCH ZPARM

**Explanation:** An MVS address space attempted to identify itself to DB2 as the DB2-established stored procedure address space, but the JOBNNAME or started task name of the address space did not match the stored procedure’s MVS procedure name recorded in the DB2 DSNZPARM module.

**System Action:** The attempt to connect to DB2 is rejected.

**System Programmer Response:** If you want to start the DB2-established stored procedure address space from the MVS console, you must use an MVS procedure name that matches the value in the DB2 DSNZPARM module.

---

**DSNX954I**
**csect-name** ATTEMPT TO START DB2-Established STORED PROCEDURE ADDRESS SPACE PROC= jobproc FAILED

**Explanation:** DB2 attempted to start the DB2-established stored procedure address space using the JCL proc name specified in the DB2 DSNZPARM module. MVS failed the request.
Possible causes for the start failing include:
• JCL proc not found
• JCL error in the proc

jclproc  The name of the JCL PROC used to start the stored procedures address space.

System Action:  The DB2-established stored procedures address space will not be available.

System Programmer Response:  Correct the error and use the -START PROCEDURE(‘*’) command to start the DB2-established stored procedure address space.

DSNX955I

Explanation:  A blank line that appears in the DISPLAY PROCEDURE or DISPLAY FUNCTION command.

System Action:  The DISPLAY command processing continues.

DSNX956I  ----  SCHEMA = schema

Explanation:  This message reports the schema name requested on the DISPLAY PROCEDURE or DISPLAY FUNCTION command.

schema  The schema name for the stored procedure or function.

System Action:  The DISPLAY command processing continues.

DSNX957I  csect-name INSUFFICIENT AUTHORITY FOR OBJECT object

Explanation:  This message is issued when a START, STOP, or DISPLAY command is issued for a stored procedure or user-defined function that the user is not authorized to START, STOP, or DISPLAY.

object  The stored procedure or user-defined function that failed the authorization test.

System Action:  The START, STOP, or DISPLAY command continues.

DSNX958I  DISPLAY TERMINATED WITH MAX LINES

Explanation:  This message indicates that the -DISPLAY PROCEDURE or -DISPLAY FUNCTION SPECIFIC report was truncated. The report was generated in response to a command from a MVS console, and more than 254 response messages were generated. Only 254 response messages are returned.

System Action:  Command processing completes. The truncated report is written to the MVS console.

System Programmer Response:  Reissue the -DISPLAY PROCEDURE or -DISPLAY FUNCTION SPECIFIC command, specifying a smaller number of routines. This can be done by specifying a list of routines, a schema qualifier, or a partial routine name in the DISPLAY command rather than the default (‘*’). Alternatively, the command can be reissued from the DB2! Commands panel or from a batch job rather than from the MVS console.

DSNX960E  csect-name SOME SQL CALL STATEMENTS CANNOT BE PROCESSED, BECAUSE THE Language Environment ROUTINE CEEPIPI CANNOT BE LOADED SSN= ssn PROC= jclproc ASID= asid WLM_ENV= wlmenv

Explanation:  To execute an SQL CALL statement, DB2 must load the Language Environment interface module (CEEPIPI). If the CEEPIPI module is not included in an accessible data set such as STEPLIB data sets, JOBLIB data sets, or the LPA library, DB2 is unable to call Language Environment to process stored procedure or function requests.

ssn  The name of the DB2 subsystem to which the stored procedures address space was connected.

ssn  The name of the JCL PROC used to start this stored procedures address space.

asid  The MVS ASID of the address space where the load was issued.

wlmenv  The name of the WLM application environment where the load was issued. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action:  The address space attempting to process stored procedures or functions terminates.

System Programmer Response:  Change the STEPLIB DD statement in the JCL used to start the stored procedure address space, or install the CEEPIPI module in one of the libraries already accessible to the address space.

After the CEEPIPI module is accessible, use one of the following techniques to restart the failing stored procedure address space:
• If the error was in a WLM-established stored procedures address space, use the MVS VARY WLM,APPLENV=-name,RESUME command.
• If the error was in the DB2-established stored procedures address space, use the -START PROCEDURE(‘*’) command.

Problem Determination:  Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**Explanation:** A WLM-established stored procedures address space was unable to perform a Java Native Interface (JNI) function.

**function**
The JNI function that failed. Possible values are:

- **GET_DEFAULTS**
  - JNI_GetDefaultJavaVMInitArgs

- **CREATE_VM**
  - JNI_CreateJavaVM

- **CALL_METHOD**
  - CallStaticVoidMethodA

**procedure-name**
The name of the stored procedure that was invoked.

**ssn**
The name of the DB2 subsystem to which the stored procedures address space is connected.

**jclproc**
The name of the JCL procedure that was used to start the stored procedures address space.

**asid**
The MVS ASID of the address space in which *function* was invoked.

**classname**
The name of the class that contains the Java method to be invoked.

**method**
The name of the Java method to be invoked.

**error-information**
The error information from the toString method for the Java error.

**System Action:** The CALL statement fails.

**System Programmer Response:** Take the appropriate action, depending on the value of *function*:

**GET_DEFAULTS** or **CREATE_VM**
Ensure that the ET/390 DLLs are in the STEPLIB concatenation for the stored procedures address space, or the z/OS UNIX System Services external link is set correctly to the PDSE that contains the DLLs.

**CALL_METHOD**
Fix the problem that is identified in *error-information*.  

---

**Explanation:** DB2 uses the Language Environment CEEPIPI service to load and execute user-written stored procedures. The Language Environment return code *rc* was not expected for the indicated Language Environment function call.

**rc**
The return code received from CEEPIPI.

**func**
The function requested by DB2. Possible values are:

- **add_entry**
  - Add an entry to the Language Environment PIPI table dynamically.

- **call_main**
  - Run a main program stored procedure using an existing Language Environment run time environment.

- **call_sub**
  - Run a sub program stored procedure using an existing Language Environment run time environment.

- **delete_entry**
  - Delete an entry from the Language Environment PIPI table dynamically.

- **end_seq**
  - End a sequence of calls using CEEPIPI.

- **identify**
  - Identify the language the module was written in.

- **init_main**
  - Create Language Environment run time environment.

- **init_sub_dp**
  - Create Language Environment sub run time environment.

- **term**
  - Terminate the Language Environment run time environment.

- **start_seq**
  - Start a sequence of calls using CEEPIPI.

**ssn**
The name of the DB2 subsystem to which the stored procedures address space was connected.

**jclproc**
The name of the JCL PROC used to start this stored procedures address space.

**asid**
The MVS ASID of the address space where the CEEPIPI error was encountered.
wlmenv  The name of the WLM application environment where the CEEPIPI error was encountered. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The attempt to run a stored procedure fails. The DB2 stored procedure address space attempts any new stored procedure requests it receives.

System Programmer Response: The Language Environment return codes from CEEPIPI are documented in Language Environment for OS/390 & VM Programming Guide.

If the values of func and rc are ‘ADD_ENTRY’ and X’0000000C’, the error might be caused by using a compiler that is not Language Environment enabled to create the stored procedure. DB2 stored procedures must be compiled with a compiler that supports Language Environment.

Problem Determination: Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

---

**DSNX964I**  
csect-name THE DB2-Established STORED PROCEDURES ADDRESS SPACE FOR SUBSYSTEM subs IS STARTED

Explanation: The DB2-established stored procedures address space is now available to process SQL CALL statements.

subs  The name of the DB2 subsystem to which the DB2-established stored procedures address space is connected.

System Action: Processing continues.

---

**DSNX965I**  
csect-name THE DB2-Established STORED PROCEDURES ADDRESS SPACE FOR SUBSYSTEM subs IS STOPPING

Explanation: The DB2-established stored procedures address space is terminating. Termination occurs when all active stored procedures in the DB2-established stored procedures address space return control to DB2.

subs  The name of the DB2 subsystem to which the DB2-established stored procedures address space was connected.

System Action: DB2 continues to process any stored procedures that are currently running. If a new SQL CALL statement is received that is to be executed in the DB2-established stored procedures address space the request is queued.

---

**DSNX966I**  
csect-name STORED PROCEDURE OR FUNCTION sp FAILED. Language Environment ENCLUAVE RC = erc, FEEDBACK INFORMATION = fi SSN= ssn PROC= jclproc ASID= asid WLM_ENV= wlmenv

Explanation: DB2 uses the Language Environment CEEPIPI call_main or call_sub service to execute user-written stored procedures or user-defined function. The CEEPIPI interface returned information indicating a failure while executing the stored procedure.

sp  The stored procedure or function name that was called using CEEPIPI.

erc  The Language Environment enclave return code.

fi  Contains one or two message identifiers. The message identifiers are constructed from the Language Environment condition token.

The message identifiers are constructed as follows:
- Single message: Facility_Id combined with Msg_No
- Two messages: Facility_Id combined with Class_Code and Facility_Id combined with Cause_Code

ssn  The name of the DB2 subsystem that called the stored procedure or function.

jclproc  The name of the JCL PROC used to start this stored procedures address space.

asid  The MVS ASID of the address space where the stored procedure executed.

wlmenv  The name of the WLM application environment where the stored procedure executed. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The attempt to run this stored procedure failed. The DB2 stored procedure address space attempts any new stored procedure requests it receives.

System Programmer Response: A description of the Language Environment enclave return code and the condition token are documented in Language Environment for OS/390 & VM Programming Guide. In many cases the feedback information contains a Language Environment message number. These are documented in z/OS Language Environment.

Problem Determination: Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

---
DSNX967I  csect-name ATTEMPT TO PERFORM WLM FUNCTION func FAILED WITH WLM RC= rc RSN= rsn SSN= ssn PROC= jclproc ASID= asid WLM_ENV= wlmenv

Explanation: A WLM-established stored procedures address space was unable to perform a WLM operation required to communicate with WLM.

func  The WLM function that failed. Possible values are:
      • IWMCONN
      • IWMSSEL
      • IWMSTBGN
      • IWMSTEND

ssn  The name of the DB2 subsystem to which this stored procedure address space was connected.

jclproc  The name of the JCL PROC used to start this stored procedures address space.

asid  The MVS ASID of the address space where this function was invoked.

wlmenv  The name of the WLM application environment where this function was invoked.

System Action: The stored procedures service task that encountered the error terminates. If this is the last service task in that address space, then that address space terminates.

The WLM return codes and reason codes are documented in MVS/ESA SP 5.3 Workload Management Services. In some cases the failures are caused by the WLM application environment being incorrectly defined or in a quiesced state. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSNX968I  csect-name STORED PROCEDURE ADDRESS SPACE IS UNABLE TO CONNECT TO WLM BECAUSE WLM_ENV = wlmenv IS STOPPED OR QUIESCED

Explanation: A DB2 stored procedures address space could not connect to the Work Load Manager services of MVS because the WLM application environment was in a stopped or quiesced state.

wlmenv  The name of the WLM application environment for which the stored procedure address space was being started.

System Action: The stored procedures address space terminates.

System Programmer Response: Correct the WLM application environment name that is being used by stored procedures address space JCL proc.

To change the status of the application environment use the MVS VARY WLM,APPLENV=wlmenv,RESUME command.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSNX969I  function status active queued maxque timeout wlm_env

Explanation: This message lists the DISPLAY SPECIFIC FUNCTION information for a given external function. The definitions of the columns are:

function  The name of the external function.

status  The status of the function. The status can be any of the following values:

STARTED  The function is able to accept SQL statement requests.

STOPABN  The function was stopped because of the previous abnormal termination of the function application. SQL statement requests for the function are rejected. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

STOPQUE  The function was stopped. SQL statement requests for the function are queued until the function is started or the installation-defined timeout interval expires. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

STOPREJ  The function was placed in this status by the STOP SPECIFIC FUNCTION ACTION(REJECT) command. SQL statement requests for the function are rejected. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

active  The number of DB2 agents that are currently running this function.
queued
The number of DB2 agents that are currently waiting for this function to be scheduled.

maxque
The maximum number of DB2 agents that have waited for this function to be scheduled, since the last START SPECIFIC FUNCTION command was issued for this function.

timeout
The number of times an SQL statement timed out while waiting for a function to be scheduled since the last START SPECIFIC FUNCTION command was issued for this function. An SQL statement can time out because the function can be stopped by the STOP SPECIFIC FUNCTION ACTION(QUEUE) command, causing requests for the function to be queued until the installation-defined time interval expires.

wlm_env
The MVS Workload Manager environment name for this function.

**System Action:** The DISPLAY SPECIFIC FUNCTION command processing continues.

**DSNX970I**  FUNCTION STATUS ACTIVE QUEUED MAXQUE TIMEOUT WLM_ENV

**Explanation:** This message displays the column headings for the list of external functions generated by the DISPLAY SPECIFIC FUNCTION command. The definitions are:

- **FUNCTION**
  The name of the external function.

- **STATUS**
  The status of the function.

- **ACTIVE**
  The number of DB2 agents that are currently running this function.

- **QUEUED**
  The number of DB2 agents that are currently waiting for this function to be scheduled.

- **MAXQUE**
  The maximum number of DB2 agents that have waited for this function to be scheduled, since the last START SPECIFIC FUNCTION command was issued for this function.

- **TIMEOUT**
  The number of times an SQL statement timed out while waiting for a function to be scheduled since the last START SPECIFIC FUNCTION command was issued for this function.

- **WLM_ENV**
  The MVS Workload Manager environment name for this function.

**DSNX971I**  FUNCTIONS begin - end STOP (act)

**Explanation:** This message indicates a STOP SPECIFIC FUNCTION command was issued with an asterisk ("\") in the function name, causing a range of function names to be stopped. This message follows the DSNX975I, DSN969I, and any DSNX970I messages.

- **begin**
  The first function name in the range of function names that are currently stopped

- **end**
  The last function name in the range of function names that are currently stopped

- **act**
  The action provided on the STOP SPECIFIC FUNCTION command

**System Action:** The DISPLAY SPECIFIC FUNCTION command processing continues.

**DSNX972I**  DISPLAY FUNCTION SPECIFIC REPORT COMPLETE

**Explanation:** The output from the DISPLAY FUNCTION SPECIFIC command is complete. This message follows DSNX975I, DSN969I, and any DSNX970I messages.

**System Action:** The DISPLAY FUNCTION SPECIFIC command processing continues.

**DSNX974I**  csect-name STOP FUNCTION SPECIFIC SUCCESSFUL FOR token

**Explanation:** The function name supplied on the STOP FUNCTION SPECIFIC command completed successfully.

- **token**
  The function name supplied on the STOP FUNCTION SPECIFIC command.

**System Action:** The STOP FUNCTION SPECIFIC command processing continues.

**DSNX975I**  csect-name - DISPLAY FUNCTION SPECIFIC REPORT FOLLOWS-

**Explanation:** This message is the title for the report output from the DISPLAY FUNCTION SPECIFIC command. It precedes messages DSNX969I and DSNX970I. Message DSNX971I might also be displayed. The final message for the report is DSNX972I.

**System Action:** The DISPLAY FUNCTION SPECIFIC command processing continues.
**DSNX977I**

csect-name **FUNCTION** funcname **HAS NOT BEEN ACCESSED**

Explanation: The function name supplied on the DISPLAY FUNCTION SPECIFIC command has not yet been accessed by any SQL statement. The specific funcname might not be present in the SYSIBM.SYSROUTINES catalog table.

funcname
The name of the function.

**System Action:** Processing continues for any additiona function names supplied on the command.

---

**DSNX978I**

**DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE**

Explanation: The DISPLAY PROCEDURE command could not obtain storage for additional messages. This should only happen for a particularly long display request, such as one requesting all stored procedures that have been accessed by DB2 applications since DB2 was started.

**System Action:** The display is truncated.

**System Programmer Response:** Reissue the -DISPLAY PROCEDURE command, and specify a smaller number of procedures. This can be done by specifying a partial procedure name in the DISPLAY PROCEDURE command rather than the default (*)

---

**DSNX980E**

csect-name **ATTEMPT TO PERFORM CALL ATTACH FUNCTION func FAILED WITH DB2 SUBSYSTEM** subsys

RETURN CODE=rc, **REASON CODE=reason**

Explanation: The DB2 stored procedures address space was unable to perform a DB2 call attach operation required to communicate with DB2.

func
The DB2 call attach function that failed.
Possible values are:
CONNECT
OPEN
CLOSE
DISCONNECT

subsyst
The DB2 subsystem name involved in the call attach function

rc
The DB2 call attach return code

reason
The DB2 reason code

**System Action:** The stored procedures service task that encountered the error terminates. If this is the last service task in the address space, the DB2 stored procedures address space terminates.

**System Programmer Response:** Consult the DB2 Application Programming and SQL Guide to determine the cause of the DB2 call attach return code and reason code.

---

**DSNX981E**

csect-name **THE PARAMETER** parm **CONTAINS AN INVALID VALUE** "string"

PROC= proc

Explanation: The DB2 stored procedures address space received an invalid value in the JCL parameter used to start the address space.

parm
The JCL parameter is specified incorrectly.
Possible values are:

**SUBSYS**
This parameter can be invalid for the following reasons:
- The SUBSYS parameter is null.
- The SUBSYS parameter is too long.
- The SUBSYS parameter contained an invalid character.

**NUMTCB**
This parameter can be invalid for the following reasons:
- A comma was not present in the parameter list to separate the NUMTCB parameter from the previous parameter.
- The NUMTCB parameter is null.
- The NUMTCB parameter contained nonnumeric characters.
- The value of the NUMTCB parameter is zero.
- The value of the NUMTCB parameter is negative.
- The value of the NUMTCB parameter is greater than the maximum number of TCBs allowed in the DB2 stored procedures address space.

**APPLENV**
This parameter can be invalid for the following reasons:
- A comma was not present in the parameter list to separate the APPLENV parameter from the previous parameter.
- The value of the APPLENV parameter is longer than eighteen characters.

string
The value provided for the parameter in error.

**jclproc**
The name of the JCL PROC used to start this stored procedures address space.

**System Action:** The DB2 stored procedures address space terminates.
If MVS WLM is used to establish the stored procedure address space, WLM will retry the start of the address space two more times. If all three attempts fail, WLM will quiesce the WLM environment associated with the stored procedure address space.

**System Programmer Response:** Correct the JCL parameter used to invoke the DB2 stored procedure address space.

If MVS WLM is used to establish the stored procedure address space, the MVS VARY WLM,APPLENV=wlmenv,RESUME command might be required to resume the WLM application environment (wlmenv) associated with the stored procedures address space.

**Explanation:** A WLM-established stored procedures address space was unable to perform an RRS attach operation required to communicate with DB2.

| func | The RRS attach function that failed. Possible values are:
|      | - SPAS_ID
|      | - SPAS_INIT_SP
|      | - SPAS_TERM_SP

| ssn | The name of the DB2 subsystem involved with the RRS attach function.

| jclproc | The name of the JCL PROC used to start the stored procedures address space.

| asid | The MVS ASID of the address space where the function was attempted.

| wlmenv | The name of the WLM application environment where the function was attempted.

**System Action:** The stored procedures service task that encountered the error terminates. If this is the last service task in that address space, then that address space terminates.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws dakiki?rs=59&context=st10133&externalid=pub11133406) for information on identifying and reporting the problem.

**Problem Determination:**

---

**DSNX983I**  csect-name ATTEMPT TO PERFORM RRS ATTACH FUNCTION `func` FAILED WITH RRS ATTACH RC= rc RSN= rsn SSN= ssn PROC = jclproc ASID= asid WLM_ENV= wlmenv

**Explanation:** A DB2 stored procedures address space could not connect to the DB2 subsystem. This occurred because the DB2 code in the stored procedures address space was not at the same release level as the code in the DB2 subsystem.

| ssn | The name of the DB2 subsystem that the stored procedure address space was attempting to connect with.

| jclproc | The name of the JCL PROC used to start the stored procedures address space.

**System Action:** The stored procedures address space terminates.

**System Programmer Response:** Correct the DB2 library name in the STEPLIB for the JCL proc for the stored procedures address space. Make the library name the same as the library name used for the DB2 subsystem address spaces. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws dakiki?rs=59&context=st10133&externalid=pub11133406) for information on identifying and reporting the problem.

---

**DSNX984I**  csect-name ALL FUNCTIONS STARTED FOR THIS SCHEMA.

**Explanation:** All functions are started for the schema listed in the preceding DSNX956I message. This message is issued only when STOP FUNCTION SPECIFIC(‘*’) was in effect.

**System Action:** The DISPLAY SPECIFIC FUNCTION command processing continues.

---

**DSNX985I**  csect-name ALL PROCEDURES STARTED FOR THIS SCHEMA.

**Explanation:** All procedures are started for the schema listed in the preceding DSNX956I message. This message is issued only when a STOP PROCEDURE(‘*’) was in effect.

**System Action:** The DISPLAY PROCEDURE command processing continues.

---

**DSNX986I**  ATTEMPT TO `func` FAILED WITH RV = `rv` RC = rc RSN = rsn SSN = ssn PROC = jclproc

**Explanation:** A WLM-established stored procedures address space was unable to register itself to z/OS UNIX System Services. z/OS UNIX System Services
are not available to stored procedures running in the address space.

func The dub setting used by z/OS UNIX System Services BPX1SDD callable service. This can be DUBPROCESS or DUBTHREAD.

rv The return value given by z/OS UNIX System Services BPX1SDD callable service.

rc The return code given by z/OS UNIX System Services BPX1SDD callable service.

rsn The reason code given by z/OS UNIX System Services BPX1SDD callable service.

ssn The name of the DB2 subsystem to which this stored procedure address space was connected.

proc The name of the JCL PROC used to start this stored procedures address space.

System Action: The stored procedure address space initialization continues. z/OS UNIX System Services callable services’ return values, return codes, and reason codes are documented in z/OS UNIX System Services Messages and Codes.

Problem Determination: Most failures are due to the user ID associated with the WLM-established stored procedures address space not being RACF defined. If you suspect an error in DB2, refer to Part 3 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

It is also possible that the number of processes was exceeded for the user ID. If the NUMBER OF TCBS is set too high during install, NUMTCB may exceed the value of the UNIX System Services MACPROCUSER setting. Refer to z/OS UNIX System Services Messages and Codes for more information.

---

**DSNX987I csect-name NAME schema-name INVALID, COMMAND IGNORED.**

Explanation: The function name or procedure name supplied on the DISPLAY, START, or STOP, FUNCTION SPECIFIC or PROCEDURE command uses an invalid wildcard schema name. The qualified routine name must specify a full schema name, "**", "**.*", or blanks.

schema-name
The schema name containing invalid characters.

System Action: The START, STOP, or DISPLAY command is rejected.

---

**DSNX988I csect-name ALL OTHER FUNCTIONS IN OTHER SCHEMAS STOPPED act**

Explanation: A STOP FUNCTION SPECIFIC(".*") is currently in effect. Any functions not listed in the preceeding DSNX969, DSNX971, and DSNX976 messages are stopped act.

act The action provided on the STOP FUNCTION command

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

---

**DSNX989I csect-name ALL OTHER PROCEDURES IN OTHER SCHEMAS STOPPED act**

Explanation: A STOP PROCEDURE(".*") is currently in effect. Any functions not listed in the preceeding DSNX942, DSNX943, and DSNX950 messages are stopped act.

act The action provided on the STOP PROCEDURE command

System Action: The DISPLAY PROCEDURE command processing continues.

---

**DSNX990E csect-name IMS ODBA INITIALIZATION FAILED BECAUSE THE CALLABLE INTERFACE CANNOT BE LOADED**

Explanation: The IMS ODBA callable interface module cannot be loaded. No IMS database DL/I calls will be supported from stored procedures. Ensure the load module named AERTDLI is located within the partitioned dataset specified in the stored procedure address space startup procedure’s DFSRESLB dd card statement.

System Action: The stored procedure address space initialization continues.

---

**DSNX991I csect-name IMS ODBA INITIALIZATION COMPLETED**

Explanation: The initialization of the IMS ODBA callable interface has completed. Stored procedure applications may use DL/I calls to access IMS databases.

System Action: The stored procedure address space initialization continues.

---

**DSNX992E csect-name IMS ODBA INITIALIZATION FAILURE, AIB RC = rc**

Explanation: The initialization of the IMS ODBA callable interface has failed. Stored procedure applications cannot use DL/I calls to access IMS databases.

rc The AIB return code provided by IMS for the CIMS INIT call. Refer to the section on DL/I Return and Reason Codes in IMS Application Programming: Database Manager for more information regarding the failure.

System Action: The stored procedure address space initialization continues.
**DSNX993I**  csest-name CALL TO REXX
PROCEDURE execname FAILED,
FUNCTION = function RC = rc RSN = rsn

**Explanation:** An attempt to establish an environment to run a REXX stored procedure has failed. Use the following pieces of information to identify the error:

execname
The name of the REXX exec.

function
The TSO or REXX function call that failed. It can be one of three values: IKJTSOEV, IRXINIT, or IRXEXEC. For more information regarding the IKJTSOEV function, refer to z/OS TSO/E Programming Services. For information regarding IRXINIT and IRXEXEC, refer to z/OS TSO/E REXX Reference.

rc
The return code for the specific function, provided by TSO or REXX. For return code explanations, refer to z/OS TSO/E Programming Services and z/OS TSO/E REXX Reference.

reason
The reason code for the specified function, provided by TSO or REXX. For reason code explanations, refer to z/OS TSO/E Programming Services and z/OS TSO/E REXX Reference.

**System Action:** The stored procedure address space initialization continues.

**Problem Determination:** View the file associated with the SYSTSPRT DD card in the Stored Procedure Address Space start-up procedure. This file contains diagnostic messages issued by TSO regarding the failing function. Refer to z/OS TSO/E Messages for any messages found in the SYSTSPRT.

**DSNX994I**  SCOPE(GROUP) COMMAND CANNOT BE PROCESSED DUE TO COMMAND ALREADY IN PROGRESS

**Explanation:** A -DISPLAY PROCEDURE, -START PROCEDURE, -STOP PROCEDURE, -DISPLAY FUNCTION, -START FUNCTION, or -STOP FUNCTION command with SCOPE(GROUP) was issued at the same time that another data sharing member was processing a SCOPE(GROUP) command. DB2 could not obtain the lock necessary to serialize these commands.

**Severity:** 8 (error)

**System Action:** The command is not processed on any members of the data sharing group.

**User Response:** Enter the command again.
Chapter 23. DSNY... messages

DSNY001I  SUBSYSTEM STARTING
Explanation:  The -START DB2 command is accepted. This message is issued to the MVS console that issued the -START command. The DSN9022I message is sent when the DB2 subsystem startup process has completed. Refer to the DSN9022I message for additional information.
System Action:  DB2 startup processing begins.

DSNY002I  SUBSYSTEM STOPPING
Explanation:  The -STOP DB2 command is accepted. The DSN9022I message is issued when the DB2 subsystem shutdown process has completed. The message is issued either to the origin of the -STOP DB2 command (for MVS MCS console) or to the MVS console from which the -START DB2 command was received. Refer to the DSN9022I message for additional information.
System Action:  DB2 subsystem shutdown is initiated.

DSNY003I  SUBSYSTEM IS ALREADY ACTIVE
Explanation:  The -START DB2 command has not been accepted, because the DB2 subsystem is active. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.

DSNY004I  SUBSYSTEM IS ALREADY STOPPING
Explanation:  The -STOP DB2 command has not been accepted either because the DB2 subsystem shutdown is in progress for the specified option (QUIESCE or FORCE), or because the QUIESCE option was specified after a FORCE option had been previously accepted. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.
System Action:  DB2 subsystem shutdown is continued.

DSNY005I  SUBSYSTEM STARTUP TERMINATED, INVALID START COMMAND
Explanation:  The DB2 subsystem can be started only by a -START DB2 command.
System Action:  DB2 subsystem startup is terminated.
Operator Response:  Start the DB2 subsystem via the -START DB2 command, and reenter the rejected command.

DSNY006I  csect-name INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE module name
Explanation:  The Initialization Procedures subcomponent detected that a module had an invalid AMODE or RMODE attribute when it was loaded. In the error message, 'module name' is the name of the load module with an invalid addressing or residency mode.
System Action:  DB2 subsystem startup is terminated.
Operator Response:  Notify the system programmer of the failure.
System Programmer Response:  Verify that all installation and maintenance activities against DB2 were executed using SMP, that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the Linkage Editor provided with the Data Facility Product (DFP) was invoked by SMP for the link edits. Correct the procedure or JCL that caused the error and rerun the necessary SMP jobs.
Problem Determination:  A DB2 dump was requested to an MVS SYS1.DUMP data set. The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNY007I  LOAD MODULE DSNHDECP DOES NOT HAVE RMODE(24) ATTRIBUTE
Explanation:  The named load module was not link-edited with the required RMODE(24) attribute.
System Action:  DB2 startup is abended with reason code 00E80160.
Operator Response:  Notify the system programmer.
System Programmer Response:  Verify that all installation and maintenance activities against DSNHDECP were executed using SMP. JCLIN for SMP must have included the correct AMODE and RMODE control statements. The Linkage Editor, provided with the Data Facility Product (DFP), was invoked by SMP for the link edits. Correct the procedure or JCL that caused the error and rerun the necessary SMP jobs.
Problem Determination:  The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNY008I  SUBSYSTEM SHUTDOWN REQUEST NOT ACCEPTED
Explanation:  The -STOP DB2 command has not been accepted because a subsystem startup has not completed to the point where shutdown can occur. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.
**DSNY009I** - **DSNY020I**

**System Action:** DB2 startup continues and the -STOP DB2 command is ignored.

**User Response:** Reissue the -STOP DB2 command after subsystem startup has completed.

**DSNY009I** SUBSYSTEM STARTING IN LIGHT MODE, NORMAL TERMINATION TO FOLLOW RELEASE OF RETAINED LOCKS

**Explanation:** DB2 issues this message during DB2 startup if it is restarted in light mode.

**System Action:** DB2 startup continues normally. The DB2 member will automatically shut itself at the end of restart after the retained locks are removed if there are no indoubt units of recovery. If indoubt units of recovery exist, then the DB2 member remains up and running in light mode so that the indoubts can be resolved.

**DSNY010I** LOAD MODULE module name IS NOT AT THE CORRECT RELEASE/VERSION LEVEL

**Explanation:** The named load module is not at the correct release/version level for the version of DB2 that was being started.

**System Action:** DB2 startup is abended with reason code 00E80161.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Verify that the correct load libraries are being used. Also verify that the application of maintenance did not result in modules being link edited into the wrong load libraries.

**DSNY011I** csect-name Z/ARCHITECTURE WITH 64-BIT ADDRESSING IS REQUIRED FOR THIS RELEASE OF DB2

**Explanation:** An attempt was made to start DB2 on a processor that either does not support z/Architecture, or is not enabled for 64-bit addressing.

**System Action:** DB2 startup abends with reason code 00E8005A.

**System Programmer Response:** Ensure that the processor on which DB2 is started supports z/Architecture and is enabled for 64-bit addressing.

**DSNY012I** csect-name THIS RELEASE OF DB2 REQUIRES Z/OS V1R3 OR ABOVE

**Explanation:** An attempt was made to start DB2 on an operating system image that was not z/OS V1R3 or above.

**System Action:** DB2 startup abends with reason code 00E80058.

**System Programmer Response:** Ensure that z/OS V1R3 or above is enabled before starting DB2.

**DSNY014I** n csect DB2 HAS BEEN STARTED WITH ACCESS(MAINT)

**Explanation:** This DB2 has been started with option ACCESS(MAINT).

**Severity:** 0 (informational)

**System Action:** None.

**Programmer Response:** None.

**DSNY015I** LIGHT(YES) ON START DB2 COMMAND WAS IGNORED, SYSTEM IS NOT ENABLED FOR DATA SHARING

**Explanation:** DB2 issues this message during startup if DB2 is started with the LIGHT(YES) keyword and the system is not enabled for data sharing.

**System Action:** DB2 startup continues normally, ignoring the LIGHT(YES) keyword.

**DSNY020I** csect-name MEASURED USAGE DATA IS NOT BEING RECORDED FOR subsystem/address-space

**Explanation:** For measured usage data to be recorded, SMF type 89 records must be collected. Two PTFs must be applied: one to the early code and one to the base. Until both are active, measured usage data cannot be recorded.

**System Action:** Processing continues, but measured usage for either the DB2 subsystem or the specified DB2 address space is not recorded.

**Programmer Response:** If measured usage data is needed, be sure that SMF type 89 records are collected and that both PTFs are applied to the running system. An IPL is required for the change to early code.

If the records are being recorded, the PTFs are applied, and an address-space is in the message, then the return code for the MVS service is located in ASCEMULC for that address space.
## Chapter 24. DSNZ... messages

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ002I</strong></td>
<td>src DSNZINIT SUBSYSTEM ssnm SYSTEM PARAMETERS LOAD MODULE NAME IS dsnzparm-name</td>
</tr>
</tbody>
</table>

**Explanation:** DB2 subsystem 'ssnm' is being started with the 'dsnzparm-name' DSNZPARM load module. This message is written to the MVS console which entered the -START DB2 command. The message will also appear in the JES SYSLOG and on the JES job log of ssnmMSTR. The message contains the name of the DSNZPARM load module entered by the operator or the default name (DSNZPARM) if no name was entered.

**System Action:** DB2 startup processing continues.

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ003I</strong></td>
<td>csect-name DSNZINIT CSECT parm-csect NOT FOUND IN SYSTEM PARAMETERS.</td>
</tr>
</tbody>
</table>

**Explanation:** The named parm-csect was not found in the system parameters (ZP Parm) specified when starting DB2. This CSECT is required to start DB2. The name of the system parameters load module that is missing this CSECT is identified in previously issued message DSNZ002I.

This error can occur if the system parameters load module specified is for a different release of DB2.

**System Action:** DB2 subsystem startup processing stops.

**Operator Response:** Verify that the correct system parameters name was specified. If the correct name was specified, notify the system programmer.

**System Programmer Response:** Verify that:
- The system parameters load module is for the release of DB2 being started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ004I</strong></td>
<td>csect-name DSNZINIT INCORRECT LEVEL wrong-level FOUND IN parm-csect SYSTEM PARAMETERS. LEVEL correct-level IS REQUIRED.</td>
</tr>
</tbody>
</table>

**Explanation:** The system parameters load module CSECT parm-csect contains an incorrect level identifier. The CSECT contains a level identifier of wrong-level and the DB2 that is starting requires a level identifier of correct-level.

This error can occur if the system parameters load module specified is for a different release of DB2. This error can also occur if the system parameters load module is missing some maintenance. In this case the parm-csect is down level and must be reassembled.

**System Action:** DB2 subsystem startup processing stops.

**Operator Response:** Verify that the correct system parameters name was specified. If the correct name was specified, then notify the system programmer.

**System Programmer Response:** Verify that:
- The system parameters load module is for the release of DB2 being started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ006I</strong></td>
<td>src SUBSYS ssnm SYSTEM PARAMETERS LOAD MODULE NAME module-name IS BEING LOADED</td>
</tr>
</tbody>
</table>

**Explanation:** DB2 subsystem ssnm is loading parameters from module-name subsystem parameters load module.

**System Action:** DB2 online refresh of subsystem parameters continues.

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ007I</strong></td>
<td>src SUBSYS ssnm SYSTEM PARAMETERS LOAD MODULE NAME module-name LOAD COMPLETE</td>
</tr>
</tbody>
</table>

**Explanation:** DB2 subsystem ssnm has loaded subsystem parameters load module module-name, and has notified all resource managers.

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DSNZ008I</strong></td>
<td>src CSECT parm-csect NOT FOUND IN SYSTEM PARAMETERS</td>
</tr>
</tbody>
</table>

**Explanation:** The named parm-csect was not found in the subsystem parameters load module specified in the -SET SYSPARM command. Message DSNZ007I, which was issued prior to this message, identifies the name of the subsystem parameters load module that is missing this CSECT.

**System Action:** DB2 online refresh of subsystem parameters terminates.

**System Programmer Response:** Verify that:
- The system parameters load module matches the release level of the DB2 that was started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.
**DSNZ009I**  
*src INCORRECT LEVEL wrong-level FOUND IN parm-csect SYSTEM PARAMETERS. LEVEL correct-level IS REQUIRED.*

**Explanation:** This message, issued during -SET SYSPARM command processing, indicates the specified subsystem parameters load module CSECT parm-csect contains an incorrect level identifier. The CSECT contains a level identifier of wrong-level.

The active DB2 subsystem requires a level identifier of correct-level. This error can occur if the specified subsystem parameters load module does not match the release level of the DB2 system. This error can also occur if the subsystem parameters load module requires additional maintenance. In the latter case, the parm-csect is down-level and requires reassembly.

**System Action:** DB2 online refresh of subsystem parameters terminates.

---

**DSNZ010I**  
*src SUBSYS ssnm SYSTEM PARAMETERS LOAD MODULE NAME module-name NOT FOUND, BLDL R15=rc, R0=rsn*

**Explanation:** During -SET SYSPARM command processing on subsystem ssnm, the specified subsystem parameters load module module-name could not be located during MVS BLDL processing. The BLDL issued a return code of rc and a reason code of rsn.

**System Action:** DB2 online refresh of subsystem parameters terminates.

**System Programmer Response:** Verify that the named load module exists, and that DB2 can access it.

---

**DSNZ011I**  
*src SUBSYS ssnm SYSTEM PARAMETERS SET TO STARTUP*

**Explanation:** DB2 issues this message when the STARTUP parameter is specified on the -SET SYSPARM command. The message indicates that the subsystem parameters specified at DB2 startup are now in effect.

**System Action:** Processing continues.

---

**DSNZ012I**  
*src SUBSYS ssnm SYSTEM PARAMETERS LOAD MODULE NAME module-name NOT LOADED, LOAD R15=rc, R1=rsn*

**Explanation:** DB2 issues this message during -SET SYSPARM command processing on subsystem ssnm, where the load of module-name failed. rc and rsn are the return and reason codes from the MVS LOAD.

**System Action:** Online refresh of subsystem parameters terminates.

---

**DSNZ013I**  
*src SUBSYS ssnm SYSPARM COMMAND REJECTED, COMMAND ALREADY IN PROGRESS*

**Explanation:** The current -SET SYSPARM command is rejected due to processing of a previous -SET SYSPARM command.

**System Action:** Online refresh of subsystem parameters for this command is rejected.

**User Response:** Retry the command after the previous -SET SYSPARM command completes.

---

**DSNZ014I**  
*src PARAMETER parm-name IN CSECT load-csect-name CANNOT BE CHANGED ONLINE. PARAMETER CHANGE IGNORED.*

**Explanation:** Subsystem parameter parm-name in load-csect-name is different from its start-up value, but parm-name cannot be changed online.

**System Action:** DB2 uses the start-up value for parameter parm-name.

---

**DSNZ015I**  
*src YOU MUST HAVE INSTALL SYSADM AUTHORITY TO CHANGE PARAMETER parm-name ONLINE. PARAMETER CHANGE IS IGNORED.*

**Explanation:** Install SYSADM authority is needed to change the parm-name parameter using the SET SYSPARM command. The previous value for parm-name is used.

**System Action:** The value for the parm-name parameter is not changed in the newly-loaded module.
Chapter 25. DSN1... messages

The messages in this section apply to DSN1LOGP, DSN1COPY, DSN1COMP, DSN1PRNT, and DSN1CHKR.

The value shown for 'severity' is the value returned as the job-step condition code from the job step in which the message is issued. If additional messages having higher severity values are issued during the same job step, the higher value is reflected as the job-step condition code.

Severity values have the following meanings:

- **0**: An informational message. No error occurred.
- **4**: A warning message. A condition was detected of which the user should be aware. The user might need to take further action.
- **8**: An error message. An error situation was detected and processing could not continue.
- **12**: A severe error message. A severe error situation was detected and processing could not continue.

---

**DSN110E** LIMIT OF 50 STATEMENTS EXCEEDED

**Explanation:** DSN1LOGP allows a total of 50 statements for a given job.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job using no more than 50 statements.

---

**DSN111E** LIMIT OF 80 TOKENS EXCEEDED

**Explanation:** DSN1LOGP allows a total of 80 keywords and corresponding value specifications. A keyword with its value is considered two tokens.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job using no more than 80 keywords.

---

**DSN112E** TOKEN xx..xx EXCEEDS 64 HEXADECIMAL CHARACTERS

**Explanation:** The SYSIN input contains the character string 'xx..xx'. This string is invalid.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job with the specified token being no more than 64 hexadecimal characters in length.

---

**DSN113E** VALUE FOR KEYWORD xxxxxxxx INVALID

**Explanation:** The SYSIN input contains the keyword 'xxxxxxx'. The value specified for that keyword is not of the form '(value)'.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job with the correct form of the keyword. The problem might be that the closing parenthesis ')' is missing or that an extra blank exists in the value.

---

**DSN114E** RBASTART MULTIPLE DEFINED

**Explanation:** The RBASTART parameter can be specified only once for a given job.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job using a single RBASTART value.

---

**DSN115E** csect-name KEYWORD keyword ALLOWS ONLY number HEX CHARACTERS

**Explanation:** The value given for keyword is too long.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job providing no more than the maximum number of characters allowed for the keyword.
**DSN116E**  
**csect-name keyword IS USED MORE THAN ONCE.**

*Explanation:* The *keyword* can be used only once in a single job.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a single keyword.

---

**DSN117E**  
**csect-name keyword SPECIFIED WITH NO VALUE OR INCORRECT VALUE**

*Explanation:* The keyword must be followed by a correct value.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a correct value for the keyword.

---

**DSN118E**  
**RBAEND > 12 HEX CHARACTERS**

*Explanation:* The maximum size of a log RBA in DB2 is 6 bytes (hence, 12 characters).

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing an RBAEND value that is no more than 12 hexadecimal characters.

---

**DSN119E**  
**DBID MULTIPLE DEFINED**

*Explanation:* The DBID keyword can be specified only once for a given job.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a single DBID value.

---

**DSN120E**  
**DBID SPECIFIED WITH NO VALUE**

*Explanation:* The DBID keyword specifies a hexadecimal database identifier and must be followed by a value.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a DBID (value).

---

**DSN121E**  
**DBID > 4 HEX CHARACTERS**

*Explanation:* A DBID is 2 bytes in length (hence, 4 characters maximum).

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a DBID which is no longer than 4 hexadecimal characters.

---

**DSN122E**  
**OBID MULTIPLY DEFINED**

*Explanation:* The OBID keyword can be specified only once for a given job.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a single OBID value.

---

**DSN123E**  
**OBID SPECIFIED WITH NO VALUE**

*Explanation:* The OBID keyword specifies a hexadecimal database object identifier. OBID must be followed by a value.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing an OBID (value).

---

**DSN124E**  
**OBID > 4 HEX CHARACTERS**

*Explanation:* An OBID is 2 bytes in length (hence, 4 characters maximum).

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing an OBID which is no longer than 4 hexadecimal characters.

---

**DSN125E**  
**PAGE SPECIFIED WITH NO VALUE**

*Explanation:* The PAGE keyword specifies a hexadecimal page number. PAGE must be followed by a value.

*Severity:* 8 (error)

*System Action:* Processing is terminated.

*User Response:* Resubmit the job providing a PAGE (value).

---

**DSN126E**  
**PAGE > 6 HEX CHARACTERS**

*Explanation:* A page number is 3 bytes in length (hence, 6 characters maximum).

*Severity:* 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing a PAGE value which is no longer than 6 hexadecimal characters.

**DSN1127E** KEYWORD xxxxxxxx UNKNOWN
Explanation: DSN1LOGP does not recognize the keyword 'xxxxxxx'.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Check to make sure all keywords are valid and resubmit the job.

**DSN1128E** csect-name keyword KEYWORD SPECIFIED WITHOUT keyword
Explanation: The identified keywords are associated with each other. You cannot specify one keyword without the other keyword.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing the corresponding correct keywords.

**DSN1129E** PAGE WITHOUT DBID OBID
Explanation: DB2 pages exist in objects called 'page sets'. When you specify a page, you must also identify the page set by using the appropriate DBID and OBID specifications.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing the associated DBID (value) and OBID (value) that correspond to the given page.

**DSN1130E** OBID WITHOUT DBID
Explanation: When you specify an OBID, you must also identify the database that contains that OBID by specifying the DBID of the database.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing both an OBID (value) and a DBID (value).

**DSN1131E** OFFSET/VALUE PAIR NUMBER xx CONTAINS INVALID HEX DATA
Explanation: A hexadecimal specification is required. The value for offset/value pair number 'xx' contains an invalid hexadecimal character.
Severity: 8 (error)

**DSN1127E** KEYWORD xxxxxxxx UNKNOWN
Explanation: DSN1LOGP does not recognize the keyword 'xxxxxxx'.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing a correct hexadecimal value specification.

**DSN1132E** URID SPECIFIED WITH NO VALUE
Explanation: The URID keyword specifies the hexadecimal unit of recovery identifier. URID must be followed by a value.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing an associated value for the URID parameter.

**DSN1133E** URID > 12 HEX CHARACTERS
Explanation: The maximum size of a URID in DB2 is 6 bytes (hence, 12 characters).
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing a valid URID value of no more than 12 hexadecimal characters.

**DSN1134E** csect-name LIMIT OF number keyword$ IS EXCEEDED
Explanation: The keyword was specified more than the maximum number of times allowed in any given job.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job specifying this keyword no more than the maximum number of times.

**DSN1135E** SUMMARY MULTIPLY DEFINED
Explanation: The SUMMARY option can be specified only once.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job using a single SUMMARY specification.

**DSN1136E** SUMMARY SPECIFIED WITH NO VALUE OR INCORRECT VALUE
Explanation: The permitted values for summary are YES, NO, ONLY, or FILTER.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Resubmit the job providing a valid parameter for the SUMMARY option.
**Severity:** 698

**Explanation:** This message shows the log sequence number of a record that serves as an implicit indication that a restart occurred just prior to this point.

*seq*  
RBA or LRSN

*nnnnnnnnnn*  
The log sequence number

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job specifying only one of the keywords.

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job providing a valid RID (value).

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job providing a valid RID value of no more than 8 hexadecimal characters.

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Resubmit the job providing the associated DBID (value) and OBID (value) that correspond to the given RID value.

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Examine current log to determine whether multiple processors are writing to the same log. (Data may be being overwritten.) This may lead to data inconsistencies.
DSN1147E  SYSCOPY MULTIPLY DEFINED

Explanation: The SYSCOPY option can only be specified once.

Severity: 8

System Action: Processing is terminated.

User Response: Resubmit the job using a single SYSCOPY specification.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

DSN1148E  SYSCOPY SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The SYSCOPY keyword must be specified with either a YES or NO value. Any other value (including no value) is incorrect.

This message is issued by the following CSECT: DSN1LPAR

Severity: 8

System Action: Processing is terminated.

User Response: Resubmit the job specifying the correct value for the SYSCOPY parameter.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

DSN1150I  SUMMARY OF COMPLETED EVENTS

Explanation: This message heads the summary of completed units of recovery (URs) and checkpoints. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Severity: 0 (informational)

System Action: Processing continues.

---

DSN1147I  csect-name mbn UR CONNID=cc
CORRID=bb AUTHID=aa PLAN=pp
START DATE=yy.dddd TIME=hh:mm:ss
DISP=xx INFO=ii STARTRBA=ss
ENDRBA=ee STARTLRSN=rr
ENDLRSN=nn NID=nnid LUWID=luid
COORDINATOR=name PARTICIPANTS:
(list of participants)

Explanation: This message describes a unit of recovery (UR) that terminated for data sharing member mbn.

mbn MEMBER=membername, where membername is the member of a data sharing group. This is printed only for a data sharing record.

cc Connection ID (for example, BATCH).

bb Correlation ID (for example, JOB xxx).

aa Authorization ID executing the UR.

pp Plan name used by the UR.

DSN1LOGP returns a plan name of SYSTEM in this field if the UR was generated as a result of a system event (such as the first update of a table space). In such a case, no bound plan exists for the UR described.

yy.dddd Starting date of the UR.

hh:mm:ss Starting time of the UR.

xx Disposition of the UR. Values reported are:

   Inflight
   In-abort
   In-commit
   Indoubt
   Committed
   Aborted
   P-Aabort

If the UR was bypassed by a conditional restart, DSN1LOGP indicates this by preceding the disposition value with the word BYPASSED.

ii The status of the data is one of the following:

   COMPLETE, indicating that all page sets modified by this UR were identified.
   PARTIAL, indicating that the list of page sets modified by this UR is incomplete.
   DSN1LOGP indicates PARTIAL status if all records associated with a UR are not available, and no checkpoint is found before the UR's completion.

ss RBA of the first log record associated with the UR (that is, the URID).

ee RBA of the last log record associated with the UR.
rr    LRSN of the first log record associated with the UR.

nn    LRSN of the last log record associated with the UR

nid   The identifier assigned by IMS or CICS for this UR. This is blank if the UR is a result of TSO, batch, or remote access.

luwid The logical unit of work identifier associated with the UR

name  The name of the remote coordinator associated with the UR. This is blank if the coordinator is the local DB2, IMS, or CICS.

list of participants
The names of all remote participants that might have updated data in this UR.

This message is followed by messages that identify the page sets modified by the UR. For each page set, a single message is printed in the following form:

DATABASE=dbid=dbname
PAGE SET=obid=psname

Where:

dbid    Internal database identifier

ddbname Database name corresponding to the dbid

obid    Internal page set identifier

psname  Page set name corresponding to the OBID
The dbname and psname fields might be absent if a full checkpoint was unavailable to DSN1LOGP or was caused by overlapped processing of DB2 during a checkpoint.

If no data was modified by the UR (for example, certain URs might be created merely to track information that is valid only for the life of the application), the phrase NO DATA MODIFIED is printed.

Severity: 0 (informational)
System Action: Processing continues.

mbn    MEMBER=memberofname, where membername is the member of a data sharing group. This is printed only for a data sharing record.

The remaining information (DISP, INFO, START, END, NID, LUWID, COORDINATOR and PARTICIPANTS) appears just as it does in message DSN1151I. If the UR did not complete, the END RBA or LRSN values are not printed.

This message is followed by messages that identify the page sets modified by the UR. Details of that are in the explanation of message DSN1151I.

Severity: 0 (informational)
System Action: Processing continues.

mbn    MEMBER=memberofname, where membername is the member of a data sharing group. This is printed only for a data sharing record.

Explanation: This message describes a complete checkpoint on the log starting and ending RBA or LRSN for data sharing member mbn. If the information is available, DSN1LOGP also returns the date and time that the checkpoint started.

When this message follows message DSN1151I, the message DSN1153I also returns the date and time that the checkpoint started.

Severity: 0 (informational)
System Action: Processing continues.

Explanation: A normal restart occurred at log RBA xx or LRSN ll.

mbn    MEMBER=memberofname, where membername is the member of a data sharing group. This is printed only for a data sharing record.

Explanation: This message describes a unit of recovery (UR) for data sharing member mbn. The UR identifying information (**) described in message DSN1151I is unavailable.
DSN1155I  csect-name CONDITIONAL RESTART  
member=membername, where membername is the member of a data sharing group. This is printed only for a data sharing record. 
Explanation: A conditional restart occurred at the log RBA xx and LRSN //. DSN1LOGP also returns the date and time of that restart. 
ss  Relative byte address of the beginning of the restart 
ee  Relative byte address of the conclusion of the restart 
ff  Whether forward log recovery phase was to be bypassed (YES | NO) 
bb  Whether backward log recovery phase was to be bypassed (YES | NO) 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1156I  ALL URS COMPLETE 
Explanation: There are no URs outstanding for restart. 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1157I  RESTART SUMMARY 
Explanation: This message heads the summary of the description of work to be performed at restart. Restart information that follows is based on the scope of the log scanned. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem. 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1158I  NO CHECKPOINT AVAILABLE — RESTART SUMMARY INCOMPLETE 
Explanation: No checkpoint is available within the scope of the log scanned. The information following this message includes: 
• URs that have not completed 
• Page sets modified by these URs 
• Page sets with writes pending. 
The information cannot be considered complete. 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1159I  NO DATABASE WRITES PENDING 
Explanation: All database I/O has been completed. If the Log Extractor can find no complete checkpoint, it will return an additional message '(BASED ON INCOMPLETE LOG INFORMATION)', to warn you that there may in fact be pending database writes. 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1160I  DATABASE WRITES PENDING: 
Explanation: Database writes are pending at restart. Each page set with outstanding I/O is identified by a separate message following this one: 
DATABASE=dbname PAGESET=psname START=ss 
Where: 
  dbid Internal database identifier 
  dbname Database name corresponding to the dbid 
  obid Internal page set identifier 
  psname Page set name corresponding to the obid 
Note: dbname and psname may be absent if a full checkpoint was unavailable to the Log Extractor or was caused by overlapped processing of DB2 during a checkpoint. 
ss  Log RBA of the earliest log record required to complete outstanding writes for this page set. If the value of ss is returned as **, this information is unavailable. Such will be the case if the Log Extractor is unable to locate a full checkpoint. In this event, DSN1LOGP will return an additional message (LIST MAY BE INCOMPLETE), to alert you to the possibility that the list of page sets with outstanding writes may be incomplete. 
Severity: 0 (informational) 
System Action: Processing continues.

DSN1162I  csect-name membername CONNID=cc 
CORRID=bb AUTHID=aap PLAN=app 
START DATE=yy.ddd TIME=hh:mm:ss 
DISP=xx INFO=// STARTRBA=ss 
STARTLRSN=ll NID=nn LUWID=luwID 
COORDINATOR=name PARTICIPANTS: 
(list of participants) 
Explanation: This message describes a unit of recovery (UR) that has not terminated. The information returned is the same as for message DSN1151, except
DSN1163E  •  DSN1175E

that the END field is not included in the message because the UR did not terminate.

mbn MEMBER=membername, where membername is the member of a data sharing group. This is printed only for a data sharing record.

Severity:  0 (informational)
System Action:  Processing continues.

DSN1163E  NO CHECKPOINT AVAILABLE DUE TO LOG ERROR -- RESTART SUMMARY INCOMPLETE

Explanation:  A log error was encountered. DSN1LOGP marked any checkpoints encountered before the log error as invalid. There were no complete checkpoints following the log error in the specified log range. The information following this message includes:
• URs that have not completed
• Page set modified by these URs
• Page sets with writes pending.

This information cannot be considered complete.

Severity:  0 (informational)
System Action:  Processing continues.

DSN1164E  INVALID xxxx FOUND AT RBA = YYYYYYYYY

Explanation:  While processing the SUMMARY option, an invalid checkpoint record (either URE or RURE identified by 'xxxx') was encountered in the log.

Severity:  0 (informational)
System Action:  Processing continues.

User Response:  If the checkpoint record identified in the message is used to restart DB2, the restart will fail because DB2 will not be able to process the unit of recovery presented by the invalid URE or RURE. DB2 must be restarted from a previous checkpoint to correctly process all units of recovery. The print log map (DSNJU004) utility can be used to list the checkpoint records in the BSDS, and the CHKPTRBA parameter of the change log inventory (DSNJU003) utility can be used to direct the DB2 restart to use a particular checkpoint.

DSN1170E  SUBTYPE MULTIPLY DEFINED

Explanation:  The SUBTYPE parameter can be specified only once for any given job.

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Provide a single SUBTYPE value and resubmit the job.

DSN1171E  SUBTYPE SPECIFIED WITH NO VALUE

Explanation:  The SUBTYPE parameter specifies a decimal set subtype. The SUBTYPE must be followed by a value, i.e. SUBTYPE(value).

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Provide a SUBTYPE value and resubmit the job.

DSN1172E  SUBTYPE > 2 DECIMAL CHARACTERS

Explanation:  The maximum size of a SUBTYPE is 2 decimal characters.

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Provide a SUBTYPE value with a maximum of 2 decimal characters and resubmit the job.

DSN1173E  csect-name INVALID VALUE value SPECIFIED FOR KEYWORD keyword

Explanation:  The specified keyword value is not valid.

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Refer to DB2 Utility Guide and Reference for a list of valid values. Provide a valid value and resubmit the job.

DSN1174E  OFFSET SPECIFIED WITH NO SUBTYPE

Explanation:  The given OFFSET has no corresponding SUBTYPE.

This message is issued by the following CSECT: DSN1LPAR

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Provide a valid SUBTYPE for the given OFFSET and resubmit the job.

DSN1175E  OFFSET SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation:  The given OFFSET has no corresponding VALUE given or an incorrect VALUE is specified, such as specifying another keyword in place of a value.

Severity:  12 (severe error)
System Action:  Processing terminates.

User Response:  Provide a valid VALUE for the given OFFSET and resubmit the job.
DSN1176  OFFSET > 8 HEX CHARACTERS
Explanation: The maximum size for an OFFSET is 4 bytes (hence, 8 characters).
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide an OFFSET with a maximum of 8 characters and resubmit the job.

DSN1177E  LIMIT OF 10 OFFSET, VALUE PAIRS EXCEEDED
Explanation: A maximum of 10 OFFSET, VALUE pairs can be specified for a given log record SUBTYPE.
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide a maximum of 10 OFFSET, VALUE pairs for a given SUBTYPE and resubmit the job.

DSN1178E  OFFSET SPECIFIED WITH NO CORRESPONDING VALUE
Explanation: The given OFFSET has no corresponding VALUE keyword specified.
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide an associated VALUE (value) for the given OFFSET and resubmit the job.

DSN1179E  VALUE SPECIFIED WITH NO CORRESPONDING OFFSET OR SUBTYPE PARAMETER
Explanation: The given VALUE has either no corresponding OFFSET or SUBTYPE parameter specified.
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide an associated OFFSET or SUBTYPE for the given VALUE and resubmit the job.

DSN1180E  VALUE SPECIFIED WITH NO VALUE OR INCORRECT VALUE
Explanation: The given VALUE has no corresponding value given, an incorrect value is specified, such as specifying a keyword in place of a value, or an uneven number of characters were specified.
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide a valid value for the given VALUE and resubmit the job.

DSN1181E  VALUE SPECIFIED WITH NO CORRESPONDING OFFSET
Explanation: The given VALUE has no corresponding OFFSET specified.
Severity: 12 (severe error)
System Action: Processing terminates.
User Response: Provide a valid OFFSET for the given VALUE and resubmit the job.

DSN1182E  LIMIT OF 10 LUWIDs EXCEEDED
Explanation: A maximum of 10 LUWID keywords can be specified in any given job.
Severity: 8 (error)
System Action: DSN1LOGP processing is terminated.
User Response: Resubmit the job providing no more than 10 LUWID keywords.

DSN1183E  LUWID SPECIFIED WITH INCORRECT VALUE OR NO VALUE
Explanation: The LUWID consists of an LU network name, an LUW instance number, and a commit sequence number. The LU network name consists of a 1 to 8 character network ID, a period, and a 1 to 8 character network LU name. The LUW instance number consists of a period followed by 12 hexadecimal characters. The LUW sequence number consists of a period followed by 4 hexadecimal characters.
Severity: 8 (error)
System Action: DSN1LOGP processing is terminated.
User Response: Resubmit the job providing a valid LUWID value.

DSN1184E  FILTER KEYWORD MULTIPLY DEFINED
Explanation: The FILTER keyword was specified more than once.
Severity: 8 (error)
System Action: DSN1LOGP processing is terminated.
User Response: Correct the input to provide only one FILTER keyword and resubmit the job.

DSN1185E  FILTER KEYWORD SPECIFIED WITHOUT SUMMARY KEYWORD
Explanation: The FILTER keyword was specified without an associated SUMMARY keyword.
Severity: 8 (error)
System Action: DSN1LOGP processing is terminated.
User Response: Correct the input to include the SUMMARY keyword and resubmit the job.
DSN1191I • DSN1210E

**DETAIL REPORT OF PAGE REGRESSION ERRORS**

**Explanation:** This message is always generated as the title for a detailed report of page regression errors. It precedes message DSN1192I.

**DBID OBID PAGE# CURRENT MEMBER PREV-LEVEL PREV-UPDATE DATE TIME**

**Explanation:** This message contains the title of the detail page regression information.

**dbid obid page# current member prev-level prev-update date time**

**Explanation:** This message contains the following information about a page regression error:
- dbid: Hexadecimal DBID of the database that has page regression.
- obid: Hexadecimal OBID of the pageset that has page regression.
- page#: Hexadecimal pageset page number that has been regressed.
- CURRENT: RBA/LRSN of the current log record at which the page regression has been detected. In non-datasharing, the RBA is printed and in datasharing environment, the LRSN value is printed.
- member: The two-byte member ID of the DB2 member that wrote the log record. In non-datasharing, this value is zero.
- prev-level: Previous level of the page from the current log record.
- prev-update: The previous update to the page found during log processing.
- date: The date portion of the current log record LRSN value, in printable format.
- time: The time portion of the current log record LRSN value, in printable format.

**SUMMARY REPORT OF PAGE REGRESSION ERRORS**

**Explanation:** This message is always generated as the title for a summary report of page regression errors. It precedes message DSN1195I.

**DATABASE SPACENAM DBID OBID #PG-REGRESSIONS**

**Explanation:** This message contains the summary title of the page regression information.

**dbid obid dbid obid dbid obid #pg-regressions**

**Explanation:** This message contains the following summary information about page regression errors:
- **database:** The name of the database that has page regression. An asterisk would be printed if the name is unknown.
- **spacenam:** The name of the pageset that has page regression. An asterisk would be printed if the pageset name is unknown.
- **dbid:** Hexadecimal DBID of the pageset that has page regression.
- **obid:** Hexadecimal OBID of the database that has page regression.
- **# pg-regressions:** The total number of regressed pages for the pageset.

**TOTAL NUMBER OF PAGES CHECKED FOR REGRESSION = page-count**

**Explanation:** This message lists the total number of unique pages that DSN1LOGP has checked for page regression errors. page-count is displayed in decimal format.

*******NO REGRESSED PAGES DETECTED*******

**Explanation:** No page regression errors were detected within the RBA/LRSN range that was specified.

**DSN1210E DSNJSLR ERROR RETCODE=xxxxxxxx REASON CODE =yyyyyyyy**

**Explanation:** The stand-alone log read function detected an error. The return code (RETCODE) is explained in Appendix C (Volume 2) of [DB2 Administration Guide](#). The reason code is explained in Part 4, "Section 4. DB2 Codes," on page 771.

**Severity:** 8 (error)

**System Action:** Processing is terminated.
**Severity:** 0 (informational)

**System Action:** Processing continues.

**User Response:** Determine if the problem is your error by dumping the data set and determining if it is a log data set.

**Problem Determination:** A common error is to specify the first data set on an archive tape (the 'Bxxxxxx' data set) as a log data set; it is actually a BSDS.

**Explanation:** This message identifies the sequence number of the first log record that was read.

<table>
<thead>
<tr>
<th>seq</th>
<th>RBA or LRSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq</td>
<td>RBA or LRSN</td>
</tr>
</tbody>
</table>

**Severity:** 0 (informational)

**System Action:** Processing continues.

**Explanation:** This message identifies the sequence number of the last log record that was read.

<table>
<thead>
<tr>
<th>seq</th>
<th>RBA or LRSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq</td>
<td>RBA or LRSN</td>
</tr>
</tbody>
</table>

**Severity:** 0 (informational)

**System Action:** Processing continues.

**Explanation:** This identifies the number (in decimal) of 'logical' log records read during DSN1LOGP processing.

**Severity:** 0 (informational)

**System Action:** Processing continues.

**Explanation:** DSN1LOGP read no log records.

**Severity:** 0 (informational)

**System Action:** Processing continues. Possible explanations:

- An error prevents DSN1LOGP from continuing, so no log records have yet been processed. If this is the case, an error message should precede this message.
- You specified the active log data sets or archive log data sets out of RBA sequence.
- You specified a STARTRBA that is greater than any RBA in the active and/or archive data sets available.

**Explanation:** The stand-alone log read function returned an error indicating that either the log has an error in one of the control intervals (CI) or a data set containing the requested sequence number cannot be located. The sequence number shown in the message indicates where the error was detected.

<table>
<thead>
<tr>
<th>seq</th>
<th>RBA or LRSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq</td>
<td>RBA or LRSN</td>
</tr>
</tbody>
</table>

**Severity:** 0 (informational)

**System Action:** Processing continues.

**Explanation:** The reason code identifies the nature of the error and is explained in "Part 4, Section 4. DB2 Codes," on page 771. The return code is explained in Appendix C (Volume 2) of the DB2 Administration Guide.

**Explanation:** A gap in the log sequence range was encountered for member mba. The CURRENT LOG sequence number shows the log record for the member.
DSN1218I • DSN1222E

following the gap, and is formatted following this message.

Previous log record can be found with same member ID.

mbn MEMBER=membername, where membername is the member of a data sharing group. This is printed only for a data sharing record.

seq RBA or LRSN

Severity: 0 (informational)

System Action: Processing continues.

Problem Determination: The reason code identifies the nature of the error and is explained in “Section 4. DB2 Codes,” on page 771. The return code is explained in Appendix C (Volume 2) of DB2 Administration Guide.

DSN1218I NUMBER OF LOG ERROR MESSAGES nnnnnnnnnnnnnnn

Explanation: DSN1LOGP distinguishes three classes of errors:

1. Code problems existing in the DB2 or system code used for DSN1LOGP. In the event of a SYSABEND dump, a user abend code of U0153 will be issued, and DSN1LOGP will be terminated.

2. Incorrect invocation of DSN1LOGP caused, perhaps, by your having used an incorrect keyword or missed a DD statement. Under these circumstances, DSN1LOGP will issue appropriate error messages, and the program will be terminated.

3. Failure by a given log CI under the scrutiny of DSN1LOGP. Such scrutiny is performed before any of the records within the CI are processed. Failure is an indication of logical damage, and error messages are issued by the Log Extractor. The CI or failing log record is printed, and DSN1LOGP continues to the next CI or log record.

The count 'nnnnnnnnnnnnnnnnnnnnn' provided summarizes the number (in decimal) of errors DSN1LOGP detected while accessing the log.

Severity: 0 (informational)

System Action: Processing continues.

DSN1219E SYSSUMRY DD STATEMENT MISSING

Explanation: You requested the SUMMARY option, but failed to include the SYSSUMRY DD statement in your JCL invocation.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job with a SYSSUMRY DD statement included in the JCL invocation.

DSN1222E ARCHIVE LOG TRUNCATED AT xxxxxxxx - INVALID LOG RECORDS WERE READ

Explanation: At a restart of DB2, an archive log was truncated. This archive log data set could not be physically altered to reflect this truncation, and invalid log records therefore still exist. DSN1LOGP has already reported this information in the summary report, and cannot retract it. Nor can it disregard the invalid log information already read in order adequately to summarize what has occurred. Therefore, all information up to this point in the log will be summarized, and a new summary report initiated. Consequently, the same UR may be reported twice with different dispositions and different page sets modified. To avoid this condition, use the BSDS DD statement instead of the ARCHIVE DD statement.

Severity: 0 (informational)

System Action: Processing continues.

DSN1221E DSNJSLR ERROR RETCODE=xxxxxxxxx REASON CODE=yyyyyyyy VSAM RETURN CODE=aaaaa ERROR CODE=bbbb

Explanation: The stand-alone log read function resulted in a VSAM error. The DSNJSLR return code 'xxxxxxxxx', and reason code 'yyyyyyyy', included in the message are documented in Appendixes (Volume 2) of DB2 Administration Guide

The VSAM return code (aaaaa), and error code (bbbb), identify the nature of the VSAM error. Refer to the appropriate VSAM publication for an explanation of these codes.

Severity: 0 (informational)

System Action: Processing continues.

DSN1222E DSNJSLR ERROR RETCODE=xxxxxxx REASON CODE=yyyyyyyy DYNAMIC ALLOCATION INFORMATION CODE=aaaa ERROR CODE=bbbb

Explanation: An error occurred while dynamically allocating a log data set. DSNJSLR return code 'xxxxxxxxx', and reason code 'yyyyyyyy', included in the message, are documented in Appendixes (Volume 2) of DB2 Administration Guide. Information code 'aaaaa' and error code 'bbbb' were returned by the dynamic allocation SVC and identify the nature of the error. Refer to the appropriate MVS publication for an explanation of these codes.

Severity: 12 (severe error)

System Action: Processing terminates.
**DSN1223E**  DSNJSLR ERROR RETCODE=xxxxxxxxx  
REASON CODE=yyyyyyyy  RDJFCB  
RETURN CODE=aaaaa

**Explanation:** An error occurred while trying to read  
the job file control block. The DSNJSLR return code  
'xxxxxxxxx', and reason code 'yyyyyyyy', included in the  
message are documented in Appendixes (Volume 2) of  
*DB2 Administration Guide*.  
The RDJFCB return code (aaaaa), identifies the nature of  
the error. Refer to the appropriate MVS publication for  
an explanation of these codes.  

**Severity:** 0 (informational)  
**System Action:** Processing continues.

---

**DSN1300E**  csect-name RBA RANGE CANNOT BE  
USED TO PRINT LOG RECORDS FROM  
MULTIPLE DB2 SYSTEMS

**Explanation:** RBASTART and RBAEND cannot be  
used to define the range when selecting log records  
from multiple DB2 systems. LRSNSTART and  
LRSNEND should be used instead.  

**System Action:** Processing terminates.  
**User Response:** Resubmit the job with either RBA  
values only or LRSN values only.

---

**DSN1303E**  csect-name INCOMPATIBLE DD  
STATEMENTS WERE SPECIFIED FOR  
LOG PROCESSING

**Explanation:** Either MxxACTn or MxxARCHV was  
erroneously specified in conjunction with MxxBSDS to  
locate the log data sets of a member of a DB2 data  
sharing group for a DSN1LOGP job.  

**System Action:** Processing terminates.  
**User Response:** Correct the DD statement and  
resubmit the job.

---

**DSN1309E**  csect-name SPECIFIED END RANGE IS  
LESS THAN START RANGE

**Explanation:** The value specified for ENDLRSN or  
ENDRBA is less than the value of STARTLRSN or  
STARTRBA for a DSN1LOGP job.  

**System Action:** Processing terminates.  
**User Response:** Resubmit the job with correct start  
and end values.

---

**DSN1700E**  VALUE FOR KEYWORD xxxxxxxx IS  
INVALID

**Explanation:** The SDMPIN input contains the  
'xxxxxxxx'. The value specified for that keyword is  
invalid.

---

**Severity:** 8 (error)  
**System Action:** Processing is terminated.  
**User Response:** Provide a correct keyword value and  
resubmit the job.

---

**DSN1701E**  START TRACE MISSING

**Explanation:** The START TRACE command is  
required. The first keyword record of the SDMPIN input  
does not contain a START TRACE command.  

**Severity:** 8 (error)  
**System Action:** Processing is terminated.  
**User Response:** Resubmit the job with START  
TRACE as the first keyword record in the SDMPIN  
input.

---

**DSN1702E**  KEYWORD xxxxxxxx MULTIPLY  
DEFINED

**Explanation:** Keyword 'xxxxxxxx' was specified  
multiple times in the SDMPIN input. All keywords are  
allowed only once.  

**Severity:** 8 (error)  
**System Action:** Processing is terminated.  
**User Response:** Specify the keyword only once.  
Resubmit the job.

---

**DSN1703E**  KEYWORD xxxxxxxx UNKNOWN

**Explanation:** DSN1SDMP does not recognize the  
keyword 'xxxxxxxx'.  

**Severity:** 8 (error)  
**System Action:** Processing is terminated.  
**User Response:** Make sure that all keywords are valid  
and then resubmit the job.

---

**DSN1704E**  UNABLE TO OBTAIN RETURN-AREA  
STORAGE

**Explanation:** An error resulted when DSN1SDMP  
attempted to obtain storage for an instrumentation  
facility interface (IFI) return area.  

**Severity:** 8 (error)  
**System Action:** Processing is terminated.  
**User Response:** When you resubmit the job either:  
- Specify a larger region size in the job control  
  language  
- Reduce the value of BUFSIZE on START TRACE.
**Severity:** 708

**User Severity:**

which

**Explanation:** A syntax error was encountered in the SDMPIN input. The location of the error is given by:

*II* The line number within the input stream that is in error.

*cc* The column number.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Correct the syntax error and then resubmit the error.

---

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Correct the syntax error and then resubmit the error.

---

**Explanation:** An invalid abend code was specified on the ACTION keyword.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Check the return area that follows message DSN1712I. Possible problems are:

- The syntax of the START TRACE command is invalid. Correct the command and resubmit the job. Do not include the subsystem recognition character before the command text.
- The user does not have authority to issue trace commands. Obtain trace authority and resubmit the job.

---

**Explanation:** DSN1SDMP allows a maximum of 50 statements for a given job.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Use no more than 50 statements when you resubmit the job.

---

**Explanation:** DSN1SDMP allows a maximum of eight SELECT criteria values.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Use no more than eight SELECT criteria values and then resubmit the job.

---

**Explanation:** An error resulted when DSN1SDMP attempted to do I/O. The ddbname of the data set to which I/O failed is ‘xxxxxxxx’

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Ensure that the ‘xxxxxxxx’ DD statement in the job control language is valid and resubmit the job.

---

**Explanation:** An error resulted when DSN1SDMP attempted to open the SDMPTRAC data set.

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Ensure that the SDMPTRAC DD statement in the job control language is valid and resubmit the job.

---

**Explanation:** DB2 did not process the submitted START TRACE command. The reason code ‘xxxxxxxx’ is returned from the instrumentation facility interface (IFI).

**Severity:** 8 (error)

**System Action:** Processing is terminated.

**User Response:** Check the return area that follows message DSN1712I. Possible problems are:

- The syntax of the START TRACE command is invalid. Correct the command and resubmit the job. Do not include the subsystem recognition character before the command text.
- The user does not have authority to issue trace commands. Obtain trace authority and resubmit the job.

---

**Explanation:** DSN1SDMP issued the START TRACE command and the return area resulting from the instrumentation facility interface (IFI) COMMAND call follows this message. The return area contains DB2 command response messages.

**Severity:** 0 (informational)

**System Action:** Processing continues.

---

**Explanation:** An error resulted when DSN1SDMP issued a instrumentation facility interface (IFI) READA call in an attempt to obtain DB2 trace records. Reason code ‘xxxxxxxx’ is the IFI reason code returned in IPCARC2.

**Severity:** 0 (informational)

**System Action:** DSN1SDMP writes any records that were returned and processing continues.

**User Response:** Possible reason codes are:
00E60802
The DSN1SDMP return area was not large enough to hold the returned trace records. This condition should not occur because the DSN1SDMP return area is the same size as the requested OPn monitor buffer.

00E60803
No trace data was available when the READA request was made. This condition occurs when the trace started by DSN1SDMP is stopped from the operator console or by another application program.

DSN1714I TRACE RECORDS WERE LOST
Explanation: DB2 trace records were lost and are not contained in the SDMPTRAC data set.
Severity: 0 (informational)
System Action: Processing continues.
User Response: Possible reasons for lost trace records are:
• The OP buffer is not large enough. Specify a larger BUFSIZE on the START TRACE command and then resubmit the job.
• The trace data is too voluminous and buffer is overflowing before the data can be read. Specify a more granular selectivity on the START TRACE command and then resubmit the job.

DSN1715E UNABLE TO OBTAIN WORK SPACE
Explanation: An error resulted when DSN1SDMP attempted to obtain work area storage.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Specify a larger region size in the job control language and then resubmit the job.

DSN1716E UNABLE TO OPEN SDMPIN
Explanation: An error resulted when DSN1SDMP attempted to open the SDMPIN data set.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Ensure that the SDMPIN DD statement in the job control language is valid and resubmit the job.

DSN1717I STOP TRACE RETURN-AREA FOLLOWS:
Explanation: DSN1SDMP issued the STOP TRACE command and the return area resulting from the instrumentation facility interface (IFI) COMMAND call follows this message. The return area contains DB2 command response messages.
Severity: 0 (informational)
System Action: Processing continues.

DSN1718E STOP TRACE ERROR, REASON=xxxxxxxx
Explanation: DSN1SDMP attempted to submit a DB2 STOP TRACE command at the end of its processing; however, the command failed. The reason code returned from the instrumentation facility interface (IFI) is 'xxxxxxxx'.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: Check the return area that follows message DSN1717I. One possible problem is:
• The trace has already been stopped from the operator’s console or by another application program.

DSN1719I ACTIONS ARE COMPLETE
Explanation: All requested IFC selective dump actions finished. All trace records have been written to the specified destination(s). If an abend action was requested, all abends have taken place.
Severity: 0 (informational)
System Action: DSN1SDMP stops the trace that it started and completes processing.

DSN1720I READA ERROR, REASON=xxxxxxxx
Explanation: An error resulted when DSN1SDMP issued a instrumentation facility interface (IFI) READA call in an attempt to obtain DB2 trace records. Reason code 'xxxxxxxx' is the IFI reason code returned in IFCAR2.
Severity: 8 (error)
System Action: Processing is terminated.
User Response: One possible reason code is:

00E60824
The user does not have correct monitor authority. Obtain the correct monitor authority (MONITOR1 or MONITOR2) and resubmit the job.

DSN1800I START OF DSN1CHKR FOR JOB job-name step-name
Explanation: This message indicates that DSN1CHKR started processing.
Severity: 0 (informational)
System Action: DSN1CHKR starts processing.
DSN1801I  ANCHOR POINT mm IN ERROR IN PAGE nnnnnn
Explanation: This message indicates that anchor point 'mm' is in error in page 'nnnnnn'. Either the backward pointer is not zero when the forward pointer is zero, or the backward pointer does not point to the last record ID in the parent chain. If this message is preceded by DSN1835I then the child pointer is pointing to a page beyond the high used RBA of the data set. Either the child pointer is invalid or the data set has been truncated.
Severity:  4 (warning)
System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.

DSN1802I  RING/LINK CHAIN BROKEN - type RID = nnnnnnn
Explanation: This message indicates that there is a broken ring or link chain beginning at 'type' (anchor or parent) with record id equal to 'nnnnnnnn'. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1803I, DSN1804I, and DSN1805I.
Severity:  4 (warning)
System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.

DSN1803I  PARENT RID = nnnnnnn
Explanation: This message supplies the record id 'nnnnnnnn' for the parent record of a detected broken ring or link. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1804I, and DSN1805I.
Severity:  4 (warning)
System Action: Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.

DSN1804I  CURRENT RID = nnnnnnn
Explanation: This message supplies the record id 'nnnnnnnn' for the current record at the time the broken ring or link was detected. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1803I, and DSN1805I.
Severity:  4 (warning)
System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.

DSN1805I  PREVIOUS IN CHAIN = nnnnnnnn
Explanation: This message supplies the record id 'nnnnnnnnn' of the record prior to when the broken ring or link was detected. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1803I, and DSN1804I.
Severity:  4 (warning)
System Action: Processing continues.
Problem Determination: Contact Your IBM Support Center for assistance.

DSN1806I  IDMAP ENTRY entry-number IN PAGE page-number IS IN ERROR
Explanation: This message indicates that the IDMAP entry 'entry-number' in page 'page-number' is not valid. Valid entries are from X'0014' to X'0Ffh' (depending on the number of IDMAP entries in the page).
Severity:  4 (warning)
System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.

DSN1807I  CHILD POINTER chd-rid IN ERROR IN PARENT RECORD par-rid IN PAGE pppppp
Explanation: This message indicates that the parent record with record ID 'par-rid' in page 'pppppp' has a child pointer with an invalid record ID of 'chd-rid'. If this message is preceded by DSN1835I, then the child pointer is pointing to a page beyond the high used RBA of the data set. Either the child pointer is invalid or the data set has been truncated.
Severity:  4 (warning)
System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.
Problem Determination: Contact your IBM Support Center for assistance.
DSN1808I OVERFLOW RECORD IN ERROR - OVERFLOW RID = ovf-rid, POINTER RID = ptr-rid

Explanation:  This message indicates that the record at record id 'ovf-rid', pointed to by the pointer record at record id 'ptr-rid', is not an overflow record.

Severity:  4 (warning)

System Action:  The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination:  Contact your IBM Support Center for assistance.

---

DSN1809I OVERFLOW RECORD IN ERROR - OVERFLOW RID = ovf-rid, HAS NO POINTER RECORD

Explanation:  This message indicates no pointer record points to the overflow record with record id 'ovf-rid'.

Severity:  4 (warning)

System Action:  The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination:  Contact your IBM Support Center for assistance.

---

DSN1810I INPUT DATA SET INVALID, NOT A CHECKABLE SYSTEM TABLESPACE

Explanation:  This message indicates that the data set defined by SYSUT1 is not a checkable table space and therefore cannot be analyzed.

Severity:  8 (error)

System Action:  Processing terminates.

System Programmer Response:  Correct the SYSUT1 DD statement and rerun the job.

Problem Determination:  Checkable system table spaces must be referenced by a hashed entry or contain links. Single-record table spaces referenced by an index are not checkable. If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

---

DSN1811I ANCHOR POINT PAGE page IS OUT OF RANGE — VALUE IS LESS THAN 2 OR GREATER THAN 'E'X

Explanation:  The ANCHOR function has an incorrect page value for the page-slot argument. Anchor points can be found only on pages 2 through 14 (E in hexadecimal). Any anchor point page specified beyond that range is invalid.

---

DSN1812I ORPHAN ID = orph-id ID ENTRY = entry-val FOUND IN PAGE page-number

Explanation:  This message indicates that the record with id = 'orph-id' and id entry = 'entry-val' in page 'page-number' is an orphan.

Severity:  4 (warning)

System Action:  Processing continues.

Problem Determination:  Examine previous diagnostic and system messages, correct problem, and rerun job.

---

DSN1813I UNABLE TO DUMP PAGE page-number

Explanation:  An error was encountered while retrieving the page and therefore page 'page-number' could not be dumped.

Severity:  4 (warning)

System Action:  Processing continues.

Problem Determination:  Examine previous diagnostic and system messages, correct problem and rerun job.

---

DSN1814I UNEXPECTED END OF DATA AT PAGE page-number

Explanation:  The END-OF-DATA condition was reached before expected at page 'page-number'.

Severity:  8 (error)

System Action:  Processing terminates.

Problem Determination:  Examine previous diagnostic and system messages, correct problem and rerun job.

---

DSN1815I DSN1CHKR COMPLETED SUCCESSFULLY, pg-cnt PAGES PROCESSED

Explanation:  This message indicates the DSN1CHKR successfully completed processing; all checks completed. The 'pg-cnt' represents the number of pages read during check processing, not the number of pages in the table space.

Severity:  0 (informational)

System Action:  Processing terminates.

---

DSN1816I DSN1CHKR TERMINATED WITH ERRORS, pg-cnt PAGES PROCESSED

Explanation:  This message indicates the DSN1CHKR did not successfully complete processing. The 'pg-cnt' represents the number of pages read during check processing.

---
DSN1817I  ARGUMENT arg-val OF THE MAP COMMAND IS INVALID

Explanation: This message indicates that the argument 'arg-val' of the MAP command is invalid.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Refer to DB2 Utility Guide and Reference for the correct syntax.

Examples of invalid arguments are:
- The offset value of the ANCHOR or HASH option is neither zero (0) nor four (4).
- When the ANCHOR and RID option has been specified, the page number specified is less than two, which would be a non-data page.

DSN1818I  IDMAP ENTRY entry-number IN PAGE page-number IS BEING USED BY MULTIPLE CHAINS - ONE OF WHICH IS IN ERROR

Explanation: This message indicates that a record is part of two different chains and therefore creates an invalid structure within the table space. If using the MAP option, the mapping of the chain stops since the path back to the starting record is lost.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1819I  HASH VALUE FOR dbid CORRESPONDS TO: PAGE = page-number AND ANCHOR POINT OFFSET = offset

Explanation: This message indicates the hash values for the given 'dbid', after applying the hash function, where 'page-number' is the page and 'offset' is the anchor point.

Severity: 0 (informational)

System Action: Processing continues.

DSN1820I  MAPPING OF map-opt (val1,val2) HAS STARTED

Explanation: This message indicates that mapping of the indicated option 'map-opt', which is either ANCHOR, PAGE, or RID, has started. The option's arguments, 'val1' and 'val2', will also be mapped. Following this message will be the records of the chain.

Severity: 0 (informational)

System Action: Processing continues.

DSN1821I  MAPPING OF 'map-opt' (val1,val2) HAS COMPLETED

Explanation: This message indicates that mapping of the indicated option 'map-opt', which is either ANCHOR, PAGE, or RID, started. The option's arguments, 'val1' and 'val2', will also be mapped. Preceding this message will be the records of the chain.

Severity: 0 (informational)

System Action: Processing continues.

DSN1822I  DBID dbid HASHED TO AN EMPTY ANCHOR POINT - NO ENTRIES FOR THE GIVEN DBID ARE AVAILABLE IN THE TABLESPACE

Explanation: DBID 'dbid' hashed to an empty anchor point. An anchor point with a value of 0 (empty) means that no entries are available in the table space. Therefore, no links are checked.

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

DSN1823I  INVALID SYNTAX, c EXPECTED

Explanation: This message indicates that an unexpected character was found while parsing the parm list and that 'c' was the expected character.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Refer to DB2 Command Reference for the correct syntax.

DSN1824I  INVALID HEX DATA: hex-data

Explanation: This message indicates that the input value 'hex-data' is not a valid hexadecimal number.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Correct input value and rerun job.
**DSN1825I**  
**Input Value Either Too Long or Omitted:** in-val

**Explanation:** This message indicates that the input value 'in-val' is either greater than 8 hexadecimal digits or was totally omitted.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**Problem Determination:** Correct input value and rerun job.

---

**DSN1826I**  
**Record with OBID = rec-obid is Invalid for this Chain**

**Explanation:** This message indicates that the record with OBID 'rec-obid' is invalid for the chain currently being processed, assuming the OBID of the parent or first record processed was not in error.

**Severity:** 4 (warning)

**System Action:** Processing terminates.

**Problem Determination:** If using the MAP function, make sure the given values point to a valid record. Otherwise, contact your IBM Support Center for assistance.

---

**DSN1827I**  
**The Specified Page Is Not a Hashed Data Page - The Requested Function Requires a Hashed Data Page.**

**Explanation:** This message indicates that the HASH or ANCHOR option of the MAP command was issued against a nonhashed data page (that is, a page with no anchor points).

**Severity:** 4 (warning)

**System Action:** Processing continues with the next set of parameters.

**Problem Determination:** If using the ANCHOR function, examine the page-slot argument to ensure that the page value is correct. If using the HASH function, ensure that the 'dbid' value is correct. Otherwise, examine the SYST1 DD statement to ensure that the table space is correct. If so, use the RID or PAGE function to achieve the desired mapping.

---

**DSN1828I**  
**OBID = rec-obid is Invalid for this Database**

**Explanation:** This message indicates that the record with OBID 'rec-obid' is invalid for the database currently being processed.

This message is issued by the following CSECTs: DSN1MAP, DSN1LNKF

**Severity:** 4 (warning)

**System Action:** Processing continues with the next set of parameters.

**Problem Determination:** If using the MAP command, ensure that all user supplied offsets actually point to valid data. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**DSN1829I**  
**Mapping Must Stop at Parent Record When Using the Backward Pointer**

**Explanation:** This message indicates that the requested mapping stopped at the parent record rather than the starting record because of the use of backward pointers.

**Severity:** 4 (warning)

**System Action:** Processing continues.

---

**DSN1830I**  
**Invalid Numbers of Values Specified for func-name**

**Explanation:** This message indicates that either:

- No value was specified.
- An odd number of values was specified for a function that requires an even number of values.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**Problem Determination:** Refer to [DB2 Utility Guide and Reference](#) for the parameter specifications. Correct the parmlist and rerun the job.

---

**DSN1831I**  
**End of Date Reached, Page = page-number Is Out of Range**

**Explanation:** This message indicates that page 'page-no', specified as a parameter of the MAP option, caused the END-OF-DATA condition to be reached. The page number is invalid for the table space being mapped.

**Severity:** 4 (warning)

**System Action:** Processing continues with the next set of parameters.

**Problem Determination:** Correct the page parameter of the MAP option and rerun the job.

---

**DSN1833I**  
**Anchor Point Is Not in Use**

**Explanation:** The anchor point to be mapped has a value of 0, which means that it is not in use. Therefore, no links are checked.

**Severity:** 4 (warning)

**System Action:** Processing continues with the next set of parameters.
**DSN1834I**  GETMAIN FOR BUFFERS FAILED. NO MORE AVAILABLE STORAGE IN ADDRESS SPACE.

**Explanation:** The GETMAIN for page buffers failed. There is no more virtual storage available in the address space. The table space being checked is too large to be processed with the current system configuration.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**Problem Determination:** Make changes to the system configuration, if possible, to allow more virtual storage to be available in the address space.

**DSN1835I**  THE REQUESTED PAGE page-no IS BEYOND THE END OF THE TABLESPACE.

**Explanation:** A request for a page number from an anchor point or a child pointer in a parent record is pointing beyond the high used RBA of the data set. Either the rid is in error or the data set has been truncated.

**Severity:** 4 (warning)

**System Action:** The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

**Problem Determination:** Examine previous diagnostic and system messages, correct problem if possible and rerun the job. Otherwise, contact your IBM Support Center for assistance.

**DSN1939I**  csect-name AN INVALID CI SIZE HAS BEEN DETECTED

**Explanation:** The VSAM Control Interval (CI) size for the output data set is invalid. The CI size must be 4K, or it must match the page size.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**System Programmer Response:** Redefine the output VSAM data set so that the CI size is either 4K or equal to the page size of the object that is being processed.

**DSN1940I**  csect-name COMPRESSION REPORT

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>noncmpbytes</td>
<td>KB WITHOUT COMPRESSION</td>
</tr>
<tr>
<td>cmpbytes</td>
<td>KB WITH COMPRESSION</td>
</tr>
<tr>
<td>percsave</td>
<td>PERCENT OF THE BYTES WOULD BE SAVED</td>
</tr>
</tbody>
</table>

The compression statistics follow:

**noncmpbytes**  The total number of uncompressed KB (where KB = 1024 bytes) for the data rows (including the row prefix). This number was rounded to the nearest KB.

**cmpbytes**  The total number of compressed KB for the data rows (including the row prefix). This number was rounded to the nearest KB.

**percsave**  The percentage of bytes that would be saved if the rows were compressed.

The values above reflect only the number of bytes for the data row and the associated row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

**numdictrows**  The number of data rows that were used to build the dictionary.

**numscanrows**  The number of data rows that were processed using the dictionary to produce the compression savings estimate.

**numdictents**  The number of entries contained in the compression dictionary.
auncmprowlen
Average uncompressed row length.

avgcmprowlen
Average compressed row length.

dictpages
The number of DB2 pages required for the compression dictionary.

noncmmppages
The estimated number of DB2 pages required by the uncompressed data rows. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages
The estimated number of DB2 pages required by the compressed data rows. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included. This number was rounded up to the next integer.

pctpgsave
An estimate of the percentage of DB2 pages that would be saved by compressing the data rows.

Severity: 0 (informational)
System Action: The utility completed successfully.

---

DSN1943I csect-name DICTIONARY PAGE ENCOUNTERED

Explanation: A dictionary page was encountered while processing the input data set. This indicates that the data is in compressed format.

Severity: 8 (error)
System Action: Processing terminated.
User Response: Run DSN1COMP on a data set containing data that is not in a compressed format.

---

DSN1944I csect-name INPUT PARAMETERS

Explanation: The input parameters used by DSN1COMP are either user-supplied or default values.

Severity: 0 (informational)
System Action: Processing continues.

---

DSN1945I csect-name DICTIONARY TREE

Explanation: The compression dictionary tree follows. Each node is formatted in the SYSPRINT data set.

Severity: 0 (informational)
System Action: Processing continues.

---

DSN1946I csect-name IMAGE COPY CONTAINING MULTIPLE PARTITIONS

Explanation: DSN1COMP will build a compression report given sufficient data in the first partition only, of an Image Copy containing multiple partitions.

Severity: 8 (error)
System Action: Processing terminated.
User Response: Run DSN1COMP on an image copy containing a single partition.

---

DSN1947I DSN1947I csect-name COMPRESSION UNAVAILABLE FOR INDEX SPACES

Explanation: Index data was provided as input to DSN1COMP. Compression is supported only for table space data.

Severity: 8 (error)
System Action: Processing terminated.
User Response: Provide DSN1COMP with data containing table space data.

---

DSN1950I DSN1COPY HAS SUPPRESSED VSAM OPEN VERIFY, ACBERRFLG=acb-error-code.open-option

Explanation: DSN1COPY suppresses the VSAM VERIFY done by the VSAM OPEN for the SYSUT1 data set. The VSAM VERIFY is not needed for the VSAM

---

Chapter 25, DB2 messages 715
data sets used by DB2. For DB2 VSAM data sets, the data set hi-used RBA in the ICF catalog is always current.

This message is issued by the following CSECT: DSN1COPY

Severity: 0 (informational)

System Action: Processing continues.

-------

**DSN1951I**  
**OCCURSpee**

**Explanation:** The VALUE parameter contained an odd number of hexadecimal characters. Only even numbers of hexadecimal characters are allowed.

This message is issued by the following CSECT: DSN1VAL

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the number of hexadecimal digits specified for the VALUE parameter and resubmit the job.

Problem Determination: Refer to DSN1COPY documentation for parameter requirements in *DB2 Utility Guide and Reference*.

-------

**DSN1952I**  
**UNEXPECTED END OF INPUT DATA** - CHECK FOR INVALID SPECIFICATION OF THE 32K PARAMETER.

**Explanation:** End of data occurred for the image copy data set specified in SYSUT1 before the first page could be read. Either the wrong input data set was specified or 32KB was specified even though the input data set contains 4KB pages.

This message is issued by the following CSECT: DSN1COPY

Severity: 8 (error)

System Action: Processing terminates.

User Response: Remove the 32KB parameter if the input data set contains 4KB pages, change the name of the input data set to specify a valid image copy, or remove the FULLCOPY or INCRCOPY parameter.

Problem Determination: Refer to DSN1COPY documentation for parameter requirements.

-------

**DSN1953I**  
**STARTING PAGE NUMBER REQUIRES AN INPUT DATA SET NAME OF data-set-name**

**Explanation:** The starting page number of the page range to be printed is inconsistent with the input data set specified.

This message is issued by the following CSECTs: DSN1COPY, DSN1PRNT

Severity: 8 (error)

System Action: Processing terminates.

User Response: Ensure that NUMPARTS, the 32KB parameter (or its default of 4KB), and the starting page number are correct. If it is correct, change the input data set name as indicated by the message.

Problem Determination: Refer to DSN1COPY or DSN1PRNT documentation for parameter requirements.

-------

**DSN1954I**  
**csect-name PARAMETER PAGESIZE OR LOB IS MISSING OR INCORRECTLY SPECIFIED.**

**Explanation:** This message is issued in the following situations:

- The program tried to determine the page size from the first page of the data set, but the first page is not a header page, or
- The first page is a LOB header page and the LOB parameter is missing.

This message is issued by the following CSECTs: DSN1COPY, DSN1PRNT.

Severity: 8 (error)

System Action: Processing terminates.

User Response: If the input data set is not a LOB table space, specify the PAGESIZE parameter. If the input data set is a LOB table space, specify the LOB or PAGESIZE parameter or both, as appropriate.

-------

**DSN1955I**  
**SYSUT1 DD CARD IS MISSING**

**Explanation:** No SYSUT1 DD statement was provided.

This message is issued by the following CSECTs: DSN1COPY, DSN1PRNT, DSN1COMP

Severity: 8 (error)

System Action: Processing terminates.

User Response: Rerun the job with a SYSUT1 DD statement.

-------

**DSN1956I**  
**csect-name SYNTAX ERROR: parm2 IS SPECIFIED WITHOUT parm1**

**Explanation:** The keyword *parm1* must be specified with *parm2*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job specifying the correct keyword.
DSN1957I  csect-name COMRESSED RECORDS CANNOT BE EXPANDED DUE TO INCORRECT INPUT DATA SET SPECIFICATION.

Explanation: DSN1PRNT issues this message when the EXPAND option is specified. The input data set might be an incremental image copy data set.

Severity: 8 (error)
System Action: Processing terminates.
User Response: Correct the cause of the allocation error and resubmit the job.

DSN1961I  PIECE NUMBER value IS INVALID.

Explanation: A page was retrieved that has a piece number greater than NUMPARTS for partitioned table spaces or greater than the default of 32 for linear table spaces. 'DPIECNUM value' is the piece number for the retrieved page. For page range printing, this message is issued if the starting page number has an invalid piece number as determined from calculations involving NUMPARTS and the page size.

Severity: 8 (error)
System Action: Processing will terminate.
User Response: Look in SYSIBM.SYSTABLESPACE for the correct number of partitions for this page. Correct NUMPARTS or 32KB if they were specified incorrectly, resubmit the job with a valid image copy, or correct the starting page number for page range printing.

DSN1962I  OUTPUT DATA SETS MUST BE VSAM WHEN IMAGE COPY DATA SETS ARE USED AS INPUT TO DSN1COPY.

Explanation: If image copy data sets are used as input to DSN1COPY, the output data sets must be VSAM. QSAM data sets cannot be used for output.

Severity: 8 (error)
System Action: Processing will terminate.
User Response: Change the output data set to VSAM, or remove the FULLCOPY and NUMPARTS parameters.

DSN1963I  ZERO PAGES ARE INVALID WHEN IMAGE COPY DATA SETS ARE USED AS INPUT TO STAND ALONE UTILITIES.

Explanation: A page in an IMAGE COPY data set has a zero header. Pages with zero headers are illegal if image copy data sets are used as input to stand-alone utilities.

Severity: 4 (warning)
System Action: Processing continues.
User Response: If the image copy data set name was invalid, look in SYSIBM.SYSCOPY for valid names. Resubmit the valid IMAGE COPY data set to the stand-alone utility. If the IMAGE COPY data set had a valid name, use the REPAIR utility to replace the zero input/output DATA SET ALLOCATION ERROR. ERROR FIELD IS ERRFIELD value1. INFORMATION FIELD IS INFFIELD value2.

Explanation: The allocation of an input or output data set failed. The ERRFIELD value1 contains the error number; the INFFIELD value2 contains the information number. See SVC99 error codes in z/OS MVS Diagnosis: Reference or z/OS MVS Programming: Authorized Assembler Services Guide for help in determining the cause of the error.

Severity: 8 (error)
System Action: Processing terminates.
User Response: Resubmit the job specifying the correct input data set.

DSN1958I  INVALID DATA SET NAME.

Explanation: A DB2 table space was given an incorrect name.

This message is issued by the following CSECT: DSN1CHDS

Severity: 8 (error)
System Action: Processing terminates.
User Response: Correct the output data set name if FULLCOPY or INCRCOPY were specified. If a page range is being printed, correct the input data set name. Refer to Part 2 (Volume 1) of DB2 Administration Guide for a discussion of DB2 data set naming conventions.

DSN1959I  BOTH FULLCOPY AND INCRCOPY PARAMETERS CANNOT BE SPECIFIED.

Explanation: DSN1COPY cannot apply to both full images copies and incremental image copies in the same execution. The full image copies are applied first. Each incremental image copy must then be applied in separate steps, starting with the oldest incremental copy.

This message is issued by the following CSECT: DSN1SDEF

Severity: 8 (error)
System Action: Processing will terminate.
User Response: Omit either FULLCOPY or INCRCOPY.

DSN1960I  csect-name input/output DATA SET ALLOCATION ERROR. ERROR FIELD IS ERRFIELD value1. INFORMATION FIELD IS INFFIELD value2.

Explanation: The allocation of an input or output data set failed. The ERRFIELD value1 contains the error number; the INFFIELD value2 contains the information number. See SVC99 error codes in z/OS MVS Diagnosis: Reference or z/OS MVS Programming: Authorized Assembler Services Guide for help in identifying the cause of the error.

Severity: 8 (error)
System Action: Processing terminates.
User Response: Resubmit the job specifying the correct input data set.

DSN1972I  PSID xxxx NOT FOUND IN THE SYSXLAT FILE REPLACE SOURCE DBID xxxx OF THE SYSXLAT FILE WITH IT  

Explanation: The second record of the SYSXLAT file has the incorrect source PSID value.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the second record of the SYSXLAT file with the correct PSID value.

DSN1973I  SOURCE DBID IS MISSING  

Explanation: The first record of the SYSXLAT file contains no DBID value.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the first record of the SYSXLAT file with a pair of source and target DBID values which match the DBID values of the source and target systems.

DSN1975I  SOURCE PSID IS MISSING  

Explanation: The second record of the SYSXLAT file contains no PSID value.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the second record of the SYSXLAT file with a pair of source and target PSID values which match the PSID values of the source and target systems.

DSN1976I  TARGET PSID IS MISSING  

Explanation: The target PSID is missing from the second record of the SYSXLAT file.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the second record of the SYSXLAT file with a target PSID value which matches the PSID values of the target system.

DSN1977I  SOURCE OBID IS MISSING  

Explanation: There is a record in the SYSXLAT file with no OBID value.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Correct the SYSXLAT file so that all the records following the first and second records will contain a pair of source and target OBID values.

DSN1978I  TARGET OBID IS MISSING  

Explanation: There is a record in the SYSXLAT file with no target OBID value specified.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the SYSXLAT file with an OBID value that matches the OBID value of the target system.

DSN1979I  csect-name SOURCE & TARGET VALUES MUST BE WITHIN THE RANGE OF 1 TO 65535.  

Explanation: The SOURCE and TARGET values of the SYSXLAT file must be between 1 and 65535.  
Severity: 8 (error)  
System Action: Processing is terminated.  
User Response: Provide the SYSXLAT file with values that are between 1 and 65535.

DSN1980I  BROKEN PAGE BIT SET, WILL RESET AND RETRY BROKEN PAGE TEST  

Explanation: This message indicates that a broken page was detected. If message DSN1990I is issued following this message, determine the cause of the broken page. If message DSN1990I is not issued, reset the broken page bit with the REPAIR utility to correct the problem. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.  
Severity: 4 (warning)  
System Action: Processing continues.  
Operator Response: Notify the system programmer.  
System Programmer Response: Use either the RECOVER or REPAIR utility to correct the broken page. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.  
Problem determination should have been done when the dump associated with the setting of the broken page bit was requested.

Example of invalid subparameters are:  
- The NUMPARTS subparameter was other than 'nn'.  
- 'nn' is a decimal number.
The NUMPARTS subparameter was missing either a left or right parenthesis.

The PRINT subparameter was missing either a left or right parenthesis.

The PRINT subparameter specified a digit in a page number which was not hexadecimal.

The PRINT subparameter contained a starting page number that is larger than the ending page number.

The PRINT subparameter contains a page number larger than six hexadecimal digits.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the indicated parameter on the EXEC DD statement, and resubmit the job.

Problem Determination: Refer to DSN1COPY, DSN1PRNT, or DSN1COMP documentation for parameter requirements.

---

**DSN1982I • NO BLANKS ARE ALLOWED WITHIN THE PARAMETER LIST**

Explanation: There is a space or spaces between one or more parameters in the utility list.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Check the parameter list and make sure that there are no spaces between any of the parameters.

---

**DSN1983I • csect-name DICTIONARY IS INVALID,
REASON= X’nnnn’**

Explanation: The dictionary found in the data set is invalid. A DB2 internal error occurred during the validation of the expansion dictionary.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Verify that the correct data set is specified. You can delete the EXPAND option and resubmit the job.

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The REASON identifies the nature of the error. The REASON is used for diagnostic purposes by the IBM Support Center.

---

**DSN1984I • UNEXPECTED PAGE NUMBER,
EXPECTING: expected-page-number**

Explanation: This message indicates that an unexpected page number was encountered. This message may be received if the input data set is an image copy but the FULLCOPY or INCRCOPY parameters were not specified. The ‘expected page number’ that is displayed (in hexadecimal) is the page number that was expected, not the one that was encountered.

Severity: 4 (warning) or 8 (error)

System Action: Processing is terminated.

User Response: Notify the system programmer.

System Programmer Response: Use DSN1PRNT to dump the table space or index space. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

---

**DSN1985I • ZERO PAGES ENCOUNTERED. FIRST PAGE = first-zero-page-number, LAST PAGE = last-zero-page-number**

Explanation: One or more pages zero pages were encountered with valid data pages after them. A zero page is a page of all zeros or a page with only the page-synchronization bit on in the first and last byte of the page. The ‘first zero page number’ and the ‘last zero page number’ displayed in hexadecimal are the pages where zeros were first encountered and last encountered. In most cases, this is not an error condition. This is a normal condition for segmented table spaces and also for index spaces created with a FREEPAGE parameter not equal to zero. In addition, it is also normal for nonsegmented table spaces to contain zero pages after certain update scenarios terminated abnormally and data rollback was required.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Notify the system programmer.

System Programmer Response: If the zero page is the result of segmenting, no action is necessary. Similarly, if the zero page is a valid zero page that was introduced by DB2, no action is necessary as this page is free space and is used by DB2 when needed. If the zero page is a valid zero page and you want to remove it from the table space, run the REORG utility.

To help determine if the zero page was validly introduced by DB2, run the CHECK INDEX utility. This assumes that at least one index is defined on the affected table space.

If the zero page is determined to be invalid, you need to run the RECOVER utility.
**DSN1986I**  NEITHER FULLCOPY NOR INCRCOPY PARAMETERS MAY BE SPECIFIED WITH THE SEGMENT PARAMETER.

**Explanation:** The parameters SEGMENT, FULLCOPY, and INCRCOPY describe the type of input that SYSUT1 references. SEGMENT is only relevant when a table space or index space is the input. FULLCOPY and INCRCOPY are only relevant when a image copy is the input. If the input data set is a segmented table space, then the FULLCOPY or INCRCOPY parameters should not be specified. If the input data set is a full or incremental image copy, then SEGMENT should not be specified.

**Severity:** 8 (error)

**System Action:** Processing will terminate.

**User Response:** Omit the incorrect parameter.

**DSN1987I**  csect-name INDEX PAGE CONTAINING OBID id HAS NO MATCHING VALUE IN THE SYSXLAT FILE.

**Explanation:** This message is issued when the OBID on the page does not find a matching value in the input source OBID list. This message can also be issued when the input does not have enough OBID values.

**Severity:** 8 (error)

**System Action:** Processing terminates with a dump of the page on which the OBID does not find a match in the source list.

**User Response:** Resubmit the job with correct input OBID values.

**DSN1988I**  csect-name EXPAND KEYWORD IS SPECIFIED BUT DICTIONARY IS NOT FOUND

**Explanation:** DSN1PRNT issues this message when the EXPAND option is specified. The dictionary was not found in the data set. An incorrect data set piece is specified or an incorrect data set number is specified for a multi-piece linear data set.

**Severity:** 8 (error)

**System Action:** Processing terminates.

**User Response:** Resubmit the job specifying the correct keyword or the correct data set name.

**DSN1990I**  csect-name BROKEN PAGE. PAGE NUMBER = broken-page-number.

**Explanation:** During page checking, the page was detected as broken for the reason given in the message. The page number is displayed in hexadecimal format.

**Severity:** 4 (warning)

**System Action:** Processing continues.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use either the RECOVER or REPAIR utility to correct the broken page.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Service information is used for diagnostic purposes by the IBM Support Center.

**DSN1991I**  UNCLUSTERED DATA DETECTED. RID: 'xxxxxxxxx'X TABLE: tablename INDEX KEY: index-key

**Explanation:** Data is not broken. Only the arrangement of data on one of the following DB2 Catalog table spaces: SYSDBASE, SYSPLAN, and SYSVIEWS has been affected. Normally, data on these pages is arranged to minimize locking contention. DSN1COPY found that the arrangement of data no longer minimizes locking contention for the objects named by the INDEX KEY for the given TABLE. Therefore, an increase in the number of deadlocks and timeouts may be seen on SYSDBASE, SYSPLAN, and SYSVIEWS.

**System Action:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Contact your IBM Support Center for assistance. Collect the following diagnostic items listed in *Appendix B, “Problem determination,” on page 1349*. [345]
DSN1992I  VSAM PUT ERROR, RPLERREG = return-code, RPLERRCD = reason-code

Explanation: VSAM PUT failed with the indicated error code.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedures. See z/OS DFSMS: Macro Instructions for Data Sets for more information on the standard VSAM procedures, the RPL fields, and the VSAM control blocks.

DSN1993I  DSN1COPY/DSN1PRNT/DSN1COMP TERMINATED, page-count PAGES PROCESSED

Explanation: This message indicates that a stand-alone utility has not successfully completed processing. The page count is displayed in decimal format.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine the previous error message of the application program.

System Programmer Response: Correct the previous error and resubmit the job.

DSN1994I  DSN1COPY/DSN1PRNT/DSN1COMP COMPLETED SUCCESSFULLY, page-count PAGES PROCESSED

Explanation: This message indicates that a stand-alone utility successfully completed processing. The page count is displayed in decimal format.

Severity: 0 (informational)

System Action: Processing terminates.

DSN1995I  VSAM GET ERROR, RPLERREG = return-code, RPLERRCD = reason-code

Explanation: VSAM GET failed with the indicated error code.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedures. See z/OS DFSMS: Macro Instructions for Data Sets for more information on the standard VSAM procedures, the RPL fields, and the VSAM control blocks.

DSN1996I  VSAM OPEN ERROR, ACBERRFLG = ACB error-code. OPEN option

Explanation: VSAM OPEN failed with the indicated 'ACB error-code'. The OPEN option was either 'INPUT' or 'OUTPUT'.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, severity code is 4.

System Action: Processing terminates if error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. See z/OS DFSMS: Macro Instructions for Data Sets for more information on the standard VSAM procedures and the VSAM control blocks.

DSN1997I  OUTPUT DSNAME = data-set-name, data-set-type

Explanation: The indicated 'data set name' is used for output. 'data set type' is either VSAM or SEQ (for sequential).

Severity: 0 (informational)

DSN1998I  INPUT DSNAME = data-set-name, data-set-type

Explanation: The indicated 'data-set-name' is used for input. 'data-set-type' is either VSAM or SEQ (indicating sequential).

Severity: 0 (informational)

DSN1999I  START OF DSN1COPY/DSN1PRNT/DSN1COMP FOR JOB job-name step-name

Explanation: This message indicates that a stand-alone utility started processing.

Severity: 0 (informational).

System Action: The stand-alone utility starts processing.
Chapter 26. DSN2... messages

There are two versions of the CICS attachment facility:

- The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release. This attachment facility issues DSNCxxx messages.
- The version shipped with CICS requires a CICS release later than Version 3 Release 3. This attachment facility issues DSN2xxx messages.

---

### DSN2001I: CICS UR INDOUBT RESOLUTION IS INCOMPLETE FOR ssid

**Explanation:** CICS cannot resolve the disposition of the units of recovery that DB2 holds indoubt from the previous connection because CICS was cold started.

**System Action:** The CICS attachment facility continues the startup process.

**Operator Response:** Notify the CICS system programmer.

**System Programmer Response:** You must resolve the indoubt units of recovery manually by issuing the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands.

---

### DSN2002I: csect-name DSN2CTxx MODULE NOT FOUND

**Explanation:** The resource control table DSN2CT with suffix xx could not be loaded.

**System Action:** The CICS attachment facility initialization terminates.

**User Response:** Reenter the start command with the correct suffix. Ensure that the resource control table DSN2CT is in the correct application program library, which is concatenated in the JOBLIB or STEPLIB statement of your CICS startup JCL.

If DSN2CT is not in your application program library, ensure that you are using the correct version of the DSNCRCT macro to assemble DSN2CT. For CICS versions later than Version 3 Release 3, the correct DSNCRCT macro is in the CICS macro library rather than in the DB2 macro library.

---

### DSN2003I: THE ATTACHMENT FACILITY IS ALREADY ACTIVE

**Explanation:** The CICS attachment facility is already active and enabled to CICS.

**System Action:** The CICS attachment facility initialization is terminated.

**Operator Response:** Only one CICS attachment facility is permitted.

---

### DSN2004I: THE PLAN NAME IS NOT FOUND IN THE RCT

**Explanation:** This message is the response to a DSNC DISPLAY or DSNC DISCONNECT command. The plan specified in the command was not found in the resource control table (RCT).

**System Action:** The CICS attachment facility command is not processed.

**Operator Response:** Reenter the command with the correct plan name.

---

### DSN2005I: THE TRANSACTION NAME IS NOT FOUND IN THE RCT

**Explanation:** This message is the response to a DSNC DISPLAY or DSNC MODIFY command. The transaction specified in the command was not found in the resource control table (RCT).

**System Action:** The CICS attachment facility command is not processed.

**Operator Response:** Reenter the command with the correct transaction name.

---

### DSN2006I: THE dest DESTINATION ID IS INVALID

**Explanation:** This message is the response to a CICS attachment facility command. The destination ID dest specified in the command was not found in the CICS destination control table (DCT) or the resource control table (RCT).

**System Action:** The CICS attachment facility command is not processed.

**Operator Response:** Reenter the command with the correct destination ID.

---

### DSN2007I: THE COMMAND VERB IS MISSING OR INVALID

**Explanation:** The CICS attachment facility does not recognize the ACTION keyword on the entered command.

**System Action:** The command is not processed.

**Operator Response:** Reenter the command with the correct syntax.
**DSN2008I**  KEYWORD IS MISSING OR INVALID  
**Explanation:** A CICS attachment facility command contains an unknown positional keyword or a keyword is missing.

**System Action:** The command is not processed.

**Operator Response:** Reenter the command with the correct syntax.

---

**DSN2009I**  THE VALUE IN THE COMMAND IS INVALID  
**Explanation:** The numeric value in the DSNC MODIFY command might be invalid. Otherwise, the error is caused by one of the following:

- The value in the command is greater than the value specified for the THRDM parameter in the resource control table (RCT).
- If the POOL RCT entry is being changed, the active thread count cannot be set to less than 3.

**System Action:** The command is not processed.

**Operator Response:** Reenter the command with a valid value.

**System Programmer Response:** If the number of threads required is more than the number allowed in the resource control table (RCT), specify a larger number of threads in the THRDM parameter and regenerate the table.

---

**DSN2011I**  tran TRANSACTION ABENDED BECAUSE THREADS ARE UNAVAILABLE  
**Explanation:** The transaction with CICS transaction ID tran was abnormally terminated because a thread connection to DB2 was not available for the transaction. This error message can occur when:

- TWAIT of the transaction entry in the resource control table is NO.
- TWAIT of the transaction entry is POOL, TWAIT in the pool entry is NO, and all threads in the POOL are active.

**System Action:** The indicated transaction is abended. No other action is taken by the CICS attachment facility.

**Operator Response:** Notify the CICS system programmer.

**System Programmer Response:** Determine which of the following actions will correct the problem:

- If more threads are available with the current generation of the resource control table (RCT), tell the master terminal operator to make more threads active by using the DSNC MODIFY command.
- Regenerate the RCT and make more threads available to the transaction that failed. Stop and then restart the CICS attachment facility to make the new RCT active.

**DSN2012I**  THE ATTACHMENT FACILITY STOP QUIESCE IS PROCEEDING  
**Explanation:** A DSNC STOP command entered by the master terminal operator is being processed.

**System Action:** The CICS attachment facility releases the terminal entering the command and proceeds with the quiesce process.

**Operator Response:** If the quiesce is not completed within the required time period, you can enter a DB2 STOP FORCE command.

---

**DSN2013I**  DISPLAY REPORT FOLLOWS  
**Explanation:** A CICS attachment facility display was requested and follows this message.

**System Action:** Processing continues.

---

**DSN2014I**  STATISTICS REPORT FOR rct-name FOLLOWS  
**Explanation:** A CICS attachment facility statistics display was requested and follows this message. The name of the resource control table (RCT) that is currently in use is rct-name.

The following information is displayed for each entry in the RCT:

- **TRAN**  CICS transaction name.
- **PLAN**  DB2 plan name.
- **CALLS**  Total number of SQL statements in this connection.
- **AUTHS**  Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread is reused. If the thread is reused and TKENE=NO, a sign-on occurs only if the authorization ID or transaction ID has changed.
- **W/P**  Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.
- **HIGH**  Maximum number of concurrent threads required by transactions associated with this entry at any time since the CICS attachment facility was started.
- **ABORTS**  Total number of units of recovery that were rolled back.
**COMMITS**

One of the following two fields is incremented each time a DB2 transaction associated with this entry has an explicit or implicit (such as EOT) sync point.

**1-PHASE**

The total number of single phase commits for transactions associated with this entry.

**2-PHASE**

The total number of two phase commits for transactions associated with this entry.

For a more detailed explanation of the fields in the statistics report, refer to “Controlling CICS Connections” in Part 4 (Volume 1) of [DB2 Administration Guide](#).

**System Action:** Processing continues normally.

---

**DSN2015E** *csect THE ATTACHMENT FACILITY FOR name IS IN STANDBY*

**Explanation:** The CICS attachment facility has dropped into standby mode because DB2 has stopped and STANDBY=SQNCODE was specified in the RCT.

**System Action:** The CICS attachment facility will issue negative SQLCODEs for all SQL requests.

**Operator Response:** Restart the attachment after DB2 is restarted.

---

**DSN2016I** *csect-name THE CONNECTION OF CICS WITH name FAILED, 'reason-code'*

**Explanation:** The CICS attachment facility is terminating abnormally because an error occurred while connecting with DB2. The error is indicated by reason-code, and the specific DB2 subsystem is indicated by name.

**System Action:** The CICS attachment facility terminates with abort completion code X’04E’. If the initial identify fails because of an authorization error, DSN2042I is issued and no dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Look up reason-code to determine the specific failure that caused the termination.

---

**DSN2017I** *ATTACHMENT OF A THREAD SUBTASK FAILED*

**Explanation:** The CICS attachment facility continues processing but is unable to start as many thread subtasks as are allowed in a resource control table (RCT) entry.

**System Action:** The CICS attachment facility attempted to terminate all subtasks that are currently unused, but none could be terminated. If other subtasks are not active to process the current transaction, CICS is requested to abend the transaction.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The error might be caused by one of the following:

- There is a shortage of storage in the local storage queue area (LSQA).
- The maximum number of thread subtasks allowed was reached. The maximum is specified in the THRDMAx parameter of RCT. The DSN2 DISPLAY STATISTICS command is useful in analyzing the current thread usage.

---

**DSN2018I** *name IS NOT ACTIVE*

**Explanation:** The DSNC STRT command cannot proceed because subsystem name is not active.

**System Action:** The DSNC STRT command processing ends without starting the CICS attachment facility.

**Operator Response:** Reenter the CICS attachment facility command after DB2 is started.

---

**DSN2019I** *THE MODIFY COMMAND IS COMPLETE*

**Explanation:** The DSNC MODIFY command completed successfully.

---

**DSN2020I** *THE DISPLAY COMMAND IS COMPLETE*

**Explanation:** The DSNC DISPLAY command completed successfully.

---

**DSN2021I** *THE DISCONNECT COMMAND IS COMPLETE*

**Explanation:** The DSNC DISCONNECT command completed successfully.

---

**DSN2022I** *THE ATTACHMENT FACILITY STOP FORCE IS PROCEEDING*

**Explanation:** A DSNC STOP FORCE command entered by the master terminal operator is being processed.

**System Action:** The CICS attachment facility releases the terminal entering the command and proceeds with the STOP FORCE processing.

---

**DSN2023I** *THE ATTACHMENT FACILITY HAS CONNECTED TO name USING rct-name*

**Explanation:** The DSNC STRT command successfully completed. Subsystem name is now available to CICS. The name of the resource control table (RCT) that was
specify for this start of the CICS attachment facility is rct-name.

**System Action:** The DSNC STRT command completes processing. The CICS attachment facility is active.

---

**DSN2024I** dest CANNOT BE LOCATED IN THE DCT

**Explanation:** The destination shown in the message cannot be located in the CICS destination control table (DCT).

**System Action:** The CICS attachment facility startup process continues. The destination entry in the resource control table (RCT) is set to "*" for potential modification by the CICS attachment facility.

**Operator Response:** Notify the system programmer. Use the DSNC MODIFY command to set the error destination to the correct identification characters.

**System Programmer Response:** Correct either the RCT or the DCT to synchronize the error destinations.

---

**DSN2025I** THE ATTACHMENT FACILITY IS INACTIVE

**Explanation:** This is the final message issued by the CICS attachment facility to inform the resource control table error destinations that the CICS attachment facility completed the shutdown process.

**System Action:** The CICS attachment facility is terminated.

---

**DSN2026I** DSN2STOP FAILED TO DISABLE THE name RMI EXIT

**Explanation:** The CICS attachment facility failed to disable the named resource manager interface (RMI) exit. Either the exit was in use at the time DSN2STOP tried to disable it, or an abend occurred in the RMI exit code while the 'in use' flag was on. The CICS system must be stopped and restarted before the CICS attachment facility can be restarted.

**System Action:** The CICS attachment facility continues termination processing after dumping the CICS trace, the resource control table (RCT), and the connection control table (CCT).

**Operator Response:** Notify the CICS attachment facility system programmer. CICS must be stopped and restarted before restarting the CICS attachment facility.

**System Programmer Response:** This could be a problem in the CICS 'task-related user exit'. Analyze the trace and any dumps associated with this execution to determine the source of the error.

---

**DSN2027I** SHUTDOWN IS IN PROGRESS. transaction COMMANDS MAY NOT BE ENTERED

**Explanation:** The CICS attachment facility does not accept commands directed to DB2 during or after the termination of the CICS attachment facility.

**System Action:** The command is rejected.

**User Response:** Notify the CICS attachment facility system programmer.

---

**DSN2028I** USER IS NOT AUTHORIZED FOR transaction COMMANDS

**Explanation:** DB2 rejected the command request during the sign-on of the user. Therefore, the user is assumed to be unauthorized for the requested function in the command.

**System Action:** The command is rejected.

**Operator Response:** Notify the CICS attachment facility system programmer.

**System Programmer Response:** The authorization ID used is described in the generation procedures of the resource control table (RCT). If this user should be allowed access to the command, use the GRANT statement to grant authorization.

---

**DSN2029I** transaction COMMAND FAILED, REASON CODE rc

**Explanation:** The DB2 command, identified in the message as transaction, failed to return a response message indicating the action taken by the command. DB2 returned reason code rc.

**System Action:** The results of the command are unknown.

**Operator Response:** Notify the CICS attachment facility system programmer.

**System Programmer Response:** Check the master console for any messages indicating why the command failed. Refer to the explanation of the reason code returned by DB2 in [Part 4, Section 4. DB2 Codes](#) on page 771.

---

**DSN2030E** AN ERROR HAS OCCURRED WRITING TO THE TRANSIENT DATA OUTPUT DESTINATION destination

**Explanation:** The CICS attachment facility encountered an error while writing to the indicated destination.

**System Action:** The CICS attachment facility continues operation.

**Operator Response:** Notify the system programmer. If the destination is one of the resource control table error
destinations, use the CICS MODIFY command to change the destination code to another destination, if one is available.

**System Programmer Response:** Follow CICS procedures to correct the error. Refer to CICS Transaction Server for z/OS Problem Determination Guide for additional information.

---

<table>
<thead>
<tr>
<th>DSN2031I</th>
<th>THE COMMAND IS INVALID. THE ATTACHMENT FACILITY IS INACTIVE</th>

<tr>
<th>DSN2036I</th>
<th>INDOUBT RESOLUTION FOR <code>ur-id</code> IS INCONSISTENT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>CICS indicates recovery resolution for the <code>ur-id</code> should be ABORT (backout), but DB2 indicates the resolution should be COMMIT. This error can be caused by a damaged CICS system journal file.</td>
</tr>
<tr>
<td><strong>System Action:</strong></td>
<td>DB2 committed the unit of recovery. The CICS attachment facility continues the startup process.</td>
</tr>
<tr>
<td><strong>Operator Response:</strong></td>
<td>Notify the CICS system programmer.</td>
</tr>
<tr>
<td><strong>System Programmer Response:</strong></td>
<td>CICS and/or DB2 restart processes are not in synchronization. You must identify the cause of the error. Take appropriate action to return all resources to a consistent state.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>DSN2037A</th>
<th>subsystem IS NOT ACTIVE transaction IS WAITING</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong></td>
<td>The CICS attachment facility start transaction identified in the message is waiting for notification from the indicated DB2 subsystem that it is active. The start of the CICS attachment facility is complete after DB2 has started.</td>
</tr>
<tr>
<td><strong>System Action:</strong></td>
<td>The CICS attachment facility waits to complete the start process.</td>
</tr>
<tr>
<td><strong>Operator Response:</strong></td>
<td>Start the DB2 subsystem.</td>
</tr>
</tbody>
</table>
**DSN2038I**  
**THE COMMAND IS INVALID WHILE WAITING FOR** subsystem name  

**Explanation:** The command entered cannot be processed while the CICS attachment facility is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is subsystem name.

**System Action:** The command is rejected.

---

**DSN2039I**  
**THE ERROR DESTINATIONS ARE:** d1 d2 d3  

**Explanation:** This message is the response to the DSNC MODIFY DESTINATION command that lists the currently active message destinations known to the CICS attachment facility. Null entries that show as "****" can be modified so they identify actual destinations.

---

**DSN2040I**  
**MODULE name COULD NOT BE FOUND**  

**Explanation:** During the CICS attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

**System Action:** The CICS attachment facility initialization is terminated.

**Operator Response:** Notify the CICS attachment facility system programmer.

**System Programmer Response:** Check the CICS JCLLIB/STEPLIB libraries and ensure that the CICS SDFAUTH and the DB2 SDSNLOAD libraries are defined there.

---

**DSN2041I**  
**NO ACTIVE THREADS**  

**Explanation:** A DSNC DISPLAY TRANSACTION or DSNC DISPLAY PLAN command was entered, but there were no active threads created. The CICS attachment facility might have identified and signed on the attached subtasks, but a create thread was not issued for any of the subtasks.

---

**DSN2042I**  
**CONNECTION NOT AUTHORIZED TO** name  

**Explanation:** The attempt to connect to the named DB2 subsystem failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

**System Action:** The CICS attachment facility terminates.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user specified on the CICS job was not authorized to connect to the named DB2 subsystem. Refer to Part 3 (Volume 1) of [DB2 Administration Guide](#) for information on how to authorize a user to access DB2.

---

**DSN2043I**  
**DSN2STOP ENCOUNTERED ERROR, RECOVERY ROUTINE started/completed**  

**Explanation:** A CICS abend occurred while disconnecting the CICS attachment facility from DB2 and deleting it from storage. This message might be issued twice. It is issued at the start of the abend recovery routine, which is indicated by 'started' in the message text. If the recovery routine is successful, the message is issued with 'completed' in the message text.

**System Action:** If the recovery routine is not successful, program DSN2STOP terminates with a CICS transaction dump. If the recovery routine is successful, the CICS attachment facility is terminated normally.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Analyze any abend dumps associated with this message to determine the cause of the failure.

---

**DSN2044I**  
**DSNCRCT ENTRY HAS BEEN CORRUPTED OR OVERLAI**  

**Explanation:** The CICS attachment facility detected that a resource control table (RCT) entry was corrupted or overlaid since the CICS attachment facility was last started.

**System Action:** The CICS task is abended with reason code 00C30011. No other action is taken by the CICS attachment facility.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Analyze the abend dumps associated with this message to determine which CICS transaction and RCT entry was corrupted. Restart the CICS attachment facility to obtain a valid copy of the RCT.

---

**DSN2045I**  
**RESOURCE MANAGER rmi-name IS UNKNOWN TO CICS ATTACH FACILITY**  

**Explanation:** The CICS attachment facility received a request from a resource manager interface (RMI) named rmi-name. This RMI is not known by the CICS attachment facility.

**System Action:** The CICS task is abended with a CICS transaction dump.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Analyze the CICS transaction dump to determine the source of the unknown resource manager interface (RMI) request.
**Problem Determination:** CICS dump information, such as the trace table and program storage, can aid in determining which module issued the request. The CICS EXEC interface block resource name field, EIBRSRCE, contains the name of the RMI.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.nsf/docview/82) for information on identifying and reporting the problem.

---

**DSN2046I**  
**RCT RELEASE LEVEL nnnn IS INCONSISTENT WITH CICS ATTACH RELEASE LEVEL mmmm**

**Explanation:** The resource control table (RCT) release level nnnn does not match the CICS attachment facility release level mmmm.

This message is issued by the following CSECT: DSN2STRT

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reassemble the RCT using the correct DB2 release level mmmm DSNCRCT macro.

---

**DSN2047I**  
**TWA SIZE IS TOO SMALL FOR TRAN tran**

**Explanation:** The CICS TWASIZE defined for transaction tran is too small to support the CICS attachment facility command processor program (DSN2COM1).

**System Action:** The CICS attachment facility abends this CICS task with a CICS transaction abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Redefine the command processor transaction to specify the correct TWASIZE.

---

**DSN2048I**  
**UNABLE TO INTERPRET SQL CALL WHILE FORMATTING AN EDF DISPLAY TRAN tran TASK task**

**Explanation:** The CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction tran and task id task. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS attachment facility.

**System Action:** A CICS transaction dump is taken of the storage in question.

**Programmer Response:** Ensure that CICS storage associated with this task was not altered or overlaid. Analyzing the storage in the CICS transaction dump might provide clues about the source of the problem.

**Problem Determination:** Analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS attachment facility resource manager

No other information is provided about the SQL statement.

---

**DSN2049E**  
**csect-name RECOVER INDOUBT FOR urid FAILED WITH reason-code**

**Explanation:** A resolve indoubt request passed to DB2 from CICS failed.

**System Action:** The attachment leaves the unit of recovery indicated by 'urid' indoubt in CICS and DB2. The attachment requests a system dump of the CICS region.

**System Programmer Response:** Use the reason code to determine why the RECOVER INDOUBT request failed. If necessary, manually resolve the unit of recovery using the RECOVER INDOUBT command.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.nsf/docview/82) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSN2052I**  
**INSUFFICIENT STORAGE AVAILABLE TO START ATTACHMENT FACILITY**

**Explanation:** During startup the CICS attachment facility was unable to allocate the required amount of storage. This message might be issued if an error occurs while the attachment facility is loading the data only load module, DSN2CTX.

**System Action:** The CICS attachment facility is not initialized.

**System Programmer Response:** Allow a larger amount of dynamic storage on your CICS system. Alternatively, you can delete unused entries or lower THRDA and THRD M values in your RCT, which reduces the size of the storage that the attachment facility requires.

For a load error, check the MVS console log for any preceding messages to determine why the load failed. If there is not enough free REGION space to load the RCT, see the appropriate CICS documentation for information on tuning your CICS system.
**DSN2053I** IN SUFFICIENT TWASIZE FOR DSN2COM1. REQUIREMENT IS `twasize`

**Explanation:** The CICS attachment facility requires a TWASIZE of `twasize` on all transactions that execute DSN2COM1. Either the TWASIZE that was specified is less than the requirement, or no TWASIZE was specified at all.

**System Action:** The attachment facility terminates.

**System Programmer Response:** Ensure that CSD group DFHDB2 was installed in the CSD. Any transaction that executes program DSN2COM1 should specify TWASIZE(`twasize`) on its transaction entry.

---

**DSN2054I** DYNAMIC PLAN PROGRAM LINK FAILED FOR TRANSACTION `transaction`. EIBRESP WAS `eibresp`.

**Explanation:** The attachment facility was unable to link to the dynamic plan exit program specified in DSNCRCT. The reason code provided by CICS in the EIBRESP field of the EIB is given in this message.

**System Action:** The transaction is abended with a DSNC abend.

**User Response:** Look up the `eibresp` value in CICS Transaction Server for z/OS Application Programming Reference. This value was returned from CICS after the attachment facility attempted to link to the dynamic plan exit. Take appropriate action based on the `eibresp`. For example, if `eibresp` was PGMIDERR, check your RCT entry for transaction `transaction` to ensure that the dynamic plan exit program name (PLNPGME or PLNPGMI) is the name of a valid program known to CICS.

---

**DSN2055I** SINGLE PHASE COMMIT FAILED FOR TRANSACTION `transaction`. EIBTASKN WAS `task number`.

**Explanation:** CICS requested a single phase commit from DB2, but DB2 was unable to comply.

**System Action:** The transaction is abended with a DSNC abend.

**User Response:** Contact the IBM Support Center for assistance.

---

**DSN2056I** csect-name CICS RELEASE release IS DOWN LEVEL FOR THIS ATTACHMENT FACILITY

**Explanation:** The attachment facility that you are using requires a CICS release later than Version 3 Release 3. You are using CICS Version 3 Release 3 or an earlier release. For this release of CICS, you must use the attachment facility shipped with DB2.

**System Action:** The attachment facility does not initialize.

**User Response:** Ensure that the CSD definition of the DSNC transaction specifies program DSNCCOM1. If you are initializing the attachment facility using CICS program list table (PLT) processing, ensure that your CICS PLTPI table uses program DSNCCOM0 to initialize the attach.

---

**DSN2059I** csect-name CICS ATTACHMENT FACILITY MISMATCH WITH RESOURCE CONTROL TABLE `rct-name`.

**Explanation:** The wrong macro library was used to assemble DSN2CT, the resource control table.

There are two versions of the CICS attachment facility. The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release; the one shipped with CICS requires a CICS release later than Version 3 Release 3. This error message indicates CICS is using the attachment facility shipped with CICS, but the RCT was assembled using the DB2 macro libraries.

**System Action:** The CICS attachment facility initialization terminates.

**User Response:** Reassemble DSN2CT using the DSNCRCT macro shipped in the CICS macro libraries.

---

**DSN2060I** csect-name INITPARM IS IGNORED BECAUSE FORMAT IS INVALID.

**Explanation:** The DSN2STRT INITPARM specified on the CICS initialization job is incorrect. The format of the INITPARM should be:

```
INITPARM=(DSN2STRT='xx,yyy')
```

where `xx` is the suffix of the RCT and `yyy` is the DB2 subsystem id. The RCT suffix cannot be greater than 2 characters, and the subsystem ID cannot be greater than 4 characters.

To specify an RCT suffix only, use the format:

```
INITPARM=(DSN2STRT='xx')
```

To specify a subsystem ID override only, use the format:

```
INITPARM=(DSN2STRT='i,yyy')
```

**System Action:** The attachment facility attempts to initialize with the subsystem ID specified in the DSNC STRT command. If no subsystem ID is provided there, it attempts to initialize with the subsystem ID specified in the resource control table.

**User Response:** If you want to override the subsystem ID, restart the attachment facility using the DSNC STRT command with the correct SSID. Alternatively, you can correct the DSN2STRT INITPARM and reinitialize CICS.
DSN2061I  csect-name INITPARM IS INVALID. ATTACHMENT FACILITY NOT STARTED.

Explanation: No resource control table suffix was specified on the DSNC STRT command, and the format of the DSN2STRT INITPARM on the CICS initialization job is incorrect. The format of the INITPARM should be:

INITPARM=(DSN2STRT='xx,yyy')

where xx is the suffix of the RCT and yyy is the DB2 subsystem id. The RCT suffix cannot be greater than 2 characters, and the subsystem id cannot be greater than 4 characters.

To specify an RCT suffix only, use the format:

INITPARM=(DSN2STRT='xx ')

To specify a subsystem ID override only, use the format:

INITPARM=(DSN2STRT=' ,yyy')

System Action: The attachment facility does not initialize.

User Response: To start the attachment facility, use the DSNC STRT command and specify a resource control table suffix on the command. Alternatively, you can correct the DSN2STRT INITPARM and reinitialize CICS.

DSN2063I  csect-name NOT AUTHORIZED TO START TRANSACTION transaction. ATTACHMENT FACILITY NOT STARTED

Explanation: The user was not authorized to start transaction transaction.

The CICS-DB2 attachment facility starts transaction during initialization. Before it starts transaction, it checks external security (such as RACF) using CICS's QUERY SECURITY command. When CICS returns the value NOTREADABLE for transaction, the attachment facility produces this message.

System Action: The attachment facility does not initialize.

System Programmer Response: Identify the authorization ID of the user who started the attachment facility. Use your external security product to authorize that user to start transaction.

DSN2064I  csect-name transaction ABENDED. ATTACHMENT FACILITY IS TERMINATING.

Explanation: The CICS-DB2 transaction transaction abended.

System Action: The CICS-DB2 attachment facility terminates.

System Programmer Response: Identify the cause of the abend, correct it if necessary, and restart the attachment facility.

DSN2065I  csect-name INVALID LENGTH. DATA NOT DISPLAYABLE.

Explanation: The module running under the CICS Execution Diagnostic Facility (EDF) attempted to display an input or output variable that had an incorrect length indicator.

System Action: EDF processing continues, but the value of the variable is not displayed.

DSN2070I  csect ROLLBACK FAILED FOR TRANSACTION transaction EIBRESP2 = X'ebresp2'

Explanation: The attachment facility was unable to issue a CICS ROLLBACK. The reason code provided by CICS in the EIBRESP2 field of the EIB is shown in ebresp2.

System Action: The transaction is abended with a DSNC abend.

System Programmer Response: Look up the ebresp2 value in CICS Transaction Server for z/OS Application Programming Reference. This value was returned from CICS after the attachment facility attempted a ROLLBACK requested by the ROLBE=YES option.

DSN2700I  DSN2SAMG message-id HAS BEEN ISSUED

Explanation: This message is issued only if the requested message was not found in the message directory (DSN2MSGT).

System Action: The system proceeds as though the requested message was issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for the message text.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSN2901I  UNRECOVERABLE IOERROR IN PROGRAM DSN2COM1. THE ATTACHMENT FACILITY WILL SHUTDOWN.

Explanation: An attempt to retrieve data stored for program DSN2COM1 failed when CICS returned an exceptional condition of I0ERR (EIBRESP = X'11').

System Action: The DB2-CICS attachment facility is shutdown.
**Operator Response:** Notify the system programmer.

**System Programmer Response:** An IOERR occurs if an input or output error occurs during a RETRIEVE operation. Examine the CICS auxiliary trace records and the CICS system log to determine the cause of the IOERR.
Chapter 27. DSN3... messages

DSN3001I  csect-name ABNORMAL DISCONNECT FROM SUBSYSTEM INTERFACE

Explanation: This message indicates that 'csect-name' detected that an online routine was still supporting SSI calls (IEFSSREQ) even though DB2 was nearly done terminating or no longer executing. This occurs with 'csect-name' DSN3RS0X when the service address space has reached end-of-memory and neither normal termination nor online error recovery routines have successfully completed termination of the DB2 subsystem. This occurs with 'csect-name' DSN3SSSTM when this condition is discovered during online termination.

System Action: The connection is terminated. All IEFSSREQ requests are handled by the DB2 ERLY code until DB2 is restarted.

Problem Determination: An SVC dump is requested. This SVC dump and associated SYS1.LOGREC entries provide information to determine which resource managers had not removed their support of particular SSI function codes.

For dumps requested by DSN3RS0X, all pertinent control blocks and stack storage are dumped. The primary control block of interest is the SSVT for DB2.

For DSN3SSSTM, the DB2 'standard dump' facility is used to dump the information necessary for problem diagnosis. The primary control blocks of interest are the 'active' CONN blocks.

DSN3002I  RECOVERY INCOMPLETE FOR connection-name

Explanation: At least one DB2 unit of recovery (UR), related to an identified subsystem ('connection-name'), is still 'indoubt' after restart synchronization has taken place. ('Indoubt' URs are those for which commit has been voted by DB2 but which have not been acknowledged by 'connection-name'.)

This message may appear if the 'connection-name' subsystem has begun to do new work before having resolved all indoubt URs. The 'connection-name' subsystem may be in the process of resolving the indoubt URs.

System Action: Resources held (locked) by these 'indoubt' URs are unavailable to any other work units until their status is resolved.

System Programmer Response: The system programmer and/or system administrator must determine the correct recovery action to resolve the 'indoubt' situations. This involves either 'ensure-commit' or 'backout' decisions for all 'indoubt' URs.

The -DISPLAY THREAD command should be used to see the URs still indoubt. It may show that all indoubt URs have already been resolved. The -RECOVER INDOUBT command should be used, either from an MVS console or through an attachment facility, to resolve the indoubt URs and to release the resources they hold.

Problem Determination: This error is probably caused by a cold start after an abnormal termination of either subsystem or by offline alterations of the logs of either subsystem.

DSN3004I  DESCRIPTOR GET FAILURE RC=X xxxxxxxx, REASON=X xxxxxxxx

Explanation: The parameter list required to create the DB2 agents under which IEFSSREQ calls are processed could not be obtained from the subsystem support subcomponent directory of internal parameters (DSN3DIR1). The RC indicates the return code received from the system parameter manager and REASON indicates the reason code (from register 0).

The return code is always 4 when this message is presented, indicating that the IEFSSREQ descriptor was not found in the subsystem support subcomponent directory. This is a system error and results in termination of the DB2 subsystem. The reason code is always 0.

System Action: Subsystem initialization is discontinued. Termination occurs.

System Programmer Response: Repair the master directory (DSNZPARM) and/or the DB2 program libraries, and restart the DB2 subsystem.

Problem Determination: If the problem persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

DSN3006I  xxxx SSI FUNCTION WAS ALREADY ACTIVE WHEN ACTIVATE WAS ATTEMPTED

Explanation: An initialization sequence error has occurred. The subsystem support for SSI services resource manager (SSSS) has discovered during its initialization that another resource manager (‘xxxx’) has already activated the EOM or FEOT SSI call by calling DSN3AC0X. If this occurs, the error is a serious one.

System Action: Subsystem initialization is discontinued. DB2 termination occurs.

System Programmer Response: Ensure that all maintenance has been applied to the DB2 program libraries, and then restart the DB2 subsystem.
Problem Determination: If the problem persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Explanation:** A termination sequence error has occurred. The subsystem support for SSI services resource manager (SSS) has discovered during its termination that another resource manager (‘xxxx’) has already deactivated the EOM or FEOT SSI call by calling DSN3AC0X. If this occurs, the error is a serious one.

**System Action:** Termination continues.

**System Programmer Response:** Ensure that all maintenance has been applied to the DB2 program libraries.

---

**Problem Determination:** If the program persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Explanation:** This message indicates that 'csect-name' has discovered that one or more resource managers are still supporting application program calls through their program request handler, even though DB2 was almost done terminating or was no longer executing. This occurs when the system services address space has gone to end of memory and neither normal termination nor online error recovery routines have successfully completed termination of the DB2 subsystem.

**System Action:** The program request handler (PRH) connection is terminated. All application program support requests are rejected with an indication that DB2 is not up.

**System Programmer Response:** See the Problem Determination section of this message.

---

**Problem Determination:** An SVC dump is requested. This SVC dump and associated SYS1.LGREGC entries provide information to determine which resource managers were still supporting application program support calls. All pertinent control blocks and stack storage are dumped. The primary control block of interest is the program request handler block (PRHB).

---

**Explanation:** DB2 has coordinator responsibility for indoubt units of recovery and RRS has a participant role in the unit of recovery. RRS has cold started and has lost knowledge of indoubt units of recovery. There might be damage at RRS Recoverable Resource Managers that also participated in the unit of recovery.

**System Action:** Processing continues.

**System Programmer Response:** Contact the database administrator.

**Database Administrator Action:** DB2 is the coordinator for one or more indoubt units of recovery at other RRS recoverable resource managers. RRS has lost all knowledge of these units of recovery. The participant RRS Recoverable Resource Managers might still have indoubt units of recovery. DB2 has no knowledge of other RRS Recoverable Resource Manager except for the RRS unit of recover ID (URID) that identifies such a unit of recovery. Subsequent DSN3017I, DSN3018I or DSN3019I messages describe the status of each unit of recovery and contain the RRS URID for each.
The existence of other participants might not be easy to
determine. The information might be available in the
MVS/RRS recovery log even though information has
been lost.

At this DB2, all indoubt threads coordinated by the RRS
must be resolved with the RECOVER INDOUBT
command. Locked data remains unavailable until
resolution. Threads that were already resolved with this
command are discarded. Threads not yet resolved are
discarded after resolution with the command.

The commit or abort decision provided using the
RECOVER INDOUBT command for a logical unit of
work are propagated to all downstream participants, if
any.

**Operator Response:** Notify the database
administrator.

**Database Administrator Action:** This message might
indicate a DB2 or RRS problem, or it might be produced
normally because one of the following prior actions:
- A DB2 conditional restart was performed that resulted
  in the loss of part or all of the DB2 log. This
  conditional restart might have happened at any time
  in the past.
- The DB2 RECOVER INDOUBT command was used
to resolve the DB2 unit of recovery with URID
  'db2_uri'.

If either of these occurred, the message can be ignored.
If neither occurred, there might be a DB2 or an RRS
problem. If the 'db2_uri' appears to be a valid log RBA,
use the DSN1LOGP utility with the SUMMARY option
and URID options using the 'db2-uri' value. If
DSN1LOGP finds the 'db2-uri', the disposition will
indicate whether the DB2 UR was committed or aborted
(rolled back). If possible, use the RRS ISPF interface to
commit or abort the RRS URID to avoid heuristic
damage.

**Problem Determination:** If you suspect an error in
DB2, refer to Part 2 of [DB2 Diagnosis Guide and
Reference](https://www.ibm.com/support/docview.wss?rs=172&os=0&uid=swg21243742) for
information on identifying and reporting

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

| DSN3012I | csect-name DB2 WAS RESTARTED ON
THE WRONG SYSTEM AND CANNOT
CONNECT TO RRS. THERE ARE
UNRESOLVED UNITS OF RECOVERY
WHERE DB2 IS THE COORDINATOR. |
| --- | --- |
| **Explanation:** DB2 is the commit coordinator for one or
more indoubt units of recovery. DB2 is unable to
connect to RRS to resolve these indoubt units of
recovery. |
| **System Action:** Processing continues. |
| **Operator Response:** Use the RRS IPCS interface to
determine the correct system and restart DB2 on that
system. |}

| DSN3013I | csect-name DB2 WAS RESTARTED ON
THE WRONG SYSTEM AND CANNOT
CONNECT TO RRS. THERE ARE
UNRESOLVED UNITS OF RECOVERY
WHERE DB2 IS A PARTICIPANT. |
| --- | --- |
| **Explanation:** DB2 has one or more indoubt threads
and is unable to connect to RRS to resolve these
indoubt units of recovery. |
| **System Action:** Processing continues. |
| **Operator Response:** Use the RRS IPCS interface to
determine the correct system and restart DB2 on that
system. |}

| DSN3014I | csect-name DB2 HAS NO KNOWLEDGE
OF RRS URID=rs_uri. THE RRS UR IS
INDOUBT. THE DB2 URID RECORDED
BY RRS=db2_uri. |
| --- | --- |
| **Explanation:** DB2 is restarting with RRS where DB2 is
a participant and RRS is the coordinator. RRS has a
unit of recovery that DB2 should be the coordinator in, but
DB2 has no knowledge of the RRS unit of recovery. The
RRS unit of recovery ID is 'rs_uri'. RRS has recorded
the DB2 unit of recovery ID as 'db2_uri'. |
| **System Action:** Restart with RRS continues. |}

Chapter 27. DB2 messages
Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSN3016I csect-name RRS HAS LOST DATA FROM ITS LOG.

Explanation: DB2 is restarting with RRS and RRS has lost some portion of its log.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: DB2 might not be able to resolve indoubt Units of Recovery successfully with RRS because of the loss of RRS log data. This message might be followed by one or more of the following messages: DSN3017I, DSN3018I, DSN3019I, DSN3020I, DSN3021I, DSN3022I and DSN3023I.

DSN3017I csect-name RRS HAS NO KNOWLEDGE OF DB2 URID=\{db2.urid\}. THE DB2 UR IS INDOUBT. THE RRS URID RECORDED BY DB2=\{rrs.urid\}.

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is a participant. DB2 has a unit of recovery that RRS should be a participant in, but RRS has no knowledge of the DB2 unit of recovery. The DB2 unit of recovery ID is ‘db2.urid’. DB2 has recorded the RRS unit of recovery ID as ‘rrs.urid’.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

DSN3018I csect-name RRS HAS NO KNOWLEDGE OF DB2 URID=\{db2.urid\}. THE DB2 UR WAS COMMITTED. THE RRS URID RECORDED BY DB2=\{rrs.urid\}.

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is a participant. DB2 has a unit of recovery that RRS should be a participant in, but RRS has no knowledge of the DB2 unit of recovery. The DB2 unit of recovery ID is ‘db2.urid’. DB2 has recorded the RRS unit of recovery ID as ‘rrs.urid’.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**DSN3020I**  
<csect-name> POSSIBLE HEURISTIC DAMAGE. RRS HAS COMMITTED THE UR WITH RRS URID=<rrs_urid>, THE DB2 UR WITH DB2 URID=<db2_uri> IS INDOUBT.

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) DB2 URID=<db2_uri> that is indoubt. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has committed the same UR. The RRS URID=<rrs_uri>.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: If possible, insure that the DB2 UR is resolved to commit. If this is done, there will be no heuristic damage. If the DB2 UR is resolved to abort, heuristic damage will have occurred since RRS committed the same UR.

---

**DSN3021I**  
<csect-name> POSSIBLE HEURISTIC DAMAGE. RRS HAS ROLLED BACK THE UR WITH RRS. URID=<rrs_uri>, THE DB2 UR WITH DB2 URID=<db2_uri> IS INDOUBT.

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) DB2 URID=<db2_uri> that is indoubt. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has rolled back the same UR. The RRS URID=<rrs_uri>.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

---

**DSN3022I**  
<csect-name> HEURISTIC DAMAGE HAS OCCURRED. RRS HAS COMMITTED THE UR WITH RRS URID=<rrs_uri>, AND DB2 HAS ROLLED BACK THE SAME UR. THE DB2 URID=<db2_uri>

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) with DB2 URID=<db2_uri> that was rolled back. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has committed the same UR. The RRS URID=<rrs_uri>.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: Heuristic damage has occurred since DB2 rolled back the UR and RRS has committed the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

---

**DSN3023I**  
<csect-name> HEURISTIC DAMAGE HAS OCCURRED. RRS HAS ROLLED BACK THE UR WITH RRS URID=<rrs_uri>, AND DB2 HAS COMMITTED THE SAME UR. THE DB2 URID=<db2_uri>

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) with DB2 URID=<db2_uri> that was committed. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has rolled back the same UR. The RRS URID=<rrs_uri>.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.
Database Administrator Action: Heuristic damage has occurred since DB2 committed the UR and RRS has rolled back the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

---

**DSN3024I**

- **csect-name** HEURISTIC DAMAGE HAS OCCURRED. COORDINATOR DB2 HAS COMMITTED THE UR WITH DB2 URID=dd2_urd, AND RRS HAS INDICATED THAT THE OUTCOME WAS MIXED. THE RRS URID=rrs_urd.

**Explanation:** DB2 is the commit coordinator and RRS is a participant. DB2 committed the UR with URID = db2_urd and RRS has indicated that one or more Recoverable Resource Managers that participated in the RRS UR with URID = rrs_urd has committed the same UR.

**System Action:** Processing continues.

**Operator Response:** Notify the database administrator.

**Database Administrator Action:** Heuristic damage has occurred since DB2 committed the UR and at least one RRS Recoverable Resource manager has committed the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

---

**DSN3025I**

- **csect-name** HEURISTIC DAMAGE HAS OCCURRED. COORDINATOR DB2 HAS ROLLED BACK THE UR WITH DB2 URID=db2_urd, AND RRS HAS INDICATED THE OUTCOME WAS MIXED. THE RRS URID=rrs_urd.

**Explanation:** DB2 is the commit coordinator and RRS is a participant. DB2 rolled back the UR with URID = db2_urd and RRS has indicated that one or more Recoverable Resource Managers that participated in the RRS UR with URID = rrs_urd has committed the same UR.

**System Action:** Processing continues.

**Operator Response:** Notify the database administrator.

**Database Administrator Action:** Heuristic damage has occurred since DB2 committed the UR and at least one RRS Recoverable Resource manager has committed the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.
have occurred since DB2 committed the same UR.

**DSN3027I**  
```csect-name POSSIBLE HEURISTIC DAMAGE. COORDINATOR DB2 HAS ROLLED BACK THE UR WITH DB2 URID=\texttt{db2\_uid}, AND RRS HAS INDICATED THAT THE OUTCOME IS PENDING. THE RRS URID=\texttt{rs\_uid}.```

**Explanation:**  
DB2 is the commit coordinator for the DB2 UR with URID=db2\_uid and RRS is a participant. RRS has also rolled back the UR but has indicated that at least one RRS Recoverable Resource Manager has not completed roll back processing for the RRS UR with URID=rs\_uid.

**System Action:** Processing continues.

**Operator Response:** Notify the database administrator.

**Database Administrator Action:** If possible, insure that the RRS Recoverable Resource Manager rolls back the RRS UR. If this is done, there will be no heuristic damage. If the RRS UR is committed by the RRS Recoverable Resource manager, heuristic damage will have occurred since DB2 rolled back the same UR.

**DSN3100I**  
```csect-name SUBSYSTEM \texttt{ssnm} READY FOR START COMMAND```

**Explanation:** This message is issued by CSECT DSN3RRSR when DB2 subsystem initialization is complete. The 'ssnm' in the message is the name of the subsystem that issued the message. This occurs during MVS IPL processing. The message is also issued by CSECT DSN3EC0Xafter termination of the previous execution of DB2 is complete. Message DSN3104I is also issued during this processing.

**Operator Response:** Issue the -START command when DB2 execution is desired.

**DSN3101I**  
```csect-name INVALID EARLY PROCESSING MODULE NAME IN PARMLIB RECORD. \texttt{ssnm} IS NOT AVAILABLE```

**Explanation:** CSECT DSN3UR00 has discovered that a parameter passed to DB2 subsystem initialization is in error. Either the Early Processing load module name is not between 1 and 8 characters long, or there are syntax errors in the parameter string. The entire parameter string must be between 3 and 10 characters long, and the next to the last character must be a `'`. The parameters were obtained from the parameter fields of a record defining a DB2 subsystem in member IEFSSNxx of SYS1.PARMLIB.

The subsystem recognition character is not inserted in this message as it is not yet known. 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

**System Action:** The DB2 subsystem with the indicated name is not available for this IPL of MVS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx, and re-IPL MVS. Refer to Part 2 of [DB2 Installation Guide] for the format of an IEFSSNxx record which defines a DB2 subsystem.

**DSN3102I**  
```csect-name INVALID SUBSYSTEM RECOGNITION CHARACTER IN PARMLIB RECORD. \texttt{ssnm} IS NOT AVAILABLE```

**Explanation:** CSECT DSN3UR00 detected that the subsystem recognition character is invalid; it must be nonblank. The subsystem recognition character is the last field of the parameter string passed to DB2 IPL initialization. It is obtained from a record for the named subsystem in member IEFSSNxx of SYS1.PARMLIB.

The subsystem recognition character is not inserted in this message as it cannot be determined. 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

**System Action:** The DB2 subsystem with the indicated name is not available for this IPL of MVS.

**Operator Response:** Notify the system programmer. Correct the parameter fields in the SYS1.PARMLIB record of \texttt{ssnm} member IEFSSNxx, and re-IPL MVS. Refer to Part 2 of [DB2 Installation Guide] for the format of an IEFSSNxx record which defines a DB2 subsystem.

**DSN3103I**  
```csect-name - UNABLE TO LOAD EARLY PROCESSING MODULE SPECIFIED IN PARMLIB RECORD. \texttt{ssnm} IS NOT AVAILABLE```

**Explanation:** CSECT DSN3UR00 is unable to load the early processing load module named in the first parameter passed to DB2 subsystem IPL initialization. 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

Either the load module name was specified incorrectly or the load module does not reside in a library included in the MVS linklist.

**System Action:** DSN3UR00 abends with code X'04E' and reason code X'00F30103'. The DB2 subsystem with the indicated name is not available for this IPL of MVS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Identify the cause of the error. Either correct the early processing load module or take the necessary steps to include the module in a link-listed library. Re-IPL MVS. Refer to Part 2 of [DB2 Installation Guide] for the format of an IEFSSNxx record which defines a DB2 subsystem. Refer to the appropriate MVS publication for MVS linklist requirements.
Problem Determination: An entry is made to SYS1.LOGREC. No SVC dump is taken.

**DSN3104I**  
**csect-name** - TERMINATION COMPLETE

**Explanation:** This message indicates that a DB2 subsystem has terminated. The actual MVS termination of the DB2 address space(s) may have completed earlier. This message is presented for every termination, normal or abnormal.

**Operator Response:** Issue a DISPLAY ACTIVE command to see if MVS has completed termination processing of the address space(s).

**DSN3105I**  
**csect-name** - UNABLE TO LOAD EARLY PROCESSING MODULE 'DSN3EPX' ssnm IS NOT AVAILABLE

**Explanation:** CSECT DSN3UR00 is unable to load the early processing module DSN3EPX required for MVS. The name of the DB2 subsystem undergoing IPL-time initialization is 'ssnm'. Either the load module has been inadvertently deleted, or does not reside in a library included in the MVS linklist.

**System Action:** DSN3UR00 abends with code X'04E' and reason code X'00F30104'. DB2 subsystem 'ssnm' is not available for this IPL of MVS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Identify the cause of the error. Either correct the early processing load module or take the necessary steps to include the module in a link-listed library. Re-IPL MVS.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** An entry is made in SYS1.LOGREC. No SVC dump is taken. Refer to MVS linklist requirements in MVS/ESA JES2 Initialization and Tuning Guide.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

**DSN3106I**  
**csect-name** SUBSYSTEM STOPPED. THIS COMMAND NOT PROCESSED: command-text

**Explanation:** A command has been received which cannot be processed due to one of the following:

- The DB2 subsystem has not been started.
- The command was queued for processing while DB2 was starting, but startup terminated with an error.
- DB2 terminated before the command could be processed.

**System Action:** The command is not processed.

**Operator Response:** Start the DB2 subsystem, then reenter the command.

**DSN3107I**  
**csect-name** COMMAND REJECTED. REQUESTER NOT AUTHORIZED

**Explanation:** CSECT DSN3EC0X has discovered that the source of the command was a console that does not have 'system' authority.

**System Action:** The command is not processed. This message is sent to the console that entered the command.

**Operator Response:** Enter the command from another console that has 'system' authority.

**System Programmer Response:** Verify that this console should be used for entering DB2 commands. If so, authorize it for 'system' commands by using MVS services.

**DSN3108I**  
**csect-name** COMMAND FACILITY PATH UNAVAILABLE

**Explanation:** CSECT DSN3EC0X has discovered that the path from MVS consoles to the DB2 command processor is unavailable. It may still be possible to enter commands through one of the attachment facilities.

**System Action:** The command is not processed. This message is delivered to the console that entered the command.

**System Programmer Response:** The console command facility is available again the next time DB2 is started. If it is necessary to regain this facility immediately, DB2 should be canceled and restarted.

**DSN3109I**  
**csect-name** - UNABLE TO OBTAIN SUBSYSTEM AFFINITY TABLE INDEX FOR SUBSYSTEM ssnm. IEFSSREQ RC = nn

**Explanation:** CSECT DSN3UR00 was unable to obtain a subsystem affinity table index for the named subsystem. MVS did not recognize the named subsystem name as a known subsystem. If this message is issued, a serious error has occurred in MVS or DB2.

In the message, 'nn' is the return code from the IEFSSREQ MVS service. 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

**System Action:** DSN3UR00 abends with completion code X'04E' and reason code X'00F30104'. The DB2 subsystem with the indicated name is not available for this IPL of MVS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Try to re-IPL. If the
problem persists, follow standard DB2 problem reporting procedures.

**Problem Determination:** A record is written to SYS1.LOGREC. No SVC dump is taken. Return codes from IEFSSREQ are documented under control block SSOB in the appropriate MVS publication.

---

**DSN311I**  
**csect-name LOAD MODULE**  
**module-name** **DOES NOT HAVE**  
**AMODE(31) ATTRIBUTE. ssnm IS NOT AVAILABLE**

**Explanation:** The DB2 program which establishes DB2 as an MVS subsystem during Master Scheduler initialization has determined that either its own load module or a load module loaded by it does not have the linkage editor attributes AMODE(31) and RMODE(ANY). Most DB2 load modules must be capable of running in the 31-bit addressing mode.

In the message, ‘csect-name’ is the name of the program detecting the error, ‘module-name’ is the name of the first load module found with an invalid AMODE attribute, and ‘ssnm’ is the name of the DB2 subsystem undergoing IPL-time initialization.

**System Action:** Program DSN3UR00 abends with a code of X'04E' and a reason code of X'00F30111'. The DB2 subsystem named ‘ssnm’ is not initialized. The subsystem will not be available until the error is corrected and MVS is re-IPLed.

**Operator Response:** Notify the system programmer of the failure.

**System Programmer Response:** Verify that all of the following were done:

- The installation and maintenance activities against DB2 were executed using SMP.
- The JCLIN for SMP included the correct AMODE and RMODE control statements.
- The appropriate Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link-edit steps.

Correct and rerun the procedure or JCL which caused the error. If necessary, REJECT all SMP APPLY steps which were executed incorrectly and rerun the rejected steps. Request a re-IPL of MVS.

**Problem Determination:** A record is written to SYS1.LOGREC. No SVC dump is taken.

The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

---

**DSN311I**  
**csect-name UNABLE TO REGISTER**  
**COMMAND PREFIX, CPF RETURN**  
**CODE = xxyy. ssnm IS NOT AVAILABLE**

**Explanation:** DB2 is unable to register the installation-specified command prefix with MVS. The command prefix is specified in the subsystem definition parameter. xx is the hexadecimal return code, and yy is the hexadecimal reason code from the CPF MVS service. Subsystem ssnm is not available.

**System Action:** This DB2 subsystem is not available.

**System Programmer Response:** Refer to the MVS documentation on the CPF macro service to determine the reason for the xx and yy codes. Ensure that the specified command prefix is not already registered, or is not a substring or superstring of an already registered command prefix. Use the MVS DISPLAY OPDATA command, if necessary, to see command prefixes registered with MVS.

---

**DSN311I**  
**csect-name INVALID SUBSYSTEM**  
**DEFINITION PARAMETER IN PARMLIB RECORD. ssnm IS NOT AVAILABLE.**

**Explanation:** DB2 detected an error in the subsystem definition parameter, which is obtained from the IEFSSNxx member of SYS1.PARMLIB. Some possible causes for this error are:

- The early processing load module name is not between 1 and 8 characters long.
- The command prefix is not between 1 and 8 characters long.
- The command prefix scope is not 1 character long.
- The command prefix scope is not X, S, or M.
- The group attach name is not between 1 and 4 characters long.

The command prefix is not inserted into this message because it is unknown. The name of the subsystem attempting to initialize is ssnm.

**System Action:** The DB2 subsystem is not available.

**System Programmer Response:** Correct the subsystem definition parameter and re-IPL MVS. Refer to the DB2 Installation Guide for the format of the subsystem definition parameter that defines a DB2 subsystem.

---

**DSN311I**  
**csect-name GROUP ATTACH NAME IS NOT ALLOWED WITH THIS RELEASE OF MVS. ssnm IS NOT AVAILABLE**

**Explanation:** DB2 found an installation-specified group attachment name specified in the subsystem definition parameter, IEFSSNxx, but DB2 group attachment is not supported with this release of MVS. DB2’s group attachment feature requires MVS/ESA SP4.2.2 or a later release. The DB2 subsystem ssnm is not available.
System Programmer Response: Delete the group attachment name in the subsystem definition parameter and re-IPL.

**DSN3115I**  
csect-name UNABLE TO REGISTER GROUP ATTACH NAME, NAME/TOKEN RC = xx. ssnm IS NOT AVAILABLE

**Explanation:** DB2 is unable to register the installation-specified group attach name with MVS. The group attach name is specified in the subsystem definition parameter. xx is the hexadecimal return code from the MVS Name/Token service. Subsystem ssnm is not available.

**System Action:** This DB2 subsystem is not available.

**System Programmer Response:** Refer to MVS documentation about the Name/Token macro service to determine the reason for the xx return codes.

**DSN3116I**  
csect-name THE VERSION OF THE DB2 EARLY CODE IS INCOMPATIBLE WITH THIS VERSION OF MVS. ssnm IS NOT AVAILABLE

**Explanation:** This version of DB2 early code requires MVS/ESA 4.2.0. Subsystem ssnm is not available.

**System Programmer Response:** The version of the DB2 early code that was loaded from the LINKLIST library is not compatible with the release of MVS that you are using. Change the concatenation order of the LINKLIST library so that a compatible release of DB2 early code is used.

**DSN3201I**  
ABNORMAL EOT IN PROGRESS FOR USER=xxxxxxxx CONNECTION-ID=yyyyyyyy CORRELATION-ID=xxxxxxxxxxxxx JOBNAME=aaaaaaa ASID=99999 TCB=99999

**Explanation:** Abnormal termination started for the agent with the values shown for USER, CONNECTION-ID, CORRELATION-ID, JOBNAME, ASID and TCB address. These values are the last known set of identifiers for the terminating agent.

The abnormal termination could be the result of a failure in the allied agent's address space or the result of an operator cancel command.

The value for the USER and/or CORRELATION-ID might be blank. If the terminating agent is connected to DB2 at the IDENTIFY level and was not previously signed on, or was not previously authorized to a plan at the time of the failure, then no CORRELATION-ID is associated with the agent. Otherwise, the values for the USER, CONNECTION-ID, CORRELATION-ID, JOBNAME and ASID are the last values established to DB2 for this connection. They might represent the current activity of the agent. The TCB value is the address of the TCB that is terminating. Previous DB2 work by this agent might have completed successfully. Correlation IDs beginning with 'nnn', where nn is a number from 01 to 28, identify system agents.

**System Programmer Response:** See the Problem Determination section for this message. The MVS CANCEL and FORCE commands have no effect and should not be issued. DB2 should not be canceled. If an extensive rollback is in progress, the subsequent DB2 restart might take a very long time because of additional log activity.

**Problem Determination:** You can detect a deferred termination condition for a task by examining several indicators. Some or all of the following might be present:

- The allied address space might be swapped out and appear to be in a never-ending WAIT condition.
- The MVS commands CANCEL and FORCE appear to have no effect.
- The allied task holds an MVS-shared ENQ on resource SYSZDSN3.ERLYOLRHerly-block-address.
- During abnormal termination of the agent associated with the failing task, but before this message was written, the task's connection appears on the -DISPLAY THREAD output with a QD status. See message DSNV404I for the definition of this status code.
- This message, DSN32011, is written to the MVS console after the agent is removed from the service task work queue when termination processing begins.
- During abnormal termination of the agent associated with the failing task, the task's connection appears on the DISPLAY THREAD output with a D status. See message DSNV404I for the definition of this status code.

**DSN3458I**  
csect-name MODULE modname MUST HAVE THE AMODE (31) ATTRIBUTE

**Explanation:** An authorization exit load module was not link-edited with the 31-bit addressing mode (AMODE) attribute. Either load module DSN3@ATH or DSN3@SGN is specified by 'modname'.

**System Action:** Subsystem startup is terminated.

**System Programmer Response:** Relink-edit the authorization exit module specifying the attributes AMODE(31), RMODE(ANY).

**Problem Determination:** Check the load module attributes used for the link-edit.
System Operator racf-retc service csect following Authorization Explanation:

DSN3581I CONNECTION FOR [EOM | FEOT | IDEN] GAVE RC=X xxxxxxxx, REASON=X xxxxxxxx

Explanation: A nonzero return code has been returned to DSN3AMI2 from the SSSS connect to subsystem interface call. The variables in the message indicate which SSI call is involved and the actual return and reason codes associated with it.

System Action: The current task (TCB) is abended with a system completion code of 'X'04E' and an abend reason code of '00F30580'. The DB2 subsystem terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Restart the DB2 subsystem.

Problem Determination: The trace table and stack storage associated with the EB in register 6 must be examined to locate the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

DSN3581I  csect-name SAF service FAILED WITH SAF RETURN CODE = saf-retc, RACF RETURN CODE = racf-retc, AND RACF REASON CODE = racf-reac. DB2 REASON CODE = db2-reac

Explanation: DB2 invoked the specified SAF (Security Authorization Facility) service which failed with the following codes:

Variable Definition

csect The CSECT name of the DB2 module that issued the message.

service The name of the service that failed.

saf-retc The SAF return code.

racf-retc The RACF return code.

db2-retc The DB2-assigned reason code for the failure.

DB2 associates the failure with a DB2 reason code which may appear in other messages associated with this failure.

System Action: The call fails. Other messages associated with this feature may follow.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: The action to take depends on the service being used.

- R_ticketserv

DB2 requests this service to parse a Kerberos ticket received from a remote client. Refer to OS/390 Security Server (RACF) Callable services for an explanation of the error.

DB2 uses the SAF R_ticketserv service to parse a Kerberos ticket that was received from a remote client. Refer to OS/390 SecureWay Security Server RACF Callable Services for an explanation of the error. A SAF and RACF return code of 8 and 16 indicate a failure from the Network Authentication Privacy Service (Kerberos) when parsing the ticket in which case the RACF reason code contains a status code from the Network Authentication Privacy Service. These status codes are documented in the OS/390 SecureWay Security Server Network Authentication and Privacy Service Administration manual. Additional information for some of the more common status codes and how they relate to DB2 follows:

96C73A07

One possibility is that you must associate the ssnmDIST started task user ID with a principal name and the client system must use this principal name in the Kerberos target principal.

Note: DB2 Connect client systems must catalog a DB2 for OS/390 database with "AUTHENTICATION KERBEROS TARGET PRINCIPAL principal_name". Assume that SYSDSP is the user ID associated with the ssnmDIST started task. A principal, say SYSDSPu, must be associated to the SYSDSP user ID by a RACF ALTUSER command. Further, the SYSDSPu principal name must appear in the target principal name of the DB2 Connect database configuration for the DB2 for OS/390 database.

- R_ticketserv(principal name)

DB2 uses the SAF R_usermap service to determine the user ID associated with a Kerberos ticket received from a remote client. Refer to OS/390 SecureWay Security Server RACF Callable Services for an explanation of the error. The principal name obtained from the ticket is included in parenthesis to assist the user in determining the cause of the problem. Either the client system is using an invalid principal name, or a principal name to user ID association has not been defined to RACF.

Principals authenticated on the local OS/390 realm must have a mapping that associates the local principal name to a local RACF user ID. This
association can be made by using the RACF
ADDUSER or ALTUSER commands with the
KERBNAME parameter.
Principals authenticated on a foreign realm must
have a mapping that associates the foreign fully
qualified principal name to a local RACF user ID.
This association can be made by using the RACF
RDEFINE or RALTER commands with the KERBLINK
parameter.

- **R_usermap**
  DB2 requests this service to determine the user ID
  associated with a Kerberos ticket received from a
  remote client. Refer to *OS/390 Security Server
  (RACF) Callable services* for an explanation of the
  error.
Chapter 28. DSN7... Messages

DSN7000I  csect-name REQUIRED CSECT
DSN6GRP COULD NOT BE FOUND IN SYSTEM PARAMETERS LOAD MODULE.

Explanation:  The required CSECT DSN6GRP was not found in the system parameters load module.

System Action:  The DB2 subsystem terminates with reason code 00F70001.

Operator Response:  Restart DB2 with the correct system parameters load module.

System Programmer Response:  Reassemble the system parameters load module and include the DSN6GRP macro.

DSN7001I  csect-name DATA SHARING SPECIFIED IN SYSTEM PARAMETERS, BUT NOT RUNNING ON A MVS SYSTEM LEVEL WHICH IS REQUIRED FOR DATA SHARING.

Explanation:  A DB2 subsystem was started with the data sharing option, but MVS is not at the required level. DB2 data sharing requires MVS Version 5 Release 1.0 or a later release.

System Action:  The DB2 subsystem terminates with reason code 00F70002.

Operator Response:  Restart DB2 on MVS Version 5 Release 1.0 or a later release.

DSN7002I  LIGHT(YES) ON START DB2 COMMAND WAS IGNORED, SYSTEM IS NOT ENABLED FOR DATA SHARING

Explanation:  DB2 issues this message during DB2 startup if DB2 is started with the LIGHT(YES) keyword and the system is not enabled for data sharing.

System Action:  DB2 startup continues normally. DB2 ignores the LIGHT(YES) specification.

DSN7101I  csect-name

Explanation:  This message indicates the beginning of the output from a DISPLAY GROUP command. It is the first line of a multi-line message response.

DSN7101I  *** BEGIN DISPLAY OF GROUP(group-name) GROUP LEVEL (group-level) PROTOCOL LEVEL (protocol-level)

Explanation:  This message is a line of output from a DISPLAY GROUP command.

group-name is the name of the data sharing group.

---

**group-level** is a string of three numeric characters:
- Version
- Release
- Modification level

**protocol-level** is a value that is supplied for serviceability only.

---

DSN7102I  -------------------

Explanation:  This message is a line of output from a DISPLAY GROUP command.

---

DSN7103I  DB2 DB2 SYSTEM IRLM

Explanation:  This message is a line of output from a DISPLAY GROUP command.

---

DSN7104I  MEMBER ID SUBSYS CMDPREF
DSN6GRP STATUS LVL NAME SUBSYS IRLMPROC

Explanation:  This message is a line of output from a DISPLAY GROUP command.

MEMBER
Name of the DB2 data sharing member.

ID
Internally assigned ID for each data sharing member.

SUBSYS
Subsystem name of the data sharing member.

CMDPREF
Command prefix of the data sharing member.

STATUS
State of the data sharing member, which can be 'ACTIVE', 'AI', 'FAILED', 'QUIESCED', 'QI', 'QR', 'QC', 'QIC', 'QIR', or 'QICR' where:

**ACTIVE**
The member is currently up and running.

**AI**
The member is active with additional conditions. Indoubt or postponed abort units of recovery are outstanding. This means retained locks are held.

**FAILED**
The member has terminated abnormally.

**QUIESCED**
The member is down normally.

**QI**
The member is down with indoubt URs.
**QR**  The member is down with resynchronization responsibility.

**QC**  The member is down with group buffer pool castout responsibility.

**QIC, QIR, QICR**  A possible combination of the quiesced states that are listed above.

**LVL**  String of three numeric characters as follows:
- DB2 Version
- DB2 Release
- DB2 Modification level

**SYSTEM NAME**  Name of the MVS system on which the data sharing member runs.

**IRLM SUBSYS**  The accompanied IRLM’s subsystem name for this DB2.

**IRLMPROC**  The accompanied IRLM’s startup procedure name.

---

**DSN7105I**  

**Explanation:** This message is a line of output from a DISPLAY GROUP command.

---

**DSN7106I**  

**member-name subsystem-name**

**command-prefix member-status**

**mvs-system-name irlm-subsystem-name**

**irlm-procedure-name**

**Explanation:** This message is a line of output from a DISPLAY GROUP command. **member-status** can be **ACTIVE, QUIESCED, or FAILED.** **member-status** may also have the string "***" as output if the member has not been quiesced normally.

---

**QUIESCED**  This is a normal quiesced state, as the result of a normal STOP DB2 command.

**Q**  The member is quiesced, but with additional conditions. Q (quiesced) can be paired with one or more of the following letters:

- **I**  Indoubt units of recovery (URs) are outstanding. This means retained locks are held.
- **C**  There was a castout error. The last updated of the page set or partition could not write from the coupling facility to DASD.
  
  Make sure there is connectivity from the coupling facility to DASD before restarting DB2.

- **R**  There is retained information needed for DB2 to perform resynchronization with one or more remote locations.

When DB2 is restarted, this resynchronization occurs.

**ACTIVE**  This is a normal active state without conditions

**A**  The member is active, but with the additonal conditions. A (active) can be paired with the following letter:

- **I**  Indoubt or postponed abort units of recovery (URs) are outstanding. This means retained locks are held.

******* Usually issued if the member has not been quiesced normally. The string "***" may also be paired with the following:

- ******** Information unknown. This may result if an unwanted member was previously added to the group, and continues to be named in other locations.

The **subsystem-name, command-prefix, irlm-subsystem-name, and irlm-procedure-name** show "****" if this information is unknown.

---

**DSN7107I**  

**GROUP ATTACH NAME**

**group-attach**

**Explanation:** This message is a line of output from a DISPLAY GROUP command. 

**group-attach** is the group attach name for the data sharing group.

---

**DSN7108I**  

**NUMBER LOCK ENTRIES:**  

**nnnnnnnnnn**

**Explanation:** This line of output from a DISPLAY GROUP command shows information about the LOCK1 coupling facility structure. The maximum number of lock table entries is displayed.

---

**DSN7109I**  

**SCA STRUCTURE SIZE:**  

**nnnnnn KB,**

**STATUS = xx, SCA IN USE: < nnn %**

**Explanation:** This message is a line of output from a DISPLAY GROUP command.

If the % value is > 0 but < 1, then a "<" character is shown before the 1 % value, e.g. "< 1 ". This can happen if the shared communications area (SCA) structure is very large or if only a small number of SCA entries are in use.

The SCA status can have following values:

- **IN**  SCA is in initialization phase.
- **AC**  SCA is active.
- **DS**  SCA loss of connectivity, delayed action started.
DC  SCA loss of connectivity, delayed action completed.
QS  SCA rebuild quiesce function started.
QC  SCA rebuild quiesce function completed.
CS  SCA rebuild connect function started.
CC  SCA rebuild connect function completed.
OS  SCA rebuild connect complete function started.
RS  SCA rebuild resource manager invocation started.
RC  SCA rebuild resource manager invocation completed.
OC  SCA rebuild connect complete function completed.
LS  SCA rebuild cleanup function started.
US  SCA rebuild resource manager invocation started.
UC  SCA rebuild resource manager invocation completed.
LC  SCA rebuild cleanup function completed.
PS  SCA rebuild process complete function started.
PC  SCA rebuild process complete function completed.
SS  SCA rebuild stop function started.
SC  SCA rebuild stop function completed.
ES  SCA rebuild stop complete function started.
EC  SCA rebuild stop complete function completed.
VS  SCA volatility change function started.
VC  SCA volatility change function completed.
TE  SCA is in termination phase.

**LOCK1 STRUCTURE SIZE:** nnnnnnnn KB
**Explanation:** This line of output from a DISPLAY GROUP command shows the size of the LOCK1 coupling facility structure.

**NUMBER LIST ENTRIES:** nnnnnnnnnnn
**LIST ENTRIES IN USE:** < nnnnnnnnnnn
**Explanation:** This line of output from a DISPLAY GROUP command shows information about the LOCK1 coupling facility structure. The maximum number of modify lock list entries and the number of those entries currently in use are displayed. (MVS documentation refers to these list entries as “record data”.)

---

**DSN7112I**  *** END DISPLAY OF GROUP(group-name)***
**Explanation:** This message is the last line of output from a DISPLAY GROUP command.

**DSN7113I**  DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE.
**Explanation:** There is not enough storage available to store the required information from this command.
**System Action:** The DB2 subsystem displays the group information, but some information is missing.

**DSN7114I**  XCF OR STRUCTURE INFORMATION NOT AVAILABLE. MVS nnnnnnnnnn
**RETURN CODE=xxxxxx, MVS nnnnnnnnnn REASON CODE=yyyyyyyy.**
**Explanation:** An error occurred during the query of the cross-system coupling facility (XCF) or CF structure information.

nmmmmmm could be IXCQUERY or IXLMG.
**System Action:** The DB2 subsystem displays the group, but some XCF or coupling facility structure information is missing. Refer to MVS/ESA Programming: Sysplex Services Reference for an explanation of IXCQUERY or IXLMG return and reason codes.

**DSN7120I**  DB2 PARALLEL PARALLEL
**Explanation:** This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

**DSN7121I**  MEMBER COORDINATOR ASSISTANT
**Explanation:** This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

**DSN7122I**  ---------
**Explanation:** This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

**DSN7123I**  member-name parallel-coordinator parallel-assistant
**Explanation:** This message is a line of output from a DISPLAY GROUP command with the DETAIL option. This message is only issued for ACTIVE DB2 members that support Sysplex query parallelism.

---
DSN7401I  csect-name INCONSISTENT DATA SHARING PARAMETER DETECTED, parameter-name IN DB2 SYSTEM PARAMETERS (sysparm-parm) IS NOT EQUAL TO PARAMETER IN THE DB2 START-UP PROCEDURE (start-parm).

Explanation: At least one data sharing parameter in the member’s system parameters is not equal to the data sharing parameter value passed on the DB2 start-up procedure.

System Action: The DB2 subsystem terminates with reason code 00F70003.

Operator Response: Restart DB2 with the correct system parameters load module or inform the system programmer to change the DB2 start-up procedure.

System Programmer Response: Reassemble the system parameters load module. Make sure that the group name and the member name match the values in the DB2 start-up procedure, or correct the parameters on the DB2 start-up procedure.

DSN7403I  csect-name MEMBER(member-name) IS ALREADY ACTIVE ON SYSTEM(mvs-system-name).

Explanation: The started DB2 subsystem is already active on another MVS system.

System Action: The DB2 subsystem terminates with reason code 00F70003.

Operator Response: If you want the DB2 subsystem to run on this MVS system, stop the DB2 subsystem on the other MVS. After the DB2 subsystem stops, restart the DB2 on this MVS.

DSN7404I  csect-name INVALID MEMBER(member-name) WAS FOUND IN DB2 XCF GROUP(db2-group-name). MEMBER HAS BEEN DELETED.

Explanation: The invalid member was found in a DB2 data sharing group, which is a particular type of cross-system coupling facility (XCF) group. The invalid member name members were found in data sharing group db2-group-name and was deleted. member-name might represent an unauthorized program, other than DB2 for MVS/ESA, that attempted to join the data sharing group.

System Action: The DB2 subsystem continues.

Operator Response: Report the occurrence of this message to your system programmer.

System Programmer Response: Investigate which unauthorized program joined the DB2 group and find its owner. This could indicate a security violation.

DSN7405I  csect-name MEMBER(member-name) UNABLE TO JOIN DATA SHARING GROUP(group-name), MVS IXCJOIN RETURN CODE=xxxxxxx, MVS IXCJOIN REASON CODE=yyyyyyy.

Explanation: An unexpected error occurred when the data sharing DB2 member attempted to join the MVS cross-system coupling facility (XCF) data sharing group.

System Action: The DB2 subsystem terminates with reason code 00F70408.

Operator Response: Issue an MVS ‘DISPLAY XCF,GROUP’ command to ensure that XCF is functional; then try to restart the DB2 subsystem.

System Programmer Response: Refer to MVS/ESA Programming: Sysplex Services Reference for an explanation of the IXCJOIN return and reason codes.

DSN7406I  csect-name UNABLE TO QUERY DATA SHARING GROUP INFORMATION, MVS IXCQUERY RETURN CODE=xxxxxxx, MVS IXCQUERY REASON CODE=yyyyyyy.

Explanation: An unexpected error occurred during the execution of the MVS IXCQUERY macro.

System Action: The DB2 subsystem terminates with reason code 00F70406.

Operator Response: Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the DB2 subsystem again.

System Programmer Response: Refer to MVS/ESA Programming: Sysplex Services Reference for an explanation of the IXCQUERY return and reason codes.

DSN7407I  csect-name AUTOMATIC RESTART MANAGER function FAILED. MVS IXCARM RETURN CODE = xxxxxx, MVS IXCARM REASON CODE = yyyyyyy.

Explanation: DB2 encountered an error using the specified MVS automatic restart manager (ARM) function.

System Action: DB2 continues. However, if DB2 abnormally terminates, the MVS ARM cannot automatically restart DB2.

System Programmer Response: Refer to MVS/ESA Programming: Sysplex Services Reference for the function, return code, and reason code from the IXCARM request.
**DSN7408I**  
`csect-name` ARM EVENT EXIT FAILED.  
DB2 SUBSYSTEM `ssnm` NOT RESTARTED. MVS IEFSSII RETURN CODE = `xxxxxxx`, MVS IEFSSI REASON CODE = `yyyyyyy`.  

**Explanation:** The DB2 ARM event exit encountered an error while attempting to define the DB2 subsystem to MVS.  

**System Action:** The automatic restart of the DB2 subsystem is stopped.  

**System Programmer Response:** Refer to MVS/ESA Programming: Assembler Services Reference for return and reason codes from the IEFSSI request. If the IEFSSI return code and reason code are 0, look in the console log for previous messages that indicate why the definition of the DB2 subsystem failed. You can manually start DB2 by using the `START` DB2 command on any system where the DB2 subsystem is defined.

**DSN7409I**  
`csect-name` MEMBER(`member-name`) UNABLE TO QUIESCE FROM DATA SHARING GROUP(`group-name`), MVS IXCQUES RETURN CODE=`xxxxxxx`, MVS IXCQUES REASON CODE=`yyyyyyy`.  

**Explanation:** An unexpected error occurred when the data sharing DB2 member attempted to place itself in an MVS cross-system coupling facility (XCF) quiesced state.  

**System Action:** The DB2 subsystem termination continues.  

**Operator Response:** Inform your system programmer.  

**System Programmer Response:** Refer to MVS/ESA Programming: Sysplex Services Reference for an explanation of the IXCQUES return and reason codes.

**DSN7501A**  
`csect-name` SCA STRUCTURE `sca-structure-name` CONNECTIVITY FAILURE.  

**Explanation:** The specified DB2 member lost connectivity to the shared communication area (SCA) structure.  

**System Action:** The specified DB2 disconnects from the SCA and terminates with reason code 00F70600.  

**Operator Response:** Notify the system programmer.  

**System Programmer Response:** Find out why the link from this central processor complex (CPC) to the SCA structure was lost. After fixing it, restart DB2.  

**DSN7502I**  
`csect-name` SCA STRUCTURE `sca-structure-name` FAILURE, ATTEMPT TO REBUILD IS IN PROGRESS.  

**Explanation:** The specified DB2 member detected the shared communications area (SCA) structure failure.  

**System Action:** DB2 tries to rebuild the SCA structure on a coupling facility in the preference list for the coupling facility.  

**Operator Response:** Wait for message DSN7503I or DSN7504A.  

**DSN7503I**  
`csect-name` SCA STRUCTURE `sca-structure-name` REBUILD SUCCESSFUL.  

**Explanation:** This member successfully connected to a shared communications area (SCA) structure on the same or an alternate coupling facility and completed restoration of its information in the shared communications area (SCA).  

**System Action:** DB2 processing continues.  

**DSN7504I**  
`csect-name` SCA STRUCTURE `sca-structure-name` REBUILD UNSUCCESSFUL. REASON CODE = `xx`.  

**Explanation:** This member has not successfully connected to a shared communication area (SCA) structure on an alternate coupling facility and completed restoration of its information in the shared communications area (SCA). This message follows message DSN7502I.  

04 An operator requested to stop the rebuild process.  
08 A DB2 resource manager requested to stop the rebuild process.  
12 The new SCA structure failed during the rebuild process.  
16 A DB2 member lost connectivity to the new SCA in the rebuild process.  
20 An MVS service used during the rebuild process failed. A message was issued from the failed MVS service.  

**System Action:** This DB2 member terminates with reason code 00F70601. Other members can continue processing.  

**System Programmer Response:** See the termination code for more details.
**DSN7505A**  
*csect-name THERE IS A SHORTAGE OF FREE STORAGE IN SCA STRUCTURE  
sca-structure-name*

**Explanation:** The amount of free storage in the shared communications area (SCA) coupling facility structure is low. The SCA is 75 percent full. Because SCA storage space is required by some DB2 commands and processes, the availability of those processes might be affected. Completely running out of SCA storage can cause DB2 subsystem outages.

This message stays on the MVS console and is highlighted.

**System Action:** DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

**Operator Response:** If the message remains highlighted after the error situation is cleared up, manually delete the message from the console.

**System Programmer Response:** You can monitor the amount of SCA storage in use with the DISPLAY GROUP command.

You can free SCA storage by removing exception conditions. Another thing you can do is issue START DATABASE commands with the SPACENAM option or use the RECOVER utility to remove pages from the logical page list (LPL).

If you don’t do anything to reclaim space, message DSN7512A appears when the SCA is 90 percent full.

**DSN7506A**  
*csect-name CONNECT TO THE SCA STRUCTURE  
sca-structure-name FAILED. MVS IXLCONN RETURN CODE=xxxxxxx, MVS IXLCONN REASON CODE=yyyyyyyy.*

**Explanation:** DB2 cannot connect to the shared communications area (SCA) coupling facility structure.

**System Action:** DB2 startup terminates with reason code 00F70602.

**System Programmer Response:** DB2 uses the MVS IXLCONN service to connect to the SCA structure. Refer to MVS/ESA Programming: Sysplex Services Reference for return and reason codes from the IXLCONN request.

**DSN7507I**  
*csect-name SCA STRUCTURE  
sca-structure-name IS ALLOCATED IN A VOLATILE STRUCTURE.*

**Explanation:** The shared communications area (SCA) structure is volatile.

**System Action:** DB2 processing continues.

**System Programmer Response:** One DB2 issue this message whenever the structure has the volatile attribute. DB2 detects this either on the first connection to the SCA or on the attribute changes later. DB2 always requests a nonvolatile SCA. If this is not what you want, change the MVS CFRM administrative policy and request a rebuild of the SCA with the MVS SETXCF START,REBUILD command.

**DSN7508I**  
*csect-name ACCESS TO THE SCA STRUCTURE  
sca-structure-name FAILED. MVS IXLLIST RETURN CODE = xxxxxxxx, MVS IXLLIST REASON CODE = yyyyyyyyy.*

**Explanation:** DB2 encountered an error in accessing the shared communications area (SCA) structure.

**System Action:** DB2 terminates with reason code 00F70603.

**System Programmer Response:** DB2 uses the MVS IXLLIST service to access the SCA structure. Refer to MVS/ESA Programming: Sysplex Services Reference for return and reason codes from the IXLLIST request.

**DSN7509I**  
*csect-name SCA STRUCTURE  
sca-structure-name IS ALLOCATED IN A NONVOLATILE STRUCTURE.*

**Explanation:** The SCA structure is now contained in a nonvolatile coupling facility structure.

**System Action:** DB2 processing continues.

**DSN7510I**  
*csect-name SCA STRUCTURE  
sca-structure-name REBUILD REQUEST RECEIVED, BUT SUBSYSTEM IS NOT READY TO PARTICIPATE.*

**Explanation:** The DB2 subsystem received a request from MVS to rebuild the shared communications area (SCA), but DB2 is not ready to participate in this process because DB2 startup has not yet completed.

**System Action:** DB2 terminates with reason code 00F70604. The SCA rebuild process might continue for other DB2s in the data sharing group.

**Operator Response:** Wait until the SCA rebuild process is finished and then start the failed DB2 again.

**DSN7511I**  
*csect-name RESPONSE TO MVS REBUILD COMPLETE OF SCA STRUCTURE  
sca-structure-name FAILED. MVS IXLREBLD RETURN CODE = xxxxxxxx, MVS IXLREBLD REASON CODE = yyyyyyyyy.*

**Explanation:** DB2 encountered an error during the rebuild of the shared communications area (SCA) structure.

**System Action:** DB2 stops.
System Programmer Response: DB2 uses the MVS IXLREBLD service during the SCA structure rebuild. Refer to MVS/ESA Programming: Sysplex Services Reference for return and reason codes from the IXLREBLD request.

**DSN7512A** csect-name THERE IS A CRITICAL SHORTAGE OF FREE STORAGE IN SCA STRUCTURE `sca-structure-name`

Explanation: The amount of free storage in the shared communications area (SCA) coupling facility structure is critically low. The SCA is 90 percent full.

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues. However, DB2 limits use of SCA to critical information. Some utilities or commands that cannot be completed can cause one or more members of the group to come down.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

Operator Response: If the message remains highlighted after the error situation is cleared up, manually delete the message from the console.

System Programmer Response: You can monitor the amount of SCA storage in use with the DISPLAY GROUP command.

You can free SCA storage by removing exception conditions. Another thing you can do is issue START DATABASE commands with the SPACENAM option or use the RECOVER utility to remove pages from the logical page list (LPL). Then restart any failed DB2s.

If your actions do not free up enough space, or if the problem continues to occur, you have the following options, depending on what level of MVS and the coupling facility control code you are running with:

- If all members of the group are running with MVS Version 5 Release 2 and with a coupling facility control code level greater than 0, issue the SETXCF START,ALTER command to increase the size of the SCA. The size you specify must be less than or equal to the maximum size defined in the CFRM policy for the SCA structure.

  If the maximum size (SIZE in the CFRM policy) is still not big enough, take the actions described below for MVS Version 5 Release 1 systems.

- If any or all members of the group are running with MVS Version 5 Release 1 or with a coupling facility control code level of 0, increase the storage for the SCA in the CFRM policy. Then issue the MVS SETXCF START,REBUILD command to rebuild the structure.

Refer to [DB2 Data Sharing: Planning and Administration](#) for more detailed recovery information.

**DSN7513I** csect-name SCA STRUCTURE `sca-structure-name` HAS ADEQUATE FREE STORAGE.

Explanation: The shared communications area (SCA) coupling facility structure has adequate free storage to function properly.

This message is shown in the following circumstances:

- After the SCA was rebuilt.
- After the SCA usage goes below 67%, after its usage was up to 75% or higher.

System Action: DB2 processing continues.

**DSN7514I** csect-name RESPONSE TO AN MVS REBUILD RELATED EVENT FOR THE SCA STRUCTURE `sca-structure-name` FAILED. MVS IXLLEESP RETURN CODE = `x`x`x`x`x`x`, MVS IXLLEESP REASON CODE = `y`y`y`y`y`y`y`y`y`y.

Explanation: DB2 encountered an error during the rebuild of the shared communications area (SCA) structure.

System Action: DB2 terminates.

System Programmer Response: DB2 uses the MVS IXLLEESP service to respond to SCA structure rebuild. Refer to MVS/ESA Programming: Sysplex Services Reference for return and reason codes from the IXLLEESP request.
Chapter 29. DSN8... messages

DSN8001I csect EMPLOYEE NOT FOUND
Explanation: The 'I' or 'list' request found no employee data that match your request.
System Action: No employees are listed.
User Response: If no employee data was expected to be found, continue.
   Problem Determination: If the error is unexpected, list the contents of the employee and department views VEMP and VDEPT to determine why the entry is missing.

DSN8002I csect EMPLOYEE SUCCESSFULLY ADDED
Explanation: Employee data was added as requested.
System Action: The request was executed successfully.

DSN8003I csect EMPLOYEE SUCCESSFULLY ERASED
Explanation: Data for an employee was erased as requested.
System Action: The request was executed successfully.

DSN8004I csect EMPLOYEE SUCCESSFULLY UPDATED
Explanation: Data for an employee was updated as requested.
System Action: The request was executed successfully.

DSN8005I csect EMPLOYEE EXISTS ALREADY, ADD NOT DONE
Explanation: A request was made to add data for a new employee, but the employee number already exists.
System Action: No employee data is added.

DSN8006E csect EMPLOYEE DOES NOT EXIST, ERASE NOT DONE
Explanation: The erase requested was not performed. The employee number requested was not present in the table.
System Action: No employee data is erased.
User Response: Determine if the employee data to be erased should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.
   Problem Determination: List the contents of the employee view, VEMP, and the department view, VDEPT.

DSN8007E csect EMPLOYEE DOES NOT EXIST, UPDATE NOT DONE
Explanation: The update requested was not performed. The employee number requested was not present in the table.
System Action: No employee data is updated.
User Response: Verify that the correct search criteria and data were entered.
   Problem Determination: List the contents of the employee table (VPHONE, VEMPLP, or EMP) and see if the employee number to be updated is in the table. Correct the update request or the table.

DSN8008I csect NO EMPLOYEE FOUND IN TABLE
Explanation: No employees match the selection criteria.
System Action: No employee data is listed.
User Response: If no employee data was expected, continue processing.
   Problem Determination: List the contents of the VPHONE view and the underlying tables.

DSN8011I csect DEPARTMENT NOT FOUND
Explanation: No departments match the selection criteria.
System Action: No departments are listed.
**User Response:** If no departments are expected to be found, continue.

**Problem Determination:** If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

---

**DSN8012I**  
*csect DEPARTMENT SUCCESSFULLY ADDED*

**Explanation:** A department was added as requested.

**System Action:** The request was executed successfully.

---

**DSN8013I**  
*csect DEPARTMENT SUCCESSFULLY ERASED*

**Explanation:** Data for a department was erased as requested.

**System Action:** The request was executed successfully.

---

**DSN8014I**  
*csect DEPARTMENT SUCCESSFULLY UPDATED*

**Explanation:** Data for a department was updated as requested.

**System Action:** The request was executed successfully.

---

**DSN8015E**  
*csect DEPARTMENT EXISTS ALREADY, ADD NOT DONE*

**Explanation:** You requested that a new department be added, but the department exists already.

**System Action:** No departments are added.

**User Response:** Display data for the existing department. If it is what you want, continue. If not, you can update data for this department or choose a new department id.

**Problem Determination:** If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to see if the data differs from what is expected.

---

**DSN8016E**  
*csect DEPARTMENT DOES NOT EXIST, ERASE NOT DONE*

**Explanation:** The erase request found no departments which match your request.

**System Action:** No department data is erased.

**User Response:** See if the department data to be erased should exist. Did you enter the correct combination of search criteria and data? If not, correct the entries and continue.

**Problem Determination:** If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

---

**DSN8017E**  
*csect DEPARTMENT DOES NOT EXIST, UPDATE NOT DONE*

**Explanation:** The update request found no department data which matches your request.

**System Action:** No department data is updated.

**User Response:** See if the department data to be updated should exist. If you did not enter the correct combination of search criteria and data, correct the entries and continue.

**Problem Determination:** If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

---

**DSN8018I**  
*csect CURRENT DEPARTMENT NOT FOUND*

**Explanation:** A request was made by a 'current' department to reference a 'higher' department. The 'current' department was not found.

**System Action:** No department data is processed.

**User Response:** If the 'current' department was not expected to exist, continue processing.

**Problem Determination:** List the contents of the department views VDEPMG1, VEMP, VASTRDE1, and VASTRDE2 and their underlying tables.

---

**DSN8019E**  
*csect NO HIGHER DEPARTMENT EXISTS*

**Explanation:** A request was made by a 'current' department to reference a 'higher' level of the department structure. A 'higher' level does not exist for the requested 'current' department.

**System Action:** No department data is processed.

**User Response:** If a 'higher' department was not expected to be found, continue processing.

**Problem Determination:** List the contents of the department views VDEPMG1, VEMP, VASTRDE1, and VASTRDE2 and their underlying tables.

---

**DSN8021I**  
*csect ACTIVITY NOT FOUND*

**Explanation:** No activities match the selection criteria.

**System Action:** No activity is listed.

**User Response:** If no activity was expected to be found, continue processing.

**Problem Determination:** List the contents of the
activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

**DSN8022I** csect ACTIVITY SUCCESSFULLY ADDED

Explanation: An activity was added as requested.

System Action: The request was executed successfully.

**DSN8023I** csect ACTIVITY SUCCESSFULLY ERASED

Explanation: An activity was erased as requested.

System Action: The request was executed successfully.

**DSN8024I** csect ACTIVITY SUCCESSFULLY UPDATED

Explanation: An activity was updated as requested.

System Action: The request was executed successfully.

**DSN8025E** csect ACTIVITY EXISTS ALREADY, ADD NOT DONE

Explanation: The addition requested was not performed. The activity requested was already present.

System Action: No activity is added.

User Response: If the activity was expected to already exist, continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

**DSN8026E** csect ACTIVITY DOES NOT EXIST, ERASE NOT DONE

Explanation: The erase requested was not performed. The activity requested was not found.

System Action: No activity is erased.

User Response: If the activity was not expected to be found, continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

**DSN8027E** csect ACTIVITY DOES NOT EXIST, UPDATE NOT DONE

Explanation: The update requested was not performed. The activity requested was not found.

System Action: No activity is updated.

User Response: Determine if the activity to be updated should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

**DSN8028I** csect ACTIVITY TYPE NOT FOUND, PLEASE ADD IT INTERACTIVELY

Explanation: The add or update was not performed. The activity type entered was not found.

System Action: No activity is listed.

User Response: If the activity type was not expected to be found, add it interactively.

Problem Determination: List the contents of the activity view, VACT, and its underlying tables.

**DSN8031I** csect PROJECT NOT FOUND

Explanation: No projects match the selection criteria.

System Action: No projects are listed.

User Response: If no projects are expected to be listed, continue.

Problem Determination: If the error is unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

**DSN8032I** csect PROJECT SUCCESSFULLY ADDED

Explanation: A project was added as requested.

System Action: The request was executed successfully.

**DSN8033I** csect PROJECT SUCCESSFULLY ERASED

Explanation: A project was erased as requested.

System Action: The request was executed successfully.

**DSN8034I** csect PROJECT SUCCESSFULLY UPDATED

Explanation: The update was performed as requested.

System Action: The request was executed successfully.
DSN8035E  csect PROJECT EXISTS ALREADY, ADD NOT DONE

Explanation: You requested that a new project be added, but the project exists already.

System Action: The request was not executed successfully.

User Response: Display the existing project. If it is what you want, continue. If not, you can update this project or choose a new project id.

Problem Determination: If the error was unexpected, list the contents of the project view VPROJ and its underlying tables to see if the data differs from what is expected.

DSN8036E  csect PROJECT DOES NOT EXIST, ERASE NOT DONE

Explanation: The erase request found no project which matches your request.

System Action: No projects are erased.

User Response: See if the project to be erased should exist. Did you enter the correct combination of search criteria and data? If not, correct the entries and continue.

Problem Determination: If the error was unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

DSN8037E  csect PROJECT DOES NOT EXIST, UPDATE NOT DONE

Explanation: The update request found no project which matches your request.

System Action: No projects are updated.

User Response: See if the project to be updated should exist. Did you enter the correct combination of search criteria and data? If not, correct the entries and continue.

Problem Determination: If the error was unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

DSN8038I  csect CURRENT PROJECT NOT FOUND

Explanation: A request was made by a 'current' project to reference a 'higher' project. The 'current' project was not found.

System Action: No project data is processed.

User Response: If the 'current' project was not expected to be found, continue processing.

Problem Determination: List the contents of the project views VPROJRE1, VDEPT, VEMPPROJACT, VEMP, VSTAFAC1, VSTAFAC2, VPSTRDE1, and VPSTRDE2 and their underlying tables.

DSN8039E  csect NO HIGHER PROJECT EXISTS

Explanation: A request was made by a 'current' project to reference a 'higher' level of the project structure. A 'higher' level does not exist for the requested 'current' project.

System Action: No project data is processed.

User Response: If a 'higher' project was not expected to be found, continue processing.

Problem Determination: List the contents of the project views VPROJRE1, VDEPT, VEMPPROJACT, VEMP, VSTAFAC1, VSTAFAC2, VPSTRDE1, and VPSTRDE2 and their underlying tables.

DSN8041I  csect STAFFING NOT FOUND

Explanation: No project staffing matches the selection criteria.

System Action: No project staffing is listed.

User Response: If no project staffing was expected to be found, continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMPPROJACT, VACT, and VEMP and their underlying tables.

DSN8042I  csect STAFFING SUCCESSFULLY ADDED

Explanation: A project staffing was added as requested.

System Action: The request was executed successfully.

DSN8043I  csect STAFFING SUCCESSFULLY ERASED

Explanation: A project staffing was erased as requested.

System Action: The request was executed successfully.

DSN8044I  csect STAFFING SUCCESSFULLY UPDATED

Explanation: A project staffing was updated as requested.

System Action: The request was executed successfully.
Explanation: A request was made to add a project staffing, but the project staffing already exists.

System Action: No project staffing is added.

User Response: Display the existing project staffing. If this is the desired project staffing, update it. Otherwise, choose a new project staffing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMP, VACT, and VEMP and their underlying tables.

Explanation: The project staffing was not erased as requested.

System Action: No project staffing is erased.

User Response: Determine if the project staffing to be erased should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMP, VACT, and VEMP and their underlying tables.

Explanation: The update was not performed because the project staffing requested was not found.

System Action: No project staffing is updated.

User Response: Determine if the project staffing to be updated should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMP, VACT, and VEMP and their underlying tables.

Explanation: The application program finished.

Explanation: After any SQLWARNING or SQLERROR, all updates are removed via a ROLLBACK statement to prevent invalid updates.

System Action: The ROLLBACK was executed successfully.

User Response: Correct the prior error.

Explanation: The last page of data has been displayed.

System Action: No more data is shown on screen.

User Response: If you expect no more data to be displayed, continue.

Problem Determination: If more displayed data is expected, list the contents of the view and the underlying tables to see if the data differs from what is expected.

Explanation: More data exists beyond that shown on the screen.

System Action: No more data is shown on screen.

User Response: Update entries as needed.

Explanation: Press the PA1 key to see the data on the next page or press the ENTER key to return to the selection menu.

User Response: Press the PA1 key or the ENTER key depending on the function you want to perform.

Explanation: The SQL statement did not execute correctly. The 'sqlcode' can be found elsewhere in this manual. This may be an SQL error or an SQL warning.

System Action: The request was not executed successfully.

User Response: Refer to Part 2, "SQL return codes," on page 11 for more information about the error.

Problem Determination: Determine which SQL statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the sqlcode.

Explanation: The SQL ROLLBACK statement was not executed correctly.

System Action: The request was not executed successfully.

Problem Determination: Determine which SQL
statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the sqrcode.

**DSN8062E**  
*csect AN OBJECT WAS NOT SELECTED*  
**Explanation:** You did not specify an object code on the input line.  
**User Response:** Select one of the object codes listed on the panel.

**DSN8064E**  
*csect INVALID DL/I STC-CODE ON GU**  
**MSG:** status-code  
**Explanation:** In attempting to get a message from IMS, an unexpected status-code was received.  
**System Action:** The application program is terminated.  
**Problem Determination:** Refer to the messages and codes manual for IMS/VS to determine the reason for the unexpected status code.

**DSN8065E**  
*csect INVALID DL/I STC-CODE ON ISRT**  
**MSG:** status-code  
**Explanation:** In attempting to insert a message for IMS, an unexpected status-code was received.  
**System Action:** The application program is terminated.  
**Problem Determination:** Refer to the messages and codes manual for IMS/VS to determine the reason for the unexpected status code.

**DSN8066E**  
*csect UNSUPPORTED PFK OR LOGIC ERROR*  
**Explanation:** The sample application found an unsupported program function key or logic error while trying to execute a request.  
**System Action:** The request was not executed successfully.  
**User Response:** Report the error in the application program.

**DSN8067E**  
*csect UNSUPPORTED SEARCH CRITERIA FOR OBJECT*  
**Explanation:** You entered a search criteria value and an object value that do not find any selections.  
**System Action:** The request was not executed successfully.  
**User Response:** Enter new search criteria values.  
**Problem Determination:** If the values you entered are expected to provide valid selections, check the contents of the view and the underlying tables to see if the data differs from what is expected. If after checking the view and the underlying tables, you find the search criteria values you entered should provide valid selections, the error is in the sample program. Report the error.

**DSN8068E**  
*csect INVALID REQUEST SHOULD BE ‘L’ OR ‘U’*  
**Explanation:** The input must begin with ‘L’ or ‘U’.  
**System Action:** The request is ignored.  
**User Response:** Correct the input request.

**DSN8069E**  
*csect NO VALID SELECTIONS QUALIFY FOR THIS REQUEST*  
**Explanation:** You entered a search criteria value and a data values that do not find any selections.  
**System Action:** The request was not executed successfully.  
**User Response:** Enter new search criteria values.  
**Problem Determination:** If the criteria values you entered are expected to provide valid selections, check the contents of the view and the underlying tables to see if the data differs from what is expected. If after checking the view and the underlying tables, you find the search criteria values you entered should provide valid selections, the error is in the sample program. Report the error.

**DSN8070E**  
*csect VITAL DATA IS MISSING IN TABLE TOPTVAL*  
**Explanation:** No valid entries exist in the table that contains possible valid entries.  
**System Action:** The request was not executed successfully.  
**User Response:** There is no valid entry you can enter. Report the error in the sample program.

**DSN8072E**  
*csect INVALID SELECTION ON SECONDARY SCREEN*  
**Explanation:** You gave an invalid line number.  
**System Action:** The request was not executed successfully.  
**User Response:** You entered a number that is not in the list on the left under the heading NO for line number. Enter a valid number.  
**Problem Determination:** If the line number you entered is in the list on the left under the heading NO for line number, then the error is in the sample program.
**DSN8073E**  
*csect SPECIFIED LINE-NUMBER NOT FOUND IN PREVIOUS SCREEN*

**Explanation:** You gave an invalid line number.

**System Action:** The request was not executed successfully.

**User Response:** You entered a number that is not in the list on the left under the heading NO for line number. Enter a valid number. If the line number is in the previous screen, then this is an error in the sample program. Report the error.

---

**DSN8074E**  
*csect DATA IS TOO LONG FOR SEARCH CRITERIA*

**Explanation:** You entered a data value that has too many characters for the type of search criterion you selected. For example, department ids have a maximum of 3 characters and most other ids have a maximum of 6 characters.

**System Action:** The request was not executed successfully.

**User Response:** Enter a data value with the correct number of characters.

---

**DSN8075E**  
*csect MESSAGE FORMAT ROUTINE ERROR, RETURN CODE IS: sqrcode*

**Explanation:** There is an error in the parameters passed to the SQLCA formatting routine, DSNTIAR.

**System Action:** The SQLCA could not be formatted properly.

**User Response:** This is an error in the program. Check the return code listing of DSNTIAR in Part 2 of *DB2 Application Programming and SQL Guide*. Report the error.

---

**DSN8076E**  
*csect VITAL DATA IS MISSING IN TABLE 'DSPTXT'*

**Explanation:** No valid entries exist in the table that contains possible valid entries.

**System Action:** The request was not executed successfully.

**User Response:** There is no valid entry you can enter. Report the error in the application program.

---

**DSN8079E**  
*CONNECTION TO DB2 NOT ESTABLISHED*

**Explanation:** Sample programs DSN8SC3, DSN8SP3, and DSN8HC3 cannot be called directly from TSO. Instead, they must be called from the ISPF sample connection manager, DSN8SCM or DSN8SPM.

**System Action:** The program ends.

---

**DSN8080E**  
*APPLICATION TERMINATED WITH CALL ATTACH TERMINATED WITH CALL ATTACH REASON CODE reason-code*

**Explanation:** The call attachment facility service requested by the application program did not execute successfully. This message is issued by the following CSECTs: DSN8SCM, DSN8SPM.

**System Action:** The requested service is not executed.

**User Response:** Notify the system programmer.

**System Programmer Response:** Check the call attachment facility reason code.

**Problem Determination:** Follow the failure analysis procedures for the call attachment facility reason code.

---

**DSN8081E**  
*RESULTS FROM THE CALL ATTACH TRANSLATE SERVICE*

**Explanation:** The call attachment facility OPEN service that was requested from the application program did not execute successfully. The TRANSLATE service was requested to provide information about the OPEN failure.

**System Action:** The requested OPEN service was not executed.

**User Response:** Refer to Part 2, “SQL return codes,” on page 11.

**Problem Determination:** Refer to Part 2, “SQL return codes,” on page 11 for more information about the error.

---

**DSN8082E**  
*THE DISCONNECT TERMINATED WITH REASON CODE reason-code*

**Explanation:** The call attachment facility DISCONNECT service requested by the application program did not execute successfully.

**System Action:** The requested DISCONNECT service is not executed.

**User Response:** Notify the system programmer.

**System Programmer Response:** Check the call attachment facility reason code.

**Problem Determination:** Follow the failure analysis procedures for the call attachment facility reason code.
**DSN8083E**  
**Explanation:** The user is requesting an invalid service.  
This message is issued by the following CSECTs: DSN8SCM, DSN8SPM  
**System Action:** The requested service was not executed.  
**User Response:** Notify the system programmer.  
**Problem Determination:** There is an error in the Sample Application Program.

---

**DSN8200E**  
**Explanation:** The employee number that is to be added refers to a department number that is not contained in the table DEPT.  
**System Action:** The employee number is not added.  
**User Response:** Ensure that the correct department number was entered.  
**Problem Determination:** List the contents of the department table DEPT.

---

**DSN8201I**  
**Explanation:** The department that is to be added has a manager number that is not contained in the table EMP. The add cannot be completed.  
**System Action:** No department is added.  
**User Response:** Ensure that the correct manager number was entered.  
**Problem Determination:** List the contents of the employee table EMP.

---

**DSN8210I**  
**Explanation:** The department number that is to be erased is the same as a project department number in table PROJ. The department cannot be erased.  
**System Action:** No department data is erased.  
**User Response:** Ensure that the correct department number was entered.  
**Problem Determination:** List the contents of the project table PROJ.

---

**DSN8212E**  
**Explanation:** The department number that is to be added has a department number that is not contained in the table DEPT. The add cannot be completed.  
**System Action:** No department is added.  
**User Response:** Ensure that the correct department number was entered.  
**Problem Determination:** List the contents of the project table PROJ.

---

**DSN8213E**  
**Explanation:** The department that is to be added has a department number that is not contained in the table DEPT. The add cannot be completed.  
**System Action:** No department is added.  
**User Response:** Ensure that the correct department number was entered.  
**Problem Determination:** List the contents of the employee table DEPT.

---

**DSN8214E**  
**Explanation:** The department that is to be updated has a manager number that is not contained in the table EMP. The update cannot be completed.  
**System Action:** No department data is updated.  
**User Response:** Ensure that the correct manager number was entered.  
**Problem Determination:** List the contents of the employee table EMP.

---

**DSN8215E**  
**Explanation:** The department that is to be updated has a administrative department number that is not in the table DEPT. The update cannot be completed.
System Action:  No department data is updated.
User Response:  Ensure that the correct department number was entered.
Problem Determination:  List the contents of the employee table DEPT.

---

DSN8216E  csect DEPT NOT AT SPECIFIED LOCATION, EMPLOYEE NOT ADDED

Explanation:  The employee number that is to be added refers to a department number whose LOCATION field in the DEPT table is different from that specified for the employee. The add cannot be completed.
System Action:  No employee is added.
User Response:  Ensure that the correct department number was entered.
Problem Determination:  List the contents of the department table DEPT.

---

DSN8217E  csect DEPT NOT AT SPECIFIED LOCATION, EMP NOT UPDATED

Explanation:  The employee number that is to be updated refers to a department number whose LOCATION field in the DEPT table is different from that specified for the employee. The update cannot be completed.
System Action:  No employee data is updated.
User Response:  Ensure that the correct department number was entered.
Problem Determination:  List the contents of the department table DEPT.

---

DSN8220E  csect INVALID PROJECT NUMBER, ACTIVITY NOT ADDED

Explanation:  The activity that is to be added contains a project number that is not contained in the table PROJ. The add cannot be completed.
System Action:  The activity is not added.
User Response:  Ensure that the correct project number was entered.
Problem Determination:  List the contents of the project table PROJ.

---

DSN8222E  csect ACTIVITY HAS DEPENDENT ROWS, NOT ERASED

Explanation:  The activity that is to be erased from table PROJ is the same as the corresponding activity in the table EMPPROJACT. The activity cannot be erased from the table PROJ.
System Action:  No activity data is erased.
User Response:  Ensure that the correct project number was entered.
Problem Determination:  List the contents of the employee table EMP.

---

DSN8223E  csect ACTIVITY HAS DEPENDENT ROWS, NOT UPDATED

Explanation:  A start date in table PROJ is to be updated, but there is a project staffing for this activity in table EMPPROJACT. The start date in table PROJ cannot be updated.
System Action:  No activity data is updated.
User Response:  Ensure that the correct start date was entered.
Problem Determination:  List the contents of the project-activity staffing table EMPPROJACT and project-activity table PROJ.

---

DSN8230E  csect INVALID DEPARTMENT NUMBER, PROJECT NOT ADDED

Explanation:  The project that is to be added contains a department number that is not present in the table DEPT. The add cannot be completed.
System Action:  No project is added.
User Response:  Ensure that the correct department number was entered.
Problem Determination:  List the contents of the department table DEPT.

---

DSN8231E  csect INVALID RESPONSIBLE ID, PROJECT NOT ADDED

Explanation:  The project that is to be added contains an employee number that is not contained in the table EMP. The add cannot be completed.
System Action:  No project is added.
User Response:  Ensure that the correct employee number was entered.
Problem Determination:  List the contents of the employee table EMP.

---

DSN8233E  csect PROJECT NUMBER HAS DEPENDENT ROWS, NOT ERASED

Explanation:  A project number in table PROJ is to be erased, but it is the same as a project number in table PROJ. The project cannot be erased from table PROJ.
System Action:  No project is erased.
User Response:  Ensure that correct project number was entered.
Problem Determination:  List the contents of the
PROJ and PROJACT tables.

---

DSN8235E  csect INVALID MAJOR PROJECT ID, PROJECT NOT ADDED

Explanation: The project that is to be added contains a major project ID that is not contained in the table PROJ. The add cannot be completed.

System Action: No project is added.

User Response: Ensure that the correct major project number was entered.

Problem Determination: List the contents of the project table PROJ.

---

DSN8236E  csect INVALID ASSOCIATE DEPT ID, PROJECT NOT UPDATED

Explanation: The project that is to be updated has a department number that is not contained in the table DEPT. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

---

DSN8237E  csect INVALID RESPONSIBLE ID, PROJECT NOT UPDATED

Explanation: The project that is to be updated has an employee number that is not contained in the table EMP. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct employee number was entered.

Problem Determination: List the contents of the employee table EMP.

---

DSN8238E  csect INVALID MAJOR PROJECT ID, PROJECT NOT UPDATED

Explanation: The project that is to be updated has a major project ID that is not contained in the table PROJ. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct project number was entered.

Problem Determination: List the contents of the project table PROJ.
Chapter 30. DSN9... Messages

**DSN9000I**  KEYWORD *keyword-name* APPEARS MORE THAN ONCE

**Explanation:**  The same keyword (specified in the messages as 'keyword-name') appears more than once in the command. This message will be issued for each occurrence of the keyword after the first.

**System Action:**  Processing for the command is terminated.

**System Programmer Response:**  Correct the command by using the keyword only once, and reenter the command.

**Problem Determination:**  Obtain a copy of the system or terminal log to verify the command entry.

**DSN9001I**  KEYWORD *keyword-name* IS INVALID

**Explanation:**  The keyword (specified in the message as 'keyword-name') is unknown or undefined. The keyword may be misspelled, or the keyword may not be applicable to the command being processed.

**System Action:**  Processing for the command is terminated.

**System Programmer Response:**  Correct the keyword, and reissue the command.

**Problem Determination:**  Obtain a copy of the system or terminal log to verify the command entry.

**DSN9002I**  UNBALANCED PARENTHESSES WERE FOUND FOLLOWING KEYWORD *keyword-name*

**Explanation:**  An invalid combination of parentheses has been encountered following the keyword (specified in the message as 'keyword-name'). Parenthesis must be paired open and close, and a close parenthesis must follow an open parenthesis before another open parenthesis is encountered.

**System Action:**  Processing for the command is terminated.

**System Programmer Response:**  Correct the error, and reissue the command.

**Problem Determination:**  Obtain a copy of the system or terminal log to verify the command entry.

**DSN9003I**  KEYWORD *keyword-name* PARAMETER CONTAINS UNBALANCED APOSTROPHES

**Explanation:**  An odd number of apostrophes is present in a parameter. If the parameter is a quoted string, it must have one apostrophe at each end of the string. If an apostrophe is to appear within the string, two adjacent apostrophes must be entered. If the parameter is a hexadecimal value, it must be entered as X'hex characters'.

**System Action:**  Processing for the command is terminated.

**System Programmer Response:**  Correct the error, and reissue the command.

**Problem Determination:**  Obtain a copy of the system or terminal log to verify the command entry.

**DSN9004I**  KEYWORD *keyword-name* RANGE (c) INCORRECTLY SPECIFIED

**Explanation:**  The range for a keyword (specified in the message as 'keyword-name') was incorrectly specified using the syntax character specified in the message as 'c'. The standard syntax character used to denote a range is a colon (:) . Either the ending limit of the range was omitted or a subset was specified within the range.

Examples of this error are LINE(1:) and GROUP(A*B*).

Examples of a correctly specified range are LINE(1:3) and GROUP(A:B).

**System Action:**  Processing for the command is terminated.

**System Programmer Response:**  Refer to [DB2 Command Reference](https://www.ibm.com/support/knowledgecenter/DB2_12.5.0/com.ibm.db2.luw.ez91/contents/db2_ez91.htm) to verify that the command you are using allows a range for the given keyword. Correct the error, and reissue the command.

**Problem Determination:**  Obtain a copy of the system or terminal log to verify the command entry.

**DSN9005I**  KEYWORD *keyword-name* SUBSET (c) INCORRECTLY SPECIFIED

**Explanation:**  The subset for a keyword (specified in the message as 'keyword-name') was incorrectly specified for use with the syntax character 'c' in the message. The standard syntax character used to denote a subset is an asterisk (*) .

For example, consider a group of objects named BLACK, BLUE, GREEN, RED, and WHITE. You may either explicitly specify BLACK and BLUE, or you may specify BL*, meaning all members of the group whose names begin with BL. The character that follows the asterisk must be a blank, comma, close parenthesis, or colon.

Examples of such an error are NAME(BL*CK) and NAME("LUE).

Examples of correct specification are NAME(BL*) and UNIT(2*).
System Action: Processing for the command is terminated.

System Programmer Response: Refer to [DB2 Command Reference] to be sure that the command you are using allows a subset for the named keyword. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

DSN9006I KEYWORD keyword-name ASTERISK (c) INCORRECTLY USED

Explanation: For the keyword specified in the message (as 'keyword-name'), an asterisk (c) was used as the first character of a parameter to specify ALL. However, the asterisk appears in a list, or the characters in juxtaposition are not a blank, comma, equal sign, or parentheses.

Examples of such errors are LINE(LINE1,*,LINE7), NAME(**), and GROUP(PQR:*).

Examples of correct specification are UNIT(*) and LINE=’ etc.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to [DB2 Command Reference] to be sure the command you are using allows specification of ALL for the given keyword. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

DSN9007I THIS COMMAND REQUIRES ONE OF THE FOLLOWING KEYWORDS BE SPECIFIED, keyword1 keyword2 keyword3 keyword4 keyword5 keyword6 keyword7 keyword8

Explanation: One of the keywords identified in the list must be specified on this command, but none of these keywords was present.

System Action: Processing for the command is terminated.

System Programmer Response: Identify the appropriate keyword from the list, include that keyword, and reissue the command. Refer to [DB2 Command Reference] for descriptions of the keywords.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

DSN9008I KEYWORD keyword-name MAY NOT BE NEGATED

Explanation: The negation characters (NO) appear in front of the keyword (specified in the message as 'keyword-name'), but negating this keyword is not allowed. As an example, consider a keyword called PRINT that could indicate that you want something printed. If you did not want the material to be printed, you might specify NOPRINT. This process of prefixing a keyword with the characters NO is called negation. While negation may be meaningful on some keywords, it is not allowed on all keywords.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to [DB2 Command Reference] for further information concerning this command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

DSN9009I KEYWORD keyword-name IS MISSING AND MUST BE SPECIFIED

Explanation: The keyword specified in the message (as 'keyword-name') must be present, but it was not entered. This keyword must be present in order for the command to process properly.

System Action: Processing for the command is terminated.

System Programmer Response: Enter the command again, and include the specified keyword.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

DSN9010I REQUIRED PARAMETER FOR KEYWORD keyword-name IS MISSING

Explanation: A parameter must be specified for the keyword specified in the message (as 'keyword-name'), but no parameter was entered.

As an example of this error, consider a keyword called PRIORITY whose value can range from 0 to 9. Specification of PRIORITY(1) is acceptable, but, if you specify PRIORITY with no parameter value, the keyword is meaningless.

System Action: Processing for the command is terminated.

System Programmer Response: Supply appropriate parameters for the specified keyword and reissue the command. Refer to [DB2 Command Reference] for valid parameter values.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

---

764 Messages and Codes
DSN9011I  PARAMETER(S) CANNOT BE SPECIFIED FOR KEYWORD keyword-name

**Explanation:** No parameter(s) can be specified for the keyword specified in the message (as 'keyword-name'). You may have misspelled the keyword-name, causing it to be interpreted as a different keyword, or the parameter may actually belong with another keyword instead of the one on which you entered it.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Correct the error, and reissue the command. Refer to [DB2 Command Reference](#) for details on how to enter the command.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

---

DSN9012I  KEYWORD keyword-name
PARAMETER(S) MUST BE HEXADECIMAL

**Explanation:** Parameter values for the keyword specified in the message (as 'keyword-name') must be hexadecimal values. The value must be specified as X'hex characters'. Hexadecimal characters are defined as the numeric digits 0 through 9 and the letters A through F. Either uppercase or lowercase is acceptable for the letters A through F.

As an example of this error, consider the keyword OFFSET, for which you are expected to enter a hexadecimal value. If you enter OFFSET(X'2C'), it is acceptable. However, entering OFFSET(Jones) is not acceptable.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Reissue the command, but ensure that the parameters for the named keyword are hexadecimal values.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

---

DSN9013I  KEYWORD keyword-name PARAMETER parameter-value EXCEEDS ALLOWABLE LENGTH OF nn

**Explanation:** The parameter value (specified in the message as 'parameter-value') exceeds the limit of 'nn' characters in length.

As an example of this type of error, consider a PRIORITY keyword whose value may range from zero to nine. If you specify PRIORITY(21) or PRIORITY(006), the value you have entered exceeds the limit of one character.

**System Action:** Processing for the command is terminated.

---

DSN9014I  KEYWORD keyword-name LIMIT OF nn PARAMETER(S) EXCEEDED

**Explanation:** Too many parameters have been specified for the keyword that is specified in the message. The command processor does not accept more than the limit (specified in the message as 'nn') of parameters. This error is probably caused by entering too many parameters. It could also be caused by a missing close parenthesis that has not yet been detected.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Reissue the command, and enter no more than the specified limit of parameters for the given keyword. If necessary, issue the command more than once to process all the desired parameter values. Refer to [DB2 Command Reference](#) for further details.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

---

DSN9015I  PARAMETER parameter-value IS UNACCEPTABLE FOR KEYWORD keyword-name

**Explanation:** The parameter value specified in the message is not an acceptable value for the named keyword.

As an example, consider a keyword called PRINT that can have parameters of YES or NO. Specification of PRINT(YES) or PRINT(NO) is valid. However, specification of PRINT(MAYBE) is unacceptable.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Refer to [DB2 Command Reference](#) for a list of acceptable parameters. Correct and reissue the command.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

---

DSN9016I  verb-name COMMAND REJECTED, UNAUTHORIZED REQUEST

**Explanation:** The command specified in the message (as 'verb-name') requires that you have proper authorization in order to use the command. You do not have the required authorization.
System Action: The command is not executed. Processing is terminated.

Operator Response: If the command must be executed on behalf of the user and your installation operating procedures permit it, enter the command on request.

System Programmer Response: Contact the system programmer responsible for system security, and request that this person grant you authorization to use the command. Otherwise, you must have someone who is authorized issue the command for you. If necessary, request the system operator to enter the command for you.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

---

**DSN9017I**  
**FAILURE WHILE PROCESSING**  
verb-name pkw-name COMMAND,  
**PROCESSING TERMINATED**

**Explanation:** The DB2 command processor has abended while processing the command (specified in the message as 'verb-name pkw-name'). The error is been recorded in SYS1.LOGREC, and an SVC dump is requested. The command may have partially completed. Refer to any prior response messages to determine what has been done.

System Action: Processing for the command is terminated.

Operator Response: If a dump was produced, have it printed. Print a copy of the contents of the SYS1.LOGREC data set for the time period involved. Forward these items with a copy of the system log to the system programmer.

System Programmer Response: Reissue the command. If a second failure occurs, consult your supervisor.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry. Contact the system operator to make sure that diagnostic information is forwarded to you.

---

**DSN9018I**  
csect-name ABORTING verb-name  
**PROCESSING DUE TO INSUFFICIENT STORAGE AVAILABLE**

**Explanation:** The command processor was unable to obtain sufficient storage to complete processing of any response messages generated by the invoked command.

System Action: Processing for the command is terminated abnormally.

Operator Response: Notify the system programmer before attempting to reissue the command.

System Programmer Response: Determine the reason for insufficient storage available to the command. If a cursory examination of the system indicates that the region sizes for DB2 are sufficient, and the current workload does not seem excessive, then a MVS Console dump (MVS DUMP command) may be required.

Insure that any retry steps defined by the command are performed prior to reissuing the command.

---

**DSN9019I**  
**VERB verb-name IS NOT A KNOWN COMMAND**

**Explanation:** The command represented by the verb specified in the message is not known to the system; it is an undefined command. A possible cause for this error is that you made a spelling error while entering the command.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to [DB2 Command Reference](#) for the correct command format.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

---

**DSN9020I**  
**ONLY ONE OF THE FOLLOWING KEYWORDS MAY BE SPECIFIED ON THIS COMMAND, keyword1 keyword2 keyword3 keyword4 keyword5 keyword6 keyword7 keyword8**

**Explanation:** Only one of the identified keywords can be specified at the same time on this command.

System Action: Processing for the command is terminated.

System Programmer Response: Identify the appropriate keyword from the list, include only that keyword, and reissue the command. Refer to [DB2 Command Reference](#) for descriptions of the keywords.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

---

**DSN9021I**  
**VERB verb-name REQUIRED**  
**KEYWORD IS MISSING**

**Explanation:** The command specified in the message (as 'verb-name') was entered, but at least one required keyword is missing. The command processor was unable to determine which keyword or keywords were missing.
DSN9024I

**KEYWORD** *keyword-name* PARAMETER(S) MUST BE NUMERIC

**Explanation:** Parameter values for the keyword (specified on these messages) must be of a specific type, such as all ALPHABETIC or all ALPHAMERIC / NATIONAL characters, or all NUMERIC values. As an example of this type of error, consider the keyword NAME, where you are expected to enter a person's last name. If you enter NAME(Jones) it is acceptable, but if you enter NAME(Jon4s), it is not acceptable.

As a second example, consider a keyword WEIGHT that specifies a numeric weight. Entering WEIGHT(47) is acceptable, but entering WEIGHT(4u) is not.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Reissue the command but ensure that the parameters for the named keyword are of the required type.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

DSN9025I

*csect-name* verb-name pkw-name

**NORMAL COMPLETION FOR SYNCHRONOUS PHASE, AND IN PROGRESS FOR ASYNCHRONOUS PHASE.**

**Explanation:** All synchronous processing for the command specified as 'verb-name pkw-name' in this message completed successfully. Any tasks executing asynchronously for the specified command might still be executing when this message is displayed.

**System Action:** Synchronous processing for the specified command is complete. Subsequent system actions defined by the command that can occur during the asynchronous phase of command processing are documented in [DB2 Command Reference](#).

---

DSN9026I

**KEYWORD** *keyword-name*

**PARAMETER(S) MUST BE ALPHABETIC**

---

DSN9027I

**KEYWORD** *keyword-name*

**PARAMETER(S) MUST BE ALPHAMERIC**

---

DSN9028I

**KEYWORD** *keyword-name*

**PARAMETER(S) MUST BE NUMERIC**

**Explanation:** Parameter values for the keyword (specified on these messages) must be of a specific type, such as all ALPHABETIC or all ALPHAMERIC / NATIONAL characters, or all NUMERIC values. As an example of this type of error, consider the keyword NAME, where you are expected to enter a person's last name. If you enter NAME(Jones) it is acceptable, but if you enter NAME(Jon4s), it is not acceptable.

As a second example, consider a keyword WEIGHT that specifies a numeric weight. Entering WEIGHT(47) is acceptable, but entering WEIGHT(4u) is not.

**System Action:** Processing for the command is terminated.

**System Programmer Response:** Reissue the command but ensure that the parameters for the named keyword are of the required type.

**Problem Determination:** Obtain a copy of the system or terminal log to verify the command entry.

---

DSN9029I

*csect-name* FAILURE WHILE PROCESSING A COMMAND

**Explanation:** A failure has been encountered while processing a command. The command may or may not have been executed. The error has been recorded in the system error log (the SYS1.LOGREC data set), and an SVC dump was attempted.
System Action:  Processing for the command is terminated.

Operator Response:  If a dump was produced, have it printed. Print a copy of the contents of the SYS1.LOGREC data set for the time period involved. Forward these items with a copy of the system log to the system programmer.

System Programmer Response:  Reissue the command. If a second failure occurs, consult your supervisor or the system programmer.

Problem Determination:  Obtain a copy of the system or terminal log to verify command entry. Contact the system operator to make sure that diagnostic information is forwarded to the system programmer.

---

### DSN9030I  KEYWORD keyword-name PARAMETER MAY NOT SPECIFY A SUBSET OF VALUES

Explanation:  The parameter for the keyword specified in the message identifies a subset using the asterisk operator (for instance, ABC*, *ABC, or "ABC"DEF"), but using a subset is not allowed for this command.

As an example, consider a keyword called NAME, for which you can specify people's names. You might specify NAME(ROBERT ROBERTS ROBERTSON) to enter three names, or you might specify NAME(ROB*) to indicate all names that begin with the characters ROB. NAME("BERT") could also be specified to indicate all names that contain the characters BERT within the name. However, not all commands allow you to specify a subset of values in this way.

System Action:  Processing for the command is terminated.

System Programmer Response:  Correct the keyword parameter, and reenter the command.

Problem Determination:  Obtain a copy of the system or terminal log to verify command entry.

---

### DSN9031I  SYNTAX ERROR DETECTED FOLLOWING KEYWORD keyword-name

Explanation:  The text that follows the named keyword contains invalid syntax.

As an example, consider specification of CLASS==A. The double equal signs do not conform to the rules of syntax and make the keyword meaningless. This is just one example of invalid syntax. It is not practical to try to illustrate every possible error here. You could, however, correctly specify CLASS=A or CLASS(A).

System Action:  Processing for the command is terminated.

System Programmer Response:  Examine the text following the named keyword to ensure that no errors were made as the command was entered. Ensure that you have followed the rules for command entry, and reenter the command.

Problem Determination:  Obtain a copy of the system or terminal log to verify command entry.

---

### DSN9032I  REQUESTED FUNCTION IS NOT AVAILABLE

Explanation:  An attempt was made to invoke a command processor that was not loaded. An example of this is invoking -START DDF or -STOP DDF when DDF is not loaded (not selected during the installation process).

System Action:  The requested function is not performed.

User Response:  Determine what function was requested. Do not invoke this function until DB2 is reinstalled and DDF is selected.

Problem Determination:  Look at the console log to determine which command caused the error.

---

### DSN9033I  KEYWORD name1 REQUIRES KEYWORD name2

Explanation:  When keyword 'name1' is specified, keyword 'name2' must also be specified.

System Action:  Processing for the command terminates.

User Response:  Resubmit the command with the missing keyword.

Problem Determination:  Obtain a copy of the system or terminal log to verify the command entry.

---

### DSN9034I  THE TOTAL LENGTH OF COMMAND RESPONSE MESSAGES EXCEEDED ITS LIMIT. DISPLAY IS TERMINATED.

Explanation:  The total length of all response messages returned from a single DB2 command exceeded the internal limit set by the system. The message chain was truncated. This message was appended at the end of the chain to inform the user of the termination of the report.

---

### DSN9038I  csect-name COMMAND REJECTED BECAUSE DB2 WAS RESTARTED IN LIGHT MODE

Explanation:  This command is not allowed when the DB2 member has been restarted with the LIGHT(YES) parameter.

System Action:  Command processing is halted.

System Programmer Response:  Refrain from issuing this command on this DB2 member until after the member has been restarted without LIGHT(YES). If the command has group scope, then you may be able to
issue the command to a different DB2 member in the group.

Chapter 31. DB2 codes

This section contains DB2 abend reason codes and reason codes. In addition, this section contains DB2 instrumentation facility interface reason codes.

Conventions used in DB2 abend reason codes are described in Part 1, "Introduction," on page 1.
Chapter 32. X’C1……’ codes

00C10002
Explanation: The DB2 call attachment facility control block (the CAB) indicated that a thread was present when it should not have been present.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Notify your system programmer.

System Programmer Response: Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

Problem Determination: This is probably a call attachment facility error.

00C10003
Explanation: The DB2 call attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Modify or repair your application so that DSNACA00, the main call attachment facility code will receive control only through the language interface.

Problem Determination: This is probably a user error.

00C10004
Explanation: The call attachment facility encountered an error retrieving a trace message during processing of a call attachment facility request.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Notify your system programmer.

System Programmer Response: Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

Problem Determination: This is probably a call attachment facility error.

00C10005
Explanation: The application program passed an ECB address of 0 to the call attachment facility on a CONNECT call. The trace message preceding the abend indicates whether the ECB was a start-up or termination ECB.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Correct the application program that makes the CONNECT call to DSNALI. Ensure that the CONNECT call uses a valid ECB address.

Problem Determination: See the Explanation above.

00C10201
Explanation: The application program passed two CONNECT calls to the call attachment facility (CAF) from the same TCB. The first CONNECT could have been either implicit or explicit.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10202
Explanation: The application program passed two OPEN commands to the call attachment facility (CAF) from the same TCB. The first OPEN could have been either implicit or explicit.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10203
Explanation: A CLOSE command was issued when there was no active OPEN.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10204
Explanation: A DISCONNECT command was issued when there was no active CONNECT.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.
00C10205

Explanation: A TRANSLATE command was issued when the DB2 subsystem was not connected to the call attachment facility (CAF).

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10206

Explanation: One of the following conditions exists:
• The wrong number of parameters were issued.
• The end-of-list bit was off.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10207

Explanation: The application program passed an unrecognized function parameter to the call attachment facility (CAF).

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10208

Explanation: The call attachment facility (CAF) received requests from the same TCB to CONNECT to the DB2 subsystem and to another subsystem.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10209

Explanation: The call attachment facility (CAF) received an explicit call to DSNALI from a DB2 stored procedure. This is not allowed.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

00C10824

Explanation: The CAB is reset and a new connection may be made.

This abend reason code is issued by the following CSECT: DSNAC70

User Response: You can continue processing.

Problem Determination: See the Explanation associated with message DSNA824I.

00C10831

Explanation: The call attachment facility (CAF) has detected a release level incompatibility between itself and DB2. Either the current CAF or DB2 release levels do not support coexistence, or the SPE level of the lower level release does not meet the compatibility requirements for coexistence between the two releases.

This reason code is issued by the following CSECT: DSNAC70

System Action: The connection is not successful.

User Response: If you used JCL or a TSO logon procedure to invoke CAF, check to insure the correct DB2 libraries are defined in your JOBLIB and STEPLIB allocations. See your system programmer if you invoke CAF using procedures supplied by your system programmer.

Problem Determination: If CAF trace (DSNTRACE) is active, message DSNA831E will indicate the release levels of CAF and the DB2 subsystem.

00C12001

Explanation: The DB2 RRSAF attachment facility function AUTH SIGNON was invoked by a program that was not APF authorized. This condition can indicate a security violation.

System Action: The application is abended.

User Response: The AUTH SIGNON function can only be invoked from an APF authorized program. Either modify your program to use the RRSAF attachment facility function SIGNON which may be invoked from a non-authorized program, or contact your security administrator to make the changes required to make your program an APF authorized program.

Problem Determination: This is a user error.

This abend reason code is issued by the following CSECT: DSNARA00

00C12002

Explanation: An abend has occurred during an attempt to access the caller-provided subsystem name parameter while executing in the PSW key of the caller.
This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00C12003

Explanation: An abend has occurred during an attempt to access the caller-provided ribptr parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00C12004

Explanation: An abend has occurred during an attempt to access the caller-provided ribptr parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00C12005

Explanation: The DB2 RRSAF attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

System Action: The application is abended.

User Response: Modify or repair your application so that DSNACA00, the main call attachment facility code, will receive control only through the language interface.

Problem Determination: This is probably a user error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00C12006

Explanation: An abend has occurred during an attempt to access the caller-provided termination ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00C12007

Explanation: An abend has occurred during an attempt to access the caller-provided startup ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in
00C12008

Explanation: An abend has occurred during an attempt to access the caller-provided correlation parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00C12013

**Explanation:** An abend has occurred during an attempt to access the caller-provided ACEE parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00C12014

**Explanation:** An abend has occurred during an attempt to access the caller-provided plan name parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00C12015

**Explanation:** An abend has occurred during an attempt to access the caller-provided collection parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00C12016

**Explanation:** An abend has occurred during an attempt to access the caller-provided reuse parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00C12018

**Explanation:** An abend has occurred during an attempt to access the caller-provided user-id parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

---

00C12019

**Explanation:** An abend has occurred during an attempt to access the caller-provided applname parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The application is abended.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register
00C12020

Explanation: An abend has occurred during an attempt to access the caller-provided ws parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12202

Explanation: The application program invoked the CREATE THREAD function request while there was already a thread created.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12203

Explanation: A TERMINATE THREAD command was issued when there was no active thread.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12204

Explanation: The application issued a function request other than IDENTIFY when no connection with DB2 existed. Only IDENTIFY may be issued when a connection does not exist.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12205

Explanation: The task that invoked the DB2 RRSASF attachment facility function SWITCH TO has not yet identified to the DB2 subsystem specified in the request.

System Action: The SWITCH TO function is performed.

User Response: Use IDENTIFY to connect to a DB2 subsystem before attempting to invoke any other function at the specified subsystem.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12206

Explanation: One of the following conditions exists:
- The wrong number of parameters were issued.
- The end-of-list bit was off.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00
00C12207
Explanation: The application program either omitted the function name parameter or passed an unrecognized function parameter to the RRSAF.
System Action: The application is abended.
User Response: Modify or repair your application to pass a valid function request to RRSAF.

00C12208
Explanation: The application program issued an IDENTIFY function request but omitted the ribptr parameter from the parameter list. An ribptr parameter is a required parameter on an IDENTIFY request.
System Action: The IDENTIFY request is rejected.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12209
Explanation: The application program issued an IDENTIFY function request but omitted the eibptr parameter from the parameter list. An eibptr parameter is a required parameter on an IDENTIFY request.
System Action: The IDENTIFY request is rejected.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12212
Explanation: The application program issued a CREATE THREAD function request and did not specify a plan name and also did not specify a collection name. If a plan name is not provided, then a collection name must be supplied.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12214
Explanation: The application program issued a TRANSLATE function request but omitted the sqlca parameter from the parameter list. An sqlca parameter is a required parameter on a TRANSLATE request.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12222
Explanation: The RRSAF received an explicit call to DSNRLI from a DB2 stored procedure. This is not allowed.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C1223
Explanation: An attempt was made to initiate a stored procedure for a task, but one already exists. This is not allowed.
User Response: You can continue processing with a corrected request.
Problem Determination: This reason code is issued
by the following CSECT: DSNARA00

00C12824

**Explanation:** The previous connection to DB2 has been terminated. Cleanup processing was performed and the RRSAF is now ready to process additional IDENTIFY requests.

**User Response:** You can continue processing, and issue an IDENTIFY request.

**Problem Determination:** This reason code is issued by the following CSECT: DSNARA00

00C12825

**Explanation:** An attempt was made to terminate a stored procedure for a task, but no stored procedure exists. This is not allowed.

**User Response:** You can continue processing with a corrected request.

**Problem Determination:** This reason code is issued by the following CSECT: DSNARA00

00C12831

**Explanation:** The release of the RRSAF code is not compatible with the earlier release of the DB2 program.

**System Action:** The connection is not made.

**User Response:** Ensure that the release of the RRSAF library is not later than the release of DB2 to which you are attempting to connect.

**Problem Determination:** This problem can be caused by improper DB2 data set allocation in a LOGON procedure or CLIST.

This reason code is issued by the following CSECT: DSNARA70
Chapter 33. X’C2......’ codes

00C20021

Explanation:  A member of a DB2 data sharing group was unable to perform a global drain because a physical close failure occurred in a peer DB2 due to an exceptional state or CASTOUT process failure. DSNT501I is sent to the console to report the condition.

System Action: A ‘resource not available’ return code, reason code, and object name are sent back to the requesting function.

This returned reason code is issued by the following CSECT: DSNB1LDA

00C20031

Explanation:  An attempt to acquire a page latch in either shared mode or exclusive mode was rejected due to a time-out on the agent’s wait time.

System Action: A ‘resource not available’ return code, reason code, and object name are sent back to the requesting function.

System Programmer Response:  A diagnostic dump with reason code 00C2010F should follow 00C20031.

This reason code is issued by the following CSECTs: DSNB1LTX, DSNB1LTS

00C20069

Explanation:  DB2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because a DB2 member in the data sharing group was in the process of restarting.

System Action: If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

Otherwise, a ‘resource not available’ return code, reason code and object name are sent back to the requesting function. DSNT501I is sent to the console to report the condition.

System Programmer Response: If DSNB350I or DSNB351I messages were issued, wait for the failed DB2 member to complete its restart processing and then recover the GRECP objects as indicated in the “System Programmer Response” for DSNB350I or DSNB351I.

00C2006A

Explanation:  DB2 was unable to perform the drain function on an object (table space, index space, or partition) because the object was held by one or more indoubt threads.

System Action: If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

System Programmer Response: Use the DB2 DISPLAY DB CLAIMERS command to find the indoubt threads. If the threads have been left indoubt because DB2 or a transaction manager was unable to automatically resolve the indoubts, you can use the DB2 RECOVER INDOUBT command to resolve the indoubt thread and remove the indoubt claimer on the object (the DB2 RECOVER INDOUBT command should only be used when automatic resolution does not work).

If DSNB350I or DSNB351I messages were issued, then after you resolve the indoubt threads, recover the GRECP objects as indicated in the “System Programmer Response” for DSNB350I or DSNB351I.

00C200A1

Explanation:  This is a DB2 internal error. The caller of the buffer manager (BM) is trying to release a page latch that is not currently held.

This abend reason code is issued by the following CSECTs:

DSNB1REL DSNB1RWI DSNIB DSNICLAP
DSNICUMW DSNICUR DSNIDLS DSNIDLEO
DSNIFRE DSNIFNP DSNIGLOK DSNILGBW
DSNILREP DSNILSMG DSNIMSCU DSNIMSTW
DSNIOSL2 DSNIOW DSNIPOCI DSNIRELS
DSNIRELU DSNIREPR DSNIRFNX DSNISEGD
DSNISEGF DSNISFS DSNISFXL DSNISGAU
DSNISGFO DSNISGNS DSNISGRT DSNISGSU
DSNISMF0 DSNISMR T DSNISMSU DSNIUPPR
DSNIUSME DSN10P

System Action:  The requesting application process is abended.

Operator Response:  Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response:  Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1, 2, 3].

00C200A2

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get a page latch that is currently held on the requesting page.

This abend reason code is issued by the following CSECTs:

- DSNB1GET
- DSNB1SWS
- DSNB1GNV
- DSNBLTCH
- DSNIB
- DSNICLAP
- DSNICUMW
- DSNICUR
- DSNIDEFR
- DSNIFFRE
- DSNIFNP
- DSNIGOK
- DSNILSMG
- DSNILSMU
- DSNIMS1W
- DSNIRELS
- DSNIRELU
- DSNIREPR
- DSNIRFNX
- DSNIRNXT
- DSNISEGF
- DSNISFS
- DSNISFXL
- DSNISGAU
- DSNISGFO
- DSNISGNS
- DSNISGRT
- DSNISMR
- DSNIUSME
- DSNIO1P

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1, 2, 3].

00C200A3

Explanation: This is a DB2/MVS internal error. The execution unit driving a buffer manager (BM) asynchronous function, which would normally run indefinitely, has been canceled. However, work being done by the execution unit is allowed to complete before the execution unit terminates.

This abend reason code is issued by the following CSECTs:

- DSNB1CMS
- DSNB5COM
- DSNB5RAP

System Action: The affected asynchronous function is terminated. If the affected function is the deferred write processor (DSNB1CMS), DB2 is abended with the abend code '00C200D3'.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Start DB2 if it is abended.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1, 2, 3].

00C200A4

Explanation: This code usually indicates a problem internal to DB2; however, the problem can result from errors in other products. An unexpected reason code was returned by the media manager function when it was invoked to process a database I/O request.

System Action: The requesting execution unit is abended.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The unexpected media manager reason code is saved in register 8.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1, 2, 3].

This abend reason code is issued by the following CSECTs:

- DSNB5COM
- DSNB5FOR
- DSNB5RAP
- DSNB5RDP
- DSNB5PCO

00C200A5

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. DB2 was unable to drain a pageset in preparation for page set cleanup processing. This might be caused by one of the following:

- An IRLM out-of-storage condition
- An internal error in the lock acquisition function

This abend reason code is issued by the following CSECT: DSNB1CFC

System Action: The execution unit driving this function proceeds normally. The abend status is recorded in SYS1.LOGREC.

Operator Response: Notify the system programmer and print the SYS1.LOGREC.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and
reporting the problem. Restart DB2.

Problem Determination: The unexpected reason code returned by the drain function in register 8 might help determine the cause of the problem. If the problem is caused by an unavailable DB2 resource, message DSN1500I might also be issued.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 5

00C200A6

Explanation: This is a DB2/MVS internal error. The execution unit scheduled by the buffer manager (BM) subcomponent of DB2 to drive the page set cleanup function has been canceled.

This abend reason code is issued by the following CSECT: DSNB1FC

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Refer to similar reason code ‘00E50013’.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

00C200A8

Explanation: An error code other than timeout, insufficient storage, or an MVS system error was returned by the IRLM LOCK request invoked by DB2 to acquire any of the following locks:
- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool-dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

This is a DB2 or IRLM internal error.

System Action: The requesting execution unit abends.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK

00C200A9

Explanation: A return code greater than 4 was returned by the IRLM UNLOCK request invoked by DB2 to release any of the following locks:
- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

This is a DB2 or IRLM error.

System Action: The requesting execution unit is abended.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The unexpected IRLM reason code is saved in register 8. It might help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK

00C200AA

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to change a page latch type, but the requesting agent already holds this latch type on this page.

This abend reason code is issued by the following CSECT: DSNBCLTH

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

Chapter 33. DB2 codes 785
00C200AB

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get another page latch, which would cause the total number of page latches held by the caller to exceed the maximum allowable number of 2.

This abend reason code is issued by the following CSECTs: DSNBLTCH DSNB2LTH

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 1 2 5

00C200AF

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to update a page under the critical mode without holding an exclusive latch on the page.

This abend reason code is issued by the following CSECT: DSNB1WS

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 1 2 5

00C200B

Explanation: Typically, this indicates a problem internal to DB2, however the problem can result from errors in other products. The buffer address passed by the buffer manager (BM) invokers does not contain the requested page. The buffer manager detected this error by comparing the information stored in the buffer control block (BB) with the information passed with the buffer manager by its invokers. The information that is compared is the page set piece block, the page number, and the buffer address.

This abend reason code is issued by the following CSECTs:

DSNB1REL DSNB1RWI DSNB1WS DSNB1GNV DSNB5COM

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:

The following general purpose registers (GPRs) contain the indicated diagnostic information:
00C200B1

**Explanation:** This is a DB2 internal error. Either the buffer manager (BM) subcomponent of DB2 is unable to locate the requesting page in the buffer pool or the invoker of the buffer manager is attempting to decrease the buffer use count which is already 0.

This abend reason code is issued by the following CSECTs:

- DSNB1REL
- DSNB1RWI
- DSNB1SWS

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C200B4

**Explanation:** This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The highest page set piece number passed by the buffer manager invoker exceeds the maximum value allowed. The maximum number of data sets that can be defined for a given page set is dependent on the page set piece size. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OPS

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C200B5

**Explanation:** This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The page size or the page set piece size passed by the buffer manager invoker is invalid. The page set piece size is expressed by n, where 2 to the power of n is the total number of pages that can be contained within a page set piece. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OFA

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [10] [12]

00C200B6

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of DB2 is unable to reallocate a data set that is required after extending a data set to a new volume. The data set reallocation was requested and the corresponding data set was not opened. This error was detected during open page set piece processing.

This abend reason code is issued by the following CSECT: DSNB1OPP

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [10] [12]

00C200B7

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The linear page set was not formatted contiguously. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OPS

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [10] [12]

00C200BB

Explanation: This is a DB2 internal error. DB2 has encountered an unexpected error while attempting to access a system page of a page set.

This abend reason code is issued by the following CSECTs: DSNB1CPP, DSNB1OPP

System Action: The requesting execution unit is abended. The SVC dump and the SYS1.LOGREC recording are requested.

Operator Response: Notify the system programmer, print the SYS1.LOGREC and the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [10] [12]

00C200BB

Explanation: This is a DB2 internal error to indicate that an invalid buffer pool ID is specified.

This abend reason code is issued by the following CSECT: DSNBRBPA

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00C200C0**

**Explanation:** DB2 is unable to perform I/O processing for the requesting function. An error code (other than a permanent I/O error) was returned by the media manager during the I/O backend processing.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The unexpected media manager reason code is saved in register 8. It might help determine the cause of the failure.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs:

- DSNB5COM
- DSNB5FOR
- DSNB5RAP
- DSNB5PCO
- DSNB5RDP

---

**00C200C1**

**Explanation:** The page version number in the database page header is outside the valid range of values. This can be caused by one of the following:

- Copying data sets improperly from another DB2 subsystem.
- In a CREATE TABLESPACE statement, specifying a VCAT catalog name that is the same as the name of an object in another DB2 subsystem on the same processor.
- Conditionally starting DB2 to a prior time with an invalid RBA range.
- Incorrect use of the REPAIR utility (modifying the page RBA).
- The page was damaged by a DB2 system error.
• TOD clock values are out of synch between systems in a Parallel Sysplex.

**System Action:** The requesting execution unit is not the one that requested the abend. If DSNB1SWS issues the ABEND, then it is preceded by a DSNT5001 message indicating which page is in error and a DSN004I message indicating the page set is put in STORP mode.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**User Response:** One of the following:

• If the data set was copied from another DB2 subsystem, run DSN1COPY with the RESET option to set the log RBAs in each page to 0.

• If a table space was created with the wrong VCAT catalog name, drop the object and create it again.

• If DB2 was conditionally started with an invalid RBA range, correct the RBA range and restart DB2 with conditions again.

• If the page was damaged by the REPAIR utility, restore it with the RECOVER utility using the PAGE option.

• If you are running data sharing, check the connectivity of the systems to the sysplex timers. The TOD clock values of all systems in the sysplex should all be within one microsecond. TOD clock values will not drift more than one microsecond apart unless a sysplex timer is malfunctioning.

• Otherwise, inform your system programmer that you suspect an error.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Address of the  page buffer (PB)</td>
</tr>
<tr>
<td>8</td>
<td>Address of the page set block (PB)</td>
</tr>
</tbody>
</table>

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

This abend reason code is issued by the following CSECT: DSNB1SWS.

**00C200C5**

**Explanation:** This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 discovered that the BM invoker is attempting to decrease the page’s write intent count (WIC), but the invoker has no write intent request outstanding.

This abend reason code is issued by the following CSECT: DSNB1RWI

**System Action:** The BM does not decrease the page’s WIC as requested, and the execution unit driving this function is abended. An SVC dump is requested and the abend status is recorded in the SYS1.LOGRREC.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349
**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200C6**

**Explanation:** This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 has discovered that the BM invoker is attempting to release a page that was not held by the invoker or the page has an unbalanced write intent (for example, reset write intent has not yet been issued prior to releasing the page).

This abend reason code is issued by the following CSECTs: DSNB1REL DSNB1RWI

**System Action:** The BM does not release the page as requested, and the execution unit driving this function terminates abnormally. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200C7**

**Explanation:** An error code, other than timeout, insufficient storage, or MVS system error, was returned by the IRLM LOCK request. The IRLM LOCK request was invoked to acquire an open lock to perform a physical open or close.

This abend reason code is issued by the following CSECT: DSNB1LCK

**System Action:** The requesting execution unit is abended.

**User Response:** Rerun the application.

**Operator Response:** Print the SYS1.LOGREC and request the SVC dump.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200C8**

**Explanation:** A return code greater than 4 was returned by the IRLM UNLOCK request invoked to release an open lock after completing a physical open or close.

This abend reason code is issued by the following CSECT: DSNB1ULK

**System Action:** The requesting execution unit is abended.

**User Response:** Rerun the application.

**Operator Response:** Print the SYS1.LOGREC and request the SVC dump.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200C9**

**Explanation:** The buffer manager (BM) subcomponent of DB2 discovered a damaged PBG control block while attempting to write a checkpoint log record.

This abend reason code is issued by the following CSECT: DSNB1CHK

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200CB**

**Explanation:** The buffer manager (BM) subcomponent of DB2 discovered a damaged ABG or control block while attempting to write a checkpoint.

This abend reason code is issued by the following CSECT: DSNB1CHK

**System Action:** DB2 is abnormally terminated; if processing were to continue, an invalid checkpoint
would be created which would damage data on a subsequent DB2 restart.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [5]

---

**00C200CC**

**Explanation:** The buffer manager (BM) subcomponent of DB2 discovered a close task has been waiting for prefetch to complete for two checkpoints.

This abend reason code is issued by the following CSECT: DSNB1CHK

**System Action:** An SVC dump is produced and checkpointing continues.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5]

---

**00C200CE**

**Explanation:** This is a DB2 internal error. An agent, which was suspended while awaiting completion of a database I/O, was invalidly resumed by someone other than the initiator of the I/O.

**System Action:** An SVC dump is taken. The affected agent res-suspends to await the completion of the I/O, and will continue executing normally.

**System Programmer Response:** Refer to Section 3 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2] [5]

---

**00C200CF**

**Explanation:** DB2 could not acquire enough virtual storage for allocating private buffers for an internal castout process. The castout operation is queued until an existing castout process becomes available.

**System Action:** The requesting execution unit is abended. No dump is produced.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNB5PCO

---

**00C200D0**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager (BM) I/O termination exit routine. Retry of the prior abend is not allowed by MVS.

This abend reason code is issued by the following CSECT: DSNB5UTX

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5]

---

**00C200D1**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O termination exit routine. An attempt to retry and to continue main line processing (after completion of processing of this prior abend) resulted in recursion to the I/O termination exit routine’s functional recovery routine (FRR).

This abend reason code is issued by the following CSECT: DSNB5UTX

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**Problem Determination:** The FRR parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to
determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C200D2

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O error exit routine during processing of a database I/O error.

This abend reason code is issued by the following CSECT: DSNB5UEX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C200D3

Explanation: A prior abend occurred in a 'must complete' processing window of a buffer manager (BM) function.

This abend reason code is issued by the following CSECT: DSNB1RRR

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200D6**

**Explanation:** An abend occurred in the I/O termination exit routine while resuming the suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

This abend reason code is issued by the following CSECT: DSNB5UTX

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The functional recovery routine (FRR) parameter list is recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200D7**

**Explanation:** A prior abend occurred while resuming a suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

This abend reason code is issued by the following CSECT: DSNB1RRR

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** See the Problem Determination section of the original abend code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200D8**

**Explanation:** This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 discovered that some buffer manager resources are inconsistent.

This abend reason code is issued by the following CSECTs: DSNB5COM DSNB1CMS

**System Action:** DB2 is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

**System Programmer Response:** Refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200E0**

**Explanation:** A table space or index space cannot be accessed because DB2 is unable to create the referenced buffer pool. The referenced buffer pool size was zero, which indicates to DB2 that this buffer pool should not be activated. DB2 message DSNB602I was issued to inform the operator of the error. This reason code and the table space or index space name are recorded in the cursor table (CT) and made available to the user in the SQLCA.

This abend reason code is issued by the following CSECTs: DSNB1OPP DSNB1OPS

**System Action:** An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

**System Programmer Response:** Analyze the virtual storage content of the ssnmDBM1 address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table space or index to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.

---

**00C200E1**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required to be accessed by the requesting function. An error was returned by the media manager CONNECT function, which was invoked to open a VSAM data set. DB2 message DSNB204I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.
This abend reason code is issued by the following CSECT: DSNB1OST

**System Action:** A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to system message IEC1611 and DB2 message DSNB204I for assistance in determining the cause of the error. Correct the situation, and notify the user to invoke the application again.

**Problem Determination:** The unexpected media manager return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| 5 | 10 | 12 |

---

**00C200E2**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required by the requesting function. An error was returned by the dynamic allocation function that was invoked to allocate a VSAM data set. DB2 message DSNB207I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1OST

**System Action:** A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

**User Response:** Notify the system programmer. Invoke the application again after the system programmer has corrected the error.

**System Programmer Response:** The error code returned from the dynamic allocation function was externalized in the DSNB207I message. Refer to the appropriate MVS publication for an explanation of this error code. Correct the situation, and notify the user to invoke the application again.

**Problem Determination:** The unexpected dynamic allocation return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| 5 | 10 | 12 |

---

**00C200E6**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to perform the I/O operation on a data set that is required by the requesting function. A permanent I/O error was detected by the buffer manager I/O functions. The logical I/O error indicates that a requested page (read operation) resides within the error page range of the data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1GET

**System Action:** A 'resource not available' code is returned to the user.

**User Response:** Notify the system programmer. Invoke the application after the system programmer has corrected the error.

**Operator Response:** Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

**System Programmer Response:** The error page range can be located from the console sheet or through the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| 5 | 10 | 12 |
**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

---

**00C200E8**

**Explanation:** The buffer pool (indicated in the SQLCA) cannot be created because of insufficient virtual storage. Message DSNB603I or DSNB605I was issued to inform the operator of the error. This reason code and the buffer pool ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

**System Action:** An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Analyze the virtual storage content of the ssnmDBM1 address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to indicate use of a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance virtual storage usage for all buffer pools.

---

**00C200E9**

**Explanation:** A buffer could not be assigned in the buffer pool (indicated in the SQLCA) because all buffers in the buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

Message DSNB601I was issued to inform the operator of the error. This reason code and the buffer pool ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECTs: DSNB1GBW DSNIBMOC DSNIWKFD

**System Action:** An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reduce concurrent activity by reducing the number of DB2 threads, or, if necessary, increase the size of the failing buffer pool by using the ALTER BUFFERPOOL command.

---

**00C200EA**

**Explanation:** DB2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because the object was held by other claimers and the drain request timed out waiting for the claim count to reach zero.

**System Action:** If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

Otherwise, a 'resource not available' return and reason code are sent back to the requesting function. DB2 message DSNT500I may be sent to the console. The reason code and the object name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in the message.

**System Programmer Response:** Take one of these actions:
- Reevaluate the utility timeout factor on installation panel DSNTIP1 and increase it, if necessary.
- Find the threads holding the object through the -DISPLAY DB CLAIMERS command on the object. Either terminate those threads or wait until no one holds the object. Then invoke the application again.

If DSNB350I or DSNB351I messages were issued, then after you take one of the actions above, recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

---

**00C200EB**

**Explanation:** A data sharing group member is not able to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer members in the group hold retained locks on the object. Message DSNT501I is sent to the console to report the condition.

**System Action:** A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

**System Programmer Response:** Use the DISPLAY DATABASE command with the LOCKS option to display the member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1DRA
**00C200EC**

**Explanation:** A member of a DB2 data sharing group was unable to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer DB2s in the group failed to drain the object because some error occurred. Both the DB2 running the request and the peer DB2 send DB2 message DSNT500I to the console to report the problem.

**System Action:** A 'resource not available' return code, reason code and object name are sent back to the requesting function.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Retrieve the DSNT501I messages from the console and analyze the corresponding reason and error codes.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1DRA

---

**00C200ED**

**Explanation:** DB2, in a data sharing environment, detected that the requested use of a type 1 index with a SUBPAGES value greater than 1 would have caused the index to become group buffer pool dependent. DB2 does not allow type 1 indexes with a SUBPAGES value greater than 1 to become group buffer pool dependent.

**System Action:** The use of the index is not allowed.

**User Response:** If the index is to be used in group buffer pool dependent mode, then either the index should be converted to a type 2 index or it should be converted to a type 1 index with SUBPAGES 1.

---

**00C200EF**

**Explanation:** DB2 is unable to open a necessary data set. The data set attributes stored in the DB2 catalog are not supported by the version of DFSMS that is currently running.

This reason code and the data set name are recorded in the SQLCA or in messages.

**System Action:** A 'resource not available' code is returned to the user.

**System Programmer Response:** This data set cannot be opened unless this DB2 is running with DFSMS Version 1 Release 5 or a subsequent release. The data set must also be associated with an extended addressability data class.

---

**00C200F0**

**Explanation:** DB2 encountered an error on an IXLCACHE request while trying to write a page to the group buffer pool during physical lock (P-lock) negotiation.

**System Action:** The requesting execution unit abends. The error is recorded to SYS1.LOGREC, but the dump is suppressed and the abend is retried in the functional recovery. Another group member, requesting the P-lock that caused the negotiation on this member, receives a resource not available code of 00C20252, and its P-lock request is denied.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5SCM

---

**00C200F1**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to unallocate a DB2 data set. An error was returned by the dynamic unallocation function that was invoked to unallocate a data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1CST

**System Action:** A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The unexpected dynamic unallocation reason code is saved in register 8. It may help determine the cause of the failure. Refer to the appropriate MVS publication for an explanation of the error code.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00C200F2**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to close a DB2 data set. An error was returned by the media manager DISCONNECT function that was invoked to close a data set. This reason code and the data set name are recorded in the cursor table (CT) and in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1CST

**System Action:** A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.
Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The unexpected media manager disconnect reason code is saved in register 8 and may help determine the cause of the failure. Locate the corresponding IEC1611 message in the operator console sheet, and refer to the appropriate MVS publication for assistance in determining the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1345:
1 2 5 10 12

00C200F3

Explanation: DB2 is unable to obtain one of the following locks:
- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected a timeout error.

System Action: A ‘resource not available’ code is returned to the user. This reason code and the data set name are recorded in the cursor table (CT) and are available to the user in the SQLCA or in messages.

User Response: Resubmit the failing application.

Problem Determination: This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK.

00C200F4

Explanation: DB2 is unable to obtain one of the following locks:
- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected an out-of-storage condition.

System Action: A ‘resource not available’ code is returned to the user. This reason code is recorded in the cursor table (CT) and is available to the user in the SQLCA or in messages.

User Response: Resubmit the failing application.

Problem Determination: This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK.

00C200F6

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required to be accessed by the requesting function. The data set has been migrated by DFHSM and the data set must be recalled before being accessed. Since the RECALL(yes) option was selected by the installation, a recall for the migrated data set has been initiated. A recall was not complete after the amount of time specified in the RECALL option had elapsed.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set requested. Other migrated data sets within the table space may exist. For each one that exists, a DSN500I message containing the data set name and reason code has been sent to the console.

This abend reason code is issued by the following CSECT: DSNB1RST

System Action: A ‘resource not available’ code is returned to the user. A DSN500I message is sent to the console.

User Response: After the data set has been restored, rerun the application program, transaction, or query. If necessary, contact the operator to find out the status of the migrated data set.

00C200F7

Explanation: The page found in the buffer is not the page requested by the buffer manager. The buffer manager detected the error by comparing the page number of the page returned with the requested page number. This error may be caused by one of the following:
- Either the VTOC or VVDS is damaged, causing multiple data sets to occupy the same extents on DASD.
- The page was altered incorrectly by a non-DB2 facility or a DB2 service aid.
- An internal DB2 error damaged the page. The recovery log will be required for problem determination.

This abend reason code is issued by the following CSECT: DSNB1GET

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The following general purpose registers (GPRs) contain the indicated diagnostic information:

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Address of the page buffer</td>
</tr>
<tr>
<td>8</td>
<td>Address of the page set block (PB)</td>
</tr>
</tbody>
</table>

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00C200F8

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to perform the I/O operation on a data set. A physical I/O error was detected by the buffer manager I/O functions.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECTs: DSNB1GET DSNB5COM

**System Action:** A ‘resource not available’ code is returned to the user. A DSNB224I message is issued, unless it has already been issued 10 times for the data set.

If the I/O is a write operation, or if the I/O is a read operation performed during restart or rollback, then the error page range of the data set is updated. A DSNU086E message is issued indicating the data set name and its corresponding I/O error page range, unless it has already been issued 10 times for the data set.

**User Response:** Notify the system programmer. Invoke the application after the system programmer has corrected the error.

**Operator Response:** Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

**System Programmer Response:** The error page range can be located from the console sheet or with the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00C200F9

**Explanation:** DB2 is unable to open a data set that the requesting function must access. The data set was migrated by HSM and must be recalled before being accessed. DB2’s attempt to initiate a recall of the migrated data set was unsuccessful.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last requested migrated data set. Other migrated data sets might exist. For each existing data set, message DSNT500I containing the data set name and reason code was sent to the console.

**System Action:** A ‘resource not available’ code is returned to the user. A DSNT500I message is sent to the console.

**User Response:** Issue the HSM command (HRECALL) to restore the migrated data set. Run your application program, transaction, or query after the data set is restored.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNB1OST

00C200FA

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. A timeout error was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LCK

**System Action:** A ‘resource not available’ code is returned to the user.

**User Response:** Resubmit the failing application.

00C200FB

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. An out-of-storage condition was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LCK

**System Action:** A ‘resource not available’ code is returned to the user.
**User Response:** Resubmit the failing application.

---

**00C200FC**

**Explanation:** The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. A system error was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LOCK

**System Action:** A 'resource not available' code is returned to the user.

**User Response:** Resubmit the failing application.

---

**00C200FD**

**Explanation:** The buffer manager is unable to perform the I/O operation on a data set due to an error on page's parity flag detected by the buffer manager's I/O function.

This abend reason code is issued by the following CSECT: DSNB1GET

**System Action:** A 'resource not available' return code is returned to the user. The related reason code 00C200FD, the page number, the page set name, and the data base name in question are recorded in the cursor table (CT) and made available to the user in the SQLCA.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The error page can be found via SQLCA. Correct the error pages with the recovery utility, and notify the user to invoke the application again.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for failure for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C200FE**

**Explanation:** DB2 is unable to open a data set that the requesting function must access. The data set was migrated by DFHSM and must be recalled before being accessed. Since the RECALL(no) option was selected by the installation, recall for the migrated data set was not initiated.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set requested. Other migrated data sets within the table space might exist. For each existing data set, message DSNT500l containing the data set name and reason code has been sent to the console.

**System Action:** A 'resource not available' code is returned to the user. A DSNT500l message is sent to the console.

**User Response:** Notify the system programmer. After the data set is restored, rerun the application program, transaction, or query.

**System Programmer Response:** Issue the DFHSM command (HRECALL) to restore the migrated data set.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNB1OST

---

**00C200FF**

**Explanation:** An attempted open of a page set failed because DB2 has reached the MVS limit on concurrent open data sets.

This reason code is issued by the following CSECT: DSNB1OST

**System Action:** A 'resource not available' (SQLCODE -904) is returned to the user and the requested open is not performed. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA. A DSNB207I message is displayed on the operator console. The SVC dump and the SYS1.LOGREC recording are not requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reduce the number of page sets that must be kept open by DB2 by limiting the amount of concurrent activity.

**Problem Determination:** Collect the following diagnostic item from Appendix B, “Problem determination,” on page 1349.

---

**00C20101**

**Explanation:** The sharing attribute is inconsistent between the header page of a data set and the DBD. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

**System Action:** A “resource not available” code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** First determine whether the database is shared, and whether it is owned by this system. This can be achieved by issuing a SELECT on the SYSIBM.SYSDATABASE catalog table, where the database name is the database you
are checking, and by examining the ROSHARE column. If the DB2 catalog indicates that it is a ROSHARE OWNER database, the problem can be corrected by the REPAIR utility or the -STOP DATABASE command. The -STOP DATABASE command will reformat the header page and make it consistent with the DBD.

If the database is ROSHARE READ on this system, then check the definition of the database on the owning system. If, on the owning system, the database is no longer defined as ROSHARE OWNER, then the table space or index should be dropped on the system on which the error was detected, since the database has been altered to nonshared by the owning system. However, if the database is defined as ROSHARE OWNER on the owning system, then issue a -STOP DATABASE with the SPACENAM parameter from the owning system, which will make the header page consistent with the owner's DBD, and force this change to DASD, making it available to other systems.

If it is a nonshared database, then the sharing attribute can only be corrected via the REPAIR utility.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

### 00C20102

**Explanation:** A read-only system attempted to access an inconsistent data set. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

**System Action:** A "resource not available" code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to insure there is no exceptional state for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

### 00C20103

**Explanation:** DB2 is unable to access a data set because its system page is inaccessible. This reason code and the data set name are available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

**System Action:** A "resource not available" code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** First determine whether the database is shared, and whether it is:
owned by this system. This can be achieved by issuing a SELECT on the SYSLIBM.SYSDATABASE catalog table, where the database name is the database you are checking, and examining the ROSHARE column.

For a data set in a ROSHARE OWNER database, if the failure occurs on a CREATE TABLESPACE or CREATE INDEX, the timestamp mismatch indicates that the table space or index was previously dropped, but DB2 was unable to delete the data set. In this case, the data set must be deleted using AMS DELETE CLUSTER before the CREATE can take place.

For a data set in a ROSHARE OWNER database at any time other than CREATE TABLESPACE or CREATE INDEX, the inconsistent timestamp can be corrected by first stopping the table space or index via the -STOP DATABASE command with the SPACENAM parameter, and then issuing the -START DATABASE command to start it. The -STOP DATABASE command will reformat the header page using the information retrieved from the DBD.

For a data set in a ROSHARE READ database, a timestamp mismatch indicates that the table space or index has been dropped and re-created on the owning system, and must also be dropped and re-created on this system.

For a data set in a nonshared database, the timestamp value in the header page can only be corrected via the REPAIR utility.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.  

---

**00C20107**

**Explanation:** An update was attempted in a ROSHARE OWNER database, but the data set was opened in RO mode. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECTs: DSNB1SWS DSNB5FOR.

**System Action:** A "resource not available" code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** Issue the -STOP DATABASE command with the SPACENAM parameter to explicitly stop this table space/index space and then issue the -START DATABASE ACCESS(RW) command.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C20108**

**Explanation:** An object in a ROSHARE OWNER database cannot be accessed. At least one system with the database defined as ROSHARE READ is still accessing it. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OST

**System Action:** A "resource not available" code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** Insure that there are no systems on which the database is defined as ROSHARE READ that are still accessing the database. Issue the -STOP DATABASE command with the SPACENAM parameter on the ROSHARE READ systems that are accessing the database.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C20109**

**Explanation:** An object in a ROSHARE READ database cannot be accessed. The system with the database defined as ROSHARE OWNER still has RW access. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OST
System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

* Use the -DISPLAY DATABASE command to insure there are no exceptional states for this table space or index.
* Issue the -STOP DATABASE command with the SPACENAME parameter to stop this table space or index.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1]. This reason code is issued by the following CSECT: DSNB1OST

00C2010A

Explanation: DB2 is attempting to open a shared data set in a ROSHARE READ database, but the system cannot locate the data set. The table space or index might already be dropped from the owning system.

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

User Response: Notify the system programmer.

System Programmer Response: Run IDCAMS LISTCAT to verify the existence of this data set. Verify whether the associated table space or index exists in the database defined as ROSHARE OWNER. If not, issue DROP TABLESPACE or INDEX on all systems in which the database is defined as ROSHARE READ.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1]. This reason code is issued by the following CSECT: DSNB1OST

00C2010B

Explanation: DB2 is attempting to open a shared data set in a database defined as ROSHARE, but the data set cannot be accessed because it is not defined with SHAREOPTIONS(1,3).

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

User Response: Notify the system programmer.

System Programmer Response: Ensure that this data set belongs to a shared database, and check the SHAREOPTIONS using IDCAMS LISTCAT. If so, use AMS ALTER SHAREOPTIONS to alter the data set to SHAREOPTIONS(1,3), and resubmit the failing application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1]. This reason code is issued by the following CSECT: DSNB1OST

00C2010C

Explanation: DB2 was unable to update the high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set. VVDS must be updated to reflect data loaded by a RECOVER, LOAD, or REORG utility job. Message DSNB200I is issued to the console with the VSAM media manager return codes.

This reason code and the data set name are recorded in the cursor table (CT) and made available in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1CST

System Action: A 'resource not available' code is returned to the user. A DSNB200I message is issued to the console. DB2 continues to close the data set.

User Response: Contact the system programmer. Restart or rerun the RECOVER, LOAD, or REORG job after the system programmer corrects the error.

System Programmer Response: Refer to system messages IEC1611 and DB2 message DSNB200A for assistance in determining the cause of the error. Correct the condition, and notify the user to reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1, 10, 11].

00C2010D

Explanation: DB2 was unable to open a required data set because an unexpected level ID was encountered.

The reason code and the data set name are made available in the SQLCA or in messages.

System Action: A 'resource unavailable' code is returned to the user. Message DSNB232I is issued to the console if it was not already issued for the data set. DB2 failed to open the data set.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to message DSNB232I for help in determining the cause of the error. Run the utility REPAIR LEVELID or recover the table space or index, and then tell the user to rerun the application.

Problem Determination: This reason code is issued by the following CSECT: DSNB1OPD
Problem 804

**Explanation:** This is a DB2 internal error. DB2 encountered a problem while trying to add a page to the logical page list (LPL).

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1LPL

---

**Explanation:** This dump provides assistance for diagnosing the page latch time-out problem after 00C20031 is returned as the reason code for ‘resource not available’.

**System Action:** The requesting execution unit is abended to take a diagnostic dump then recovered to return an SQLCODE -904 (resource not available) to the user with the 00C20031 reason code. The resource name is also provided.

**User Response:** Contact the system programmer to determine why the resource is unavailable. Print the SYS1.LOGREC and the SVC dump.

This reason code is issued by the following CSECTs: DSNB1LTX, DSNB1LTS.

---

**Explanation:** DB2 cannot access a table space, index, or partition because the highest formatted page (as recorded by DB2 in the header page) is higher than that derived from the VSAM high-used RBA.

The reason code and the data set name for this error are available in the SQLCA or in messages.

**System Action:** DB2 returns a ‘resource unavailable’ code to the user.

**System Programmer Response:** To enable access to the object, take one of the following actions:

- Restore the object to a consistent state with the RECOVER or REBUILD utility, DSN1COPY, or some other means.
- Replace the data using the LOAD REPLACE utility.
- Allow access to the data in its current state. Use the REPAIR LEVELID utility to reset the high-used page number in the header page to be consistent with the VSAM high-used RBA. This may result in inconsistent data.

**Problem Determination:** Determine the high-formatted page number in the header page by running DSN1PRNT with the FORMAT option, and checking the value of HPDHPREF.

You can also determine the VSAM high-used RBA by running an IDCAMS LISTCAT on the dataset.

---

**Explanation:** An attempt was made to access a DB2 striped data set with a page size of 8K, 16K or 32K that is defined with the 4K Control Interval (CI) size. DB2 does not allow this because partial writes cannot always be detected.

**System Action:** A ‘resource not available’ code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA.

**User Response:** Convert the data set attribute ‘control interval size’ of the associated tablespace from 4K CI into the one matching the page size. DB2 Utilities REORG tablespace, LOAD with REPLACE, and RECOVER can be used to convert the table space.

**System Programmer Response:** Ensure that the data set is defined with the CI size that matches its page size.

**Problem Determination:** Obtain an access method services LISTCAT for the named data set’s attributes.

---

**Explanation:** DB2 was unable to open a required index data set because the index was formatted incorrectly. For example, it may have been formatted as a Type 1 index when the DB2 catalog indicates that it should be Type 2.

The reason code and index data set name are made available in the SQL communication area or in related messages.

**System Action:** A ‘resource unavailable’ code is returned to the user.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use the RECOVER utility to restore the index to a consistent state.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1OPP.

---

**Explanation:** DB2 cannot connect to a group buffer pool. The group buffer pool is not usable by this release of DB2. This DB2 subsystem is a member of a data sharing group containing DB2 members of different release levels. A later release level of DB2 specified an option for this group buffer pool that is not supported by the previous DB2 releases. The presence of this option
makes the group buffer pool inaccessible to the previous DB2 releases.

**System Action:** DB2 takes the following actions:
- Unless already issued, message DSNB301E is sent to the console with this reason code to indicate that a connect failure occurred.
- SQLCODE -904 (resource not available) is returned to the user with this reason code. The resource type and resource name are also returned.

**User Response:** Contact the system programmer.

**System Programmer Response:** Do one of the following:
- Issue the -ALTER GROUPBUFFERPOOL command from a DB2 that is at the later release level to remove the new option so that previous release levels of DB2 can access the group buffer pool.
- Migrate the previous release levels to the current release.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1GC0

---

00C20204

**Explanation:** DB2 is unable to connect to a group buffer pool because MVS detected a problem on the IXLCONN request.

**System Action:** SQLCODE -904 (resource not available) and the group buffer pool name are returned to the user. Unless already issued for the IXLCONN code, message DSNB301E, which contains this reason code and the IXLCONN code, is issued to the console.

**User Response:** Contact the system programmer.

**Problem Determination:** The reason code returned by the IXLCONN request is given in message DSNB301E.

If the connection problem was caused by insufficient storage in a coupling facility, tell the MVS system administrator to alleviate the storage constraint problem by making additional storage available to the involved coupling facility, or by changing the active MVS CFRM administrative policy to redefine the coupling facility structure to a different coupling facility. Another alternative is to have the database administrator reassign those inter-DB2 sharing page sets to a different DB2 buffer pool.

Refer to MVS/ESA Programming: Sysplex Services Reference for the MVS IXLCONN reason code.

This abend reason code is issued by the following CSECT: DSNB1GC1
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]. This reason code is issued by the following CSECT: DSNB1GC1

00C20210

Explanation: An attempt was made to access a page set or partition which is currently in group buffer pool recovery pending (GRECP) status.

System Action: SQLCODE -904 (resource not available) is returned with this reason code. The resource name is also given. GRECP page sets or partitions remain unavailable until recovery against the affected page set or partition is complete.

User Response: Contact the system programmer to determine when the resource will be available for use.

System Programmer Response: Use the START DATABASE command with the ACCESS RW option to recover the page set or partition and remove the GRECP status. In extreme or unusual circumstances, you can also remove GRECP status as follows:

- RECOVER, either to currency, or to a prior point in time
- REPAIR SET with NORCVRPEND
- LOAD REPLACE
- START DATABASE with ACCESS FORCE (Not recommended. Specifying this option can result in inconsistent data.)

Problem Determination: This reason code is issued by the following CSECT: DSNB1OPP

00C20211

Explanation: DB2 is unable to access a group buffer pool because the group buffer pool is rebuilding, and the attempt to access the group buffer pool timed out waiting for the rebuild to complete.

System Action: ‘Resource not available’ return and reason codes are sent back to the requesting function.

User Response: Resubmit the request.

System Programmer Response: Use the DB2 DISPLAY GROUPBUFFERPOOL command or the MVS D XCF,STR command to monitor the status of the rebuild. Also, monitor the status messages that the DB2 members issue as the rebuild progresses (refer to messages DSNB331I, DSNB332I, and DSNB338I). If the rebuild is not progressing satisfactorily, you can use the MVS command SETXCF,STOP,REBUILD to stop the rebuild.
**00C20220**

**Explanation:** While DB2 was accessing a group buffer pool, MVS detected an environmental error during an IXLCACHE request from DB2.

**System Action:** The requesting execution unit abends.

**Problem Determination:** The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to MVS/ESA Programming: Sysplex Services Reference for the MVS IXLCACHE reason code.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB5BPL  DSNB5GGP  DSNB5PCO  DSNB5SCM  DSNB5SCO

---

**00C20221**

**Explanation:** While accessing a group buffer pool, DB2 received an unexpected error from MVS, which detected an invalid parameter on an IXLCACHE request from DB2. This code usually indicates a DB2 internal problem. However, the problem can result from errors in other products.

**System Action:** The requesting execution unit abends.

**Problem Determination:** The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to MVS/ESA Programming: Sysplex Services Reference for the MVS IXLCACHE reason code.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB5BPL  DSNB5GGP  DSNB5PCO  DSNB5SCM  DSNB5SCO

---

**00C20222**

**Explanation:** While accessing a page in a buffer pool, DB2 received an unexpected error from MVS, which detected an invalid parameter on an IXLVECTR request from DB2. This code usually indicates a DB2 internal problem. However, the problem can result from errors in other products.

**System Action:** The requesting execution unit abends.

**Problem Determination:** See the IXLVECTR return code in register 8 to help determine the cause of the error. Refer to MVS/ESA Programming: Sysplex Services Reference for the MVS IXLVECTR reason code.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB1LTS  DSNB1LTX  DSNB1RSS

---

**00C20223**

**Explanation:** DB2 encountered an error while invoking the IXLCACHE macro.

**System Action:** The requesting execution unit abends. DB2 terminates abnormally causing MVS to reset the castout locks.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5PCO

---

**00C20224**

**Explanation:** DB2 received an unexpected return and reason code from the MVS IXLFCOMP macro for a group buffer pool.

**System Action:** DB2 abends the agent and requests a dump. If the group buffer pool is in duplex mode, then DB2 may stop duplexing for the group buffer pool in response to this error.

**System Programmer Response:** If the group buffer pool was duplexed and is entered back into simplex mode as a result of this error, and duplexing is not automatically reestablished, then use the MVS SETXCF command to enter the group buffer pool back into duplex mode if duplexing is desired. If DUXPLEX(ENABLED) is specified in the active CFM policy for the group buffer pool, then the system attempts to automatically reestablish duplexing for the structure.

**Problem Determination:** See MVS/ESA Programming: Sysplex Services Reference for an explanation of the MVS IXLRBLD reason code.

Refer to Section 3 of Diagnosis Guide and Reference for more information on identifying and reporting the problem.
00C20230

Explanation: DB2 could not establish duplexing for a group buffer pool because a coupling facility with CFLEVEL = 5 functionality was not available in which to allocate the secondary group buffer pool.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: Upgrade the coupling facilities to CFLEVEL = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVEL = 5 functionality.

00C20231

Explanation: DB2 could not establish duplexing for a group buffer pool because the primary structure instance of that group buffer pool is allocated in a coupling facility that does not have CFLEVEL = 5 functionality.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: Upgrade the coupling facilities to CFLEVEL = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVEL = 5 functionality.

00C20232

Explanation: DB2 could not establish duplexing for a group buffer pool because the group buffer pool is defined with GBPCACHE(NO). DB2 does not allow GBPCACHE(NO) group buffer pools to be duplexed.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB741I is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: If duplexing is desired for the group buffer pool, issue the DB2 ALTER GROUPBUFFERPOOL command to specify GBPCACHE(YES) before trying to initiate duplexing.

00C20233

Explanation: DB2 detected a version id mismatch for the secondary group buffer pool when connecting to a duplexing group buffer pool. The version id mismatch indicates that the process to establish duplexing completed prematurely (for example due to a system failure), and thus the secondary group buffer pool in not in sync with the primary.

System Action: DB2 stops duplexing for the group buffer pool. The group buffer pool is entered back into simplex mode. Message DSNB743I is issued indicating the reason code as the reason why the process to establish duplexing was stopped. If DUPLEX(AUTO) is specified for the group buffer pool in the active CFRM policy, then duplexing is automatically reinitiated.

System Programmer Response: If duplexing is desired for the group buffer pool and duplexing is not automatically reinitiated, then use the MVS SETXCF command to initiate duplexing for the group buffer pool.

00C20251

Explanation: DB2 is unable to obtain a physical lock (P-lock) because of an out-of-storage condition detected by IRLM.

System Action: SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Operator Response: Notify the system programmer.

System Programmer Response: IRLM exhausted the amount of virtual storage available to it to represent locks. Refer to code 00C90092 for methods to reduce the storage needed by IRLM.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20252

Explanation: DB2 is unable to obtain a physical lock (P-lock). Another DB2 holds the P-lock in an incompatible state, but is unable to downgrade because it does not have access to the corresponding group buffer pool.

System Action: SQLCODE -904 (resource not available) is returned to the user. The other DB2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries, and/or an SVC dump. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20254

Explanation: DB2 is unable to acquire or upgrade a physical lock (P-lock) because of an incompatible retained lock held by one or more other DB2 subsystems in the DB2 data sharing group. Retained locks are locks that persist across DB2 abnormal terminations.

System Action: SQLCODE -904 is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.
**System Programmer Response:** Use the -DISPLAY DATABASE command to display the DB2 member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition. To show the status of the DBMS and IRLM subsystems, you can use the following command:

F irmlproc,STATUS,ALLD

---

**00C20255**

**Explanation:** DB2 is unable to obtain a physical lock (P-lock). This is a DB2 internal error.

**System Action:** SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other DB2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries and/or an SVC dump.

**Problem Determination:** Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1PER

---

**00C20256**

**Explanation:** DB2 is unable to obtain a physical lock (P-lock). This is a DB2 internal error.

**System Action:** SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other DB2 produces SYS1.LOGREC entries, and, depending on the type of abend, might also produce an SVC dump.

**Problem Determination:** Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1PER

---

**00C20257**

**Explanation:** DB2 is unable to obtain a physical lock (P-lock) because of an 'out of record list storage' condition that IRLM detected. The record list is that part of the coupling facility lock structure that IRLM uses to record 'modify locks' (those locks that would be retained in case of a failure).

**System Action:** SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

**System Programmer Response:** Allocate a larger coupling facility lock structure by using the MVS SETXCF,REBUILD command. Make sure that the active MVS CFRM policy specifies a larger structure size for the IRLM coupling facility lock structure before you initiate the rebuild. You can use the MVS SETXCF,STOP,POLICY and SETXCF,START,POLICY commands to change the active MVS CFRM policy. If lock size is not already at the current POLICY maximum size, you can increase lock size with the SETXCF START,ALTER,STRNAME=lock_structure,SIZE=new_size command.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1SCR

---

**00C20258**

**Explanation:** DB2 is not able to obtain a physical lock (P-lock) until a peer member restarts. Another DB2 holds the P-lock in an incompatible state but cannot downgrade until it completes its restart.

**System Action:** SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are made available to the user in the SQLCA.

**User Response:** Resubmit the failing application. The P-lock becomes available after the peer member completes its restart processing.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1PER

---

**00C20259**

**Explanation:** This is a DB2 internal error. This reason code and the group buffer pool name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

**System Action:** A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB1SCR

---

**00C2025A**

**Explanation:** DB2 encountered an unexpected error from IRLM while trying to acquire a global lock for MBA (multiple buffer pool) object.

**System Action:** The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested. Collect messages DSN376I, DSN500I, and DSN501I for further diagnosis.
00C2025B • 00C20264

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1BSD, DSNB1GIO, DSNB1PM2, DSNB1PMT

---

**00C2025B**

**Explanation:** DB2 encountered an unexpected error while trying to read from the shared communications area (SCA) for MBA (multiple buffer pool) object.

**System Action:** The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1BSD, DSNB1GIO, DSNB1PM2

---

**00C2025C**

**Explanation:** DB2 encountered an unexpected error while trying to write to the shared communications area (SCA) for MBA (multiple buffer pool) object.

**System Action:** The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1BSD

---

**00C20260**

**Explanation:** This is a DB2 internal error. Castout was unsuccessful because DB2 lost connectivity to the group buffer pool.

**System Action:** A 'resource not available' code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** Establish this DB2’s connectivity to the group buffer pool before allowing operations that reference this group buffer pool.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1PM2

---

**00C20261**

**Explanation:** This is a DB2 internal error. Castout was unsuccessful due to a group buffer pool structure failure.

**System Action:** A 'resource not available' code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** Establish this DB2’s connectivity to the group buffer pool before allowing operations that reference this group buffer pool.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB5PCO

---

**00C20262**

**Explanation:** This is a DB2 internal error. Castout was unsuccessful due to errors in writing a page to DASD.

**System Action:** A 'resource not available' code is returned to the user.

**User Response:** Notify the system programmer.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB5PCO

---

**00C20263**

**Explanation:** This is a DB2 internal error. Castout was unsuccessful due to an unexpected error.

**System Action:** A 'resource not available' code is returned to the user. An SVC dump and the SYS1.LOGREC recording were requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECT: DSNB5PCO

---

**00C20264**

**Explanation:** DB2 is unable to acquire or upgrade a physical lock (P-lock) because at least one other DB2 subsystem in the data sharing group is holding an incompatible retained lock. The amount of time this DB2 can wait for a locked resource was exceeded. This reason code is only issued if the RETLWAIT installation parameter in DSN6SPRM is set to 'YES'. If RETLWAIT is set to 'NO' (this is the default), then any IRLM lock...
that conflicts with a retained lock will not wait, but
instead will be immediately rejected (see reason code
00C20254).

**System Action:** An SQLCODE -904, -911, -913 or
-923 is issued, and message DSN51 is issued. Also,
message DSNT378I is issued.

**System Programmer Response:** Refer to the
'System Programmer Response' in message DSNT378I.

**Problem Determination:** This reason code is issued
by the following CSECT: DSNB1PER

---

**00C20267**

**Explanation:** DB2 is unable to recover GRECP status
for a table space or index because one or more sharing
group members could not perform a global drain
request on the object.

**System Action:** A DB2 message of DSNB350 or
DSNB351 is issued.

**User Response:** Issue a START DB command to
explicitly recover the page set from GRECP/LPL status.

**System Programmer Response:** Refer to the
'System Programmer Response' in message DSNB350
or DSNB351.

---

**00C20268**

**Explanation:** DB2 is unable to recover GRECP status
for a table space or index because one or more sharing
group members could not perform a global drain
request on the object. One or more peer DB2s in the
group failed to drain the object because some error
occurred.

**System Action:** A DB2 message of DSNB350 or
DSNB351 is issued.

**User Response:** Issue a START DB command to
explicitly recover the page set from GRECP/LPL status.

**System Programmer Response:** Refer to the
'System Programmer Response' in message DSNB350
or DSNB351.

---

**00C202A1**

**Explanation:** DB2 encountered an unexpected error
while trying to read from or write to the shared
communications area (SCA).

**System Action:** The requesting execution unit
abends. A SYS1.LOGREC entry is written and an SVC
dump is requested.

**Problem Determination:** Refer to Part 2 of [DB2
Diagnosis Guide and Reference](https://www.ibm.com) for information on
identifying and reporting the problem.

This abend reason code is issued by the following
CSECT: DSNB1GBS

---

**00C202A2**

**Explanation:** MVS returned an unexpected error from
an IXLDISC request to disconnect a group buffer pool.

**System Action:** The requesting execution unit
abends. A SYS1.LOGREC entry is written and an SVC
dump is requested. The IXLDISC reason code is saved in
register 8 for SYS1.LOGREC recording and the SVC
dump.

**System Programmer Response:** Refer to MVS/ESA
Programming: Sysplex Services Reference for the MVS
IXLDISC reason code.

**Problem Determination:** If you suspect an error in
DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting
the problem.

This abend reason code is issued by the following
CSECT: DSNB1GD1

---

**00C202A3**

**Explanation:** MVS returned an unexpected error from
an IXLFORCE request to deallocate a group buffer pool.

**System Action:** A SYS1.LOGREC entry is written and
an SVC dump is requested. The IXLFORCE reason code
is saved in register 8 for SYS1.LOGREC recording and the SVC
dump.

**System Programmer Response:** Refer to MVS/ESA
Programming: Sysplex Services Reference for the MVS
IXLFORCE reason code.

**Problem Determination:** If you suspect an error in
DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting
the problem.

This abend reason code is issued by the following
CSECT: DSNB1GD1

---

**00C202A4**

**Explanation:** MVS detected an error on an IXLCONN
request from DB2.

**System Action:** A SYS1.LOGREC entry is written and
an SVC dump is requested. Unless already issued,
message DSNB301E, which contains this reason code,
is issued to the console. The IXLCONN reason code is
saved in register 8 for SYS1.LOGREC recording and the SVC
dump. This reason code and the group buffer
pool name are returned to the user in the SQLCA.

**System Programmer Response:** Refer to MVS/ESA
Programming: Sysplex Services Reference for the MVS
IXLCONN reason code.

**Problem Determination:** If you suspect an error in
DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting
the problem.
This abend reason code is issued by the following CSECT: DSNB1GC1

---

**00C202A5**

**Explanation:** The cache coupling facility structure attributes passed back by MVS on an IXLCONN request were incorrect.

**System Action:** A SYS1.LOGREC entry is written. The newly-connected group buffer pool is disconnected. If this is a non-rebuild connect then message DSNB301E, which contains this reason code, is issued to the console (unless it has already been issued). In the message this reason code and the group buffer pool name are returned to the user in the SQLCA. If this is a rebuild connect, then message DSNB330E, which contains this reason code, is issued to the console and this reason code is used to stop the rebuild.

**Problem Determination:** Check the SYS1.LOGREC variable recording area (VRA) for the following information:

- **VRARRK30 - Error mask, set as follows:**
  - If bit X'40' is set, DB2 specified a structure disposition of KEEP, but the structure was not allocated this way.
  - If bit X'20' is set, the data element size was not allocated as DB2 requested. VRARRK31 contains the requested data element size, and VRARRK32 contains the allocated data element size.
  - If bit X'10' is set, the allocated vector was not long enough to cover the corresponding buffer pool. VRARRK31 contains the requested vector length, and VRARRK32 contains the allocated vector length.

This abend reason code is issued by the following CSECT: DSNB1GC1

---

**00C202A6**

**Explanation:** This is a DB2 internal error. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

**System Action:** A SYS1.LOGREC entry is written and an SVC dump is requested. The newly-connected group buffer pool is disconnected. This reason code and the group buffer pool name are returned to the user in the SQLCA.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1GC1

---

**00C202A7**

**Explanation:** While processing an ALTER GROUPBUFFERPOOL command request, DB2 encountered an unexpected return code from the MVS IXCQUERY service.

**System Action:** The requesting execution unit abends. A SYS1.LOGREC entry is written. An SVC dump is requested if it appears to be a DB2 problem (return code 8 from IXCQUERY). Command processing is terminated.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1AGB

---

**00C202AA**

**Explanation:** An error occurred in IRLM on a physical lock (P-lock) or change request from DB2. This a DB2 internal error.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested. SQLCODE -904 is issued. This reason code and the resource name are returned in the SQLCA.

**System Programmer Response:** Examine SYS1.LOGREC for a previous error related to IRLM.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPFLG1 (1 byte)
- Flags from RLPFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHESTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLPWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PER

00C202AB

Explanation: The IRLM UNLOCK request returned an error code when DB2 attempted to release a physical lock (P-lock). This is a DB2 internal error.

System Action: The requesting execution unit abends. The SVC dump and SYS1.LOGREC recording are requested.

User Response: Resubmit the failing application.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:
• IRLM return code (4 bytes)
• IRLM reason code (4 bytes)
• IRLM function code (1 byte)
• Lock state (1 byte)
• Flags from RLPFLFLG1 (1 byte)
• Flags from RLPFLFLG4 (1 byte)
• Returned cached state (1 byte)
• Unused (1 byte)
• P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRLPL) and is mapped as follows:
• RLPSTAT (1 byte): Current held state of the P-lock by this DB2
• RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLRPRST (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
• Unused (1 byte)
• RLPWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PER

00C202AC

Explanation: There was an error during physical lock (P-lock) negotiation. This is a DB2 internal error.

System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPPL (mapped by DXRRLPL) and is mapped as follows:
• RLPSTAT (1 byte): Current held state of the P-lock by this DB2
• RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLRPRST (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
• Unused (1 byte)
• RLPWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202AD

Explanation: DB2 could not start even one castout process. A probable cause is that no virtual storage is available to acquire private buffers for the castout process.

System Action: The requesting execution unit abends and DB2 terminates abnormally.

System Programmer Response: Restart DB2 after increasing the REGION parameter value on the ssnmDBM1 startup procedure to get more virtual storage.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB5PCO

00C202AE

Explanation: IRLM returned an invalid cached state on a physical lock (P-lock) request from DB2. This is an internal error.

System Action: SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested.
System Programmer Response: Examine SYS1.LOGREC for a preceding error related to IRLM.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:
• IRLM return code (4 bytes)
• IRLM reason code (4 bytes)
• IRLM function code (1 byte)
• Lock state (1 byte)
• Flags from RLPLFLG1 (1 byte)
• Flags from RLPLFLG4 (1 byte)
• Returned cached state (1 byte)
• Unused (1 byte)
• P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPLPPL (mapped by DXRRLPPL) and is mapped as follows:
• RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
• RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
• Unused (1 byte)
• RLWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202B0
Explanation: This is a DB2 internal error.
System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the physical lock (P-lock) requester that caused the conflict and the subsequent negotiation.
User Response: Resubmit the failing application.
System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPLPPL (mapped by DXRRLPPL) and is mapped as follows:
• RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
• RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
• Unused (1 byte)
• RLWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202AF
Explanation: There was an incompatible physical lock (P-lock) held. This is a DB2 internal error.
System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.
System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPLPPL (mapped by DXRRLPPL) and is mapped as follows:
• RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
• RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
• RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
• Unused (1 byte)
• RLWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202B1
Explanation: An error occurred during physical (P-lock) negotiation. This is a DB2 internal error.
System Action: An SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested. This reason code and the resource name are returned in the SQA C.
System Programmer Response: Examine
SYS1.LOGREC for a previous error related to IRLM.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:
- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRLPPL) and is mapped as follows:
- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCRSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTST (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPHUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PER

---

**00C202B2**

**Explanation:** DB2 could not obtain a page set or partition physical lock (P-lock).

**System Action:** A 'resource unavailable’ condition is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

**System Programmer Response:** This problem might be caused by having multiple DB2 release levels in the DB2 data sharing group.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1PPP, DSNB1PG.

---

**00C202B3**

**Explanation:** This is a DB2 internal error. The execution unit encountered an error while doing damage assessment for a group buffer pool.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNB1DAO

---

**00C202B4**

**Explanation:** This is a DB2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNB1CPX, DSNB1GC0, DSNB1GC1

---

**00C202B5**

**Explanation:** This is a DB2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNB1GC0, DSNB1GC1

---

**00C202B6**

**Explanation:** This is a DB2 internal error. The execution unit received an error return code while trying to translate the DB2 member name to a member ID.

**System Action:** The requesting execution unit is abended.
Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1DA2

00C202B7

Explanation: This is a DB2 internal error. An unexpected error occurred during recovery processing from a group buffer pool link failure.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB1LNK

00C202C2

Explanation: DB2 received an unexpected return and reason code from the MVS IXLREBLD macro during rebuild processing for a group buffer pool.

System Action: The DB2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I will be issued indicating that the IXLREBLD request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: See MVS/ESA Programming: Sysplex Services Reference for an explanation of the MVS IXLREBLD reason code.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202C3

Explanation: DB2 received an unexpected return and reason code from the MVS IXLEERSP macro during rebuild processing for a group buffer pool.

System Action: The DB2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I is issued indicating that the IXLEERSP request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: See MVS/ESA Programming: Sysplex Services Reference for an explanation of the MVS IXLEERSP reason code.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202C4

Explanation: DB2 detected that the number of changed pages in the new structure is greater than the number of changed pages in the original structure at the time that the rebuild of the group buffer pool was about to be completed.

System Action: DB2 abends and takes a dump. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
This abend reason code is issued by the following CSECT: DSNB1xxx

00C202D0

Explanation: DB2 is unable to respond to an event that was reported by MVS. This is a DB2 internal error.

System Action: DB2 terminates abnormally.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5REE

00C202D1

Explanation: This is a DB2 internal error. DB2 encountered an unrecoverable error while trying to add a page to the logical page list (LPL).

System Action: The DB2 subsystem is abnormally terminated.

Operator Response: Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1LPL

00C20300

Explanation: This is a DB2 internal error. The execution unit attempted to access, claim, or drain a page set or partition, but the page set was not logically opened.

This reason code is issued by the following CSECTs: DSNB1CLM DSNIOPNP DSNISGSC DSNITFFS DSNIWPSC DSNUQUIA

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00C20301

Explanation: This is a DB2 internal error. The execution unit attempted to access, claim, or drain a logical partition, but the page set is not a type 2 nonpartitioned page set.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs: DSNB1LCM DSNB1LDN DSNB1CPP DSNBWFOR DSNBLCLM DSNBDRN DSNBDDRN

00C20302

Explanation: This is a DB2 internal error. A page set was not logically opened by the execution unit that was attempting to do one of the following:

• Logical close a page set
• Physical close a page set or partition

This reason code is issued by the following CSECT: DSNB1DDN

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00C20303

Explanation: This is a DB2 internal error. A page set is not in-use, but an execution unit was attempting to do one of the following:

• Logical close a page set
• Physical close a page set or partition

This reason code is issued by the following CSECT: DSNB1CPS

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
**00C20304**

**Explanation:** This is a DB2 internal error. During force write processing, the buffer manager detected that the write claim class count is not zero or there are pending updates on the page set or partition.

This reason code is issued by the following CSECT: DSNB1WFO

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00C20305**

**Explanation:** This is a DB2 internal error. The execution unit attempted to access, claim, drain, open, or close a partition or piece, but the partition or piece number is invalid.

This reason code is issued by the following CSECTs: DSNB1ABP, DSNB1CLM, DSNB1CPP, DSNB1DCM, DSNB1DDN, DSNB1DRA, DSNB1GET, DSNB1SWS, DSNICLDR, DSNICLOS, DSNICLTO, DSNICMTC, DSNICMT2, DSNIDLALC, DSNIERST, DSNIWPS, DSNIOPNP, DSNIRCLS, DSNISGSC, DSNITFFS, DSNPXTN0, DSNUQUIA, DSNXISB2

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00C20306**

**Explanation:** This is a DB2 internal error.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs: DSNB1GET, DSNB1LTS, DSNB1LTX, DSNB1SWS
Chapter 34. X’C3......’ codes

For information about the CICS transaction abend/dump code DSNC, refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347.

00C30001

Explanation: The CICS attachment facility terminated because of errors that cannot be corrected. The attachment facility task-related user exit detected one of the following conditions:

- The life of task block (LOT) is invalid.
- The LOT and connection control table (CCT) element were disconnected before the end of a unit of recovery
- The previous application program support (APS) call failed and a commit call is being attempted

These symptoms might be caused by an overlay of the LOT and/or the CCT.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the dumps and system console messages for storage violations.

Problem Determination: One or more control blocks do not pass validity checks. The most probable cause is that they were overlaid by some user application. A CICS dump (DSNC) and a subtask dump (system abend X’04E’ with abend reason code 00C30001) were requested. Register 9 in the CICS transaction dump contains the address of the LOT.

If the LOT is valid, CLOTCCTE contains the CCT element address, and CCCTLOT contains the LOT address. Use these pointers (CLOTCCTE and CCCTLOT) to verify the validity of the LOT and the CCT element. Both control blocks should contain seven character eye catchers (DSNCLOT and DSNCCCT or DSN2LOT and DSN2CCT). If they are in error, check the application program for possible storage violations.

00C30002

Explanation: The CICS attachment facility was not able to start.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: A subtask dump (system abend X’04E’ with abend reason code 00C30002) is requested unless FRBRC2 equals 00F30013 or 00F30058. Within the dump, register 7 contains the address of the resource control table load module. In this load module, location CRCTCCTA contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block for the IDENTIFY to DB2. The FRB control block begins at CCCTFRB within the CCT. You can also locate the FRB with the CCT control block by scanning the CCT for the FRB character string eye catcher. The FRB contains two fields, FRBRC1 and FRBRC2, which contain the return code and reason code from the IDENTIFY to the DB2 subsystem.

00C30003

Explanation: The CICS attachment facility could not complete a recover indoubt call because of the return and reason codes from DB2.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates. The unit of recovery (UR) is not resolved and remains indoubt.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the recover indoubt process does not allow the CICS attachment facility to complete the unit of recovery (UR). If the UR included in the error is valid, an attempt should be made to resolve the UR manually, using the DB2 -RECOVER command.

A subtask dump (system abend X’04E’ with abend reason code 00C30003) is requested. Register 7 contains the address of the resource control table. Location CRCTCCTA in load module DSNCRCTx or DSN2CTxx contains the address of the connection control table (CCT) in subpool 99.

The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates problems specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Examine the MVS console for DB2 messages that might indicate any related errors. If an SVC dump was also taken, print it as well as the SYS1.LOGREC to obtain further diagnostic information. The CICS SYSTEM LOG
might help to determine the final disposition of the indoubt unit of work.

Register 6 in the subtask abend dump plus X'20' contains the address of a 16-byte area that contains the network id (NID). The last 8 bytes of the NID contain the store clock value that was passed to DB2 by CICS to identify the logical unit of work (LUW). This value can be used to correlate the DB2 unit of recovery with the CICS logical unit of work.

00C30004

Explanation: A thread subtask failed because of a validity check failure of a transaction-related life of task block (LOT).

This abend reason code is issued by the following CSECTs: DSNCTEXT3 DSN2EXT3

System Action: The CICS attachment facility continues operation; however, the one subtask is abended and a subtask dump (system abend X'04E' with abend reason code 00C30004) is requested.

Because the LOT contains an ECB on which the CICS application is waiting and this error indicates the LOT was overlaid, the effect on the CICS application is unpredictable.

Operator Response: Notify the system programmer.

Problem Determination: The most probable cause is that the LOT was overlaid by some user application. In the subtask abend dump, register 7 contains the address of the resource control table (RCT).

CRCTCCTA in the RCT contains the address of the CCT, and CCCTLN in the CCT contains its length. Register 9 contains the CCT element that was assigned to the application in error.

This CCT element address can be validated by ensuring that it lies within the CCT. If the CCT address is valid, CCCTLOT contains the address of the LOT in error. To determine the source of the error, analyze the subtask dump and check the CICS master terminal for any storage violation messages.

00C30005

Explanation: The CICS attachment facility could not complete a commit or abort call for a transaction because of return codes from the application program support call.

This abend reason code is issued by the following CSECTs: DSNCTEXT3 DSN2EXT3

System Action: The CICS attachment facility continues operation, but the one subtask abends with a subtask dump (system abend X'04E' with abend reason code 00C30005). The CICS transaction that is associated with the abend is also abended with a CICS transaction dump

Operator Response: Notify the system programmer.

Problem Determination: The return code from the commit or abort does not allow the CICS attachment facility to complete the transaction’s unit of recovery. Register 7 in the subtask dump contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module contains the address of the connection control table (CCT) in subpool 99. CCCTSUB in the CCT contains the address of the subtask work area (CSUB or C2UB).

The subtask work area contains the FRB control block, which you can locate by scanning DSNCSUB or DSN2SUB for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Refer to the reason code in Part 4, “Section 4. DB2 Codes.” on page 771 and prepare a search argument, using the reason code as the appropriate keyword. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it and the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00C30006

Explanation: The CICS attachment facility failed because of return codes from the MVS ATTACH macro while attempting to start a thread subtask.

This abend reason code is issued by the following CSECTs: DSNCSMUSB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: A subtask dump (system abend X'04E' with abend reason code 00C30006) is requested. To determine why the ATTACH failed, use the MVS dump, MVS system trace, SYS1.LOGREC, and MVS console listing. Refer to the appropriate MVS publication to interpret the meaning of return codes from the MVS ATTACH macro.

00C30007

Explanation: The start of the CICS attachment facility failed because of return codes while attempting to establish a shutdown listen exit with DB2.

This abend reason code is issued by the following CSECTs: DSNCSMUSB DSN2MSUB
System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the establish exit process does not allow the CICS attachment facility to start. A subtask dump (system abend X'04E' with abend reason code 00C30007) is requested. Register 7 contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module (DSNCRCTx or DSN2CTxx) contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Refer to the reason code in Part 4, “Section 4. DB2 Codes,” on page 771. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it as well as the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00C30008

Explanation: The start of the CICS attachment facility failed while attempting to establish an ESTAE recovery exit, because of reasons indicated by the return codes.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: An X'04E' abend subtask dump is taken, and the CICS attachment facility remains partially initialized.

Operator Response: Notify the system programmer, and issue the DSNC STOP FORCE command.

Problem Determination: The return code from the ESTAE macro does not allow the CICS attachment facility to start. A subtask dump (system abend X'04E' with abend reason code 00C30008) is requested. To determine why the ESTAE failed, use the MVS dump, MVS system trace, SYS1.LOGREC, and MVS console listing. The MVS trace contains the return code from the ESTAE macro. Refer to the appropriate MVS publication for the meaning of return codes from the MVS ESTAE macro.

00C30009

Explanation: The CICS attachment facility failed because of the return code and reason code from DB2 for the SHOW INDOUBT units of recovery process.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates, and a subtask dump is requested.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the SHOW INDOUBT process does not allow the CICS attachment facility to continue. A subtask dump (system abend X'04E' with abend reason code 00C30009) is requested. Register 7 contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module (DSNCRCTx or DSN2CTxx) contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity. Analyze the subtask dump.

Refer to the reason code in Part 4, “Section 4. DB2 Codes,” on page 771. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it and the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00C30010

Explanation: An IDENTIFY call to DB2 from a CICS attachment facility connection subtask failed, indicating that DB2 is no longer active.

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

System Action: A subtask dump is requested for the failing task thread, and the automatic STOP of the CICS attachment facility is initiated.

Operator Response: Notify the system programmer.

Problem Determination: Some other error, which is the source of the failure, probably occurred prior to this action. Use the subtask dump, SYS1.LOGREC, MVS console listing, and any SVC dumps that might have been requested if DB2 failed.
**00C30011**

**Explanation:** The CICS attachment facility detected that a resource control table (RCT) entry was corrupted or overlaid since the CICS attachment facility was last started.

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

**System Action:** The CICS attachment facility abends CICS task with a CICS transaction abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Stop and then restart the CICS attachment facility to refresh the RCT.

**Problem Determination:** Analyze the CICS dumps to determine which CICS trans-id and corresponding RCT entries were affected. The CICS transaction dump contains the RCT storage at the time of the failure. Location CRCTAUWD in the affected RCT entry was altered since the CICS attachment facility was last started. This might be caused by an application program modifying storage it does not own (a CICS storage violation).

**00C30020**

**Explanation:** A previous error occurred during create thread processing which put the transaction in a must-abort state. The only request allowed in this state is a SYNCPOINT ROLLBACK.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2EXT1

**System Action:** The transaction is placed in a must-abort state and remains in that state until the transaction terminates or issues a SYNCPOINT ROLLBACK. Any SQL statement issued by a transaction while in a must-abort state receive an SQLCODE -906. SYNCPOINT requests without the ROLLBACK option cause an ASP7 abend.

**User Response:** If the create thread error was anticipated, and the transaction can correct the situation that caused the create thread error, the transaction might issue a SYNCPOINT ROLLBACK and continue processing.

**System Programmer Response:** If it is undesirable for a transactions to continue after create thread errors, reassemble the resource control table (RCT) and change the PCTEROP parameter to AEY9, or remove it completely and take the default.

**Problem Determination:** Unless PCTEROP=N906, this error reason code is preceded by a DSNC transaction dump, which provides diagnostic information about the create thread failure. The SQLCA also contains the SQL return code identifying the create thread error.

**00C30021**

**Explanation:** The CICS attachment facility detected an application which is using the instrumentation facility interface (IFI) and is link-edited with a back level version of the CICS attachment facility language interface module DSNCLI.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2EXT1

**System Action:** The transaction is abended with a DSNC abend. The life of task block (LOT) contains reason code 00C30021.

**User Response:** Relink-edit the application with the appropriate version of the CICS attachment facility language interface module DSNCLI which corresponds to the current CICS attachment facility maintenance level.

**System Programmer Response:** Ensure the appropriate level of the CICS attachment facility language interface module DSNCLI is available to all users. Discard any back level version of DSNCLI.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** If the problem continues to occur after link-editing the application again with the proper level of the CICS attachment facility language interface module, validate that the correct DSNCLI is being used.

The eye catcher in DSNCLI should have the proper maintenance level identified. Look at the DSNCLI, which is actually link-edited with the application to ensure the proper level.

**00C30100**

**Explanation:** An application attempted to issue an SQL request when the CICS attachment was not operational. This reason code results when the attachment is in STANDBY mode and the RCT STANDBY option is “SQLCODE”.

**System Action:** The SQL request is not executed.

**User Response:** Wait until the CICS attachment facility is started. Then resubmit the transactions that failed.

**Operator Response:** Restart the CICS attachment facility after ensuring that DB2 is active.

**System Programmer Response:** Collect any dumps produced by the CICS attachment facility or DB2, the MVS system console log, and any record of -STOP DB2 commands that might have been issued. Determine if the termination of the CICS attachment facility was the result of a DB2 stop command or abnormal termination of DB2.
**Problem Determination:** The CICS attachment facility was in standby mode. This occurs if DB2 stops and the RCT STANDBY option is "SQLCODE". Locate all the CICS attachment facility dumps and all DB2 termination dumps. Follow the problem determination procedures documented for the error conditions that caused the dumps to be produced.

---

**00C30200**

**Explanation:** An application attempted to issue an SQL request but no thread resource was available for that request. This reason code results when the CICS-DB2 attachment DB2ENTRY definition for the transaction is disabled.

**System Action:** The SQL request is not executed.

**User Response:** Retry the transaction after the DB2ENTRY has been reenabled.

**System Programmer Response:** Enable the transaction’s DB2ENTRY or set the DISABLEDACT to POOL to allow transactions in that entry to run.

---

**00C30805**

**Explanation:** The caller’s connection with DB2 terminated because the CICS attachment facility is terminating in stop force mode. This reason code indicates that the CICS attachment facility is terminating because stop force was initiated. Stop force was probably initiated by the DSNC STOP FORCE command, the STOP DB2 MODE(FORCE) command, DB2 abnormally terminating, or the CICS attachment facility abnormally terminating. If a command was not used to cause stop force processing, abnormal termination dumps are produced by either DB2 if it is abnormally terminating, or by the CICS attachment facility if it is abnormally terminating.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2CEXT1

**System Action:** All current requests are returned with an indication that the CICS attachment facility is terminating.

**User Response:** Wait until the CICS attachment facility is restarted; then resubmit the transactions that failed.

**Operator Response:** Restart the CICS attachment facility after ensuring that DB2 is active.

**System Programmer Response:** Collect any dumps produced by the CICS attachment facility or DB2, the MVS system console log, and any record of DSNC STOP commands that might have been issued. Determine if the termination of the CICS attachment facility was the result of a STOP command or abend.

**Problem Determination:** The CICS attachment facility was forced into termination. This occurs if the DSNC STOP FORCE command is issued, if the CICS attachment facility detected an unexpected condition, if the DB2 STOP MODE(FORCE) command was issued, or if DB2 abnormally terminated. If the stop command with the force option was not issued, locate all the CICS attachment facility abnormal termination dumps and all DB2 abnormal termination dumps. Follow the problem determination procedures documented for the error conditions that caused the dumps to be produced.
Chapter 35. X’C5......’ codes

For these codes, the standard documentation to be collected is a SYSUDUMP and a printout of the DSNTRACE data set. The standard SPUFI documentation is a SYSUDUMP and a printout of the ISPF log for this session. A SYSUDUMP data set must be allocated in advance to collect your dump. A DSNTRACE data set must be allocated in advance to collect your DSN trace stream unless you are running in the background, in which case the SYSTSPRT data set contains the DSNTRACE output. ISPF normally runs with an active log data set. ISPF suppresses dumps unless it is invoked with the TEST parameter. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

In the TSO attachment facility, the user can control whether or not message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

The following abends can occur in the TSO attachment facility.

00C50001
Explanation: This is probably a DB2 subsystem error. DSNESM30 has detected an illegal value in the YTYPE portion of the SQLTYPE field of the SQLDA.

This abend reason code is issued by the following CSECT: DSNESM30

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35. “X’C5......’ codes” for information about obtaining dumps and displaying message IDs.

Problem Determination: An illegal value was detected in the YTYPE of the SQLDA. This may have been caused by this field being overlaid in error. Analyze the SQLDA in the storage dump to determine the source of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [4 21]

00C50003
Explanation: This could be either a user or a system error. SPUFI was unable to obtain the required storage via GETMAIN.

This abend reason code is issued by the following CSECTs: DSNESM10, DSNESM20

System Action: SPUFI task abends. User returns to ISPF main menu.

User Response: If the problem persists, notify the system programmer. You may have to specify a larger machine size at logon time.

System Programmer Response: If the problem persists, the standard SPUFI documentation should be collected. Refer to Chapter 35. “X’C5......’ codes” for information about obtaining dumps and displaying message IDs.

Problem Determination: Register 2 contains the amount of storage that was requested. Message DSNE392E, in the ISPF log data set, gives the name of the module that issued this abend.

Collect the following diagnostic items listed in
**00C50005**

**Explanation:** This could be either a user or a system error. The DYNAALLOC SVC returned an unexpected return code when attempting to allocate a data set.

This abend reason code is issued by the following CSECT: DSNESM55

**System Action:** The contents of the field are written to the ISPF log.

**User Response:** If the problem persists, notify the system programmer.

**System Programmer Response:** The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5...... codes," on page 825 for information about obtaining dumps and displaying message IDs.

**Problem Determination:** Message DSNE381E, in the ISPF log data set, gives the return code and reason code values returned from the dynamic allocation request. Refer to the appropriate MVS publication to determine the source of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00C50009**

**Explanation:** This is probably caused by an error in the SPUFI code. The SQLCODE translation service (module DSNTIAR) has returned an unexpected return code.

This abend reason code is issued by the following CSECT: DSNESM40

**System Action:** The contents of the field have been written to the ISPF log.

**User Response:** If the problem persists, notify the system programmer.

**System Programmer Response:** The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5...... codes," on page 825 for information about obtaining dumps and displaying message IDs.

**Problem Determination:** Message DSNE387A, in the ISPF log data set, gives the return code value returned from DSNTIAR. The meanings of these return codes are:

- **4** More data was available than could fit into the message area provided.
- **8** The LRECL was not within the limits: 72 ≤ LRECL ≤ 240.
- **12** The message area was not large enough. Message length ≥ 240.
- **16** Error in message routine (IKJEFF02).
Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349

**00C50100**

**Explanation:** This is probably caused by an error in the DSN command processor code. Module DSNECP66 (in the DSN command processor) called module DSNTIAR to format an error message to explain an unexpected SQL return code received by DCLGEN. DSNTIAR failed.

This abend reason code is issued by the following CSECT: DSNECP66

**User Response:** If the problem persists, notify the system programmer.

**System Programmer Response:** The standard documentation should be collected, including a DSN trace stream. Refer to Chapter 35, “X'05......' codes,” on page 825 for information about obtaining dumps and displaying message IDs.

**Problem Determination:** Message DSNE004E in the output gives the return code value returned from DSNTIAR. For an explanation of these return codes, see abend reason code '00C50009'.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349

**00C50101**

**Explanation:** The user has entered the ABEND subcommand of the DSN command processor. This causes a X'04E' abend and a dump to be requested. In order to retain the dump, you must have previously allocated a SYSUDUMP or SYSDUM data set. The ABEND subcommand can be useful for debugging.

This abend reason code is issued by the following CSECT: DSNECP19

**System Action:** A X'04E' abend results, and a dump is requested.

**System Programmer Response:** The standard documentation may be needed. Refer to Chapter 35, “X'05......' codes,” on page 825 for information about obtaining dumps and displaying message IDs.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

**00C50102**

**Explanation:** An error probably occurred in DB2 while it attempted to process an IDENTIFY request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP13

**System Action:** Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50102'.

**User Response:** If the problem persists, notify the system programmer.

**System Programmer Response:** See the Problem Determination section of this message.

**Problem Determination:** Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349

**00C50103**

**Explanation:** An error probably occurred in DB2 while it attempted to process an ESTABLISH EXIT request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP12

**System Action:** Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50103'.

**User Response:** If the problem persists, notify the system programmer.

**System Programmer Response:** See the Problem Determination section of this message.

**Problem Determination:** Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349

**00C50104**

**Explanation:** An error probably occurred in DB2 while it attempted to process a CREATE THREAD request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP13

Chapter 35. DB2 codes 827
00C50108 - 00C50111

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50104'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: 

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C50108

Explanation: An error probably occurred in DB2 while it attempted to process a BIND, REBIND, or FREE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP30

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50108'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: 

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C50109

Explanation: An error probably occurred in DB2 while it attempted to process a TERMINATE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP18

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50109'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: 

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C50110

Explanation: This is a DSN command processor error. It occurs when the DSN STAX routine (DSNEBP01) is entered and the DSN control blocks cannot be located; the AEPLUSR field did not contain the CIB address. This code is issued by the following CSECT: DSNECP01

Severity: 4

System Action: The DSN command processor abended.

User Response: If you allocated a SYSUDUMP or SYSABEND dump data set, collect the dump. Otherwise, allocate SYSUDUMP and DSNTTRACE data sets, turn on DSN tracing, and try to recreate the error. Save these data sets.

System Programmer Response: 

00C50111

Explanation: Your application program made an instrumentation facility component application program interface (instrumentation facility interface) call to DB2 language interface module DSNELI, but your application program was not running under the DSN command processor. You must run all application programs using DSNELI under DSN. To do this, first issue the DSN command, then start your application using the RUN subcommand of the DSN command processor, and finally, when the application completes, stop DSN with an END subcommand.

This reason code is issued by the following CSECT: DSNELI

System Action: Control returns to the application. Your application can continue processing. Further attempts at instrumentation facility interface (IFI) calls will continue to produce this return and reason code.

User Response: Rerun your application under the DSN command processor.

System Programmer Response: Modify the job to
invoke DSN. Initiate the application program using the RUN subcommand of the DSN command processor.
Chapter 36. X’C6......’ code

00C60001

Explanation:  DB2 received return code X’20’ when issuing a WTO request to display a DB2 console message. MVS sets this return code when there are no message buffers for either Multiple Console Support (MCS) or JES3, or when there is a JES3 WTO staging area excess. The WTO request is terminated. The current DB2 console message and all subsequent DB2 informational console messages are ignored until the MVS problem is corrected.

At the time of the abend, general register zero contains the return code from WTO request.

This abend reason code is issued by the following CSECT: DSNFWTO

System Action:  A record is written to SYS1.LOGREC. A retry is requested and execution continues. DB2 resumes issuing console messages when the condition is corrected.
Chapter 37. X’C8……’ codes

Abends in the precompiler are not intercepted via ESTAE, so standard system abends might occur. The SYNAD exit is not used, so I/O errors cause S001 or S002 abends. S04E abends are generated for precompiler internal errors. Following is a list of reason codes.

00C8901x

Explanation: An internal precompiler/parser consistency check failed. An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

In the reason code, x is one of the following:

1  Parser received a token code of 0 from a lexical scan. A lexical scan refers to a scan of words rather than syntax.

2  Error in storage suballocation control blocks. The error might occur when a DB2 SQL statement limitation is exceeded. The SQL statement might be referencing, creating, or declaring more columns than the DB2 defined maximum number allowed for an SQL statement. Another possibility is that too many host variables are being referenced in the SQL statement.

3  Error in storage suballocation request. This error might occur because of storage constraints when building the DBRM entry for the SQL statement or because the SQL statement exceeds the DB2 maximum statement length.

4  Error in pointer structures.

5  Host variable information in the precompiler/parser dictionary or in the DBRM is not consistent with host variable information for an SQL statement. The error might occur when the precompiler misinterprets an illegal host variable declaration.

6  Unexpected value for parser option.

7  Internal limit exceeded. A fully qualified name exceeds the maximum length of 255 characters.

8  Internal conversion error. An error occurred when converting a timestamp version-id.

9  Internal stack storage exhausted.

A  Language Environment required, but not available.

System Programmer Response: Obtain the SVC dump and a copy of the application program source. If the abend reason code is 00C89015, obtain a copy of the DBRM being bound (IEBCOPY).

00C89041

Explanation: More storage is needed, but could not be obtained during the precompiler execution. An S04E abend occurs. The error type and reason code are found in register 15 of the dump.

This reason code is issued by the following CSECT: DSNHCORE

System Programmer Response: The storage required for the current statement could not be acquired or exceeds the maximum (64KB) for a single request. If the region is full, determine if the region can be expanded. If it cannot be expanded, the SQL statement is too large to be processed.
Chapter 38. X’C9......’ codes

00C9007D

**Explanation:** The compression dictionary for the table space or partition cannot be stored in the table space or partition. Therefore, the LOAD or REORG utility cannot complete successfully.

This abend reason code is issued by the following CSECTs: DSNIZLDDL, DSNIDLOD

**System Action:** The table space or partition is implicitly stopped by DB2. Messages DSNIT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Recover and start the table space or partition and tell the user to resubmit the request.

00C9007E

**Explanation:** The compression dictionary for the table space or partition was not successfully retrieved. Therefore, the data request failed.

This abend reason code is issued by the following CSECTs: DSNIRFNX, DSNIRLPG, DSNICUMR, DSNIMSMS, DSNINXPT, DSNIRDC, DSNIRNXT, DSNIRSET, DSNISRID, DSNISFS, DSNISFX, DSNISRTI, DSNICUMW, DSNILREP, DSNIMS1W, DSNIRELF, DSNIRELS, DSNIREDR, DSNIENSR

**System Action:** The table space or partition is implicitly stopped by DB2. Messages DSNIT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Correct the problem and resubmit the LOAD or REORG job. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00C9007F

**Explanation:** The compression dictionary for the table space or partition is invalid. Therefore, the table space or partition cannot be opened.

This abend reason code is issued by the following CSECT: DSNIZLDR

**System Action:** The table space or partition is implicitly stopped by DB2. Messages DSNIT501I and DSNI004I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Recover and start the table space or partition and tell the user to resubmit the request.

00C90080

**Explanation:** An attempt was made to allocate a resource for update operations. However, the resource was already started for read-only access.

This reason code is issued by the following CSECTs: DSNIDBCA DSNIDBCI DSNIDBCN DSNIDBCP DSNIDBET

**System Action:** The allocation process is not allowed.

**User Response:** Determine when the resource is started for read/write access, and rerun the job.

**Operator Response:** If this reason code appears in message DSNIT501I, determine whether the named resource should be started for read-only access.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNIT501I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes,” on page 11 or to the description of the DSNIT501I message in Chapter 18, “DSNT... Messages,” on page 415. SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 3 5 32

00C90081

**Explanation:** An attempt was made to allocate a resource that is stopped for all access.

This reason code is issued by the following CSECTs:
**00C90083**

**Explanation:** An attempt was made to allocate a resource for update operations. However, the resource is already allocated to a DB2 utility function that allows other users to have read-only access.

This reason code is issued by the following CSECTs:

DSNIDBCJ  DSNIDBCO  DSNIDBCQ

**System Action:** DB2 determines whether there is a utility function that would prohibit allocation of the resource. If it finds an indication of a such a utility, the allocation of the resource is not allowed.

**User Response:** Determine when the resource is no longer restricted by a utility and is started for read/write access, and rerun the job.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. The resource allocated to the DB2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. To access a resource that is reserved for a utility, use the -TERM UTILITY command. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.1

3 | 5 | 32 | 72

---

**00C90082**

**Explanation:** An attempt was made to allocate a resource that is already allocated to a DB2 utility function.

This reason code is issued by the following CSECTs:

DSNIDBCJ  DSNIDBCO  DSNIDBCQ

**System Action:** The allocation process is not allowed.

**User Response:** Determine when the resource is available and rerun the job.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. The resource allocated to the DB2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. To access a resource that is reserved for a utility, use the -TERM UTILITY command. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.1

3 | 5 | 32 | 72

---
Appendix B, “Problem determination.” on page 1349

00C90084

**Explanation:** The temporary file with the page size shown in NAME is not available. An error was detected either during the opening of the page set or during the formatting of the header and the space map pages of the page set.

This reason code is issued by the following CSECTs: DSNIWKFL, DSNITFFS

**System Action:** DB2 startup/restart continues if this reason code appears in a DSNT500I message issued during the startup process.

If the reason code appears in a DSNT500I message issued during the -START DATABASE command, the request fails. In either case, the temporary file function does not allocate any temporary file on the page set.

**User Response:** Delete and redefine the temporary data set(s) in question, and then issue the -START DATABASE command to start the temporary file.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return codes, on page 111, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination.” on page 1349

00C90085

**Explanation:** The limit of 253 extends for a temporary file has been reached.

One of the following could be the reason.

- Large number of concurrent transactions requiring use of temporary files.
- Small primary/secondary quantity defined for table space(s) in temporary file database.
- Inadequate space allocated to temporary file database.

This reason code is issued by the following CSECT: DSNIWNCUB

**System Action:** The request to extend temporary file is not allowed.

User Response: To resolve the above situation, do one of the following:

- Reduce the number of concurrent transactions.
- Increase primary/secondary quantity defined for the table space(s) in the temporary file database.
- Increase space allocated to temporary file database.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination.” on page 1349

00C90086

**Explanation:** An attempt was made to allocate a resource that is started for DB2 utility access only.

This reason code is issued by the following CSECTs: DSNIDBCA DSNIDBCI DSNIDBCN DSNIDBCP

**System Action:** The allocation process is not allowed.

**User Response:** Determine when the resource is available for use, and rerun the job.

**Operator Response:** If this reason code appears in message DSNT501I, determine whether the resource should be started for utility access only.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT501I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination.” on page 1349
00C90087

**Explanation:** A page that is marked as 'broken' has been read. The database, table space or index space, and the page number are identified in NAME.

This reason code is issued by the following CSECT: DSNIADBR

**System Action:** The data manager function that detected this condition returns a 'resource not available' condition to its invoker. Access to the page is not be permitted until it is repaired.

**User Response:** If the TYPE is '00000300', examine the name to determine if the page is in an index space or a table space. Use the REPAIR utility to fix the broken page.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C90089

**Explanation:** The environmental descriptor manager (EDM) function of the data manager subcomponent did not have enough storage in its pool or data space to support the retrieval of object with ID 'object id' (DBD ID, SKPT plan name or SKPT package name). The object can be either a database descriptor (DBD), a skeleton cursor table (SKCT) or a skeleton package table (SKPT).

This reason code is issued by the following CSECTs: DSNGEDLC DSNGEDST DSNGEELC DSNGEFSP DSNGESC LC DSNGEPLC

**System Action:** The requested operation is not performed.

**User Response:** Invoke the application again. If, after several attempts, there is still not enough space, the following actions can be taken to reduce EDM storage requirements:

- Reduce the number of concurrent users using DB2.
- Try reducing the number of SQL statements in the plan or package and rebind.
- Try to simplify the database design—for example, reduce the number of partitions in the database.

To increase the EDM pool size definition, on the UPDATE install panels:

- If EDM storage shortage is a recurring problem, change the installation parameters that affect the size of the EDM pool—that is, increase the number of concurrent users and the number of currently active databases, then restart DB2.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on the identifying and reporting the problem.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9008A

Explanation: The database procedure installation exit identified by NAME cannot be loaded for execution.

This reason code is issued by the following CSECTs: DSNIREDR, DSNIENSRA

System Action: The requested operation is not performed.

User Response: Determine the reason the installation exit could not be loaded, correct the problem, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT5001 is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT5001 message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9008B

Explanation: An attempt was made to create a database, but no DBID s are available; that is, the system limit has been reached.

This reason code is issued by the following CSECT: DSNDCID

System Action: The create is not allowed.

User Response: DROP all unused databases, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT5001 is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT5001 message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9008C

Explanation: An attempt was made to allocate or bind to a partitioned table space for which no partitioning key was defined.

System Action: The bind or allocation process is not allowed.

User Response: Define the partitioning key or partitioning index for the partitioned table space, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT5001 is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT5001 message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9008D

Explanation: An attempt was made to bind to a table space that had an incomplete clustering definition.

This reason code is issued by the following CSECTs: DSNISPSC, DSNIPSFI

System Action: The bind process is not allowed.

User Response: Complete the clustering definition for the table space, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT5001 is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT5001 message in Chapter 18, "DSNT... Messages," on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on the identifying and reporting the problem.
**00C90090**

**Explanation:** An attempt to lock a required resource failed.

**System Action:** The operation is not performed.

**User Response:** Wait for all jobs which hold a lock on the resource in an incompatible lock state to complete before reissuing the failing statement.

**Problem Determination:** The requested operation is not performed. If the resource type is table space, table, or index, then issue the -DISPLAY DATABASE command with the LOCKS option to get a list of jobs which currently hold locks on the required resource.

If the resource type is a package, then wait for BIND activity on that package to complete before reissuing the failing request.

If the problem persists after jobs which hold incompatible locks complete, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 [Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [3 5 32 38 39]

---

**00C9008E**

**Explanation:** A lock request for the resource identified by NAME could not be granted, and the request waited for a period longer than the maximum specified by the installation.

This reason code is issued by the following CSECT: DSNILMCL

**System Action:** The data manager function that detected this condition returns 'resource not available' to its invoker.

Message DSNT378I might also be issued.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904, -911, -913, or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 [Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [3 5 32 38 39]

---

**00C9008F**

**Explanation:** The database descriptor's size (DBD) has reached the limit of 25% of the EDM Pool size.

This reason code is issued by the following CSECT: DSGDCPD

**System Action:** The request to create/alter a database object is not allowed.

**User Response:** Create the database object in a different database or drop unused database objects from the database. If you drop an object that is an index or a table space, the space becomes available in the DBD as soon as the drop is committed. If you drop an object that is a table, the space in the DBD is made available only after all of the following:

- The DROP is committed.

- The DB2 REORG is run on the table space and there is no point in time recover after the REORG.

- MODIFY is run to delete all image copies of data that contains rows of the dropped table, that is, copies that were taken before the REORG. Note that MODIFY will reclaim space in the DBD only if there are SYSCOPY rows to delete.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 [Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [3 5 32 38 39]

---

**00C9008G**

**Explanation:** The data manager function that detected this condition returns 'resource not available' to its invoker.

Message DSNT378I might also be issued.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904, -911, -913, or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 [Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [3 5 32 38 39]

---

**Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [3 5 15 17 32 33 35]
**00C90091**

**Explanation:** The table space or index space could not be started, because there is an outstanding indoubt UR that must be resolved before the start is allowed.

This reason code is issued by the following CSECT: DSNILSTS

**System Action:** The START operation is not performed.

**Problem Determination:** Message DSNI0021 is issued. See the description of that message for additional information.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

| 03 | 05 | 06 | 07 | 08 | 09 |

**00C90092**

**Explanation:** DB2 received an out-of-storage indication from IRLM resulting from a lock, unlock, or lock change request.

This reason code is issued by the following CSECT: DSNILMCL

**System Action:** A record is written to SYS1.LOGREC only when an abend is issued. No dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** IRLM has exhausted the amount of virtual storage available to it to represent locks. Insufficient virtual storage remains to satisfy this request. Refer to Part 5 (Volume 2) of [DB2 Administration Guide](#) for the IRLM procedure to determine the amount of storage space available.

The current mix of transactions caused all available storage to be used. You can find the number of locks held by a particular transaction by either using the DB2 performance trace facility or by performing IRLM tracing. Refer to Part 5 (Volume 2) of [DB2 Administration Guide](#) for information about the DB2 performance trace facility.

Determine what transactions were running and the number of locks they held. You might want to schedule some of these transactions at a different time.

You can reduce the total number of page or row locks that applications concurrently hold by changing the locking protocol on one or more table spaces. Use one of the following:

- **ALTER TABLESPACE...LOCKSIZE ANY**
- **ALTER TABLESPACE...LOCKSIZE TABLESPACE**

- **LOCK TABLE statements**

If application logic permits, reduce the number of page or row locks concurrently held for SELECT statements by re-binding application plans with isolation level of cursor stability instead of repeatable read or read stability. Refer to Chapter 4 of [DB2 SQL Reference](#) for further information on SELECT.

You can reduce the total number of LOB locks that applications concurrently hold by changing the locking protocol on one or more LOB table space. Use one of the following:

- **ALTER TABLESPACE...LOCKSIZE TABLESPACE**
- **LOCK TABLE statement**

**Problem Determination:** One or more of the following might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

| 03 | 05 | 13 | 32 | 33 | 36 |

**00C90093**

**Explanation:** An error occurred in IRLM.

This reason code is issued by the following CSECT: DSNILMCL

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Examine SYS1.LOGREC for a preceding error related to IRLM.

**Problem Determination:** One or more of the following might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as shown for abend reason code 00C90101. The first four bytes of CTSIWHY contain the return code from the IRLM function. The fifth byte of CTSIWHY contains the request code, as follows:

- **X'02'** Lock
- **X'03'** Unlock

Chapter 38. DB2 codes 841
X'04'  Change

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C90094

Explanatlon: A data set is in a state that is different from what DB2 expects. Possible causes are:

- A data set was deleted and redefined without DB2's knowledge.
- A previous DB2 failure involving the data set might have occurred.

This reason code is issued by the following CSECT: DSNIBMCL

System Action: The requested action is not performed. If the invoker of this module (DSNIBMCL) abends, a record is written to SYS1.LOGREC, and the invoker probably initiates a dump. If the invoker does not abend, no record is written to SYS1.LOGREC, and no dump is requested. If this occurs, an SQL return code is issued, and/or message DSNT500I is issued. If the invoker of DSNIBMCL is not a utility, the data set is placed in a stopped status.

User Response: If the code was received while processing a user table, DB2 determined that the data set is empty. A DROP TABLESPACE statement followed by a CREATE TABLESPACE statement and a CREATE TABLE statement defines the dropped table to DB2. Use the IDCAMS LISTCAT for the failing DB2 dataset. Check the HI-USED-RBA for this dataset; if HI-USED-RBA = 0, the dataset is empty. If it was received while processing a DB2 catalog or directory, then recover the object as specified in DB2 Administration Guide in the section "Recovering Catalog and Directory Objects".

Operator Response: Notify the system programmer.

System Programmer Response: If you do not have the current level of the data set, you must perform DB2 recovery to return the data set to its expected state. See the Problem Determination section of this message for procedures to determine the name of the data set to be corrected. Use the DISPLAY command to check the status of the data set. If the data set is stopped, use the START command before performing recovery.

Problem Determination: For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 415.

00C90095

Explanatlon: An attempt was made during DB2 restart to access a page in order to apply a log record but DB2 was unable to access the page. This abend reason code appears as the reason code in message DSN1001.

This abend reason code is issued by the following CSECTs: DSNIBMOC, DSNIIMPD

System Action: The restart of the named table space, index space, or partition is deferred by the subsystem.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the problem, and then use either the -START DATABASE command or the RECOVER utility to make the table space, index space, or partition available.

Problem Determination: Examine previous messages on the console to determine why DB2 could not access the page. One possible reason is that a back-level pack was mounted. That is, the page to which the log record applies was not yet formatted by VSAM. DB2 does not extend data sets during restart.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
Explanation: The page, row or LOB lock on the page or subpage identified by NAME in message DSNT5001 or DSNT5011 caused the total number of page, row or LOB locks concurrently held to reach the installation maximum number of page, row or LOB locks (NUMLKUS) allowed for a single agent in the system.

This reason code is issued by the following CSECT: DSNILMCL.

System Action: The operation that encountered this condition is not executed. If a utility job encountered this condition, the utility is stopped. Otherwise, any database updates for the statement that was executing are backed out. Any database reads for the statement that was executing are not executed. The position of the cursor is unpredictable.

User Response: Rerun the application after correcting the cause of this resource unavailable condition.

Programmer Response: Reduce the total number of page, row or LOB locks that the application concurrently holds by changing the locking protocol on one or more of the table spaces to table space level locking. To do this, use the ALTER ... LOCKSIZE TABLESPACE or LOCK TABLE statements.

Review the application to see if a different choice of SQL statements can be used to perform the same operation with less concurrent access to multiple tables with page, row or LOB locking.

If application logic permits, reduce the number of page, row or LOB locks concurrently held for SELECT statements by rebinding the application plan with isolation level of cursor stability instead of repeatable read or read stability, or add more frequent commits.

System Programmer Response: If the application should be able to run with the current page, row or LOB locking protocol and SQL statements, increase the NUMLKUS value for the installation to allow a higher limit of page, row or LOB locks to be concurrently held by a single application. If a utility job encountered this resource unavailable condition, the NUMLKUS value must be increased to accommodate the utility, because utilities are programmed to use the minimum number of page, row or LOB locks possible. Refer to Part 5 (Volume 2) of [DB2 Administration Guide] for further information about choosing the value for NUMLKUS.

Operator Response: If a utility job encountered this resource unavailable condition, terminate the utility and restart it after the cause of the resource unavailable condition has been corrected.

Problem Determination: An SQLCODE -904 and message DSNT5001 or DSNT5011 are issued. For more information refer to the SQL return code in [Part 2, "SQL return codes," on page 11] or message DSNT5001 or DSNT5011 in [Chapter 18, "DSNT... Messages," on page 415].

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C90097

Explanation: An attempt was made to allocate to a table space for update operations. However, the table space was marked as 'image copy' required, and updates are not allowed. This condition occurs as a result of any of the following:

- Running a REORG LOG NO or LOAD LOG NO utility on the table space without running a copy that specifies FULL YES.
- Execution of a RECOVER utility which specifies the TORBA or TOCOPY options, without following it with the required COPY utility.
- Execution of a -TERM UTILITY command on a COPY utility that failed during the copy phase or was active in the copy phase. Until the COPY utility completes, SQL updates are not allowed because the integrity of the data would be compromised.
- Execution of a MODIFY utility after all back up copies of the table space or data set were deleted from the SYSCOPY catalog table.

This reason code is issued by the following CSECTs: DSNIDBCJ DSNIDBCO DSNIDBCQ

System Action: The allocation process is not allowed.

User Response: Run the COPY utility. However, if the table space is to be used for read-only access, or if recoverability of the data is not required, instead of taking a full image copy you can run the REPAIR utility and request that the image copy required condition be removed.

Problem Determination: The requested operation is not performed. An SQLCODE -904 and/or message DSNT5011 is issued. For more information, refer to the SQL return code in [Part 2, "SQL return codes," on page 11] or to the description of the DSNT5011 message in [Chapter 18, "DSNT... Messages," on page 415].

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on
identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00C90098

Explanation: An attempt was made to increase read-only or write-access counts of the utility in process beyond the maximum (255) allowed.

This abend reason code is issued by the following CSECT: DSNIDBMF.

User Response: Use the -DISPLAY UTILITY command to determine how many utility jobs are currently active. If a number of utility jobs are active but not in the stopped state, notify the system programmer. If the utility jobs are running, resubmit your job after they complete.

System Programmer Response: Determine why active utilities are in the stopped state. Use the -TERM UTILITY command to terminate utilities and reduce the UIP (utility in process) counts. If no active utilities are indicated, then use the -DISPLAY DATABASE command to show which table spaces or partitions are in a UTRO or UTRW state.

Problem Determination: Message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

00C90099

Explanation: An attempt was made to load data into a partition, but the partition is full. Based on the High Key value specified in the Index for each partition, utilities instructed Data Manager to load a record into the proper partition. This required Data Manager to build a new page with a page number one higher than the last page in the partition. However, this new page is in the next partition.

This abend reason code is issued by the following CSECT: DSNILPG

System Action: The requested action is not performed.

User Response: Redefine the High Key values in the Index and retry the load.

If you receive this code during a reorganization, query the catalog to check the PCTFREE and FREEPAGE values. You might be able to decrease the amount of free space to allow the REORG utility to complete successfully.

Operator Response: Notify the system programmer.

System Programmer Response: Use the -TERM UTILITY command to terminate the load utility and reduce the UIP (utility in process) counts.

Problem Determination: For more information, refer to the explanation of message DSNT500I in the Service Controller Messages section of this book.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00C9009A

Explanation: An attempt was made to create a system database which, according to the DBID space map, has already been created. However, the catalog shows the database was not created. This discrepancy between the catalog and the space map for DBIDs may be due to an unsuccessful migration.

This abend reason code is issued by the following CSECT: DSNDCID

System Action: Database is not created.

Operator Response: Notify the system programmer.

System Programmer Response: Drop the database, then create it (using DROP and CREATE commands). If this fails to resolve the error, follow the steps in problem determination.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes.” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 415.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of Database [Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00C9009B

Explanation: An attempt was made to load data into a linear table space, but the table space is full. A linear table space can contain a maximum of 64GB of data.

This abend reason code is issued by the following CSECT: DSNILPG

System Action: The requested action is not performed.

User Response: Use the -TERM UTILITY command to terminate the LOAD utility. Use ALTER TABLE SPACE to reduce the amount of free space within a page (PCTFREE) and the number of free pages within the table space (FREEPAGE). Then retry the load. If it
is a resume load job, reorganize the table space before rerunning the load.

**Problem Determination:** For more information, refer to the explanation of message DSNT500I in Chapter 18, "DSNT... Messages," on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 32 37].

---

**00C9009C**

**Explanation:** An attempt was made to insert data into a partitioned table space or index space, but the partition is full. For table space partition, the data to be inserted is based on the high-key value specified in the cluster index. If it is an index space partition, the index entry to be inserted is also based on the high-key value associated with the index.

This abend reason code is issued by the following CSECTs: DSNISMPI, DSNISMXP

**System Action:** A ‘resource not available’ code is returned to the end user and the requested action is not performed. The SVC dump and the SYS1.LOGREC recording are not requested.

**User Response:** Notify the system programmer to redefine the partitions and rerun the job.

**System Programmer Response:** Refer to Part 2 (Volume 1) of *DB2 Administration Guide* to redefine a partition. The partition that must be redefined is identified in the DSNT501I message.

If you suspect an error in DB2 refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** For more information, refer to the explanation of message DSNT501I in Chapter 18, "DSNT... Messages," on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 37].

---

**00C9009E**

**Explanation:** The object depends on new facilities of the release and is therefore unavailable for processing. For data-sharing systems, the object will be available on a new release in a data-sharing group. For non-data-sharing systems, the object will be available after re-migration if release fall back has occurred.

This abend reason code is issued by the following CSECTs: DSNICUBC, DSNIIPSFI

**System Action:** The operation is not allowed. The data manager function that detected this condition returns 'resource not available' to its invoker.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** In order to perform the operation on the object:

- For non-data sharing systems a re-migration is required.
- For data sharing systems, insure that the operation is performed on a member at the correct level of DB2.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in...
Appendix B. “Problem determination,” on page 1349.

00C9009F

Explanation: A table has been referenced that has a primary key or unique key but no index exists to enforce its uniqueness. The reference is usually to a parent table when attempting to verify the referential constraint of an insert or update operation to a dependent table.

This abend reason code is issued by the following CSECTs: DSNIALLC DSNICUBC DSNIKESR DSNIRELI

System Action: The use of the table is not allowed.

User Response: Create a unique index on the referenced table to enforce the primary key or unique key.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued. For more information, refer to Part 2, “SQL return codes,” on page 11, or to the description of the DSN501I message in Chapter 18, “DSNT... Messages,” on page 415.

00C900A0

Explanation: An attempt was made to allocate or access a table space or index that is in the rebuild pending status (PSRBD) or an index in pageset rebuild pending status (PSRBD).

System Action: The use of the object is not allowed.

User Response: Determine when the resource is available for use and rerun the job.

Operator Response: Determine whether the RECOVER utility should be run to complete recovering the object.

Problem Determination: The requested operation is not performed because the table space or index might be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I and/or message DSNI005I is issued. For more information, refer to Part 2, “SQL return codes,” on page 11, or to the description of the DSN501I message in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00C900A1

Explanation: An attempt was made to allocate a table space or index that is in group recovery pending state.

System Action: The use of the object is not allowed.

User Response: Run the RECOVER utility, LOAD utility or START DATABASE command to recover the object.

Operator Response: Determine whether the RECOVER utility or START DATABASE command should be run to complete recovery of the object.

Problem Determination: The requested operation is not performed because the table space or index might be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I is issued. For more information, refer to Part 2, “SQL return codes,” on page 11, or to the description of the DSN501I message in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00C900A3

Explanation: An attempt was made to allocate a table space, index space, or a related index space while the table space or index space was in check pending status.

This abend reason code is issued by the following CSECTs: DSNIDBCI DSNIDBCJ DSNIDBCN DSNIDBCO DSNIDBCP DSNIDBCQ DSNIDBDT DSNIRCCA

System Action: The operation is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: The check pending status needs to be resolved before the operation will be allowed.

If the object is a table space with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space with LOB columns, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is a LOB table space, then run the CHECK LOB utility to validate the structure of the LOB table space.

If the object is an index space, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space or table space partition.

For more information, see Part 2 (Volume 1) of DB2 Administration Guide.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued. For more information, refer to Part 2, “SQL return codes,” on page 11, or to the description of the DSN501I message in Chapter 18, “DSNT... Messages,” on page 415.
00C900A4

Explanation: An attempt was made to allocate a segment for a table in a segmented table space, but there are no free segments. A segmented table space can contain a maximum of 64GB of data. A segment will be allocated under one of the following conditions:
- When a table is ready to be created in a segmented table space with the CREATE TABLE statement.
- When a record is inserted/loaded into a segmented table and free space is not available from existing segments.

This abend reason code is issued by the following CSECTs: DSNISEGF, DSNISGNS

System Action: A 'resource not available' code is returned to the end user and the requested action is not performed.

User Response: Notify the system programmer to reclaim some free space in the associated segment table space and rerun the job.

System Programmer Response: An SQLCODE -904 is issued, and/or message DSNT5011 is issued. The segmented table space name is identified in SQLCA and/or in the DSNT5011 message. If the requested function is the CREATE TABLE statement, create the table in a different segmented table space. Otherwise, run the DB2 REORG utility to attempt to reclaim additional free space. If no free space can be reclaimed, then notify the database administrator to redistribute the data into different table spaces.

Problem Determination: For more information, refer to the explanation of message DSNT5011 in Chapter 18, "DSNT... Messages," on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][37]

00C900A5

Explanation: The temporary file(s) is full or the maximum number of extensions for a VSAM data set(s) has been exceeded for all temporary files or the volume(s) has no space available in which to extend.

This reason code is issued by the following CSECT: DSNIXWKF

System Action: The reason code appears in a DSNT5011 message, and the requested operation is not performed.

User Response: If the reason code appears in a DSNT5011 message, issue -DISPLAY THREAD to determine the total number of concurrent users. If there were a large number of users using temporary file(s), resubmit the job when concurrent users are low. IDCAMS LISTCAT may be used to determine the VSAM data set(s) space allocations.

- If there was no space available on a volume(s), then clear space from the volume(s) or add more volumes to the STOGROUP or redefine the VSAM data set to concatenate more volumes.
- If the maximum number of extensions has been exceeded for the VSAM data set(s), then ALTER or delete and redefine the temporary data set(s) with a larger size.
- If all the temporary files are full, then create or define more temporary files.

Issue the -START DATABASE command to start the temporary file.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or message DSNT5011 is issued, and/or message DSNT5011 is issued. For more information, refer to SQLCODE -904 in SQL Return Codes, Part 2, “SQL return codes,” on page 11, or to the description of the DSNT5011 message in Part 3, “DB2 messages,” on page 155.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][32][10] and definitions of temporary file(s) involved in the error.

00C900A6

Explanation: Access to the catalog was requested but denied because the catalog was not migrated to the current release level. The object in the catalog is available after the catalog is migrated.

This abend reason code is issued by the following CSECT: DSNICUBC

System Action: The operation is not allowed. The data manager function that detected this condition returns 'resource not available' to its invoker.

Operator Response: Notify the system programmer.

System Programmer Response: To perform the operation on the object, you must migrate the catalog to the current release. To do this, run DSNTIJTC. Refer to Part 2 of DB2 Installation Guide for information about this job.

Problem Determination: The requested operation is not performed. SQLCODE -904 and message DSNT5011 are issued. For more information refer to the SQL Return Code section or to the description of the DSNT5011 message in Chapter 18, "DSNT... Messages," on page 415.

00C900A7

Explanation: At allocation of a bound plan or a bound package, a lock inconsistency is detected. A DB2 internal bind error is probably responsible for this condition. The plan or the package cannot be allocated.
00C900A8 • 00C900AB

This reason code is issued by the following CSECT: DSNJALLC

System Action: The plan or the package is not allocated. A DSNT5011 message is issued and an SQLCODE -923 is returned to the application.

System Programmer Response: Re-bind the plan or the package.

Problem Determination: If the problem persists after the plan or the package is rebound, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C900A8

Explanation: The table space, index, or partition could not be started because of a failure to acquire the lock. Activity on the table space, index, or partition must quiesce before the START DB ACCESS FORCE command can acquire the necessary lock.

The abend reason code is issued by the following CSECT: DSNISTFO

System Action: The START operation is not performed.

User Response: Wait for all activity on the table space, index, or partition to complete before reissuing the START command.

Problem Determination: The requested operation is not performed. Message DSNI002I is issued. For more information, refer to the description of this message in Chapter 10, “DSNI... Messages,” on page 283. If the problem persists after all activity on the table space, index, or partition completes, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C900A9

Explanation: An attempt was made to allocate a resource that is deferred.

The abend reason code is issued by the following CSECT: DSNIDBCN

System Action: The allocation process is not allowed.

User Response: Determine the reason for which the resource was deferred and take the appropriate action to correct the problem. Such actions include issuing the START DATABASE command or running the RECOVER TABLESPACE, RECOVER INDEX, RECOVER, or LOAD REPLACE utility.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT5011 or DSNT5011 is issued. For more information, refer to the SQL return code or to the description of the DSNT5011 or DSNT5011 message.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C900AA

Explanation: The table space or index space could not be stopped because it is indoubt.

The abend reason code is issued by the following CSECTs: DSNILSTS DSNIPDBA

System Action: The STOP operation is not performed.

User Response: Resolve the indoubt unit of recovery (UR) using the RECOVER INDOUBT command.

Problem Determination: Message DSNI003I is issued. For more information, refer to the description of this message. If the problem persists after all indoubts with locks on the table space/index space are resolved, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C900AB

Explanation: An attempt was made to access a resource that is in the restart pending state.

System Action: The use of the resource is not allowed.

System Programmer Response: Use the DISPLAY THREAD TYPE(POSTPONED) to determine the status of the resource.
Use the RECOVER POSTPONED command if recover has not already been started.

**Problem Determination:** The requested operation is not performed because the table space might be in an inconsistent state. An SQLCODE -904 is issued. For more information, refer to the "Section 2. SQL Return Codes" in topic A.2 or to the description of the DSNT501I messages in "Section 3. DSNT Messages" in topic A.3.

**00C900AC**

**Explanation:** The DB2 subsystem currently serves as a remote site tracker system. Users cannot have write access for tracker systems, and a tracker DB2 will not allow the use of any SQL statement that requires write access.

**System Action:** DB2 cannot process the operation.

**System Programmer Response:** None.

**Problem Determination:** A tracker DB2 does not allow the use of any SQL statement that requires write access, such as DDL, GRANT/REVOKE, INSERT, DELETE, or UPDATE. DB2 issues SQL code -904 in conjunction with this message. You can also find more information in the description for message DSNT501I, which DB2 issues along with this reason code.

Additionally, a tracker DB2 does not allow the START DATABASE command to perform LPL/GRECP recovery. If you attempt a START DATABASE command on a tracker DB2, DB2 will issue message DNSI005I with this reason code.

**00C900AD**

**Explanation:** An attempt was made to access a resource that is in the REORG pending state.

This reason code is issued by the following CSECT:

**System Action:** The use of the resource is not allowed.

**System Programmer Response:** Use the REORG utility with SHRLEVEL(NONE) PART n1:n2 to resolve the REORG pending state. The following methods may be used to resolve the REORG pending state:

- REORG SHRLEVEL(NONE) PART (m:n)
- LOAD REPLACE tablespace
- DROP tablespace

**Problem Determination:** The requested operation is not performed because the table space might be in an inconsistent state. A SQLCODE -904 is issued.

**00C900AE**

**Explanation:** An attempt was made to allocate or access an index that is in the rebuild pending status.

This abend reason code is issued by the following CSECTs:

DSNIDBCJ  DSNIDBCO  DSNIDBCQ

**System Action:** The use of the object is not allowed.

**User Response:** Determine when the resource is available for use and rerun the job.

**Operator Response:** Determine whether the REBUILD utility should be run to complete recovering the object.

**Problem Determination:** The requested operation is not performed because the index may be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I and/or message DSNI005I is issued. For more information, refer to Part 2, “SQL return codes,” on page 11, or to the description of the DSNT501I message in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00C900BA**

**Explanation:** A request for a drain lock for the resource identified by NAME in messages DSNT500I and DSNT501I could not be granted. The request waited for a period longer than the maximum specified by the installation.

This reason code is issued by the following CSECT: DSNILMCL

**System Action:** The requested action is not performed. The Data Manager function that detected this condition returns 'resource not available' to its caller.

**User Response:** Wait for all jobs that hold a drain lock on the resource in an incompatible state to complete before reissuing the failing statement. To display drain locks, issue a DISPLAY DB LOCKS command. In order to avoid a potential deadlock, the application should either commit or roll back to the previous COMMIT.

**System Programmer Response:** See SQLCODE -913 or -911 and/or message DSNT501I, which accompany this abend reason code.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**00C900BC**

**Explanation:** The statement depleted the record identifier (RID) storage available.

This abend reason code is issued by the following CSECT: DSNIREFS

**System Action:** The requested action is not performed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restructure the SQL statement so that fewer RIDs are needed. The best way to do this is to split the statement into two or more SQL statements equivalent to the original statement. Also, in some cases, increasing the virtual storage might eliminate the times when storage is depleted.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** SQL return code -904 and/or message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

---

**00C900BE**

**Explanation:** DB2 is unable to acquire a lock on a resource because another DB2 subsystem in the DB2 data sharing group holds an incompatible retained lock on that resource. Retained locks are locks that persist across DB2 abnormal terminations.

**System Action:** The requested action is not performed. SQLCODE -904 is issued. A 'resource not available' code is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. If it is active, an IFCID 0021 trace record is written and might contain additional diagnostic information.

**System Programmer Response:** If this becomes a prevalent problem, you will need to redistribute the coupling facility lock structure storage resource to make more room for the record list. You can do this in one of two ways:
- issue a rebuild, or
- dynamically change the lock structure size

See Chapter 6 of *DB2 Data Sharing: Planning and Administration* for more details about these options.

---

**00C900C0**

**Explanation:** A request for an internal lock could not be granted. The request waited for a longer period than is allowed.

This reason code is issued by the following CSECT: DSNILMCL

**System Action:** The request action is not performed. A 'resource not available' reason code is returned to the caller.

**User Response:** If the user is a DB2 utility, rerun or restart the utility. If it is a DB2 command, reissue the command. DB2 applications should either commit or roll back to the previous commit, then retry from the commit point.

**System Programmer Response:** See SQLCODE -911 or -913 and/or message DSNT500I, which accompany this reason code. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00C900C1**

**Explanation:** An attempt was made to allocate an index that has one or more logical partitions in a rebuild pending state.

**System Action:** Use of the object is not allowed.

**User Response:** Determine when the resource is available for use and rerun the job.

**Operator Response:** Determine when the REBUILD utility should be run to complete recovering the object. Only the logical partitions marked as rebuild pending need to be recovered.

**Problem Determination:** The requested operation is not performed because the index might be in an inconsistent state. An SQLCODE -904 or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," or to the description of the DSNT501I.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on...
identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00C900C4**

**Explanation:** An attempt was made to insert values into a table that has a ROWID column with the generated by default attribute but no index exists to enforce its uniqueness.

**System Action:** The use of the table is not allowed.

**System Programmer Response:** Create a unique single column index for the ROWID column.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

**00C900C5**

**Explanation:** An attempt was made to access a table space that is in the auxiliary check pending state (ACHKP).

**System Action:** The operation is not allowed. DB2 returns ‘resource not available’ to its invoker.

**System Programmer Response:** Use the CHECK DATA utility to identify the invalid LOBs. Use the SQL UPDATE statement to replace the invalid LOBs or the SQL DELETE statement to remove the rows with the invalid LOBs. After rectifying all invalid LOBs, run CHECK DATA again to clear the ACHKP state from the table space.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00C900C6**

**Explanation:** DB2 detected an uncommitted write on an index being altered to change the type during the same commit scope. This is not allowed. Commit or rollback all changes to an index before alter index convert type is used to change the index type.

**System Action:** The alter index convert type of the index is not allowed.

**System Programmer Response:** The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQL code in “Section 2. SQL Return Codes”. Commit or rollback changes to the index and retry the Alter Index convert type.

**Problem Determination:** The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQL return code in “Section 2. SQL Return Codes.”

**00C900C7**

**Explanation:** The requested function was either:

- not supported by the current release or maintenance level of DB2, or
- deactivated by a modified the system parameters.

In the former case, the NAME field of the accompanying message indicates the required level of maintenance. In the latter case, the NAME field indicates the deactivating system parameter.

**System Action:** The requested action is not performed.

**User Response:** Inform the system administrator.

**System Programmer Response:** To permit the use of the function, take the appropriate actions according to the situation. Apply the indicated maintenance, migrate to the indicated release of DB2, or use an alternate setting for the indicated system parameter.

**00C900C8**

**Explanation:** Access to the index is disallowed within the same commit scope as an ALTER TABLE statement that alters the key column in the index. If the ALTER TABLE statement failed, then commit the changes to the index and retry the ALTER TABLE statement. If an INSERT, DELETE, UPDATE, or SELECT statement failed, then commit the ALTER and retry the statement.

**System Action:** The operation is not allowed.

**User Response:** Commit and then retry the operation.

**00C900C9**

**Explanation:** After being expanded to process triggers, a row has grown too large to fit into a 32K page of a workfile.

**System Action:** DB2 does not perform the requested operation.

**Programmer Response:** Drop and recreate triggers to use less LOB columns as transition variables, or eliminate the use of the ROWID column as a transition variable. For a table with LOB columns or a ROWID
column whose row size is very close to 32K, it may not be possible to use transition tables with triggers.

**Problem Determination:** DB2 does not perform the requested operation. DB2 issues SQL code -904, and may also issue message DSNT500I or DSNT501I. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 415.

Collect the following terms listed in Appendix B, "Problem determination," on page 1349:

---

### 00C900CB

**Explanation:** Resource is unavailable because the resource is in a refresh pending state.

**System Action:** The use of the resource is not allowed.

**Problem Determination:** DB2 does not perform the requested operation because the table space or index space might be in an inconsistent state. DB2 issues SQL code -904. For more information, refer to the SQL return code, or to the description of the DSNT501I message.

---

### 00C900CC

**Explanation:** DB2 does not accept the NOBACKOUT request during the rollback of a non-global transaction while the backout of catalog changes is in progress.

**System Action:** DB2 rejects the NOBACKOUT request.

**Problem Determination:** DB2 does not perform the requested operation because the backout in progress must be complete before the NOBACKOUT request can succeed. Wait for the backout to complete, then reissue the request.

---

### 00C900CD

**Explanation:** DB2 does not accept the NOBACKOUT request during the rollback of a non-global transaction. At least one of the objects of the transaction is shared by another transaction.

This reason code is issued by the following CSECT: DSNILABR

**System Action:** DB2 rejects the NOBACKOUT request.

**Problem Determination:** DB2 does not perform the requested operation because at least one object involved in the operation is also updated by other active transactions in DB2. Wait for the other transactions to finish, then reissue the request.

---

### 00C900CE

**Explanation:** Resource is unavailable because the resource is in a state that is incompatible with this version of DB2.

**System Action:** DB2 does not allow the use of the resource.

**Problem Determination:** DB2 does not perform the requested operation because the table space or index space might be in an inconsistent state. DB2 issues SQL code -904. For more information, refer to the SQL return code or to the description of the DSNT501I message.

---

### 00C900CF

**Explanation:** DB2 was unable to open the specified object because it is one of the following types:

1. A Type 1 index
2. An index with a data set password
3. A table space with a data set password
4. An ROSHARE database

The reason code and object name are in the SQL communication area or in related messages.

**System Action:** Use of the object is not allowed.

**User Response:** Use the ALTER INDEX, ALTER TABLESPACE, or ALTER DATABASE command to put the object into a supported state. DROP can also be used if the object is no longer needed.

**Problem Determination:** The requested operation is not performed. A resource unavailable code is returned to the user.

---

### 00C900D0

**Explanation:** An attempt was made to access a value in a column with one of the LOB data types (BLOB, CLOB, DBCLOB), but the value of the column is no longer valid.

**System Action:** The operation is not allowed. DB2 returns 'resource not available' to its invoker.

**System Programmer Response:** Use the CHECK LOB utility to identify the invalid LOBs. Use update to replace or delete the invalid LOBs.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes." on page 11, or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 415.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C90001

Explanation: The amount of space allowed for processing LOB values by a user has been exceeded. The amount of space allowed per user is indicated by panel DSNTIP7.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C90002

Explanation: The amount of space allowed for processing LOB locators for a system has been exceeded. The amount of space allowed for a system is indicated by panel DSNTIP7.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C90003

Explanation: No more space in the data space is available for processing LOB values.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C9001

Explanation: The data manager detected an internal error within DB2. This error may indicate inconsistent data or an error in internal DB2 control structures or code.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

Possible causes of this error include:
• Improper migration or fallback procedures,
• All DB2 directory and DB2 Catalog restored to different points in time,
• Table space restored improperly,
• An internal DB2 failure.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If this abend occurred while
processing data in one or more pages, message DSNI014I is issued to identify each page involved. In general, the data in these pages is fine. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, you may want to analyze the set of pages specified.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI014I is data.
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1349 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Address of the page set block (PB)</td>
</tr>
<tr>
<td>3</td>
<td>Address of the log record, if any</td>
</tr>
<tr>
<td>8</td>
<td>Address of the buffer block (BB)</td>
</tr>
<tr>
<td>9</td>
<td>Address of the page buffer</td>
</tr>
</tbody>
</table>

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

If the abend reason code was issued by a CSECT with name DSNxxxxx, where ‘xxxx’ is any value, make a copy of DSNDDB01.DBD01, DSNDDB01.SCT02, and DSNDDB01.DSNSTC02 on tape with DSN1COPY. This might be a large copy.

Explanation: An inconsistent page was detected. This has been caused by a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNIBROK

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

In addition, the following general purpose registers (GPRs) contain the indicated diagnostic information:

- GPR 2: Address of the page set block (PB)
- GPR 3: Address of the log record, if any
- GPR 8: Address of the buffer block (BB)
- GPR 9: Address of the page buffer

Explanation: Bad data was returned from either the edit or the validation exit.

This abend reason code is issued by the following CSECTs: DSNIREDR, DSNIENSR

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as in the abend reason code '00C90101'. Refer to the table accompanying that abend reason code for details.

The '00C90103' abend reason code was issued because one of the checks described in the following list failed:

- Save first and last byte of the input record. On return from exit, see if either group has been modified. If so, abend.
- Check length of edited data. If greater than maximum allowed for this row, or less than one, abend.
- Store a special character in the first byte past the end of the output area (place for edit procedure to put edited or (original unedited) row), to make sure the exit doesn't overrun this area. On return, check if it is still the same special character. If not, abend.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Explanation: An inconsistent page was detected. This has been caused by a DB2 internal error.
This abend reason code is issued by the following CSECT: DSNIBROK

**System Action:** A record is written to SYS1.LOGREC, an SVC dump is requested, and the page will be scheduled for automatic recovery. If automatic recovery is successful, message DSNB215I is issued. If automatic recovery fails, message DSNIO12I is issued, and an abend '04E' with reason code 00C90102 will occur.

**Note:** If the resource required for automatic recovery is in use, automatic recovery will be delayed until the resource is available.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9. Exceptions to the table definitions of the VRA fields are:

- VRARRK5 is the name of the module that called the check page routine that detected the error in the page.
- VRARRK6 identifies the error in the page.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Address of the page set block (PB)</td>
</tr>
<tr>
<td>3</td>
<td>Address of the log record, if any</td>
</tr>
<tr>
<td>8</td>
<td>Address of the buffer block (BB)</td>
</tr>
<tr>
<td>9</td>
<td>Address of the page buffer</td>
</tr>
</tbody>
</table>

Refer also to [Table 4 in Appendix B, “Problem determination,” on page 1349](#) for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 5 8 12 32

**00C90107**

**Explanation:** At commit phase 1, a nonzero write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNICMT2

**System Action:** A record is written to SYS1.LOGREC, an SVC dump is requested. The thread is aborted.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 5 8 12 32 33

**00C90108**

**Explanation:** At commit phase 2, a nonzero read intent count or write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNICMT2

**System Action:** A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is committed and the application is allowed to continue without notification of the error.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 5 8 12 32 33

**00C90109**

**Explanation:** At deallocate, a nonzero read intent count or write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNIDALC

**System Action:** A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is deallocated normally.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 5 8 12 32 33
**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C90110**

**Explanation:** The data manager detected an inconsistent data condition. This may be caused by an inconsistency in either the DB2 catalog or the DB2 directory. In this case, the OBD for the requested OBID cannot be located in the database descriptor (DBD). The DBD in storage may be inconsistent. Specifically, the OBDDMAP(OBID) array element should contain an offset into the DBD where the OBD should be located. However, in this case the OBD expected was not at the indicated offset.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The DBD in use at the time of the abend is inconsistent in storage and may be inconsistent on DASD. Since the nature and extent of the damage done to the DBD is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:
- Incomplete recovery of DB2 catalog and/or DB2 directory.
- Invalid restore of DB2 catalog and/or DB2 directory to a prior point in time.
- A conditional restart which bypassed recovery of either the DSNB01.DBD01 page set or the DSNB06.SYSDBASE page set.
- A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C90111**

**Explanation:** The data manager detected an inconsistent data condition. In this case, the OBD for the requested OBID does not exist. This may be caused by an inconsistency in either the DB2 catalog or the DB2 directory. Specifically, the OBDDMAP(OBID) entry is zero rather than an offset to an OBD within the DBD.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Since the DB2 directory does not agree with the DB2 catalog, either of these may be inconsistent. Since the nature and extent of the inconsistency between the DB2 catalog the DBD is not immediately known, an analysis of the entire DB must be done.

The inconsistency may be due to:
- Incomplete recovery of DB2 catalog and/or DB2 directory.
- Invalid restore of DB2 catalog and/or DB2 directory to a prior point in time.
- A conditional restart which bypassed recovery of DSNB01.DBD01 or DSNB06.SYSDBASE page sets.
- A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00C90112**

**Explanation:** The data manager detected an inconsistent data condition. There may be more than one object with the same OBID in the DB2 Catalog. To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

This abend reason code is issued by the following CSECT: DSNGDCOB

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Since the extent of this inconsistency is not immediately known, an analysis of the entire DB must be done.

The inconsistency may be due to:
- Incomplete recovery of the DB2 Catalog and/or the DB2 Directory.
• Invalid restore of the DB2 Catalog and/or the DB2 Directory to a prior point in time.
• A conditional restart which bypassed recovery of DSND801.DBD01 or DSND806.SYSDBASE page sets.
• A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00C90124

Explanation: An attempt was made to apply prior-version/release DB2 log records other than checkpoint records.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save the output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00C90203

Explanation: The data manager detected an inconsistent data condition. In this case, one of the pointers in a hash chain does not point to a valid row or anchor (that is, the hash chain is ‘broken’). The pointer, the target row/anchor, or the page that contains the pointer or target row/anchor is in error.

This abend reason code is issued by the following CSECT: DSNnnnnnn

‘nnnnnn’ is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). ‘DSNnnnnnn’ is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save the output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide

Page 5 of 5
Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name and the table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:
- The page type indicated in message DSNI014I is index
- The page type indicated in message DSNI014I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

<table>
<thead>
<tr>
<th>00C90205</th>
</tr>
</thead>
<tbody>
<tr>
<td>Explanation: The data manager detected an inconsistent data condition. In this case, a row obtained from an index entry does not point to a valid row in a data page. The error is probably caused by an extra index entry, but it could also result from a table update not being reindex when it should have been.</td>
</tr>
<tr>
<td>System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.</td>
</tr>
<tr>
<td>User Response: Notify the system programmer.</td>
</tr>
<tr>
<td>Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.</td>
</tr>
<tr>
<td>System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.</td>

</tbody>
</table>
message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSN1014I is index
- The page type indicated in message DSN1014I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Appendix B, “Problem determination,” on page 1349 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00C90207

Explanation: The data manager detected an inconsistent data condition. In this case, a pointer record does not point to a valid overflow record. The pointer record, the overflow record, or the page that contains the pointer or overflow record is in error.

This abend reason code is issued by the following CSECT: DSNnnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the index page. It also identifies the database name and the table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.
Refer also to Appendix B, “Problem determination,” on page 1349 Table 4 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2] [5] [31] [32] [33] [42] [62]

**00C90211**

**Explanation:** The data manager detected an inconsistent data condition. In this case, a row is missing a column that is not nullable and does not allow default values.

This abend reason code is issued by the following CSECT: DSNnnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnnn' is the full CSECT name given in the dump title.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Message DSNi013I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2] [5] [31] [32] [33] [42] [62]

**00C90212**

**Explanation:** The data manager detected an inconsistent data condition. In this case, there is an empty index leaf page other than the root. (DB2 removes empty pages from the index tree.)

This abend reason code is issued by the following CSECT: DSNnnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnnn' is the full CSECT name given in the dump title.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Message DSNI013I is issued to identify the index leaf page. It also identifies the database name and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI014I is index.
- The page type indicated in message DSNI014I is data.
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load module.CSECT qualifier of the location where the abend occurred. ‘Qualifier’ is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Appendix B, “Problem determination,” on page 1349 Table 4 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2] [5] [31] [32] [33] [41] [43]
**Explanation:** The data manager detected an inconsistent data condition. In this case, a row has an unexpected OBID stored in its prefix. A possible cause is that the table space was restored (via DSN1COPY or similar tool) improperly. For example, the wrong data set was copied for the given table space.

This abend reason code is issued by the following CSECT: DSNnnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnnn' is the full CSECT name given in the dump title.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Message DSN013I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1349 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

- 00C90213
- Explanation: The data manager detected an inconsistent data condition. In this case, a row has an unexpected OBID stored in its prefix. A possible cause is that the table space was restored (via DSN1COPY or similar tool) improperly. For example, the wrong data set was copied for the given table space.

- 00C90214
- Explanation: The data manager detected a condition of inconsistent data. The description of the index in the index OBD does not match the attributes of an index page. The problems consists of one of the following conditions:
  - IPPNUNI does not equal OBDKNUUNI,
  - IPPTLTH does not equal OBDKLEN,
  - IPPOLTH does not equal OBDLENO, or
  - If the page is a leaf page, the segmentation flag or number of subpages conflict (IPPNLPG does not equal OBDINLPG or IPPSEGm conflicts with OBDINLPG).

The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.

- 00C90215
- Explanation: The data manager detected a condition of inconsistent data. The index manager subcomponent has been passed a key with a key length not equal to the key length in pages of the index. The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.
This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA. 'DSNnnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Message DSN013I is issued to identify the data page that contains the record that is longer than allowed by its corresponding record definition. This could occur if the DB2 directory was recovered to a previous point, allowing new object creations (with a shorter record length) to be created having record identifiers identical to objects previously created in the table space. Also the table space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given table space.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1349 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00C90218

Explanation: The data manager detected an inconsistent data condition in a segmented table space. In this case, an unallocated segment was found on a segment chain.

This abend reason code is issued by the following CSECT: DSNnnnnn

The CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA is 'nnnnn' (see the Problem Determination section of this message). The full CSECT name given in the dump title is 'DSNnnnnnn'.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Message DSN013I is issued to identify the space map page that contains the bad segment entry. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are:

determination.

This abend reason code is issued by the following
CSECT: DSNnnnnn
The CSECT name identifier given in the dump header
and appearing in VRARRK5 of the VRA in the SDWA is
'nnnnn' (see the Problem Determination section of this
message). The full CSECT name given in the dump title
is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC,
and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from
the system on which the job was run for the period of
time spanning the failure. Save this output for use in
problem determination.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of DB2 Diagnosis Guide
and Reference for information on identifying and
reporting the problem.

Problem Determination: Message DSN013I is issued
to identify the space map page that contains the bad
segment entry. The database name and table space
name will also be identified.

SYS1.LOGREC contains information in the variable
recording area (VRA) of the system diagnostic work
area (SDWA). Significant fields for this abend code are:
VRARRK5, VRARRK6, VRARRK7, VRARRK8, and
VRARRK9.

Refer also to Table 4 in Appendix B, "Problem
determination," on page 1349 for further information on
DSN1COPY misuse.

Collect the following diagnostic items listed in
Appendix B, "Problem determination," on page 1349 [1]
3 32 37

00C9021B

Explanation: The data manager detected an
inconsistent data condition in a segmented table space.
In this case, the space map page indicates a data page
that is not empty exists. However, the data page is
either not formatted by the data manager or it is beyond
the highest VSAM formatted area.

This abend reason code is issued by the following
CSECT: DSNnnnnn
The CSECT name identifier given in the dump header
and appearing in VRARRK5 of the VRA in the SDWA is
'nnnnn' (see the Problem Determination section of this
message). The full CSECT name given in the dump title is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the inconsistent data page and its covering space map page. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

Problem Determination: Message DSNI013I will be issued.

If a DB2 internal error is indicated, collect the following diagnostic items:
- DSN1COPY of the user table space.
- DSN1COPY of DSND01.DBD01.

Also collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9021D

Explanation: During a LOAD/REORG utility or termination of a utility, the data manager detected an inconsistent data condition. A space map page was missing from the table space. This abend may indicate an internal DB2 error (caused by the utilities subcomponent passing a bad start position to the data manager), but most likely occurs due to a user error. Possible causes are that the table space data set has been deleted and redefined without DB2's knowledge, or that the table space was incorrectly restored from an improper DSN1COPY of the table space.

This abend reason code is issued by the following CSECT: DSNIDLOD

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The dump is required in the event that the problem is determined to be a DB2 internal error.

User Response: Notify the system programmer.

System Programmer Response: Determine if the data set was improperly restored or deleted and redefined by the user. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I will be issued. If the message information describes page 'xx0001'X of the table space, this indicates that the data set was deleted and redefined without DB2's knowledge.

If a DB2 internal error is indicated, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00C9021E

Explanation: The data manager detected an inconsistent data condition in a segmented table space. An invalid page was requested. The page number is outside the highest formatted RBA for the page set. Either the segment chain is broken, or the table space has been truncated. A truncated table space could be a possible user error.

This abend reason code is issued by the following CSECTs: DSNISGSC, DSNISNPG
System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1][2][3][8][12][37]

---

00C90220

Explanation: The data manager detected an inconsistent data condition. In this case, free index page cannot be found in the index space. The problem could be caused by a problem detected by IRLM, such as out-of-storage, or some other problem.

This abend reason code is issued by the following CSECT: DSNISMXF.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name, table space name, and index space name. This message is issued for all pages at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

From the console output, determine if resource unavailable message DSNT500I/DSNT501I was given prior to the abend. If there is and the reason code given is 00C90092, 00C90093, or 00C90096, then refer to the description of the appropriate message in this book for more information. Otherwise, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1][2][3][8][12][37][32][33] Also collect a DSNTCOPY output of the tables and indexes before any recover is performed.

---

00C90221

Explanation: The data manager detected an inconsistent data condition. In this case, a nonsegmented space map page was read for a table space that had been defined as segmented. This problem could be caused by incorrect use of the DSN1COPY service aid or a DB2 internal problem reading the space map page.

This abend reason code is issued by the following CSECT: DSNISGUA

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of
time spanning the failure. Save this output for use in problem determination.

**System Programmer Response:** If you suspect an error in DB2, Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** SY$1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1349 for further information on DSNTCOPY misuse. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 for information on diagnosing and reporting the problem.

---

**00C90222**

**Explanation:** While starting DB2, the data manager detected a utility in process (UTUT, UTRO or UTRW) state on an object that originated from Version 2 Release 3. This abend might indicate an internal DB2 error, but most likely occurs because of a user error. A possible user error is a result of not terminating all utilities before migrating to this release.

This abend reason code is issued by the following CSECT: DSNIERST

**System Action:** The -START DB2 command fails. A record is written to SY$1.LOGREC and an SVC dump is requested. The dump is required if the problem is determined to be a DB2 internal error.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine if an improper procedure was used to migrate to this release. If the utilities were not terminated before migrating, fall back to Version 2 Release 3 and restart DB2. Use the -TERM UTILITY command to terminate utilities, use the -DISPLAY UTILITY command to make sure no utility job is currently active, stop DB2, and remigrate to this release.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 for information on identifying and reporting the problem.

---

**00C90303**

**Explanation:** An attempt to make the database exception table (DBET) consistent failed after an agent failure.

**System Action:** The DB2 subsystem abends, a record is written to SY$1.LOGREC, and an SVC dump is requested.

**Problem Determination:** This reason code is issued by the following CSECT: DSNIDBPX

Restating the member rebuilds the local DBET. Analyze SY$1.LOGREC and the dump to determine why the agent failed and why the attempt to make the DBET consistent failed.

---

**00C90304**

**Explanation:** START DATABASE recovery of GRECP cannot proceed because the recover base RBA value in the header page for the object is invalid. The following might have occurred:

- The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.
- DSN1COPY RESET utility command.

**System Action:** The GRECP recovery for this object is terminated; all other objects being recovered by this START DATABASE command are not affected.

**System Programmer Response:** Use the RECOVER utility without the LOGONLY option.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349: 1, 5

This abend reason code is issued by the following CSECT: DSNISREC

| 00C90611 |
| Explanation: | The Security Server was unable to process this row-level, Multilevel Security (MLS) request. |
| System Action: | The operation that was requested is not performed. |
| System Programmer Response: | Refer to the Security Server documentation for advice regarding corrective action, and an explanation of the SAF/RACF return/reason codes that were placed in resource-name. |

| 00C90614 |
| Explanation: | DB2 attempted to load a DBD during DB2 startup in deferred mode. |
| System Action: | Startup continues, and the DBD is not loaded. |
| User Response: | After DB2 startup is complete, the DBD can be loaded or recovered. |

| 00C90D01 |
| Explanation: | DB2 detected an inconsistent condition. An entry in the auxiliary index was not found. The error is probably caused by not recovering all table spaces in a table space set to the same point-in-time. |
| This abend reason code is issued by the following CSECTs: DSNONLLE and DSNOTCSO |  |
| System Action: | A record is written to SYS1.LOGREC and an SVC dump is requested. |
| System Programmer Response: | If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem. |
| Problem Determination: | Message DSNI013I is issued to identify the index page. Run CHECK INDEX on the auxiliary index followed by CHECK DATA on the base table space in order to identify the inconsistencies. See DB2 Utility Guide and Reference for information about CHECK INDEX and CHECK DATA. |
| Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 3, 5 |
Chapter 39. X’D1……’ codes

For X’D1’ codes, DB2 provides the following diagnostic information in the SYS1.LOGREC variable recording area (VRA) of the SDWA for many of the reason codes:

**MODID**
Name of module issuing the abend

**LEVEL**
Change level

**COMPONENT**
Subcomponent ID

**REGISTERS**
General purpose registers (GPRs) 0 through 15 at time of abend

---

**00D10010**

**Explanation:** The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issues this reason code. The RANGE parameter on the OPEN request specifies the address of a 12-byte area containing the log relative byte address (RBA) range to be processed by subsequent GET requests. However, the RBA specified in the second six bytes of the RANGE parameter (which indicates the end of the log RBA) is less than or equal to the RBA specified in the first six bytes of the RANGE parameter (which indicates the start of the log RBA).

This reason code is issued by the following CSECT: DSNJRS01

**System Action:** In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 8 in register 15 and a reason code of 00D10010 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user application program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

**System Programmer Response:** Correct the RANGE RBA parameter input, and resubmit the request.

---

**00D10011**

**Explanation:** The DB2 stand-alone log services OPEN and GET processing macro (DSNJSLR) issued this reason code. During the initial processing of a FUNC=OPEN or FUNC=GET request, storage is obtained to contain the control blocks and other information required to process this request. An MVS GETMAIN failed when attempting to obtain the required storage.

This reason code is issued by the following CSECTs: DSNJRS01 DSNJRS03 DSNJRS04

**System Action:** In response to the DSNJSLR FUNC=OPEN or FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10011 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

**System Programmer Response:** In all likelihood, the REGION parameter on the EXEC statement for the user program is too small. Increase the REGION size, and resubmit the user program.

---

**00D10012**

**Explanation:** The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The Job Control Language (JCL) for the user program that uses the DSNJSLR macro must specify either the use of the bootstrap data set (BSDS) or, in the absence of the BSDS, the active or archive data set(s) which is used in the processing. The FUNC=OPEN request failed because neither BSDS nor any log data set is allocated for the job.
00D10013 • 00D10015

This reason code is issued by the following CSECT: DSNJRS01

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 8 in register 15 and a reason code of 00D10012 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

System Programmer Response: Correct the JCL and resubmit the user program.

00D10013

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS).

This reason code is issued by the following CSECT: DSNJRS04

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10013 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM OPEN error return code is placed in SLRFERG15. The ACB error code (ACBERFGLG) is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

System Programmer Response: Two choices are available:
1. Continue to use the BSDS method of access. If this choice is made, then the FUNC=OPEN invocation must specify a range of RBAs to be examined by use of the RANGE parameter.
2. Replace the use of the BSDS method of access. This can be done by using explicit archive data set ddnames and/or active log data set ddnames in the JCL used to invoke the user-written application program.

00D10015

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The VSAM OPEN of the bootstrap data set was successful but the record format of the BSDS is invalid. An invalid BSDS is the result of a failure during a prior attempt to run conversion program DSNJCNVB.

System Action: In response to DSNJSLR
00D10016

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, MxxARCHV and/or MxxACTn DD statements were specified for a DB2 member while MxxBSDS was also specified for the same member. However, the specification of MxxARCHV and MxxACTn DD statements is mutually exclusive with the specification of MxxBSDS DD statement for the same member.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10016 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response:
Correct the JCL and rerun the job. Specify either the DD statements for the log data sets (MxxARCHV and MxxACTn) or the DD statement for the BSDS (MxxBSDS) for a given member; do not specify both.

For additional details about the stand-alone log services, including a sample of an application program that reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

00D10017

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The job control language (JCL) associated with the user-written application indicated that the logs from more than one DB2 member were to be read in CI mode. However, CI mode is allowed only when reading the log of a single DB2 system.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10017 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response:
Either remove the CI mode from the OPEN request to read log records of more than one member or change the JCL to specify only one system’s log to read its log in CI mode.

For additional details about the stand-alone log services, including a sample of an application program that reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

00D10018

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, more than one DB2 system’s logs were identified. However, on the OPEN request an RBA range was specified. When reading logs from more than one DB2 system, you cannot specify an RBA range; you must specify an LRSN range.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10018 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Correct the range specification on the OPEN request, and rerun the job. If range is specified when reading log records from multiple members, LRSN=YES must also be specified. Also range must be specified if GROUP DD or a MxxBSDS (BSDS) DD is specified in the JCL.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero
reason codes, refer to Appendix C (Volume 2) of "DB2 Administration Guide"

00D10019

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS). The error was determined to be one which could be corrected by use of an AMS VERIFY, but the VERIFY also failed.

This reason code is issued by the following CSECT: DSNJRS04

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10019 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFGLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of "DB2 Administration Guide"

System Programmer Response: Refer to the z/OS DFSMS: Macro Instructions for Data Sets to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD, take appropriate action, and resubmit the FUNC=OPEN request.

00D10020

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The end of the data has been reached (end of the log, end of the user-specified log data set(s), or end of the log RBA range specified by the RANGE parameter).

This reason code is issued by the following CSECTs: DSNJRS02, DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10020 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of "DB2 Administration Guide"

System Programmer Response: This is not an error; rather, this reason code denotes a normal end of data condition. No action is necessary.

00D10021

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVEEn and ARCHIVE ddnames in the user’s JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

This reason code is issued by the following CSECT: DSNJRS02

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10021 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis and Reference" for information on identifying and reporting the problem.

System Programmer Response: As mentioned above, this may or may not be an intentional error. Check the user’s JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNUJ004) utility
to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSNILOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of the **DB2 Administration Guide** for information about recovery from log failures.

**00D10022**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records, and the log RBA of the next record following the gap is greater than the end RBA of the RBA range specified by the RANGE parameter.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVEN and ARCHIVE dnames in the user’s JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

This reason code is issued by the following CSECTs: DSNJRS03, DSNJRS04

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10022 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of the **DB2 Administration Guide**.

**System Programmer Response:** As mentioned above, this may or may not be an intentional error. Check the RBA range specified on the RANGE parameter to determine if the end RBA value was in error. Check the user’s JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNJU004) utility to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSNILOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of the **DB2 Administration Guide** for information about recovery from log failures.

**00D10023**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered, and a conditional restart record has been found beyond a conditional restart truncation point. This condition exists when a log RBA gap was intentionally forced by the user as part of log truncation during conditional restart.

This reason code is issued by the following CSECT: DSNJRS02

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10023 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length, address, and RBA of the conditional restart record are placed in fields SLRFRCALL, SLRFFRAD and SLRFRBA, respectively.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of the **DB2 Administration Guide**.

**System Programmer Response:** Use the print log map (DSNJU004) utility to examine the conditional restart control records and the RBA ranges of log data sets. Note any RBA gaps which may have resulted from the truncation of the log during a conditional restart.

If it appears that a log error may have occurred, execute the log print utility (DSNILOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of the **DB2 Administration Guide** for information about recovery from log failures.
**00D10024**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A log RBA sequence error has occurred. The RBA of the previous log record is greater than the RBA of the current log record.

This reason code is issued by the following CSECT: DSNJRSD03

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10024 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM GET error return code is placed in SLRFRS15. The RPL error code (RPLERRCD) is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of [DB2 Administration Guide](https://www.ibm.com/support/docview latex?srs=us&rs=55&context=SS1408293807FA0911051558605D85C82&mode=print&vs=9). 

**System Programmer Response:** The DD statements in the user’s Job Control Language (JCL) must specify the log data sets in ascending log RBA range order. If both ARCHIVE and ACTIVEN DD statements are included, the first archive data set must contain the lowest log RBA value.

Use the print log map (DSNJU004) utility to obtain a listing of the RBA ranges associated with each archive log data set and active log data set. If necessary:

- Adjust the concatenation sequence of the archive data sets in the user’s JCL to ensure that the log records are read in ascending RBA sequence.
- Adjust the order of the active log data sets such that the RBA range is arranged in ascending order, starting with the ACTIVE1 ddname, and progressing through the ACTIVEN ddname.

Following the above adjustments, resubmit the user’s JCL.

---

**00D10025**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A VSAM error occurred while reading an active log data set.

This reason code is issued by the following CSECT: DSNJRSD04

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10025 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA for which the GET request failed is placed in SLRFRBA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.
For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

System Programmer Response: There could be several reasons for this error:

- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on all active log data sets and all archive log data sets. This will normally occur when the user has specified the bootstrap data set (BSDS) method in the JCL.
- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on the active log data sets and/or archive log data sets supplied in the user’s JCL. This will occur when the user has supplied log data sets using the ACTIVERn and ARCHIVE dnames.

To resolve the problem, use the print log map (DSNJU004) utility to obtain a listing of the archive and active log data sets, and their corresponding RBA ranges. Check the user’s JCL and the user’s RANGE parameter to ensure that they are in harmony with one another. Correct the JCL and RANGE parameters as necessary, and rerun the application.

00D10027

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A VSAM error occurred while reading the bootstrap data set (BSDS).

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10027 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM GET error return code is placed in SLRFRG15. The RPL error code (RPLERRCD) is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

00D10028

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. Both LRSN range and CI mode read were specified on the OPEN request when reading the log of a DB2 system. However, when reading the log in CI mode, range can be specified only in RBA.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10028 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Correct the range specification on the OPEN request, and rerun the job.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

00D10029

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The BSDS data set of a member named in the BSDS data set pointed to by the GROUP DD statement cannot be allocated.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10029 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Make sure the BSDS data set of every member named in the BSDS data set pointed to by the GROUP DD statement is available for allocation. If the missing BSDS data set belongs to a member that is no longer active and its BSDS data set does not exist any more, then do not use GROUP DD to allocate required BSDS and log data sets. To read log records of other active members, specify a MxxBSDS DD statements for each active member. The print log map
(DSNJU004) utility can be used to find the name of every member’s SDS data set.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

00D1002A

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002A in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRSL01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM OPEN error return code is placed in SLRFRG15. The ACB error code (ACBERFLG) is placed in SLRFRCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

System Programmer Response: Refer to the z/OS DFSMS: Macro Instructions for Data Sets to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFRCD. Take appropriate action, and resubmit the application job.

If the SLRFRCD field contains X’1001’ (decimal 4097), then the error is the result of an inconsistency between the TESTCB parmlist generated in DSNJRSL03 and the level of MVS under which the application program was executed. Contact IBM for assistance if SLRFRCD reflects this value.

00D1002C

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set. The error was determined to be one which could be corrected; however, a system error occurred while executing an MVS TESTCB macro to determine whether the active log data set which had just been opened was a VSAM ESDS data set or a VSAM LDS data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002B in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRSL01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFRCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

System Programmer Response: Refer to the z/OS DFSMS: Macro Instructions for Data Sets to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFRCD. Take appropriate action, and resubmit the application job.

If the SLRFRCD field contains X’1001’ (decimal 4097), then the error is the result of an inconsistency between the TESTCB parmlist generated in DSNJRSL03 and the level of MVS under which the application program was executed. Contact IBM for assistance if SLRFRCD reflects this value.
**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002C in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFERG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

---

**System Programmer Response:** Refer to the z/OS DFSMS: Macro Instructions for Data Sets to determine the meaning of the VSAM OPEN error returned in SLRFERG15, and the ACB error code returned in SLRFERCD. Take appropriate action (in most cases, the problem can be solved by use of an AMS VERIFY against the active log data set named in the SLRFDDNM field of the SLRF). Once the problem is solved, resubmit the application job.

---

**00D1002D**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set. The open error was corrected by use of an access method services VERIFY, but a subsequent attempt to reposition the VSAM pointer back to the beginning of the active log data set (via access method services POINT) failed.

This reason code is issued by the following CSECT: DSNJRS03

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002D in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFERG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

---

**00D10030**

**Explanation:** The DB2 stand-alone log services GET and CLOSE processing macro (DSNJSLR) issued this reason code. The stand-alone log services uses a request block to establish communication between itself and the invoking application program. The address to the request block is returned to the application program on a FUNC=OPEN call, and is required for all subsequent stand-alone FUNC=GET and FUNC=CLOSE calls in the RBR parameter. This reason code is returned to the invoking application when the RBR does not address a valid stand-alone request block. Subsequently, the application program's request cannot be processed.

This reason code is issued by the following CSECT: DSNJRS01

**System Action:** In response to the DSNJSLR FUNC=GET or FUNC=CLOSE call, DB2 places a return code of 8 in register 15 and a reason code of 00D10030 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.
reason codes, refer to Appendix C (Volume 2) of [DB2 Administration Guide](#).

**System Programmer Response:** On a `FUNC=OPEN` call, the RBR value is returned in register 1. The application program must preserve this value for all subsequent stand-alone `FUNC=GET` and `FUNC=CLOSE` calls. Due to an application program logic error in the program which invokes the stand-alone log services, the RBR value has been compromised. Repair the application program, and resubmit the application job.

---

**00D10031**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in a log data set which was previously not opened. The user’s Job Control Language (JCL) has specified that the bootstrap data set (BSDS) be used as the guide to determining which log data sets are required. An attempt to dynamically allocate the appropriate log data set (via MVS SVC 99) failed.

This reason code is issued by the following CSECT: DSNJRS05

**System Action:** In response to the DSNJSLR `FUNC=GET` call, DB2 places a return code of 12 in register 15 and a reason code of 00D10031 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The SVC 99 error code (S99ERROR) and information code (S99INFO) are placed in the SLRFRC and SLRFINFO fields, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of [DB2 Administration Guide](#).

**System Programmer Response:** Refer to the appropriate MVS publication to determine the meaning of the SVC 99 error code (S99ERROR) returned in SLRFGR15, and SVC 99 information code (S99INFO) returned in SLRFINFO. Take the appropriate action to correct the error, and resubmit the application job.

---

**00D10040**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. An attempt is made to open the second file on the archive log tape (the first file normally contains the bootstrap data set, while the second is normally the archive log data set). If this first attempt failed because the archive log data set was not the second file on an archive tape, then the RDJFCB macro is used to change the data set sequence number from the default value of 2 to a value of 1, before the OPEN is attempted again. This reason code is generated when an error was returned from the RDJFCB macro.

This reason code is issued by the following CSECT: DSNJRS03

**System Action:** In response to the DSNJSLR `FUNC=GET` call, DB2 places a return code of 12 in register 15 and a reason code of 00D10040 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RDJFCB error code is placed in SLRFGR15. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of [DB2 Administration Guide](#).

**System Programmer Response:** Refer to the DFSMS/MVS: Using Advanced Services to determine the meaning of the RDJFCB error code returned in SLRFGR15. Take the appropriate action to correct the error, and resubmit the application job.

---

**00D10044**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. The attempt to open the archive log data set failed.

This reason code is issued by the following CSECT: DSNJRS03

**System Action:** In response to the DSNJSLR `FUNC=GET` call, DB2 places a return code of 12 in
register 15 and a reason code of 00D10044 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

System Programmer Response: Determine the cause of the QSAM OPEN error, take the appropriate action to correct the error, and resubmit the application job.

00D10048

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A QSAM GET error occurred while reading an archive log data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10048 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

System Programmer Response: Determine the cause of the QSAM GET error, take the appropriate action to correct the error, and resubmit the application job.

00D10050

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The bootstrap data set (BDS) was erroneously specified as one of the ARCHIVE data sets in the user’s Job Control Language (JCL). Consequently, the GET request failed.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10050 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the requested log record control interval is placed in SLRFRA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide

System Programmer Response: Examine the user’s JCL, and remove the occurrence of the BDS data set as one of the concatenated ARCHIVE data sets. Resubmit the application job.

00D10061

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The log record control interval (CI) requested by the application program was read successfully from an active log data set or an archive log data set. However, the physical record length returned from reading the CI is not the expected length. The GET function will complete, but will issue this reason code as a warning.

The length of a log CI in an active log data set is expected to be 4089 bytes. The length of a log CI in an archive log data set is expected to be 4096 bytes.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in
register 15 and a reason code of 00D10061 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddbname of the data set on which the activity occurred is placed in SRLFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

**System Programmer Response:** Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of DB2 did not originally construct the LRH properly.
- The log record header (LRH) for the log record segment was damaged after it was written by the DB2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected DB2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

---

**00D10063**

**Explanation:** The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The requested record was found to be a middle spanned record segment, but a preceding first record segment does not exist. The GET function will complete, but will issue this reason code as a warning.

This reason code is issued by the following CSECT: DSNJRS02

**System Action:** In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10062 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddbname of the data set on which the activity occurred is placed in SRLFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of DB2 Administration Guide.

**System Programmer Response:** Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of DB2 did not originally construct the LRH properly.
- The log record header (LRH) for the log record segment was damaged after it was written by the DB2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected DB2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.
data set on which the activity occurred is placed in SLRFFDMN.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSRLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of **DB2 Administration Guide**.

**System Programmer Response:** Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of DB2 did not originally construct the log record header (LRH) properly.
- The LRH for the log record segment was damaged after it was written by the DB2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected DB2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

---

**00D10102**

**Explanation:** A request to disable data sharing failed.

This abend reason code is issued by the following CSEC: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect an SVC dump, and contact the system programmer.

**System Programmer Response:** Obtain the SVC dump for the return code. To disable data sharing, you must run the disable data sharing job (DSNTIJ GF) and then restart DB2. For more information, see Chapter 2 of **DB2 Data Sharing: Planning and Administration**.

**Problem Determination:** General register 2 contains a return code. Explanation of the return code is as follows:

- **2** A request to disable data sharing is in the BSDS, but a conditional restart record is not present. You must use job DSNTIJGF for the correct conditional restart control record.
- **4** A request to disable data sharing is recorded in the BSDS, but the conditional restart record is not correct. You cannot request a normal conditional restart with a disable request. You must use job DSNTIJGF.
- **8** Update of the BSDS failed. Data sharing was not disabled. See DB2 code 00D10411 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart DB2.
- **10** A delete in the BSDS failed. Data sharing was not disabled. See DB2 code 00D10413 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart DB2.

---

**00D10103**

**Explanation:** DB2 failed to open the shared communications area (SCA) structure.

This abend reason code is issued by the following CSEC: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.
00D10104

Explanation: DB2 failed to find the data sharing member record in the BSDS during DB2 startup.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: If this is the first startup of a new member joining the data sharing group, run the DSNJUJZ job created to enable data sharing for this DB2 subsystem, and then restart this DB2 subsystem. Also, check whether the correct BSDS is specified in the DB2 master startup procedure. See message DSN7501A for additional problem determination.

00D10105

Explanation: DB2 found a mismatch in the shared communications area (SCA) while a new member was attempting to join a data sharing group.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: This indicates that a new member is attempting to join the data sharing group. If this a migration from DB2 3.1, then catalog migration must be completed before a new member can join this data sharing group. Wait until catalog migration completes, then restart this DB2 to join the group. Otherwise, group restart is required. Wait until group restart completes, then restart this DB2 to join the group. For more information, see Chapter 2 of DB2 Data Sharing: Planning and Administration.

00D10106

Explanation: DB2 failed to update an internal control record in the BSDS for data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: If an SCA structure already exists for this DB2 data sharing group, use the MVS command SETXCF to delete this structure, then restart DB2 to complete the re-enable process.

00D10107

Explanation: DB2 failed to insert an internal control record in the BSDS for data sharing re-enable.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 code 00D10412 for problem determination.

00D10108

Explanation: DB2 failed to write an internal control record for re-enable in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See message DSN7501A for problem determination.

00D10109

Explanation: DB2 found a shared communications area (SCA) structure during the data sharing re-enable process. This structure should not be built at this time.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Display the existing SCA structures on this MVS system.

Problem Determination: If an SCA structure already exists for this DB2 data sharing group, use the MVS command SETXCF to delete this structure, then restart DB2 to complete the re-enable process.

882 Messages and Codes
**00D1010A**

**Explanation:** DB2 failed to write a record for re-enable in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

---

**00D1010B**

**Explanation:** DB2 failed to update an internal control record in the BSDS to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** See DB2 Code 00D10411 for problem determination.

---

**00D1010C**

**Explanation:** DB2 failed to write an internal control record in the shared communications area (SCA) to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

---

**00D1010D**

**Explanation:** DB2 could not find an internal control record for data sharing in the BSDS or the shared communications area (SCA).

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Check to be sure that this DB2 system is supposed to be part of a data sharing group. If this DB2 is in a group, you can restart another DB2 subsystem that is in the same DB2 data sharing group first, and then restart. If no other DB2 subsystems exist in this group, you must recover the BSDS before restarting.

---

**00D1010E**

**Explanation:** DB2 failed to write an internal control record for a data sharing restart in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

---

**00D1010F**

**Explanation:** DB2 failed an attempt to change the generic LU or location name in the shared communications area (SCA) structure for the data sharing group.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis. All members in the data sharing group must first be stopped, then this DB2 subsystem can be restarted to make this change.

**Problem Determination:**

---

**00D10110**

**Explanation:** DB2 failed to write an internal control record for a generic LU or location name change in the shared communications area (SCA) structure.
This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** DB2 failed in a write to the SCA structure for a data sharing restart change. Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

---

**00D10111**

**Explanation:** DB2 failed to find an internal record in the shared communications area (SCA) that is needed to re-enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis. To re-enable data sharing, you must start the surviving DB2 member first before other members can be started. If this is meant to be a re-enable attempt, check whether the surviving member was started first. If this re-enable is already complete, check that this is the correct data sharing group.

Another possibility is that the SCA is damaged. Use the MVS command SETXCF to rebuild the SCA.

---

**00D10112**

**Explanation:** DB2 failed to update an internal control record in the BSDS for a generic LU or location name change.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** DB2 failed in an update to the BSDS for a data sharing generic LU or location name change. See DB2 Code 00D10411 for problem determination.

---

**00D10113**

**Explanation:** DB2 failed to update a data sharing member's information record in the BSDS to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** See DB2 Code 00D10411 for problem determination.

---

**00D10114**

**Explanation:** DB2 failed to write a data sharing member information record in the shared communications area (SCA) for a restart of data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

---

**00D10115**

**Explanation:** DB2 failed to update the data sharing record in the BSDS to reset the enable flag.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** See DB2 code 00D10411 for problem determination.

---

**00D10116**

**Explanation:** DB2 failed to update an internal control record in the BSDS for non-data sharing migration or fallback with DB2.
This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** See DB2 Code 00D10411 for problem determination.

---

**00D10117**

**Explanation:** DB2 failed to truncate and switch to a new log for data sharing re-enable.

This abend reason code is issued by the following CSECT: DSNJS001

**System Action:** DB2 startup terminates.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** Determine why DB2 failed to truncate and switch to a new log. DB2 might be using the last log. If so, determine why off-load has not occurred. See DB2 messages DSNJ319I and DSNJ320I for problem determination.

---

**00D10210**

**Explanation:** An internal logic error occurred during processing.

**System Action:** The error is recorded in SYS1.LOGREC and an SVC dump is requested. DB2 then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the System Programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump. This is likely an error in DB2.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

[Appendix B, “Problem determination,” on page 1349](#) [1] [5] [16]

---

**00D10219**

**Explanation:** DB2 found that the current LRSN is less than the prior LRSN after calculating a delta for the current LRSN.

**System Action:** DB2 terminates.

---

**Operator Response:** Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump for analysis.

**Problem Determination:** This indicates that the system time is now less than the time recorded earlier in the DB2 log data set. Check that this DB2 subsystem is using the correct BSDS and log data sets. Also check that the correct system time is being used.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00D10220**

**Explanation:** An unsuccessful completion of a LOG WRITE has occurred. An invalid write cursor ID was supplied.

This abend reason code is issued by the following CSECT: DSNJW001

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in

[Chapter 39, “X’D1.......” codes, on page 869](#)

Collect the following diagnostic items listed in

---

**00D10221**

**Explanation:** An unsuccessful completion of a LOG WRITE has occurred. An invalid number of areas was specified.

This abend reason code is issued by the following CSECT: DSNJW001

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.
Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[2]3[16].

00D10222

Explanation: An unsuccessful completion of a LOG WRITE has occurred. The record length specified was greater than 32767.

This abend reason code is issued by the following CSECT: DSNJW001

System Action: An execution unit writes a record SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[2]3[16].

00D10231

Explanation: An unsuccessful completion of a CHECK LOG has occurred. The specified RBA is beyond the end of the log.

This abend reason code is issued by the following CSECT: DSNJW004

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[2]3[16].

00D10223

Explanation: There was an attempt to modify a log data set while doing a conditional restart with CSRONLY specified.

This abend reason code is issued by the following CSECTs: DSNJB001, DSNJW001

System Action: DB2 startup terminates.

Operator Response: Notify the system programmer.

System Programmer Response: If a complete DB2 startup is desired, remove CSRONLY from the control statement. Restart DB2.

00D10232

Explanation: A request was made to force an LRSN in non-data sharing mode.

System Action: DB2 issues an SVC dump and returns an error to the requesting function.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: The requesting function can be determined from the SVC dump. It has requested a data sharing log manager function in non-data sharing.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

00D10230

Explanation: A CHECK LOG was issued and the log RBA specified in the macro had not been written to DASD at the time.

This abend reason code is issued by the following CSECT: DSNJW004

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

00D10240

Explanation: An unsuccessful completion of a CLOSE LOG FOR WRITE has occurred. An invalid write cursor ID was supplied.
This abend reason code is issued by the following CSECT: DSNJW002

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D10250**

**Explanation:** An unrecoverable error occurred while updating either the BSDS or the MVS catalog to reflect changes in active log data sets.

This abend reason code is issued by the following CSECT: DSNJW307

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. DB2 then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump. Correct the error, and restart DB2.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, see abend reason code 00D10252 for a description of the information recorded in the variable recording area (VRA) of the SDWA. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Examine the console log for a DSNJxxxx message preceding this abend to determine whether the error was a BSDS error or an MVS catalog update error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D10251**

**Explanation:** An unrecoverable error occurred in the log buffer writer.

This abend reason code is issued by the following CSECT: DSNJW008

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. DB2 then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump.

This error is usually caused by a previous error that was recorded on SYS1.LOGREC and produced an SVC dump. The SYS1.LOGREC entries and SVC dump should be examined to determine the primary error that occurred.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, see abend reason code 00D10252 for a description of the information recorded in the variable recording area (VRA) of the SDWA. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D10252**

**Explanation:** This abend reason code is used to define the format of the information recorded in the variable recording area (VRA) of the SDWA.

This abend reason code is issued by the following CSECT: DSNJW008

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and SVC dump.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, the following information is contained in the variable recording area (VRA) of the SDWA:

- Reason code 00D10252 stored with key=VRARC.
- The log buffer writer recovery tracking area is stored with key=VRARRP. These fields in the VRA are described by the system mapping macro IHAVRA.
If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10253

**Explanation:** An application program check occurred in an MVCP instruction that attempted to move a parameter list or other data from the caller's address space to the recovery log manager address space.

This abend reason code is issued by the following CSECTs:

DSNJR001 DSNJW001 DSNJW002

**System Action:** An execution unit writes a record to SYS1.LOGERC and requests an SVC dump.

**Operator Response:** Collect the SYS1.LOGERC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGERC and SVC dump. Examine the area from which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DA opcode and indicates the registers showing address and length to be moved.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10254

**Explanation:** An application program check occurred in an MVCICS instruction that attempted to move data from the recovery log manager address space to the caller's address space.

This abend reason code is issued by the following CSECT: DSNJR103

**System Action:** An execution unit writes a record to SYS1.LOGERC and requests an SVC dump.

**Operator Response:** Collect the SYS1.LOGERC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGERC and SVC dump. Examine the area to which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DA opcode and indicates the registers showing address and length to be moved.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10255

**Explanation:** DSNJR008 attempted to resume the waiting execution unit, and a failure occurred leaving the state of the resume indoubt.

This abend reason code is issued by the following CSECTs: DSNJRE08, DSNJW206

**System Action:** An execution unit writes a record to SYS1.LOGERC and requests an SVC dump. The DB2 subsystem then terminates to avoid leaving the execution unit in a state of indefinite suspension.

**Operator Response:** Collect the SYS1.LOGERC and SVC dump. Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869. In addition, register 6 has the address of the execution block (EB).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10256

**Explanation:** Recursive abends were detected while trying to reinitialize an archive log read service task.

This abend reason code is issued by the following CSECTs: DSNJR008 DSNJR206 DSNJR208

**System Action:** An execution unit writes a record to SYS1.LOGERC and requests an SVC dump. The DB2 subsystem then terminates to avoid leaving an execution unit in a state of indefinite suspension.

**Operator Response:** Collect the SYS1.LOGERC, SVC dump, and console output. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGERC, the SVC dump, and a listing of the BDSs by running the print log map (DSNJU004) utility. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869.

Collect the following diagnostic items listed in
**00D10261**

**Explanation:** While scanning the records and record segments in a log control interval (CI), it was discovered that the forward register chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

This reason code is issued by the following CSECTs:

- DSNJOFF1
- DSNJRS01
- DSNJR005
- DSNJW009
- DSNJW107

**System Action:** This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked ‘stopped’.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10261 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET feedback area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI which contains the errant log record header are placed in SLRFFRAD and SLRFRCLL, respectively. The dname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

**Operator Response:** If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

**System Programmer Response:** If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349, and Table 49, “Volume 869, “X’D1.....’ codes,” on page 869.

**Problem Determination:** If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1.....’ codes,” on page 869.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

---

**00D10262**

**Explanation:** While scanning a log control interval (CI), the offset to the last record or record segment in the CI was found to be incorrect.

This reason code is issued by the following CSECTs:

- DSNJOFF1
- DSNJRS01
- DSNJR005
- DSNJW009
- DSNJW107

**System Action:** This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked ‘stopped’.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

**Operator Response:** If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.
This reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10262 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the beginning of the CI is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of DB2 Administration Guide.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1……” codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.
Feedback register of SYS1.LOGREC (DSNJRS01), stand-alone If

If the system (CI), Explanation: 00D10264 diagnostic (DSNJSLR),

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

**00D10264**

**Explanation:** While scanning a log control interval (CI), the beginning log RBA of the CI was not the expected RBA.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009

DSNJW107

**System Action:** This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10264 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The expected RBA of the beginning of the CI is placed in SLRFRBA. The address and length of the CI are placed in SLRFRRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of **DB2 Administration Guide**.

**Operator Response:** If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

**System Programmer Response:** If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**Problem Determination:** If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “XiD…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of **DB2 Administration Guide** for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of **DB2 Administration Guide** for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

**00D10265**

**Explanation:** While scanning the records and record segments in a log control interval (CI), it was discovered the backward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009

DSNJW107

**System Action:** This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic
record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10265 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLR, respectively. The ddname of the data set on which the activity occurred is placed in SRLFDDNM.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Operator Response:** If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

**System Programmer Response:** If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

- RLM standard diagnostic information is provided under Chapter 39, "X'01...x' codes," on page 869.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

---

**Explanation:** While scanning a log control interval (CI), a unit of recovery ID or LINK RBA in some record was found to be inconsistent with the beginning log RBA of the CI.

This reason code is issued by the following CSECTs:

- DSNJOFF1
- DSNJRS01
- DSNJR005
- DSNJW009
- DSNJW107

**System Action:** This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked ‘stopped’.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10266 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the log record with the invalid RBA is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLR, respectively. The ddname of the data set on which the activity occurred is placed in SRLFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

**Operator Response:** If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.
System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

System Programmer Response: If the reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJR005), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddbname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of DB2 Administration Guide.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

System Programmer Response: If the reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJR005), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddbname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of DB2 Administration Guide.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

System Programmer Response: If the reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJR005), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddbname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of DB2 Administration Guide.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

System Programmer Response: If the reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJR005), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddbname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of DB2 Administration Guide.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, “X’D1…… codes,” on page 869.
- Refer to Part 4 (Volume 1) of DB2 Administration Guide for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of DB2 Administration Guide for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.
an active DB2 subsystem as the log buffers are
scanned before they are written to the active log, or by
the DB2 stand-alone log services GET processing
macro (DSNJSLR) as a CI is retrieved from a
user-specified active or archive log data set.
If the reason code is issued by an active DB2
subsystem, then an abend is issued. A diagnostic
record is written to SYS1.LOGREC, and an SVC dump is
requested.
• If the error was detected by DSNJOFF1, then
the archiving of the active log data set is terminated
and the faulty active log data set is marked 'stopped'.
• If the error was detected by DSNJR005, then
message DSNJ012I is issued and the calling agent is
terminated.
• If the error was detected by DSNJW009, then
message DSNJ012I is issued and the DB2 subsystem is
terminated.
• If the error was detected by DSNJW107, then the
DB2 subsystem is terminated.

If this reason code is issued as the result of DB2
stand-alone log services GET processing, no abend is
issued by the stand-alone log services CSECT
(DSNJRS01), and no information is written to
SYS1.LOGREC data set. Rather, in response to the
DSNJSLR FUNC=GET call, DB2 places a return code of
4 in register 15 and a reason code of 00D10268 in
register 0. Information about the results of the GET
request is also returned in the stand-alone log GET
Feedback Area (SLRF). The RBA of the record segment
in error is placed in SLRFRA. The address and length
of the CI are placed in SLRFRAD and SLRFRCLL,
respectively. The ddname of the data set on which the
activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log
services, refer to Appendix C (Volume 2) of DB2
Administration Guide

Operator Response:  If the reason code is issued by
an active DB2 subsystem, collect the SYS1.LOGREC
and SVC dump, and notify the system programmer.

System Programmer Response:  If the reason code
is issued by an active DB2 subsystem, obtain the
SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in
3 [16].

Problem Determination:  If the reason code is issued by
an active DB2 subsystem:
• RLM standard diagnostic information is provided under
Chapter 39, “X’D1……. codes,” on page 869.
• Refer to Part 4 (Volume 1) of DB2 Administration
Guide for information about recovery from log failures.
• Refer to Appendix C (Volume 2) of DB2
Administration Guide for failure analysis procedures,
with particular emphasis on the use of the DB2
stand-alone log Services.
• Obtain a DSN1LOGP detail report containing the log
record(s) associated with the failure.

If the reason code is issued upon return of an
invocation of the DB2 stand-alone log services macro
(DSNJSLR), then an additional user-written exit or
diagnostic routine may have to be written.

00D10269

Explanation:  An unrecoverable error was found in one
of the buffers, while moving the current log buffer to the
static write buffer ('shadow buffer') in preparation for the
physical write to the active log. Refer to Part 4 (Volume
1) of DB2 Administration Guide for information about
recovery from log failures.

This abend reason code is issued by the following
CSECT: DSNJW107

System Action:  An execution unit writes a record to
SYS1.LOGREC and requests an SVC dump. The
subsystem then terminates.

Operator Response:  Collect the SYS1.LOGREC and
SVC dump. Notify the system programmer.

System Programmer Response:  Obtain the
SYS1.LOGREC and the SVC dump. If you suspect an
error in DB2, refer to Part 2 of DB2 Diagnosis Guide
and Reference for information on identifying and
reporting the problem.

Problem Determination:  RLM standard diagnostic
information is provided under Chapter 39, “X’D1......
codes,” on page 869.

Collect the following diagnostic items listed in
3 [16].

00D10301

Explanation:  An unsuccessful completion of an OPEN
LOG FOR READ has occurred. An open log read cursor
already exists for this execution block (EB). Only one
log read cursor per EB is permitted.

This abend reason code is issued by the following
CSECT: DSNJR001

System Action:  An execution unit writes a record to
SYS1.LOGREC and requests an SVC dump. The
execution unit then terminates abnormally.

Operator Response:  Collect the SYS1.LOGREC and
SVC dump. Notify the system programmer.

System Programmer Response:  Obtain the
SYS1.LOGREC and SVC dump. Scan the read cursor
pool for a cursor with the same EB, or examine through
the DB2 trace for the problem. Trace IDs 040301 and 040302 identify OPEN entries while 040303 and 040304 are for CLOSE.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1…… codes,” on page 869. All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5. Register 6 contains the address of the EB.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [5 16]

### 00D10302

**Explanation:** An unsuccessful completion of an OPEN LOG FOR READ has occurred. A valid scope was not specified.

This abend reason code is issued by the following CSECT: DSNJR001

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1…… codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [5 16]

### 00D10303

**Explanation:** An unsuccessful completion of an OPEN LOG FOR READ has occurred. An invalid log RBA range was specified. HIGHRBA is less than LOWRBA.

This abend reason code is issued by the following CSECT: DSNJR001

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide](#) for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1…… codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [5 16]

### 00D10304

**Explanation:** An unknown function was requested in an open of a log read cursor.

**System Action:** DB2 issues a return code of 4 and reason code of 00D10304 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

### 00D10305

**Explanation:** A peer log read request was made without a peer log read cursor.

**System Action:** DB2 issues a return code of 4 and reason code of 00D10305 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

### 00D10306

**Explanation:** A request to read merged log records failed.

**System Action:** DB2 issues a return code of 4 and reason code of 00D10306 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** The requesting function has put this error code out. Check on this function.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

Chapter 39. DB2 codes 895
00D10307

Explanation: A log read open in data sharing failed because the RBA values were not increasing or were overlapping.

System Action: DB2 issues a return code of 4 and reason code of 00D10307 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10308

Explanation: A log read open in data sharing failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10308 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10309

Explanation: A peer BSDS open request failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10309 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D1030A

Explanation: A peer log read request was made in non-data sharing.

System Action: DB2 issues a return code of 4 and reason code of 00D1030A to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10310

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10311

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid write cursor ID was specified.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1...... codes,” on page 869. In addition, all log write cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBWCPHB. The LMB is pointed to by register 5. Read cursors are in a similar pool at LMBRCPHB.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10312

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid log RBA range was specified. HIGHRBA is lower than LOWRBA.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, ‘X’D1......’ codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10322

Explanation: An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with record matching the specified SCOPE is not found.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, ‘X’D1......’ codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10325

Explanation: An unsuccessful completion of a LOG READ has occurred. The sum of CDATA length value and CDATA offset value is greater than 256.

Chapter 39. DB2 codes  897
This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/docs/en/db2) for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1…… codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D10328**

**Explanation:** A LOG READ completed unsuccessfully, because a MODE request sequence was invalid. A read request specifying a sequential MODE (any MODE except DIRECT) must be preceded by an open log for read, a set read cursor range, or a read with the same MODE parameter value. It is invalid to intermix read requests with different sequential mode values.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/docs/en/db2) for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1…… codes,” on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D10329**

**Explanation:** A LOG READ completed unsuccessfully, because an I/O error occurred while reading the log data set.

Refer to Part 4 (Volume 1) of [DB2 Administration Guide](https://www.ibm.com/docs/en/db2) for information about recovery from log failures.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Examine SYS1.LOGREC and SVC dump information. Also,
examine any prior messages with a DSNJ prefix from the log buffer reader.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes, on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

### 00D1032A

**Explanation:** An unsuccessful completion of a LOG READ has occurred. BSDS does not map the specified RBA into a log data set. Either the BSDS is in error, or the log data set has been deleted.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from BSDS or log failures.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. Also, obtain a listing of the BSDS by running the print log map (DSNJU004) utility. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes, on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

### 00D1032B

**Explanation:** A LOG READ completed unsuccessfully because an error occurred while trying to allocate a log data set.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

**System Action:** An execution unit writes a record to SYS1.LOGREC and might request an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump, if a dump was produced. Notify the system programmer.

**System Programmer Response:** Examine LOGREC and SVC dump information, if a dump was produced. Also, examine any prior messages with a DSNJ prefix from recovery log manager allocation processing.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes, on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

### 00D1032C

**Explanation:** A LOG READ completed unsuccessfully, because an error occurred while opening or closing a log data set.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Examine LOGREC and SVC dump information. Also, examine prior messages from recovery log manager open/close processing. These messages have a prefix of DSNJ.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes, on page 869.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

### 00D1032D

**Explanation:** An unsuccessful completion of a LOG READ has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to the Part 2 of *DB2 Diagnosis Guide*...
and Reference for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

**00D10330**

**Explanation:** An unsuccessful completion of a Close Log for read has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR001

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

**00D10331**

**Explanation:** A LOG READ completed unsuccessfully because a LINK RBA did not point to the beginning of a LOG record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, “X’D1……’ codes,” on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.
information is provided in Chapter 39, “X'D1......' codes,” on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRPCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

**00D10332**

**Explanation:** A log read completed unsuccessfully because a link RBA pointed to a log record with a different URID. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

**System Action:** A record is written to SYS1.LOGREC and an SVC DUMP is requested. The requesting execution unit is abnormally terminated.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** While reading the log backwards using the LRHLINK RBAs, a log record was found that contained a different URID. A link read is normally done when processing a rollback or an abort. This abend is issued to prevent a rollback of the wrong transaction. If this occurs during abort processing, the subsystem is brought down. If the abend reoccurs on the subsequent restart of DB2, a conditional restart is necessary to bypass the invalid log record. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information on recovering from a log failure during restart and resolving inconsistencies resulting from conditional restart.

**Problem Determination:** RLM standard diagnostic information is provided in “Recovery Log Manager Reason Codes (X'D1')”. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRPCPHB. The LMB is pointed to by register 5 and described in the DSNDLMB macro.

**00D10334**

**Explanation:** An unsuccessful completion of a LOG READ occurred because of an invalid LOGRBA value. MODE=SEQUENTIAL DIRECT with the requested RBA does not match the start of a log record.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in “Recovery Log Manager Reason Codes (X'D1')”.

**00D10335**

**Explanation:** An unsuccessful completion of a LOG READ occurred because the log was not being read in ascending order for MODE=SEQUENTIAL DIRECT.

This abend reason code is issued by the following CSECT: DSNJR003

**System Action:** An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference
Problem Determination: RLM standard diagnostic information is provided in "Recovery Log Manager Reason Codes (X'D1')".

00D10340

Explanation: An unsuccessful completion of a LOG READ has occurred. This reflects a logic failure internal to the recovery log manager (RLM) subcomponent and is probably caused by a passed parameter list being lost or a previous abend processing a LOG READ request.

This abend reason code is issued by the following CSECT: DSNJR008

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System Programmer Response: Examine LOGREC and SVC dump information for prior abends during LOG READ processing. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D10341

Explanation: A LOG READ completed unsuccessfully because an error was detected during a Forward READ of the log record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1...... codes," on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10342

Explanation: A LOG READ completed unsuccessfully because an error was detected during a backward READ of a log record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1...... codes," on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10343

Explanation: A LOG READ completed unsuccessfully because an error was detected during a READ of a log record due to an invalid CI offset. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1...... codes," on page 869. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.
**00D10345**

**Explanation:** A LOG READ completed unsuccessfully because an error was received from a CATALOG LOCATE request for an archive log data set. The requested archive log data set might have been uncataloged or deleted.

**System Action:** An execution unit might write a record to SYS1.LOGREC and request an SVC dump.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump, if requested. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump, if requested. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RLM standard diagnostic information is provided in Chapter 39, "X'01......' codes," on page 869.

This abend reason code is issued by the following CSECT: DSNJR106

---

**00D10347**

**Explanation:** An attempt to notify a peer to force write the log buffer failed.

**System Action:** DB2 issues a return code of 4 and reason code of 00D10347 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10348**

**Explanation:** The maximum retry count was exceeded while attempting to read a log RBA.

**System Action:** The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** This problem might occur if the user has added an archive log to the BSDS with an incorrect RBA range using Change Log Inventory (DSNJU003) or if an active log dataset has been regressed such that the log dataset does not contain the RBA range that is listed in the BSDS.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10349**

**Explanation:** A deadlock occurred attempting to allocate an archive log tape.

**System Action:** DB2 issues a return code of 8 and reason code of 00D10349 to the requesting function.

**System Programmer Response:** Review the DB2 console for the terminated function.

**Problem Determination:** The requesting function was terminated. There was another function allocating the same archive log tapes. Rerun the terminated function after the present function no longer has the archive log tapes allocated.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10350**

**Explanation:** A lock or unlock failed in an attempt to allocate an archive log tape.

**System Action:** An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

**System Programmer Response:** This is an internal DB2 error, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10401**

**Explanation:** A BSDS read was requested and the record was not found.

**System Action:** DB2 returns a return code of 4 and reason code of 00D10401 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10402**

**Explanation:** A BSDS read was requested and the input area was too small.

**System Action:** DB2 returns a return code of 8 and reason code of 00D10402 to the requesting function.

**System Programmer Response:** Review the DB2 console for related errors.

**Problem Determination:** If you suspect an error in
DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10403

Explanation: A BSDS update was requested and the record was not found.

System Action: DB2 returns a return code of 4 and reason code of 00D10403 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10404

Explanation: A BSDS insert was requested and the record already exits.

System Action: DB2 returns a return code of 4 and reason code of 00D10404 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10405

Explanation: A BSDS delete was requested and the record does not exist.

System Action: DB2 returns a return code of 4 and reason code of 00D10405 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10406

Explanation: The bootstrap data set access service received a request with an invalid function code.

This abend reason code is issued by the following CSECT: DSNJB001

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10410

Explanation: An unsuccessful completion of a READ BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Use the SYS1.LOGREC and SVC dump to determine the cause of the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, ‘X’D1……’ codes,” on page 869. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset ‘X8‘ in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10411

Explanation: An unsuccessful completion of a WRITE UPDATE BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic
information is provided in Chapter 39, “X’D1......’ codes,” on page 869. In addition, the VSAM RPL fields RPLERRCD and RPLERRREG are stored in the BDS request parameter list. The address of the BDS request parameter list is stored in the BDS request element (BSDSREQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10412

Explanation: An unsuccessful completion of a WRITE INSERT BDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1......’ codes,” on page 869. In addition, the VSAM RPL fields RPLERRCD and RPLERRREG are stored in the BDS request parameter list. The address of the BDS request parameter list is stored in the BDS request element (BSDSREQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10414

Explanation: DB2 cannot dynamically allocate a copy of the requested bootstrap data set (BDS).

System Action: The system places the BDS in disabled mode.

User Response: Notify the system programmer.

System Programmer Response: Restore the BDS data set (or data sets) and restart the DB2 subsystem associated with the BDS.

Problem Determination: This reason code is issued by the following CSECT: DSNJB002

00D10415

Explanation: The bootstrap data set (BDS) is not a valid BDS for the data sharing group.

System Action: The system places the BDS in disabled mode.

User Response: Notify the system programmer.

System Programmer Response: Restore the BDS data set (or data sets) and restart the DB2 subsystem associated with the BDS.

Problem Determination: This abend reason code is issued by the following CSECT: DSNJB002

00D10416

Explanation: A peer BDS process was requested in non-data sharing.

System Action: DB2 issues a return code of 8 and reason code of 00D10416 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: Peer BDS requests cannot occur in non-data sharing.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
00D10417

Explanation: A peer BSDS process was requested for a host BSDS.

System Action: DB2 issues a return code of 8 and reason code of 00D10417 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: Peer BSDS requests cannot be processed for the host BSDS.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D10500

Explanation: The recovery log manager’s dynamic allocation function has been passed a bad function code (LRB4FUNC in control block LRB4).

This abend reason code is issued by the following CSECT: DSNJDS01

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869. In addition, trace entry 501 provides the return address to the module that passed the LRB4 with the undefined function code. It also provides the address of the LRB4. This address is also in register 7 at the time of the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10700

Explanation: An error completion code was returned by SETLOCK OBTAIN.

This abend reason code is issued by the following CSECT: DSNJM002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869. In addition, register 0 contains the return code from SETLOCK OBTAIN.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D10501

Explanation: The recovery log manager’s common access method services has passed a bad function code (DSPLFUNC in control block DSPL).

This abend reason code is issued by the following CSECT: DSNJDS05

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X’D1……” codes,” on page 869. In addition, register 0 contains the return code from SETLOCK RELEASE.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

906 Messages and Codes
00D10800

**Explanation:** The log manager command processor (DSNJJC001) was entered with an invalid Tokenized Command Segment (TCS).

This reason code is issued by the following CSECT: DSNJC001

**System Action:** A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00D10901

**Explanation:** DB2 failed to locate a data sharing member in the SCA.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

**Problem Determination:** Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00D10902

**Explanation:** A dynamic allocation of a peer’s BSDS failed.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

**Problem Determination:** Review the DB2 system console for possible errors relating the peer’s BSDS on both the host and peer DB2 system.

See the DB2 system console for messages DSNJ103I and DSNJ700I that are issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00D10903

**Explanation:** An open of a peer BSDS failed.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

**Problem Determination:** Review the DB2 system console for messages DSNJ100I and DSNJ700I that are issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00D10904

**Explanation:** There was a VSAM MRKBFR error for a peer BSDS.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

**Problem Determination:** The VSAM MRKBFR error is placed in LRB1XRC.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

00D10905

**Explanation:** There is a mismatch between the two BSDS timestamps of a peer.

**System Action:** If this was an unconditional request,
an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Problem Determination:** There is a mismatch between the two BSDS system timestamps of a peer, the BSDS change log inventory (DSNJU003) timestamps of a peer, or both. The peer log environment might have changed. This must be resolved at the peer DB2 subsystem by determining which BSDS is in error and recovering that BSDS.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10906**

**Explanation:** The change log inventory (DSNJU003) timestamp does not match the system timestamp in the peer BSDS.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Problem Determination:** A change log inventory (DSNJU003) job was executed against the peer BSDS after the last peer DB2 subsystem restart. The peer log environment might have changed. Restart the peer DB2 subsystem to reset this condition.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10907**

**Explanation:** DB2 could not locate a peer’s active log data set in the peer’s BSDS.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials including SYS1.LOGREC, an SVC dump, and console output.

**Problem Determination:** Run a print log map (DSNJU004) job against the peer’s BSDS to compare BSDS active log entries with the existing peer’s log data sets. There is probably a mismatch between them.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10908**

**Explanation:** An open of a peer’s active log failed.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

**Problem Determination:** Review the DB2 system console for possible errors relating the peer’s active log on both the host and peer DB2 system.

The VSAM CONNECT return code is in LRB1XRC if an SVC dump was taken.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10909**

**Explanation:** There was no active BSDS found for the peer DB2 subsystem.

**System Action:** If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

**Problem Determination:** Review the DB2 system console for possible errors relating the peer’s BSDSs on both the host and peer DB2 system.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

The peer BSDSs have been placed in inactive mode. There might have been an error against this peer’s BSDSs and a recovery is needed.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00D10910**

**Explanation:** A BLDVPRP/DLVRP macro failed for the BSDS buffer.

**System Action:** An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output.

**Problem Determination:** Review the DB2 system
console for possible errors relating to the BSDS.

A BLDVRP/DLVRP macro for a VSAM shared resource pool failed for the BSDS. General register 2 will contain a value of 1 for a BLDVRP macro or a value of 2 for a DLVRP macro. The macro return code is contained in general register 3. See the appropriate VSAM publication for advanced VSAM applications.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

______________________________

00D10916

Explanation: DB2 received an error while attempting to read shared communications area (SCA) information from the coupling facility.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System Programmer Response: Correct the problem with the coupling facility, and restart DB2.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

1, 2, 5

______________________________

00D10917

Explanation: DB2 received an error while attempting to write shared communications area (SCA) information to the coupling facility.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System Programmer Response: Correct the problem with the coupling facility, and restart DB2.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

1, 2, 5
**Chapter 40. X’D3......’ codes**

**00D30000**

**Explanation:** The operator canceled the allied agent at the requesting location and a dump was requested, or the agent abended with a reason code that indicated a possible communication problem. In either case, the database access agent at this location abended to take a dump to assist in problem determination.

This abend reason code is issued by the following CSECT: DSNLABRT

**System Action:** The agent terminates.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The information collected as a result of this abend is related to information collected at the requesting location. Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Contact the system programmer at the requesting location (the location name can be determined from the dump header) to coordinate further action.

**Problem Determination:** This abend was initiated in order to save diagnostic information that might be useful in problem determination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D30001**

**Explanation:** The DPS RALE was not initialized. The DSNLSPRR was invoked with the DPSB defined as the functional recovery routine (FRR) anchor. The DPSB is created after the DPS RALE is initialized.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D30002**

**Explanation:** The distributed data facility (DDF) standard ESTAE and FRR recovery routines detected a bad recovery element. This is a DB2 internal error.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D30003**

**Explanation:** While establishing an ESTAE functional recovery, DB2 detected a failure.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D30004**

**Explanation:** A database access agent received an invalid message. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:
System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSN028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

00D30009

Explanation: During allocation of a database access agent, simultaneous use of an APLE was attempted. An APLE can be used once during allocation of a database access agent. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLTMRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSN028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

00D3000A

Explanation: DB2 invoked the DSNLTDSC macro or a function of the distributed transaction manager (DTM). The required function could not be performed because the DPSB control block does not exist. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLBABR DSNLCTM1 DSNLDALB DSNLTGBK DSNLTMIG DSNLTRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.
Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: DB2 detects this error when the module that abnormally terminated is invoked and determines that the existence of the DDF agent local anchor block (DFSB) is not indicated by the DDF RAL or is not indicated by the ACE.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 00D3000B

00D3000B

Explanation: A function of the distributed transaction manager (DTM) was invoked and attempted to establish a functional recovery environment. The functional recovery element (FRE) that was created was not the first one on the chain of FREs anchored in the DPSB. This is a DB2 internal error. This abort reason code is issued by the following CSECTs: DSNLAGNT, DSNLCMT1.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSML027 and DSML028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 00D3000D

00D3000D

Explanation: A request using application-directed access starting at site 'A' referenced an object at site 'B' that is stored at site 'A'. This abend reason code is issued by the following CSECT: DSNLTMIG

System Action: The application statement was not processed.

User Response: Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local DB2. Objects stored at the local site must be referenced using a local name.

Problem Determination: If necessary, consult with the data base administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

00D3000E

Explanation: The DSMLFTMB macro was invoked to determine whether an update request was sent to a specified location, but the transaction has not yet been migrated to that location. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSML027 and DSML028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem
**00D3000F**

**Explanation:** A DB2 resource manager attempted to add a duplicate entry to the list of resource managers. This list contains the names of resource managers that can participate in the allocation of a database access agent at a remote site. This is a DB2 error.

This abend reason code is issued by the following CSECT: DSNLADRA

**System Action:** DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=ssg1S1003895) for information on identifying and reporting the problem.

**Problem Determination:** The module that incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D30010**

**Explanation:** A DB2 resource manager attempted to delete a resource manager that is not given in the list of resource managers that participate in the allocation of a database access agent at a remote site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLADRA

**System Action:** DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=ssg1S1003895) for information on identifying and reporting the problem.

**Problem Determination:** This module which incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D30011**

**Explanation:** Only a certain number of resource managers can participate in the allocation of a database access agent at a remote site. The maximum has been attained and cannot be extended. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLADRA

**System Action:** DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=ssg1S1003895) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D30012**

**Explanation:** More than one resource manager attempted to reserve the same RALE for use in the allocation of a database access agent at a remote site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLTMIG

**System Action:** DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=ssg1S1003895) for information on identifying and reporting the problem.

**Problem Determination:** The RALE was previously reserved by another resource manager and is not available.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D30013**

**Explanation:** The facility section (DSN6FAC) in the DB2 initialization parameter module does not exist.

This abend reason code is issued by the following CSECT: DSNLSSRW

**System Action:** DB2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility is terminated.
Operator Response: Notify the system programmer.

System Programmer Response: This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem Determination: Ensure that DSN6FAC was installed correctly.

00D30014

Explanation: The distributed transaction manager (DTM) detected an internal error. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLATRN  DSNLBABR  DSNLCTM1  DSNLEDDA
DSNLEDEP  DSNLEDTS  DSNLITRC  DSNLPREP
DSNLSSAB  DSNLSSBP  DSNLSSRC  DSNLTAC1
DSNLCTM1  DSNLTXC  DSNLTGBK  DSNLTXAC
DSNLMTOK  DSNLTMRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D30015

Explanation: The facility section (DSN6FAC) in the DB2 initialization parameter module is invalid.

This abend reason code is issued by the following CSECT: DSNLSSRW

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility (DDF) is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem Determination: Ensure that DSN6FAC was installed correctly.

00D30016

Explanation: An allied agent received an invalid response. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLCTM1

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D30018

Explanation: An agent exists at the site at which the abend occurred, but an agent that should exist at another site does not exist at that site. This is probably a DB2 internal error.

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The distributed data facility (DDF) error monitor, which terminates the agent that is waiting for some action to be taken by the nonexistent agent, detects this error. The module that was waiting for the action of the nonexistent agent is the module that issued the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D30019

Explanation: The distributed data facility (DDF) error monitor detected an error at another site which caused the agent at this site to be canceled. This is probably a DB2 internal error.

System Action: DB2 writes a SYS1.LOGREC record
and requests a SVC dump. The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The DDF error monitor, which terminates the agent because of an error detected at another site to which the agent is connected and for which the agent is waiting, detected this error. The module that was suspended to wait for the action to be taken at the other site is the module that issued the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][5]:

---

**00D3001A**

**Explanation:** A CANCEL THREAD or CANCEL DDF THREAD command naming a distributed thread caused the thread to be terminated. A dump is provided for diagnostic purposes as a result of the CANCEL command DUMP keyword.

**System Action:** DB2 writes a SYS1.LOGREC record and requests an SVC dump. The execution unit abends. If the canceled distributed thread is an allied thread, DB2 requests the cancelation of each associated database access thread at each of the server sites (refer to the explanation for 00D30000).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The command might have been used to terminate a thread that was in a state where no processing was occurring and the thread could not continue.

If you suspect an internal DB2 error, obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][5]:

The module that was suspended while waiting for some action to be taken is the module that issued the abend.

---

**00D3001B**

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote primary authorization ID.

When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECTs: DSNLTACC, DSNLTMRA.

**System Action:** The DSNL030I message is issued at the server. The database access agent is not allocated.

**Operator Response:** Notify the communications database administrator

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

---

**00D3001C**

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote new user primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECTs: DSNLRUSE, DSNLTEXC.

**System Action:** The DSNL030I message is issued at the server. The database access agent is not allocated.

**Operator Response:** Notify the communications database administrator

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
**00D3001D**

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote plan owner authorization ID. When the SYSTEM column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLTMRA

**System Action:** The DSNL030I message is issued at the server. The database access agent is not allocated.

**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the SYSTEM column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

---

**00D3001E**

**Explanation:** The SYSTEM PARAMETER section (DSN6SYSP) in the DB2 installation parameter module does not exist.

This abend reason code is issued by the following CSECT: DSNLTMIN

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DDF is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an installation error. Obtain a listing of the DSNZPARN module used.

**Problem Determination:** Ensure that DSN6SYSP was installed correctly.

---

**00D3001F**

**Explanation:** ACCRDBRM received from the remote server indicates incompatible server.

This abend reason code is issued by the following CSECT: DSNLTAAC1

**System Action:** The TYPDEFNAM or TYPDEF0VR values returned from the remote server in the DDM ACCRDBRM reply require data type and/or code page translations that cannot be supported by the local DB2. The local DB2 has disconnected the conversation with the remote server. DB2 requests neither a SVC dump nor a SYSLGREC record.

**User Response:** Notify the system programmer. Invoke the application after the problem has been corrected.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. Notify the system programmer at the remote location that the remote server may not be usable.

**Problem Determination:** Determine the server being accessed by examining the SQLCODE -30041 message text. Refer also to the DDM documentation of the ACCRDB command and the ACCRDBRM reply message.

---

**00D30020**

**Explanation:** The processing of the CONNECT statement at a remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) EXCSAT command sent by the local DB2 to the remote server.

This reason code is issued by the following CSECT: DSNLTEXTC

**System Action:** The remote server database access agent (DBAA) sends a DRDA reply message (for example, MGRLVRM) to the local DB2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local DB2.

**User Response:** The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local DB2 system administrator with this information.

**Operator Response:** Operator will not detect this problem.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This represents a DRDA configuration mismatch between the local DB2 and the remote server. The precise mismatch is determined from the reply message sent from the remote server to the local DB2. The reply message may be determined by examining the SQLCODE and the SQLCA tokens returned for the CONNECT statement.

The remote server and local DB2 system administrators

Chapter 40. DB2 codes 917
should consult together to determine if this is a system configuration error, or if an internal error exists at either the local DB2 or remote server.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

Collect the following local DB2 diagnostic items:
• Application source code and runtime listing.
• Relevant error and system logs spanning the time of the failure.

00D30021

Explanation: The processing of the CONNECT statement at a DB2 remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) ACCRDB command sent by the local DB2 to the remote server.

This reason code is issued by the following CSECT: DSNLTACC

System Action: The remote server database access agent (DBAA) sends a DRDA reply message (for example, VALNSPRM) to the local DB2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local DB2.

User Response: The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local DB2 system administrator with this information.

Operator Response: Operator will not detect this problem.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This represents a DRDA configuration mismatch between the local DB2 and the remote server. The precise mismatch is determined from the reply message sent from the DB2 remote server to the local DB2. The reply message may be determined by examining the SQLCODE and the SQLCA tokens returned for the CONNECT statement. It could indicate any one of the following problems (but is not limited to these):
• The EXCSAT command was not successfully processed prior to receipt of the ACCRDB command.
• The TYPDEFNAM parameter (specifies local DB2 data types) in the ACCRDB command is not supported.
• The TYPDEFOVR parameter (specifies local DB2 CCSIDs) in the ACCRDB command is not supported.

• The local DB2 product is not recognized/supported by the remote server.

The system administrators for the two locations should consult together to determine if this is a system configuration error or if an internal error exists at either location.

Collect the following diagnostic items at the remote server:
• Console output from the system on which the job was run and a listing of SYSLOG data set for the period of time spanning the failure.
• Listing of SYS1.LOGREC data set obtained by executing IFCEREP1.
• The system CCSIDs.

Collect the following diagnostic items at the local DB2:
• Application source code and runtime listing.
• Relevant error and system logs spanning the time of the failure.
• The system CCSIDs.

00D30022

Explanation: The processing of the CONNECT statement at the remote server has failed and the local DB2 Data Base Access Agent (DBAA) has been abended. This is because authorization checking has failed at the remote server.

This abend reason code is issued by the following CSECTs: DSNLTACC DSNLTExC

System Action: The conversation with the local DB2 is terminated by the remote server with an LU6.2 SNA sense code. The DBAA is abended. A DSNL030I message is written to the MVS console at the remote server, and an alert is generated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Either the user does not have the proper authority to execute at the remote server, or there is a security configuration mismatch between the local DB2 and the remote server. Examine the DSNL030I message or the alert for a more specific reason code describing the failure. Consult with the two system administrators if necessary to fix the problem. No dump is generated for this abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

**00D3002D**

**Explanation:** The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the plan owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This abend reason code is issued by the following CSECTs: DSNLTXAC DSNLTMIG

**System Action:** A resource unavailable is returned to the application. The request is not sent to the remote site.

**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

---

**00D3002E**

**Explanation:** No resync list entry exists during resynchronization when one is expected to exist. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRLA DSNLTRLO DSNLTRPA DSNLTRPN DSNLTRRH

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00D30030**

**Explanation:** This site is not considered a coordinator or participant during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRD DSNLTER DSNLTPV DSNLTVS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.
for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 56 57

---

**Problem 00D30031**

**Explanation:** An unknown 2-phase COMMIT protocol is being used during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRLO DSNLTRVS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 56 57

---

**Problem 00D30032**

**Explanation:** This site is not considered either an initiator or recipient of resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCP DSNLTRLA DSNLTRLN DSNLTRPA DSNLTRPN

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 56 57

---

**Problem 00D30033**

**Explanation:** This site is invalidly an initiator of resynchronization. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRPN

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 56 57

---

**Problem 00D30034**

**Explanation:** An INDOUBT resync list entry does not have the correct associated structures during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRPA DSNLTRPN

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 56 57
00D30035

Explanation: A resolved unit of work still has internal structures associated with it during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRPA DSNLTRLA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56](#) [57](#)

00D30036

Explanation: Either the coordinator or participant has an invalid status during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCA DSNLTRCN DSNLTRLA DSNLTRLN DSNLTRLO DSNLTRPA DSNLTRPN DSNLTRRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56](#) [57](#)

00D30037

Explanation: The resync list latch is erroneously still being held during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56](#) [57](#)

00D30038

Explanation: The storage calculation for the amount of storage needed for -DISPLAY THREAD is invalid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTDI

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56](#) [57](#)
00D30039

**Explanation:** A resync conversation is invalid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRVR

**System Action:** A record is written to SYS1.LOGERC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGERC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56 57]

---

00D3003A

**Explanation:** An error occurred during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCA DSNLTRCN DSNLTE DSNLTRLA DSNLTRLN DSNLTRPA DSNLTPN DSNLTPV DSNLTRA

**System Action:** A record is written to SYS1.LOGERC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGERC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56 57]

---

00D3003B

**Explanation:** A distributed thread was canceled because the timeout value in the DB2 startup parameters module (usually DSNZPARM) was exceeded. This value is specified by the IDLE THREAD TIMEOUT value in the DSNTIPR installation panel or the IDTHTOIN value in the DSN6FAC macro, which is used to build the DB2 start up parameters module.

**System Action:** The execution unit abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The server thread was holding DB2 resources and the requester application did not make a request to the DB2 server thread for an extended period of time. The server thread is terminated in order to releases resources that might affect other threads.

This usually occurs for one of these reasons:

- The ACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user did not make a request to the DB2 server for an extended period. This can happen, for example, during a lengthy end user absence. As a result, the server thread becomes susceptible to being canceled because of the timeout value.

Determine why the requester application has not made a request to the DB2 server in the specified time. If the design or use of the application requires additional time, increase the IDLE THREAD TIMEOUT value or set it to zero to deactivate the function.

- The INACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user:
  - Failed to commit before an extended dormant period (such as end user absence), or
  - Committed before an extended dormant period (such as end user absence), but database resources are still held because of other existing conditions.

As a result, the server thread cannot be moved to the inactive state and becomes susceptible to being canceled because of the timeout value.

Determine why the server thread was not moved to the inactive state. For information about active and inactive threads, see the description of the DDF THREADS option of the DSNTIPR installation panel in “Planning and Installing DB2” in Part 2 of [DB2 Installation Guide](#) If the design or use of the application requires additional time, increase the IDLE THREAD TIMEOUT value or set it to zero to deactivate the function.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNLBABBR
00D300F1

Explanation: The DSNLTKOS macro was invoked to extract error information from the DTMF block using the CHECK_SQCODE keyword and the DTMF block was either uninitialized or contained an SQL return code that was not negative. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The execution unit is abnormally terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This name of the module that invoked the function given as the abending module name. This is not the module in error. An earlier failing module neglected to report error information in the DTMF block.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

00D300F2

Explanation: EXCSATRD reply received from a remote server indicates an incompatible server.

This abend reason code is issued by the following CSECT: DSNLTEX1

System Action: The manager levels returned from the local DB2 in the DDM EXCSATRD reply were too low for the local DB2 to support. The local DB2 has disconnected the conversation with the remote server. DB2 requests neither an SVC dump nor a SYS1.LOGREC record written.

User Response: Notify the system programmer. Invoke the application after the problem has been corrected.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. Notify the system programmer at the remote location that the remote server is not usable.

Problem Determination: Determine the server being accessed by inspecting the SQCODE -30041 message text. Refer to the DDM documentation of the EXCSAT command.

00D300F3

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the new user primary DB2 authorization ID. When the USERMAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This abend reason code is issued by the following CSECTs: DSNLTMIG DSNLTXAC

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERMAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D300F4

Explanation: A DRDA protocol error occurred. Either a reply chain is broken but there is no DDM reply with a high enough severity to break the chain, or a message chain is unbroken in spite of a high severity code, or a conversation expected to be available has been terminated. The problem, though detected by DB2, is believed to have originated at the remote server. The server might not be a DB2 subsystem.

This abend reason code is issued by the following CSECTs:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1 DSNLTXAC

System Action: This reason code is returned to the application. A request message has likely been sent to the remote site but the outcome is uncertain. A DSNL031I message may have been written to the console. Refer to the description of this message for more information. If this reason code is returned for an SQL 'COMMIT' statement, determine if manual recovery of the unit of work is necessary.

Operator Response: Notify the operator or systems programmer for the remote server.
**System Programmer Response:** Determine the product type of the server. The DISPLAY THREAD command may be used. Refer to the server products' diagnostic recommendations. If the server DBMS is DB2, contact your IBM representative to report the problem and open an APAR.

**Problem Determination:** The problem originated with the remote server. Follow the diagnostic recommendations published for the server DBMS product, which might not be DB2.

---

**00D300F5**

**Explanation:** DDM command chaining is in use.

This reason code is issued by the following CSECT: DSNLTXAC

**System Action:** The DTM module returns to its invoker with a return code = 4.

---

**00D300F6**

**Explanation:** A valid but unexpected DDM reply was received from a remote server during a connect, commit, or abort operation. For a connect, the expected DDM reply is EXCSATRD (for EXCSAT command) or ACCRDBRM (for ACCRDB command). For a commit or abort, the expected DDM reply is ENDUOWRM. (The DDM command for a commit is RDBCMM. For a rollback, it is RDBRLLBCK).

This reason code is issued by the following CSECTs:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1

**System Action:** The local DB2 tried to access a remote server and the server replied with an unexpected DDM answer. The remote server may have suffered permanent damage. The local DB2 may or may not subsequently disconnect the conversation to the server. This is an internal-only DDF reason code. The local DB2 requests neither a SVC dump nor a SYS1.LOGREC record.

**User Response:** Contact the system programmer

**System Programmer Response:** If the SQLCA is available, examine all fields in the SQLCA. Using this information, try to determine what DDM reply was received. Contact the system programmer at the server site with this information. This is probably a programming error at the server database system, although it may be a DB2 error. The server database system may have recorded diagnostic information for the problem. If this is a DB2 error, write an APAR.

**Problem Determination:** Examine the SQL return code in the SQLCA. It should give further indication of the real cause.

---

**00D300F7**

**Explanation:** A DDM reply message was too big to fit in the DTM reply buffer.

This abend reason code is issued by the following CSECTs:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1 DSNLTXAC

**System Action:** The requesting allied agent is terminated. A SYS1.LOGREC record is written and an SVC dump is requested at the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This error should never occur. Write an APAR.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

---

**00D300F8**

**Explanation:** An attempt was made to access data at a remote location that has been started in restricted access mode. When a DB2 system is started in restricted access mode, no remote inbound or outbound access is allowed.

**System Action:** Remote access is not allowed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the remote location where the remote data access was attempted. Retry the request when the remote location and/or the local DB2 has been restarted in full access mode.

---

**00D300F9**

**Explanation:** The DB2 server was unable to allocate a database access agent since the maximum number allowed was zero (ZPARM MAXDBAT value was zero).

This abend reason code is issued by the following CSECT: DSNLAGNT

**System Action:** The DB2 server terminates the conversation with a 084B6031 SNA sense code for application-directed access and a 00D300F9 DB2 code for system-directed access. A DSNL0301 message containing this reason code is written to the MVS operator console at the DB2 server site.

**System Programmer Response:** At the server, currently no data base access agents are allowed because the MAXDBAT value in the ZPARM is zero. If
access to this site from a remote site is desirable, change the MAXDBAT parameter in ZPARM to the maximum number of database access agents desired. Restart DB2 at the server. Notify the user to rerun the application.

**00D300FA**

**Explanation:** You attempted a COMMIT statement for a plan that specified ISOLATION (RR) and update operations were performed either at the local site or at a remote site. The COMMIT operation could not be performed because the COMMIT request could not be transmitted to a remote site where Repeatable Read operations had been performed.

This abend reason code is issued by the following CSECT: DSNLCMT1

**System Action:** All update operations were backed out.

**System Programmer Response:** Determine why the COMMIT failed and retry the application.

**00D300FB**

**Explanation:** A resource was not available during database access agent allocation at a remote site.

This abend reason code is issued by the following CSECTs: DSNLTACC DSNLTMRA

**System Action:** The allocation of the database access agent was unsuccessful. A 'resource not available' code is returned to the user. DB2 requests neither a SVC dump nor a SYS1.LOGREC record.

**User Response:** Notify the system programmer. Invoke the application after the problem has been corrected.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Determine the name of the resource being allocated and correct the problem.

**00D300FC**

**Explanation:** You attempted to allocate a resource at a remote site using an invalid name.

This abend reason code is issued by the following CSECTs: DSNLTACC DSNLTMRA

**System Action:** The allocation of the database access agent was unsuccessful. 'Resource not available' code is returned to the user. DB2 requests neither a SVC dump nor a SYS1.LOGREC record. This reason code is returned only for system-directed access (DSNLTMRA).

**User Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Determine the resource being allocated and correct the problem.

**00D300FF**

**Explanation:** You attempted a COMMIT statement and update operations were performed at a remote site. The success of the COMMIT operation could not be determined because a failure occurred at the remote site or in the communication link with the remote site after the request to commit the operation had been transmitted.

This abend reason code is issued by the following CSECT: DSNLCMT1

**System Action:** The remote updates have been committed or backed out, depending on when the error occurred.

**User Response:** After communication has been reestablished with the remote site, use SQL to query the updated data to determine whether the updates were committed. If the updates were not committed, rerun the application and perform the updates again.

**00D300FE**

**Explanation:** You executed a COMMIT statement and update operations were performed at a remote site. The success of the COMMIT operation could not be determined because a failure occurred at the remote site or in the communication link with the remote site after the request to commit the operation had been transmitted.

**System Action:** The remote updates have been committed or backed out, depending on when the error occurred.

**User Response:** After communication has been reestablished with the remote site, use SQL to query the updated data to determine whether the updates were committed. If the updates were not committed, rerun the application and perform the updates again.

**00D300FF**

**Explanation:** You attempted a COMMIT statement and update operations were performed at a remote site. The attempt failed.
This abend reason code is issued by the following CSECT: DSNLCMIT1

**System Action:** The updates at the remote site have been backed out.

**User Response:** Rerun the application.

**Problem Determination:** Determine why the COMMIT failed and retry the application.

---

**Explanation:** A COMMIT statement was chained to a set of commands sent to an remote server. The remote server stopped processing the chained commands before it reached the COMMIT. COMMIT was NOT performed.

This reason code is issued by the following CSECT: DSNLCMIT1

**System Action:** Any updates performed within the current unit of Work have been backed out.

**User Response:** Notify the system programmer of the failure.

After the problem causing the chain to be broken at the remote server is fixed, rerun the application and perform the updates again.

**Operator Response:** Operator will not detect this problem.

**System Programmer Response:** See “Problem Determination” section below.

**Problem Determination:** Collect the following diagnostic items from the local DB2 system:

- Listing of application program and output from application program.
- Console output and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.

Consult with the remote server system programmer to determine the cause of the error.

The remote server system programmer may need to collect the following remote server diagnostic items:

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server dumps.

---

**Explanation:** A COMMIT was attempted but failed due to a prior error. Communications to a remote site have been lost. The COMMIT operation cannot be performed because the COMMIT request could not be transmitted to a remote site. If the program has performed updates, the updates have been backed out to the prior COMMIT point.

This reason code is issued by the following CSECT: DSNLCMIT1

**System Action:** All update operations were backed out.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restart DDF at the affected sites and rerun the application.

---

**Explanation:** This reason code may be returned for a failed distributed commit using DRDA protocols. It indicates that commit has failed because an ABNUOWRM reply message was received from the server for a prior SQL statement, but an abort had not been driven at the DB2 requester prior to this commit and after the receipt of the ABNUOWRM.

An ABNUOWRM reply message is sent by the server when it has rolled back its unit-of-work in response to an unusual situation at the server (for example, deadlock or operator intervention). When an ABNUOWRM reply message is received by the requester, an abort must be driven at the requester to synchronize the distributed systems. Until an abort is driven, all subsequent SQL statements will receive an SQLCODE -906. After an abort is driven, further SQL statements will be accepted.

This reason code is issued by the following CSECT: DSNLCMIT1

**System Action:** The commit at the DB2 requester fails.

**User Response:** Scan backwards in your application for the first non -906 SQLCODE prior to the commit. This SQLCODE was returned with the ABNUOWRM from the server system. Use the server product reference manuals to determine and correct whatever problem this SQLCODE represents on the server and rerun your application. This may involve contacting your system programmer if the situation at the Server cannot be corrected or improved by changes to the application program.

**Operator Response:** The operator will not detect this problem.

**System Programmer Response:** Determine the cause of the problem represented by the SQLCODE returned with the ABNUOWRM and if necessary, work with the system programmer at the server to resolve it. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items:
• User’s application output, including SQLCAs returned for each SQL statement.

00D30104

Explanation: The unit-of-work disposition (commit or rollback) received from a DRDA server is inconsistent with the command sent (commit or rollback), and the SQL code returned from the server. For example, if a commit is sent to the server, and the reply message indicates the unit of work (UOW) was committed, but the SQL code returned is negative, then this reason code will be contained in the alert sent to NetView.

This reason code is issued by the following CSECTs: DSNL0M1 DSNLBABR.

System Action: An alert is generated and sent to NetView. Two trace records, IFCID 0191 and IFCID 0193, may be written to the Statistics Class 4 trace, and two DSNL0311 messages may be written to the console. The trace records and messages will not be written if this error was previously detected within the last 5 minutes. The Statistics Class 4 trace must be active for the trace records to be written.

An SQLCODE +30100, -30020, or -30030 is returned to the application. An SQLCODE -30020 indicates a rollback was sent to the DRDA server, but a commit unit-of-work disposition was received. An SQLCODE +30100 or -30030 conveys the unit-of-work disposition reported by the server, and replaces the original SQL return code sent by the server, which was not consistent with the UOW disposition. The original SQL return code and SQLSTATE returned by the server are saved as tokens in the SQLCA.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DRDA distributed protocol problem. Once the nature of the inconsistency is known, the server system programmer may have to be contacted to help resolve the problem.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

• Listing of the user’s application program output, including printouts of the SQLCAs received for all SQL statements.

• Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.

• Listing of the Statistics Class 4 trace records for the LUWID associated with the failing request.

If no DSNL0311 messages were written at the same time as the alert, then scan the log backwards for previous DSNL0311 messages. A DB2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the two DSNL0311 messages, locate the IFCID 0191 and 0193 trace records written for the problem by using the IFCID sequence numbers from the DSNL0311 messages.

The IFCID 0193 trace record will document the nature of the inconsistency (command sent, UOW disposition received, SQL return code received).

The IFCID 0191 trace record will document the exact data stream returned from the Server. Use this information to determine if the reply message from the server was correctly converted into the UOW disposition and the SQL return code reported in the IFCID 0193 record. If the data stream was correctly converted, then the problem lies at the server and you should contact the system programmer at the server and have him or her analyze the data stream produced by the server.

00D30105

Explanation: A distributed commit has failed because the allied agent was cancelled as a result of a STOP DDF MODE(FORCE) command during a previous execution of DDF which has terminated. When an allied agent does not issue database requests for more than 2 minutes after a STOP DDF MODE(FORCE) command is issued, DDF will come down without terminating the allied agent. The agent is cancelled when it makes its next request to DB2.

This reason code is issued by the following CSECT: DSNL0M1

System Action: The commit operation is failed and the agent is cancelled. The last unit of work was rolled back at all server systems when the STOP DDF MODE(FORCE) command was processed.

User Response: Contact the operator to re-start DDF. After DDF is re-started, continue your application’s work starting with the last unit of work that was rolled back.

Operator Response: Re-start DDF.

00D30106

Explanation: The result of a DRDA distributed commit could not be determined because the reply message from the server either was invalid or could not be deciphered.

This reason code is issued by the following CSECT: DSNL0M1

System Action: An alert is generated and sent to NetView. An IFCID 0191 trace record may be written to the statistics class 4 trace, and a DSNL0311 message may be written to the console. The trace record and
message will not be written if this error was previously detected within the last 5 minutes. The statistics class 4 trace must be active for the trace records to be written.

The requester disconnects from the server system. The state of the unit of work at the server is unknown. It may have been committed, or it may have been rolled back. An SQLCA indicating the nature of the DRDA reply message distortion is given to the application.

**User Response:** Notify the system programmer. After the problem has been resolved, re-connect to the server site to determine whether the last unit of work was committed or rolled back. Continue your application after correcting the server database (if necessary).

**Operator Response:** Notify the system programmer whenever a DSNL0311 message is written to the MVS console.

**System Programmer Response:** This is a DRDA distributed protocol problem. Once the nature of the problem is known, the server system programmer may have to be contacted to help resolve the problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items:

- Listing of the user’s application program output, including printouts of the SQLCAs received for all SQL statements.
- Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of the statistics class 4 trace records.

If no DSNL0311 message was written at the same time as the alert, then scan the log backwards for a previous DSNL0311 message. A DB2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the DSNL0311 message, locate the IFCID 0191 trace record written for the problem by using the IFCID sequence number from the DSNL0311 message.

The IFCID 0191 trace record will document the exact data stream returned from the server. Use this information to determine if the reply message from the Server was correct, and if so, the error resides with the DB2 AR.

If the data stream is incorrect, then the problem lies at the server and you should contact the system programmer at the server and have he or she analyze the data stream produced by the server.

---

**00D3010A**

**Explanation:** This might occur when a version of IMS that does not support the COMMIT VERIFY exit is running an IMS MODE=MULTI application with one or more non-DB2 servers. This is probably a user error, since this scenario is not supported by DB2 and IMS unless the IMS version is 4 or later.

IMS requested a new user SIGNON without an immediately preceding commit or abort, and your application was connected to one or more remote non-DB2 servers. In order to preserve the consistency of database updates made at several different servers, when at least one server is a non-DB2 server, a commit or abort must precede any new user SIGNON.

This reason code is issued by the following CSECT: DSNLXNEW

**System Action:** The execution unit writes a record to SYS1.LOGREC. No dump is requested. The IMS
application terminates as a result of the abend.

**Operator Response:** Collect the SYS1.LOGREC. Notify the system programmer.

**System Programmer Response:** Determine if the IMS version and release being used invokes the DB2 COMMIT VERIFY exit, which is available in DB2 Version 3 and later. Obtain the SYS1.LOGREC.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D3010B**

**Explanation:** Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the conversation SYNC_LEVEL supported by the partner changed from a cached value of SYNC to the current value NONE.

SYNC_LEVEL NONE servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back (abort).

This reason code is returned as a token in the SQLCODE -904.

This reason code is issued by the following CSECT: DSNLTAC1

**System Action:** The connection to the server is deallocated. The server’s portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

**User Response:** If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different level.

Rerun your application starting with the unit of work containing the SQL statement that received the SQLCODE -904.

---

**00D3010C**

**Explanation:** Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the partner was started with a program that does not support two-phase commit.

Such servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back.

This reason code is returned as a token in the SQLCODE -904.

This reason code is issued by the following CSECT: DSNLTAC1

**System Action:** The connection to the server is deallocated. The server’s portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

**User Response:** If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different level.

Rerun your application starting with the unit of work containing the SQL statement that received the SQLCODE -904.

---

**00D3010D**

**Explanation:** DB2 requested updates at multiple servers, but at least one server does not support distributed two-phase commit.

This reason code is issued by the following CSECT: DSNLCMT1

**System Action:** The commit fails for this unit of work (UOW). If the application is using TSO or BATCH attach, then DB2 rolls back the UOW. If the application is using CICS or IMS attach, then CICS or IMS rolls back the UOW after receiving the NO commit vote from DB2.

**User Response:** Change the application so that updates to multiple servers (including the local server) are not performed within a single UOW unless all the update servers in the UOW support distributed two-phase commit.

**Problem Determination:** In the UOW that was not committed, the first SQL statement that performed an update that was not allowed received an SQLCODE
-919. All subsequent SQL statements also received an SQLCODE -919 until a ROLLBACK or a static ROLLBACK SQL statement was executed (if either occurred).

---

00D3010E

**Explanation:** The DRDA server system does not support the authentication mechanism specified in the communications database. For example, the communications database specified that RACF passports were supposed to be used, but the server does not support it.

**System Action:** The attempt to access the remote server fails. An SQLCODE -30073 is returned to the application.

**User Response:** Notify the system programmer.

**System Programmer Response:** Modify the row in SYSIBM.LUNAMES or SYSIBM.IPNAMES to specify a security mechanism in the SECURITY_OUT column that the remote server supports.

---

00D3010F

**Explanation:** DB2 was unable to authenticate the DRDA end user, due to an error detected by RACF or DCE.

**System Action:** The end user's attempt to connect is rejected. An SQLCODE -30082 is returned to the application.

**User Response:** Notify the system programmer.

**System Programmer Response:** Correct the error detected by DCE or RACF. Both products write messages to the MVS console describing the error.

---

00D31010

**Explanation:** An internal logic error occurred while a DCRM functional service was being invoked.

This abend reason code is issued by the following CSECT: DSNLClnnn

DSNLClnnn identifies that a DCRM Conversation manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D31011

**Explanation:** An internal logic error occurred while invoking a VTAM functional service.

This abend reason code is issued by the following CSECT: DSNLVnmm

DSNLVnmm identifies that a DCRM VTAM manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the SYS1.LOGREC listing and the SVC dump.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---
**00D31012**

**Explanation:** A VTAM functional service request failed because the state of the conversation was invalid for the request.

This abend reason code is issued by the following CSECTs: DSNLVDDC DSNLVFSM

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the SYS1.LOGREC listing and the SVC dump.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57]

---

**00D31013**

**Explanation:** A DB2 message was received with an invalid message block header (MBH). The MBH is a header that precedes all messages exchanged between two DB2 subsystems.

This abend reason code is issued by the following CSECTs:

DSNLVASY DSNLRVCA DSNLRVQP

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the SYS1.LOGREC listing and the SVC dump.

**System Programmer Response:** Determine which connected sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57]

---

**00D31014**

**Explanation:** One or more invalid parameters were supplied while invoking a VTAM functional service.

This abend reason code is issued by the following CSECTs:

DSNLVASY DSNLVDDC DSNLVFSM DSNLVINF
DSNLVRCA DSNLVREQ DSNLRVQP DSNLVSCA
DSNLVSDA DSNLVSEA

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the SYS1.LOGREC listing and the SVC dump.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57]
00D31019
Explanation: A DDM protocol error was detected in a DDM reply received from a remote distributed database remote server.
This abend reason code is issued by the following CSECTs: DSNLCMSR DSNLCSRR
System Action: The attempt to access the distributed resource fails, and the failure is reported to the local DB2.
A DSNL031I message might have been written to the console. Refer to the description of this message in this book for further information.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][83]

00D3101A
Explanation: A syntax error was detected in a DDM request received from a remote distributed database local DB2.
This abend reason code is issued by the following CSECT: DSNLCRTD
System Action: The attempt to access the DB2 server fails, and the failure is reported to the local DB2.
A DSNL032I message might have been written to the console. Refer to the description of this message for further information.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][83]

00D3101B
Explanation: A DDM protocol error was detected in a DDM request received from a remote distributed database local DB2.
This abend reason code is issued by the following CSECT: DSNLCRTD
System Action: The attempt to access the DB2 server fails, and the failure is reported to the local DB2.
A DSNL032I message may have been written to the console. Refer to the description of this message for further information.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][83]

00D3101C
Explanation: DB2 has detected an error while processing a connection request from DDCS. A DB2RA connection request was received from DDCS.
This reason code is issued by the following CSECTs: DSNLCRTD and DSNLIRTR.
System Action: A DDM reply message (SYNTAXXRM) is returned to the DRDA client.
Operator Response: Notify the DDCS system administrator.
System Programmer Response: This is probably not a DB2 problem. This error is most likely caused by an incorrect entry in the DCS directory on DDCS. Refer to IBM Distributed Database Connection Services Installation and Configuration Guide for information on configuring your DDCS system.

00D31022
Explanation: The requested VTAM function for allocating a conversation was not performed because the data manager returned an unavailable resource when attempting to read the SYIBM.LOCATIONS table in the communication database (CDB). The LOCATION cannot be resolved to the remote DB2 subsystem LUNAME.
This abend reason code is issued by the following CSECT: DSNLVCML
System Action: Notification of the failure is returned to the application. The conversation is not allocated.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: For more information, refer to the explanation of message DSNL700I. Collect the following diagnostic items:
• Definitions of the communication database (CDB) table space, tables, and indexes involved in the error.
00D31023

Explanation: A request for a protected SNA conversation was rejected by a DB2 server because the SNA exchange log names (XLN) process has not yet completed with the requesting system.

This abend reason code is issued by the following CSECT: DSNLVPFV

System Action: Message DSNL030I is displayed on the system console with reason code 00D31023. The SNA conversation is rejected with SNA sense code 08640001, indicating the SNA protocol for protected conversations was violated.

User Response: Notify the DB2 system programmer.

System Programmer Response: The requesting system must have sent a valid SNA XLN request before starting a protected conversation. Contact the system programmer for the requesting system to determine why the SNA XLN process was not completed successfully.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31024

Explanation: The requested VTAM function for allocating a conversation was not performed because the location name is not defined in the SYSIBM.LOCATIONS table in the communication database (CDB).

This abend reason code is issued by the following CSECTs:

DSNLVAAC DSNLVCLM DSNLVPF5

System Action: Notification of the failure is returned to the application. The conversation is not allocated to the specified location.

Operator Response: Notify the system programmer.

System Programmer Response: Add the mode name to be selected in the SYSIBM.MODESELECT table for the authorization ID, PLANNAME, and LUNAME of the service request that failed.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31025

Explanation: The requested VTAM function for allocating a conversation was not performed because a mode name could not be found in the SYSIBM.MODESELECT table in the communication database (CDB) for the requesting thread.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: Notification of the failure is returned to the application. The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Add the mode name to be selected in the SYSIBM.MODESELECT table for the authorization ID, PLANNAME, and LUNAME of the service request that failed.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31026

Explanation: The requested VTAM function was not performed because VTAM returned a nonzero return code while attempting to communicate on a conversation.

This abend reason code is issued by the following CSECT: DSNLVRLP

System Action: Notification of the failure is returned to the application. The conversation is abnormally deallocated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNL500I or message DSNL502I, depending on the type of conversation that failed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31027

Explanation: The requested VTAM function cannot be performed because VTAM is abending or because the operator has issued a HALT NET command to terminate VTAM.

This abend reason code is issued by the following CSECTs:

DSNLVAAC DSNLVASY DSNLVCNS DSNLVDDC
DSNLVRCA DSNLVREQ DSNLVSQA DSNLVSDDA
DSNLVSEA DSNLVPSC DSNLVPF5 DSNLVROP

System Action: Notification of DDF termination is reported to the application. No remote communications are allowed. The distributed data facility is terminated.

Operator Response: Notify the system programmer.
System Programmer Response: Determine why VTAM was terminated.

00D31029

Explanation: The requested VTAM function to allocate a conversation failed. VTAM returned a nonzero return code while attempting to negotiate limits with a remote location for a mode.

This abend reason code is issued by the following CSECT: DSNLVCNS

System Action: Notification of the failure is returned to the application. All communications to the remote location on the mode fail until the CNOS is successfully negotiated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNL501I.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00D3102A

Explanation: A conversation was not allocated because a VTAM LU name contained in the LUNAME column of the SYSIBM.LULIST table was also present in the LUNAME column of the SYSIBM.LUNAMES table. A given VTAM LU name can appear in only one of these two tables.

System Action: The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure each remote VTAM LU is defined in the SYSIBM.LULIST table or the SYSIBM.LUNAMES table, but not both tables.

Problem Determination: Collect the following diagnostic items:

1. Print the contents of the SYSIBM.LUNAMES table.
2. Print the contents of the SYSIBM.LULIST table.

This abend reason code is issued by the following CSECT: DSNLVCLM

00D3102B

Explanation: A conversation was not allocated because the partner LU attempted to allocate a conversation using a blank mode name. Although DB2 tolerates CNOS requests with a blank mode name, DB2 does not accept conversations with a blank mode name.

System Action: Message DSNL030I is displayed on the system console with reason code 00D3102B. The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the definitions at the partner LU to prevent conversations from being allocated with a blank mode name.

00D31031

Explanation: The local distributed data facility (DDF) is terminating.

This abend reason code is issued by the following CSECTs:

DSNLCCCN DSNLVAAC DSNLVCNS DSNLVDDC DSNLVINF DSNLVRCA DSNLVREQ DSNLVSCA DSNLVSDA DSNLVSEA

System Action: Notification of the failure is returned to the application. DB2 does not allow any new distributed threads while DDF is in termination or is terminated.

User Response: Contact your system programmer to determine why DDF was terminated.

Operator Response: Contact the system to determine the cause of DDF termination.

System Programmer Response: To determine why DDF was terminated and then start DDF.

00D31032

Explanation: The requested VTAM function failed because the distributed data facility (DDF) at the remote location is terminating.

This abend reason code is issued by the following CSECTs:

DSNLCTR DSNLCTRM DSNLVRPL

System Action: DB2 writes a SYS1.LOGREC record. No communication on the conversation is allowed.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the DDF termination, contact the communication administrator at the location.

00D31033

Explanation: The VTAM function request to allocate a conversation failed because the thread timed-out while waiting for a session.

This abend reason code is issued by the following CSECT: DSNLVALM
System Action: Notification of the failure is returned to the application.

Operator Response: Notify the system programmer.

System Programmer Response: The defined session limit for the mode used by the thread might be too small. The CONVLIMIT specified for the mode might have to be negotiated with the communication administrator at the remote subsystem.

Problem Determination: Refer to message DSNL510I for the limit negotiated by VTAM for the location and mode used by the thread. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31034

Explanation: The MAX REMOTE CONNECTED limit was reached and the conversation was abnormally deallocated. The thread was not allowed to connect to DB2.

This abend reason code is issued by the following CSECT: DSNLVPFV

System Action: The requestor is not connected to DB2.

Operator Response: Notify the system programmer.

System Programmer Response: The maximum number of database access threads that can concurrently exist is defined by the installation option MAX REMOTE CONNECTED. When the MAX REMOTE CONNECTED limit is equal to the number of active database access threads plus the number of inactive database access threads, additional threads are not allowed to connect to DB2. Use the DDF global statistics to determine if the limit should be increased.

Problem Determination: Collect the following diagnostic items:

- DDF global statistics to determine the number of requests that failed because of the MAX REMOTE CONNECTED limit.

00D31035

Explanation: The requested VTAM function failed. The database access agent was aborted at the remote location. Notification of the failure is returned to the application. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCTRC

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31036

Explanation: The LINKNAME column of the SYSIBM.LOCATIONS table was invalid. Since LINKNAME is a foreign key of the SYSIBM.LUNAMES table, the LINKNAME column must specify one of the values provided in the LUNAME column of the SYSIBM.LUNAMES table. This error should not occur.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC, and the SVC dump.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets from the DB2 site with the inconsistently defined communications database (CDB).

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31037

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the primary DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECTS:

DSNLCCCN DSNLCSRR DSNLTMIG

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.
**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.USERNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

---

**00D31038**

**Explanation:** A conversation was not allocated for one of these reasons:

- The requesting LU is part of a DB2 sysplex. When one or more LU names within a DB2 sysplex appear in the SYSIBM.LULIST table at the remote site, all LU names within the sysplex must be identified in the SYSIBM.LULIST table at the remote site.
  - You might have intended to list all the sysplex’s LU names in the SYSIBM.LULIST table, but you did not include one or more LU names.
  - You listed a subset of the LU names in SYSIBM.LULIST but none of the LU names you listed are currently available. Please note that it can take up to 3 minutes for LU availability information to be updated following START DDF at the remote site.
- The location name sent to a remote site does not match the location name recorded in the BSDS at that remote site.
- The local SYSIBM.LULIST table is incorrectly defined for the remote location.

A DSNL0301 message might have been written to the console.

**System Action:** A record is written to SYS1.LOGREC and the conversation is not allocated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The CDB tables and DB2 BSDS parameters must correctly associate the LOCATION names with their corresponding LUNAME names.

The cause of this error is usually one of the following:

- The BSDS at the remote site does not have the correct LOCATION or LUNAME value, which causes the remote DBMS to respond to the wrong LOCATION name when receiving distributed database requests.
- The SYSIBM.LOCATIONS table at the local DB2 system has an incorrect value in the LINKNAME or LOCATION column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.

- The SYSIBM.LULIST table at the local DB2 system has an incorrect value in the LUNAME column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.
- Not all LU names in the requesting DB2 sysplex are defined in the SYSIBM.LULIST table at the remote site.
- Not all LU names in the requesting DB2 sysplex are defined in the SYSIBM.LULIST table at the server DB2 subsystem. The remote LU is not allowed access to the server subsystem.

In general, when the requester is a member of a sysplex, each member of the requesting sysplex should be defined in SYSIBM.LULIST of the server subsystem. However, there may be causes where an LU of a remote sysplex is not defined in SYSIBM.LULIST of the local subsystem to prevent the remote LU from being a candidate member when accessing the remote sysplex. This is known as “member specific routing”. If the remote sysplex LU attempts to access the local subsystem, this reason code will be returned if the remote LU is not defined in the local SYSIBM.LULIST table and is also not defined in SYSIBM.LUNAMES. Remote requesting sysplex members can be defined in SYSIBM.LULIST, or, when member specific routing requirements to the remote sysplex member are desired, the remote sysplex LU can be defined in SYSIBM.LUNAMES for inbound purposes from the remote sysplex LU that contain the appropriate inbound security characteristics.

- The local DB2 system contains a SYSIBM.LULIST row for a remote system that is not a member of a Data Sharing group. SYSIBM.LULIST rows CANNOT be defined for remote non Data Sharing server systems. Remove the SYSIBM.LULIST row for the remote systems.

**Problem Determination:**

- Determine the LUNAME and LOCATION name of the DB2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LOCATIONS table at that site.
- Print the contents of the SYSIBM.LULIST table at both the local site and the remote site.
- Determine the LUNAME and LOCATION name of the remote DBMS involved in the failure from the BSDS at the remote site.
- Issue the -DISPLAY LOCATION command to determine which LUNAMES and LOCATIONs were active at the time of failure.

This abend reason code is issued by the following CSECTs:
00D31039

Explanation: The requested VTAM function to allocate a conversation was not performed because the SYSIBM.USERNAMES table at the requesting site did not contain a row describing the remote authorization ID to be used for this DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B', outbound name translation is in effect. The SYSIBM.USERNAMES table must contain entries describing the remote authorization ID to be used for each DB2 authorization ID communicating with that LUNAME.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: A record is written to SYS1.LOGREC, and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization ID, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem Determination: Determine the LUNAME and authorization ID for the failing VTAM conversation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

58 [59]

00D3103A

Explanation: Database access agent allocation failed because the RACROUTE REQUEST=EXTRACT macro failed to locate a user profile for the DB2 primary authorization ID obtained from the SYSIBM.USERNAMES table. When the ENCRYPTED column in SYSIBM.LUNAMES specifies 'Y', the requesting DB2 system must be able to extract the encrypted password (via RACROUTE REQUEST=EXTRACT) and send this encrypted password to the responding DB2 system for validation.

This reason code is issued by the following CSECT: DSNLVINF

System Action: The reason code is returned to the application.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the new authorization ID column in SYSIBM.USERNAMES has been specified correctly for the indicated LUNAME. If you intend to use encrypted passwords, the new authorization ID must be defined to your MVS security subsystem.

Problem Determination:
• Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
• Verify that the names given in the NEWAUTHID column are defined to your MVS security subsystem properly.

00D3103B

Explanation: An attempt to allocate an LU6.2 conversation failed because the conversation limits for the desired partner LU and VTAM MODE have been reached.

This abend reason code is issued by the following CSECT: DSNIVALM

System Action: This reason code is generated internally when an attempt is made to allocate an LU6.2 conversation and conversation limits have been reached for the desired partner LU and VTAM MODE. In this situation, the requesting DB2 system will attempt to reuse one of the existing LU6.2 conversations that have already been allocated to the agent in question.

The allocate process will be retried using the existing conversation.

System Programmer Response: If you increase the LU6.2 conversation limits for the indicated partner LU and VTAM MODE, it will not be necessary for DB2 to reclaim conversations in order to allocate additional LU6.2 conversations. The reclaiming process will reduce system throughput, since the reclaimed conversation will have to service multiple SQL statements.

00D3103C

Explanation: An attempt to allocate an LU6.2 conversation failed because the specified partner LU cannot support the LU6.2 SECURITY=SAME capability (that is, the LU6.2 Already-Verified security function).

This abend reason code is issued by the following CSECT: DSNLVAAC

System Action: The attempt to allocate an LU6.2 conversation fails, and the error is reported to the DB2 application that requested access to the distributed resource.

User Response: Notify your DB2 system programmer.

System Programmer Response: DB2 will attempt to use SECURITY=SAME when connecting to remote database systems whose USERSECURITY column in the SYSIBM.LUNAMES table contains a value other than 'C'. In order to support the LU6.2 SECURITY=SAME function, the target DBMS must
Problem 938

If the diagnostic is caused by an ALREADYV at the remote DB2 subsystem.

1. The DB2 VTAM APPL definition must specify SECACPT=ALREADYV at the remote DB2 subsystem.

2. The value in the USERSECURITY column of the SYSIBM.LUNAMES table at the remote DB2 subsystem must specify a value other than 'C' in the row associated with the requesting DB2 subsystem.

**Problem Determination:** Collect the following diagnostic items:
- The VTAM APPL definition for the remote DB2 system.
- The contents of the SYSIBM.LUNAMES table.

**00D3103D**

**Explanation:** An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the request did not contain the proper security information.

This abend reason code is issued by the following CSECT: DSNLVRPL

**System Action:** The attempt to access the remote database resource failed and the failure is reported to the application.

**User Response:** Notify the communications database administrator.

**System Programmer Response:** This error is usually caused by transmitting an invalid authorization ID or password in a request to the remote site. However, this is not always the case, so it is important to review the diagnostic information at the remote site to determine the cause of the failure.

- If the remote site is a DB2 subsystem, refer to the DSNL0301 message at the remote site for the cause of the security failure. Additionally, an ALERT will be recorded in NetView (if the NetView product is available) to describe the security failure.
- If the remote site is not a DB2 subsystem, obtain any diagnostic information about the security failure at the remote site.

If you suspect the authorization ID or password is not correct, the DB2 CDB on the local DB2 system should be examined to validate the following items:

- If the remote site requires both an authorization ID and a password on LU6.ALLOCATE requests (i.e., the remote site does not accept already-verified ALLOCATE requests), the USERNAMES column of the SYSIBM.LUNAMES table at the local DB2 system must specify either 'O' or 'B'.
- If the USERNAMES column of the SYSIBM.LUNAMES table at the local DB2 system specifies 'O' or 'B', the SYSIBM.USERNAMES table will be used to determine the authorization ID and password sent on the LU6.ALLOCATE request.

If you intend to translate the authorization IDs, ensure that the NEWAUTHID column of the SYSIBM.USERNAMES table contains the correct authorization ID to be used at the remote site.

- If the remote site is a DB2 system, the ENCRYPTPWD value in the SYSIBM.LUNAMES table must exactly match the ENCRYPTPWD column of the SYSIBM.LUNAMES table at the remote site.
- If the remote site is not a DB2 system, the ENCRYPTPWD value in the SYSIBM.LUNAMES table must be set to 'N'.
- If you are transmitting passwords to the remote site, the password transmitted by the local DB2 system must exactly match the value expected by the remote site.

1. For encrypted passwords, the password sent to the remote DB2 subsystem is obtained by extracting the RACF password of the user identified by the NEWAUTHID column in the SYSIBM.USERNAMES table. This user's RACF password must exactly match the password at the remote site.

2. If password encryption is not used, the password will be taken from the PASSWORD column of the SYSIBM.USERNAMES table. This value must exactly match the password at the remote site.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D3103E**

**Explanation:** The requested VTAM function to allocate a conversation was not performed because the VTAM MODE specified a conversation limit of zero. The conversation limits must be set to a value greater than zero before a conversation can be allocated.

This abend reason code is issued by the following CSECT: DSNLVALM

**System Action:** The conversation is not allocated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you have placed entries in the SYSIBM.LUMODES table, make sure CONVLIMIT column has a nonzero value. If you are allowing the session limits to be chosen by VTAM, make sure the DSESLLIM values on the VTAM APPL and mode entries are nonzero.

**Problem Determination:** Collect the following diagnostic items:
- Determine the LUNAME and MODE name of the DB2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LUMODES table.
• Determine the session limits defined on the VTAM APPL statement and the VTAM MODE entry.

00D3103F

Explanation: An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the server at the remote LU does not support the SNA two-phase commit process.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: DB2 starts a new conversation to the remote site that does not use two-phase commit. DB2 does not attempt to use two-phase commit with this remote site until DDF is restarted.

System Programmer Response: This reason code is produced when the LU at the remote site supports two-phase commit, but the TPN at the remote LU does not support two-phase commit. This is a normal situation, so no system programmer action is required.

00D31040

Explanation: The requested VTAM function failed before the database access agent has failed. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCTRC  DSNLCSRTR  DSNLCRTD

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 failure. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 56 57.

00D31041

Explanation: The requested VTAM function to allocate a conversation was not performed because the SYSIBM.USERNAMES table at the responding site did not contain a row whose authorization ID column matches the DB2 authorization ID received from the requesting DB2 system. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', inbound name translation is in effect. The SYSIBM.USERNAMES table must contain entries describing the local DB2 authorization ID to be used for each DB2 authorization ID sent by the requesting DB2 system.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use local authorization IDs that differ from the remote DB2 authorization ID, verify that the SYSIBM.USERNAMES table has rows that correctly specify the local authorization ID to be used for each possible remote authorization ID. These rows must specify 'I' in the TYPE column of the SYSIBM.USERNAMES table.

Problem Determination: Determine the LUNAME and authorization ID for the failing VTAM conversation. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 56 57.

00D31042

Explanation: The requested VTAM function failed. The connection to the remote location was interrupted. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 56 57.
00D31043

**Explanation:** The requested VTAM function failed. The connection from the remote location was interrupted. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the failed DB2 site.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg2134956) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [58] 59.

00D31045

**Explanation:** A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security subfield that supplies the USERID, or the USERID was not 1 to 8 bytes in length.

This abend reason code is issued by the following CSECT: DSNLVPF5

**System Action:** The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

**User Response:** Notify the communications database administrator.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg2134956) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [58] 83 [59].

00D31046

**Explanation:** A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem indicated SECURITY=SAME (also known as Already-Verified) and the subsystem in question was not authorized to send requests with SECURITY=SAME.

This abend reason code is issued by the following CSECT: DSNLVPF5

**System Action:** The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console.

**User Response:** Notify the communications database administrator.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg2134956) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [58] 59.
**System Programmer Response:** The request was rejected because the SECURITY_IN column of the SYSIBM.LUNAMES table contained a 'V' in the row associated with the remote system. The value 'V' indicates that the remote system must send both a USERID and a PASSWORD, which corresponds to SECURITY_PGM in the SNA LU6.2 architecture. Users should also be aware that in the absence of a SYSIBM.LUNAMES row that specifically identifies the remote LU, a "default" SYSIBM.LUNAMES row (blank LUNAME) may be utilized, if defined, if the inbound connection is via DRDA protocols. This "default" row may not reflect the desired inbound security characteristics in which case a SYSIBM.LUNAMES row can be defined that explicitly identifies the remote LU.

If the remote LU is a member of a remote sysplex and the local system requires access to the remote sysplex, then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table although a SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST (for example when you don’t want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location).

This problem can be corrected in two ways:

1. If you would like DB2 to accept requests that are marked with SECURITY=SAME, change the SECURITY_IN value in the SYSIBM.LUNAMES table to 'A' for the remote LU in question. Also the DB2 VTAM APPL definition should specify SECACPT=ALREADY.
2. If you would like DB2 to continue to reject requests of this kind, the remote LU must be configured to send requests that contain both a USERID and PASSWORD (SECURITY=PGM in SNA LU6.2 terms).

If the remote LU is DB2, the SECURITY_OUT column in the SYSIBM.LUNAMES table must specify either 'R' or 'P' in the row associated with the local DB2 subsystem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1348.

---

**Explanation:** A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security subfield that supplies the PASSWORD, or the PASSWORD was not 1 to 8 bytes in length.

This abend reason code is issued by the following CSECT: DSNLVPF5

**System Action:** The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

**User Response:** Notify the communications database administrator.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1348.
then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table although a SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST (for example when you don’t want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location).

A DSNL030I message may have been written to the console at the server.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [58]

---

**00D31049**

**Explanation:** A request using application-directed access starting at site 'A' referenced an object at site 'B' that is stored at site 'A'.

This abend reason code is issued by the following CSECT: DSNLCCCN

**System Action:** The application statement was not processed.

**User Response:** Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local DB2. Objects stored at the local site must be referenced using a local name.

**Problem Determination:** If necessary, consult with the database administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

---

**00D3104A**

**Explanation:** A remote server issued an SNA BACKOUT, which was not sent as a reply to an SNA PREPARE or REQUEST_COMMIT. This indicates the server backed out the current unit of work without waiting for the SQL application to either commit or roll back.

This abend reason code is issued by the following CSECT: DSNLVRLP

**System Action:** The attempt to access the remote database resource fails and the failure is reported to the application. DB2 terminates the SNA conversation to the remote server and forces the application to roll back.

**User Response:** Notify the DB2 systems programmer.

**System Programmer Response:** DB2 never issues an unsolicited SNA BACKOUT. Non-DB2 servers can send an SNA BACKOUT indication when resources required to complete the unit of work are not available. For example, a deadlock might cause the non-DB2 server to send an SNA BACKOUT. Contact the system programmer for the remote system to determine why the unit of work had to be aborted.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [58]

---

**00D3104B**

**Explanation:** An SNA conversation was rejected by a DB2 server because the SNA FMH5 specified SNA persistent verification. DB2 does not support the SNA persistent verification option.

This abend reason code is issued by the following CSECT: DSNLVPF5

**System Action:** Message DSNL030I is displayed on the system console with reason code 00D3104B. The SNA conversation is rejected with SNA sense code X'080F6051', indicating the SNA security parameters in the FMH5 were not acceptable.

**User Response:** Notify the DB2 system programmer.

**System Programmer Response:** The SECACPT keyword on the VTAM APLL statement tells VTAM whether DB2 supports persistent verification. Because DB2 does not support persistent verification, the SECACPT=PERSISTV and SECACPT=AVPV options cannot be used on DB2's VTAM APLL statement.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [58]

---

**00D3104C**

**Explanation:** The SNA Exchange Log Names (XLN) process failed because of a log name mismatch between DB2 and a remote LU in the network.

This abend reason code is issued by the following CSECT: DSNLCLXI

**System Action:** The attempt to allocate an SNA two-phase commit conversation fails with reason code 00D3104C. Message DSNL410 is displayed on the system console to describe the error.

**User Response:** Contact the DB2 systems programmer.

**System Programmer Response:** The log name recorded in the DB2 log does not match the log name currently in use at the remote LU. There are indoubt units of work that need to be resolved at this DB2 system. The log name required to resolve the indoubt units of work is displayed in the DSNL410 message.

If a non-DB2 partner was started with the wrong log, it might be possible to restart the non-DB2 partner with the desired log name. This should cause the indoubt units of work to be resolved automatically.
If the partner cannot be restarted with the desired log name, the -RECOVER INDOUBT command can be used to resolve the indoubt units of work. Once the indoubt units of work are resolved, DB2 will accept an SNA XLN with a new partner log name.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00D3104D**

**Explanation:** The local DB2 system does not support connectivity to the DB2 release currently running at the remote DB2 site.

This abend reason code is issued by the following CSECT: DSNLCSIM

**System Action:** The attempt to allocate an SNA conversation is rejected with reason code 00D3104D.

**User Response:** Contact the DB2 systems programmer.

**System Programmer Response:** DB2 distributed database connections can only be established between compatible DB2 releases. For example, DB2 Version 3 can connect to DB2 2.3, but not to DB2 2.2.

In order to establish connectivity, the down-level DB2 system must be migrated to a supported release of DB2.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00D3104E**

**Explanation:** An SNA Exchange Log Names (XLN) protocol violation was detected when attempting to establish a connection to a remote site.

This abend reason code is issued by the following CSECT: DSNLCXLI

**System Action:** The attempt to allocate an SNA conversation is rejected with reason code 00D3104E. Message DSNL421E is written to the system console and IFCID 0213 is produced to describe the protocol violation.

**User Response:** Contact the DB2 systems programmer.

**System Programmer Response:** Contact the system programmer for the remote site. The invalid XLN message is recorded in the IFCID 0213 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00D3104F**

**Explanation:** A connection to a remote location was lost during a previous communication operation.

This abend reason code is issued by the following CSECTs:

DSNLBCS DSNLCSRM DSNLCSRR DSNLCMSR

**System Action:** If the communication failure occurred during a commit or abort operation, the SQL application might not be aware that a failure occurred. Messages associated with the failure were written to the system console at the time of failure. Additionally, alerts were reported to NetView at the time of failure.

**User Response:** Reestablish the connection to the remote site and reissue the SQL statement.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00D31050**

**Explanation:** DB2 expected to receive security information for the remote client but a valid DRDA SECCHK command was not received for a connection request from a DRDA application requester (AR). The DRDA SECCHK command is only valid with a DRDA security manager level greater than or equal to 5.

This can be the case if one of the following occurs:

- The DRDA AR requested a DRDA security manager less than level 5 for an SNA connection where the APPL command for DB2 was specified with the SECACPT=NONE option.
- The DRDA SECCHK command did not contain the required security information.
- The DRDA AR requested a DRDA security manager less than level 5 for a TCP/IP connection.

This abend reason code is issued by the following CSECTs: DSNLTEXC, DSNLTSEC.

**System Action:** The attempt to access the local database resource fails, the failure is reported to the SQL application, and the conversation is terminated.

**System Programmer Response:** For SNA connections, if SECACPT=NONE and the DRDA AR does not support DRDA security manager level 5, contact the DB2 security administrator to change the SECACPT option to ALREADYV or CONV to allow for security information in the VTAM FMH-5 in the form of userid or userid/password fields. If SECACPT=NONE is not changed, then DB2 cannot accept connection requests from this remote client.

For SNA connections, If SECACPT=ALREADYV or CONV, then even though userid or userid/password fields in the FMH-5 are received and validated, DB2...
must evaluate a DRDA SECCHK command if it is sent. If the DRDA AR requests this level of security but does not provide the correct information in the form of a SECCHK command, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

For TCP/IP connections, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide](#) for information on identifying and reporting the problem. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D31052**

**Explanation:** An application caused recursive access to a remote location, followed by access to another remote location, which is not permitted.

For example, an application at location LOC1 might have connected to location LOC2 and accessed a table using an alias that resolves back to LOC1. There was a subsequent remote access from LOC1 to LOCn, which caused the error.

**System Action:** The attempt to access the remote location fails. The SQL application receives a -904 SQLCODE.

**System Programmer Response:** Correct the application program so that it does not cause recursive access to a location followed by remote access from that location. The application might have used table aliases, three-part table names, stored procedures, user-defined functions, or triggers to cause the condition.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D31055**

**Explanation:** The remote location defined in the SYSIBM.LOCATIONS table could not be accessed because the TCP/IP interface to DDF is not available.

**System Action:** The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** One of the following actions should be taken:

- If the remote site is not supposed to be using TCP/IP, add a row to SYSIBM.LUNAMES defining the LUNAME used by the remote location.

---

If the remote site is correctly defined in the CDB, examine the messages written to the console during -START DDF processing. Those messages describe any errors that would prevent DDF from using TCP/IP.

- Determine if DB2 is started in restricted access mode. If so, retry the request when DB2 has been started in full access mode.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D31056**

**Explanation:** The PORT column of the SYSIBM.LOCATIONS table could not be converted to a TCP/IP port number by the getservbyname TCP/IP socket call.

This abend reason code is issued by the following CSECT: DSNLxxxx

**System Action:** The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL514, DSNL517, or DSNL518 is written to the console describing the error.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use the information in the DSNL514, DSNL517, or DSNL518 message to resolve the error.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D31057**

**Explanation:** DB2 was able to find the row in SYSIBM.LOCATIONS for the LOCATION specified in the SQL request. However, the LINKNAME column value specified in LOCATIONS did not match any row in SYSIBM.LUNAMES or SYSIBM.PINAMES.

This abend reason code is issued by the following CSECT: DSNLxxxx

**System Action:** The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Insert a row in SYSIBM.LUNAMES or SYSIBM.PINAMES that matches the LINKNAME specified in SYSIBM.LOCATIONS.
00D31058

Explanation: The IPADDR column of the SYSIBM.IPNAMES table could not be converted to an IP address by the gethostbyname TCP/IP socket call.

This abend reason code is issued by the following CSECT: DSNLxxxx

System Action: The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL513, DSNL517, or DSNL518 is written to the console describing the error.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information in the DSNL513, DSNL517, or DSNL518 message to resolve the error.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1]

00D31059

Explanation: An attempt to allocate a conversation to the remote site failed because DB2 was unable to obtain a RACF PassTicket. The user specified an ‘R’ in the SECURITY_OUT column of the SYSIBM.IPNAMES and/or SYSIBM.LUNAMES communications database (CDB) tables for the partner site. As a result, DB2 invokes RACF to extract a PassTicket for the partner site. However, RACF could not provide a PassTicket, and the attempt failed.

System Action: The attempt to access the remote database resource failed, and the failure is reported to the application.

User Response: Notify the system programmer.

System Programmer Response: The error usually occurs due to incorrect or missing RACF definitions. To avoid this error, specify the proper RACF definitions to provide for the PassTicket. Alternatively, you may avoid the use of PassTickets by changing the SECURITY_OUT column of the SYSIBM.IPNAMES and/or SYSIBM.LUNAMES CDB table for the partner site. For information regarding PassTickets, refer to Part 3 (Volume 1) of DB2 Administration Guide

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[14][58][74]

00D3105A

Explanation: Userid, password is not valid for the location specified. An SQL CONNECT with userid/password was issued to connect to a location that requires RACF PassTicket authorization. The entry in SYSIBM.SYSLUNAMES or SYSIBM.IPNAMES for the location specified on the SQL CONNECT specifies that a connection request must contain a user ID and RACF PassTicket.

System Action: The connect request is not processed. The application is placed in the unconnected and connectable state.

00D31100

Explanation: The data communications function service was invoked with a parameter list that contained one or more invalid parameters. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCBCS DSNLCBF U DSNLCCCN DSNLCCDR DSNLCCNR DSNLCSIM DSNLCMSR DSNLCSRM DSNLCTCN DSNLCTDR DSNLCTR C

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and STS1LOGREC at the site of a DB2 abend.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[14][58][74]

00D31101

Explanation: A data communications functional service was invoked with the cursor table marked invalid. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCCCN DSNLCCDR DSNLCSRM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected
site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31102**

**Explanation:** A data communications functional service encountered an inconsistency in the requesting thread control block structure. This is an internal error.

This abend reason code is issued by the following CSECTs:

```
DSNLCCCN  DSNLCSRMD  DSNLCTCN
```

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31103**

**Explanation:** A data communications functional service received an invalid logical-unit-of-work ID (LUWID) or no LUWID. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCCCN, DSNLCCDR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC as the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31104**

**Explanation:** A data communications functional service cannot find a distributed processing block for the primary thread. This is an internal error.

This abend reason code is issued by the following CSECTs:

```
DSNLCSRMD  DSNLCTCN  DSNLBCS  DSNLCCNR  DSNLPCPR  DSNLCTDR
```

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31105**

**Explanation:** A data communications functional service detected an invalid or incorrect buffer size on a send message operation. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSRMD

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference*
for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

---

**00D31106**

**Explanation:** A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSRM

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

---

**00D31107**

**Explanation:** A data communications functional service was invoked incorrectly (protocol violation) to wait for a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRM, DSNLCCNR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

---

**00D31108**

**Explanation:** A data communications functional service was invoked incorrectly (protocol violation) to receive a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRM, DSNLCCNR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

---

**00D31109**

**Explanation:** A data communications functional service was invoked incorrectly (protocol violation) to send a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRM, DSNLCCNR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] [57].

---

**00D3110A**

**Explanation:** A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.
This abend reason code is issued by the following CSECTs: DSNLCSRMR, DSNLCBCS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D3110B**

Explanation: While a message was being sent or received by the data communications resource manager, an internal error was detected in DB2. Register 4 contains a reason code that provides additional information about this error. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCSRMR DSNLCSBC DSNLCSIM DSNLCSRMR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31110**

Explanation: Instrumentation facility component (IFC) has passed a nonzero return code to the data communications resource manager. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRTR, DSNLCSRTRD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

**00D31111**

Explanation: The instrumentation facility component (IFC) passed a nonzero return code to the data communications resource manager. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRTR, DSNLCSRRTD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)
00D31112

**Explanation:** The data communications resource manager cannot find the LUWID for the remote thread in the database thread control blocks. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCRTR, DSNLCTD

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56, 57]

---

00D31113

**Explanation:** The data communications resource manager received an invalid set of control block pointers. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCTD

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56, 57]

---

00D31114

**Explanation:** A data communications resource manager (DCCM) block for a deallocated conversation which belongs to a database access thread cannot be found. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56, 57]

---

00D31115

**Explanation:** The data communications resource manager attempt to enqueue a request for a database access thread failed. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56, 57]
00D31116

**Explanation:** The data communications resource manager received an invalid DC message number. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

00D31117

**Explanation:** The data communications resource manager received a request with an invalid response type. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

00D31118

**Explanation:** A message-processing routine returned to the data communications resource manager without the requested response. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

00D31119

**Explanation:** The data communications resource manager processed a request with an unassigned or disconnected message class. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]
00D3111A

Explanation: The data communications resource manager received an unexpected communications error when processing a request. This can occur for any of the following reasons:

- A VTAM session failure caused the premature termination of a DB2 conversation.
- A VTAM VARY NET, INACTIVE or HALT NET command was issued which interrupted a DB2 conversation.
- A DB2 internal logic error occurred.

This abend reason code is issued by the following CSECTs:

DSNLCRTR  DSNLCSIM  DSNLCSND

System Action: A record is written to SYS1.LOGREC and an SVC dump may be requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: If the abend appears to have been caused by a DB2 logic error, determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site as well as any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3111B

Explanation: The data communications resource manager cannot find the remote location for the requesting thread in the control blocks. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3111C

Explanation: An internal logic error occurred while invoking a TCP/IP functional service.

This abend reason code is issued by the following CSECT: DSNLinnn

DSNLinnn identifies that a DCRM TCP/IP manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3111F

Explanation: The maximum amount of buffered query data has been exceeded. Rather than return one block of query data, the DRDA server system elected to return multiple extra blocks. Instead of fetching all rows in all the extra blocks, the requesting application executed an SQL statement not related to the query or executed a commit while a held cursor was still open. DB2 buffers the extra in-transit blocks, however DB2 was not able to buffer the entire set of extra blocks and thus truncated the result set. The application then resumed fetching and attempted to fetch data beyond the point of truncation.

System Action: The SQL statement fails.

User Response: Notify the system programmer.
Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing application program and consider the following resolutions:

- The cursor definition may cause the server to return extra blocks. In this case, the cursor definition can be changed to reduce the number of rows, thus extra blocks, being returned by the server.

DB2 UDB for z/OS systems return extra blocks for cursors defined with the Optimize For n Rows clause and will return only enough extra blocks in order to return n rows. When a cursor is defined with Optimize For n Rows, either in the application or in a stored procedure, this indicates an application intent to fetch all n rows before attempting to execute other SQL statements. The application is not abiding by its intent and is executing other SQL, or committing, prior to fetching all n rows. In this case, the cursor definition can be changed to reduce the value of n, or the application logic can be modified to fetch all n rows or to close the cursor before executing the statement that caused the in-transit data to be buffered.

- The number of extra blocks returned can be controlled by DB2 installation parameters. The maximum number of extra blocks requested by a DB2 requester system is determined by the “Extra Blocks Req” option of the DSNTIP5 DB2 installation panel. This value can be reduced which prevents the server system from returning more blocks than the DB2 requester system can buffer. Similarly, the server system may also provide a method to regulate the maximum number of extra blocks that it will return to a requester in which case this number can also be reduced. For DB2 UDB for z/OS systems, this is determined by the “Extra Blocks Srv” option of the DSNTIP5 DB2 installation panel.

For information about block fetching result sets, see Part 5 (Volume 2) of DB2 Administration Guide.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D31201

Explanation: DB2 has detected an inconsistency in the TCP/IP PORT configuration parameter between the DRDA and RSYNC ports. A BIND ipaddr was specified on the DRDA PORT statement in the PROFILE.TCPIP data set, but the BIND ipaddr was not specified on the RSYNC PORT statement in the PROFILE.TCPIP data set. When using dynamic virtual IP addresses (VIPA), DB2 requires both the DRDA PORT and RSYNC PORT to be configured to use a VIPA.

System Action: DDF is abnormally terminated.

System Programmer Response: If using dynamic VIPA to bind to a DB2 PORT number, verify that a VIPA is defined for both the DRDA PORT number and RSYNC PORT number by specifying the BIND ipaddr on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORTs for DB2. If not using dynamic VIPA to bind to DB2 PORT, remove the BIND ipaddr option on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORT numbers for DB2. After fixing the TCP/IP PORT configuration statements, start DDF.

00D31202

Explanation: DB2 has detected an inconsistent change in the TCP/IP PORT configuration parameter for the RSYNC PORT. A BIND ipaddr specified on the RSYNC PORT statement was changed in the PROFILE.TCPIP data set since DDF was started.

System Action: DDF is abnormally terminated. This change may cause outages because of invalid sysplex routing information or commit resynchronization failures due to invalid IP addresses being returned to requesters.

System Programmer Response: Verify the BIND ipaddr specified on the RSYNC PORT number in the TCP/IP PORT statement and start DDF.

00D31203

Explanation: A conversation was not allocated for one of these reasons:

- The LINKNAME was present in the SYSIBM.IPLIST table, but not in SYSIBM.INPENCES table.
- The IP address that is contained in the IPADDR column of SYSIBM.IPLIST table was also present in the IPADDR column of SYSIBM.INPENCES table. An IP address can only appear in one of these two tables.

System Action: A record is written to SYS1.LOGREC, and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the LINKNAME in SYSIBM.IPLIST table is also defined in SYSIBM.INPENCES table. Make sure the IP address is specified in the IPADDR column of SYSIBM.IPLIST table and a blank value is specified in the IPADDR column of SYSIBM.INPENCES table.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34401

Explanation: The relational data system (RDS) passed an invalid function code to the distributed RDS (DRDS). This is an internal error.
This abend reason code is issued by the following CSECT: DSNLXRDS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34404**

**Explanation:** The relational data system (RDS) passed the distributed RDS (DRDS) an invalid distributed interface block (DIB). This is an internal RDS error.

This abend reason code is issued by the following CSECT: DSNLXRDS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34405**

**Explanation:** The data communications resource manager (DCRM) passed an invalid LMPP message number to the distributed relational data system (DRDS). This is either an internal DCRM error or an internal DRDS error.

This abend reason code is issued by the following CSECT: DSNLXRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34407**

**Explanation:** The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a SEND request. This is a DCRM internal error.

This abend reason code is issued by the following CSECTs:

DSNLXQEX DSNLXQFH DSNLXQOP DSNLXQPR
**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

**00D34408**

**Explanation:** The distributed relational data system (DRDS) received an invalid LMPP from the data communications resource manager (DCRM). This is either a DCRM internal error or a DRDS internal error.

This abend reason code is issued by the following CSECTs:

DSNLXOPF  DSNXLXPF  DSNLXPR  DSNLXRTR  DSNLXQP  DSNLXPP

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

**00D3440B**

**Explanation:** The distributed relational data system (DRDS) detected an inconsistency. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLXCM  DSNLXCNV  DSNLXQS  DSNLXSA  DSNLXGET  DSNLXIVB  DSNLXOPF  DSNLXQS  DSNLXPEX  DSNLXPP  DSNLXPI  DSNLXQAL  DSNLXQCL  DSNLXQEX  DSNLXQFH  DSNLXQP  DSNLXQPR  DSNLXQR  DSNLXQRO  DSNLXQUR  DSNLXQXI  DSNLXRAP  DSNLXRAX  DSNLXRBF  DSNLXRCL  DSNLXRCM  DSNLXRC  DSNLXRAX  DSNLXRAX  DSNLXRAX  DSNLXRTF  DSNLXRQ  DSNLXRSL  DSNLXRQ  DSNLXSS  DSNLXRTR  DSNLXRUW  DSNLXXS

**System Action:** DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [56 57]

---

**00D34409**

**Explanation:** The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state transition occurred. This is a DRDS internal error.

This abend reason code is issued by the following CSECTs:
00D3440C

Explanation: The distributed relational data system (DRDS) requesting site control block must exist at this time but does not. This is an internal DRDS error.

This abend reason code is issued by the following CSECT: DXNLXRDs

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system operator.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] 57

00D3440F

Explanation: The distributed relational data system (DRDS) detected a message of invalid length from the data communications resource manager (DCRM). The message is smaller than the buffer size, but the return code from the DCRM indicates that the message is greater than one buffer. This is either an internal DRDS error or an internal DCRM error.

This abend reason code is issued by the following CSECTs: DSNLXQR, DSNLXQSQ

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system operator.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56] 57

00D34410

Explanation: The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a RECEIVE request. This is an internal DCRM error.

This abend reason code is issued by the following CSECTs: DSNLXQPR, DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at
the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34411**

**Explanation:** The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state is specified. This is an internal DRDS error.

This abend reason code is issued by the following CSECTs:

DSNLXOPF DSNLXQFH DSNLXRTR

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34412**

**Explanation:** The distributed relational data system (DRDS) detected an internal inconsistency. An internal buffer offset variable contains an invalid value. This is an internal DRDS error.

This abend reason code is issued by the following CSECT: DSNLXQGT

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34413**

**Explanation:** The data header on the message received from the responding site contains invalid information. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLXQGT, DSNLXQFH

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D34414**

**Explanation:** The relational data system (RDS) did not specify an area for the null indicator of the data. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXQGT

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00D34415

Explanation: The input host variable SQLDA format specified in the RDI is not valid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXIVB

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34416

Explanation: An incomplete response was received on a conversation when a complete response was expected.

This abend reason code is issued by the following CSECT: DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34417

Explanation: DRDS detected an illegal attempt to enter Continuous Block Fetch mode.

This abend reason code is issued by the following CSECT: DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34418

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an ‘O’ describing the remote authorization identifier to be used for the plan owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies ‘O’ or ‘B’ requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECT: DSNLXQAL

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
00D34419

**Explanation:** RDS has passed an invalid DESCRIBE request to DRDS. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXRDS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56][57]

---

00D3441B

**Explanation:** DRDS detected an invalid use of a conversation.

This abend reason code is issued by the following CSECT: DSNLXCNV

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56][57]

---

00D3441C

**Explanation:** Allocation of the distributed processing services block (DPSB) failed.

This abend reason code is issued by the following

CSECTs:

- DSNLXCV
- DSNLXQL
- DSNLXQEX
- DSNLXQFH
- DSNLXQOP
- DSNLXQPR
- DSNLXQSD
- DSNLXQXI

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56][57]
00D3441E

Explanation: The distributed relational data system (DRDS) subcomponent has determined that the function to be executed is not a valid function. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXRCM DSNLXRCN DSNLXR CX DSNLXRQX DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDing agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[56] 57

00D34420

Explanation: The application executed a dynamic COMMIT or ROLLBACK operation while executing in an environment in which DB2 is not coordinating the COMMIT/ROLLBACK process (for example, IMS or CICS). This is an application error.

This abend reason code is issued by the following CSECT: DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[56] 57

00D34442F

Explanation: The distributed relational data system (DRDS) subcomponent is in an invalid state and cannot process the function requested. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDing agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[56] 57
00D34423

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Data Interchange Service (DDIS) subcomponent on an invocation to generate a request. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXPRS DSNLXRAX DSNLXRBF DSNLXRCL
DSNLXRCM DSNLXRDT DSNLXRTF DSNLXROP
DSNLXRSL DSNLXRSP

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34425

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Data Communications Resource Manager (DC) subcomponent. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXRAX DSNLXRBF DSNLXRCL DSNLXRCM
DSNLXRCX DSNLXRCX DSNLXRTF DSNLXROP
DSNLXRQX DSNLXRQX DSNLXRSP

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D34426

Explanation: The distributed relational data system (DRDS) subcomponent has detected an invalid date format in DSNHDECP. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRSM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC
sets or similar data from each connected site, the SVC
dump at the site of the DB2 failure, and any related
dumps from each connected site. Refer to Part 2 of
*DB2 Diagnosis Guide and Reference* for information on
identifying and reporting the problem.

**Problem Determination:** Collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [56, 57]

---

**00D34427**

**Explanation:** The distributed relational data system
(DRDS) subcomponent has detected an invalid time
format in DSNHDECP. This is a DB2 internal error.

This abend reason code is issued by the following
CSECT: DSNLXRCL

**System Action:** A record is written to SYS1.LOGREC
and an SVC dump is requested at the site of the DB2
ABEND.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which
sites the ABENDing agent was connected to by
examining the DSNL027 and DSNL028 SYSLOG
console messages at the site of the DB2 ABEND.
Obtain copies of the SYS1.LOGREC and SYSLOG data
sets or similar data from each connected site, the SVC
dump at the site of the DB2 failure, and any related
dumps from each connected site. Refer to Part 2 of
*DB2 Diagnosis Guide and Reference* for information on
identifying and reporting the problem.

**Problem Determination:** Collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [56, 57]

---

**00D34429**

**Explanation:** The distributed relational data system
(DRDS) subcomponent has detected that the call type
in the RDI is invalid. This is a DB2 internal error.

This abend reason code is issued by the following
CSECT: DSNLXRST

**System Action:** A record is written to SYS1.LOGREC
and an SVC dump is requested at the site of the DB2
ABEND.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which
sites the ABENDing agent was connected to by
examining the DSNL027 and DSNL028 SYSLOG
console messages at the site of the DB2 ABEND.
Obtain copies of the SYS1.LOGREC and SYSLOG data
sets or similar data from each connected site, the SVC
dump at the site of the DB2 failure, and any related
dumps from each connected site. Refer to Part 2 of
*DB2 Diagnosis Guide and Reference* for information on
identifying and reporting the problem.

**Problem Determination:** Collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [56, 57]
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 56 57

00D3442E

Explanation: The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

The local DB2 has received an ENDUOWRM that indicates that the remote server processed a dynamic COMMIT request successfully; however, the SQLCARD that accompanies the ENDUOWRM contains a negative SQL return code.

This reason code is issued by the following CSECT: DSNLXRAX

System Action: An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE -30100 for this operation.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Examine the trace record associated with the failing request’s LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 63

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 49

00D3442F

Explanation: The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

The inconsistency may manifest itself as follows:

- In the processing of an embedded SELECT SQL statement, a prior execution of this embedded SELECT SQL statement resulted in a SQLDTARD that is NOT the same as the SQLDTARD received on the current execution of this SQL statement.

- In the processing of an OPEN cursor SQL statement, a prior description of the resultant data, obtained either as a result of a PREPARE or a prior execution of this SQL statement is NOT the same as the description of the resultant data that was received on the current execution of this SQL statement.

The data length, the data type and CCSID of each column of resultant data is checked for consistency.

This reason code is issued by the following CSECTs: DSNLXROP, DSNLXRSL

System Action: An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE -30020 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Examine the trace record associated with the failing request’s LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At the local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 63

At the remote server, collect the following items listed in Appendix B, “Problem determination,” on page 1349 [1] 49

00D34431

Explanation: The distributed relational data system (DRDS) subcomponent encountered an error while processing a FREE package request. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRURUW

System Action: The request was not processed successfully.
00D34432

**Explanation:** The Distributed Relational Data System (DRDS) subcomponent encountered a positive SQL return code during remote program BIND processing. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRUW

**System Action:** The request was successfully processed.

---

00D34433

**Explanation:** The distributed relational data system (DRDS) subcomponent encountered a negative SQL return code during remote program BIND processing. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRUW

**System Action:** The request was not successfully processed.

---

00D34434

**Explanation:** The distributed relational data system (DRDS) subcomponent was forced to deallocate the conversation. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNXLRCN

**System Action:** The request was not processed successfully.

---

00D34436

**Explanation:** The distributed relational data system (DRDS) subcomponent detected that a remote program BIND request specified the local site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRHCN

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the ABENDing agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 ABEND, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

00D34438

**Explanation:** The distributed relational data system (DRDS) subcomponent received an invalid SQLD value from the Relational Data System (RDS) component as a result of a DESCRIBE request. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXXSS

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the ABENDing agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 ABEND, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [56](#) [57](#)

---

00D3443A

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote plan owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECT: DSNLXALC

**System Action:** The DSNL030I message is issued at the server. The database access agent is not allocated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
**00D3443B**

**Explanation:** The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a chained request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

Examples of inconsistencies follow:

- The local DB2 believes that the chain is intact but the remote server believes that the chain has been severed.
- The local DB2 believes that the chain has been severed but the remote server believes that the chain is intact.
- The local DB2 has received a negative SQL return code while processing a response to BEGIN BIND yet the remote server has not severed the chain.

This reason code is issued by the following CSECTs: DSNLXRCX, DSNLXROX

**System Action:** An alert is generated. If this error has not been previously detected, then message DSNL031I is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During BIND, the application will receive a DSNT500I message. During execution the application will receive an SQLCODE -904 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Examine the trace record associated with the failing request’s LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At the local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

At the remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D3443C**

**Explanation:** The distributed relational data system (DRDS) received an invalid return code from the relational data system (RDS) on a string translation request. This is a DRDS internal error.

This reason code is issued by the following CSECT: DSNLXQTD

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D3443D**

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLXALC

**System Action:** The DSNL030I message is issued at the server. The database access agent is not allocated.

**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
00D3443E

**Explanation:** The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote package owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLXRCS

**System Action:** The database access agent is not allocated.

**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443F

**Explanation:** The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the package owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECT: DSNLXRCS

**System Action:** A resource unavailable is returned to the application. The request is not sent to the remote site.

**Operator Response:** Notify the communications database administrator.

**System Programmer Response:** Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

**Problem Determination:** Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D34440

**Explanation:** A timeout or deadlock was detected during remote bind processing. This can occur during BIND, REBIND, or FREE.

This reason code is issued by the following CSECT: DSNLXRUS

**System Action:** The BIND is not successful.

**User Response:** Reissue the BIND subcommand.

**System Programmer Response:** None is required.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem Determination," on page 1349.

00D34443

**Explanation:** Userid, password not valid in an IMS or CICS environment. An IMS or CICS application issued an SQL CONNECT with userid password.

**System Action:** The connect request is not processed. The application is placed in the unconnected and connectable state.

00D34444

**Explanation:** The Userid or Password submitted on a request to CONNECT to the local DB2 exceeded the maximum length supported. The maximum length for each is 8 characters.

**System Action:** The connect request is not processed. The application is placed in the unconnected and connectable state.

00D34445

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CTQRY command received from a remote requester. A previous CTQRY command specified a QRYROWSET parameter, indicating the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester and a number of rows in the requested rowset are still unfetched, and thus pending. The DRDA rules require that this subsequent CTQRY command must specify a QRYROWSET value equal to the pending rows in the rowset or must reset the query blocks from the pending rowset. The CTQRY command did not specify the QRYRSTBLK parameter to reset the query blocks, and thus this command is assumed to one that completes
the pending rowset. Since the requested QRYROWSET value does not equal the number of pending rows in the rowset requested by the previous CNTQRY, a DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. A previous CNTQRY command specified a QRYROWSET parameter, indicating the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester and a number of rows in the requested rowset are still unfetched, and thus pending. The CNTQRY command being processed specified a QRYRTNNTDA value of FALSE, but the DRDA rules require that this subsequent CNTQRY command must either explicitly or implicitly specify a QRYRTNNTDA value of TRUE. A DRDA exception is detected.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. If both the OPNQRY command and the first CNTQRY command specified QRYROWSET parameter, then all subsequent CNTQRY commands must specify the QRYROWSET parameter explicitly. The CNTQRY command did not specify a QRYROWSET parameter as required by the DRDA rules and a DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. If both the OPNQRY command and the first CNTQRY command did not specify the QRYROWSET parameter, then all subsequent CNTQRY commands must specify the QRYROWSET parameter as required by the DRDA rules and a DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
commands may not specify the QRYROWSET parameter. The CNTQRY command specified a QRYROWSET parameter which is prohibited by the DRDA rules and a DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

**00D3444A**

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. The CNTQRY is fetching data from a scrollable cursor which is being accessed in a scrollable manner by the requester. The CNTQRY command will return one or more LOB columns as LOB data, but the RTNEXTDTA parameter on the CNTQRY command (indicating how LOB values are to be returned) did not specify RTNEXTALL as required by the DRDA rules. A DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

**00D34449**

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. Scrolling parameters were specified on the CNTQRY command (such as QRYSCRORN, QRYROWNB, QRYROWSNS, QRYBLKRT, QRYRTNDTA) but either the cursor is not scrollable or the cursor is scrollable but is being accessed by the requester in a non-scrollable manner (both the OPNQRY command and the first CNTQRY command did not specify the QRYROWSET parameter). A DRDA exception is generated.

**System Action:** A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1](#).

**00D3444D**

**Explanation:** The distributed relational data system (DRDS) subcomponent detected an error. This is a DB2 internal error.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.
Operator Response: Notify the system programmer.

System Programmer Response: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3444E

Explanation: The stored procedure result set contains an unsupported data type.

System Action: The stored procedure call fails.

Programmer Response: Modify the stored procedure to return result sets that include only data types that are supported by the requester. You may also upgrade the level of the code at the requester to one that supports the data types that were returned by the server.

00D35000

Explanation: DB2 has detected a DRDA exception condition. This is a generic reason code that describes a situation not covered by any other reason codes.

This reason code is issued by the following CSECT: DSNLZxxx

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at the local DB2:

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server:

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35030

Explanation: DB2, acting as a DRDA server, detected an error while processing an SQL request from a remote DRDA client. DB2 was building a DDM query descriptor (QRYDSC or FDODSC) to return to the DRDA client, but could not do so because the descriptor required more late environment descriptors (LEDs) than DB2 can support.

System Action: The DBAA is abended. The conversation with the remote site is terminated. At the server console, the DSNL0271 message is issued, accompanied by one or more DSNL0281 messages identifying all remote sites where the distributed agent also exists and where diagnostic information might also be collected.

User Response: The SQL request issued by the client cannot be processed by DB2. As a circumvention, the SQL request can be simplified to reduce the number of LEDs required to describe the data using DRDA. LEDs may be required, for example, if columns being fetched are in a different code page (CCSID) than the default CCSID for the DB2 for MVS system.

Operator Response: Notify the application programmer or user creating the SQL statement.

If the remote DRDA client is a DB2 for MVS system, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECT: DSNLZSRD.

00D35101

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM level 6b object, other than a Reply DSS or an Object DSS, is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items
00D35102

Explanation: DB2 has detected an error in the DDM reply data object received from the remote server in response to a DDM command. The object, carried in a level 6b OBJDSS, is not defined as valid for DDM level 3.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30072 and SQLSTATE 58016.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35104

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The reply data object is not defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30071 and SQLSTATE 58015.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

• Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

• Relevant error and system logs spanning the time of the failure.

• Any relevant remote server trace information or dumps.

00D35105

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. While defined by DDM Level 3 as a valid reply object for this command, DB2 does not support the object.
This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35106

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The object must be contained within a single OBDJSS, but was received in an OBDJSS which contained other objects. The object must be contained within a single DSS but was received in a DSS which contained other DDM objects.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35108

Explanation: DB2 has detected an error in the DDM S Q L T A R D reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the FDO D S C scalar, contained within the SQLTARD, exceeds 32KB. The DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the FDO D S C object, contained within the SQLTARD collection, exceeds 32KB. The DDM extended length field required to support this is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [I49]

00D35109

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The DDM SQLDTARD object is a collection consisting of the FDODSC and FDODTA scalars. The FDODSC scalar, describing a single row returned on SELECT, is not contained with the SQLDTARD reply data object. The DDM SQLDTARD object is a collection which contains the FDODSC and FDODTA DDM objects. The FDODSC element, describing the single row, is not contained within the SQLDTARD reply data object.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [I49]

00D3510B

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the resultant row, contained with the FDODTA scalar, exceeds 32KB. The FDODTA DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the resultant row exceeds 32KB. The DDM extended length field required to support this is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.
Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The length of the DDM object is incorrect.

This reason code is issued by the following CSECT: DSNLZRPNA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The value of the DDM object specifies a machine environment which is not supported by DRDA.

This reason code is issued by the following CSECT: DSNLZRPNA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace
record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.83

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.49

00D3510F

Explanation:  DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPEDEFOVR collection signaling a remote server change in CCSIDs. The length of one of the constituent scalars, CCSIDSBC, CCSIDMBC or CCSIDDBC is incorrect.

This reason code is issued by the following CSECT: DSNLZRPA

System Action:  An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.83

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.49

00D35111

Explanation:  DB2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (MIXED CCSID). This is an error. The DDM object is a TYPEDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDMBC (MIXED CCSID) code point is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action:  An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.83

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.49

00D3510F • 00D35111
items listed in Appendix B, “Problem determination,” on page 1349.

00D35112

Explanation: DB2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (GRAPHIC CCSID). This is an error. The DDM object is a TYPEDEFOVR collection signaling a remote server change in CCSIDs. The CCSISDDBC (GRAPHIC CCSID) code point is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35113

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPEDEFOVR collection signaling a remote server change in CCSIDs. The DDM object length is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
• Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
• Relevant error and system logs spanning the time of the failure.
• Any relevant remote server trace information or dumps.

00D35115

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The sum of the lengths of the constituent DDM objects
within an OBJDSS is inconsistent with the length of the DSS carrier.

This reason code is issued by the following CSECT: DSNLZRPA

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

---

**00D35116**

**Explanation:** DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM reply message is not valid for the current command.

This reason code is issued by the following CSECT: DSNLZRPA

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

---

**00D35117**

**Explanation:** DB2 has detected an error in the SQLDTARD reply data object received in response to an EXCSQLSTT DDM command. The FDODTA element of the SQLDTARD collection contains a null SQLDTAGRPA containing no data and a null SQLCAGRPA, indicating that the SQL SELECT operation was successful. This is an inconsistency.

This reason code is issued by the following CSECT: DSNLZRPA

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

---

**00D35118**

**Explanation:** DB2 detected an error in the DDM reply data object received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply data object (that is, the level of DDM required to support the object) exceeds the DDM level of the AS specified during CONNECT processing.
This reason code is issued by the following CSECT: DSNLZRPA

**System Action:**  An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30020 and SQLSTATE 58009.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35119**

**Explanation:**  DB2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply message (that is, the level of DDM required to support the reply message) exceeds the DDM level of the AS specified during CONNECT processing.

This reason code is issued by the following CSECT: DSNLZRPA

**System Action:**  An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application received SQLCODE -30020 and SQLSTATE 58009.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D3511B**

**Explanation:**  DB2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. Neither the SQLCARD nor the SQLDTARD is contained in the summary component.

This reason code is issued by the following CSECT: DSNLZRPA.

**System Action:**  An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3511C

Explanation: DB2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLTARD reply data object, and a DDM SQLRSLRD reply data object. The DRDA result set component should consist of at least the DDM OPNQRYRM reply message and the DDM QRYDSC reply data object. The OPNQRYRM message is not present following the SQLRSLRD object.

This reason code is issued by the following CSECT: DSNLZRPA.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3511F

Explanation: DB2 received a DDM reply message from the remote server in response to a DDM command. The reply message, while valid for the DDM command, indicates that the DDM command and hence the SQL statement was not successfully processed. The application is notified of the failure through the architected SQLCODE (-300xx) and associated SQLSTATE.

This reason code is issued by the following CSECT: DSNLZRPA.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number included in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

---

00D35201

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is the FDODSC element of an SQLDTARD. The size of the FDODSC is greater than 32KB and the DDM level 6b extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D35202

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The SQLCADTA row (RLO) MDD is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35204**

**Explanation:** DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQSLT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the first component of the SQLCADTA row or the number of elements taken from the SQLCAGR GP replication factor (or both) are incorrect. The descriptor is invalid. The DDM object is either a QRYDSC or the FDODSC element of the SQLDTARD collection. The FDOCA geometry is incorrect. The first elements of the row correctly enumerate the elements of the early SQLCAGR GP, however, the local identifier (LID) following the SQLCAGR GP LID is different than the LID of the SQLDTAGR GP group previously specified. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRS

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information. The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35206**

**Explanation:** DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQSLT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors is included within the previously specified SQLDTAGR GP late group descriptor. However, SQLDTARD row (RLO) Meta Data Definition (MDD) is either incorrect or has not been included within the SQLDTARD descriptor. The descriptor is invalid. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors have been included within the previously processed SQLDTAGR GP group. However, the Meta Data Definition (MDD) of the SQLDTARD row (RLO) has not been included within the descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRS

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D35208

Explanation: DB2 has detected an error in the QRYDSC or SQLTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLTARD collection. The FDOCA geometry is incorrect. Either the SQLCADTA LID referenced within the SQLTARD RLO did not match the LID defined within the SQLCADTA RLO or the number of elements or replication factor (or both) within the SQLTARD RLO was non zero. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If this DB2 is the AR for the thread, the DDM object received is an SQLDTA or QRYDSC. The application will receive SQLCODE -30000 and SQLSTATE 58008. If this DB2 is an remote server for the thread, the DDM object received is SQLDTA. DSCINVRM will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at the local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

---

00D35209

Explanation: DB2 has detected an error in the QRYDSC or SQLTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLTARD collection. The FDOCA geometry is incorrect. Either the length is specified in the LL preceding the QRYDSC or FDOFSC...
Problem reporting and Operator

The description

DSNL031I

This DSS.

SQLDTARD

contained the SQLDTARD

00D3520A

is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the QRYDSC or FDODSC. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58000.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 49

00D3520B

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b DSSs. One or more of the containing level 6b DSSs is (are) other than an object (OBJ) DSS. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58000.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 49

00D3520C

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b object DSSs. One or more of the DDM code points within the containing object DSSs is (are) other than QRYDSC (X‘241A’). The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS
00D3520D • 00D35301

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D3520E

Explanation: DB2 has detected an error in the DDM QRYDSC or the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTTT command that generated query result sets. The number of columns described by the QRYDSC object is inconsistent with the number of columns described by the DDM SQLCINRD object.

This reason code is issued by the following CSECT: DSNLZRDS.

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D35301

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message code point is not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number
enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

**00D35302**

**Explanation:** DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message contains one or more constituent instance variables whose code point is not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

**00D35303**

**Explanation:** DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message is greater than the sum of the lengths of the constituent instance variables.

This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

**00D35305**

**Explanation:** DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message exceeds the sum of the lengths of all the constituent instance variables.
This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35306**

**Explanation:** DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the RDBNAM instance variable is 18 bytes as specified by DDM Level 3, however, bytes 17 and 18 are non blank. DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35307**

**Explanation:** DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the DDM enumerated value instance variable, DTALCKST is other than TRUE (X’F1’) or FALSE (X’F0’).

This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35308**

**Explanation:** DB2 has detected an error in the MGRVLVRM reply message received from the remote server in response to the EXCSAT DDM command. The MGRVLVRM specified is not supported by DB2. DB2 supports the following DDM Level 3 managers: CMNAPPC, SUPERVISOR, SECMSGR, AGENT, DIRECTORY, SQLAM, and RDB.

This reason code is issued by the following CSECT: DSNLZRPY

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]
enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35309

Explanation:  DB2 has detected an error in the ACCRDBRM reply message received from the remote server as in response to the ACCRDB command. The length of the PRIDID instance variable is invalid.

This reason code is issued by the following CSECT: DSNLZRPY

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3530B

Explanation:  DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM OPNQRY command. The value of the enumerated instance variable, QRYPACTYP, is other than SNGROWPRC or LMTBLKPRC.

This reason code is issued by the following CSECT: DSNLZRPY

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58017.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3530A

Explanation:  DB2 has detected an error in the ACCRDBRM reply message received from the remote server in response to ACCRDB DDM command. DB2 is currently disabled to connect to the server specified by the value of the PRIDID instance variable.

This reason code is issued by the following CSECT: DSNLZRPY

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3530C

Explanation:  DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the severity code (SVRCOD) instance variable, as specified by DRDA, is not valid for this reply message.

This reason code is issued by the following CSECT: DSNLZRPY
System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3530D

Explanation: DB2 has detected an error in the ACCRDBRM reply message received from the remote server in response to the ACCRDB DDM command. The length of the TYPDEFOVR instance variable, a collection, is different than the sum of the lengths of the constituent scalar instance variables. This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D3530F

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM fixed length collection or scalar is different than that specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

00D35301

Explanation:  DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM variable length collection or scalar is different than that specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

00D35311

Explanation:  DB2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM EXCSQIMM or EXCSQLSTT command. The AS DDM level specified during CONNECT is 4 and an ENDUOWRM was returned signaling that a dynamic COMMIT or ROLLBACK was performed. The correct response from an AS supporting DDM Level 4 is the CMMRQOSRM reply message.

This reason code is issued by the following CSECT: DSNLZRPY

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30000 and SQLSTATE 58009.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL031I message.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

00D35401

Explanation:  DB2 detected an error in the DDM SQLCARD reply data object received from the remote server in response to a DDM command. The object contains nonzero lengths for both the SQLERRMSG_m and SQLERRMSG_s elements as described by the SQLCAXGRP early group descriptor. This is invalid as specified by DRDA.

This reason code is issued by the following CSECT: DSNLZRCR

System Action:  An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  Analyze the statistics class 4 trace record identified by the IFCID sequence number identified in the DSNL031I message.

00D35501

Explanation:  DB2 has detected an error in the DDM SQLARD reply data object received from the remote server in response to a DDM PRPSQLSTT command. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLDAROW occurrences within the SQLDAR array, is either negative or is inconsistent with the size of the SQLDAR array.

This reason code is issued by the following CSECT: DSNLZRD
System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

00D35502

Explanation: DB2 has detected an error in the DDM SQLDAROW data object received from the remote server in response to a DDM PRPSQLSTT command. Within one or more SQLDAROW occurrences, either (a) the lengths of SQLNAME_m and SQLNAME_s are both non-0, or (b) the lengths of SQLLABEL_m and SQLLABEL_s are both non-0, or (c) the lengths of SQLCOMMENTS_m and SQLCOMMENTS_s are both non-0. The data is invalid with regard to the Early SQLDARGP group descriptor as defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

00D35602

Explanation: DB2 has detected an error in a SQLSTT, SQLSTTVRB, SQLOBJNAM or SQLDTA data object received from a local DB2. The length of the data to be retrieved from the data stream is defined by an SDA which is part of an early or late descriptor. The length exceeds the length of remainder of the OBJDSS carrier of the command data object. The data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

System Action: An alert is generated and message
DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM DTAMCHRM reply message will be returned to the AR.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

---

**00D35603**

**Explanation:** DB2 has detected an error in SQLCARD, SQLDARD, or SQLDTARD reply data object received from a remote server in response to a DDM command. The reply data is described by either the SQLCAGRP or SQLDAGRP early descriptors or the SQLDTAGRP (contained within a SQLDTARD) late descriptor. The length of the data to be retrieved is specified by the default length of a constituent SDA within the SQLCAGRP or SQLDAGRP early groups or the SDA length specification within the SQLDTAGRP late group. All OBJDSSs received in response to the DDM command have been processed but the SQLCARD, SQLDARD, or SQLDTARD is incomplete. These must be returned in their entirety. The data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

---

**00D35605**

**Explanation:** DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which is contained in a level 6b DSS. One or more of the containing level 6b
DSSs is other than a DDM level 6b object DSS. This is invalid.

This reason code is issued by the following CSECT: DSNLZFD'T

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

00D35606

Explanation: DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLTDARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which are contained in a level 6b Object DSS (OBJDSS). The code points of one or more of the DDM reply data objects is other than QRYDTA (X'241B'). This is invalid.

This reason code is issued by the following CSECT: DSNLZFD'T

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

---

00D35608

Explanation: DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLTDARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The current data to be retrieved from the QRYDTA is described by an SDA defining Null-Terminated data (DRDA types X'2C', X'2D', X'2E', X'2F', X'42' or X'43'). The null terminator cannot be located within the reply data. The data is inconsistent with the descriptor defined by the QRYDSC.
This reason code is issued by the following CSECT: DSNLZFDT

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00D35609

**Explanation:** DB2 detected an error in conversion of numeric data. Possible scenarios are: floating point conversion overflow, or digits of numeric character out of range.

This reason code is issued by the following CSECT: DSNLZFDT

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30073 and SQLSTATE 58017.

**User Response:** Check your numeric data. If you are connecting to DB2 via a non-S/370 type machine, overflow can occur when the floating point value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35701

**Explanation:** DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late descriptor includes late environmental descriptors and the SQLDTAGRP meta data definition (MDD) is either invalid or has not been included within the descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35702

**Explanation:** DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The SQLDTAGRP triplet is not defined as an FDOCA nullable group. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within
the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35703

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The local identifier (LID) of one of the SQLDTAGRP constituent triplets has not been previously defined by a late environmental descriptor and the LID is outside of the bounds of the default environmental descriptor LIDs (LID > X'49'). Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35705

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. All the OBDDSS carriers have been processed and the SQLDTAGRP has not been assembled. The SQLDTAGRP is incomplete and the descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT
System Action: If the error occurs within the QRYDSC or SQLDTARD reply data object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.
- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.
- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

Explanation: DB2 has detected an error while processing the SQLDTAGRDP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM level 6b DSSs. One or more of the containing level 6b DSSs is other than an object (OBJ) DSS. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

Explanation: DB2 has detected an error while processing the SQLDTAGRDP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM level 6b DSSs. The code point of one or more of the containing DDM objects is other than QRYDSC (X’241B’). The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.
the application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35709**

**Explanation:** DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is one of the following: QRYDSC, SQLDTARD or SQLDTA. The length override value in one of the constituent SQLDTAGRP SDAs is a placeholder length value, but an allowable placeholder length was not received. This is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

**System Action:** An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command or message DSNL031I is written to the console if the error is detected while parsing a command reply. Refer to the description of this message for further information.

If the error occurs within a QRYDSC or SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DCINVRM reply message will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D3570B**

**Explanation:** DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD or SQLDTA late descriptor. The DDM object is the OUTOVR object. A non-zero local identifier (LID) was received as an output override descriptor, but the LID value was not one of the values allowed for the current DRDA level (DRDA Level 4). This is invalid.
This reason code is issued by the following CSECT:
DSNL2GDT

System Action: An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[149]

---

00D35802

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD reply data object, or an SQLDTA command data object. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) either specifies a local identifier (LID) of 0 or defines a nonrelational database application class (other than X’05’) or the meta data reference type is other than X’01’. The MDD and the entire descriptor are invalid.

This reason code is issued by the following CSECT:
DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[149]

---

00D35803

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor.
contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the descriptor following the MDD is either not an SDA or is an SDA with a length other than 12 (X'0C'). The SDA and the entire descriptor are invalid.

This reason code is issued by the following CSEC: DSNLZLEP

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35804**

**Explanation:** DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the SDA immediately following the MDD is overriding a DRDA type not supported by DRDA. The SDA and the entire descriptor are invalid.

This reason code is issued by the following CSEC: DSNLZLEP

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35805**

**Explanation:** DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD, or SQLDTA data object. The FDOCA geometry is incorrect. The size of the late environmental descriptors exceeds the size of the DDM level 6b DSS carrier. The descriptor is invalid.

This reason code is issued by the following CSEC: DSNLZLEP

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If the error occurs within a QRYDSC or SQLDTARD replay data object (SQLDTARD late descriptor), the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within an SQLDTA command data object (SQLDTA late descriptor), a DSCINVRM reply message will be returned to the local DB2.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.
• Relevant error and system logs spanning the time of the failure.
• Any relevant remote server trace information or dumps.

00D35806

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either an SQLDTARD or SQLDTA, each of which may not span DDM level 6b object (OBJ) DSSs. The containing level 6b OBJDSS contains only late environmental descriptors and neither groups or rows are defined. The descriptor is invalid. This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information. If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349][1] [83]
At this remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349][1] [49]

00D35808

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within the SQLDTARD late descriptor. The DDM object is a QRYDSC which spans multiple query blocks. One or more of the code points of the DDM objects carrying the descriptor is (are) other than QRYDSC (X'241B'). The descriptor is invalid. This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information. If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items
A DDM reply message (PRCCNVRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

### 00D35902

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first level 6b DSS received is an object DSS. The DDM command carried in a level 6b request DSS (RQSDSS) must be the first level 6b DSS received.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]
**00D35903**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first level 6b DSS received is neither a request (ROK) DSS, Object (OBJ) DSS nor Reply (RPPY) DSS and is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49].

---

**00D35904**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM command, specified by the code point contained within the level 6b ROQSDDS, is invalid or not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49].

---

**00D35905**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first DDM command received on this conversation, while a valid DDM Level 3 command, is other than EXCSAT. The first command must be EXCSAT.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49].

---

**00D35906**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The EXCSAT command has been successfully processed but the current DDM command, while supported by DDM Level 3 and DB2, has been sent prior to ACCRDB. The only valid command prior to ACCRDB is another EXCSAT command.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.
Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from an local DB2. The DDM command has been successfully processed and the current command is another ACCRDB instance. This is invalid.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBACCRRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]
00D3590A

Explanation: DB2 has detected an error while parsing DDM command data received from a local DB2. The DDM command data object, as defined by the DDM code point, is either invalid or not valid for this command, as specified by DDM level 3.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (OBJNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [I49]

00D3590B

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data object received from a local DB2. One or more DDM command data objects, defined as required by DDM Level 3, were not received with the DDM command.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [I49]

00D3590D

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is a TYPDEFNAM, signaling a change in machine representation from the local DB2, however, the value of this DDM scalar is other than QTDSQL370, QTDSQLX86 or QTDSQL400. These are the only valid machine representations supported by DRDA.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the
description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>

---

**00D3590E**

**Explanation:** DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDDBC, CCSIDMBC, and CCSIDDDBC. The length of one of the constituent scalars is incorrect.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>

---

**00D35910**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDDBC, CCSIDMBC, and CCSIDDDBC. The TYPDEFOVR contains multiple instances of the CCSIDMBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]<sup>3</sup>
**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDDBC, CCSIDMBDC, and CCSIDDDBC. The TYPDEFOVR contains multiple instances of the CCSIDDDBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IF CID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

---

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDDBC, CCSIDMBDC, and CCSIDDDBC. The TYPDEFOVR length exceeds the sums of the lengths of the constituent scalars. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IF CID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

---

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDDBC, CCSIDMBDC, and CCSIDDDBC. The TYPDEFOVR contains an object other than CCSIDDBC, CCSIDDDBC, or CCSIDDDBC. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IF CID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2:

- Statistics class 4 trace record identified by the IF CID sequence number specified in message DSNL031I.
Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35914

**Explanation:** DB2 detected an error while parsing a DDM command received from the application requester (AR). The minimum level attribute of the DDM command received from the AR, (that is, the level of DDM required to support the command) exceeds the DDM level specified by the AR during CONNECT processing.

This reason code is issued by the following CSECT: DSNLZSPA

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL032I message.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D35918

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. The DDM command, specified by the code point contained within the level 6b RQSDSS, is invalid or not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** A DDM reply message (CMDNSPRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D35919

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is greater than or equal to 5, and the required ACCSEC and SECCHK commands were not received before the ACCRDB command.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.
A DDM reply message (MGRDEPRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

---

**00D3591A**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and an ACCSEC command was received.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** A DDM reply message (CMDNSPRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

---

**00D3591B**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC command was received when an ACCSEC command had already been executed successfully.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** The conversation is terminated, and message DSNL0301 is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

---

**00D3591C**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and a SECCHK command was received.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** A DDM reply message (CMDNSPRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 49].

---

**00D3591D**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. A SECCHK command was received out of order, which means either an ACCSEC command has not executed successfully, or a SECCHK command has already been processed.
This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

---

**00D3591E**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent after an ACCRDB was successfully processed.

This reason code is issued by the following CSECT: DSNLZSPA.

**System Action:** The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

---

**00D35A01**

**Explanation:** DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is either an SQLSTT, SQLOBJNAM, or SQLSTTVPB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. The instantiation of both the SBCS and mixed data SDAs has been sent. This is invalid.

This reason code is issued by the following CSECT: DSNLZSMT

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DTAMCHRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149].

---

**00D35A02**

**Explanation:** DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is either an SQLSTT, SQLOBJNAM, or SQLSTTVPB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. Further, either the SBCS or mixed (not both) must be instantiated. The data retrieved from the object instantiates neither the SBCS nor the mixed SDA. This is invalid.

This reason code is issued by the following CSECT: DSNLZSMT

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.
A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D35B01**

**Explanation:** DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The length of the SQLDTA exceeds 32KB, however, the DDM extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZS DT

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**00D35B03**

**Explanation:** DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA is a DDM collection consisting of the FDODSC and FDODTA scalars. The length of the FDODSC scalar exceeds 32KB, however, the format of the DDM extended length is invalid.

This reason code is issued by the following CSECT: DSNLZS DT

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35B04

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained in the FDODSC scalar, includes late environmental descriptors, however, the SQLDTA meta data definition (MDD) is either invalid or has not been included within the SQLDTA descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35B05

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor geometry is incorrect. Either the SQLDTA triplet length is incorrect or the SQLDTA triplet type is other than an row layout (RL0). The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35B06

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor geometry is incorrect. The SQLDTA RLO triplet either specifies a local identifier (LID) which is different than that defined in the previously processed SQLDTAGRP later group descriptor, or specifies a nonzero number of elements or a repetition factor other than 1. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

00D35B07

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained within the FDODSC scalar, has been validated, however, the FDOCTA scalar, containing the host variable data, is not included within the SQLDTA DDM object. This is invalid.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]
This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]

00D35B08

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained within the FDODSC descriptor, has been validated. The length of the FDODTA scalar, containing the host variable data, exceeds 32KB, however, the format of the DDM extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]

00D35C02

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a BGNBND command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]
enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C03**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a DRPPKG command.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C04**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on an ENDBND command.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

---

**00D35C05**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a REBIND command.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C06**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. One or more instance variables, defined by DDM Level 3 as required parameters for this DDM command, were not received.
This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg2134933) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](http://www.ibm.com/support/docview.wss?uid=swg2134933).

At this DB2 remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](http://www.ibm.com/support/docview.wss?uid=swg2134933).

---

**00D35C07**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM BGNBND, BDNSQSLT, ENDBND, DRPPKG, or REBIND command data received from a local DB2. The DDM command contains an instance variable which is not defined within DDM level 3.0 The instance variable (parameter) is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg2134933) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this DB2 remote server.

- Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

---

**00D35C08**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BDNSQSLT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Multiple occurrences of a DDM instance variable, defined by DDM Level 3 as nonrepeatable, have been processed as parameters on this DDM command.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](http://www.ibm.com/support/docview.wss?uid=swg2134933) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](http://www.ibm.com/support/docview.wss?uid=swg2134933).

At this DB2 remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](http://www.ibm.com/support/docview.wss?uid=swg2134933).

---

**00D35C09**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BDNSQSLT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDCHKEXS, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

---

**00D35C0A**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDCRTCTL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

---

**00D35C0B**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDEXPOPT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].
**00D35C0D**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, DECPRC, is invalid.

This reason code is issued by the following CSECT: DSNL2ZBSD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C0E**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Bytes 9 through 18 of the DDM scalar, DFRTRDCOL are other than blank. While DDM defines the length of DFRTRDCOL to be 18 bytes, DB2 supports only 8-byte collection identifiers.

This reason code is issued by the following CSECT: DSNLZBSD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C10**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of the DDM scalar PKGDFTCC is invalid.

This reason code is issued by the following CSECT: DSNLZBSD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C11**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDSBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C13**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDMBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35C12**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDDBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem
determination," on page 1349.

00D35C14
Explanation: DB2 has detected an error while parsing
a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG,
or REBIND command received from a local DB2. The
DDM PKGDFTCC collection consists of three DDM
scalars: CCEOOSDBC, CCSIDMBBC, and CCEOOSDDBC. The
PKGDFTCC collection contains an invalid DDM object.

This reason code is issued by the following CSECT:  
DSNLZSBD

System Action: An alert is generated and message
DSNL032I is written to the console. Refer to the
description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to
the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of [DB2 Diagnosis Guide
and Reference] for information on identifying and
reporting the problem.

Problem Determination: The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL032I message should be
analyzed.

At this local DB2, collect the following diagnostic items
listed in Appendix B, "Problem determination," on page
1349.

At this DB2 remote server, collect the following
diagnostic items listed in Appendix B, "Problem
determination," on page 1349.

00D35C15
Explanation: DB2 has detected an error while parsing
a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG,
or REBIND command received from a local DB2. The
value of the DDM enumerated scalar, PKGDFTCST, is
invalid.

This reason code is issued by the following CSECT:  
DSNLZSBD

System Action: An alert is generated and message
DSNL032I is written to the console. Refer to the
description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to
the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of [DB2 Diagnosis Guide
and Reference] for information on identifying and
reporting the problem.

Problem Determination: The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL032I message should be
analyzed.

At this local DB2, collect the following diagnostic items
listed in Appendix B, "Problem determination," on page
1349.

At this DB2 remote server, collect the following
diagnostic items listed in Appendix B, "Problem
determination," on page 1349.

00D35C16
Explanation: DB2 has detected an error while parsing
a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG,
or REBIND command received from a local DB2. The
value of the DDM enumerated scalar, PKGISOLVL, is
invalid.

This reason code is issued by the following CSECT:  
DSNLZSBD

System Action: An alert is generated and message
DSNL032I is written to the console. Refer to the
description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to
the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of [DB2 Diagnosis Guide
and Reference] for information on identifying and
reporting the problem.

Problem Determination: The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL032I message should be
analyzed.

At this local DB2, collect the following diagnostic items
listed in Appendix B, "Problem determination," on page
1349.

At this DB2 remote server, collect the following
diagnostic items listed in Appendix B, "Problem
determination," on page 1349.

00D35C17
Explanation: DB2 has detected an error while parsing
a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG,
or REBIND command received from a local DB2. The
DDM object PKGNNAM is a mapped scalar containing
RDBNAM, RDBCOLID and PKGID. Bytes 17 and 18 of
the DDM scalar, RDBNAM, are other than blank. While
DDM defines the length of RDBNAM to be 18 bytes,
DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT:  
DSNLZSBD

System Action: An alert is generated and message
DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [3].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [49].

---

**00D35C18**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAM is a mapped scalar containing RDBNAM, RDBCOLID, PKGIS and PKGCNSTK. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSB

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of the *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [3].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [49].

---

**00D35C1A**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAMCT is a mapped scalar containing RDBNAM, RDBCOLID, PKGIS and PKGCNSTK. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSB

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#). At this DB2 remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

### 00D35C1B

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, PKGRPLOPT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#). At this DB2 remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

### 00D35C1D

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#). At this DB2 remote server, collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).
**00D35C1E**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the RDBNAM scalar is other than the local DB2 RDBNAM.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C20**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTDATFMT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C21**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTDECDEL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C22**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTSTRDEL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C24**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM TIMESTAMP scalar has been received as a command parameter from a database other than DB2. The TIMESTAMP scalar is private to DB2.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

---

**00D35C23**

**Explanation:** DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local DB2. The value of the DDM enumerated scalar, STTIMFMT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [B3]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]
00D35C25

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object is less than 4, the minimum length of any DDM object. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1149]

00D35C27

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object exceeds the length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1149]

00D35C26

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1149]

00D35C28

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object is less than the length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.
Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35C29

Explanation: DB2 has detected an error while parsing a DDM command or DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. A package related identifier or collection identifier is in violation of the SAA syntax. This is either the collection identifier (DFTRDBCOL) received on a BGNBND or REBIND command or the package identifier or collection identifier within the PKGNAM, PDGNAMCT, or PKGNAMECSN mapped scalars received on a BGNBND, BNDSQLSTT, ENDBND, or DRPPKG command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

Collect the following diagnostic items at this local DB2.
• Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL032I.

Collect the following diagnostic items at the remote server.
• Relevant error and system logs spanning the time of the failure.
• Any relevant AS trace information or dumps.

00D35C2A

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local DB2. The value of MAXSCTNBR received on the ENDBND command is invalid. The value must be within the range 1 to 32767 inclusive.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

Collect the following diagnostic items at this local DB2.
• Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL032I.

Collect the following diagnostic items at the remote server.
• Relevant error and system logs spanning the time of the failure.
• Any relevant AS trace information or dumps.

00D35C2B

Explanation: DB2 detected an error in a DDM BGNBND or REBIND command received from a DRDA requester. The value of the enumerated scalar, PKGATHRUL, is invalid.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the DRDA requester.

Operator Response: Notify the system programmer.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL032I.
If the DRDA requester is a DB2, then DB2 diagnostic information is available. In that case, at the DB2 requestor, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This reason code is issued by the following CSECT: DSNLZSBD

00D35D01

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on one of the following DDM commands: CLSQRY, DSCRDBTBL, DSCSQLSTT, or EXCSQLMM.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35D02

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM CNTQRY command.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35D03

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM OUTEXP enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35D04

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM EXCSQLSTT command.

This reason code is issued by the following CSECT: DSNLZSQL
**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

**00D35D05**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The value of DDM QRYBLKCTL instance variable, received as a parameter on OPNQRY, is other than FRCSNGROW. The local DB2 may not specify LMTBLKPRC or SNGROWPRC as values of QRYBLKCTL as an OPNQRY parameter.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

**00D35D07**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM RTNSQLDA enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

**00D35D08**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM PRPSQLSTT command.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

**00D35D09**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM RDRCMM or RDRLLCBK command.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL0321 is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

**00D35D0A**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The length of the DDM command is not equal to the sum of the lengths of the constituent instance variables.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL0321 is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

**00D35D0B**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. One or more instance variables, defined by DDM Level 3 as required for this command, were not received as command parameters.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL0321 is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

**00D35D0C**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined by DDM Level 3 as not valid for this command, has been received as a command parameter.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL0321 is written to the console. Refer to the
description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35D0D**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. Multiple occurrences of one or more instance variables, defined by DDM level 3 as nonrepeatable, have been received as parameters of this DDM command.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35D0F**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the RDBNAM instance variable is different than that received on the ACCRDB command.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [33].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

00D35D10

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The mapped scalar, PKGNAMCNS, is invalid. Bytes 17 and 18 of the DDM scalar RDBNAM, contained within PKGNAMCNS, are other than blank. While DDM Level 3 defines the length of this scalar to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [33].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

00D35D12

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM scalar, QRYBLKKSZ, contained as a parameter on a DDM OPNQRY, CNTQRY, or EXCSQLSTT command, is invalid. The value of QRYBLKKSZ must be between 512 and 32767, inclusive.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [33].

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

00D35D11

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The mapped scalar, PKGNAMCNS, is invalid. Either bytes 9 through 18 of the package name are other than blank or the section number is nonpositive. While the DDM scalar, PKGID, is defined by DDM level 3 to be 18 bytes in length, DB2 supports only 8 byte package names.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.
**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. A TIMESTAMP instance variable has been included as a command parameter received from a database other than DB2. This DDM scalar is private to DB2.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35D15**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The length of the DDM command is less than the sum of the lengths of all constituent instance variables.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00D35D16**

**Explanation:** DB2 has detected an error while parsing a DDM command received from a local DB2. The length of an instance variable received as a command parameter exceeds the length of the instance variable, as specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZSQL.

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXXRM) will be returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*...
Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of an instance variable received as a command parameter is less than the length of the instance variable, as specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]

Explanation: DB2 has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar TYPSQLDA is invalid.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 UDB for OS/390, at the DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [83]
**00D35D1A**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. An instance variable, defined as valid by DDM Level 5, but not supported by DB2, has been detected on a DDM DSCSQLSTT command.

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [8]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

---

**00D35D1B**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM OPNQRY or EXCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar RTNEXTDTA is invalid.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [8]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

---

**00D35D1C**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM CNTQRY command received from a remote DRDA client. The value of the DDM enumerated scalar RTNEXTDTA is invalid.

This reason code is issued by the following CSECT: DSNLZSQL

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [8]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

---

**00D35E00**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS

**System Action:** If the length of the RDBNAM is greater than 18, then a DDM reply message...
(SYNTAXRM) is returned to the DRDA client. If the data in characters 17-18 of the RDBNAME is non-blank, then a DDM reply message (VALNSPRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349:

```
00D35E01
```

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent without one or more of its required DDM instance variables.

This reason code is issued by the following CSECT: DSNLZSAS.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349:

```
00D35E03
```

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349:

```
00D35E04
```

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E07

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMGRNM length was sent on an ACCSEC command. The SECMGRNM must be null.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349. At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E08

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SECHK command.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83]
At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMEC length was sent on a SECCHK command. The SECMEC must be null.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83]
At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid USRID length was sent on a SECCHK command. DB2 userids cannot exceed 8 bytes.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83]
At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1149]
At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E0D

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid PASSWRD length was sent on a SECCHK command. DB2 passwords cannot exceed 8 bytes.

This reason code is issued by the following CSECT: DSNLZSAS.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E0F

**Explanation:** DB2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The size of the object is greater than 32KB and the DDM level 6b extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZODM

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide* and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E10

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte or 8-byte floating point number in IEEE format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the
description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the floating point value.
Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 Diagnosis Guide and Reference* for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

---

### 00D35E11

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte or 8-byte floating point number in IEEE format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the floating point value.
Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

---

### 00D35E13

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the floating point value.
Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [83]

---

### 00D35E12

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte floating point number in VAX format to System/370 format.
**00D35E14**

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 8-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of DB2 SQL Reference for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D35E16**

**Explanation:** DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of DB2 SQL Reference for details of floating point range.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

00D35E18

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 8-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating point value is out of the System/370 floating point range. Refer to Appendix A of DB2 SQL Reference for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

00D35E1A

Explanation: DB2, acting as a DRDA client, has detected an error in a NUL-terminated string of length less than 257 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

00D35E1B

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable NUL-terminated string of length less than 257 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.
At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

00D35E1C

Explanation: DB2, acting as a DRDA client, has detected an error in a numeric character data field (nullable or non-nullable). DB2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the numeric data.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

00D35E1D

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]
**Explanation:** DB2, acting as a DRDA client, has
detected an error in a nullable variable length DBCS
character data field whose length is given by a 2-byte
length field and whose maximum length is less than 257
bytes. The value of the length field is either negative or
greater than the maximum length specified by the DDM
descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

**System Action:** An alert is generated and message
DSNL031I is written to the console. Refer to the
description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of *DB2 Diagnosis Guide
and Reference* for information on identifying and
reporting the problem.

**Problem Determination:** The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [83]

---

**Explanation:** DB2, acting as a DRDA client, has
detected an error in a nullable variable length DBCS character
data field whose length is given by a 2-byte length field and
whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

**System Action:** An alert is generated and message
DSNL031I is written to the console. Refer to the
description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of *DB2 Diagnosis Guide
and Reference* for information on identifying and
reporting the problem.

**Problem Determination:** The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [83]

---

**Explanation:** DB2, acting as a DRDA client, has
detected an error in a variable length DBCS character
data field whose length is given by a 1-byte length field. The value of the length field is greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

**System Action:** An alert is generated and message
DSNL031I is written to the console. Refer to the
description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an
error in DB2, refer to Part 2 of *DB2 Diagnosis Guide
and Reference* for information on identifying and
reporting the problem.

**Problem Determination:** The statistics class 4 trace
record identified by the IFCID sequence number
enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349 [83]
**Explanation:** DB2, acting as a DRDA client, has detected an error in a nullable variable length DBCS character data field whose length is given by a 1-byte length field. The value of the length field is greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](/DB2/DB2-Diagnosis-Guide) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[83]

### 00D35E26

**Explanation:** DB2, acting as a DRDA client, has detected an error in a nullable variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](/DB2/DB2-Diagnosis-Guide) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[83]

### 00D35E27

**Explanation:** DB2, acting as a DRDA client, has detected an error in a variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](/DB2/DB2-Diagnosis-Guide) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[83]
**00D35E28**

**Explanation:** DB2, acting as a DRDA client, has detected an error in a nullable variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DS NLZFEX

**System Action:** An alert is generated and message DS NL0311 is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DS NL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83]

---

**00D35E29**

**Explanation:** DB2, acting as a DRDA client, has detected an error in a zoned decimal data field (nullable or non-nullable). DB2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

**System Action:** An alert is generated and message DS NL0311 is written to the console. Refer to the description of this message for further information.

**Operator Response:** Notify the system programmer.

**User Response:** Check the numeric data.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DS NL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83]

---

**00D35E2A**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BDNOPT command data object received from a remote DRDA client. The BDNOPT collection contains multiple instances of the BDNOPTVL scalar. This is invalid.

This reason code is issued by the following CSECT: DS NLZOBO

**System Action:** An alert is generated and message DSNL0321 is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DS NL0321 message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[83]
record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]

**00D35E2C**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains an invalid instance.

This reason code is issued by the following CSECT: DSNLZOBO

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]

---

**00D35E2E**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTVL instance variable is required for this DDM collection but was not received.

This reason code is issued by the following CSECT: DSNLZOBO

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [49]

---

**00D35E2D**

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTNM instance variable is required for this DDM collection but was not received.

This reason code is issued by the following CSECT: DSNLZOBO

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83] For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.
At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM object is less than 4, the minimum length of any DDM object. This is invalid.

This reason code is issued by the following CSECT: DSNLZOB0

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](page 1349) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

This reason code is issued by the following CSECT: DSNLZOB0

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](page 1349) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

**Explanation:** DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM object is less than 4, the minimum length of any DDM object. This is invalid.

This reason code is issued by the following CSECT: DSNLZOB0

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](page 1349) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
00D35E32

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of a DDM instance variable is greater than the maximum length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZOB0.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide] and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49].

00D35E34

Explanation: DB2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. Within one or more SQLRSROW occurrences, the lengths of SQLRSNAME_m and SQLRSNAME_s are both non-0, but only one of these lengths should be non-0. The data is invalid with regard to the Early SQLRSGRP group descriptor as defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRRS.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide] and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [83].

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1].

00D35E33

Explanation: DB2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLRSROW occurrences within the SQLRSLRD array, is inconsistent with the number of result sets indicated in the RSLSETRM.

This reason code is issued by the following CSECT: DSNLZRRS.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide] and Reference for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [83].

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1].

00D35E35

Explanation: DB2 has detected an error in the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single
element of the SQLNUMGRP, SQLNUM, defining the total number of SQLCIROW occurrences within the SQLCINRD array, is either negative or is inconsistent with the size of the SQLCINRD array.

This reason code is issued by the following CSECT: DSNLZRCI.

**System Action:** An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] for information on identifying and reporting the problem.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 83

---

**00D35E36**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid IPADDR length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [1] for information on identifying and reporting the problem.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 49

---

**00D35E38**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SNAADDR length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.
At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E39

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on a SYNCSLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E3A

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid LOGNAME length was sent on a SYNCSLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [*DB2 Diagnosis Guide and Reference*](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00D35E3D

Explanation: DB2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The DDM level 6b length field is invalid.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E3F

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCCTL command.

This reason code is issued by the following CSECT: DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D35E40

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SYNTAXRM length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT: DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0321 message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**00D35E41**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RLSCONV length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT: DSNLZSAS

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

**00D35E42**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT: DSNLZSAS

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

**00D35E43**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCRSY command.

This reason code is issued by the following CSECT: DSNLZSAS

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

**00D35E44**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCRSY command.

This reason code is issued by the following CSECT: DSNLZSAS

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [3]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]
00D35E45
Explanation:  DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RSYNCTYP length was sent on a SYNCRSY command.
This reason code is issued by the following CSECT: DSNLZSAS
System Action:  A DDM reply message (SYNTAXRM) is returned to the DRDA client.
Operator Response:  Notify the system programmer.
System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.  
At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D35E46
Explanation:  DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCRSY command.
This reason code is issued by the following CSECT: DSNLZSAS
System Action:  A DDM reply message (SYNTAXRM) is returned to the DRDA client.
Operator Response:  Notify the system programmer.
System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.  
At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D35E47
Explanation:  DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWSTATE length was sent on a SYNCRSY command.
This reason code is issued by the following CSECT: DSNLZSAS
System Action:  A DDM reply message (SYNTAXRM) is returned to the DRDA client.
Operator Response:  Notify the system programmer.
System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.
At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.  
At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
**00D35E49**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. An invalid TCPHOST length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

---

**00D35E4B**

**Explanation:** DB2 has detected an error while parsing a DDM command or DDM command data. A required instance variable was not sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL.

**System Action:** A DDM reply message (SYNTAXRM) is returned to the DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [49]

---

**00D35E51**

**Explanation:** DB2, acting as a DRDA server, has detected an error in a DDM command data object received from a remote client. The DDM object is the OUTOVR object. The size of the OUTOVR is greater than 32KB and the DDM level 6b extended length field is invalid.

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A SYNTAXRM reply message will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [83]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.
At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D35E52

Explanation: DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. The SQLCADTA row (RLO) MDD is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZS0V

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D35E53

Explanation: DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. The SQLCADTA row triplet (RLO) is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZS0V

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

**00D35E55**

**Explanation:** DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. The first component of the SQLCADATA row correctly enumerates the elements of the SQLCAGRP; however, the second component, identifying the SQLDTAGRP (late) group, is incorrect. Either the SQLDTAGRP local identifier (LID) is different from the LID of the SQLDTAGRP previously specified or the number of elements taken from the SQLDTAGRP replication factor (or both) are incorrect. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSOV

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

**00D35E56**

**Explanation:** DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. One or more late environment descriptors is included within the previously specified SQLDTAGRP late group descriptor. However, the SQLDTARD row (RLO) Meta Data Definition (MDD) is either incorrect or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSOV

**System Action:** An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63].

00D35E58

Explanation:  DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the length specified in the LL preceding the OUTOVR is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the OUTOVR. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSOV

System Action:  An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63].

00D35E59

Explanation:  DB2, acting as a DRDA server, has detected an error in a DDM command data object received from the remote client. The DDM object is the OUTOVR scalar of the SQLDTARD collection. The FDOCA descriptor geometry is incorrect. Either the length specified in the LL preceding the OUTOVR is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the OUTOVR. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZSOV

System Action:  An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63]. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [63].
items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35E5B**

**Explanation:** DB2 has detected an error while parsing the DDM ACCSEC command or its reply data. The encryption connection key passed in the SECTKN instance variable has an invalid length. The connection key must be a 32-byte security token.

**System Action:** If at the server, a DDM reply message (SYNTAXRM or INTTKRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]

---

**00D35E5C**

**Explanation:** DB2 has detected an error while parsing the DDM SECHK command or its reply data. The encrypted password passed in the SECTKN instance variable has an invalid length. DB2 supports an 8-byte or a 16-byte encrypted password.

**System Action:** If at the server, a DDM reply message (SYNTAXRM) is returned to the local DB2.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349 [83]

At this remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [149]
Chapter 41. X’D4......’ codes

00D40001

Explanation: The IMS attachment facility detected an invalid save area chain pointer. This condition occurs only if the save area is overlaid or if the save area pointer is invalid.

This abend reason code is issued by the following CSECTs:

DSNMCMD0  DSNMSTR0  DSNMSTR0  DSNMID0  DSNMINT  DSNMIDR0  DSNMSN00

System Action: The task is abended.

System Programmer Response: If the abend occurred in an IMS dependent region, restart the region. If the abend occurred in the IMS control region, restart the connection. Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

Problem Determination: Analyze the dump. Register 13 plus four bytes is the address of the invalid save area chain pointer.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

00D40008

Explanation: The IMS attachment facility command module’s ESTAE routine places this reason code in the variable recording area of SYS1.LOGREC. The reason code indicates that the entry is not a standard DB2 entry. The reason code is followed by the current IMS attachment facility trace entry, the first four characters of the command, the output destination, and the authorization ID for the failing command.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

00D40061

Explanation: The IMS attachment facility could not establish a connection with DB2 because an IMS /STOP SUBSYS command was issued.

This abend reason code is issued by the following CSECT: DSNMSN00

System Action: The application's SQLCA is updated with an SQLCODE -924 and reason code 00D40061. Control is returned to the application.

User Response: Wait for the IMS /START SUBSYS command to be issued before reentering the transaction.

Operator Response: Issue the IMS /START SUBSYS command to establish a connection with DB2 and reenter the transaction.

System Programmer Response: Determine why the IMS /STOP SUBSYS command was issued.

Problem Determination: Analyze the application's SQLCA.

00D40062

Explanation: The IMS attachment facility could not establish a connection with DB2 because IMS is shutting down.

This abend reason code is issued by the following CSECT: DSNMSN00

System Action: The application's SQLCA is updated with an SQLCODE -924 and reason code 00D40062. Control is returned to the application.

User Response: Reenter the transaction after IMS has been restarted.

Operator Response: Restart IMS.

System Programmer Response: Determine why IMS was stopped.

Problem Determination: Analyze the application's SQLCA.

00D40063

Explanation: DB2's IMS attachment facility received an unexpected return code from the IMS external subsystem attach facility while attempting to start the
subsystem connection to DB2.

This abend reason code is issued by the following CSECT: DSNMSNO0

System Action: The application's SQLCA is updated with an SQLCODE -924, reason code 00D40063, and the return code received from the IMS external subsystem facility. One of the following return codes may appear.

• 12 - DB2 connection unsuccessful. The external subsystem encountered an error processing the request.
• 24 - DB2 connection unsuccessful. The external subsystem responded with a 'never connect' return code from the initialization exit.
• 28 - DB2 connection unsuccessful. IMS resources were unavailable to process the request.
• 32 - DB2 connection unsuccessful. An invalid EPL was encountered.
• 36 - DB2 connection unsuccessful. Request rejected due to the external subsystem invoking the subsystem termination service exit.

Control is returned to the application.

Operator Response: Notify the system programmer.

System Programmer Response: This is an internal error. To be certain the proper diagnostic information is available, stop the region with a dump.

Problem Determination: The WAL control block in the dump contains an IMS attach trace table. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

00D40069

Explanation: DB2's IMS attachment facility received an unexpected return code from the IMS external subsystem attach facility while attempting to establish a connection to DB2.

This abend reason code is issued by the following CSECTs:

DSNMDR10  DSNMERR0  DSNMSNO0

System Action: The application's SQLCA is updated with an SQLCODE -924, reason code 00D40069, and the return code received from the IMS External Subsystem Attach Facility. Control is returned to the application.

Operator Response: Notify the system programmer.

System Programmer Response: This is an internal error. To be certain the proper diagnostic information is available, stop the region with a dump.

Problem Determination: The WAL control block in the dump contains an IMS attach trace table. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

00D44011

Explanation: The DB2-DL/I batch support or IMS BMP job step cannot continue because the application program could not be loaded.

This abend reason code is issued by the following CSECT: DSNMTV01

System Action: The DB2-DL/I batch support or IMS BMP job step cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Be sure the DDIITV02 SYSIN data (for DB2-DL/I batch support) or IMSBATCH procedure (for an IMS BMP job step) names a subsystem member (SSM) parameter that points to a resource translation table (RTT). The RTT maps the IMS application name to the DB2 plan name.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

00D44021

Explanation: The DB2-DL/I batch support cannot continue because the length of a parameter value specified in the DDIITV02 SYSIN data set is incorrect.

This abend reason code is issued by the following CSECT: DSNMTV02

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the DDIITV02 SYSIN data set parameter value in error and rerun the job. Make sure the correct data set name is specified by the DDIITV02 DD statement and the DCB RECFCM is F or FB for the data set.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for more information about failure analysis procedures. For information on identifying and reporting the problem.
Problem Determination: The parameter value length limits are the following:
- DB2 subsystem name: 0 < SSN < 5.
- LIT value < 5.
- DB2 initialization module name = 8.
- DB2 optional resource translation module name < 9.
- Region error option value < 2.
- The command recognition value < 2.
- The connection name < 9.
- The DB2 plan name < 9.
- The application program load module name < 9.

Register 8 indicates the delimiter following the field in error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44022

Explanation: The DB2-2/DL/I batch support cannot continue because the DDITV02 SYSIN data set cannot be opened or an end of file was reached before a record was read.

This abend reason code is issued by the following CSEC: DSNMTV02

System Action: The DB2-2/DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the DDITV02 DD statement or data set in error and rerun the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for more information about the problem.

Problem Determination: See if a DDITV02 data set exists and contains a properly formatted record.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44023

Explanation: The DB2-2/DL/I batch support cannot continue because one or more of the DDITV02 SYSIN data set values are incorrectly specified. The end of the input record was detected before all the values were found.

This abend reason code is issued by the following CSEC: DSNMTV02

System Action: The DB2-2/DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the DDITV02 DD value or data set in error and rerun the job. Make sure the correct data set name is specified by the DDITV02 DD statement and the DCB RECFM is F or FB for the data set.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for more information about the problem.

Problem Determination: Check the DDITV02 DD SYSIN values for proper format.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44024

Explanation: The DB2-DL/I batch support cannot continue because the DDITV02 SYSIN data set value for the DB2 initialization module refers to an incorrect module.

This abend reason code is issued by the following CSEC: DSNMTV02

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the DDITV02 SYSIN DD value or data set in error by specifying DSNMIN10 as the initialization module and rerun the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information about the problem.

Problem Determination: Check the DDITV02 DD SYSIN value for the required parameter DSNMIN10.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44025

Explanation: The DB2-DL/I batch support cannot continue because the DDITV02 SYSIN data set value for the DB2 region error option is incorrect. Only R, Q, A, or null (specified as ..) are valid.

This abend reason code is issued by the following CSEC: DSNMTV02

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the DDITV02 SYSIN DD value for the region error option of R, Q, A, or null and rerun the job.
If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Check the DDITV02 DD SYSIN value for the proper value of the error option of R, Q, A, or null.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

__00D44031__

**Explanation:** The DB2-DL/I batch support cannot continue because a connection could not be established to the DB2 subsystem named in the DDITV02 SYSIN data set. This error usually occurs for one of these reasons:

- The DB2 subsystem name specified either in the DDITV02 SYSIN data set (default) or in the member defined by the IMSID-SSM combination is incorrect.
- The DB2 system is not operational.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** The DB2-DL/I batch support cannot continue and processing terminates abnormally.

**User Response:** Notify the system programmer.

**Operator Response:** It might be necessary to start the DB2 subsystem specified.

**System Programmer Response:** Either correct the DDITV02 DD SYSIN or the member pointed to by the IMSID-SSM combination for the DB2 subsystem name if it is incorrect, and rerun the job. Otherwise, have the operator start the DB2 subsystem if it is stopped.

**Problem Determination:** Either check the DDITV02 DD SYSIN or the member pointed to by the IMSID-SSM combination for the proper DB2 subsystem name. Make sure the correct data set name is specified by the DDITV02 DD statement and the DCB RECFM is F or FB for the data set.

The WAL control block in the dump contains information about the connection and the IMS attach trace table. Field WALSSSID indicates the name of the DB2 subsystem being called.

The last entry in the trace table has an ID of ID00 and the CALL STATUS contains the 2-byte return code and 4-byte reason code of the failure. The 4-byte reason code might provide additional diagnostic information to help determine the cause of the failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

If the correct DB2 subsystem name was specified and was available, refer to the specific reason code explanation for details about the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

__00D44032__

**Explanation:** The DB2-DL/I batch support cannot continue because the DB2 create thread or signon failed.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** The DB2-DL/I batch support cannot continue and processing terminates abnormally.

**Operator Response:** Notify the system programmer.

**User Response:** Verify that all required DB2 objects are available and that the specified plan name is correct. If the problem persists, notify the system programmer.

**Problem Determination:** Examine the WAL control block in the dump, or any X’5501FF00’ IMS attachment log records in the IMS log data set (if available) for specific DB2 return and reason codes, along with the WALERN field which indicates the reason for the failure.

The WAL control block in the dump contains information about the connection and the IMS attach trace table. The last entry in the trace table will have an ID of CTHD or SIGN and the CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

__00D44033__

**Explanation:** The DB2-DL/I batch support cannot continue because the application was selected as a dead lock victim.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**User Response:** Notify the system programmer.

**Operator Response:** It may be necessary to schedule the application program when lock out conditions are less likely to occur.

**System Programmer Response:** Analyze the reason for the dead lock condition from information sent to the MVS console by DB2 as message number DSNT375I or DSNT376I.
If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00D44034

**Explanation:** The DB2-DL/I batch support cannot continue because an unrecoverable error was encountered during resolve indoubt processing between IMS and DB2. The status of the current indoubt DB2 thread remains unchanged.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a site problem. A PSB name beginning with SYSADM is being used as the authorization ID.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The PSB= parameter of the job step execute statement indicates the PSB name used. Register 3 plus X'34' is the authorization ID specified.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00D44036

**Explanation:** The DB2-DL/I batch support cannot continue because the authorization ID has been changed by the application program.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a site problem. The application program has modified the authorization ID.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The authorization ID saved by DB2 does not match the value in ASXBUSER. Control block modification has occurred. Register 3 plus X'34' is the changed value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00D44037

**Explanation:** The DB2-DL/I batch support cannot continue because the stack of save areas has been exhausted. The error can occur when multiple levels of recursion have been invoked.

This abend reason code is issued by the following CSECTs:

DSNMTV03  DSNMTV04  DSNMTV05

**System Action:** The DB2-DL/I batch support cannot
continue and processing is terminated.

**Operator Response:** Notify the system programmer

**System Programmer Response:** This might be a multiple recursion problem caused by the execution of a changed data capture exit.

**Problem Determination:** Verify that the user exit(s) are not being recursively invoked during a data base update operation.

---

**00D44038**

**Explanation:** The DB2 IMS Attach facility attempted to notify the IMS subsystem that captured DB2 table data is ready for propagation. However, the IMS exit manager was not available for notification.

This abend reason code is issued by the following CSECT: DSNMTV03

**System Action:** DB2 propagation processing is abnormally terminated.

**User Response:** Notify the system programmer.

**System Programmer Response:** This is a site problem. The required release of IMS is not available.

**Problem Determination:** Verify that the IMS release that supports data propagation from DB2 to IMS is installed.

---

**00D44039**

**Explanation:** The DB2-DL/I batch support cannot continue because the record format (RECFM) for the DDOTV02 output data set has a format of fixed or fixed block.

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**System Programmer Response:** Change the RECFM parameter in the DCB from fixed 'F' or fixed blocked 'FB' to variable 'V' or variable blocked 'VB'. Specify LRECL=4092 and a BLKSIZE of at least LRECL+4. Then rerun the job.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Check the DDOTV02 DD for the proper DCB-RECFM value of 'V' or 'VB'.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D44050**

**Explanation:** The DB2-DL/I batch support cannot continue because a DB2 prepare problem was detected.

This abend reason code is issued by the following CSECT: DSNMTV05

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is an internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of PREP. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D44051**

**Explanation:** The DB2-DL/I batch support cannot continue because a DB2 commit continue problem was detected.

This abend reason code is issued by the following CSECT: DSNMTV05

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is an internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of COMC. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D44052**

**Explanation:** The DB2-DL/I batch support cannot continue because a DB2 abort problem was detected.

This abend reason code is issued by the following CSECT: DSNMTV05

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is an internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
Problem Determination: The WAL control block in the dump contains an IMS attach trace table. The last entry in the trace table will have an ID of ABRT. The CALL STATUS contains the two-byte return code and four-byte reason code of the failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44053

Explanation: The DB2-DL/I batch support cannot continue because a DL/1 XRST call problem was detected.

This abend reason code is issued by the following CSECT: DSNMTV05

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an application program error. Check the PCB status code for a nonblank value, validate the PCB used for the call, and validate the parameters passed by the call. Correct the application program and resubmit the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44054

Explanation: The DB2-DL/I batch support cannot continue because an IMS XRST call problem was detected. An XRST call, if issued, must be issued before any SQL call is issued; only one XRST call should be issued.

This abend reason code is issued by the following CSECT: DSNMTV05

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an application program error. Correct the application program so it will issue the XRST call before any SQL statements are processed. Then resubmit the job. Also make sure only one XRST call is issued by the application program.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44055

Explanation: The DB2-DL/I batch support cannot continue because an IMS CHKP call problem was detected by IMS.

This abend reason code is issued by the following CSECT: DSNMTV05

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an application program error. Check the PCB status code for a nonblank value, validate the PCB used for the call, and validate the parameters passed by the call. Correct the application program and resubmit the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D44056

Explanation: The DB2-DL/I batch support cannot continue because an IMS ROLL or ROLB call problem was detected by IMS.

This abend reason code is issued by the following CSECT: DSNMTV05

System Action: The DB2-DL/I batch support cannot continue and processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an application program error. Check the PCB status code for a nonblank value, validate the PCB used for the call, and validate the parameters passed by the call. Correct the application program and resubmit the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
**Problem Determination:** Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 1, 4, 32, 54, 55.

---

**00D44057**

**Explanation:** The DB2-DL/I batch support cannot continue because an IMS call problem was detected by the DB2-DL/I batch support. An IMS SYNC, ROLS, or SETS call is not allowed.

This abend reason code is issued by the following CSECT: DSNMTV05

**System Action:** The DB2-DL/I batch support cannot continue and processing is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an application program error. Correct the application program to use supported IMS calls and resubmit the job.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Follow normal IMS debugging techniques to gather the IMS documentation.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 1, 4, 32, 54, 55.
Chapter 42. X'D6......’ codes

00D60001
Explanation: DB2 detected an inconsistent condition. The index entry for a LOB does not point to a valid LOB in the auxiliary table. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been or from a point-in-time recovery.

This abend reason code is issued by the following CSECTs: ??

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the index page. Run the CHECK utility to identify the extent of index inconsistency.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3] 5 31, 32, 33, 41, 42.

00D60100
Explanation: DB2 detected an inconsistent condition. The index entry for a LOB does not point to a valid LOB in the auxiliary table. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been or from a point-in-time recovery.

This abend reason code is issued by the following CSECTs: ??

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the index page. Run the CHECK utility to identify the extent of index inconsistency.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3] 5 31, 32, 33, 41, 42.

00D60802
Explanation: Available LOB locator space exceeded. The amount of space allowed for processing LOB locators by a user or for a system has been exceeded.

This reason code is issued by the following CSECTs: ??

System Action: The operation is not allowed. DB2 returns ‘resource not available’ to its invoker.

System Programmer Response:
If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, “SQL return codes,” on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, “DSNT... Messages,” on page 415.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3] 5

00D60803
Explanation: An attempt was made to access a value in a column with one of the LOB data types (BLOB, CLOB, DBCLOB), but the value of the column is no longer valid.

This reason code is issued by the following CSECTs: ??

System Action: The operation is not allowed. DB2 returns ‘resource not available’ to its invoker.

System Programmer Response: Use the CHECK
LOB utility to identify the invalid LOBs. Use update to replace or delete to remove the invalid LOBs.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the [Part 2, “SQL return codes,” on page 11](#) or to the description of the DSNT500I and DSNT501I messages in [Chapter 18, “DSNT... Messages,” on page 415](#).

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#):

---

**00D60C02**

**Explanation:** Auxiliary index entry not found. An attempt was made to access an auxiliary index, but the entry was missing. This could be caused by not recovering all the table spaces in the a table space set to the same point in time.

This reason code is issued by the following CSECTs: ??

**System Action:** The operation is not allowed.

**System Programmer Response:** Use the CHECK DATA to determine the rows of the table which are inconsistent. Use SQL UPDATE or DELETE to correct these errors.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The requested operation is not performed.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#):

---

**00D60C03**

**Explanation:** Unable to access a LOB data page because it is not formatted or it belongs to another LOB.

This reason code is issued by the following CSECTs: ??

**System Action:** The operation is not allowed.

**System Programmer Response:** Run CHECK LOB to determine the extent of the inconsistency.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The requested operation is not performed.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#):
Chapter 43. X’D7......’ codes

00D70001

**Explanation:** Either the data space manager (DSM) subcomponent of DB2 could not access some storage group definition, or the storage group contains no volume IDs. Possible sources of the error include use of an incorrect name for the storage group and removal of all volume IDs via ALTER STOGROUP without providing new ones.

This reason code is issued by the following CSECT: DSNPGSGI

**System Action:** A 'resource not available' code is returned to the caller.

**User Response:** If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

**System Programmer Response:** Notify the database administrator if appropriate. Otherwise, check the SQLCA for the name of the storage group. Check this storage group (via an SQL SELECT on SYSIBM.SYSSTOGROUP) to ensure that it exists. Check for associated SYSIBM.SYSVOLUMES table entries to see if any volume IDs exist for this storage group. If you suspect an error in DB2, refer to Part 2 of the **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

**Problem Determination:** Obtain output listing from SELECT * FROM SYSIBM.SYSSTOGROUP and SELECT * FROM SYSIBM.SYSVOLUMES, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any. Use this documentation to determine the cause of the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- 1
- 2
- 14
- 15
- 32
- 35

If you suspect an error in DB2, refer to Part 2 of the **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs:

- DSNPCLO0
- DSNPSCTC
- DSNPSCTD
- DSNPSCT0
- DSNPSCTE

00D70003

**Explanation:** Some or all of the data sets already exist. The data space manager (DSM) subcomponent of DB2 has discovered the preexistence of a data set having the same name as one it was about to create. The name of the data set appears in the SQLCA and/or in message DSNP002I (DEFINE FAILED FOR data-set-name) or DSNP023I (RENAME NEW DATASET SHOULD NOT EXIST FOR data-set-name). If you suspect an error in DB2, refer to Part 2 of the **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem. Refer to Part 2 (Volume 1) of the **DB2 Administration Guide** for data set naming conventions.

This may occur if a user creates a data set with VSAM
access method services (intending to use it for a table space or index), then creates the table space or index via SQL CREATE statement, but forgets to specify USING VCAT.

Another possibility is that the data set remained from some prior, unsuccessfully completed DROP or DELETE operator backup operation of DB2. This failure would probably occur if the data set or integrated catalog facility (ICF) catalog were unavailable at the time of the DROP or DELETE backup. For example, packs may be offline, or other operational problems may exist. In this case, the table space would be dropped, but the data sets could remain and be brought back online at a later time.

There should have been some indication of this type of failure at the time it occurred. (for example, some DSNP-prefixed message indicating the data set was not deleted). You might check recent console sheets for such a message; however, it may have happened a long time ago.

This reason code is issued by the following CSECTs: DSNPDFTN1 DSNPRNM0

**System Action:** Error indication is returned to the end user.

**User Response:** If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

**System Programmer Response:** Notify the database administrator if appropriate. Otherwise, either use access method services to delete the data set or use a different name for the table or index you are trying to create.

If the data set name is correct, is cataloged, and appears in the VTOC, run the access method services DIAGNOSE command against the integrated catalog facility (ICF) catalog identified by the first qualifier of the data set name. The DIAGNOSE command is described in DFSMS/MVS: Access Method Services for the Integrated Catalog.

**Problem Determination:** Information is needed concerning the history of the use of this data set; that is, of the table space/index name in conjunction with this database name. Listings of the console, integrated catalog facility (ICF) catalog, and VTOC may also be needed, with details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any. Use this documentation to determine the cause of the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D70004

**Explanation:** Certain data set(s) are pending deletion. Creation of a new data set is blocked by the presence of the name on a drop list. This is usually a user error. It usually occurs when the user has dropped an old object (table space, index, and so forth) and then attempted to redefine it without committing the drop.

This reason code is issued by the following CSECTs: DSNPCPS0, DSNPDFN1

**System Action:** Error indication is returned to the user.

**User Response:** You must commit the drop prior to redefining. Notify the system programmer or database administrator, if necessary.

**System Programmer Response:** The user must commit the drop of the data set on the drop list. Collect the materials listed in the Problem Determination section of this message to determine the specific cause of the problem.

**Problem Determination:** Documentation is needed showing activities from the last committed action up to and including details of the request that resulted in this code. You also need to examine the contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any. Use this documentation to determine the cause of the problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00D70005

**Explanation:** The specified data set was access method services user-defined. It does not have the required DB2 attributes.

**System Action:** No action is taken with the named data set. An error code is returned and a dump is not taken.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Delete the named data set and define it with the correct attributes. Refer to Part 2 of DB2 Installation Guide for the correct data set definition attributes.

**Problem Determination:** Obtain an access method services LISTCAT for the named data set’s attributes.

This reason code is issued by the following CSECTs: DSNPSCTC DSNPSCT0
00D70006

**Explanation:** The data sets are not owned by this DB2 subsystem. The data sets backing a table space or index can be deleted only by the data space manager (DSM) subcomponent of the DB2 subsystem that created them or by one having the same authorization ID at the time of installation. This is a safety feature to restrict DSM from deleting data sets that might have been created by the user but that have a name that matches the one we are trying to delete. This safety feature also prevents the deletion of data sets that might have been created by some other DB2 subsystem and that are still needed there.

This reason code is issued by the following CSECTs: DSNPDLT1 DSNPDLTE

**System Action:** The data sets remain intact.

**User Response:** If you are unable to resolve the problem yourself, notify the system programmer or database administrator.

**System Programmer Response:** Notify the database administrator if appropriate. Otherwise, check the name of the data sets in question. Delete those names, then issue appropriate DROP and DELETE requests on the DB2 subsystem that created them (see the ‘OWNER’ parameter in the integrated catalog facility (ICF) catalog entry for the data set), or issue access method services DELETE CLUSTER statements directly.

**Problem Determination:** Obtain integrated catalog facility (ICF) catalog and VTOC listings, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any. This documentation will assist you in determining the cause of the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00D70008

**Explanation:** During allocation, DB2 detects that the attributes for the data set were incorrect. This data set requires the extended addressability attribute defined through DFSMS.

**System Action:** Error indication is returned to the end user and a dump is not taken.

**User Response:** Notify the system programmer or storage administrator.

**System Programmer Response:** To be larger than 4 GB, this data set must belong to a DFSMS data class that is defined with the extended addressability attribute. Specify EXT in the DATA SET NAME TYPE field of the DATA SET CLASS DEFINE panel of DFSMS and make sure the automatic class selection routine associates this data set with this data class.

**Problem Determination:** Obtain the data set attribute information from the corresponding SMS data class for the named data set.

00D70009

**Explanation:** The specified data set was access method services user-defined. It does not have the required DB2 attributes. The data set was defined with a Control Interval (CI) size that is incompatible with the page size. A compatible CI size is either 4K or the page size. For example, if the page size is 32K, the ControlIntervalSize parameter in the Define command should be specified with either 4K or 32K. DB2 recommends the use of the page size as the Control Interval size.

**System Action:** A ‘resource not available’ code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA.

**User Response:** Delete the data set that was named and redefine it with the correct CI attributes. Refer to Part 2 of [DB2 Installation Guide](#) for the correct data set definition attributes.

**System Programmer Response:** Ensure that the data set is defined with the compatible CI size, which is 4K or its page size.

**Problem Determination:** Obtain an access method services LISTCAT for the named data set’s attributes.

00D70010

**Explanation:** This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

**System Action:** The data sharing extend is incomplete.

**Operator Response:** Notify the system programmer or database administrator.
System Programmer Response: For additional information, see the description of message DSNP0211.  

Problem Determination: Obtain the console sheet showing the associated DSNP0211 message and any related messages preceding that message.  

Refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.  

This reason code is issued by the following CSECTs: DSNPXTN0 DSNPNUX1 DSNPNUX2

00D70011  

Explanation: The data space manager (DSM) subcomponent of DB2 has been requested to extend a table space or index space, but the table space or index space has already been extended to its maximum size. The size of a partition depends on the number of partitions, and can be 1, 2 or 4GB. If the table space or index space is not partitioned, the maximum size is 64GB (32 data sets—'pieces'—of 2 GB each). The maximum size for an NPI for a large partitioned table space is 512GB (128 data sets of 4GB each).  

For the name of the data set from which the name of the table space, index space, and/or partition can be derived, see message DSNP0011 or DSNP0071 and/or the SQLCA. Refer to Part 2 (Volume 1) of "DB2 Administration Guide" for data set naming conventions.  

This reason code is issued by the following CSECT: DSNPXTN0  

System Action: No extension is done. Whatever operation was in progress is terminated and uncommitted activities are backed out.  

User Response: If you are unable to resolve the problem yourself, notify the system programmer or database administrator.  

System Programmer Response: Notify the database administrator if appropriate. Otherwise, check the passwords and/or RACF authorizations.  

Problem Determination: Obtain output from SQL SELECT * FROM SYSIBM.SYSTABLESPACE and (if storage group related) SELECT * FROM SYSIBM.SYSSTOGROUP. Also obtain integrated catalog facility (ICF) catalog listing, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. This documentation will assist you in determining the cause of the problem if it is not merely an incorrect password. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.  

Collect the following diagnostic items listed in Appendix B. "Problem determination," on page 1349

00D70012  

Explanation: A password or security error has occurred. An attempt to access an integrated catalog facility (ICF) catalog entry for a cluster (data set) failed because of some security violation. This is probably a user error. It may be caused either by the incorrect specification of a password or the changing of the password in the DB2 catalog (via SQL ALTER) but not in the integrated catalog facility (ICF) catalog (via access method services ALTER) or vice versa.  

This reason code is issued by the following CSECTs: DSNPAVL R DSNPSCT D DSNPSCT0

System Action: A 'resource not available' code is returned to the end user.  

User Response: Ensure that the correct password is being used. If you are unable to resolve the problem yourself, notify the database administrator.  

System Programmer Response: Notify the database administrator if appropriate. Otherwise, check the passwords and/or RACF authorizations.  

Problem Determination: Obtain output from SQL SELECT * FROM SYSIBM.SYSTABLESPACE and (if storage group related) SELECT * FROM SYSIBM.SYSSTOGROUP. Also obtain integrated catalog facility (ICF) catalog listing, details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator's console sheet showing related messages, if any. This documentation will assist you in determining the cause of the problem if it is not merely an incorrect password. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.  

Collect the following diagnostic items listed in Appendix B. "Problem determination," on page 1349

00D70013  

Explanation: A required integrated catalog facility (ICF) catalog does not exist or is inaccessible. An attempt to access an integrated catalog facility (ICF) catalog entry for a cluster (data set) failed. This is probably a user error.  

System Action: A 'resource not available' code is returned to the end user.  

User Response: If you are unable to resolve the problem, notify the system programmer or database administrator.  

System Programmer Response: Do the following:
• Check that the proper catalog name was specified and is available to DB2.
• Check the associated DSNP012I message on the operator’s console for the integrated catalog facility (ICF) return and reason codes.
• See the description of DSNP012I.
• Look for any related messages on the console sheet.
• Refer to the appropriate MVS publication for a description of message IDC3009I.

Problem Determination: Obtain the following to help you determine the cause of the problem:
• Details of the request that resulted in this code
• Contents of the SQLCA

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

This reason code is issued by the following CSECTs:
DSNPDLT1  DSNPSCTC  DSNPSCTD  DSNPSCT0  DSNPDLTE

00D70014

Explanation: An attempt to update the high-used RBA for a data set failed in media manager services.

This reason code is issued by the following CSECT: DSNPXTN0

System Action: Abort the request.

User Response: Notify the operator, system programmer, or database administrator.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: Notify the database administrator (DBA), if appropriate. The DBA should be made aware of the extend problem. However, this is probably a system problem.

Problem Determination: Obtain console sheet showing associated DSNP001I, DSN0007I, or DSNP011I messages and any related messages preceding them. This documentation will assist you in determining the cause of the problem. For additional information, see the description of these messages.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00D70016

Explanation: This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

System Action: The data sharing extend is incomplete.

User Response: Notify the operator, system programmer, or database administrator.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: For additional information, see the description of message DSNP021I.

Problem Determination: Obtain the console sheet showing the associated DSNP021I message and any related messages preceding that message.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs: DSNPNUX1, DSNPNUX2

00D70017

Explanation: An error occurred while attempting to obtain information from an integrated catalog facility (ICF) catalog.

System Action: The request is terminated.

System Programmer Response: Ensure that the proper packs and catalog are online and operating correctly. See message DSNP012I.
Problem Determination:  Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 4 5 10 14 32

This reason code is issued by the following CSECTs:

DSNPAVLR  DSNPCLO0  DSNPSCTC  DSNPSCTD  DSNPSCT0

00D70018

Explanation:  This is a DB2 internal error. One of the following circumstances has occurred:

- A data set inquiry function was called for a partitioned table space or index space. Its function applies only to nonpartitioned table spaces or index spaces.
- The reset function of data space manager (DSM) was called on a table space that had been opened incorrectly.

This reason code is issued by the following CSECTs:  
DSNPGNP0, DSNPRST0

System Action:  Abort the request.

Operator Response:  Notify the system programmer.

System Programmer Response:  Collect the materials listed in the Problem Determination section of this message. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination:  Request a dynamic dump. In the dump, the second parameter passed to the data set inquiry function identifies the table space or index space. The third parameter is the table space or index space object descriptor block (OBD). The OBD indicates whether or not the table space or index space is partitioned. If it is partitioned, the calling module is in error. If it is not partitioned, the test in the data set inquiry function must be at fault.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 4 5 10 14 32

00D70019

Explanation:  The data space manager (DSM) subcomponent of DB2 could not release the extend lock it acquired against a data set during an attempt to extend that data set.

This reason code is issued by the following CSECT:  
DSNPXTN0

System Action:  The SQL request that led to the abend is terminated, and the unit of recovery that issued the request is backed out.

Operator Response:  Notify the system programmer.

System Programmer Response:  Collect the materials listed in the Problem Determination section of this message. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination:  The SQL request that led to the abend is terminated, and the unit of recovery that issued the request is backed out.

00D70020

Explanation:  This is probably an internal error. An attempt to extend a data set failed because a problem was detected in media manager services during the DSM notify process.

System Action:  The request is terminated.

Operator Response:  Notify the system programmer or database administrator.

System Programmer Response:  For additional information, see the description of message DSNP021I.

Problem Determination:  Obtain the console sheet showing the associated DSNP021I message and any related messages preceding that message.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

This reason code is issued by the following CSECT:  
DSNPNUX1

00D70021

Explanation:  The data space manager (DSM) subcomponent of DB2 could not write a required log record.

This reason code is issued by the following CSECT:  
DSNPDFN1

System Action:  Abort the request.

Operator Response:  Notify the system programmer.

System Programmer Response:  Collect the materials listed in the Problem Determination section of this message. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination:  Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 4 5 10 14 32 33 35

00D70022
00D70022

Explanation: The data space manager subcomponent of DB2 is unable to acquire a needed lock. The extend request can not be completed.

This reason code is issued by the following CSECT: DSNPXTN0

System Action: Abort the request.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain documentation from message DSNP014I. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: See message DSNP014I.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

| 2 | 10 | 12 | 14 | 32 | 35 |

00D70023

Explanation: There is an insufficient amount of space in primary allocation to format control pages.

This reason code is issued by the following CSECT: DSNPPPP

System Action: The requested table space or index space creation is backed out.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: Notify the database administrator if appropriate. Otherwise, increase the primary allocation value in the data set that was defined directly via access method services. (This should not happen for storage group related data sets, because the DB2 interpreter ensures a sufficient setting for the primary value.)

Problem Determination: Obtain integrated catalog facility (ICF) catalog and VTOC listings, details of the request that led to this code, and contents of the SQLCA. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. Results of SQL SELECT * FROM SYSIBM.SYSTABLESPACE may also be useful. Also obtain the operator’s console sheet showing related messages, if any.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

| 2 | 10 | 12 | 15 | 32 | 35 |

00D70024

Explanation: No data sets exist for a nonpartitioned table space or index space. Because at least one existed at create time, a serious problem might have occurred for this table space or index space. The name of the data set that DB2 expected to find for the table space or index space appears in message DSNP012I and/or in the SQLCA along with the reason code.

System Action: The request is terminated.

System Programmer Response: Ensure that the data set and its pack are available to DB2 and that the data set has not been inadvertently deleted or migrated by any DASD operation.

If the data set name is correct, is cataloged, and appears in the VTOC, run the access method services DIAGNOSE command on the integrated catalog facility (ICF) catalog identified by the first qualifier of the data set name. The DIAGNOSE command is described in DFSMS/MVS: Access Method Services for the Integrated Catalog.

Problem Determination: Obtain the following:

- The integrated catalog facility (ICF) catalog
- The VTOC listings
- Details of the request that led to this code
- Contents of the SQLCA
- The operator’s console sheet showing related messages

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

| 2 | 10 | 12 | 14 | 32 | 35 |

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs: DSNPCP00 DSNPGN0

00D70025

Explanation: An access method services request failed.

This reason code is issued by the following CSECT: DSNPAMS

System Action: Abort the request.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: Examine messages DSNP009I and DSNP010I on the operator’s console for the access method services messages they encompass. Refer to the appropriate MVS publication for information about specific access method services messages received.
Problem Determination: See the message DSNP009I description.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D70026

Explanation: This is an internal error. An attempt to extend a data set failed because a problem was detected in the DSM notify process.

System Action: The data sharing extend did not complete.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: For additional information, see the description of message DSNP022I.

Problem Determination: Obtain the console sheet showing the associated DSNP022I message and any related messages preceding that message.

Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNPXTN0

00D70027

Explanation: The secondary allocation value is 0. No physical extension is done. If this occurs in a create of a segmented table, the primary allocation of the table space is not big enough to allocate the first segment. The first segment consists of a number of pages which are defined in SEGSIZE.

This reason code is issued by the following CSECT: DSNPXTN0

System Action: The request to extend the data set is terminated.

System Programmer Response: Notify the database administrator if appropriate. Otherwise, if you intended to allow physical extension of the data set, change its secondary value to a nonzero quantity.

Problem Determination: Obtain the integrated catalog facility (ICF) catalog and VTOC listings, and (if storage group-defined) the output from SELECT * FROM SYSIBM.SYSTOGROUP. Also obtain details of the request that resulted in this code, contents of the SQLCA, and the operator’s console sheet showing related messages, if any.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00D70028

Explanation: An HSM request for the recall of a migrated data set failed.

This abend reason code is issued by the following CSECT: DSNPHRC0

System Action: The HSM recall is aborted by data space manager and control returns to the function that issued the recall request. The higher level function will not necessarily terminate processing since the data set may have already been recalled.

Operator Response: If processing was terminated, notify the system programmer or database administrator.

System Programmer Response: If processing was terminated, investigate the reason for the HSM failure via messages issued to the MVS operator’s console. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Refer to the problem determination section(s) of the associated DB2 and HSM messages which were issued to the MVS operator’s console.

Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1349.

00D70030

Explanation: Unexpected reason code was received from some DB2 subcomponent invoked by data space manager (DSM).

Almost any DSNP module can issue this reason code.

System Action: Abort the request.

Operator Response: Notify the system programmer.

System Programmer Response: There is not much the system programmer can do here, but see register 2 in the accompanying dump for the unexpected code. Its description may provide a clue to the type of problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Obtain a listing of the SQL request that resulted in this code and a listing of the contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any. There should be at least one DSNP-prefixed message containing the ‘00D70030’ code. Messages preceding it from other subcomponents (having other prefixes beginning with DSN) may provide additional details about the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
00D70040

Explanation: An attempt to rename an existing data set failed, because a name does not conform to the naming convention.

This reason code is issued by the following CSECTs: DSNPRNM0 DSNPDLTE

System Action: Error indication is returned to the end user.

User Response: Notify the system programmer.

System Programmer Response: Notify the database administrator if appropriate.

Problem Determination: This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I or DSNP026I.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [10 12 14 15 32 33]

00D70041

Explanation: An attempt to rename an existing data set failed.

This reason code is issued by the following CSECT: DSNPRNM0

System Action: Error indication is returned to the end user.

User Response: Notify the system programmer.

System Programmer Response: Notify the database administrator if appropriate.

Problem Determination: This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [10 12 14 15 32 33]

00D70042

Explanation: An attempt to rename an existing data set failed, because the old and new names are not compatible. This problem might arise in one or both of the following situations:

1. One data set name is a DB2 page set data set name and another data set name is a non-DB2 page set data set name.
2. Both are DB2 page set data set names, but there is a mismatch in the catalog alias names, the database names, or the table space/index space names.

This reason code is issued by the following CSECT: DSNPRNM0

System Action: Error indication is returned to the end user.

User Response: Notify the system programmer or database administrator.

System Programmer Response: Notify the database administrator if appropriate.

Problem Determination: This problem probably arises during execution of the REORG utility with SHRLEVEL REFERENCE or CHANGE. See message DSNP027I.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. [10 14 15 32 33]

00D70043

Explanation: During the define cluster for a undefined data set, DB2 detected that the specified data set requested to be defined already exists.

System Action: A 'resource not available' code is returned to the end user.

User Response: Delete the existing cluster and rerun the job.

00D70046

Explanation: This is an internal error. An attempt to extend a data set failed because an error is detected. The high used page number of the pageset recorded in DB2 does not match the high used control interval from the integrated catalog facility (ICF) catalog.

System Action: The data sharing extend did not complete.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: For additional information, see the description of message DSNP007I.

Problem Determination: Obtain the console sheet showing the associated DSNP007I message. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D70051

Explanation: One of the following is issued on a ROSHARE OWNER database:

- A CREATE TABLESPACE statement
- A CREATE INDEX statement, or
- The REORG utility with SHRLEVEL REFERENCE or SHRLEVEL CHANGE using user-managed data sets

However, the data sets are not defined with VSAM SHAREOPTIONS(1,3).

System Action: An SQLCODE -731 is returned to the end user (for CREATE TABLESPACE or INDEX) The
CREATE TABLESPACE or INDEX statement or the REORG utility is not executed.

User Response: Use AMS ALTER SHAREOPTIONS to alter the data set to SHAREOPTIONS(1,3) and resubmit the CREATE TABLESPACE or INDEX statement or the REORG utility.

00D70052

Explanation: An ALTER DATABASE statement is issued to convert a database to ROSHARE OWNER. But, within this database, at least one user defined data set is not defined with VSAM SHAREOPTIONS(1,3). All user-defined data sets that are within this database must be converted to SHAREOPTIONS(1,3) before the database can be altered to ROSHARE OWNER.

This reason code is issued by the following CSECT: DSNPATS50

System Action: An SQLCODE -731 is returned to the end user and the ALTER DATABASE statement is not performed.

User Response: Use AMS ALTER SHAREOPTIONS to alter all user-defined data sets that are within this database to SHAREOPTIONS(1,3), and resubmit the ALTER DATABASE statement.

00D70100

Explanation: A requested resource is not available. Either the data space manager (DSM) or some subcomponent that invoked discovered that some resource is not available. The name and type of the resource and the reason it is unavailable are placed in the CT control block by the subcomponent that made the discovery. This information is made available to the end user in the SQLCA and/or messages. The reason code in the CT/SQLCA contains the identifier of the subcomponent that discovered the problem.

Almost any DSNP module can issue this reason code.

System Action: Abort the current request.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: Notify the database administrator if appropriate. Otherwise, determine what resource was unavailable (from SQLCA information) and, if it is something you can control, make it available.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section in the description of the code that appears in the SQLCA or CTURES field of the CT and/or in the description of any associated console messages. Obtain details of the request that resulted in this code, and contents of the SQLCA. Also obtain operator’s console sheet showing related messages, if any.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 14 32 35]

00D79999

Explanation: A severe error has occurred. For example, an invalid data space manager (DSM) function is invoked.

Almost any data space manager (DSM) function can issue this reason code.

System Action: Abort the request.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Obtain the console sheet, dump, details of the request that led to this code, and contents of the SQLCA. Use these in conjunction with the procedures in Part 2 of DB2 Diagnosis Guide and Reference

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 14 32 35]
Chapter 44. X’D9......’ codes

00D90000

Explanation: A recovery manager module received control from its FRR for retry and found an invalid retry point identifier. The name of the module in which the failure occurred appears in the SYS1.LOGREC entry showing this reason code in register 15.

System Action: Standard DB2 diagnostic information is provided. The error is recorded in SYS1.LOGREC, an SVC dump is scheduled, and DB2 subsystem termination is requested. The subsystem termination reason code reflects the function for which retry was unsuccessfully attempted.

Operator Response: Print SYS1.LOGREC, and restart DB2.

System Programmer Response: This is a secondary subsystem error. Obtain a copy of SYS1.LOGREC and the SVC dump for this failure and for the original failure that resulted in the retry attempt.

Problem Determination: Examine the SYS1.LOGREC information and the dumps from both the original failure and this second failure to determine if the recovery parameter area was damaged or if retry incorrectly restored registers for the mainline module.

00D90003

Explanation: A failure occurred while DB2 was attempting to open an object in the shared communications area (SCA).

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Operator Response: Ensure the coupling facility for the SCA is available, and restart DB2.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5]

This abend reason code is issued by the following CSECT: DSNRIT03

00D90010

Explanation: During the process of re-enabling data sharing, all members, other than the surviving member, are forced to cold start. In the process of setting up the cold start for this member, an active conditional restart control record was discovered in the BSDS. This record could not have been in the BSDS when data sharing was disabled, and this DB2 should have been inactive since data sharing was disabled; therefore, it is unclear what the conditional restart control record is requesting.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

System Programmer Response: Use the change log inventory (DSNJU003) utility to cancel the active conditional restart control record in this member’s BSDS.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5 16]

This abend reason code is issued by the following CSECT: DSNRRGRI

00D90011

Explanation: DB2 determined that the version of the shared communications area (SCA) recorded within the SCA did not match the version of the SCA returned from MVS.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in
00D90012

Explanation: An error occurred while DB2 was attempting to create a service task.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1][2][5]

This abend reason code is issued by the following CSECT: DSNRRGRI

00D90013

Explanation: The restart parameters for TRKRSITE are invalid. If TRKRSITE is YES on DSNZPARM and this DB2 subsystem has not successfully restarted in this ‘Tracker Recovery cycle’, DB2 requires special conditions before it can restart.

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System Programmer Response: Ensure that the Conditional Restart Control Record is correct, then restart DB2. You can run the Print Log Map Utility (DSNJU004) to examine the current Conditional Restart record. The following conditions are correct:

- BACKOUT = NO
- FORWARD = NO

- Either an ENDRBA value for non-data sharing or an ENDLRSN value for data sharing. In data sharing, the ENDLRSN value must be the same for all members restarting in this ‘Tracker Recovery cycle’.

To avoid a cold start or log skipping in a tracker site, ensure that STARTTRBA has no specified value. You can create or modify the Conditional Restart parameters with the Change Log Inventory Utility (DSNJU003). See [DB2 Utility Guide and Reference](#) for more information on these utilities.

00D90014

Explanation: The System Level Recovery restart was invalid. All members of the data sharing group must truncate their logs with the same LRSN value that was specified in the SYSPTR conditional restart parameter.

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System Programmer Response: Ensure that the conditional restart control record is correct, and then restart DB2. You can run the Print Log Map utility (DSNJU004) to examine the current conditional restart record.

00D9001F

Explanation: An invalid function code was passed to a DB2 service task.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1][2][5]

This abend reason code is issued by the following CSECT: DSNRRUTT

00D90020

Explanation: During the process of re-enabling data sharing, the surviving member of the previous data sharing disable must be the first member started. An attempt was made to start a member other than the surviving member during the process of re-enabling data sharing.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Operator Response: To initiate the data sharing re-enable process, start the surviving member of the previous data sharing disable first.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.[1][2][5]
This abend reason code is issued by the following CSECTs: DSNRRSBS, DSNRRGRC

00D90021

Explanation: After data sharing is disabled, only the surviving member of the group can be started. An attempt was made to start a member other than the surviving member.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

This abend reason code is issued by the following CSECT: DSNRRSBS

00D90022

Explanation: After reading information from the BSDS of a peer member in its data sharing group, this DB2 was not able to close the peer’s BSDS.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

This abend reason code is issued by the following CSECT: DSNRTFY

00D900E0

Explanation: A DB2 functional recovery routine invoked DB2 subsystem termination because an unrecoverable error was detected.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the original problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

This abend reason code is issued by the following CSECT: DSNRRGRT

00D900E1

Explanation: The operator replied ‘NO’ to message DSNR020I. See message DSNR020I for more information.

System Action: DB2 terminates.

Problem Determination: This abend reason code is issued by the following CSECT: DSNRRGRC

00D900EB

Explanation: This abend reason code appears at a member, other than the surviving member, when the surviving member is not able to complete the process of re-enabling data sharing. This member cannot continue because data sharing was not re-enabled successfully.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: Determine why the surviving member was not able to complete the data sharing re-enable.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. This abend reason code is issued by the following CSECT: DSNRCRPR

**00D900EC**

**Explanation:** During the process of re-enabling data sharing, a member other than the surviving member was not able to complete its portion of the re-enabling process.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. This abend reason code is issued by the following CSECT: DSNRCRPR

**00D900F3**

**Explanation:** DB2 received an error while attempting to read the BSDS.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**System Programmer Response:** Correct the problem with the coupling facility, and restart DB2.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. This abend reason code is issued by the following CSECTs: DSNRGRGI, DSNRRINI, DSNRSCA

**00D900F4**

**Explanation:** DB2 received an error while attempting to write to the BSDS.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**System Programmer Response:** Correct the problem with the BSDS, and restart DB2.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. This abend reason code is issued by the following CSECTs: DSNRGRGI, DSNRRIT02, DSNRIT03, DSNRRGRT, DSNRRGRH, DSNRGGRI, DSNRGRFT, DSNRRGRT, DSNRSCA

**00D900F2**

**Explanation:** DB2 received an error while attempting to write shared communications area (SCA) information to the coupling facility.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**System Programmer Response:** Correct the problem with the coupling facility, and restart DB2.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of **DB2 Diagnosis Guide and Reference** for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349. This abend reason code is issued by the following CSECTs: DSNRGRGI, DSNRRINI, DSNRSCA
This abend reason code is issued by the following CSECTs: DSNRNTFY, DSNRRGRT, DSNRSCA

00D900F5

Explanation: DB2 received an error while attempting to read the BSDS of another member in the data sharing group.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

System Programmer Response: Correct the problem with the BSDS, and restart DB2.

Problem Determination: Register 4 contains the member ID of the member whose BSDS was being read.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECT: DSNRRINI

00D900F7

Explanation: DB2 received an error while attempting to acquire a lock.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump might be requested. Depending on the error, DB2 might initiate subsystem termination.

Problem Determination: Register 4 points to the resource that DB2 was attempting to lock.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNRCRPR, DSNRRGRI, DSNRRGRT

00D900F8

Explanation: DB2 received an error while attempting to release a lock used to serialize portions of restart or group restart.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNRIT02, DSNRIT03, DSNRRGRC, DSNRRGRI, DSNRRGRT, DSNRRSBS, DSNRSCA

00D900F9

Explanation: DB2 received an error while attempting to notify other members in the data sharing group of a restart or group restart event.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNRIT02, DSNRIT03, DSNRRGRC, DSNRRGRI, DSNRRGRT

00D900FA

Explanation: The DB2 subsystem that is starting is using an unsupported level of code or does not have the proper level of SPE applied.

System Action: The DB2 subsystem terminates. An SVC dump might be requested.

System Programmer Response:

Verify that:

• The DB2 startup procedure points to the correct set of load libraries.

• The correct SPE has been applied to all active members in the group.

00D90100

Explanation: A DB2 functional recovery routine invoked DB2 subsystem termination because an unrecoverable error was detected.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is
requested before DB2 subsystem termination is initiated.

**Problem Determination:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the original problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECT: DSNRTIMR

---

**00D90110**

**Explanation:** This is an internal error.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECT: DSNRTIMR

---

**00D90111**

**Explanation:** This is an internal error.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested before DB2 subsystem termination is initiated.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECT: DSNRTIMR

---

**00D92004**

**Explanation:** The checkpoint/restart serial controller (DSNRCRSC) FRR invoked DB2 subsystem termination, because an unrecoverable error was detected while processing a request.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECT: DSNRCRSC

**System Action:** Subsystem termination is initiated. Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the associated abend.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error, and follow the instructions associated with it.

**Problem Determination:** See the original error.

---

**00D92003**

**Explanation:** The restart request servicer (DSNRQRRQS) FRR invoked DB2 subsystem termination, because an unrecoverable error was detected while processing a restart request.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECT: DSNRRQRRQS

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D92004**

**Explanation:** The shutdown checkpoint controller (DSNRCSHT) FRR invoked DB2 subsystem termination, because an unrecoverable error was detected while processing a shutdown request.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECT: DSNRCSHT

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of
SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D92011**

**Explanation:** An invalid URE was found during checkpoint processing. An overlay of the URE may have occurred.

This abend reason code is issued by the following CSECT: DSNRPBCW

**System Action:** The checkpoint process will ABEND to prevent a damaged URE from being written out to the log, and the subsystem will be terminated. This is to prevent the loss or incorrect processing of a DB2 unit of recovery (UR). DB2 Restart will use the previous checkpoint and apply all the DB2 log records up to the point of failure. Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**Operator Response:** Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart DB2.

**System Programmer Response:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][3].

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Examine the SVCDUMP and the DB2 Trace Table in the dump to determine the cause of the URE overlay.

---

**00D92012**

**Explanation:** An invalid RURE was found during checkpoint processing. An overlay of the RURE may have occurred.

This abend reason code is issued by the following CSECT: DSNRPBCW

**System Action:** The checkpoint process will abend to prevent a damaged RURE from being written out to the log, and the subsystem will be terminated. This is to prevent the loss or incorrect processing of a DB2 unit of recovery. DB2 Restart will use the previous checkpoint and apply all the DB2 log records up to the point of failure. Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**Operator Response:** Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart DB2.

**System Programmer Response:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][3].

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Examine the SVCDUMP and the DB2 Trace Table in the dump to determine the cause of the RURE overlay.

---

**00D92013**

**Explanation:** An invalid GXID was found during checkpoint processing. An overlay of the GXID might have occurred.

**System Action:** The checkpoint process will abnormally terminate to prevent a damaged GXID from being written out to the log, and the subsystem will be terminated. This is to prevent the loss of or incorrect processing of a DB2 unit of recovery. DB2 Restart will use the previous checkpoint and apply all the DB2 log records up to the point of failure. Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**Operator Response:** Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer. Restart DB2.

**System Programmer Response:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][3].

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Examine the SVCDUMP and the DB2 Trace Table in the dump to determine the cause of the GXID overlay.

---

**00D92021**

**Explanation:** An invalid URE was read from the log during the current status rebuild phase of restart. Restart cannot process the damaged URE.

This abend reason code is issued by the following CSECT: DSNRPLCS

**System Action:** The restart processing abends, which terminates the subsystem. This is to prevent the loss or incorrect processing of a DB2 unit of recovery.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. The first 4 digits of the RBA of the invalid log record is contained in register 3 and the last 8 digits in register 4.

**Operator Response:** Do not attempt to restart DB2 until the error is resolved. Notify the system programmer and collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][3][5].

**System Programmer Response:** Print the BSDS using the print log map (DSNJJU004) utility. Find the
checkpoint queue in the output listing from DSNJU004.

Next, run the change log inventory (DSNJU003) utility to create a conditional restart record with the CHKPTRBA option specifying the Begin checkpoint RBA found in the second entry of the checkpoint queue. Restart DB2 using the conditional restart record found. If the same failure occurs, repeat the conditional process using the next begin checkpoint RBA in the checkpoint queue.

Repeat this process, going down the checkpoint queue until DB2 restarts. This will be prior to the time when the invalid URE was written to the log. The restart process is then able to apply all the log records to the end of the log. For information on running DSNJU004 and DSNJU003, see DB2 Utility Guide and Reference.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D92023

Explanation: An invalid RURE was read from the log during the current status rebuild phase of restart. Restart cannot process the damaged RURE.

This abend reason code is issued by the following CSECT: DSNRPLCS

System Action: The restart processing will abend, which will terminate the subsystem. This is to prevent the loss or incorrect processing of a DB2 unit of recovery.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. The first 4 digits of the RBA of the invalid log record is contained in register 3 and the last 8 digits in register 4.

Operator Response: Do not attempt to restart DB2 until the error is resolved. Notify the system programmer and collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

System Programmer Response: Print the BSDS using the Print Log Map (DSNJU004) utility. Find the checkpoint queue in the output listing from DSNJU004.

Next, run the Change Log Inventory (DSNJU003) utility to create a conditional restart record with the CHKPTRBA option specifying the begin checkpoint RBA found in the second entry of the checkpoint queue. Restart DB2 using the conditional restart record found. If the same failure occurs, repeat the conditional process using the next begin checkpoint RBA in the checkpoint queue.

Repeat this process, going down the checkpoint queue until DB2 restarts. This will be prior to the time when the invalid RURE was written to the log. The restart process is then able to apply all the log records to the end of the log. For information on running DSNJU004 and DSNJU003 utilities, refer to DB2 Utility Guide and Reference.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00D92024

Explanation: During restart, the state of a logged unit of recovery and the state of the global transaction which the unit of recovery is part of are incompatible.

System Action: The restart processing abnormally terminates, which terminates the subsystem. This is to prevent the loss or incorrect processing of a DB2 unit of recovery.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.
**Problem Determination:** The state of the logged unit of recovery is reported in register 1 and the state of the global transaction is provided in register 2. The meanings of these values are shown below.

Unit of recovery state (in register 1):
- 1 inflight
- 2 ensure abort
- 3 commit indoubt
- 4 ensure commit

Global Transaction State (in register 2):
- 1 inflight
- 2 ensure abort
- 3 commit indoubt
- 4 ensure commit

**Operator Response:** Do not attempt to restart DB2 until the error is resolved. Notify the system programmer and collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**System Programmer Response:** Print the BSDS using the Print Log Map (DSNJU004) utility. Find the checkpoint queue in the output listing from DSNJU004.

Next, run the Change Log Inventory (DSNJU003) utility to create a conditional restart record with the CHKPTRBA option specifying the begin checkpoint RBA found in the second entry of the checkpoint queue. Restart DB2 using the conditional restart record found. If the same failure occurs, repeat the conditional process using the next begin checkpoint RBA in the checkpoint queue.

Repeat this process, going down the checkpoint queue until DB2 restarts. This will be prior to the time when the invalid record was written to the log. The restart process then applies all the log records to the end of the log. For information on running DSNJU004 and DSNJU003, see DB2 Utility Guide and Reference.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D93002**

**Explanation:** The DB2 subsystem is terminated because an unrecoverable error was detected during must-complete processing for phase 2 of a commit-UR request for an agent that is a participant in a global transaction. This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2. Notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in the commit of the global transaction. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** DB2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with DB2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00D9300F**

**Explanation:** The commit/abort secondary FRR invoked DB2 subsystem termination. This occurs only if functional recovery itself fails while processing a failure during must-complete processing for phase 2 of a commit-UR request.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error. Standard DB2 diagnostic information is also recorded in
SYS1.LOGREC for the secondary error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC for both the original and the secondary error, and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**Explanation:** A subcomponent of DB2 invoked commit when the agent state was invalid for commit-UR invocation. Commit-UR was requested for an agent that was modifying data. Either commit-UR or abort-UR was already in process, or the recovery structure (URE) was damaged.

This abend reason code is issued by the following CSECT: DSNRUC01

**System Action:** Abnormal termination of the agent results, including backing out (abort-UR) of its activity to the previous point of consistency. This releases all locks held by the agent for its resources.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area by reason code '00D9CCCC', is added to the SDWA variable recording area.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

If the agent were in a must-complete state (in-commit2 or in-abort), the DB2 subsystem is also terminated with reason code '00D93001'. When the subsystem is next restarted, recoverable activity for this agent (such as an ensure-abort or ensure-commit UR) is handled to complete the commit or abort process.

**System Programmer Response:** This is a DB2 subsystem error. Collect the materials mentioned in the Problem Determination section of this message.

**Problem Determination:** Examine the SYS1.LOGREC data and the DB2 trace table in the dump to establish whether either commit-UR was invoked incorrectly or the control structure (ACEPROG) was damaged.

---

**Explanation:** The request to commit an agent that was a participant in a global transaction failed because a mismatch between the state of the agent and the state of the global transaction. State field was damaged.

**System Action:** Abnormal termination of the agent occurs, including backing out (abort-UR) its activity to the previous point of consistency. This releases all resource locks held by the agent.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in the commit of the global transaction. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** DB2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with DB2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

---

**Explanation:** This reason code indicates that a DB2 allied agent does not need to participate in the Phase 2 (Continue Commit) call, because all required work has been accomplished during the Phase 1 (Prepare) call.
This reason code is generated by Recovery Manager when it is determined that a DB2 allied agent has not updated any DB2 resource since its last commit processing occurred.

**System Action:** The "yes" vote is registered with the Commit coordinator.

---

### 00D94001

**Explanation:** The commit/abort FRR (DSNRCAFR) invoked DB2 subsystem termination, because an unrecoverable error was detected during must-complete processing for an abort-UR request.

This is a DB2 subsystem termination reason code.

This reason code is issued by the following CSECTs: DSNRCAFR, DSNRUA02

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the reason code for the original error.

---

### 00D94002

**Explanation:** The DB2 subsystem is terminated because an unrecoverable error was detected during must-complete processing for an abort-UR request for an agent that is a participant in a global transaction.

This is a DB2 subsystem termination reason code.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination initiates.

**Operator Response:** Print SYS1.LOGREC, and restart DB2. Notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in the commit of the global transaction. Refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** DB2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with DB2 or with the commit coordinator of the global transaction.

Collect the following diagnostic items listed in Appendix B, “Problem Determination,” on page 1349.

---

### 00D9400F

**Explanation:** The commit/abort FRR invoked DB2 subsystem termination. This occurs only if functional recovery itself fails while processing a failure during must-complete processing for an abort-UR request.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, "IRLM Abend Reason Codes," on page 1335.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error. Standard DB2 diagnostic information is also recorded in SYS1.LOGREC for the secondary error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC for both the original and the secondary error, and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

### 00D94011

**Explanation:** A subcomponent of DB2 invoked abort at a point when the agent state is invalid for invoking the function that aborts units of recovery. Either abort-UR or commit-UR phase 2 was already in process, or the agent structure was damaged.

This abend reason code is issued by the following CSECT: DSNRUA01

**System Action:** Abnormal termination of the agent results and, because the agent is in a must-complete state, the DB2 subsystem is terminated with reason code ‘00D94001’. When the DB2 subsystem is restarted, recoverable activity for this agent is handled to complete the commit or abort process.

Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is scheduled. Additional information, identified in the SDWA variable recording area by reason code ‘00D94001’, is added to the SDWA variable recording area. If you suspect an error in DB2, refer to Part 2 of the DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**System Programmer Response:** This is a DB2 subsystem error. Collect the materials mentioned in the Problem Determination section of this message.

**Problem Determination:** Examine the SYS1.LOGREC data and the DB2 trace table in the dump to establish whether commit-UR was invoked incorrectly or the control structure (ACEPROG, UREPLOG) was damaged.
**00D94012**

**Explanation:** During rollback, the end of the log was read before all the expected log ranges were processed. The abend is accompanied by a DB2 abnormal subsystem termination with reason code 00D94001.

This reason code is issued by the following CSECT: DSNRUA02

**System Action:** The agent is abnormally terminated. Because the agent is in a must-complete state, the DB2 subsystem is terminated with reason code 00D94001 and message DSNV086E. Standard DB2 diagnostic information is recorded in SYS1.LOGREC. An 04E-D94012 SVC dump is requested.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print the content of both BSDSs.
2. Print SYS1.LOGREC.
3. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Refer to the recovery scenarios in Part 4 (Volume 1) of [DB2 Administration Guide](http://www.example.com) before restarting.

To restart DB2, you must do one of the following:
- Add the missing archive log data sets back to the BSDS with the change log inventory (DSNJU003) utility and increase the MAXARCH parameter in the DSN6LOGP member of DSNZPARM to complete the rollback, or
- Restart DB2 with a conditional restart specifying BACKOUT=NO to bypass the unit of recovery that is in-abort.

**Problem Determination:** At the time of the abend, registers 3 and 4 contain the 6-byte relative byte address (RBA) of the beginning of this unit of recovery. DB2 must read the log back to this point to complete the ROLLBACK of this unit of recovery.

---

**00D94014**

**Explanation:** A savepoint request encountered an invalid request block. This is an internal error.

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested.

**Operator Response:** Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

**Problem Determination:** At the time of the abend, general register zero contains the address of the invalid SRPL request block.

---

**00D95001**

**Explanation:** The recovery manager’s common FRR (DSNRCRFR) invoked DB2 subsystem termination, because an unrecoverable error was detected during checkpoint (DSNRCPRC) processing.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](http://www.example.com).

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D95011**

**Explanation:** The recovery manager checkpoint (DSNRPCWC) FRR invoked DB2 subsystem termination, because an unrecoverable error was detected while performing its checkpoint functions.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](http://www.example.com).

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D96001**

**Explanation:** The recovery manager’s restart FRR invoked DB2 subsystem termination, because an unrecoverable error was detected during the restart processor (DSNRRPRC) processing.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](http://www.example.com).
This reason code is issued by the following CSECTs:

DSNRCRFR  DSNRRAUB  DSNRCSL  DSNRCSR
DSNRRHSL  DSNRRHSR  DSNRPMU  DSNRPDC

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. If possible, correct cause of original error and restart DB2. If you cannot correct the error, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

---

**00D96011**

**Explanation:** The restart participation FRR invoked DB2 subsystem termination, because an unrecoverable error was detected while processing log records during restart.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, ”IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECT:

DSNRPBSCS

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, correct the problem, and restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.

---

**00D96021**

**Explanation:** The DB2 subsystem was terminated during restart because a failure occurred while attempting to read the log forward MODE(DIRECT). It is accompanied by a recovery log manager abend X’04E’ with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, ”IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECTs:

DSNRRHSR, DSNRRCSR

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. If you cannot correct the error, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

**Problem Determination:** At the time of the abend, registers 2 and 3 (as shown in the dump or in SYS1.LOGREC) contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.
00D96031

**Explanation:** The restart FRR invoked DB2 subsystem termination, because a failure occurred while attempting to read the log backward MODE(DIRECT). It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, “IRLM Abend Reason Codes,” on page 1335.](#)

This reason code is issued by the following CSECT: DSNRRAUB

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start DB2 again.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the accompanying abend reason code.

00D96032

**Explanation:** During restart, the end of the log was read before all the expected log ranges had been processed. The abend is accompanied by a DB2 abnormal subsystem termination with the same reason code (00D96032).

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, “IRLM Abend Reason Codes,” on page 1335.](#)

This reason code is issued by the following CSECT: DSNRRAUB

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC. A 04E-D96032 SVC dump is requested. The DB2 subsystem is terminated with DSNV086E message.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Notify your system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error. Determine where the log went. Refer to Part 4 (Volume 1) of [DB2 Administration Guide](#) before restarting.

**Problem Determination:** At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

00D96041

**Explanation:** The recovery manager’s restart function detected an internal error.

This abend reason code is issued by the following CSECT: DSNRXRU

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the error. For more information see message DSNL429.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See message DSNL429 for more information.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B, “Problem Determination,” on page 1349](#).

00D98001

**Explanation:** The recovery manager’s common FRR (DSNRCRFR) invoked DB2 subsystem termination, because an unrecoverable error was detected during indoubt-UR (DSNRIRPR, DSNRRIRD, DSNRRIUN, DSNRIPMU) processing.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, “IRLM Abend Reason Codes,” on page 1335.](#)

This reason code is issued by the following CSECT: DSNRCRFR

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the original error.
00D98011

**Explanation:** The FRR for the resolve-indoubt-UR request service (DSNRIURS) invoked DB2 subsystem termination, because an unrecoverable error was detected processing a request.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](#).

This reason code is issued by the following CSECT: DSNRIURS

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:** Print SYS1.LOGREC, and restart DB2.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the accompanying abend reason code.

---

00D98021

**Explanation:** The resolved indoubt FRR invoked DB2 subsystem termination because of a failure while attempting to read the log MODE(DIRECT) during forward recovery. It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the beginning RBA of the portion that is read.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](#).

This reason code is issued by the following CSECT: DSNRRIRD

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNUJ004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start DB2 again.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

---

00D98031

**Explanation:** The resolved indoubt FRR invoked DB2 subsystem termination, because a failure occurred during an attempt to read the log MODE(DIRECT) while reading the log backward. It is accompanied by a recovery log manager abend X'04E' with a reason code describing the specific failure.

Each time a portion of the log is skipped, a read direct is used to validate the begin-scope RBA of the portion that is read.

This is a DB2 subsystem termination reason code. For further information, see [Chapter 61, "IRLM Abend Reason Codes," on page 1335](#).

This reason code is issued by the following CSECT: DSNRIUN

**System Action:** Standard DB2 diagnostic information
is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start DB2 again.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** See the accompanying abend reason code.

---

**00D98032**

**Explanation:** Resolved indoubt FRR invoked abend when end-of-log was reached before all ranges had been processed for backward recovery. This abend is accompanied by abnormal DB2 subsystem termination with the same reason code (‘00D98032’).

This is a DB2 subsystem termination reason code. For further information, see Chapter 61, “IRLM Abend Reason Codes,” on page 1335.

This reason code is issued by the following CSECT: DSNRRIU

**System Action:** Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested for the original error before DB2 subsystem termination is initiated.

**Operator Response:**
1. Run the print log map (DSNJU004) utility to print content of both BSDSs.
2. Print SYS1.LOGREC.
3. Follow instructions for the accompanying recovery log manager error. Use the MVS DISPLAY DUMP command to get the failure reason code from dump titles.
4. Start DB2 again.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump for the original error.

**Problem Determination:** At the time of the abend, registers 2 and 3 contain the 6-byte relative byte address (RBA) of the last log record that was read before end-of-log was encountered.

---

**00D99001**

**Explanation:** An attempt to read the CHKPTRBA failed to return a valid checkpoint record. This abend is issued after the DSNR015I error message is issued.

**System Action:** Restart is abended.

**Operator Response:** Inform the system programmer.

**System Programmer Response:** Let the change log inventory (DSNJ003) utility select the checkpoint RBA when building the conditional restart record. If a specific checkpoint is desired, use DSN1LOGP to print out the checkpoint log records within a specified range. If manual selection of the checkpoint RBA is desired, use the print log map (DSNJU004) utility to print the checkpoint queue. Print the checkpoint queue by using the CHKPTRBA keyword.

**Problem Determination:**
- Print the checkpoint records within the desired range using DSN1LOGP.
- Print the checkpoint queue using DSNJU004.
- Verify the checkpoint queue against the DSN1LOGP report.
- If automatic checkpoint selection was used and the checkpoint was invalid, find the valid checkpoint RBA in the DSN1LOGP report. Use this checkpoint RBA in the CRCR using the CHKPTRBA keyword.
- If an explicit checkpoint was specified and the checkpoint was invalid, let DSNJU003 automatically choose the checkpoint by not specifying a CHKPTRBA keyword.

---

**00D99002**

**Explanation:** Validation of the STARTRBA failed because either the end of the log was reached, or a bad log record was encountered while attempting to find the first complete log record.

**System Action:** Restart abends.

**Operator Response:** Inform the system programmer.

**System Programmer Response:** Check the console log for DSNJ (Log Manager) messages; these may indicate failures in the Log Manager processing, or may reveal additional useful information for diagnostic purposes. Use DSN1LOGP to find a safe STARTRBA to use for restart. If a STARTRBA is specified, the Recovery Manager will use it as a starting point. From the starting point, the Recovery Manager will attempt to find the beginning of a valid log record.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**00D99003**

**Explanation:** CSRONLY was specified in the conditional restart record. Only the DB2 status phase of restart will complete.

**System Action:** Restart abends.

**System Programmer Response:** Use the change log inventory (DSNUJ003) utility to cancel the current conditional restart record or create a new conditional restart record.

**00D99004**

**Explanation:** A log read failed because an internal error was detected by the data manager while examining the log record during DB2 restart.

This abend reason code is issued by the following CSECT: DSNRHRLS

**System Action:** The execution unit writes a record to SYS1.LOGREC and requests a SVC dump. Restart abends.

**User Response:** Notify the system programmer.

**Operator Response:** Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

**System Programmer Response:** Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** RM standard diagnostic information is provided in “Recovery Manager Reason Codes (X'D9’).” In addition, the following diagnostic information is provided in registers:

**Register 0**
- The data manager ERQUAL that identifies the place within the data manager filter routine where the error was detected

**Register 2,3**
- The RBA of the log record that was being read at the time of the error

**Register 8**
- The address of ssnnDBM1’s selection block

**Register 9**
- The address of DSCF' selection block

**00D99000**

**Explanation:** The request to commit the unit of recovery failed because the agent is a participant in a global transaction and the global transaction is going to be backed out.

**System Action:** The unit of recovery is not committed.

**User Response:** The application must roll back to the previous COMMIT.

**00D9AAAA**

**Explanation:** This reason code identifies additional data stored in the SDWA variable recording area following a failure during abort-UR.

This reason code appears only in the SDWA variable recording area (VRA) and serves only to identify data (in addition to the standard DB2 diagnostic information that is stored in the SDWA). This reason code is the first data item of the standard information. As such, it always appears in the VRA of an SDWA for a primary error completion/reason code. If no data is added, the reason code in the SDWA VRA is the same as that associated with the completion code.

This reason code is issued by the following CSECT: DSNRCAF

**System Action:** Five bytes of data preceded by code VRAHEX are stored following the EBCDIC string ‘RMC-COMMIT/ABORT’.

**Length Data**
- 1 byte Retry flags
- 1 byte Retry id
- 1 byte Notification RMID
- 2 bytes ACE progress state (ACEPROG)

**System Programmer Response:** Use this information in conjunction with other information for the primary failure. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**00D9BBBB**

**Explanation:** This reason code identifies additional data stored in the SDWA variable recording area following a failure during begin-UR.

This reason code appears only in the SDWA variable recording area (VRA) and it serves only to identify data (in addition to the standard DB2 diagnostic information, stored in the SDWA). This reason code is the first data item of the standard information. As such, it always appears in the VRA of an SDWA for a primary error completion/reason code. If no data is added, the reason code in the SDWA VRA is the same as that associated with the completion code.

This reason code is issued by the following CSECT: DSNRUB01

**System Action:** The following data is stored preceded by code VRAHEX.

**Length Data**
- 4 bytes Content of ACEURE
- 4 bytes URE address
- 4 bytes DSNWRCD return code
- 1 byte Retry flags

**System Programmer Response:** Use this information with the instructions for the specific failure. If you
suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

00D9CCCC

Explanation: This reason code identifies additional data stored in the SDWA variable recording area following a failure during commit-UR.

This reason code appears only in the SDWA variable recording area (VRA) and serves only to identify data (in addition to the standard DB2 diagnostic information, stored in the SDWA). This reason code is the first data item of the standard information. As such, it always appears in the VRA of an SDWA for a primary error completion/reason code.

This reason code is issued by the following CSECT: DSNRCAFR

System Action: Five bytes of data preceded by code VRAHEX are stored following the EBCDIC string 'RMC-COMMIT/ABORT'.

Length Data
1 byte Retry id
1 byte Notification RMID
1 byte ACE progress state (ACEPROG)
1 bit In flight
1 bit In-Commit1
1 bit Indoubt
1 bit In-Commit2
1 bit End-Commit
1 bit In-Abort
1 bit End-Abort
1 bit (Reserved)

System Programmer Response: Use this information with the instructions for the specific failure. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

00D9EEEE

Explanation: This reason code identifies additional data stored in the SDWA variable recording area following a failure during end-UR.

This reason code appears only in the SDWA variable recording area (VRA) and serves only to identify data (in addition to the standard DB2 diagnostic information, stored in the SDWA). This reason code is the first data item of the standard information. As such, it always appears in the VRA of an SDWA for a primary error completion/reason code.

This reason code is issued by the following CSECT: DSNRUE01

System Action: The following data is stored preceded by code VRAHEX.

Length Data
Chapter 45. X’E2……’ codes

00E20001
Explanation: The get variable storage function detected that input parameters passed by the invoker were invalid.

This abend reason code is issued by the following CSECT: DSNSV BK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 4 contains the address of the pool header block (PHB), which contains information for the current status of the pool.
- Register 7 contains the value of the caller’s saved register 14.
- Offset X’1EF’ in the SDWA contains a VRACAN key of X’3D’, followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349 [1] 2 3 4 5

00E20003
Explanation: In order to satisfy an unconditional request for storage, the get variable storage function needed to obtain storage (from GETMAIN) to expand a storage pool. However, GETMAIN indicated that sufficient storage in the private area was not available.

This abend reason code is issued by the following CSECT: DSNSV BK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size. If the region size is already defined at the maximum, consider enabling the CONTSTOR system initialization parameter. For more information, see DB2 Installation Guide

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14.

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker. The trace information contains the requested amount of storage.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349 [1] 2 3 4 5

00E20004
Explanation: In order to satisfy an unconditional request for storage, the get variable storage function needed to obtain additional storage (from GETMAIN) to expand a storage pool. However, the pool attributes defined at the time the pool was created indicated that the pool was already at maximum size.
That detected

Explanation: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14.

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E20005

Explanation: The free variable storage function detected that the address of a block being freed was invalid. That is, it did not lie within an existing storage pool.

This abend reason code is issued by the following CSECT: DSNSVBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14. Register 11 contains the address of the invalid block to be freed.

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E20006

Explanation: The free variable storage function detected that the block being freed was not allocated. That is, it was already free.

This abend reason code is issued by the following CSECT: DSNSVBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14. Register 11 contains the address of the free block.

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E20007

Explanation: The allocate variable storage pool function detected that the input parameters passed by the invoker were invalid.

This abend reason code is issued by the following CSECT: DSNSVPL

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

Register 2 contains the input parameter list address.
Register 3 contains the input maximum pool size.
Register 4 contains the input expansion segment size.
Register 5 contains the input initial segment size.

The trace information contains the address of the invalid parameter list.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349
00E20008

Explanation: The free variable storage pool function detected that the input parameter (PHB—pool header block) did not represent an existing pool.

This abend reason code is issued by the following CSECT: DSNSVPL

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The trace information contains the address of the invalid PHB (pool header block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E20009

Explanation: The get fixed blocks function detected that input parameters passed by the invoker were invalid.

This abend reason code is issued by the following CSECT: DSNSFBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 4 contains the address of the pool header block (PHB).
- Register 7 contains the value of the caller’s saved register 14.
- Register 5 contains the number of blocks requested.

The invalid input parameters are also contained in the trace information.

Offset X’1EF’ in the SDWA contains a VRACAN key of X’3D’, followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E2000A

Explanation: The get tracked storage function requested storage from the DSNSGETM function for a tracking element in order to track the storage to be returned to the invoker. However, storage for the tracking element was unavailable. The invoker’s request was unconditional.

This abend reason code is issued by the following CSECT: DSNSGMN

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E2000B

Explanation: In order to satisfy an unconditional request, the get fixed block(s) function needed to obtain additional storage to expand a storage pool. However, GETMAIN indicated that insufficient storage existed in the private area.

This abend reason code is issued by the following CSECT: DSNSFBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size. If the region size is already defined at the maximum, consider enabling the CONTSTOR system initialization parameter. For more information, see [DB2 Installation Guide]

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14. The trace information contains the number of blocks requested.

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]
00E2000C

Explanation: In order to satisfy an unconditional request, the get fixed block(s) function needed to obtain additional storage to expand a storage pool. However, the pool attributes defined at the time the pool was created indicated that the pool was already at maximum size.

This abend reason code is issued by the following CSECT: DSNSFBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14. The trace information contains the number of blocks requested.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E2000E

Explanation: DB2 detected that a segment of storage within the pool on which the request was directed was invalid or contained an invalid 'free chain' of free blocks in the segment.

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: The most likely cause of the problem is a storage overlay or an invalid storage request from a DB2 component. A product other than DB2 could cause the storage overlay problem.

Problem Determination: Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of the caller’s saved register 14. Register 11 contains the address of the block to be freed if freeing a fixed block.

At offset X'1EF' in the SDWA, there is a VRACAN key of X'3D', followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E2000D

Explanation: DB2 detected that either the address of a block being freed (the only block or a block on a chain of blocks) was invalid or the block did not lie within an existing storage pool.

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: The most likely cause of the problem is a storage overlay or an invalid storage request from a DB2 component. A product other than DB2 could cause the storage overlay problem.

Problem Determination: Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 7 contains the value of the caller’s saved register 14. Register 11 contains the address of the invalid block to be freed.

At offset X'1EF' in the SDWA, there is a VRACAN key of X'3D', followed by the module name of the storage manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E2000F

Explanation: The free fixed block(s) function detected that the only block, or the one block on the chain of blocks, being freed did not represent an allocated block; that is, it was already free.

This abend reason code is issued by the following CSECT: DSNSFBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 4 contains the address of the pool header block (PHB). Register 7 contains the value of
the caller's saved register 14. Register 11 contains the address of the free block.

At offset 1EF in the SDWA, there is a VRACAN key of '3D' (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E20010

Explanation: The allocate fixed-block pool function detected an invalid input parameter passed by its invoker.

This abend reason code is issued by the following CSECT: DSNSFPL

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The trace information has the address of the pool header block (PHB).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E20012

Explanation: The get tracked storage from the GETMAIN function detected an invalid input parameter passed by its invoker.

This abend reason code is issued by the following CSECT: DSNSGMN

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The following general purpose registers contain the indicated diagnostic information:

- Register 2 contains the input parameter list address.
- Register 3 contains the input request block size.
- Register 4 contains the input maximum pool size.
- Register 5 contains the input expansion segment size.

The trace information also contains the address of the invalid parameter list.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E20013

Explanation: The get tracked storage from GETMAIN function was unable to obtain sufficient storage in private area to satisfy an unconditional request.

This abend reason code is issued by the following CSECT: DSNSGMN

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed. The trace information has the address of the parameter list.

Collect the following diagnostic items listed in
Appendix B, "Problem determination," on page 1348

00E20014

Explanation: The free tracked storage function detected that the area requested to be freed was not valid. Either the address did not represent storage currently allocated (via the DSNSGETM function), or the storage class passed as input to DSNSFREM did not match the class assigned to the storage by DSNSGETM.

This abend reason code is issued by the following CSECT: DSNSGMN

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The trace information has the address of the storage and the storage class.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

00E20015

Explanation: The allocate stack function, which is always unconditional, requested storage from GETMAIN to obtain a stack segment. GETMAIN indicated that 8K bytes of private area storage in subpool 229 was not available.

This abend reason code is issued by the following CSECT: DSNSVSTK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase maximum private storage.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. There is probably a shortage of private area storage in the address space in which the failure occurred. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

00E20016

Explanation: The get stack storage function, in order to satisfy an unconditional request for stack storage, requested storage from GETMAIN. However, GETMAIN indicated that sufficient storage in subpool 229 was not available.

This abend reason code is issued by the following CSECT: DSNSVSTK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

00E20017

Explanation: The free stack storage function detected that the address of the area to be freed did not lie within allocated storage in the stack indicated by the requester.

This abend reason code is issued by the following CSECT: DSNSTACK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

00E20018

Explanation: The get stack storage function detected that the amount of storage requested by the invoker was less than or equal to zero.

This abend reason code is issued by the following CSECTs:

System Action: The agent is abended.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E20019

Explanation: The purge pool function detected that input parameters passed by the invoker were invalid.
This abend reason code is issued by the following CSECT: DSNSPOWN
System Action: The agent is abended.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The following general registers contain the indicated diagnostic information:
   Register 4 contains the input pool address.
   Register 5 contains the input pool owner ID.

The trace information also contains the input parameters.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E2001A

Explanation: ESTAE recovery can not be established, because either an unexpected error occurred, or SCB is not available.
This abend reason code is issued by the following CSECT: DSNCON
System Action: The agent is abended.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 15 contains the return code from DSN3EST0; this is the MVS ESTAE return code.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E2001B

Explanation: The SETLOCK OBTAIN function issued a nonzero return code.
This abend reason code is issued by the following CSECTs:

DSNSCON2 DSNSCTL DSNSFBK DSNSFL
DSNSGMN DSNSHWN DSNSINTM DSNSTERM
DSNSVBK DSNSVPL DSNSVSTK

System Action: The invoker of storage manager functions is abnormally terminated.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 5]

00E2001C

Explanation: The purge stack function detected that one of the SKBs (stack block) is not valid and the SKB chain is possibly damaged.
This abend reason code is issued by the following CSECT: DSNSPURS
System Action: The SKB chain is repaired and processing continues.
Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The trace information contains the address of the EB for which the stack segments are to be purged.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E2001D

Explanation: Either GPVT (global pool anchor) or LPVT (local pool anchor) is damaged, and no storage managed by storage manager can be accessed.

This abend reason code is issued by the following CSECT: DSNRSRSUP

System Action: The DB2 subsystem is abended. In some cases, the FRR is established by the caller of the storage manager (SM) subcomponent. When this is the case, the SVC dump is requested by the caller. When this is not the case, the SM requests the SVC dump.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: A DB2 dump is requested, but in some cases the dump request is made by the caller of storage manager, rather than by storage manager itself. Register 6 contains the address of the EB.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E2001E

Explanation: The get stack storage function detected that two asynchronous (unrelated) agents use the same stack storage.

This abend reason code is issued by the following CSECT: DSNVSSTK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E20020

Explanation: The get variable pool function needed to obtain storage (from GETMAIN) to create pool header block (PHB) to represent the pool, but GETMAIN indicated that sufficient storage in private area was not available.

This abend reason code is issued by the following CSECT: DSNVSPL

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the address of the stack segment (SKB). Register 6 contains the address of the EB. In the event of an ABEND, DSNTFRCV saves information in the VRA of the SDWA.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E20021

**Explanation:** The get fixed pool function needed to obtain storage (from GETMAIN) to create pool header block (PHB) to represent the pool, but GETMAIN indicated that sufficient storage in common service area (CSA) was not available.

This abend reason code is issued by the following CSECT: DSNSFPL

**System Action:** The agent is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Increase region size.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E20024

**Explanation:** To create a pool header block (PHB) that represents the pool, the get fixed pool function requested storage from GETMAIN. However, GETMAIN indicated that insufficient storage existed in the common service area (CSA) to satisfy the request.

This abend reason code is issued by the following CSECT: DSNSFPL

**System Action:** The agent is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Increase common service area (CSA) size.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The common service area (CSA) portion of the dump should be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E20025

**Explanation:** The get tracked storage from GETMAIN function was unable to obtain sufficient storage in common service area (CSA) to satisfy an unconditional request.

This abend reason code is issued by the following CSECT: DSNSGMN

**System Action:** The agent is abended.

**System Programmer Response:** Increase common service area (CSA) size.
Operator Response: Notify the system programmer.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. The trace information has the address of the parameter list. The common service area (CSA) portion of the dump should be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E20026

Explanation: Either the allocate stack storage function or the get stack storage function was unable to obtain 4KB of private area storage in subpool 229 for an all-segment table in which a record (representing a stack storage segment) was to be inserted.

This abend reason code is issued by the following CSECT: DSNSVSTK

System Action: The invoker of the function is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Increase region size.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. There is probably a shortage of private area storage in the address space in which the failure occurred. Register 2 contains the ASID, in hexadecimal, of the private area to be printed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E20027

Explanation: The free variable storage function detected that unallocated storage in the block being freed has been modified.

This abend reason code is issued by the following CSECT: DSNSVBK

System Action: The agent is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR Content

1102 Messages and Codes
the indicated diagnostic information:

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>value of the pool header block (PHB)</td>
</tr>
<tr>
<td>7</td>
<td>address of the caller’s saved register 14</td>
</tr>
<tr>
<td>11</td>
<td>address of the invalid block to be freed</td>
</tr>
</tbody>
</table>

At offset 1EF in the SDWA, there is a VRACAN key of ‘3D’ (in HEX), followed by the module name of the Storage Manager invoker.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349

00E2002A

**Explanation:** The SMC Recovery Stack Management function detected that the number of allowed entries in the SMC Recovery Stack has been exceeded, or the structure has been incorrectly modified.

This abend reason code is issued by the following CSECTs:

- DSNCTL
- DSNSFBK
- DSNSRSUP
- DSNSTACK
- DSNVBK
- DSNVSTK

**System Action:** The invoker is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 6 contains the address of the current execution block (EB). This EB has a pointer to the current head stack block (SKB) that is encountering the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349

00E2002B

**Explanation:** This abend code is used to force percolation in the case when an abend is encountered while in Storage Manager code and the Storage Manager has been called recursively.

This abend reason code is issued by the following CSECTs:

- DSNCTL
- DSNSFBK
- DSNSRSUP
- DSNSTACK
- DSNVBK
- DSNVSTK

**Problem Determination:** Refer to the originating abend code.

00E2002C

**Explanation:** DB2 detected that the free chain in a data space was damaged.

This abend reason code is issued by the following CSECT: DSNSDSGM

**System Action:** The requested function is not performed. A DB2 dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a DB2 internal error. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349

00E2002D

**Explanation:** DB2 is unable to create a data space.

This abend reason code is issued by the following CSECT: DSNSDSGM

**System Action:** The requested function is not performed. A DB2 dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a DB2 internal error. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. If the error was caused by DSPSERV, the reason code from DSPSERV is saved in register 15. If the error was caused by ALESERV, the return code from ALESERV is saved in register 15. Refer to the appropriate MVS publication for the meaning of the return and reason codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349

00E2002E

**Explanation:** DB2 detected an internal error during the freeing of data space storage.

This abend reason code is issued by the following CSECT: DSNSDSFM

**System Action:** The requested function is not performed. A DB2 dump is requested.

**Operator Response:** Notify the system programmer.
System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

Explanation: DB2 detected an internal error during the freeing of data space storage.

This abend reason code is issued by the following CSECT: DSNSDSFM

System Action: The requested function is not performed. A DB2 dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:
Chapter 46. X’E3……’ codes

00E30001

Explanation:  A service controller internal inconsistency has been encountered. This is probably a DB2 subsystem error. This abend reason code is issued by the following CSECTs:

DSNTAAL  DSNTBAB  DSNTBAP1  DSNTBCM1
DSNTBFR  DSNTBRB  DSNTLBC  DSNTLCAU
DSNTLDU  DSNTLIDE  DSNTSFST  DSNTSGST
DSNTSIN  DSNTCGET  DSNTCSR  DSNTDINQ
DSNTLSUS  DSNTTIM

System Action:  A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abnormally terminated.

Operator Response:  Notify the system programmer.

System Programmer Response:  This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination:  The service controller has determined an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5]

00E30004

Explanation:  This abend is issued by the service controller initialization module whenever an error return code is received from a database services subcomponent participating in the DB2 startup process. This abend ensures that DB2 is terminated.

This abend reason code is issued by the following CSECT: DSNTSTRT

System Action:  The database services shutdown process is initiated after an SVC dump is requested, and a record is written to the SYS1.LOGREC data set. DB2 is abended.

Operator Response:  Notify the system programmer.

System Programmer Response:  This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination:  A list of all database services subcomponents whose initialization process has been completed may be obtained from the SVC dump requested by this abend. Register 2 in the SDWA points to a structure that contains the following diagnostic information:

0 (0)  Module qualifier that identifies the area within DSNTSTRT at which the error was detected. The qualifier should be:
A (10)  Error found upon return from the SCC startup initialization process
B (11)  Error found upon return from the SCC IRLM identify process
C (12)  Error found upon return from the buffer manager initialization process
D (13)  Error found upon return from the data manager initialization process
E (14)  Error found upon return from the data space manager initialization process
F (15)  Error found upon return from the RDS initialization process or LOB Manager initialization process.

2 (2)  Error return code from the invoked subcomponent

© Copyright IBM Corp. 1983, 2004 1105
4 (4) Error reason code from the invoked subcomponent
8 (8) Pointer to a structure containing a character string SSCM followed by a 32-bit map representing the following information:
Bit 0 1 if DB2 has successfully ‘signed on’ to IRLM
10 (16) Error found upon return from the SCC startup initialization process
Bit 1 1 if the buffer manager subcomponent initialization process is completed
Bit 2 1 if the data manager subcomponent initialization process is completed
Bit 3 1 if the data space manager subcomponent initialization process is completed
Bit 4 Not used
Bit 5 1 if the RDS subcomponent initialization process is completed
Bit 6 Not applicable
Bit 7 1 if the SCC initialization process is completed
Bit 8 1 if the LOB Manager initialization is completed
Bit 9 – 31 Not used
C (12) Pointer to invoked subcomponent’s RMFT.

From this information the appropriate subcomponent’s startup process may be identified.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349[1][2][5]

**00E30005**

**Explanation:** A service task could not be created during the database services initialization process. This is probably a DB2 error.

This abend reason code is issued by the following CSECTs: DSNTSTRT, DSNTCST1

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is possibly a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Register 2 in the SDWA points to a structure that contains the following diagnostic information:
0 (0) Should equal X’3’
2 (2) Return code from the service task creation function of the agent services manager (ASM) subcomponent
4 (4) Abend reason code from the service task creation function of the agent services manager (ASM) subcomponent
8 (8) Not used
C (12) Not used

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349[1][2][5]

**00E30008**

**Explanation:** DSNTSTR2 loaded an incorrect version of the system parameter CSECT DSN6SPRM while DB2 was executing. Message DSNT103I is generated before the abend occurs.

This abend reason code is issued by the following CSECT: DSNTSTR2

**System Action:** DB2 is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the ‘PARAM=’ parameter specifies an MVS/XA version of the DB2 subsystem parameters.
**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [9]

---

### 00E3000A

**Explanation:** A bad recovery element was detected by the database services standard ESTAE and FRR recovery routines. This is probably a DB2 subsystem error.

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This error is detected when a module invokes the macro DSNTSFRR to disconnect a functional recovery element (FRE) from a functional recovery chain to which it is not connected. The name of the module passing the invalid FRE is the module issuing the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5].

---

### 00E3000B

**Explanation:** The database services section (DSN6SPRM) in the DB2 initialization parameter module (DSNZPARM) does not exist.

This abend reason code is issued by the following CSECT: DSNTSTR2

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an installation error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Register 2 in the SDWA points to a structure that contains the following diagnostic information:

- 0 (0): Should equal X’1’
- 2 (2): Return code from the get descriptor function of the system parameter manager (SPM) subcomponent of DB2
- 4 (4): Not applicable
- 8 (8): Not applicable
- C (12): Not applicable

First, ensure that DSNZPARM was installed correctly. Then, using the return code from SPM, determine why the descriptor is not available.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [9].

---

### 00E3000C

**Explanation:** A database services TCB service task that cannot be reinstated has been abnormally terminated. Entries in SYS1.LOGREC that precede this entry indicate the source of the error.

This abend reason code is issued by the following CSECT: DSNTSREI

**System Action:** The executing unit is abended. A record is written to SYS1.LOGREC.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [9].

---

### 00E3000D

**Explanation:** A failure occurred and was detected while an ESTAE functional recovery was being established.

This abend reason code is issued by the following CSECTs:

- DSNBICST
- DSNBIOST
- DSNIDDBD
- DSNIDPRO
- DSNILDSP
- DSNTAP
- DSNTMST
- DSNTSTOP
- DSNTSTRT

**System Action:** The executing unit is abended. A record is written to SYS1.LOGREC.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] [2] [5] [9].

---

### 00E3000E

**Explanation:** The execution unit supporting the database services checkpoint process has abended. The CSECT involved in the abend writes a record to SYS1.LOGREC and requests an SVC dump.
This abend reason code is issued by the following CSECT: DSNTRCKP

**System Action:** DB2 is abended. A record is written to SYS1.LOGREC.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC, and determine the cause of the problem from the information that precedes this entry.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00E3000F**

**Explanation:** The database services functional recovery load module, DSNTF, has an unrecognizable entry point.

This abend reason code is issued by the following CSECT: DSNTSTRT

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an installation error. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Register 2 in the SDWA points to a structure that contains the following diagnostic information:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Should equal X’4’</td>
</tr>
<tr>
<td>2</td>
<td>Not applicable</td>
</tr>
<tr>
<td>4</td>
<td>Not applicable</td>
</tr>
<tr>
<td>8</td>
<td>Not applicable</td>
</tr>
<tr>
<td>C</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

The abend is generated whenever the DB2 load module DSNTFEPL is not link-edited with a load module entry point name of DSNTF. To correct this, link-edit DSNTFEPL again with the correct entry point name.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00E30010**

**Explanation:** The database services initialization process could not read the DB2 bootstrap data set (BSDS).

This abend reason code is issued by the following CSECT: DSNTSTR2

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Reassemble DSN6SPRM and relink-edit the DSNZPARM load module. This is done by resubmitting the installation job stream, DSNJUZ, that built the load module named in the -START DB2 command ‘PARM=’ parameter.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00E30014**

**Explanation:** The value specified in the DSN6SYSP CSECT to define reserve storage for a 'must complete' process is either negative or 0.

This abend reason code is issued by the following CSECT: DSNTSTR2

**System Action:** DB2 is terminated.

**Operator Response:** Notify the system programmer.
System Programmer Response: Reassemble DSN6SPRM and relink-edit the DSNZ Parm load module. This is done by resubmitting the installation job stream, DSNTIJUZ, that built the load module named in the -START DB2 command 'PARAM='.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1][5].

00E30017
Explanation: While loading the DB2 database services function recovery and emergency shutdown modules, the Service Controller function abends with this reason code. This is because it detected a load module which was loaded with an invalid addressing capability. The abend is preceded by message DSNT107E.
This abend reason code is issued by the following CSECT: DSNTSTRT

System Action: DB2 database services startup is terminated.

System Programmer Response: Refer to message DSNT107E.

Problem Determination: Refer to message DSNT107E.

00E3001B
Explanation: A plan could not be executed because the system from which you are attempting to run is disabled or unknown. The system type might be unknown if the attach library that you are using is from a previous release of DB2 that does not support the ENABLE and DISABLE options of the bind operation.
This abend reason code is issued by the following CSECT: DSNTAAL

System Action: The plan is not allocated.

System Programmer Response: Refer to the SYSIBM.SYSPLSYSTEM table to determine the systems from which the plan can be executed, or correct the attach library.

00E30021
Explanation: A processing error has occurred during authorization checking.
This abend reason code is issued by the following CSECT: DSN TAXAC

System Action: The request to allocate a plan to the authorization ID is denied.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1][5].

00E30034
Explanation: The authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist.
This abend reason code is issued by the following CSECT: DSNTAUTH

System Action: The request to allocate a plan to the authorization ID is denied.

User Response: Verify that the correct plan name was specified. If the plan exists, then authority to execute the plan must be granted.

00E30035
Explanation: A processing error has occurred during authorization checking.
This abend reason code is issued by the following CSECT: DSNTAUTH

System Action: The request to allocate a plan to the authorization ID is denied.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1][5].

00E30036
Explanation: A processing error has occurred during authorization checking.
This abend reason code is issued by the following CSECT: DSNTLBAC

System Action: The IRLM query request is denied.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349[1][5].
00E30037

Explanation: An internal logic error occurred while invoking a distributed transaction manager function.

This abend reason code is issued by the following CSECTs:

DSNTDINQ  DSNTLSUS  DSNTCGET

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

00E30040

Explanation: An internal logic error occurred while the catalog access function was being invoked.

This abend reason code is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command fails. The governing status prior to issuing this command continues unchanged.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: At the time of the abend, the registers contain the following information:

Register       Contents
0              Address of the catalog access package parameter list
2              Catalog access return code
3              Catalog access reason code
4              Data manager return code
5              Data manager reason code
7              CT address

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

00E30041

Explanation: An internal error occurred when trying to obtain a limit from the resource limit specification table.

This abend reason code is issued by the following CSECT: DSNTCGET

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The requested execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

00E30065

Explanation: The service controller’s BIND processor detected an error in the user’s database request module (DBRM) while building the SYSDBRM record.

This abend reason code is issued by the following CSECT: DSNTBCM1

System Action: The BIND command fails.

User Response: An invalid field in the DBRM was found while processing the BIND command. The DBRM might be bad. Rebuild the DBRM and reissue the BIND command.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

00E30066

Explanation: The service controller’s BIND processor has detected an invalid release dependency mark in the cursor table.

This abend reason code is issued by the following CSECT: DSNTBBP

System Action: The BIND command fails.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following
R3  R4
<  4 Simple reference
    R8 = zero
>0 >4 MVCL
    R8 = From address
    R4 = move length

To and from lengths are equal.

0 >4 GETMAIN for user storage failed
    R4 = storage length required
    R8 = GETM

To fix this problem, increase your region size.

<0 >4 FREEMAIN of user storage failed
    R4 = length of storage of free
    R8 = address of storage to free

00000204
Message block in user storage. R8 = Message block address.

Except as indicated above, the information in the other registers is as follows:
R3  Parameter address
R4  Parameter length
R5  Parameter storage key
R8  Input parameter list address

00000205
Package-list name list.

00000206
ENABLE/DISABLE system list.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs:
DSNTBAP  DSNTBAP1  DSNTBAP2

00E30068

Explanation: A function invoked by a BIND subcommand has returned an unexpected error.

This abend reason code is issued by the following CSECTs:
DSNTAAL  DSNTBAB  DSNTBAP1  DSNTBBP
DSNTBCM1  DSNTBFR  DSNTBRB  DSNTBCM2
DSNTBRB2  DSNTBFR2  DSNTBCM3  DSNTBAP

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The BIND subcommand is terminated.

User Response: Notify the system programmer.
**System Programmer Response:** This is an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The service controller code has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Operator Response:** The IRLM should be started before the DB2 subsystem is started. If this does not resolve the problem (that is, if the IRLM actually was started before DB2 was started) notify the system programmer.

**System Programmer Response:** This is probably not a DB2 problem. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** If IRLM abended, and if you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. Otherwise, ensure that the IRLM is started before the -START DB2 command is issued.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E30069**

**Explanation:** An attempt to allocate a cursor table (CT) failed.

This abend reason code is issued by the following CSECTs:

DSNTXSTB  DSNTDMST  DSNTDSTP

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The service controller code has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E30071**

**Explanation:** Either DB2 terminated without successfully signing off from IRLM, or another subsystem with the same SSNAME is still connected. This abend reason code accompanies message DSNT380I.

This abend reason code is issued by the following CSECT: DSNTLIDE

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Determine if another DB2 subsystem is active. If another subsystem is not active, and IMS is not sharing the same IRLM, cancel IRLM prior to starting DB2. Regardless, notify the system programmer.

**System Programmer Response:** Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

If the error was caused by a previously unsuccessful QUIT from the IRLM, manually stop IRLM. If IMS is using the same IRLM, refer to the IMS documentation to determine the effect of IRLM terminating while IMS is connected.

If you are running multiple versions of DB2, ensure that the SSNAME specified by the DSN6SPRM macro during the installation of the member DSNZPARM is not the same as the SSNAME in another version of DB2.

**Problem Determination:** A previously unsuccessful sign-off from the IRLM is documented by an abend of X'00E30075' during the previous termination of DB2.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00E30072

Explanation: An error was encountered during an IRLM lock request.

This abend reason code is issued by the following CSECTs: DSNTLAGL, DSNTLORY

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: At the time of the abend, the registers contains the following information:

- R2: Address of the lock request RLPL
- R4: Address of the IRLM query request RLPL
- R5: Address of the IRLM query RLQD
- R7: CT address

Refer to Part 5, “IRLM messages and codes,” on page 1303 for information identifying IRLM return and reason codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E30073

Explanation: An unrecoverable system error occurred while processing a LOCK or UNLOCK request.

This abend reason code is issued by the following CSECTs:

- DSNTAL
- DSNTBAB
- DSNTBCM1
- DSNTBFR
- DSNTBRB
- DSNTSFST
- DSNTSGST
- DSNTSINI

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The requested execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The service controller (SC) subcomponent has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E30074

Explanation: A global out-of-storage condition was encountered by the Internal Resource Lock Manager (IRLM) during the processing of a LOCK or UNLOCK request.

This abend reason code is issued by the following CSECTs:

- DSNTAAL
- DSNTBAB
- DSNTBCM1
- DSNTBFR
- DSNTBRB
- DSNTSFST
- DSNTSGST
- DSNTSINI

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably not a DB2 problem. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The name of the module issuing the abend is recorded in the SYS1.LOGREC entry. It is also recorded in the SVC dump as the CSECT involved in the abend. A parameter in the IRLM procedure specifies the amount of the common service area (CSA) to be used by IRLM. Do one of the following:

- Increase the CSA limit.
- Use a local IRLM (that is, an IRLM option that causes IRLM to operate from another address space).
- Using IRLM lock tracing, determine what application is acquiring so many locks that it causes the IRLM CSA limit to be exceeded.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E30075

Explanation: During the normal sign-off from IRLM or during the abnormal shutdown of DB2, an AUTO-STOP of IRLM using SVC 34 abnormally terminated. Message DSNT383I is issued.

This abend reason code is issued by the following CSECT: DSNTLQUI

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably a
DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The name of the CSECT issuing the abend is found in both the SYS1.LOGREC and the SVC dump. Register 2 contains the SVC return code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E30076**

**Explanation:** An attempt to sign-off from IRLM failed.

This abend reason code is issued by the following CSECT: DSNTLQUI

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The service controller subcomponent has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend. This CSECT is found in both the SYS1.LOGREC and the SVC dump.

The request parameter list (RLPL) used during the sign-off process resides in the IRLM interface manager’s communication block (DSNTLMC) from ACOM.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E30077**

**Explanation:** A database command processor encountered an error when attempting to create a cursor block (CUB) on a DB2 catalog table.

This abend reason code is issued by the following CSECTs:

DSNTDINQ DSNTDMSST DSNTTDIS

**System Action:** An error was detected during the generation of messages to satisfy a DATABASE command. A DSNT305I message appears on the console of the requester, with the RC parameter of 12 and a REASON parameter of X'00E30089'.

**Operator Response:** Notify the system programmer.

---

**System Programmer Response:** This is probably an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** The service controller subcomponent has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend. This CSECT is found in both the SYS1.LOGREC and the SVC dump.

The request parameter list (RLPL) used during the sign-off process resides in the IRLM interface manager’s communication block (DSNTLMC) from ACOM.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E30078**

**Explanation:** IRLM called the service controller IRLM interface status exit with register 0 equal to 1 in order to notify DB2 that IRLM is terminating. This is not a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSNTLSTA

**System Action:** DB2 is abended when IRLM is terminated before DB2 is terminated. An entry is written to SYS1.LOGREC.

---

**00E30079**

**Explanation:** An error was encountered on return from the Internal Resource Lock Manager (IRLM) IDENTIFY function.

This abend reason code is issued by the following CSECT: DSNTLIDE

**System Action:** A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This may be an internal DB2 error or an operator procedure problem. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

**Problem Determination:** In the SVC dump, register 2 contains the return code and register 3 contains the reason code from the identify function to the IRLM. Examine the reason code in register 3, either from the dump or system console log. A reason code of X’4004’ indicates that the identify function code (51, X’33’) does not exist in the IRLM SSVT. This may be due to the operator issuing a stop IRLM command followed by a start DB2 command before the IRLM has completed termination processing. The sequence of commands can be determined from the system console log.

A reason code of X’4008’ indicates that the IRLM is unavailable, that is, IRLM is not started and the autostart is not requested by parameters in DSNZPARM.

Collect the following diagnostic items listed in...
00E3007A

Explanation: DB2 encountered an IRLM request error indicating that IRLM is not available to take requests.

This abend reason code is issued by the following CSECT: DSNTLCAU

System Action: DB2 terminates because it cannot complete an IRLM request.

Operator Response: Notify the system programmer.

System Programmer Response: Look for the IRLM error code or messages to find out why IRLM is not available to take the DB2 request. Most likely, IRLM is terminating at the same time.

If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:
Refer to the IRLM problem determination process.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E30080

Explanation: An attempt was made to start the Internal Resource Lock Manager (IRLM) using the MGCR (SVC 34), and a nonzero return code was returned.

This abend reason code is issued by the following CSECT: DSNTLIDE

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Examine the SVC return code to determine whether this is a system problem or a DB2 internal problem. Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Register 2 contains the SVC return code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E30081

Explanation: An attempt was made to start the Internal Resource Lock Manager (IRLM). IRLM did not come up in the time limit specified to DB2.

This abend reason code is issued by the following CSECT: DSNTLIDE

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. DB2 is abended.

Operator Response: Notify the system programmer.

System Programmer Response: This problem can be circumvented. To do this, either specify a longer time limit in the IRLMSWT parameter of the DSN6SPRM assembler macro in the DSNTIJUZ job stream, or update the IRLM system wait time parameter in the DB2 installation update panel. You must also specify all other parameters contained in this version of the CSECT.

Then resubmit the installation job DSNTIJUZ with the link-edit SYSIN file NAME parameter that matches the -START DB2 'PARM-l parameter. Refer to Part 2 of DB2 Installation Guide for additional information.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E30082

Explanation: IRLM discovered a bad request parameter list (RLPL). This may occur if the RLPL storage is overlaid while an agent is suspended.

This abend reason code is issued by the following CSECT: DSNTLSUS

System Action: The execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: An IRLM request was made that IRLM could not honor immediately. IRLM called DSNTLSUS to suspend the request. While waiting, the request parameter list (RLPL) was changed and is no longer valid. Someone may be reusing the RLPL, or the storage may have been overlaid.

Register 2 contains a pointer to the RLPL.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E30083

Explanation: This agent has been selected as the victim of a deadlock or timeout. This reason code is not used in abends. This reason code is issued by the following CSECTs: DSNTAAL DSNTBAB DSNTBCM1 DSNTBFR DSNTBRB

00E30084

Explanation: Message DSNT305I appears on the console of the requester with RC=8 and REASON=E’00E30084’. This message tells the requester that an error was detected while building the database command display. Other entries in the SYS1.LOGREC help to identify the source of the error. This abend reason code is issued by the following CSECTs: DSNTDMSG, DSNTDMUL

System Action: This is a DB2 subsystem error. No SVC dump is requested because a previous dump of the failing subcomponent is expected.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00E30085

Explanation: An error was indicated by the RDS Authorization function. This is an internal DB2 error. This abend reason code is issued by the following CSECT: DSNTDMI

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The command is abended after displaying a DSNT305I message with an RC parameter of 12 and a REASON parameter of X’00E30089’.

Operator Response: Notify the system programmer.

System Programmer Response: This is an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The error return code address of the Display Command Communication Area is found in register 8.

00E30086

Explanation: An error was indicated by the data manager (DM) subcomponent. This is probably an internal DB2 error. This abend reason code is issued by the following CSECTs: DSNTDMI, DSNTDCST

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The command is abended after displaying a DSNT305I message with an RC parameter of 12 and a REASON parameter of X’00E30089’.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The error return code of the data manager may be found in the cursor table (CT), the address of which is found in register 7.

00E30089

Explanation: This code is used in the REASON parameter of the DSNT305I database command message to inform the requester that the execution unit supporting the database command processor has terminated. Other entries in the SYS1.LOGREC identify the source of the error.

This abend reason code is issued by the following CSECT: DSNTDMSG

System Action: A DSNT305I message appears on the console of the requester, with an RC parameter of 12 and a REASON parameter of X’00E30089’. This is probably a DB2 subsystem error. No SVC dump is requested because a prior dump of the failing subcomponent is expected.

Operator Response: Notify the system programmer.

System Programmer Response: See the SYS1.LOGREC for prior failure.

00E30090

Explanation: A service controller internal inconsistency has been encountered during message generation.

This abend code is issued by the following CSECTs: DSNTDMSG, DSNTDMUL

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an
error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, register 2 contains the message number that was to be generated.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

---

**00E30091**

**Explanation:** A failure was detected during the retry process of DB2 recovery.

**System Action:** DB2 is abended after a record is written to SYS1.LOGREC and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably an internal DB2 error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This abend is issued by DSNTFRCV of the service controller (SC) subcomponent.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

---

**00E30092**

**Explanation:** A retry recovery failure has been detected. This is a critical error.

This abend reason code is issued by the following CSECT: DSNTFRCV

**System Action:** DB2 is abended. This is probably a DB2 subsystem error.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Obtain a copy of the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The service controller recovery module has detected an internal inconsistency. The problem can be determined by analyzing the CSECT involved in the abend. The name of this CSECT is found in both the SYS1.LOGREC and the SVC dump.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

---

**00E30095**

**Explanation:** DB2 is unable to acquire a modify lock because of an incompatible retained lock held by one or more DB2 subsystems in the DB2 data sharing group. Retained locks are locks that persist across DB2 abnormal terminations.

**System Action:** SQLCODE -904 is returned to the user. This reason code and the resource name are also returned.

**System Programmer Response:** Use the DISPLAY DATABASE command to display the DB2 member names owning the retained locks. You must restart those subsystems to remove the ‘resource unavailable’ condition.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNTAAL DSNTBFR DSNTBAS2 DSNTBCM1 DSNTBCM3 DSNTBIAB DSNTBRB DSNXEAAL

---

**00E30096**

**Explanation:** DB2 is unable to acquire a modify lock. Lock negotiation failed because another DB2 subsystem in the DB2 data sharing group is abnormally terminating.

This abend reason code is issued by the following CSECTs: DSNTBFR

**System Action:** A ‘resource unavailable’ condition is returned to the user. This reason code, the resource type, and the resource name are also returned.

**User Response:** Resubmit the request.

**System Programmer Response:** Determine why the other DB2 member abnormally terminated. The ‘resource unavailable’ condition will be cleared when that DB2 member has completely terminated.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

---

**00E3009E**

**Explanation:** The plan depends on new facilities of the release from which fall back has occurred.

This abend reason code is issued by the following CSECT: DSNTAAL

**System Action:** The allocation for the user failed.

**User Response:** Do not use this plan until your DB2 subsystem is remigrated to the newer release.

**System Programmer Response:** Warn the user community NOT to run this plan until you have remigrated to the newer release.

Chapter 46. DB2 codes
00E30100

**Explanation:** This reason code can be returned in the following cases:
- A parallel task running on a DB2 terminates abnormally.
- An assisting DB2 terminates abnormally.

This reason code is issued by the following CSECTs: DSNTTTC, DSNTTREB

**System Action:** The member name where the failure occurred is returned to the application as the resource name in SQLCODE -904. In a non-data-sharing environment, the member name is blank, and the failure occurs on the local DB2.

**Operator Response:** Enter DISPLAY GROUP from an active DB2 to see if a DB2 subsystem is down. Restart the failed DB2 subsystem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349

| 1 | 2 | 3 |

00E30101

**Explanation:** The result of issuing a SETFRR macro indicates that this FRR is not the top FRR.

This abend reason code is issued by the following CSECT: DSNTAC1

**System Action:** A record is written to SYS1.LOGREC. An SVC dump is requested.

**System Programmer Response:** This is probably a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/docs/en/db2-diagnostics) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349

| 1 | 2 | 3 |

00E30104

**Explanation:** This reason code is used by the service controller (SC) subcomponent to respond NO on a prepare-to-commit notification.

This abend reason code is issued by the following CSECT: DSNTAC1

**System Action:** If the service controller indicates that DB2 cannot commit to perform the work requested by the application since the last commit point, it responds NO on the prepare-to-commit notification (COMMIT1). This forces the commit to be changed to an abort, causing the work performed by the application since the last commit point to be backed out.

00E30105

**Explanation:** IRLM was informed of a link failure to a coupling facility that contains a lock table being actively used by this data sharing group.

**System Action:** The DB2 subsystem is terminated with this reason code.

**System Programmer Response:** See IRLM message DXRxxxE to determine the root cause of the failure and the appropriate corrective action.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNTLSTA

00E30301

**Explanation:** You have attempted to execute a plan that does not exist. This reason code is used by the automatic BIND function to indicate that no record exists in SYSIBM.SYSPLAN for the plan-ID you are attempting to run, so plan allocation fails.

This reason code is issued by the following CSECT: DSNTBAB

**System Action:** The plan is not executed.

**User Response:** Determine if the object name was correctly specified. If so, ensure that the plan exists (by selecting from SYSIBM.SYSPLAN).

00E30302

**Explanation:** This reason code is used by the automatic BIND function to indicate that the plan currently being allocated is not operational. The automatic BIND for the plan failed because the plan was dependent on something that was altered or dropped. An unavailable database might also cause this problem.

This reason code is issued by the following CSECT: DSNTBAB

**System Action:** The autobind fails, and the plan cannot be allocated.

**System Programmer Response:** Determine what made the plan not operational. Make sure the required database is available. Issue a REBIND subcommand for the plan.

00E30303

**Explanation:** You have attempted to execute a package that does not exist. This reason code is used by the automatic package BIND function to indicate that no record exists in SYSIBM.SYSPACKAGE for the package-ID you are attempting to run, so package allocation fails.

This abend reason code is issued by the following CSECT: DSNTBAB2
System Action:  Package allocation fails.

User Response:  Determine if the object name was correctly specified. If so, ensure that the package exists (by selecting from SYSIBM.SYSPACKAGE).

00E30305

Explanation:  This reason code is used by the automatic BIND function to indicate that the package currently being allocated is not operational. That upon which the package was dependent has been altered or dropped, causing the automatic BIND for the package to fail.

This abend reason code is issued by the following CSECT: DSNTBAB2

System Action:  Agent allocation fails or DROP package fails.

System Programmer Response:  Determine what has made the package not operational. Issue a REBIND subcommand for the package.

00E30306

Explanation:  This reason code is returned when the automatic bind for plan is disabled. The automatic bind is disabled through the installation process.

This abend reason code is issued by the following CSECTs: DSNTAAL, DSNXAAB, DSNXEAAL

System Action:  The plan is not automatically bound.

System Programmer Response:  Rebind the plan prior to execution.

00E30402

Explanation:  This subcode is found in register 2 to clarify abend reason code X'00E30077'. See X'00E30077' for more information.

This reason code is issued by the following CSECT: DSNTDINQ

00E30405

Explanation:  This subcode is found in register 2 to clarify abend reason code X'00E30077'. See X'00E30077' for more information.

This reason code is issued by the following CSECT: DSNTDINQ

00E30406

Explanation:  This subcode is found in register 2 to clarify abend reason code X'00E30077'. See X'00E30077' for more information.

This reason code is issued by the following CSECT: DSNTDMST

00E30407

Explanation:  This subcode is found in register 2 to clarify abend reason code X'00E30077'. See X'00E30077' for more information.

This reason code is issued by the following CSECT: DSNTDDIS

00E30700

Explanation:  A resource limit as determined from the active resource limit specification table has been exceeded. The SQL statement has been terminated with an SQLCODE -905.

This abend reason code is issued by the following CSECTs: DSNB1GET, DSNXSRID

System Action:  The current SQL statement contains an SQLCODE -905.

User Response:  See the text for the SQLCODE -905. It will specify the resource limit that was exceeded. The SQLCODE -905 text will also include the name of the resource limit specification table that was used to derive the limit. Determine why the limit was exceeded.

Operator Response:  Notify the system programmer.

System Programmer Response:  An SQL statement used too much resource space. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

00E30800

Explanation:  An attempt was made to identify to an IRLM that does not support the level of function DB2 needs. Message DSNT803I accompanies this abend reason code.

System Action:  Message DSNT803I is issued to the console, and DB2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

System Programmer Response:  DB2 Version 6 requires IRLM Version 2.1, at a maintenance lever that includes APAR PQ15290 Version 6 will not run with any earlier release of IRLM or with IRLM Version 2.1 at a lower level of maintenance. Ensure that the STEPLIB statement in your IRLM startup procedure is referencing the correct IRLM code library and that the appropriate level of maintenance has been applied.

Problem Determination:

00E30802

Explanation:  DB2 was not able to identify to IRLM because another subsystem already identified to IRLM. Message DSNT811E accompanies this abend reason code.
**System Action:** Message DSNT811E is issued to the console. DB2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

**System Programmer Response:** IRLM Version 2.1 enforces a one to one (1:1) mapping between IRLM and DB2. Multiple DBMS subsystems can no longer use the same IRLM. Ensure that:
- Each DB2 subsystem is associated with its own IRLM subsystem.
- The correct IRLM procedure name and subsystem name are specified in the DB2 system parameters.

**Problem Determination:** This reason code is issued by the following CSECT: DSNTLIDE

---

00E30803

**Explanation:** An error occurred in one of the DB2-supplied exits to IRLM. This abend reason code is issued only in a DB2 sharing data environment and indicates an internal error in DB2 or IRLM.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is initiated. DB2 terminates abnormally.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](<link>) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNTLPNE

---

00E30805

**Explanation:** DB2 could not activate one of the exits used with IRLM for data sharing. This is a DB2 internal error.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is initiated. DB2 terminates abnormally.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](<link>) for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNTRSTE

---

00E30806

**Explanation:** IRLM could not successfully join its IRLM data sharing group. Message DSNT800I accompanies this abend reason code.

**System Action:** Message DSNT800I is issued to the console, and DB2 abnormally terminates with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

**System Programmer Response:** Some possible reasons why IRLM could not join its data sharing group are:
- The lock structure is not properly defined in the active MVS CFRM administrative policy. The lock structure name is a concatenation of the DB2 data sharing group name and the string 'LOCK1', separated by an underscore (_). For example, if the DB2 data sharing group name is DSNCAT, DSNCAT_LOCK1 would be the lock structure name.

Ensure that the lock structure is properly defined in the active MVS CFRM policy. The name of the lock structure that IRLM attempted to access is given in message DSNT800I. IRLM issues message DXR138E to indicate that the lock structure definition could not be accessed in the active MVS CFRM policy.

- IRLM could not connect the lock structure. The reason for the connect failure is given in IRLM message DXR135E.

- IRLM could not join its data sharing group. The reason for the join failure is given in IRLM message DXR134E.

- IRLM joined the wrong group. The set of IRLMs that are connected to a given lock structure must all be members of the same group.

Ensure that the GROUP parameter is correctly specified in the IRLM startup procedure. If you give an incorrect group name, IRLM connects the lock structure, and then times out waiting for responses from other connectors. IRLM issues message DXR133I for the timeout.

**Problem Determination:** This reason code is issued by the following CSECT: DSNTLIDE

---

00E30807

**Explanation:** DB2 failed on the IRLM Identify request because no lock structure name was specified. Message DSNT810E accompanies this abend reason code.

**System Action:** Message DSNT810E is issued to the console, and DB2 terminates abnormally with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

**System Programmer Response:** This condition occurs if you are not running DB2 in data sharing mode, but the associated IRLM is running with global scope (SCOPE=GLOBAL in the IRLM startup procedure). If you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL. Conversely, if you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

**Problem Determination:** This reason code is issued by the following CSECT: DSNTLIDE
**00E30808**

**Explanation:** DB2 issued an IRLM PURGE request to purge retained locks, but the PURGE request was not successful. This abend reason code accompanies message DSNT807I.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is initiated. The DB2 restart process is terminated.

**System Programmer Response:** The IRLM return and reason codes are in the SYS1.LOGREC record.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSNTRSTE

---

**00E30809**

**Explanation:** DB2 failed on the IRLM Identify request because IRLM did not return the lock structure version ID. Message DSNT809I accompanies this abend reason code.

**System Action:** Message DSNT809I is issued to the console, and DB2 abnormally terminates with this reason code. A record is written to SYS1.LOGREC. No SVC dump is taken.

**System Programmer Response:** This condition occurs if you are running DB2 in data sharing mode, but the associated IRLM is running with local scope (SCOPE=LOCAL in the IRLM startup procedure). If you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL. Conversely, if you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL.

**Problem Determination:** This reason code is issued by the following CSECT: DSNTLIDE
Chapter 47. X’E4…….’ codes

Many of the utilities codes ask you to determine the failing environment. This means that you should determine the following things:

- The address space in which the failure occurred
- The utility that was running
- Whether it was a restart of a utility that failed previously
- Whether the job step invocation was through the DSNUTILB program
- Whether a -DISPLAY or -TERM UTILITY command was involved.

To assist you in determining the problem, register 2 might contain a secondary reason code. This secondary reason code might be an IBM internal reason code; therefore, it might not be documented here.

When DB2 resources are unavailable to utilities, message DSNT500I are issued along with the utility reason code. Refer to message DSNT500I for the correct action.

00E40000

Explanation: A function of DB2 was invoked and attempted to establish a functional recovery environment. The functional recovery element (FRE) that was created was not the first one.

This abend reason code is issued by the following CSECTs: DSNUGKW DSNUGCUR

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The execution unit is abended.

Operator Response: Notify the system programmer.

Problem Determination: This is a DB2 internal error. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40001

Explanation: No cursor table was present at entry to database services portion of utility.

This abend reason code is issued by the following CSECT: DSNUGRAR

System Action: The utility job step that caused the function to be requested is abended. Utility processing is not initiated.

System Programmer Response: This is an internal error. Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40002

Explanation: The caller of the database services portion of the utility was in the wrong protect key.

This abend reason code is issued by the following CSECTs: DSNUGBAC, DSNUGRAR

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment.

If a JOBLIB or STEPLIB is being used in the batch utility job, check that all application program libraries included in the concatenation are authorized.

Check that the batch utility program DSNUTILB was included in the MVS program properties table during the installation of DB2. The entry for DSNUTILB in the MVS program properties table was provided by MVS. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40003

Explanation: An error occurred while getting FRBPARM from application storage.

This abend reason code is issued by the following CSECT: DSNUGRAR

System Action: The utility job step that caused the
function to be requested is abended. The utility job is placed in the stopped state.

**System Programmer Response:** Determine the failing environment. In particular, whether invocation was through program DSNUTILB. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** If the environment was DSNUTILB, the problem could be internal.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40004**

**Explanation:** An error occurred while getting FRB from application storage.

This abend reason code is issued by the following CSECT: DSNUGRAR

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**System Programmer Response:** Determine the failing environment. In particular, whether invocation was through program DSNUTILB. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** If the environment was DSNUTILB, the problem could be internal.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40005**

**Explanation:** A nonzero reason code was returned from MVS sort.

This abend reason code is issued by the following CSECT: DSNUGSOR

**System Action:** Any error message generated by sort in conjunction with the nonzero reason code is directed to the device/data set identified by the UTPRINT DD statement in the utility job step.

Error message DSNU044I, that contains the nonzero reason code, is directed to the device/data set identified by the SYSPRINT DD statement in the utility job step.

**User Response:** Determine the cause of the error. If the error can be corrected, the utility may be restarted from the beginning of the sort phase by using the ‘RESTART(PHASE)’ parameter. If the error prevents the utility from completing, the -TERM command should be issued to remove the stopped utility from the system.

The -TERM UTILITY should seldom be used when the stopped utility is REORG.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

**Problem Determination:** This abend is accompanied by the utility message DSNU044I, that contains the sort reason code and an SVC dump. In most cases, the error messages from SORT that are sent to the device/data set identified by the UTPRINT DD statement identify the problem. The dump may not be needed. If SORT is unable to open the UTPRINT data set, only the message and abend are provided. In this case, correct the problem associated with the UTPRINT DD statement, and restart the job with the RESTART(PHASE) option.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40006**

**Explanation:** An error was detected while manipulating the utility-in-progress bits of the DBA table. The error might occur if the SYIBM.SYSUTIL table and the DBA table are out of sync, if the utility-in-progress condition was not properly reset after execution of a prior utility, or if a resource unavailable condition exists.

This abend reason code is issued by the following CSECT: DSNUGUIP

**System Action:** Utility processing is abended. This abend might be accompanied by message DSNT500I. An SDUMP might be requested.

**User Response:** If applicable, correct the resource unavailable condition identified by the DSNT500I message. For an explanation of resource types, see "Resource types" on page 1351. Either restart the utility from the last commit point or terminate the utility and submit it again.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code. Consult the system programmer to diagnose the problem.

**System Programmer Response:** Use the -DISPLAY UTILITY command to display the status of any utilities in progress. Determine if another utility is active on the same table space. Use the -DISPLAY DATABASE command to determine if the table space has a utility-in-progress condition set on.

The utility-in-progress bit is turned on only for table spaces. If a utility is run against an index, the utility-in-progress bit is turned on for the appropriate table space.
A utility-in-progress condition set without a corresponding entry for an active or stopped utility in the SYSUTIL table is an inconsistent condition caused by a prior error. To resolve this, issue a -START DATABASE command specifying the proper table space with the ACCESS(FORCE) parameter. This causes the utility-in-progress status to be cleared.

If the problem cannot be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment.

Collect the following diagnostic items listed in [Appendix B. “Problem determination.” on page 1349]

**00E40007**

**Explanation:** The COPY utility function is unable to open the table space as directed. The failure can occur because the table space is currently not available. The failure can also be an internal error.

This abend reason code is issued by the following CSECTs: DSNUBAID DSNUBASI

**System Action:** If the table space is currently not available, a DSNT500I RESOURCE UNAVAILABLE message is directed to the device or data set identified by the SYSPRINT DD statement. The utility job step is placed in the stopped state.

**User Response:** If the abend was accompanied by a DSNT500I message, look up DSNT500 in [Chapter 18. “DSNT... Messages.” on page 415] to determine the cause of the resource unavailability. You can restart the utility when the resource becomes available, or you can terminate the utility job step and resubmit the job at a later time.

If a DSNT500I message was not issued, an internal processing error occurred. Provide the system programmer with dumps and messages for fault analysis.

**Operator Response:** After the environmental information is determined, an operator with SYSOPR authority can terminate the utility job step and free the resources, but this might not be necessary.

**System Programmer Response:** If a DSNT500I message preceded the abend, follow the procedures outlined under that message number in [Chapter 18. “DSNT... Messages.” on page 415] for Problem Determination. Otherwise, determine the failing environment.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B. “Problem determination.” on page 1349]

**00E40009**

**Explanation:** An error was detected while attempting to access the target object (table space or index space).

This abend reason code is issued by the following CSECTs: DSNUGACC, DSNUGAGS, DSNUGUTC, DSNURLOG

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. The DSNT500I message might be preceded by other related messages on the console. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in [Appendix B. “Problem determination.” on page 1349]

**00E4000A**

**Explanation:** An error has been detected while force closing a page set.

This abend reason code is issued by the following CSECTs: DSNUCLVE, DSNUGACC

**System Action:** Utilities processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** This is an internal error. Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B. “Problem determination.” on page 1349]

**00E4000C**

**Explanation:** This is an internal control error. The utility subcomponent that manages the function control flow associated with DB2 database services has been requested to perform a function that it does not recognize.
This abend reason code is issued by the following CSECTs:

DSNUBCOP DSNUBBFR DSNUCBFW DSNUGRAR

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** To determine how much of the requested function within the job step was completed, examine the data set/device identified by SYSPRINT. Consult the system programmer to diagnose the problem. Determine whether the utility job step should be terminated in order to release resources.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources (this might not be necessary).

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- [ ] 5
- [ ] 32
- [ ] 46
- [ ] 60
- [ ] 61

---

### 00E4000D

**Explanation:** An error was detected while scanning or updating table SYSIBM.SYSUTIL.

This abend reason code is issued by the following CSECTs:

DSNUGSRI DSNUGDIS DSNUGSRI DSNUGTER

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- [ ] 5
- [ ] 32
- [ ] 46
- [ ] 60
- [ ] 61

---

### 00E4000E

**Explanation:** An error was detected while attempting to create a cursor block (CUB).

This abend reason code is issued by the following CSECTs: DSNUGACC, DSNUKINE

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- [ ] 5
- [ ] 32
- [ ] 46
- [ ] 60
- [ ] 61

---

### 00E4000F

**Explanation:** An error was detected while checking or setting the state of the database exception table (DBET). This abend might be accompanied by message DSNT500I.

**System Action:** Utilities processing is abended. An SDUMP might be requested.

**User Response:** Correct the 'resource unavailable' condition identified by message DSNT500I. Either restart the utility from the last commit point or terminate the utility and restart it from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem.

If the condition cannot be corrected, determine the failing environment.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:
00E40010

**Explanation:** A request to IRLM on behalf of a DB2 utility to lock a page or an entire table space has failed. This is either an internal DB2 or an IRLM problem. The error occurred in the database services address space.

This abend reason code is issued by the following CSECTs: DSNUCDA1, DSNUCRVCL

**System Action:** The utility job is abended. An SVC dump is requested (with the address of the IRLM parameter list, RLPL, in register 4). The utility is placed in the stopped state.

**User Response:** Consult the system programmer to diagnose the problem. Determine if the utility should be terminated.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources (this might not be necessary).

**System Programmer Response:** Check the IRLM return and reason codes in the RLPL. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 5 32 46 60 61

00E40011

**Explanation:** An attempt to extend the error range information in the database allocation table (DBAT) failed.

This abend reason code is issued by the following CSECT: DSNUCDA1

**System Action:** The I/O error that did not get recorded in the DBAT table was reported in error message DSNU086E, that was directed to the device/data set identified by the SYSPRINT DD statement. The utility job step is placed in the stopped state.

**User Response:** The system programmer should be notified and given the relevant environmental information. Subsequent to its correction, the stopped utility can be restarted using the RESTART option, or it can be terminated and resubmitted at a later time.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 5 32 46 60 61

00E40012

**Explanation:** An error was detected while attempting to find a database descriptor block (DBD) address.

This abend reason code is issued by the following CSECTs: DSNUGACC DSNUGCKP DSNUGMAP DSNUQUIA DSNUSINI

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 5 32 46 60 61

00E40013

**Explanation:** An error was detected while creating an ECB exit for -STOP DB2.

This abend reason code is issued by the following CSECT: DSNUGBAC

**System Action:** Utilities processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in
00E40014

**Explanation:** An error was detected from the terminate thread function.

This abend reason code is issued by the following CSECT: DSNUGBAC

**System Action:** Utilities processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

<table>

00E40015

**Explanation:** A RECOVER utility was initiated with the ERROR RANGE option specified. The request was rejected when it was determined that there was not a sufficient number of alternate tracks for the pages in the error range to be recovered.

This abend reason code is issued by the following CSECT: DSNUCRVT

**System Action:** The abend was issued in the database services address space. The dumps requested are dependent upon the JCL of the utility job step. The utility job step is abended. The utility is placed in the 'stopped' state.

**User Response:** Recovery can be accomplished by resubmitting the RECOVER utility without the ERROR RANGE option. Recovery can be by data set or the table space as a whole.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to free resources if that should prove necessary (this might not be necessary).

**Problem Determination:** Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

<table>

00E40017

**Explanation:** An error was detected from terminate identify.

This abend reason code is issued by the following CSECT: DSNUGBAC

**System Action:** Utilities processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

<table>

00E40018

**Explanation:** Either an error was detected during the execution of a restarted utility or a condition was detected that might have required restart of a utility. A message is issued prior to this abend code to indicate the type of error.

This abend reason code is issued by the following CSECT: DSNUGBAC

**System Action:** Utility processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Check messages issued prior to this abend code to determine the cause of the error. Correct the error, and restart the job.

Problem Determination: This abend is forced to allow restart of the utility when work data sets are used and the disposition is (MOD,DELETE,CATLG).

00E4001A

Explanation: An error was detected while using SVC 99 to retrieve information on the DD statements supplied.

This abend reason code is issued by the following CSECT: DSNUGDD

System Action: Utility processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment.

Problem Determination: This is a DB2 internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00E4001B

Explanation: A DB2 utility has attempted to allocate a data set to the generic unit name SYSLALLDA, but the allocation has failed. This dynamic allocation was attempted because the utility had been requested to perform sorts in parallel, a DFS Parm data set was present in the job JCL, the DFS Parm data set was allocated to SYSIN, and no SORTDEVT specification was supplied in the utility control statement.

System Action: Utility processing is abended.

User Response: If the failing utility was REORG, and the UNLOAD phase had completed, restart the utility after doing one of the following:

- Delete the DFS Parm data set from the job JCL.
- Create a DASD data set containing the DFSORT control statements you wish to use and change the job JCL to point to that data set instead of SYSIN.

If the failing utility was not REORG, or if it was REORG and the UNLOAD phase had not completed, use the -TERM command to terminate the utility. Then resubmit the job after doing one of the following:

- Delete the DFS Parm data set from the job JCL.
- Create a DASD data set containing the DFSORT control statements you wish to use and change the job JCL to point to that data set instead of SYSIN.

- Use the SORTDEVT keyword in the utility control statement to specify a generic device unit name (such as SYSLA) that can be used to do the dynamic allocation.

00E4001C

Explanation: An error was detected while attempting to map externals to a specific file object descriptor (OBD).

This abend reason code is issued by the following CSECT: DSNUGMAP

System Action: Utilities processing is abended. The abend might be accompanied by message DSN5001. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSN5001 message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSN5001 was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00E4001D

Explanation: An error was detected while attempting to read a row from the SYSLB.M.SYSSYNONYMS table.

This abend reason code is issued by the following CSECT: DSNUGMAP

System Action: Utilities processing is abended. The abend might be accompanied by message DSN5001. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSN5001 message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSN5001 was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E4001E

**Explanation:** An error was detected while attempting to read a row from the SYSIBM.SYSTABLES table.

This abend reason code is issued by the following CSECTs:

DSNUGMAP DSNUGTBN DSNUKINP DSNUCBRK

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E4001F

**Explanation:** An error was detected while attempting to read a row from the SYSIBM.SYSINDEXES table.

This abend reason code is issued by the following CSECT: DSNUGMAP

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, "Problem determination," on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40020

**Explanation:** An error was detected while attempting to RARQ to the database storage.

This abend reason code is issued by the following CSECT: DSNUGPRE

**System Action:** Utilities processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40021

**Explanation:** Utility processing was performing an AUTHORIZATION CHECK for the utility user and specified object, when an error was detected. A necessary resource for the check was not available.

This abend reason code is issued by the following CSECTs: DSNUGMAP, DSNUKINE

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Make the resource available and either -TERM the utility and resubmit it, or resubmit the utility with the [RESTART](#) parameter. Refer to message DSNT500I in Chapter 18, "DSNT...Messages," on page 415. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This abend is accompanied by the message DSNT500I, that identifies the unavailable resource. The message is written to the SYSPRINT data set.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40022

**Explanation:** An error was detected while attempting to read a row from the SYSIBM.SYSUTIL table.

This abend reason code is issued by the following CSECT: DSNUGSUU

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
User Response: Correct the 'resource unavailable' condition identified by the DSNT5001 message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, "Problem determination," on page 1349 for an explanation of resource type codes.

If DSNT5001 was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40023

Explanation: The internal protocols required for utility update of table the SYSIBM.SYSUTIL have been violated. Utility modifications to SYSIBM.SYSUTIL were not committed.

This abend reason code is issued by the following CSECTs: DSNUGSRI, DSNUGSRX

System Action: The utility job step that caused the function to be requestied is beind. The utility job is placed in the stopped state.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40024

Explanation: Internal protocols required for utility serialization were violated. Specifically, utility serialization cleanup was not invoked upon completion of utility processing.

This abend reason code is issued by the following CSECT: DSNUGUCA

System Action: The utility job step is terminated, placing the utility in the stopped state.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40027

Explanation: An error has been detected while attempting to update a row of the SYSIBM.SYSUTIL table.

This abend reason code is issued by the following CSECT: DSNUGUCA

System Action: Utilities processing is beind. The utility job might be accompanied by message DSNT5001. An SDUMP might be taken.

Operator Response: Correct the 'resource unavailable' condition identified by the DSNT5001 message. Either
restart the utility from the last commit point or terminate
the utility and start it again from the beginning. Refer to
Table 3 in Appendix B, “Problem determination,” on
page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a
secondary DB2 reason code that gives more information
about the problem. If the secondary reason code is not
documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be
corrected, determine the failing environment. Refer to
Part 2 of DB2 Diagnosis Guide and Reference for
information on identifying and reporting the problem.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349:
5 32 46 60 51

00E4002A
Explanation: During utility restart processing, a record
in the SYSUTILX checkpoint/restart area was not
recognized. The utility might not be restartable.

This abend reason code is issued by the following
CSECT: DSNUGSUG

System Action: Utility processing is abended.

Operator Response: An operator with SYSOPR
authority can issue the -TERM UTILITY command to
release the resources claimed by the stopped utility.

System Programmer Response: Determine the
failing environment. Refer to Part 2 of DB2 Diagnosis
Guide and Reference for information on identifying and
reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in “Appendix
B. Diagnostic Items for Problem Determination”: 1, 2, 4,
30, 31, 46, 49.

00E4002B
Explanation: The utility check pending protocol
detected invalid parameters for the setting or resetting
of the check pending state.

This abend reason code is issued by the following
CSECT: DSNUGCKP

System Action: The utility job is abended.

System Programmer Response: Determine the
failing environment. Refer to Part 2 of DB2 Diagnosis
Guide and Reference for information on identifying and
reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349:
5 32 46 60 51

00E4002D
Explanation: This abend is issued as a result of an
error other than the ‘resource unavailable’ condition that
was encountered while attempting to update a DB2
catalog for the setting or resetting of the check pending
state.
This abend reason code is issued by the following CSECT: DSNUGCKP

**System Action:** An SVC dump is requested, the error flag in the DBA table is set on for the table space for which the check pending state is being set or reset, and processing continues.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Determine the reason for the catalog access error. This abend is accompanied by console message DSN972I. See the problem determination for this message for a description of how processing is affected by this error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00E4002E

**Explanation:** During utility serialization or utility restart, an attempt to either read or retrieve from SYSUTIL or SYSUTLX has failed.

**System Action:** DB2 abends the utility job.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00E40030

**Explanation:** A DISPLAY UTILITY or TERM UTILITY command has failed in the command subsystem.

This abend reason code is issued by the following CSECT: DSNUGCCC

**System Action:** Command processing is terminated. For TERM UTILITY, all previous actions taken by the command are backed out.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This error is accompanied by additional messages and/or SVC dumps that identify the failure in the utility command subsystem. Refer to this manual under those messages and/or codes for additional problem determination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 00E40033

**Explanation:** Internal control blocks were scanned for internal IDs representing the SYSIBM.SYSUTIL table. No corresponding ID was found.

This abend reason code is issued by the following CSECTs:

DSNUAGS DSNUGDIS DSNUGSRI DSNUGTER

**System Action:** The utility job step is terminated, placing the utility in the stopped state.

**Operator Response:** An operator with SYSOPR authority can issue the TERM UTILITY command to release the resources claimed by the stopped utility, but this might not be necessary.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

---

### 00E40034

**Explanation:** The utility message generator was unable to obtain the requested storage. The available storage used to buffer messages produced by the database memory is full and a request to obtain more storage from subpool 229 failed.

This abend reason code is issued by the following CSECT: DSNUGMSG

**System Action:** Utility processing abends. No SYSAEND dump or SVC dump is requested.

**User Response:** This abend occurs. No SYSABEND dump or SVC dump is requested.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This error is accompanied by additional messages and/or SVC dumps that identify the failure in the utility command subsystem. Refer to this manual under those messages and/or codes for additional problem determination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
If the abend occurs as a result of the REBUILD INDEX utility, the unique index might have to be dropped and recreated as a nonunique index. If a unique index is required and the data contains a large number of duplicates, the duplicates must be reduced before attempting to rebuild the index again.

**Problem Determination:** Refer to the prior error messages to determine how to correct the problem.

---

**00E40035**

**Explanation:** The -START ACCESS FORCE command was issued when DSNDB01.SYSUTILX was in a pending state, which prohibits further processing. The pending state was either copy or recovery pending.

This abend reason code is issued by the following CSECT: DSNUGETR

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer so that the pending condition can be resolved.

**System Programmer Response:** Issue a DISPLAY DATABASE command to determine the state of DSNDB01.SYSUTILX. If the state is copy pending, do a full image copy. If the state is recovery pending, use the RECOVER utility to recover DSNDB01.SYSUTILX.

If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SS4278_11.3.0/com.ibm.db2.luw.admin.dbapp.doc/doc/c0031329.html) for information on identifying and reporting the problem.

---

**00E40040**

**Explanation:** An error was returned from the DSNILREQ protocol during page level locking. This abend code is accompanied by message DSNT500I that explains the 'resource unavailable' condition.

This abend reason code is issued by the following CSECTS: DSNUCBFW, DSNUCBRP.

**System Action:** Utility processing is abended and the utility is placed in a stopped state.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Then, either restart the utility from the last commit point or terminate the utility and restart it from the beginning.

**System Programmer Response:** If the conditions identified in the DSNT500I message can not be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SS4278_11.3.0/com.ibm.db2.luw.admin.dbapp.doc/doc/c0031329.html) for information on identifying and reporting the problem.

**Problem Determination:** Refer to the description for message DSNT500I.

Refer to Table 3 in Appendix B, "Problem determination," on page 1349 for an explanation of resource type codes.

---

**00E40045**

**Explanation:** A failure has occurred during an attempt to free storage.

This abend reason code is issued by the following CSECTs: DSNUGSTB, DSNUGSTA

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**Operator Response:** An operator with SYSOPR authority can terminate the utility job step and free the resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SS4278_11.3.0/com.ibm.db2.luw.admin.dbapp.doc/doc/c0031329.html) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 32, 46, 60, 61

---

**00E40051**

**Explanation:** Invalid OTYPE was passed to DSNUGMAP.

This abend reason code is issued by the following CSECT: DSNUGMAP

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**Operator Response:** An operator with SYSOPR authority can terminate the utility job step and free up any resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/SS4278_11.3.0/com.ibm.db2.luw.admin.dbapp.doc/doc/c0031329.html) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349: 3, 32, 46, 60, 61

---

**00E40053**

**Explanation:** An invalid OBID of zero was found by the module that maps external object names to OBIDs.

This abend reason code is issued by the following CSECT: DSNUGMAP

**System Action:** The utility job step that caused the
function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**Operator Response:** An operator with SYSPR authority can terminate the utility job step and free any resources (this might not be necessary). However, this should not be done until after the diagnostic environment has been established.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** OBIDs are extracted from the DB2 catalog. The OBID for a table space is found in the SYSIBM.SYSTABLESPACE table. The OBID for a table is found in the SYSIBM.SYSTABLES table. The OBID for a indexed index is found in the SYSIBM.SYSINDEXES table. If the object exists, the OBID cannot be zero.

Collect the following diagnostic items listed in *Appendix B. "Problem determination," on page 1349*.

---

**00E40070**

**Explanation:** A utility data set could not be opened. The abend was issued to place the utility in the stopped state for review and correction.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** Utility error message DSNU036I or DSNU037I was issued to identify the DD statement associated with the DSB that could not be opened. If neither message was issued, the SYSPRINT DD statement was omitted. The utility job step is placed in the stopped state.

**User Response:** If the ddname is one you submitted, review and correct it. Then resubmit the job. If the ddname is one the system provided, consult the system programmer. If neither message was issued, verify that the SYSPRINT DD statement exists.

**Operator Response:** An operator with SYSPR authority can terminate the utility to release the held resources, but this may not be necessary.

**System Programmer Response:** Correct the JCL, and resubmit the job.

**Problem Determination:** Collect the following diagnostic items listed in *Appendix B. "Problem determination," on page 1349*.

---

**00E40071**

**Explanation:** An I/O error was encountered on a required OS/VS data set. An abend was issued to place the utility in a stopped state for review and correction. Resubmit the utility.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** One of two utility error messages (DSNU032E or DSNU040I) is sent to the data set/device associated with the SYSPRINT DD statement of the utility job step. The error message identifies the error and the data set in error.

The utility is stopped at the beginning of the phase that used the OS/VS data set.

**User Response:** If the utility message was DSNU032E, the job can be restarted if an undamaged output data set is provided. Obtain an undamaged output data set, and restart the utility job step with the RESTART PHASE option. The job cannot be restarted if an unload data set, during the RELOAD phase of either the LOAD or REORG, is used as input instead of output.

If utility message was DSNU040I, determine the problem as described in Problem Determination. Then either resubmit the utility job using the RESTART option, or -TERM the utility job step.

**Operator Response:** An operator with SYSPR authority can terminate the utility and release any held resources (this might not be necessary).

**Problem Determination:** Problem determination depends upon which error message was directed to the data set/device identified by the SYSPRINT DD statement.

If DSNU032E was issued, an I/O error was encountered on a required utility work data set. The message describes the error and the data set in error.

If DSNU040I was issued, an error has occurred during BSAM access to the data set defined by the DD statement specified in the message. The DECB provided as a hexadecimal string contains the ECB in the first four bytes. The first byte of the ECB contains status bits that indicate the cause of the error.

There might be an IOS message on the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for the message. Refer to the appropriate MVS publication for the meaning of the status bits.

Collect the following diagnostic items listed in *Appendix B. "Problem determination," on page 1349*.

---

**00E40072**

**Explanation:** An error was encountered while processing a BSAM data set.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** A message identifying the error might
have been sent to the data set/device associated with the SYSPRINT DD statement of the utility job step. If no prior message was produced, a dump was requested. The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** If a message was produced to identify the error, refer to that message description for the proper action. If no message can be found, then notify the system programmer.

**Operator Response:** Notify the user or system programmer.

**System Programmer Response:** Review the job output and failing environment. If a message was produced to identify the error, correct the error and resubmit or restart the job. If no message was produced, then a dump should have been requested. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Problem determination depends upon which error message, if any, was directed to the data set/device identified by the SYSPRINT DD statement. If a message was produced, it describes the type of error and data set involved. Refer to the message description for information on what action to take. If no message was produced, then this might be an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

### 00E40074

**Explanation:** An internal error was encountered while processing a BSAM data set. The utility in progress issued an internal point to a BSAM data set which is opened for write. Point is only valid for data sets opened for read.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** The utility job step is terminated, placing the utility in the stopped state.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

### 00E40075

**Explanation:** An end-of-data (EOD) has been encountered while attempting to reposition an input data set during the restart of a utility.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** Processing is abnormally terminated. A system dump is requested.

**User Response:** Review the JCL and ensure that the input data set is correct. Further analysis might be necessary.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

### 00E40079

**Explanation:** A utility work data set has a block size that is too small to accommodate the data to be written. An abend is issued to place the utility job step in a stopped state. This allows the error to be reviewed and corrected, and the job step to be resubmitted.

This abend reason code is issued by the following CSECT: DSNUGSDA

**System Action:** Utility error message DSNU038I is directed to the device/data set identified by the SYSPRINT DD statement. The utility job step is placed in the stopped state.

**User Response:** Delete the data set in error. Change
the JCL so that the block size for the data set with the
ddname nominated in error message DSNU038I is at
least the indicated block size. Resubmit the utility job
step with RESTART(PHASE) option.

Problem Determination: Utility error message
DSNU038I is directed to the device/data set identified
by the SYSPRINT DD statement. It gives the name of
DD statement that defines the data set with the
inadequate block size and gives the minimum block size
in bytes.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349

00E40080

Explanation: An error has been detected during utility
termination cleanup. The DSNXKACC CLOSEALL
protocol has returned an error.

This abend reason code is issued by the following
CSECT: DSNUGUCA

System Action: The utility job step is placed in the
stopped state.

Problem Determination: This abend code might be
accompanied by a DSNT500I error message that might
indicate a correctable problem.

If the DSNT500I message has not been issued or if the
problem can not be corrected, collect the following
diagnostic items listed in Appendix B, “Problem
determination,” on page 1349

00E40081

Explanation: The REORG utility has completed the
UNLOAD phase while processing in a shared mode and
has attempted to change to an exclusive mode for the
RELOAD and subsequent phases. Utility processing
has detected an internal error.

This abend reason code is issued by the following
CSECT: DSNUGSRX

System Action: The utility job step that caused the
function to be requested is aborted. The utility job is
placed in the stopped state.

Operator Response: An operator with SYSOPR
authority can issue the -TERM UTILITY command to
release the resources claimed by the stopped utility (this
might not be necessary).

System Programmer Response: Determine the
failing environment. Refer to Part 2 of DB2 Diagnosis
Guide and Reference for information on identifying and
reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic item listed in
Appendix B, “Problem determination,” on page 1349

00E40082

Explanation: An error has been detected by utility
serialization protocols. Protocols were issued in the
wrong order.

This is an internal error and cannot be corrected by the
user.

This abend reason code is issued by the following
CSECT: DSNUGSRX

System Action: Utility processing is abnormally
terminated and the utility is placed in a stopped state.
An SDUMP is requested.

User Response: The -TERM UTIL command can be
issued to free resources held by the failing utility.

System Programmer Response: Determine the
failing environment. Refer to Part 2 of DB2 Diagnosis
Guide and Reference for information on identifying and
reporting the problem.

00E40083

Explanation: An error was detected by utility
serialization protocols. Required parameters are missing
or contain invalid values.

This is an internal error and cannot be corrected by the
user.

This abend reason code is issued by the following
CSECT: DSNUGASO

System Action: Utility processing is abnormally
terminated and the utility is placed in a stopped state.
An SDUMP is requested.

User Response: Issue the -TERM UTIL command to
free resources held by the failing utility.

System Programmer Response: Determine the
failing environment. Refer to Part 2 of DB2 Diagnosis
Guide and Reference for information on identifying and
reporting the problem.

00E40085

Explanation: A utility serialization LOCK or UNLOCK
request has received an error from the IRLM. Either
message DSNU099I is issued prior to this abend code
to provide information about the error or message
DSNI002I is issued if the problem occurred while
running the START DATABASE ACCESS(FORCE)
command.

This abend reason code is issued by the following
CSECTs:

DSNUGDIS DSNUGSRI DSNUGSRX DSNILSTS
System Action: Either the utility job step is terminated and the utility is placed in a stopped state or the START DATABASE command abnormally terminates.

User Response: Notify the system programmer. An attempt can be made to restart the utility or rerun the START DATABASE command.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command if the user does not wish to attempt to restart the utility. For the START DATABASE command, rerun the command.

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem. For the START DATABASE command, no response is needed.

00E40090

Explanation: Utility processing is unable to invoke the designated utility, because an internal error has occurred. The specified utility is not recognized by the utility job controller.

This abend reason code is issued by the following CSECTs:

DS NugUTC  DS NugDFL  DS NugSRI

System Action: The utility job step is terminated, placing the utility in the stopped state.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E40096

Explanation: Utility access path creation has detected an invalid OBID. The specified value is too small, too large, or does not exist in the subsystem.

This abend reason code is issued by the following CSECT: DS NugACC

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E400A0

Explanation: An error was detected while the internal structure to access the tables of a table space was being built. The table space had no tables.

This abend reason code is issued by the following CSECT: DS NugACC

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in
Appendix B. “Problem determination,” on page 1349

00E400AF

Explanation: A DSNGDALT macro invocation has returned a nonzero return code. An attempt to modify a DBD by setting the OBDFIB bit on was unsuccessful.

This abend reason code is issued by the following CSECTs: DSNUGFB, DSNURFIB

System Action: Processing is abended.

User Response: This abend might be caused by an unavailable resource. Check for a DSNT500I message being issued prior to the abend. A dump will be suppressed in this case. If no ‘resource unavailable’ condition is indicated, notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349

00E400B0

Explanation: Utilities invocation of CREATE THREAD has ended abnormally.

This abend reason code is issued by the following CSECTs: DSNUGBAC, DSNUGUTC

System Action: The utility job step is terminated. No record of the utility job step remains in the system.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349

00E400C0

Explanation: A -STOP DB2 MODE(FORCE) command has been entered while a utility was executing, or a -STOP DB2 MODE(QUIESCE) command has been entered while a utility with multiple input statements was executing and the current input statement execution has completed.

This abend reason code is issued by the following CSECTs: DSNUGPRE, DSNUGUTC

System Action: Utility processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the reason that the -STOP DB2 command was issued. After DB2 has been started again, the utility job can be restarted.

00E400C1

Explanation: DB2 failed while attempting to latch or unlatch an index page. This is an internal error.

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNUSIDX DSNURFBI DSNUCBRL DSNUKGET DSNUKIFK DSNURBXA DSNURBXC DSNURBXZ DSNURBXE

00E400C2

Explanation: DB2 received an unexpected return code from MVS. This is an internal error.

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00E400C3

Explanation: An error was detected during the restart of a utility that uses a TEMPLATE name specification to dynamically allocate the data sets. The data sets that need to be reused for restart were not found.

System Action: Utility processing is abended.

User Response: Examine the JCL and ensure that the TEMPLATE control statement specifies the correct disposition for the data sets. Further analysis might be needed.

Problem Determination: This abend is forced to allow restart of the utility when work data sets are used and...
the disposition is not MOD, DELETE, and CATLG (for example, not DISP=(MOD,DELETE,CATLG))

00E400D0

**Explanation:** A conversion error occurred during the conversion of a string to a different coded character set.

**System Action:** The utility job is abended. The dump is suppressed.

**User Response:** Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#) and report the problem.

00E400E0

**Explanation:** An attempt to modify the catalog information was unsuccessful.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that was identified by the DSNT500I message. Terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code. Notify the System Programmer.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

00E40100

**Explanation:** DB2 failed during execution of the DSNBGETP macro.

This abend reason code is issued by the following CSECTs:

DSNUCBFW DSNUBCL5 DSNUCRVA DSNUBFI DSNUBAID DSNUBASI DSNUBASM DSNUBASP

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

00E40101

**Explanation:** DB2 failed during execution of the DSNBSETW macro.

This abend reason code is issued by the following CSECT: DSNUBASP

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

00E40102

**Explanation:** The data manager subcomponent of DB2 failed during execution of the DSNICCOB macro.

This abend reason code is issued by the following CSECT: DSNUAHR2

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

00E40103

**Explanation:** The data manager subcomponent of DB2 failed during execution of the DSNICCUB macro.

This abend reason code is issued by the following CSECTs: DSNUADP1, DSNUADP2

**System Action:** Utility processing is abended.
abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#) [1][5][32][46][60][61]

---

**00E40104**

**Explanation:** The data manager subcomponent of DB2 failed during execution of the DSNIDISP macro.

This abend reason code is issued by the following CSECTs: DSNUGDTC, DSNULOG1

**System Action:** The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#) [1][5][32][46][60][61]

---

**00E40105**

**Explanation:** The data manager subcomponent of DB2 failed during execution of the DSNIDLET macro. This abend reason code is issued by the following CSECTs:

DSNUADP1  DSNUADP2  DSNURLAP  DSNURRRI

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in [Appendix B, “Problem determination,” on page 1349](#) for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#) [1][5][32][46][60][61]

---

**00E40107**

**Explanation:** The data manager subcomponent of DB2 failed during execution of the DSNIISRT macro.

This abend reason code is issued by the following CSECTs: DSNUAHR2, DSNURLAP

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.
Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- DSNUADP1
- DSNUADP2
- DSNUAHR2
- DSNUPLGR

00E40108

Explanation: The data manager subcomponent of DB2 failed during execution of the DSNINEXH macro.

This abend reason code is issued by the following CSECTs:

- DSNUADP1
- DSNUADP2
- DSNUAHR2
- DSNUPLGR

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- DSNUADP1
- DSNUADP2
- DSNUAHR2
- DSNUPLGR

00E4010A

Explanation: DB2 failed during execution of the DSNIPSCB macro.

This abend reason code is issued by the following CSECTs:

- DSNUCLVL
- DSNUCLVS
- DSNUCRVI
- DSNUGUP
- DSNUSINI
- DSNUBACI
- DSNUBAII
- DSNURLOG

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- DSNUADP1
- DSNUADP2
- DSNUAHR2
- DSNUPLGR

00E4010B

Explanation: DB2 failed during execution of the DSNIPZOP macro.

This abend reason code is issued by the following CSECTs:

- DSNUCBFW
- DSNUCLVE
- DSNUCRVA
- DSNUKINT
- DSNUCLRS
- DSNUCLVS
- DSNUCRVT
- DSNURBXC

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.
User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349:

- 00E4010C

Explanation: The data manager subcomponent of DB2 failed during execution of the DSNIREPL macro.

This abend reason code is issued by the following CSECTs: DSNUADP1, DSNUADP2, DSNUAIHR2, DSNUBCL5, DSNUPLGR, DSNURRR

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349:

- 00E4010D

Explanation: The data manager subcomponent of DB2 failed during execution of the DSNISETH macro.

This abend reason code is issued by the following CSECTs:

DSNUADP1, DSNUADP2, DSNUAIHR2, DSNUBCL5, DSNUPLGR, DSNURRR

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349:

- 00E4010E

Explanation: The data manager subcomponent of DB2 failed during execution of the DSNISRCF macro.

This abend reason code is issued by the following CSECT: DSNUCRV

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349:

- 00E4010F

Explanation: The data manager subcomponent of DB2 failed during execution of the DSNISRBA macro.

This abend reason code is issued by the following CSECT: DSNULOG1

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a
secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination:  If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40110

Explanation:  The data space manager subcomponent of DB2 failed during execution of the reset of an index space or table space page set.

This abend reason code is issued by the following CSECTs:
DSNUCLRS  DSNUCRVA  DSNUCTER

System Action:  The utility job is abnormally terminated. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response:  Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility or terminate the utility and submit it again.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination:  If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40111

Explanation:  The data space manager subcomponent of DB2 failed during execution of the DSNPXTND macro.

This abend reason code is issued by the following CSECT: DSNUCBFWS

System Action:  The utility job is abended. DSM provides diagnostic information.

User Response:  Notify the system programmer.

System Programmer Response:  Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40112

Explanation:  DSNUGMAP, a utilities program, failed.

This abend reason code is issued by the following CSECT: DSNUCBFWS

System Action:  The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response:  Notify the system programmer.

System Programmer Response:  Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E40113

Explanation:  The data space manager subcomponent of DB2 failed during execution of the reset of an index space or table space page set.

This abend reason code is issued by the following CSECTs:
DSNUCLRS  DSNUCRVA  DSNUCTER

System Action:  The utility job is abnormally terminated. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response:  Correct the 'resource unavailable' condition identified by the DSNT500I message and either restart the utility or terminate the utility and submit it again. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that will give more information about the problem. Notify the system programmer.

System Programmer Response:  If the condition identified cannot be corrected, determine the failing environment, and if you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  See message DSNT500I in this manual for a 'resource unavailable' condition.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349
00E40114

Explanation: DB2 failed during execution of DSNICLPS.

This abend reason code is issued by the following CSECTs:

DSNUCLRS  DSNUCRVA  DSNUGUIP

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00E40117

Explanation: DSNURBXB, a utilities module, failed.

This abend reason code is issued by the following CSECT: DSNUCRVI

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00E40118

Explanation: The data space manager subcomponent of DB2 failed during execution of DSNPGNPO macro.

This abend reason code is issued by the following CSECT: DSNUCRVA

System Action: The utility job is abended. The DSM provides any required diagnostic information, such as messages, dumps, or log records.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

00E40119

Explanation: This abend reason code is issued in these instances:
• During recovery, a full image copy was not found for the DB2 directory or the DB2 catalog table space.

• The MERGECOPY utility did not recognize a record from the SYSIBM.SYSCOPY catalog table.

This abend reason code is issued by the following CSECT: DSNUBLCL0

System Action: The utility job is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: When the recovery of the DB2 catalog or directory table space is requested, make sure that a full image copy has been taken first. If the MERGECOPY utility abended, either issue a select statement or run the REPORT utility to check the SYSIBM.SYSCOPY table for invalid rows.

00E4011A

Explanation: An error occurred in the RECOVER utility while applying log with log RBA=0.

This abend reason code is issued by the following CSECTs: DSNULCLVL, DSNUCRVL

System Action: The utility job is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Make sure the SYSLGRNX table space is not empty before applying the log.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

53 53 60

00E4011B

Explanation: The data manager subcomponent of DB2 failed during the execution of DSNHDFM.

This abend reason code is issued by the following CSECTs: DSNUCRVA, DSNUCLVE

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User Response: Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility or terminate the utility and execute it from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

1 3 8 16 32 33 60 61

00E4011C

Explanation: The log manager subcomponent of DB2 failed during execution of the DSNLGLR macro.

This abend reason code is issued by the following CSECTs: DSNULG01, DSNULGLR

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

System Programmer Response: Register 2 contains a secondary reason code. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

1 3 8 16 32 33 60 61

00E4011D

Explanation: DB2 detected an error during execution of the DSNIDDRN macro. This is an internal error.

This abend reason code is issued by the following CSECT: DSNUCBRP

System Action: The utility job step that caused the function to be requested is abended. The utility job is placed in the stopped state.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

1 2 4 31 32 47 50
00E4011F

Explanation: The RECOVER utility is unable to clear the group buffer pool pending status.

System Action: The RECOVER utility abends with this code.

Problem Determination: Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

This abend reason code is issued by the following CSECT: DSNUCARS

00E40120

Explanation: A delete of SYSLGRNX information failed during -TERM UTILITY command processing for a REORG utility in the RELOAD phase.

This abend reason code is issued by the following CSECT: DSNUBCOP

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

This abend reason code is issued by the following CSECT: DSNUBCKB

00E40121

Explanation: A RDJFCB macro invocation returned a nonzero return code.

This abend reason code is issued by the following CSECT: DSNUBCKB

System Action: Processing is abended.

User Response: This is probably a user error. A DD statement might be missing or specified incorrectly. If the DD statements appear to be correct, there might be another cause of the error and you should notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The DD statement referred to by the COPYDDN Utility keyword might be missing or specified incorrectly. If COPYDDN was not specified, a DD statement with a default name equal to SYSCOPY must be present in the job step.

00E40122

Explanation: A IEFAB4UV invocation returned a nonzero return code.

This abend reason code is issued by the following CSECT: DSNUBCKB

System Action: Processing is abnormally terminated.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

This abend reason code is issued by the following CSECT: DSNUBCOP

00E40123

Explanation: The RECOVER TABLESPACE utility cannot access the SYSIBM.SYSVOLUMES catalog table to process a concurrent copy produced by the DF DUMP command.

System Action: The RECOVER TABLESPACE utility abends.

System Programmer Response: Resolve the access problem to the SYSVOLUMES catalog table. Then restart the RECOVER TABLESPACE utility.

Problem Determination: See the console for additional diagnostic messages.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

This abend reason code is issued by the following CSECT: DSNUCADF.

00E40124

Explanation: A down level internal control block was detected.

System Action: The utility job step that requested the function is abended. The abend is accompanied by message DSNJ424I.
00E40125

User Response: Refer to the APAR mentioned in message DSNU424I.

Explanation: The RECOVER utility was recovering an indexspace with index versioning active. The utility issued the DSNDBIXD macro which calls the Index Manager subcomponent. An error occurred while the Index Manager was building an internal control block.

System Action: The RECOVER INDEX/INDEXSPACE utility abends.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Section 3 of Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNUCALA, DSNUCAWR, DSNUCAWT.

00E40126

Explanation: The RECOVER utility was recovering an indexspace with index versioning active. The utility issued the DSNDIDPB macro which calls the Index Manager subcomponent. An error occurred while the Index Manager was building the Index Descriptor Page.

System Action: The RECOVER INDEX/INDEXSPACE utility abends.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Section 3 of Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNUCATM.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNUAH1R2.

00E40163

Explanation: An error was detected during activity history recording insert of SYSIBM.SYSLGRNG or SYSLGRNX.

This abend reason code is issued by the following CSECT: DSNUAHR2

System Action: Processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNUADP1, DSNUADP1.

00E40164

Explanation: An error was detected during activity history recording update of SYSIBM.SYSLGRNG or SYSLGRNX.

This abend reason code is issued by the following CSECT: DSNUAHR2

System Action: Processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNUADP1.

00E40165

Explanation: An error was detected during an execution unit switch while performing application history recording or drop processing.

This abend reason code is issued by the following CSECTs: DSNUAH1R1, DSNUADP1

System Action: Processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in
Appendix B. “Problem determination.” on page 1349

00E40166
Explanation: A delete of SYSIBM.SYSLGRNX information failed during DROP processing.

This abend reason code is issued by the following CSECT: DSNUADP2

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

00E40170
Explanation: The COPY or RECOVER utility was executing in PARALLEL mode. An error occurred in the data transport mechanism while data was being transferred between the batch and the online DB2 address spaces.

System Action: The COPY or RECOVER utility abends.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Section 3 of Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination.” on page 1349

00E40189
Explanation: An error was detected while inserting records from SYSIBM.SYSCOPY.

This abend reason code is issued by the following CSECT: DSNUBINS

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

User Response: Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point, or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to
Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00E40190**

**Explanation:** An error was detected while scanning the SYSIBM.SYSCOPY catalog table.

This abend reason code is issued by the following CSECTs: DSNUMDEL DSNUBAUS

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00E40191**

**Explanation:** An error was detected while deleting records from SYSIBM.SYSCOPY.

This abend reason code is issued by the following CSECT: DSNUMDEL

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be requested.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

---

**00E40192**

**Explanation:** An invalid call to DSNULOG1 was detected when a partial recovery function in DSNULOG1 was invoked. The passed parameter is not a TOCOPY or TORBA to SYSCOPY, SYSUTILX, or DSNDB01.

This abend reason code is issued by the following CSECTs: DSNULOG1 DSNUBAUS

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

---

**00E40193**

**Explanation:** An error was detected while a utility was attempting to retrieve catalog table information. This is an internal error. This abend reason code is issued by the following CSECTs:

DSNUKINT DSNUGTBN DSNUGPAR

**System Action:** The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40194**

**Explanation:** This is an internal error. An error was detected running the COPY utility with the SHRLEVEL CHANGE option.

**System Action:** The utility job step that requested the function is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

The abend reason code is issued by the following CSECT: DSNUBAID
00E40195

**Explanation:** This is an internal error. An error was detected running the COPY utility with the SHRLEVEL CHANGE option.

**System Action:** The utility job step that requested the function is abended. The utility job is placed in the stopped state.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment.

**Problem Determination:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 4 5 32 46]

This abend reason code is issued by the following CSECT: DSNUBAID

00E40196

**Explanation:** DB2 detected an error while reading the catalog history tables.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3 4 5 32 46]

00E40197

**Explanation:** DB2 detected an error while deleting rows from the catalog history table.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3 4 5 32 46]

00E40201

**Explanation:** RUNSTATS was unable to reposition and continue processing after a COMMIT.

This abend reason code is issued by the following CSECTs: DSNUSIDX, DSNUSTBL

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3 4 5 32 46 60 61]

00E40202

**Explanation:** An error was detected while scanning a table space or index during RUNSTATS processing.

This abend reason code is issued by the following CSECTs: DSNUSIDX, DSNUSTBL

**System Action:** Utilities processing is abended.

**User Response:** If message DSNT500I was issued, assure that the indicated resource is available and resubmit the job, otherwise notify the system programmer.

**System Programmer Response:** If message DSNT500I was issued, refer to the description of the message in Chapter 18, “DSNT... Messages,” on page 415 otherwise, this is an internal error. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3 4 5 32 46 60 61]
00E40203

Explanation: An error was detected in a parameter list passed to the RUNSTATS message-formatting routine.

This abend reason code is issued by the following CSECT: DSNUUSMSG

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 5, 32, 46, 60, 61

00E40204

Explanation: An error was detected while attempting to locate the PB0 control block for a table space partition.

This abend reason code is issued by the following CSECT: DSNUSTBL

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 3, 4, 5, 32, 46

00E40205

Explanation: An error was returned from COMMIT or ABORT processing during RUNSTATS.

This abend reason code is issued by the following CSECTs:

DSNUUSDRB DSNUUSIDX DSNUSTBL

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 3, 4, 5, 32, 46

00E40206

Explanation: DB2 detected an error while updating the statistics in the SYSIBM.SYSCOLUMNS or SYSIBM.SYSCOLUMNS_HIST catalog table.

System Action: Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the ‘resource unavailable’ condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 3, 4, 5, 32, 46

00E40207

Explanation: DB2 detected an error while updating the statistics in the SYSIBM.SYSINDEXES or SYSIBM.SYSINDEXES_HIST Catalog table.

System Action: Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the ‘resource unavailable’ condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1, 3, 4, 5, 32, 46
**00E40208**

**Explanation:** DB2 detected an error while updating the statistics in the SYSIBM.SYINDEXPART or SYSIBM.SYSINDEXPART_HIST Catalog table.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40209**

**Explanation:** DB2 detected an error while updating the statistics in the SYSIBM.SYSTABLEPART or SYSIBM.SYSTABLEPART_HIST Catalog table.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40210**

**Explanation:** DB2 detected an error while updating the statistics in the SYSIBM.SYSTABLES or SYSIBM.SYSTABLES_HIST Catalog table.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40211**

**Explanation:** An error was detected while updating the statistics in the SYSIBM.SYSTABLESPACE Catalog table.

This abend reason code is issued by the following CSECTs: DSNUSCT6, DSNUSUTS

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message, terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40212**

**Explanation:** A 'resource unavailable' condition was detected while attempting to access a catalog table during RUNSTATS processing.

This abend reason code is issued by the following CSECT: DSNUSTATS

**System Action:** Utility processing is abended. The abend will be accompanied by message DSNT500I. An SDUMP might be taken.
**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message and restart the utility. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that will give more information about the problem. Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment and if you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** See message DSNT500I in this manual. See the secondary reason code from register 2, also in this manual. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [13 3 4 5 32 46].

---

**Explanation:** DB2 detected an error while updating the statistics in the SYSCOLDIST_HIST catalog table.

**System Action:** Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code. Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [13 3 4 5 32 46].

---

**Explanation:** An error was detected while updating the statistics in the SYSCOLDIST_HIST catalog table.

**System Action:** Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message, terminate the utility, and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code. Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code. Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00E40217**

**Explanation:** An error was detected while updating the statistics in the SYSCBM.SYSCOLDISTSTATS catalog table.

This abend reason code is issued by the following CSECTs: DSNUSUPD DSNUSACD

**System Action:** Utilities processing is abended. Message DSNT500I might accompany this abend. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message, terminate the utility, and start it again from the beginning. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code. Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00E40218**

**Explanation:** DB2 detected an error while updating the statistics in the SYSCBM.SYSLOBSTATS or SYSCBM.SYSCOLSTATS_HIST Catalog table.

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition that is identified by the DSNT500I message, terminate the utility, and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented here, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00E40220**

**Explanation:** An error was detected while accessing the SYSCBM.SYSTABLEPART catalog table during STOSPACE processing.

This abend reason code is issued by the following CSECT: DSNUTSSA

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00E40221**

**Explanation:** An error was detected while accessing the SYSCBM.SYSTABLEPART catalog table.

This abend reason code is issued by the following CSECTs: DSNUTSSA, DSNUKINP

**System Action:** Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to

Chapter 47. DB2 codes 1155
00E40222

Explanation: An error was detected while accessing the SYSCMD.SYSINDEXES catalog table during STOSPACE processing.

This abend reason code is issued by the following CSECT: DSNUSSA

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the second reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

8 60 61

00E40224

Explanation: An error was detected while accessing the SYSCMD.SYSINDEXPART catalog table during STOSPACE processing.

This abend reason code is issued by the following CSECT: DSNUSSA

System Action: Utility processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

User Response: Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the second reason code is not documented in this manual, it is an internal IBM code.

Problem Determination: If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

8 60 61

00E40225

Explanation: An error has been detected by DSNIPSCAT during STOSPACE processing.

This abend reason code is issued by the following CSECT: DSNUSSA

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

8 60 61

00E40300

Explanation: An error occurred in END INDEX LOAD processing following a sequence of index entry loads.

This abend reason code is issued by the following CSECTs: DSNURBXA, DSNURXCB

System Action: The utility job is abended.

Collect the following diagnostic items listed in
SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

```
00E40301

Explanation: An error was encountered while attempting to obtain the high used RBA for the data sets associated with the table space being reorganized.

This abend reason code is issued by the following CSECT: DSNURFIT

System Action: Processing abnormally terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the reason the high used RBA could not be obtained, correct the situation, and restart the utility.

Problem Determination: The data sets associated with the table space being reorganized must be opened in order to obtain the high used RBA. Ensure that the data sets are available and can be opened by the utility.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

```
00E40302

Explanation: An error occurred while attempting to force a page set closed.

This abend reason code is issued by the following CSECTs:

DSNURBXA DSNURBXB DSNURCLP DSNURBXC

System Action: The utility job is abended. A SYSABEND dump of batch storage is requested.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

```
00E40303

Explanation: An attempt was made to access the SYSIBM.SYNSINDEXES catalog table to retrieve the NAME, CREATOR, TBNAME and TBCREATOR columns. An error was returned from the DSNXKACC protocol used to access SYSIBM.SYNSINDEXES.

This abend reason code is issued by the following CSECTs: DSNUGIXN, DSNUKINT

System Action: The utility job is abended. Unless a 'resource unavailable' condition was indicated, a SYSABEND dump of batch storage is requested.

User Response: If a 'resource unavailable' message was issued, refer to the description for that message. If the unavailable resource becomes available, the utility step is restartable.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This might be an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

```
00E40304

Explanation: An error occurred during key/RID pair delete processing for a nonclustering index.

This abend reason code is issued by the following CSECT: DSNURBXA

System Action: The utility job is abended. A SYSABEND dump of batch storage is requested.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

```
00E40305

Explanation: An error occurred during the reset of an index space or table space page set or page set partition.

This abend reason code is issued by the following CSECTs: DSNURBXC, DSNUGRST

System Action: The utility job is abended. The abend may be accompanied by message DSNT500I. The
DSNT500I may be preceded by other related messages on the console. An SDUMP may be taken.

**User Response:** Correct the ‘resource unavailable’ condition identified by the DSNT500I message and either restart the utility or terminate the utility and submit it again. If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that will give more information about the problem. Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment, and if you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference or information on identifying and reporting the problem.

**Problem Determination:** See message DSNT500I in this manual. See the secondary reason code from register 2.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

5 32 46 60 61

---

**00E40306**

**Explanation:** An error occurred during a locate or create PCB for a table space or index space page set.

This abend reason code is issued by the following CSECTs: DSNURBXB, DSNURBXC

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference or information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

5 32 46 60 61

---

**00E40309**

**Explanation:** An error occurred during the construction of an index entry. The error occurred while reading the table space record, while extracting the key from the table space record, or while connecting the entry into the index.

This abend reason code is issued by the following CSECT: DSNURBXB

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference or information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

5 32 46 60 61

---

**00E40307**

**Explanation:** An error occurred during the creation of a dynamic cursor block (CUB) for a table space or index space page set.

This abend reason code is issued by the following CSECT: DSNURBXB

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference or information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

5 32 46 60 61

---

**00E4030A**

**Explanation:** A mismatch was found between the total number of keys processed during the current phase and the total number of keys expected to be processed in this phase.

**System Action:** The utility job is abnormally terminated, and all target objects are placed in rebuild.
pending state. Message DSNU255I was issued earlier to report both the keys processed and the keys expected. A dump is requested.

User Response: TERM the utility and re-access the indexes by running REPAIR utility to reset the rebuild pending states on indexes. Run the CHECK INDEX utility to determine if any of the affected indexes are inconsistent. Inconsistent indexes may be recovered by the REBUILD INDEX or RECOVER utility.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If working data set was manipulated by user during restart process, make sure it was handled properly.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E4030B

Explanation: A mismatch was found between the total number of records processed during the current phase and the total number of records expected to be processed in this phase.

System Action: The utility job is abnormally terminated. Message DSNU254I was issued earlier to report the records that were processed and the records that were expected. A dump is requested.

User Response: Notify the System Programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Make sure that the unload data set was handled correctly.

Collect the following diagnostic items: listed in Appendix B, “Problem determination,” on page 1349.

00E4030C

Explanation: An internal error occurred while building the dictionary.

This abend reason code is issued by the following CSECTs: DSNUDCTI DSNUDCTB DSNUDCTC DSNUDCTV DSNURBDC DSNURPDCC DSNURWBF

System Action: The utility is stopped.

Operator Response: If necessary, an operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

System Programmer Response: Determine the

failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items: listed in Appendix B, “Problem determination,” on page 1349.

00E4030D

Explanation: A LOAD or REORG utility detected an index that was potentially in a physically inconsistent state, which prohibited the LOAD or REORG utility from completing its processing for that index.

System Action: The utility job is abended. No SYSABEND dump or SVC dump is requested.

User Response: If the abend occurred during REORG utility processing, all indexes that were not built must be rebuilt using the DB2 Rebuild Index utility. To determine which indexes did not complete processing, use the DB2 DISPLAY DATABASE command with the SPACENAM and RESTRICT options. Indexes that have not completed processing are in a 'RBDP' (rebuild pending) or 'PSRBD' (page set rebuild pending) state. Terminate the failed REORG utility using the DB2 -TERM UTILITY command. Submit a job to rebuild the inconsistent indexes using the DB2 REBUILD or RECOVER Index utility.

If the abend occurred during LOAD utility processing, the data might need to be rebuilt if one or more of the indexes not built is unique. In that case, rebuilding the indexes without first rebuilding the data could cause error messages for duplicate keys to be issued during the REBUILD utility processing.

Problem Determination: Message DSNU548I is issued before this abend and specifies which index was in a 'PSRDB' (page set rebuild pending) state. The LOAD or REORG utility could not process an index in such a state and abnormally terminated. 'PSRDB' is set for secondary indexes of a partitioned table space and indicates that the index might be physically inconsistent. This occurs when a DB2 utility physically alters such an index during utility processing (that is, during the build process for that index). If the utility is unable to complete that process, the index is left in the 'PSRDB' state and must be rebuilt before DB2 can use it.

00E4030E

Explanation: In REORG with SHRLEVEL CHANGE, during processing of the log, a log record is inconsistent with the table that maps between old and new RIDs. Specifically, one of these is true:

- The log record implies that before an update, the data record was a pointer data record, but the mapping table implies that the data record was a regular or overflow data record.
00E4030F  •  00E40312

- The log record implies that before an update, the data record was a regular or overflow data record, but the mapping table implies that the data record was a pointer data record.

This abend reason code is issued by the following CSECT: DSNURLXL

System Action: The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

System Programmer Response: This is an internal error. Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349, either 2 or 4 (depending on whether the ABEND is issued from DSNUTILA or DSNUTILB), 5, 32, 37, 47, 50, 64, 66, 72, 86, 87.

00E4030F

Explanation: After the last iteration of log processing, one or more index keys in the shadow copy are not unique.

REORG with SHRLEVEL CHANGE operates as follows:
1. Unloads data from the original copy of the area (table space or partition) being reorganized
2. Reloads into a shadow copy of that area
3. Iteratively applies the log (which records applications' writing of the original copy) to the shadow copy so that the shadow copy and the original copy contain the same data

If the table space has any unique indexes, those indexes will enforce uniqueness of the relevant index keys in the original copy. Those index keys should also be unique in the shadow copy.

This abend reason code is issued by the following CSECT: DSNURLOG.

System Action: The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

System Programmer Response: This is an internal error. Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349, either 2 or 4 (depending on whether the ABEND is issued from DSNUTILA or DSNUTILB), 5, 32, 37, 47, 50, 64, 66, 72, 86, 87.

00E40310

Explanation: An error occurred during the restart of a LOAD or REORG utility execution. An appropriate error message is issued.

This abend reason code is issued by the following CSECTs: DSNURELD, DSNURULD

System Action: The utility is abended.

User Response: Respond to the error message issued prior to the abend by making the correction in the input as indicated. Then restart the LOAD or REORG utility execution.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349, either 2 or 4 (depending on whether the ABEND is issued from DSNUTILA or DSNUTILB), 5, 32, 37, 47, 50, 64, 66, 72, 86, 87.

00E40311

Explanation: An error occurred during commit processing.

This abend reason code is issued by the following CSECTs:

DSNUK001 DSNUPREC DSNUPTSS DSNURELD DSNURENF DSNURULD DSNURWBF

System Action: The utility is abended. A SYSABEND dump of batch storage is requested.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349, either 2 or 4 (depending on whether the ABEND is issued from DSNUTILA or DSNUTILB), 5, 32, 37, 47, 50, 64, 66, 72, 86, 87.

00E40312

Explanation: An error occurred during abort processing.

This abend reason code is issued by the following CSECTs: DSNURELD DSNURULD

System Action: The utility is abended. A SYSABEND dump of batch storage is requested.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| CSECT | 5 | 32 | 46 | 60 | 61 |

---

**00E40313**

**Explanation:** An error occurred while the first or next key entry was being retrieved from an index.

This abend reason code is issued by the following CSECTs:

- DSNUKGET
- DSNURBXC
- DSNURCRI
- DSNURFBI
- DSNURALP
- DSNURLXL

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| CSECT | 5 | 32 | 46 | 60 | 61 |

---

**00E40314**

**Explanation:** An error occurred while repositioning the cursor block (CUB) to the last index entry that was retrieved.

This abend reason code is issued by the following CSECT: DSNURFBI

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

| CSECT | 5 | 32 | 46 | 60 | 61 |

---

**00E40317**

**Explanation:** An object descriptor block (OBD) could not be found for the OBID associated with the object descriptor.

This abend reason code is issued by the following CSECTs: DSNURLXL, DSNUNnnnn

'nnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA. DSNUNnnnn is the full CSECT name given in the dump title.

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in
**Appendix B. “Problem determination,” on page 1349**

00E40318

**Explanation:** An error occurred while preparing for or ending a series of data record loads or while attempting a data record load.

This abend reason code is issued by the following CSECTs: DSNURWBF, DSNUGTER

**System Action:** The utility job is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E40319

**Explanation:** An error occurred while retrieving information from the SYSIBM.SYSTABLES catalog table.

This abend reason code is issued by the following CSECT: DSNURWIR

**System Action:** The utility job is abended. A SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E4031A

**Explanation:** One or more broken pages were detected in the shadow data set while copying pages for the inline copy during REORG TABLESPACE SHRLLEVEL(CHANGE). Message DSNU518I in the job output identifies each broken page.

This abend reason code is issued by the following CSECTs: DSNURCCP

**System Action:** The utility job is abended. An SDUMP of the ssnDBM1 address space is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Section 3 of Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E4031B

**Explanation:** For the area (table space or partition) being reorganized, REORG with SHRLLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form “catname.DSNDBx.dbname.psname.I0001.Annn”. The shadow name of a data set is in the form “catname.DSNDBx.dbname.psname.S0001.Annn”. The temporary name of a data set is in the form “catname.DSNDBx.dbname.psname.T0001.Annn”. REORG uses such data sets for indexes as well as data.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

1. In the switch phase, it renames the original data set from the original name to the temporary name
2. In the switch phase, it renames the shadow data set from the shadow name to the original name
3. In the utility phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

This abend code means that during the switch phase of REORG, one of these errors was detected:

1. On rename 1, a data set with a temporary name already exists.
2. On rename 2, a data set with an original name already exists.

These error conditions can arise for a DB2-managed or user-managed data set.

Message DSNU360I also appears, with the name of the data set and with a context code of 1, or 2.

This abend reason code is issued by the following CSECT: DSNURNM.

**System Action:** The utility job step that caused the function to be requested abends. The utility job is placed in the stopped state.

**User Response:** Take one of the following actions:
Delete the data set and then restart the utility.
TERM the utility. Delete the data set before trying to execute REORG again with SHRLEVEL REFERENCE or CHANGE.

00E4031C

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE uploads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "catname.DSNDBx.dbname.psnamed.name.l0001.Annn". The shadow name of a data set is in the form "catname.DSNDBx.dbname.psnamed.name.S0001.Annn". The temporary name of a data set is in the form "catname.DSNDBx.dbname.psnamed.name.T0001.Annn". REORG uses such data sets for indexes as well as data.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

1. In the switch phase, it renames the original data set from the original name to the temporary name
2. In the switch phase, it renames the shadow data set from the shadow name to the original name
3. In the uutilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

If a -TERM UTILITY is issued after any renaming, the -TERM UTILITY undoes the renaming that the REORG performed by renaming:

4. The original data set from the shadow name to the temporary name
5. The shadow data set from the original name to the shadow name
6. The original data set from the temporary name to the original name

During REORG, or during -TERM UTILITY, an attempt to rename a data set failed due to a system problem. This error condition can arise for a DB2-managed or user-managed data set.

Message DSNP027I also appears, with the old and new names of the data set and with other information.

This abend reason code is issued by the following CSECT: DSNURRNM.

System Action: The job step that caused the function to be requested abends. The utility job or the -TERM UTILITY command is placed in the stopped state.

User Response: If this condition arises during renaming 1, 2, or 3, and you can correct the problem. Choose between these actions:

- Correct the problem and then RESTART the utility.
- TERM the utility.

If this condition arises during renaming 1, 2, or 3, and you cannot correct the problem, TERM the utility and notify the system programmer.

If this condition arises during renaming 4, 5, or 6, notify the system programmer.

System Programmer Response: This is an internal error. Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 3 4 5 10 12 32. Also, collect the information that appears with message DSNP027I.

00E40320

Explanation: A failure occurred while attempting to restart the RELOAD phase of the LOAD or REORG utility.

This abend reason code is issued by the following CSECT: DSNURWUC

System Action: The utility job is abended. A SYSABEND dump of batch storage is requested.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 3 4 5 10 12 32.

00E40321

Explanation: An error occurred while retrieving information from the SYSIBM.SYSCOLUMNS catalog table.

This abend reason code is issued by the following CSECTs:

DSNUKINE DSNUROFL DSNUCBRK

System Action: The utility job is abended. A
SYSABEND dump of batch storage is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00E40324

**Explanation:** An error occurred during the construction of an index entry. The error occurred while extracting the key from the table space.

This abend reason code is issued by the following CSECT: DSNURBXB

**System Action:** The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00E40325

**Explanation:** An error occurred during the construction of an index. The error occurred while loading the index entries into the index page set.

This abend reason code is issued by the following CSECT: DSNURBXB

**System Action:** The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:
00E40326

**Explanation:** An error occurred during the construction of an index. The error occurred during sort.

This abend reason code is issued by the following CSECT: DSNURBXB

**System Action:** The utility job is abended. A SYSABEND dump of batch storage and an SVC dump of the database services storage are requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 32 60 61

00E40333

**Explanation:** An error occurred while attempting a forced write of RELOAD phase data buffers.

This abend reason code is issued by the following CSECT: DSNUFIS

**System Action:** RELOAD phase processing is terminated. An SDUMP of the ssnmDBM1 address space is requested.

**System Programmer Response:** Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00E40343

**Explanation:** LOAD or REORG utility processing was attempting to retrieve COLUMN information from the SYSIBM.SYSFIELDS catalog table when an error was detected.

This abend reason code is issued by the following CSECTs: DSNURFIT, DSNURWIS, DSNUBACI, DSNUBAFI

**System Action:** Utility processing is abended. An SDUMP is requested unless this abend is accompanied by a DSNT500I message written to the SYSPRINT data set.

**User Response:** Notify the system programmer.

**System Programmer Response:** Correct the indicated error, if possible, and resubmit the terminated utility job with the RESTART parameter. If the problem cannot be corrected, and if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00E40355

**Explanation:** An error has been detected while attempting to read a row from the SYSIBM.SYSRELS table.

This abend reason code is issued by the following CSECT: DSNUGRLN

**System Action:** The utility job is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 32 60 61

00E40364

**Explanation:** LOAD or REORG utility used the DSNXIFPS protocol to invoke a field procedure for encode or decode and an error code was returned that indicates a DB2 internal error.

This abend reason code is issued by the following CSECTs: DSNURFBR, DSNURWBG

**System Action:** Utility processing is abended. An SDUMP is requested.

**User Response:** Notify the system programmer.

**Problem Determination:** This is an internal error.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00E40340

**Explanation:** The LOAD or REPAIR utility used the DSNXVCCR protocol to invoke a conversion routine for a date/time data type. An error code was returned that indicates a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNURWBG DSNURWUT DSNUCBRK

**System Action:** The utility job is abended. An SDUMP of the ssnmDBM1 address space is requested.

**User Response:** Notify the system programmer.
System Programmer Response: Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E40341

**Explanation:** A failure occurred during reset processing for a LOAD REPLACE or LOAD PART REPLACE utility.

**System Action:** The utility job is abended. An SDUMP of the ssnDBM1 address space is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E40343

**Explanation:** The LOAD or REORG utility used the DSNJCKLO protocol to obtain the current log RBA. An error code was returned that indicates a DB2 internal error.

**System Action:** The utility job is abended. An SDUMP of the ssnDBM1 address space is requested.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E40345

**Explanation:** The subtask performing an MVS sort terminated abnormally.

This abend reason code is issued by the following CSECTs: DSNUREKY, DSNURELD, DSNURBXD

**System Action:** Any error message generated by sort in conjunction with the abend is directed to the device/data set identified by the UTPRINT DD statement in the utility job step.

**User Response:** Determine the cause of the error. If the error can be corrected, the utility can be restarted from the beginning of the reload phase by using the ‘RESTART(PHASE)’ parameter. If the error prevents the utility from completing, the -TERM command should be issued to remove the stopped utility from the system.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

**Problem Determination:** This error can be caused by abend 00E40005 and error message DSNU0441 issued from the subtask. If this is the case, correct the error causing the subtask to abend. In most cases, the error messages from SORT that are sent to the device/data set identified by the UTPRINT DD statement identify the problem. The dump might not be needed. If SORT is unable to open the UTPRINT data set, only the message and abend are provided. In this case, correct the problem associated with the UTPRINT DD statement, and restart the job with the RESTART(PHASE) option.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E40346

**Explanation:** The LOAD or REORG subtask creating a COPY data set terminated abnormally.

**System Action:** Any error message generated by the subtask in conjunction with the abend is directed to the device and data set identified by the SYSPRINT DD statement in the utility job step.

**User Response:** Determine the cause of the error. If you can correct the error, restart the utility from the beginning of the reload phase by using the ‘RESTART(PHASE)’ parameter. If the error prevents the utility from completing, issue the -TERM command to remove the stopped utility from the system.

**Operator Response:** An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

**Problem Determination:** This error can be caused by out of space situations on the data sets identified by the COPYDDN and RECOVERYDDN keywords. If this is the case, correct the data set allocations and restart the job with the RESTART(PHASE) option.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E40347

Explanation: This utility’s main task is abending because one of its subtasks terminated abnormally. The subtask itself issues an abend before this one is issued.

System Action: Any error message generated by the subtask in conjunction with the abend is directed to the device and data set identified by the SYSPRINT DD statement in the utility job step.

User Response: Determine the cause of the error in the subtask. If you can correct the error, restart the utility from the beginning of the phase by using the ‘RESTART(PHASE)’ parameter. If the error prevents the utility from completing, issue the TERM UTILITY command to remove the stopped utility from the system.

Operator Response: An operator with SYSOPR authority can issue the TERM UTILITY command to release the resources claimed by the stopped utility (this might not be necessary).

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40350

Explanation: An error has been returned from LOB MANAGER insert.

System Action: Utilities processing is abended.

User Response: Register 2 contains a secondary DB2 reason code that will give more information about the problem. Notify the system programmer.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40351

Explanation: LOAD RESUME YES for a table space containing a table with CLOB, BLOB or DCBLOB columns cannot be restarted in the RELOAD phase with the “RESTART(PHASE)’ parameter.

System Action: Utilities processing is abended.

User Response: The utility can be restarted or terminated:
- To restart the utility, specify the “RESTART” parameter to restart at the last commit point.
- To terminate, use the -TERM command to terminate the utility, then run the CHECK LOB utility to identify any LOBs in the LOB table space that are not associated with a row in the base table.

00E40353

Explanation: An error was detected while reorganizing a LOB table space.

This abend reason code is issued by the following CSECTs: DSNURLOB

System Action: Utilities processing is abended.

User Response: Register 2 contains a secondary DB2 reason code that will give more information about the problem. Notify the system programmer.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40355

Explanation: An error was detected while unloading or reorganizing a table space. A security label column was found to be in error.

System Action: Utilities processing is abended.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40401

Explanation: An error has been detected while scanning for a specified key in REPAIR by KEY processing.

This abend reason code is issued by the following CSECT: DSNUCBRP

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40403

Explanation: An error has been detected while scanning for the requested RECORD during REPAIR by record processing.

This abend reason code is issued by the following CSECT: DSNUCBRP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40404
Explanation: An error has been returned from the get-page function, DSNBGETP.
This abend reason code is issued by the following CSECT: DSNUCBRP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40405
Explanation: An error has been returned from the open-piece function, DSNBOPPP.
This abend reason code is issued by the following CSECT: DSNUCBRP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40406
Explanation: An error has been returned from the replace-page function, DSNBRELSP.
This abend reason code is issued by the following CSECT: DSNUCBRP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40408
Explanation: An error has been returned from the reporting function, DSNBREP.
This abend reason code is issued by the following CSECT: DSNUCBRP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.
Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E40410
Explanation: The data manager protocol DSNISETR returned an error.
This abend reason code is issued by the following CSECTs: DSNUCDEL, DSNURLAP
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

00E40411
Explanation: An error has been returned from a DSNIDLET protocol during REPAIR DELETE processing.
This abend reason code is issued by the following CSECT: DSNUCDEL
System Action: Utilities processing is abended.
User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

00E40413
Explanation: An error has been detected by the REPAIR utility. Specifically, the DSNIOTC protocol has returned an error.
This abend reason code is issued by the following CSECTs:
DSNUCBRP DSNUCBRR DSNUCDEL
System Action: The utility job step is placed in the stopped state.
Problem Determination: This abend code may be accompanied by a DSNT500 error message that may indicate a correctable problem. If the DSNT500
message has not been issued or if the problem can not be corrected, collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E40414

Explanation: An error was detected while trying to determine the highest member ID in the data sharing environment. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNUPREC, DSNUCALA, DSNUAHR2.

System Action: Utilities processing is abended.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00E40415

Explanation: An error was detected while trying to determine the member name for the data sharing member ID. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNUPREC, DSNUPLGR, DSNUCALA.

System Action: Utilities processing is abended.

System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00E40500

Explanation: An error was returned by the reset function, DSNPRSPPS or DSNPREST.

This abend reason code is issued by the following CSECT: DSNUJGTER.

System Action: Utilities processing is abended.

User Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This abend might be accompanied by one or more DSN messages to the operator’s console. The DSN messages might indicate a user error that can be corrected. If DSN messages do not accompany this message, the likely cause of the abend is an internal error.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E40600

Explanation: There was a utility abend on the batch side of DB2. This abend can be issued by either the CATMAINT or the REPAIR DBD utility. The utility terminates and all work up to the time of abend is backed out.

This abend reason code is issued by the following CSECTs:

DSNUECML DSNUECMU DSNUECM0 DSNUECM1
DSNUEXDB DSNUEXDL DSNUEXLO DSNUEXUN DSNUEXUP

System Action: The execution unit driving this function proceeds normally. A user dump is requested.

Operator Response: Notify the system programmer, request the user dump, and print the SYS1.LOGREC, and the BSDS.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: SYSOUT might contain the record being processed at the time of abnormal termination.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR Content
2 Address of the error message
5 Address of the load table

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

00E40601

Explanation: There was a utility abend in the DB2 database services address space (ssnmDBM1).

This abend can be issued by either the CATMAINT or the REPAIR DBD utility. The utility terminates and all work up to the time of abend is backed out.

This abend reason code is issued by the following CSECTs:

DSNUECM1 DSNUECM2 DSNUEXDL

System Action: The execution unit driving this function proceeds normally.

Operator Response: Notify the system programmer, request the SVC dump, and print the SYS1.LOGREC, and the BSDS.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide.
and Reference for information on identifying and reporting the problem.

**Problem Determination:** The following general purpose registers (GPRs) contain the indicated diagnostic information:

<table>
<thead>
<tr>
<th>GPR</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Address of the error message</td>
</tr>
<tr>
<td>7</td>
<td>Address of CT</td>
</tr>
</tbody>
</table>

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40609**

**Explanation:** A DBD was encountered which is noncontiguous in the EDM pool due to prior operations and the DBD is currently accessed by users. The utility requires the DBD to be contiguous in the EDM pool.

This abend reason code is issued by the following CSECT: DSNUECMI

**System Action:** The utility that detected this condition returns “RESOURCE NOT AVAILABLE” to its invoker.

**User Response:** Allow all SQL access to this database to cease; this will allow the DBD to be flushed from the EDM pool. After all users have finished accessing the database, invoke the utility again. A contiguous DBD will be brought into the EDM pool.

---

**00E40702**

**Explanation:** An error has been detected by CHECK DATA utility during table scanning processing. The data manager protocol DSNINRFCH has returned an error.

This abend reason code is issued by the following CSECT: DSNUKSCT

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E40705**

**Explanation:** The data manager protocol DSNIEXTK returned an error.

This abend reason code is issued by the following CSECTs: DSNUKSCT, DSNUKCK, DSNURLXL

**System Action:** Utility processing abends.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**0040703**

**Explanation:** An error has been detected by CHECK DATA utility during table scanning processing. The data manager protocol DSNINXTR has returned an error.

This abend code is issued by the following CSECT: DSNUKSCT

**System Action:** Utility processing is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E40706

**Explanation:** The CHECK DATA utility detected an error while processing primary keys matching. The data manager protocol DSNKSET returned an error.

This abend reason code is issued by the following CSECTs: DSNUKIFK, DSNUKNFK

**System Action:** Utility processing abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/DB2ightly) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40707

**Explanation:** The CHECK DATA utility detected an error while processing primary keys matching. The data manager protocol DSNKNEX returned an error.

This abend reason code is issued by the following CSECT: DSNUKIFK

**System Action:** Utility processing abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/DB2ightly) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40708

**Explanation:** The CHECK DATA utility detected an error while positioning records for cascade delete processing. The data manager protocol DSNISETD returned an error.

This abend reason code is issued by the following CSECT: DSNUKRDY

**System Action:** Utility processing abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/DB2ightly) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E40709

**Explanation:** An error has been detected by the CHECK DATA utility during positioning of records for cascade delete processing. The data manager protocol DSNINEXD has returned an error.

This abend reason code is issued by the following CSECT: DSNUKRDY

**System Action:** Utilities processing is abended.

**User Response:** Correct the error condition identified by the DSNT500I message, terminate the utility and restart it from the beginning.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If the condition identified cannot be corrected, determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/DB2ightly) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E4070A

**Explanation:** The CHECK DATA utility detected an error during insert records processing. The data manager protocol DSNISRT returned an error.

This abend reason code is issued by the following CSECTs: DSNUKRDN DSNUKRDY

**System Action:** Utility processing abended.

**User Response:** Review the definition of the exception tables involved to determine if the following conditions are causing the error:

- The exception table has referential constraints.
- The exception table has unique indexes.
- The exception table "table-name2" is identical with "table-name1" in the FOR EXCEPTION keyword.

If none of these is the cause, notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/knowledgecenter/DB2ightly) for information on identifying and reporting the problem.

**Problem Determination:** If the errors listed in the User Response section are not the cause, this is an internal error.

Collect the following diagnostic items listed in
00E4070D

**Explanation:** An error was detected while attempting to update the EPOCH column of SYSIBM.SYSTABLEPART table.

This abend reason code is issued by the following CSECT: DSNUGUEN

**System Action:** Utilities processing is abended. The abend might be accompanied by message DSNT500I. An SDUMP might be taken.

**User Response:** Correct the 'resource unavailable' condition identified by the DSNT500I message. Either restart the utility from the last commit point or terminate the utility and start it again from the beginning. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349 for an explanation of resource type codes.

If DSNT500I was not issued, register 2 contains a secondary DB2 reason code that gives more information about the problem. If the secondary reason code is not documented in this manual, it is an internal IBM code.

**Problem Determination:** If the condition cannot be corrected, determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

1. 32
2. 46
3. 60
4. 51

00E4070F

**Explanation:** An error was detected during the execution of a restarted utility. A message is issued prior to this abend code to indicate the type of error.

This abend reason code is issued by the following CSECT: DSNUK001

**System Action:** Utility processing is abended.

**User Response:** Check messages issued prior to this abend code to determine the cause of the error. Correct the error, and restart the job.

**Problem Determination:** This abend is forced to allow restart of the utility when work data sets are used and the disposition is (MOD,DELETE,CATLG).

00E40900

**Explanation:** The DIAGNOSE utility forced an ABEND. The specified instance of the specified utility TRACEID or message, from the DIAGNOSE ABEND utility input statement, was encountered during utility processing while DIAGNOSE mode was on.

This abend reason code is issued by the following CSECT: DSNUGABN

**System Action:** The utility is abended as requested.

**User Response:** Continue with the diagnosis procedure in progress.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The ABEND option of the DIAGNOSE utility was invoked to force an abend on a particular instance of a specified utility TRACEID or message. The instance of that TRACEID or message was encountered during utility processing while DIAGNOSE mode was active and an abend was forced to occur at that point.

00E40901

**Explanation:** The DIAGNOSE utility failed while attempting to set the batch utility address space nonswappable.

This abend reason code is issued by the following CSECT: DSNUDIAG

**System Action:** Utility processing is abended.

**User Response:** Terminate the utility and restart it from the beginning. If the problem persists, wait until fewer applications are running on the system before resubmitting the job.

**System Programmer Response:** Determine the environment for the SYSEVENT TRANSWAP failure. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The DIAGNOSE utility attempted to set the batch utility address space nonswappable by issuing a SYSEVENT TRANSWAP operation. The operation failed to set the address space nonswappable.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

1. 32
2. 61

00E40902

**Explanation:** A bad parameter has been detected for the DIAGNOSE WAIT function.

This abend reason code is issued by the following CSECT: DSNUDWTC

**System Action:** Utilities processing is abended. An SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**System Programmer Response:** Determine the failing environment. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E41000  •  00E4D5D2

resource type codes. See the secondary reason code from register 2, also in this manual. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E41000

Explanation:  An internal error has occurred. A utility general service was called incorrectly.

This abend reason code is issued by the following CSECTs: DSNUGDYN, DSNUGTDS

System Action:  The utility job step is placed in the stopped state.

User Response:  The general services DSNUGDYN and DSNUGTDS can be bypassed by not using TEMPLATE dynamic allocation.

Operator Response:  None

System Programmer Response:  This abend should never occur. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  This is an internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E4D5D2

Explanation:  This abend is placed at logic points that will occur only through a programming error.

System Action:  Utility processing abends. No SYSABEND dump or SVC dump is requested.

User Response:  Any 00E4D5D2 is an APARable situation. The abend module and offset will identify the code location in error.

Problem Determination:  Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Chapter 48. X’E5……’ codes

00E50001

Explanation: A latch acquisition request violates latch deadlock prevention protocols. If the request was unconditional, the execution unit owns a latch at a level equal to or greater than the level of the requested latch. If the request was conditional, the execution unit already owns a latch at the requested level. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: See Problem Determination.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer of the abend.

System Programmer Response: Collect the necessary diagnostic material. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This abend is issued by the in-line expansions of the latch release macros DSNVUNLS and DSNVUNLX and from module DSNVXUL0.

At the time of the abend, diagnostic information is placed in general registers 2 through 5.

If the abend is issued from the in-line expansion macros, then the registers are set as follows:

<table>
<thead>
<tr>
<th>Register</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Latch class number (1-32).</td>
</tr>
<tr>
<td>3</td>
<td>Address of the latch</td>
</tr>
<tr>
<td>4, 5</td>
<td>Latch class name (1-8 characters, left-justified)</td>
</tr>
</tbody>
</table>

If the abend is issued from DSNVXUL0, then the registers are set as follows:

<table>
<thead>
<tr>
<th>Register</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Latch class number (1-32)</td>
</tr>
<tr>
<td>3</td>
<td>Address of the latch</td>
</tr>
<tr>
<td>4</td>
<td>Address of the holder of the latch</td>
</tr>
<tr>
<td>5</td>
<td>First waiter for the latch</td>
</tr>
</tbody>
</table>

Registers 2-12 of the invoking module were saved in the save area pointed to by register 13 at the time the error was detected.

It is the responsibility of the requesting resource manager to have functional recovery in place before requesting a latch. It is expected that a record will be written to SYS1.LOGREC and a DB2 SVC dump will be requested. Examine SYS1.LOGREC and, if available, the SVC dump to determine the subcomponent and module requesting the latch.

00E50002

Explanation: A release latch request was issued for a latch not held by the requesting execution unit. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: See Problem Determination.

System Action: The requesting execution unit is abended.
identifying and reporting the problem.

**Problem Determination:** A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50004**

**Explanation:** An error was found while attempting to resume a waiter after a latch was released. This abend is issued when the next resource options block (ROB) to be resumed is the same as the immediately previous ROB. That is, the ROBCHAIN of a ROB points to itself.

This abend reason code is issued by the following CSECT: DSNVXUL0

**System Action:** The current execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** A record is written to SYS1.LOGREC, and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50005**

**Explanation:** A resource options block (ROB) which was to be added to a latch waiter chain was discovered to be on the chain already. The same ROB cannot be on the same latch waiter chain twice. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs:

DSNVSLT0  DSNVSUL0  DSNVXLT0

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register three contains the address of the ROB which would have been added to the latch waiter chain.

A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50006**

**Explanation:** An execution unit which, according to tracking information, is currently suspended on a latch waiter chain issued a request to acquire a latch. A single execution unit cannot be doing both at the same time. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: DSNVSLT0, DSNVXLT0, and any CSECT that issues the DSNVLT0S or DSNVLT0X latch acquisition macros.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50007**

**Explanation:** An execution unit which, according to tracking information, is currently suspended on a latch waiter chain issued a request to test or to release a latch. A single execution unit cannot be doing both at the same time. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: DSNVXLT0, DSNVSUL0, DSNVXLT0, and any CSECT that issues the DSNVULS or DSNVULX latch release macros.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
Reference for information on identifying and reporting the problem.

Problem Determination: At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

Operator Response: Notify the system programmer.

System Programmer Response: Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E50008

Explanation: A latch manager module detected that an execution unit requesting latch manager service pointed to an invalid execution block (EB). This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs:

DSNVLT0  DSNVSLT0  DSNVSUL0  DSNVXLT0  DSNVXUL0

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E50009

Explanation: A latch manager module detected an invalid resource options block (ROB) while processing a request for service. This is probably a DB2 subsystem error.

This may be either an abend reason code or a DB2 subsystem termination code.

This reason code is issued by the following CSECTs:

DSNVLFRR  DSNVLT0  DSNVSLT0  DSNVSUL0  DSNVXLT0  DSNVXUL0

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The recovery routine in DSNVSDC0 creates diagnostic material, an entry in SYS1.LOGREC and a DB2 SVC dump is requested. These must be examined to determine the task and resource manager which made the illegal request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

00E50013

Explanation: A DB2 execution unit has been abended. This abend code must ultimately be issued by resource managers when the CANCEL exit is driven as a result of a suspend request.

This abend reason code is issued by the following CSECTs:

DSNVEUS1  DSNVEUS3  DSNVASTM  DSNVCST0  DSNVDST0  DSNVFEB  DSNVSLT0  DSNVSUL0  DSNVXLT0

System Action: The agent cancel processing continues.

Operator Response: Notify the system programmer only if the abend results in the termination of the DB2 subsystem.
System Programmer Response: This reason code may be issued as a result of any connected TCB abend, or operator -STOP DB2 M.O.DE(FORCE) command. No further action is required.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If DB2 abends, examine the SVC dump to determine the suspended resource manager and the state of the failing subcomponent. For example, the ACEMC (must complete) bit should be off.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50014

Explanation: Either the execution block (EB) or the agent services global communication area (VGCA) was invalid. The error was detected when the agent services resume function attempted to resume a TCB in an address space other than the primary of the resume requester. This is a subsystem error.

This abend reason code is issued by the following CSECT: DSNVSRSB

System Action: The error is percolated (passed) to the recovery routine for the TCB that was to have been resumed.

Operator Response: Notify the system programmer.

System Programmer Response: The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: An entry is written to SYS1.LOGREC, and a DB2 dump is requested by the FRR DSNVSRR. Examine the SVC dump and determine the resource manager module requesting the resume operation. Register 3 contains the SRB address. Register 5 contains the EB address. If the VGCA is invalid, its address is in register 8. The EB in question is that of the target TCB.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50015

Explanation: The MVS control block (either RB or STSV - SRB Status Save Area) that was the intended object of a resume request was invalid. The RB or STSV address was obtained from the DB2 EB (execution block) at offset X'1C' This is a subsystem error.

This abend reason code is issued by the following CSECTs:

DSNVSR DSNVSRSB DSNVSDC0

System Action: If the CSECT that abends is DSNVSRSB, the error is percolated (passed) to the recovery routine for the TCB that was to have been resumed. If the CSECT that abends is DSNVSR, the error is percolated to the DB2 SRB recovery task DSNVRC. Ultimately, the subsystem may be terminated abnormally. If the CSECT that abends is DSNVSDC0, the error will be retried one time and, if unsuccessful, the DB2 subsystem is terminated with a 00E50054 reason code.

Operator Response: Notify the system programmer.

System Programmer Response: The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A SYS1.LOGREC entry and a DB2 SVC dump are requested by the FRR DSNVSRR and by the recovery routine in DSNVSDC0. Register 6 contains the target EB address.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E5001A

Explanation: A CANCEL THREAD command caused the thread to be terminated. A dump is provided for diagnostic purposes as a result of the CANCEL command DUMP keyword.

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: The command might have been used to terminate a thread that was in a state where no processing was occurring and the thread could not continue.

If you suspect an internal DB2 error, obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO).

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
The module that was suspended while waiting for some action to be taken is the module that issued the abend.

00E50029

Explanation: The Agent Services function which establishes the DB2 tasking structure abends with this reason code following the detection of a load module which was loaded without the 31-bit addressing capability. The abend is preceded by message DSNV029.

This abend reason code is issued by the following CSECT: DSNVASIM

System Action: Subsystem start-up is terminated.

System Programmer Response: See message DSNV029I.

00E50030

Explanation: A request was made to initialize an already-initialized DB2 address space. This is a subsystem error.

This abend reason code is issued by the following CSECT: DSNVASIM

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Examine the SVC dump and determine the resource manager module (contents of register 14 in save area pointed to by register 13) that invoked DSNVASIM. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5]

00E50031

Explanation: An agent termination request was issued from a secondary execution unit for an agent created with APLOPT=1. This is an invalid use of the terminate allied agent function.

This abend reason code is issued by the following CSECT: DSNVTRTH

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the resource manager module that invoked DSNVTRTH. Register 14, in the save area pointed to by register 13, contains the return address of the invoking module. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: A record is written to SYS1.LOGREC, and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5]
**Explanation:** A conversion error occurred during the start of DB2. This conversion is used to determine if conversion services are set up correctly.

**System Action:** DB2 is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See message DSNT552I to resolve the problem.

---

**00E50035**

**Explanation:** During the processing of a request to perform system agent allocation, a resource manager returned a nonzero return code from an allocation notification. This is a subsystem error.

This abend reason code is issued by the following CSECT: DSNVIALC

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The error is recorded on SYS1.LOGREC, and an SVC dump is requested. Register 7 contains the nonzero return code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E50036**

**Explanation:** A request was made to perform system agent allocation for an agent that had already been allocated.

This abend reason code is issued by the following CSECT: DSNVIALC

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The error is recorded on SYS1.LOGREC, and an SVC dump is requested. The fullword address at register 6, which points to the EBROB, should have been zero. That address points to the ROBACE which, in turn, points to the ACERAL.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E50040**

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a terminate allied agent request at the thread, sign on, or identify level. The FRR (DSNVTFR) covering module DSNVTRTH was unable to recover. This is a subsystem termination reason code.

This reason code is issued by the following CSECT: DSNVTFR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E50041**

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a terminate agent structure request. The FRR (DSNVTFR) covering module DSNVFACE was unable to recover. This is a subsystem termination reason code.

This abend reason code is issued by the following CSECT: DSNVTFR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.
00E50042

**Explanation:** An execution unit which, according to tracking information, is currently suspended on a latch waiter chain is in the agent termination process. This may indicate that a latch manager request is still incomplete or has not been serviced properly. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: DSNVFACE, DSNVTEB

**System Action:** The current execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E50045

**Explanation:** A terminate agent request was issued for an agent with an active unit of recovery (URE). This is an invalid use of the terminate allied agent service and is a subsystem error.

This abend reason code is issued by the following CSECT: DSNVTRTH

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** The error is recorded on SYS1.LOGREC, and an SVC dump is requested. Register 1 at entry to the module contains the ACE address of the agent to be terminated. The ACEURE field should have been zero.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

00E50046

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a create agent structure request. The FRR (DSNVCFRR) covering module DSNVCRTTH was unable to recover. This is a subsystem termination reason code.

This reason code is issued by the following CSECT: DSNVCFRR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, "CICS Transaction Abend/Dump Code," for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

*Page 1345 for information about X'04F' and X'04E' abend completion codes.*

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

*Appendix B, "Problem determination," on page 1349.*

---

00E50044

**Explanation:** An execution unit which, according to tracking information, is currently suspended on a latch waiter chain is in the agent termination process. This may indicate that a latch manager request is still incomplete or has not been serviced properly. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: DSNVFACE, DSNVTEB

**System Action:** The current execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register zero contains the address of the latch upon which the execution unit is supposedly waiting and general register two contains the address of the resource options block (ROB) which was put on the latch waiter chain.

A record is written to SYS1.LOGREC and a DB2 SVC dump is requested.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

00E50046

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a create agent structure request. The FRR (DSNVCFRR) covering module DSNVCRTTH was unable to recover. This is a subsystem termination reason code.

This reason code is issued by the following CSECT: DSNVCFRR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, "CICS Transaction Abend/Dump Code," for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

*Appendix B, "Problem determination," on page 1349.*

---

00E50046

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a create agent structure request. The FRR (DSNVCFRR) covering module DSNVCRTTH was unable to recover. This is a subsystem termination reason code.

This reason code is issued by the following CSECT: DSNVCFRR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, "CICS Transaction Abend/Dump Code," for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.

---

*Appendix B, "Problem determination," on page 1349.*

---
**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**Explanation:** DB2 subsystem termination was invoked following an unrecoverable error while processing a Format EB RMRQ request. The FRR (DSNVCFRR) covering module DSNVFEB was unable to recover. This is a subsystem termination reason code.

This reason code is issued by the following CSECT: DSNVCFRR

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**Explanation:** The MVS cross-memory lock (CML) of the system services address space was held by the invoking resource manager execution unit during invocation of the cancel, suspend, resume, or SRB redispacth functions. This violates the entry protocols for these functions.

This abend reason code is issued by the following CSECTs: DSNVSR, DSNVSDC0

**System Action:** The requesting execution unit is abended.

Because resource manager serialization cannot be maintained without the use of this lock, normal recovery is not possible for this abend. The recovery routine terminates the DB2 subsystem through invocation of the agent services subsystem termination protocol.

An '00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA, indicating that synchronization services was responsible for DB2 subsystem termination.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Internal protocols specify that no MVS locks may be held at DSNVSR or DSNVSDC0 invocation. Determine the invoking resource manager, the function requested, and the current owner (ASCB) of the CML lock at the time of the error. Diagnostic information for this error may be obtained through the SYS1.LOGREC and DB2 SVC dump materials provided.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**Explanation:** The resource manager requesting the resume function specified the TCTL=YES option while executing in TCB mode. This violates the entry protocols for this function. This is a subsystem error.

This abend reason code is issued by the following CSECT: DSNVSR

**System Action:** Mainline processing is abended with an '04E' abend code and this reason code.

Because this error is an internal resource manager protocol violation, normal recovery is not possible for this abend. The recovery routine terminates the DB2 subsystem through invocation of the agent services subsystem termination protocol. An '00E500054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for DB2 subsystem termination.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Internal protocol documentation specifies that the TCTL=YES option is valid only for resource managers executing in SRB mode at time of invocation. Determine the invoking resource manager at time of error. Diagnostic information for this error may be obtained through the
SYS1.LOGREC and DB2 SVC dump materials provided.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50052

**Explanation:** The MVS cross-memory lock (CML) of the system services address space could not be released during termination processing of the cancel, suspend, resume, or SRB redispacth functions.

This abend reason code is issued by the following CSECTs: DSNVSR, DSNVSDC0

**System Action:** Mainline processing is abended with an '04E' abend code and this reason code.

Because resource manager serialization can no longer be maintained without the use of this lock, normal recovery is not possible for this abend. The recovery routine terminates the DB2 subsystem through invocation of the agent services subsystem termination function.

An '00E50054' recovery reason code is placed in the SDWACOMU field of the SDWA indicating that synchronization services was responsible for DB2 subsystem termination.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** For this abend to occur, the CML lock must have been successfully obtained at some point during mainline processing. Determine the invoking resource manager, the function requested, and the current owner (ASCB) of the CML lock at the time of the error. Diagnostic information for this error may be obtained through the SYS1.LOGREC and DB2 SVC dump materials provided.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50054

**Explanation:** The DB2 subsystem is abended by the synchronization services recovery routine when an unrecoverable error is encountered during recovery processing for the suspend, cancel, resume, or SRB redispacth functions. This is a subsystem termination reason code.

This reason code is issued by the following CSECTs: DSNVSR, DSNVSDC0

**System Action:** The DB2 subsystem is terminated.

This reason code is associated with an '04F' abend code indicating that synchronization services was responsible for termination.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the system termination message DSNV086E. Follow the failure analysis procedures for the specific abend(s). Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

One of the following conditions was encountered during recovery processing for the requested function:

- Unable to complete resume processing for an SRB mode execution unit that was suspended at time of error.
- Errors were encountered during primary recovery processing causing entry to the secondary recovery routine.
- Recovery initiated retry to mainline Suspend/Resume code caused retry recursion entry into the functional recovery routine.
- Unable to obtain or release the cross-memory lock (CML) of the system services address space either during mainline processing or during functional recovery processing (for example, reason code '00E50051' or '00E50052').
- The invoking resource manager requested the TCTL=YES option of the resume function while executing in TCB mode (for example, reason code '00E50051').

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50055

**Explanation:** The synchronization services functional recovery routine was unable to successfully complete resume processing for a suspended TCB mode execution unit. The resume processing was requested by the cancel or resume functions. This reason code is placed in the SDWACOMU field of an SDWA.

This reason code is issued by the following CSECT: DSNVSR

**System Action:** Because the suspended TCB mode execution unit must not be permitted to remain in a suspended state, the recovery routine invokes the MVS CALLRTM (TYPE=ABTERM) service to abend the execution unit with an '04F' completion code. Depending upon which execution unit was terminated, the DB2
subsystem may be abended.

**Operator Response:** Notify the system programmer, and restart DB2 if necessary.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Scan the MVS system log and the contents of SYS1.LOGREC for DB2 abends occurring immediately before the abend of the execution unit. Follow the failure analysis procedures for the specific (s). Refer to Appendix A, "CICS Transaction Abend/Dump Code," on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1 2 5 7]

---

**Explanation:** An application request (RARQ) was issued to a resource access list (RAL). At the time of the request, the RAL had the RAL suppress (RLSUPPR) flag on, and the function vector list entry (FVLE) that was accessed (through FRBFVLE) did not have FVLEBIT0 on. This is not allowed. That is, the FVLE function is not allowed during RAL suppress.

This error may indicate that an IMS/VS or CICS caller had completed Commit Phase 1 and that the next request was not Commit Phase 2, Abort, or Terminate with the Commit or Abort option. This abend is the result of an internal system problem, possibly the DB2 attachment facility or the requesting IMS/VS or CICS subsystem.

This abend reason code is issued by the following macro: DSNARARQ

**System Action:** The allied task requesting the RARQ is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The recovery routines of the module invoking the DSNARARQ macro should have requested SYS1.LOGREC recording and either an SVC or application dump (or both.) The FRB contains the FRBRALE and FRBFVLE entries. It also contains the pointers to the RAL and to the execution block address (FRBE). Register 3 contains the address of the RAL from FRBRAL. Register 4 contains the address of the RALE as located by the FRBRAL pointer (and as indexed by FRBRALE). Register 6 contains the address of the EB from FRBE.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1 2 5 22 23 24 25 26]

---

**Explanation:** A resource access request (RARQ) was issued to a function vector list entry (FVLE) that is valid but unauthorized for this allied user at this time. This abend occurs if a request is issued out of sequence. For example, two consecutive CREATE THREAD requests would give this result. This abend also occurs if a request is issued that is never authorized for the caller. For example, it occurs if a BATCH protocol user issues a PREPARE request. A program call (PC) is issued to module DSN3ABND, which issues the X'04E' abend with this reason code.

This abend reason code is issued by the following CSECT: DSN3ABND

**System Action:** The task issuing the RARQ is
abended. However, DB2 recovery may translate this abend to a return code 256 with this reason code.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is a user error. The issuer of the RARQ was not authorized to use the requested function at this time. The following diagnostic information is available:

- An entry in the DB2 trace table is made for entry to module DSN3ABND. The items traced are the RALE and the FVLE of the intended DSNARARQ request. To determine the sequence of DSNARARQ requests, examine the previous trace table entries for the same execution block (EB).
- An application dump is requested with DB2-supplied control blocks. This includes the FRB associated with the intended DSNARARQ request. Fields FRBRALE and FRBFVLE contains the indexes for the intended request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- 00E50065

Explanation: RMRQ linkage was requested, specifying a function code that is undefined in the resource manager function table (RMFT) of the designated resource manager.

This abend reason code is issued by the following CSECT: DSNVRMEL

System Action: The execution unit under which RMRQ was requested is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The recovery routine of the abended resource manager module requested SYS1.LOGREC recording and a DB2 SVC dump. Register 14 points to the resource manager module that requested linkage to the undefined function.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

- 00E50070

Explanation: This abend reason code is issued in response to a delete service task request specifying purge. Additionally, any service task not deleted by the owning resource manager at subsystem shutdown is abended with this reason code.

This abend reason code is issued by the following CSECTs:

- DSNVEUS3
- DSNVDST0
- DSNVEOT1

System Action: This abend usually occurs through MVS CALLRTM and, in certain cases, is issued by the service task dispatcher executing under the TCB being
abended. The service task is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** If the service task is abended with a completion code of X’04F’, no DB2 SVC dump is taken. Some resource managers have elected to terminate their service tasks with the purge option. Consequently, the abend may or may not be an actual error. At the time of the abend, register 6 points to the execution block (EB) of the execution unit that was active when the abend occurred. The EBHQ field in turn contains a pointer to the service queue header associated with the abending service task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** This abend reason code is issued following an unanticipated cancel return from DSNVSR for an execution unit not expected to be canceled. This code is also a subsystem termination reason code if the abend was issued by module DSNVCST0.

This abend reason code is issued by the following CSECTs:

DSNVEUS3  DSNVEUS4  DSNVSTC0  DSNVEOT1

**System Action:** The DB2 subsystem is abended.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** At the time of the abend, register 6 points to the execution block (EB) associated with the abending execution unit.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**Explanation:** Execution unit switch processing detected an invalid execution block (EB) or an invalid resource options block (ROB). This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECTs:

DSNVEUS2  DSNVEUS3  DSNVTEB

**System Action:** The current execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register zero contains the address which should have pointed to a valid control block but did not.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E50074

**Explanation:** This abend reason code is issued in response to a nonzero return code from ATTACH during an attempt to create a service task.

This abend reason code is issued by the following CSECT: DSNVEUS4

**System Action:** The ATTACH is retried. If a failure occurs again, DB2 is terminated.

**Operator Response:** Notify the system programmer, and restart DB2 if necessary.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Register 2, in the SDWA, contains the return code from the ATTACH request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E50075

**Explanation:** On an execution unit switch request, an invalid service queue header (SQH) and/or service task identifier (STID) was specified. Alternately, the specified or implicit address space may be invalid. This is an internal DB2 protocol error.

This abend reason code is issued by the following CSECT: DSNVEUS1

**System Action:** The requester is abandoned.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch. If the recording FRR is EUS1FRRE, then the deadlock was detected by the execution unit switch service. Otherwise, the error was found during a delete service task request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E50076

**Explanation:** A request was made for an execution unit switch to a service task currently undergoing delete processing. This is an internal DB2 protocol error.

This abend reason code is issued by the following CSECT: DSNVEUS1

**System Action:** The requester is abandoned.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch. If the recording FRR is EUS1FRRE, then the deadlock was detected by the execution unit switch service. Otherwise, the error was found during a delete service task request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E50077

**Explanation:** A deadlock condition was encountered. A request was made to either delete or synchronously execute a service task already participating in a chain of service tasks leading to the current request. This is an internal subsystem protocol error.

This abend reason code is issued by the following CSECTs: DSNVEUS1, DSNVDST0

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the function. If the recording FRR is EUS1FRRE, then the deadlock was detected by the execution unit switch service. Otherwise, the error was found during a delete service task request.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Using the SYS1.LOGREC entry and associated SVC dump, determine the resource manager requesting the creation of a service task. DB2 was probably already terminating when this error was encountered. New service tasks cannot be created during subsystem termination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1345.

00E50079

Explanation: An invalid address space (ASCE) was specified as the target of an execution unit switch request. This can occur if the target is an allied address space or if the address space was concurrently undergoing termination.

This abend code may also be issued when a passed agent services control block is determined to be invalid.

This abend reason code is issued by the following CSECTs:

DSNVEUS1  DSNVSR  DSNVSDC0

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Using the SYS1.LOGREC entry and the associated SVC dump, determine the resource manager module that requested the execution unit switch, suspend, resume, cancel, or SRB dispatch function. Using register 6 as a pointer to the execution block (EB), verify that the agent services control blocks — execution block (EB) and resource options block (ROB) — are valid.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1345.

00E50080

Explanation: An execution unit (SRB or TCB) processor determined that the current MVS Functional Recovery Routine (FRR) stack contained one or more entries for FRR’s which should not exist. This check is made at the conclusion of a resource manager function executing under the SRB or TCB.

This error reason code is issued by the following CSECTs: DSNVEUS2, DSNVEUS3.

System Action: An SVC dump is requested specifying an abend code of X’04E’ and this reason code. The extraneous FRR entries are deleted from the stack. Execution continues. The application is not notified.

Operator Response: Notify the system programmer of the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: MVS console data is logged and the SVC dump is taken. No record is written to SYS1.LOGREC.

One or more resource manager functions created an FRR which was not deleted. Examine the current FRR stack in the PSA of the active CPU. The only valid stack entries are those established by DB2 and MVS Dump Services and, if DSNVEUS2, an entry established by that module. The format of the FRR stack is provided as data area FRRS in the appropriate MVS debugging guides.

00E50081

Explanation: A TCB execution unit processor determined that the list of active ESTAE exits associated with the TCB contained one or more entries for ESTAEs which should not be active. This check is made at the conclusion of a resource manager function executing under the TCB.

This error reason code is issued by the following CSECT: DSNVEUS3.

System Action: An SVC dump is requested specifying an abend code of X’04E’ and this reason code. The extraneous ESTAE entries are deleted. Execution continues. The application is not notified.

Operator Response: Notify the system programmer of the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: MVS console is logged and the SVC dump is taken. No record is written to SYS1.LOGREC.

One or more resource manager functions created an ESTAE exit which was not deleted. Locate the TCB requesting the dump (It will be a DB2 service task in the home address space at the time the dump was requested.) Field TCBSTABB points to a chain of STAE
Control Blocks (SCB) for active exits. The only valid SCBs are for the ESTAE exit established (with a token) by DSNVEUS3 and an ESTAI exit established when the task was created. SCBs are located in LSQA. The SCB format is provided as a data area in the appropriate MVS debugging guides.

**00E50094**

**Explanation:** The macro service to get a resource options block (ROB) determined that a ROB taken from the ROB cache was not formatted properly. This can occur if the queue which controls the ROB cache was overlaid, if the ROB itself was overlaid, or if there is a programming error in DB2.

This abend reason code is issued by the following CSECTs: Any CSECT which invokes the get ROB service may use this abend reason code.

**System Action:** The requesting execution unit is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws?v=docid) for information on identifying and reporting the problem.

**Problem Determination:** Register zero, which should appear in the SYS1.LOGREC entry for this abend, contains the address which should have pointed to a ROB but apparently did not.

Use the SYS1.LOGREC entry and the associated dump to examine the area which should have been a ROB. It may also be helpful to examine the chain of ROBs in the cache. This chain is anchored in the DB2 DSNDBGCA control block.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50095**

**Explanation:** The macro service to release a resource options block (ROB) determined that a ROB passed to it for release was not formatted properly and did not, in fact, appear to be a ROB at all. This can occur as a result of a storage overlay or if there is a programming error in DB2.

This abend reason code is issued by the following CSECTs: Any CSECT which invokes the release ROB service may use this abend reason code.

**System Action:** The requesting execution unit is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws?v=docid) for information on identifying and reporting the problem.

**00E50096**

**Explanation:** A request was made to suspend an execution unit but the resource options block (ROB) which is required for this request is invalid. This is likely a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: Any CSECT that requests suspension is subject to this abend since it is issued by the in-line expansion of the macro used to make the request.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Collect the necessary diagnostic materials. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws?v=docid) for information on identifying and reporting the problem.

**Problem Determination:** At the time of the abend, general register zero contains the address which should have pointed to a valid ROB but did not.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00E50097**

**Explanation:** A request was made to resume an execution unit but the resource options block (ROB) which is required for this request is invalid. This is likely a DB2 subsystem error.

This abend reason code is issued by the following CSECTs: Any CSECT that requests the resume service is subject to this abend since it is issued by the in-line expansion of the macro used to make the request.

**System Action:** The requesting execution unit is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws?v=docid) for information on identifying and reporting the problem.
Problem Determination: At the time of the abend, general register zero contains the address which should have pointed to a valid ROB but did not.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50098

Explanation: A request was made to resume an execution unit but a non-zero return code was received from the IEAMSCHD service attempting to schedule a client or enclave SRB.

System Action: The requesting execution unit is abended.

User Response: Notify the system programmer and rerun the application.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: At the time of the abend, general register zero contains the return code from IEAMSCHD.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNVSR DSNVEUS1

00E50100

Explanation: The ASCE could not be found during recover stack processing. This is an internal subsystem error.

This abend reason code is issued by the following macro: DSNVRRSTK

System Action: The requesting recovery routine is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Using register 6 as the address of the execution block (EB), check that field EBPASCE contains a valid ASCE address. Also determine the recovery module invoking the macro from the information provided by the SYS1.LOGREC entry and the associated SVC dump.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50101

Explanation: The agent cancel function was unable to establish an ESTAE while preparing to cancel all active allied agents during processing of the -STOP DB2 MODE(FORCE) command.

This abend reason code is issued by the following CSECT: DSNVAGCL

System Action: The abend is passed on to a subsystem support subcomponent (SSS) ESTAE. Probably, DB2 is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: The inability to establish an ESTAE is normally due to insufficient free space in the local system queue area (LSQA) for an ESTAE control block (SCB). If necessary, increase the size of the system services address space.

Problem Determination: Review the associated SVC dump for usage and free areas in the LSQA subpools belonging to the system services address space.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50102

Explanation: An unrecoverable error occurred while canceling all active agents during processing of the -STOP DB2 MODE(FORCE) command. This is a subsystem termination reason code.

This abend reason code is issued by the following CSECT: DSNVAGCL

System Action: The subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E50105
Explanation: This in an internal error.
This abend reason code is issued by the following CSECT: DSNVAI
System Action: The caller’s task is abended.
Operator Response: Notify the system programmer.
System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 5 84]

00E50106
Explanation: This in an internal error.
This abend reason code is issued by the following CSECT: DSNVAI
System Action: The caller’s task is abended.
Operator Response: Notify the system programmer.
System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 5 84]

00E50107
Explanation: This in an internal error.
This abend reason code is issued by the following CSECT: DSNVAI
System Action: The caller’s task is abended.
Operator Response: Notify the system programmer.
System Programmer Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 5 84]

00E50100
Explanation: An MVS LOCAL or CML lock could not be obtained during DB2 subsystem abnormal termination processing.
This abend reason code is issued by the following CSECT: DSNVATRM
System Action: The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal DB2 subsystem termination is completed under a different execution unit if possible.
Operator Response: Notify the system programmer, and restart DB2.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Problem Determination: A SYS1.LOGREC entry is requested. Reason code ‘00E50504’ is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of subsystem termination at the time of error.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 5]

00E5002
Explanation: An MVS LOCAL lock could not be obtained during DB2 subsystem abnormal termination processing.
This abend reason code is issued by the following CSECT: DSNVATR4
System Action: The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal DB2 subsystem termination is completed under a different execution unit if possible.
Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: A SYS1.LOGREC entry is requested. Reason code '00E50502' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of the subsystem termination at the time of error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50503

Explanation: An MVS LOCAL lock could not be released during DB2 subsystem abnormal termination processing.

This abend reason code is issued by the following CSECT: DSNVATR4

System Action: The execution unit is abended. The error is recorded on SYS1.LOGREC, and abnormal DB2 subsystem termination is completed under a different execution unit if possible.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: A SYS1.LOGREC entry is requested. Reason code '00E50503' is placed in the SDWA variable recording area (VRA). The VRA data contains information about the status of the subsystem termination at the time of error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50504

Explanation: This reason code is used to define the format of the information recorded in the SDWA variable recording area (VRA) by the subsystem termination processor. The code identifies additional information provided in the VRA for abends encountered in module DSNVATRM.

This abend reason code is issued by the following CSECT: DSNVATR4

System Action: Recording of the error encountered during subsystem termination continues.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: Standard DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the abend. Register 6 contains the address of the active EB when the commit failed. The DB2 global trace table contains an entry for the commit-UR function exit. The entry contains return and reason codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Appendix about Abend/Dump error.

Problem 2 termination.

System DSNVCST0

Resume X'04E'.

Refer to Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A DB2 dump of the original failure was requested by the recovery routine for DSNVEUS2 and a record written to SYS1.LOGREC. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04E' and X'04E' abend completion codes.

Explanation: An error occurred while processing in SRB mode which could not be recovered.

This termination reason code is issued by the following CSECT: DSNVEUS2

System Action: The DB2 subsystem is abended with this reason code.

Operator Response: Notify the system programmer and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries looking for one or more DB2 abends immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A DB2 dump of the original failure was requested by the recovery routine for DSNVEUS2 and a record written to SYS1.LOGREC. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04E' and X'04E' abend completion codes.

Explanation: This subsystem termination reason code is used following an error while attempting to resume a suspended execution unit. The successful completion of resume processing was indoubt.

This reason code is issued by the following CSECTs:

DSNVST0 DSNVST0 DSNVEUS1 DSNVEUS3

System Action: The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04E' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Explanation: A subsystem termination was requested for one of the following reasons:

1. An agent was flagged as executing in 'must complete' mode,
2. An execution unit holds a latch,
3. An agent is marked as being on a latch waiter queue, when none of these conditions should be true. Additionally, the subsystem termination may have been preceded by an abend with this reason code.

This termination reason code is issued by the following CSECTs:

DSNVEOT1 DSNVEUS2 DSNVEUS3

System Action: The DB2 subsystem is abended.

Operator Response: Notify the system programmer and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries looking for one or more DB2 abends immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Chapter 48. DB2 codes 1193
The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to the accompanying abend code to determine the failure while in 'must complete' state. Refer to "DB2 abend completion codes (X'04E' and X'04F')" on page 5 for information about X'04F' and X'04E' abend completion codes.

If subsystem termination was requested by module DSNVEUS2, a standard MVS SVC dump will be generated.

The 'must complete' indicator is bit ACEMC. Latch-held indicators are in field EBLTCHLD. Latch waiter status information is in field EBLWSI.

Usually these conditions occur as the result of a prior failure where the associated recovery routine did not perform correct resource cleanup. The condition may also occur if a resource manager function does not release all latches and/or reset the 'must complete' bit before returning control to either DSNVEUS2 or DSNVEUS3.

**Explanation:** Either an unrecoverable error occurred while processing an End-of-Task condition on a DB2 service task or an asynchronous service task terminated for reasons other than an explicit "Delete Service Task" request. An abend with this reason code is requested if the latter situation occurs.

This termination reason code is issued by the following CSECT: DSNVEOT1

System Action: The subsystem is terminated with this reason code. Additionally, if no SDWA was provided to the recovery routine, a subsystem termination dump is requested.

Operator Response: Notify the system programmer of the failure and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries looking for one or more DB2 abends immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If an SDWA was available, a DB2 dump of the original failure was requested and should be analyzed to determine the nature of the original error. If no SDWA was available, the standard MVS SVC dump taken by subsystem termination must be analyzed. Refer to Appendix A, "CICS Transaction Abend/Dump Code," on page 1347 for information about X'04F' and X'04E' abend completion codes.
SYS1.LOGREC. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

00E50709

Explanation: Subsystem termination was requested following a failure in a service task, the service task controller, or the recovery control task that could not be recovered by the ESTAE of the failing task.

This reason code is issued by the following CSECT: DSNVSTAI

System Action: The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. Determine the registers and the failing task at the time of the error. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50710

Explanation: An abend occurred while disconnecting an allied agent from its home address space. The disconnect function is required before the agent can be connected to the Systems Services address space and then terminated.

This termination reason code is issued by the following CSECT: DSNVDISC

System Action: The DB2 subsystem is terminated with this reason code.

Operator Response: Notify the system programmer of the failure and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A DB2 dump of the original error was requested and a record entered into SYS1.LOGREC. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

00E50711

Explanation: An error occurred in a latch manager function and the status of one or more execution units waiting for a latch is indoubt. The latch manager functional recovery routine could not determine whether all waiting execution units had been resumed.

This termination reason code is issued by the following CSECT: DSNVLFR

System Action: The DB2 subsystem is terminated with this reason code.

Operator Response: Notify the system programmer of the failure and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries looking for one or more DB2 abends immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A DB2 dump of the original error was requested and a record entered into SYS1.LOGREC. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information about X'04F' and X'04E' abend completion codes.

Chapter 48. DB2 codes 1195
00E50713 • 00E50717

Explanation: The agent services recovery control task was entered in the suspend CANCEL exit. Subsystem termination was requested with this reason code.

This reason code is issued by the following CSECT: DSNVRCT

System Action: The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. It may be necessary to analyze the MVS SVC dump requested by the subsystem termination processor. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: An MVS SVC dump was requested by the subsystem termination processor. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347, for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50715

Explanation: Subsystem termination was requested following an unrecoverable error in a DB2 SRB mode execution unit.

This reason code is issued by the following CSECT: DSNVRCT

System Action: The SRB-related task was abended as a result of SRB to TCB percolation. The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347, for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E50717

Explanation: The subsystem was terminated, because resource manager ESTAE exits could not be purged for the default service task.

This reason code is issued by the following CSECT: DSNVEUS3

System Action: The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If an abend preceded the subsystem termination request, DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347, for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
unable to generate a standard DB2 SYS1.LOGREC entry and SVC dump, because system diagnostic work area (SDWA) was not provided by the recovery termination management (RTM) facility of MVS. An MVS SVC dump was requested by system termination. To determine the location of the error, examine the RB structure of the failing TCB.

DB2 diagnostic information may have been obtained by other recovery routines if an abend preceded the subsystem termination request. Refer to Appendix A, "CICS Transaction Abend/Dump Code," on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

00E50725

Explanation: Subsystem termination was requested because of an unrecovered error in a DB2 scheduled SRB-mode execution unit.

This reason code is issued by the following CSECT: DSNVRCT

System Action: The SRB-related task DSNVRCT was abended. due to SRB to TCB percolation. The DB2 subsystem is abended.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Scan the SYS1.LOGREC entries for one or more DB2 abends occurring immediately prior to the subsystem termination. If necessary, analyze the MVS SVC dump requested by subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: DB2 diagnostic information may be obtained through SYS1.LOGREC and SVC dump materials generated at the time of the original error. If the subsystem termination request was issued by module DSNVEUS2, an MVS SVC dump was requested. Refer to Appendix A, "CICS Transaction Abend/Dump Code," on page 1347 for information about X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

00E50730

Explanation: A thread being processed through thread deallocation was found to still have an outstanding unit of recovery and is marked as being in flight. This is a subsystem termination reason code.

System Action: The DB2 subsystem is terminated with this reason code.

Operator Response: Contact the system programmer.

System Programmer Response: Scan the SYS1.LOGREC entries and associated console listing for one or more DB2 abends prior to subsystem termination. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: A DB2 dump of the error is requested and a record is entered into SYS1.LOGREC. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:

This abend reason code is issued by the following CSECTs: DSNVIALC
Chapter 49. X’E6……’ codes

This chapter contains Instrumentation Facility abend codes.

00E60000

**Explanation:**  This reason code is used to indicate that information has been added to the SDWA variable recording area (VRA) following the data provided by the DSNWVRCD service. This is done so that anyone examining a SYS1.LOGREC entry can determine, from the reason code, what additional data has been placed in the VRA. The reason code is the first data item in the VRA, as mapped by macro IHAVRA.

This abend code is issued by the following CSECT: DSNWVM1

**System Action:**  The command being processed, failed. The DB2 subsystem remains operational.

**Problem Determination:**  The diagnostic data table (DSNDDDT control block) should appear in the SDWA variable recording area.

Collect the following diagnostic items listed in  

00E60008

**Explanation:**  This reason code is used to indicate that MVS and DB2 dispatching units do not match. There is an internal DB2 dispatching unit problem which should not occur.

This abend code is issued by the following CSECT: DSNWVPAP

**System Action:**  The function being traced is abended. The DB2 subsystem remains operational and the functional recovery of TRACE will retry if possible.

**Problem Determination:**  The problem is either the ASID of EB primary (EBPASCE->ASCE->ASID) did not match the EPAR ASID, or the ASID of the EB home (EBHASCE->ASCE->ASID) did not match the MVS home dispatching unit (PSAAOLD->ASCB->ASID), or the PSATOLD did not match the EBXU field. Analyze the dump and previous SYS1.LOGREC entries do isolate the cause of the problem.

Collect the following diagnostic items listed in  

00E60086

**Explanation:**  An internal logic problem occurred trying to obtain the MVS CML lock.

This abend reason code is issued by the following CSECTs: DSNWARDA, DSNWVOPX

**System Action:**  The request is abended.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  Request the SYS1.LOGREC and SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  This is an internal error.

Collect the following diagnostic items listed in  

00E60087

**Explanation:**  An internal error occurred attempting to free the MVS CML lock.

This abend reason code is issued by the following CSECTs: DSNWARDA, DSNWVOPX

**System Action:**  The request is abended.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  Request the SYS1.LOGREC and SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  This error is an internal error.

Collect the following diagnostic items listed in  

00E60088

**Explanation:**  An internal logic problem occurred on a READS request. The event is being traced asynchronously, which is not allowed.

This abend reason code is issued by the following CSECT: DSNWVS2

**System Action:**  The request is abended.

**Operator Response:**  Notify the system programmer.

**System Programmer Response:**  Request the SYS1.LOGREC and SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:**  This is an internal error.

Collect the following diagnostic items listed in  
00E60100 through 00E60199

**Explanation:** The reason codes 00E60100 through 00E60199 are used by the instrumentation facility component (IFC) when a trace event occurs for which IBM service personnel have requested a dump using the IFC selective dump service aid.

This abend reason code is issued by the following CSECT: DSNWVAPR

**System Action:** The abending agent might be retried or terminated, depending upon the serviceability dump request.

**Problem Determination:** The abend is issued on the occurrence of a specified trace event. A SVC dump is taken to the SUS1.DUMPxx data set. Problem determination methods depend on the condition that IBM service personnel are attempting to trap.
Chapter 50. X’E6......’ reason codes

This chapter contains Instrumentation Facility Interface (IFI) reason codes. Where there are two numbers, the first number is the return code that DB2 places in field IFCARC1 of the IFI Communication Area (IFCA); the number after the slash is the reason code that DB2 places in field IFCARC2. Where there is a single number, that number is the reason code that DB2 places in field IFCAGRSN. See Appendix E (Volume 2) of [DB2 Administration Guide] for information on IFI.

00000004/00E60800

Explanation: The command was completed, but the return area was not large enough to accommodate all the output messages. The return area contains the last complete message segment that fit. The IFCABM field in the IFCA indicates the number of bytes moved to the return area. The IFCABNM field in the IFCA indicates the number of bytes which were not moved because the return area was too small.

This reason code is issued by the following CSECT: DSNWACMD

User Response: Allocate more storage for the return area, if desired, and reissue the request.

00000004/00E60801

Explanation: The command was partially completed, but an internal error was encountered. Check the return area for a message.

This reason code is issued by the following CSECT: DSNWACMD

User Response: Dependent upon the message in the return area.

00000004/00E60802

Explanation: The instrumentation facility request was partially completed, but the return area was not large enough to accommodate all the output. The return area contains the last complete record that fit. The IFCABM field in the IFCA indicates the number of bytes moved to the return area for the READS or READA request. The IFCABNM field in the IFCA indicates the number of bytes that could not fit in the return area.

This reason code is issued by the following CSECT: DSNWARDA

User Response: Allocate more return area storage and reissue the request.

00000004/00E60803

Explanation: No data was returned from the READA request because none was available. Either the OPn storage buffer was empty or the application program had already retrieved all the trace records.

00000004/00E60804

Explanation: No data was returned from the READS or READA request, or no data was returned for at least one of the requested IFCIDs on a READS request for multiple IFCIDs. This can happen for one of these reasons:

- The destination OPx value specified in the IFCA was not active for a READA request.
- The qualification information specified did not match a process for a READS request.
- No information was available for a READS request.
- The user return area on a READS or READA request was too small to receive even a single record.

This reason code is issued by the following CSECTs: DSNWAAPI, DSNWARDA, DSNWALCK, DSNWARDS

User Response: If the OPn destination was not active, then activate the OPn destination or issue the request using an OPn destination that is active.

If the IFCABNM field (number of bytes not moved) is nonzero, then the user return area is too small. Increase the size of the user return area, and resubmit the request.

Problem Determination: See EREP log record in SYS1.LOGREC. See the Environmental Record Editing and Printing program (EREP) User’s Guide and Reference for instructions on how to print SYS1.LOGREC.

00000004/00E60805

Explanation: The request for information resulted in an abend.

This reason code is issued by the following CSECT: DSNWAAPI

User Response: Dependent upon the abend code in the log record. Refer to the IFCABM field in the IFCA (the number of bytes moved to the return area) to determine if partial information was returned.

00000004/00E60806

Explanation: The request for information resulted in an abend, perhaps because one of the parameters on the call was invalid. If a SYSUDUMP or SYSABEND DD
statement is present in your JCL, you will receive an abend dump.

This reason code is issued by the following CSECT: DSNWAAP

**User Response:** Dependent upon the abend code.

**Problem Determination:** See abend code in abend dump or EREP log record in SYS1.LOGREC. Examine the parameter list. Among other possible causes, the high-order bit of the last parameter must be on in order to indicate the end of the parameter list. See the Environmental Record Editing and Printing program (EREP) User’s Guide and Reference for instructions on how to print SYS1.LOGREC.

---

**00000004/00E60807**

**Explanation:** The request for information resulted in an abend, possibly because either the ACE token passed was invalid or became invalid during processing. In this case, no SDUMP is taken and control returns to the application program.

This reason code is issued by the following CSECT: DSNWAAP

**User Response:** If your application program does not pass a token, you can reissue the previous IFI request from the application program.

**Problem Determination:** If the application program passes an ACE token, the token is probably invalid.

---

**00000004/00E60808**

**Explanation:** The request for information resulted in an abend. Perhaps a DB2 structure became invalid while your application program was using it.

This reason code is issued by the following CSECT: DSNWAAP

**User Response:** To reduce the chance of this occurring, issue requests from a task with a higher priority than DB2 and its users. Certain requests (for example, a READS for IFCIDs 0147 and 0148) are more likely to encounter this type of problem. The request may be reissued. No SDUMP is taken and control is returned to the application program.

---

**00000004/00E60809**

**Explanation:** An IFI READS request for the IDCID 129 record was only partially successful. The request attempted to obtain CLs that have yet to be written. All available complete CLs were returned.

This reason code is issued by the following CSECT: DSNWALOG

**User Response:** No response is needed. All available CLs were returned.

**Problem Determination:** Examine the WQALLRBA and WQALNUM fields of the READS request. (WQALLRBA + (WQALNUM * 4KB)) > ending RBA of the last complete CI in the log.

---

**00000004/00E6080A**

**Explanation:** On a READS request for IFCID 316, the request was partially successful. The return area was not big enough to accommodate all the output. The return area contains up to the last record that fits.

**User Response:** Allocate more return area storage and reissue the request.

---

**00000004/00E6080B**

**Explanation:** On a READS request for IFCID 317, no data was returned because a matching statement was not found.

**User Response:** Ensure that the statement identifier for a currently cached statement is provided and reissue the request.

---

**00000004/00E6080C**

**Explanation:** On a READS request for IFCID 316, no data was returned because no statements matched the qualification criteria. This error can happen when WQALFLTR = X’02’ and no cached statements exceed the threshold specified in WQALFVAL. This can also happen if the dynamic statement cache but no statements have yet been inserted into the cache.

**User Response:** Adjust the qualification criteria and reissue the request.

---

**00000004/00E60810**

**Explanation:** A READS request for IFCID 0254 was partially successful. The return area was not large enough to accommodate all output. The return area contains as many complete records as can fit.

**User Response:** Allocate more return area storage and reissue the request.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWATGS

---

**00000004/00E60811**

**Explanation:** On a READS request for IFCID 0254, no data was returned because no qualified group buffer pools were connected.

**User Response:** Ensure that the qualified group buffer pools are connected and reissue the request.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWATGS

---
00000004/00E60812

Explanation: On a READS request for IFCID 0306, log records are returned. The end-of-scope log point has been reached and no position is held in the log. The end-of-scope log point is returned in field QW0306ES, and the number of records is returned in field QW0306CT from the QW0306 section.

User Response: A WQALMODT request to terminate the log position might be necessary to release held resources, or a WQALMODF request after a pause to initiate a first call.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

00000004/00E60813

Explanation: On a READS request for IFCID 0306, no data is returned because no log records were found that met the criteria. No position is held in the log. The end-of-scope log point is returned in field QW0306ES and zero is returned in field QW0306CT from the QW0306 section.

User Response: If this is caused by a WQALMODN call, issue a WQALMODF call after a pause to initiate a first call. However, there is still no guarantee that log records will be returned that meet the criteria.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

00000004/00E60814

Explanation: On a READS request for IFCID 0306, a WQALMODT call was invoked to terminate log position when no position is held in the log.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

00E60815

Explanation: On a READA or READS request for multiple members of a data sharing group, the return area was not large enough to hold all the data returned from other members. This reason code is returned in field IFCAGRSN of the IFCA.

User Response: Increase the size of the return area.

00E60816

Explanation: On a READA or READS request for multiple members of a data sharing group, no data was returned from other members of the data sharing group. This reason code is returned in field IFCAGRSN of the IFCA.

00000008/00E60820

Explanation: The command request did not complete normally. Check the IFCABM field in the IFCA to see if any message segments have been returned. There are many reasons for this condition, including:
- Command authorization failure
- Command processor abend
- Command syntax error
- Command output limit being exceeded.

This reason code is issued by the following CSECT: DSNWACMD

Problem Determination: To determine the reason for the failure, analyze the message or messages that are returned.

00000008/00E60821

Explanation: The request was not processed because a specified IFCID is not valid for the READS or WRITE function.

This reason code is issued by the following CSECT: DSNWAAP

User Response: Remove or replace the invalid IFCID.

Problem Determination: Check the IFCA diagnostic area (IFCAD) for the IFCID in error.

00000008/00E60823

Explanation: The WRITE request was not processed because the IFCID specified was not active.

This reason code is issued by the following CSECT: DSNWAAP

User Response: Activate the IFCID or reissue the request with a different IFCID.

00000008/00E60824

Explanation: An authorization failure occurred. On a READA request, the ownership token specified did not match the owner of an active trace, or on either a READA or READS request the user did not have the correct monitor authority.

This reason code is issued by the following CSECTs: DSNWARDA, DSNWARDS

User Response: Reissue the request with the correct ownership token for the desired OPN destination or obtain the appropriate monitor authority, as needed.

Problem Determination: Examine the specified ownership token and the monitor authority of the user.
00000008/00E60825

Explanation: Stack storage was not available for copying the output area.

This reason code is issued by the following CSECTs: DSNWAAPI, DSNWARDA

00000008/00E60826

Explanation: On a READA request, the destination specified did not match a valid destination.

This reason code is issued by the following CSECT: DSNWARDA

User Response: Reissue the request using a valid destination.

00000008/00E60827

Explanation: On a READA request, the destination specified did not have an instrumentation facility buffer assigned. The application program must start a trace to the destination specified before attempting a READA request.

This reason code is issued by the following CSECT: DSNWARDA

User Response: Start a trace to the desired destination, and reissue the request.

00000008/00E60828

Explanation: On a READS request for IFCID 149 or 150, IRLM was not able to return all the data that was applicable to the queried agent or resource. IRLM can return a maximum of 32KB of lock data about a given agent or resource. If IRLM notifies DB2 that more than 32KB of lock data is applicable for a given agent or resource, then DB2 does not request the information from IRLM. No data is returned, and reason code 00E60828 is issued by IFI.

This reason code is issued by the following CSECT: DSNWALCK

User Response: The READS request for IFCID 149 or 150 continues to return code 00E60828 until less than 32KB of lock data is applicable to the given agent or resource that the READS request for IFCID 149 or 150 is querying. You can continue to issue READS requests for IFCID 149 or 150 with no guarantee that the volume of lock data has decreased.

00000008/00E60829

Explanation: On a READS request, an unexpected return code was received from IRLM.

This reason code is issued by the following CSECT: DSNWALCK

00000008/00E60830

Explanation: An unexpected return code was received on a READS request.

This reason code is issued by the following CSECT: DSNWARDA

User Response: Reissue the request. If the condition persists, contact your IBM support center and tell them the message you are encountering.

00000008/00E60831

Explanation: A number of abends have occurred while processing IFI requests resulting in the disabling of all IFI request and MONITOR trace processing.

This reason code is issued by the following CSECT: DSNWAAPI

User Response: Issue a -START TRACE to clear the condition. This condition may not be cleared by issuing the -START TRACE command via instrumentation facility interface COMMAND function.

Problem Determination: Obtain a copy of the system or terminal log. If a dump was produced, have it printed. Print a copy of the contents of SYS1.LOGREC for the time period involved. Forward these items along with a copy of the system log to the systems programmer.

00000008/00E60832

Explanation: The IFCID specified on a READS was not active.

This reason code is issued by the following CSECT: DSNWAAPI

User Response: Issue a -START TRACE for monitor class 1.

00000008/00E60833

Explanation: A request for storage from the log-read storage pool has failed due to exhaustion of available storage or four log-read read requests are already holding storage from the pool.

This reason code is issued by the following CSECT: DSNWALOG

User Response: Allow other active READS requests for IFCID 129 to finish and then reissue the request.

Problem Determination: Examine the activity of READS requests for IFCID 129. If requests for more than 64 CIs are active at the same time, storage problems may occur.
### Explanation

**0000008/00E60834**

An unexpected return code was received from log manager macro DSNJOLGR.

This reason code is issued by the following CSECT: DSNWALOG

**User Response:** Reissue the request. If the problem persists, contact your IBM service representative.

**Problem Determination:** Examine the validity of WQALLRBA and WQALLNUM fields.

---

**0000008/00E60835**

An unexpected return code was received from Log Manager Macro DSNJLGR.

This reason code is issued by the following CSECT: DSNWALOG

**User Response:** Reissue the request. If the problem persists, contact your IBM service representative.

**Problem Determination:** Examine the validity of WQALLRBA and WQALLNUM fields.

---

**0000008/00E60836**

An unexpected return code was received from log manager macro DSNJCLGR.

This reason code is issued by the following CSECT: DSNWALOG

**User Response:** Reissue the request. If the problem persists, contact your IBM service representative.

**Problem Determination:** Examine the validity of WQALLRBA and WQALLNUM fields.

---

**0000008/00E60837**

On an IFI READS request for IFCID 1 or 2, storage was not available to satisfy the request.

This reason code is issued by the following CSECT: DSNWASTA

**User Response:** Reissue the request. This condition is only temporary and should be extremely rare. If this condition persists, contact your IBM support representative, and tell them the message you are encountering.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg2700000) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### Explanation

**0000008/00E60838**

On a READS request for IFCID 0254, a resource was unavailable while attempting to collect statistics for a specific group buffer pool.

**User Response:** Reissue the request. If the problem persists, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.wss?uid=swg2700000) for information on identifying and reporting the problem.

**Problem Determination:** The group buffer pool name and the reason code returned from the internal macro are saved in fields IFCAGBPN and IFCAR0B.

This reason code is issued by the following CSECT: DSNWATGS

---

**0000008/00E60839**

On a READS request for IFCID 149 or 150, IRLM was not able to return all the data that was available to the queried agent or resource. IRLM can return a maximum of 32KB of lock data about an agent or resource. If IRLM notifies DB2 that more than 32KB of lock data is available for that agent or resource, DB2 requests the information from IRLM, but returns up to 32KB of information to the application and IFI issues this reason code.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWALCK

---

**0000008/00E6083A**

On a READS request for IFCID 316 or IFCID 317 no data was returned because Dynamic Statement Caching is not active on this DB2 system.

**User Response:** The Dynamic Statement Cache must be activated through a system initialization parameter before READS requests can be processed for IFCID 316 or 317.

---

**0000000C/00E60840**

An invalid function was specified. The function specified does not match one of the IFI supported functions.

This reason code is issued by the following CSECT: DSNWAAP

**User Response:** Correct the function field of the DSNWLI call so that it is a left-justified, 8-character field containing WRITE, READA, READS, or COMMAND.

---

**0000000C/00E60841**

The IFCA was specified incorrectly. The return code and reason code will be placed at the correct offset in the erroneous IFCA. The IFCA length might be invalid, or the IFCA eye-catcher (IFCAID) might be missing.
This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Examine the length of the IFCA and the eye-catcher field of the IFCA. Correct any mistakes.

**Problem Determination:** See the return and reason codes placed at the correct offset in the erroneous IFCA.

---

**Explanation:** The return area was specified incorrectly. The length might be invalid. The length of the return area must be a fullword. The valid range for the return area length on IFI READS requests is X'000000064' to X'7FFFFF'. The valid range for the return area length on all other IFI requests is X'000000064' to X'00100000'.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Respecify the return area length to conform to the valid range.

---

**Explanation:** The IFCID area was specified incorrectly. The length might be invalid. The valid range is from X'0006' to X'0044'.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Respecify the IFCID area length field to conform to the valid range.

**Problem Determination:** Examine the length field of the IFCID area.

---

**Explanation:** The qualification area was specified incorrectly. The length might be invalid, or the WQAL eye-catcher (WQALEYE) might be missing.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Correct any incorrect specification of the qualification area length and eye-catcher fields.

**Problem Determination:** Examine the length and eye-catcher fields of the qualification area.

---

**Explanation:** An IFCID specified for a READS or a WRITE request was invalid.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Replace the errant IFCID with a valid one or remove it from the request.

---

**Problem Determination:** Check the IFCA diagnostic area for the IFCID in error.

---

**Explanation:** The output area was specified incorrectly.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Correct either the output area length or the output area parameter on the DSNWLI call, depending on which one is in error.

**Problem Determination:** The length might be invalid; the valid range is from X'000A' to X'1000'. Also, the output area parameter on the DSNWLI call may have been specified as zero. The output area parameter must point to a valid output area.

---

**Explanation:** The buffer information area was specified incorrectly.

This reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** Check that the buffer information area has an eye-catcher value of 'WBUF' and a length value equal to the length of 'WBUF' and correct any invalid values.

**Problem Determination:** The length might be invalid, or the 'WBUF' eye-catcher might be missing.

---

**Explanation:** The parameters are specified incorrectly on the IFI command request.

This abend reason code is issued by the following CSECT: DSNWAAPICSECT

**User Response:** If the selective dump function is not being used, check that the parameters are specified correctly on the IFI request. If the selective dump function is being used, notify the system programmer.

**Problem Determination:** If the selective dump function is not being used, check that the parameters are correctly specified on the command request. Among other possible causes, the high-order bit of the last parameter must be on in order to indicate the end of the parameter list. For assembler users, this can be done by using the VL option on the call. Another possible cause is the sixth parameter is specified on the IFI request. The sixth parameter is reserved for the selective dump function.
### Explanation:
The specified WQALLRBA was not in the active log.

### User Response:
Correct the invalid WQALLRBA value and reissue the request.

### Problem Determination:
Examine the validity of the WQALLRBA field. For IFCIDs 185, the valid values are A, Y, and N. If a value is not specified, a value of A is used as the default.

---

### Explanation:
An invalid WQALLNUM value was specified on a READS request.

### User Response:
Correct the invalid WQALLNUM value and reissue the request.

### Problem Determination:
Examine the validity of the WQALLNUM field. The valid range is X'0001' to X'0007'.

---

### Explanation:
A log RBA value past the end of the current active log was specified. The specified WQALLRBA value was beyond the end of the log. The CI has yet to be written.

### User Response:
Correct the invalid WQALLRBA value and reissue the request.

### Problem Determination:
Examine the validity of the WQALLRBA field. Check the ending RBA of the log. The WQALLRBA field must be less than the ending RBA value.

---

### Explanation:
No complete CIs are available from the RBA specified in WQALLRBA.

### User Response:
Lower the value in WQALLRBA by at least X'1000' or wait until at least one CI has been written beyond the RBA specified in WQALLRBA and reissue the request.

### Problem Determination:
Examine the WQALLRBA field and determine whether or not one complete CI beyond WQALLRBA has been written to the log.

---

### Explanation:
This code indicates that an IFI READS request for IFCID 185 contained an invalid WQALCDDC value.

### System Action:
Control returns to the user program with return code 0000000C in field IFCARC1 and reason code 00E60857 in field IFCARC2.

### User Response:
WQALCDDC is a user-specified field in the QUAL_AREA of an IFI READS for IFCID 185. Reissue the request with a valid WQALCDDC value. For IFI READS requests for IFCID 185, the valid values are A, Y, and N. If a value is not specified, a value of A is used as the default.
**Explanation:** This code indicates that an IFI READS request for IFCID 185 was denied because the system parameters indicate that data capture processing is not allowed on this DB2 system. The system parameter field SPRMCDC is set to 'no'.

**System Action:** Control returns to the user program with return code 0000000C in field IFCARC1 and reason code 00E60858 in field IFCARC2.

**User Response:** Inspect system parameter SPRMCDC. If change data capture is not allowed on this system, consult with the database administrator to determine if the system parameter should be changed to 'yes' to allow DB2 data capture processing.

---

**Explanation:** An IFI READS request for IFCID 129 was made to pass the last partially full log CI to the log exit, but the log exit is not active. Either the log exit (DSNJW117) was not installed, or an error in the exit has deactivated the exit.

This reason code is issued by the following CSECT: DSNWALOG

**User Response:** Either install the log capture exit, or look for message DSNJ150E indicating that the log capture exit has been deactivated. See the description for DSNJ150E for more information about reactivating the log capture exit.

---

**Explanation:** On a READS request for IFCID 0254, an error was encountered while collecting statistics for a group buffer pool.

**User Response:** Reissue the request. If the problem persists, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The group buffer pool name is saved in field IFCABGPBN. The reason and return code from the internal macro are saved in fields IFCAR0B and IFCAR1B.

This reason code is issued by the following CSECT: DSNWATGS

---

**Explanation:** An invalid WQALGBP value was specified on a READS request.

**User Response:** Correct the invalid WQALGBP value and reissue the request.

**Problem Determination:** Examine the validity of the WQALGBP field. The qualifier is an 8-byte group buffer pool name in which an imbedded X'00' is used as a pattern character.

This reason code is issued by the following CSECT: DSNWATGS

---

**Explanation:** On a READS request for IFCID 0306, a resource was unavailable while attempting to read the log.

**User Response:** Reissue the request. If the problem persists, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWALRS

---

**Explanation:** On a READS request for IFCID 0306, the return area supplied was not large enough to hold one log record. No log record is returned, but position is held in the log.

**User Response:** Increase the size of the return area and issue a WQALMODN request. If the problem persists, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The size of the return area required is returned in field IFCABSRQ of the IFCA return area.

This reason code is issued by the following CSECT: DSNWALRS

---

**Explanation:** On a READS request for IFCID 0306, no data is returned for a WQALMODF call because log position is already held in the log, possibly by a previous WQALMODF call.

**User Response:** You might want to use a WQALMODN request instead.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWALRS

---

**Explanation:** On a READS request for IFCID 0306, no data is returned for a WQALMODN call because no log position is held in the log.

**User Response:** A WQALMODF call might be necessary before a WQALMODN call.

**Problem Determination:** This reason code is issued by the following CSECT: DSNWALRS
Explanation: An invalid WQALLRBA value was specified on a READS request for IFCID 0306. The specified value exceeds the end-of-log.

User Response: Correct the WQALLRBA field. A pause might also be necessary before you issue a WQALMODF request again.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

Explanation: The return area was specified incorrectly for IFCID 0306. The return area did not reside in ECSA storage.

User Response: Respecify the return area and make sure that it resides in ECSA storage.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

Explanation: An invalid WQALLCRI field was specified on a READS request for IFCID 0306.

User Response: Correct the invalid WQALLCRI field and reissue the request.

Problem Determination: Check the validity of the WQALLCRI field. It must be X'00'.

This reason code is issued by the following CSECT: DSNWALRS

Explanation: An invalid WQALLOPT field was specified on a READS request for IFCID 0306.

User Response: Correct the invalid WQALLOPT field and reissue the request.

Problem Determination: Check the validity of WQALLOPT field. It must be X'00' or X'01'.

This reason code is issued by the following CSECT: DSNWALRS

Explanation: On a READS request for IFCID 306, log records are returned, but data is not decompressed as requested.

This reason code is issued by the following CSECT: DSNWALRS

Problem Determination: See the reason code in field QW0306DG to determine why decompression was not performed. One reason code can be 00C90064, which means that the decompression dictionary changed since the log record was written.

Explanation: On a READS request for IFCID 0306, no data is returned for a WQALMODD call because log position is already held in the log, possibly by a previous WQALMODF or WQALMODN call.

User Response: If WQALMODD is desired, make sure that a WQALMODT call has been issued first.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

Explanation: On a READS request for IFCID 0306, no data is returned for a WQALMODF call because the RBA supplied was too old. This is because DB2 has migrated into and out of or out of data sharing mode.

User Response: The change of mode into and out of data sharing also changes the log sequencing from RBA to LRSN and back to RBA. A log read application that is sensitive to log sequencing should take an appropriate action. A cold start of the application might be necessary.

Problem Determination: This reason code is issued by the following CSECT: DSNWALRS

Explanation: An invalid value was specified for WQALFLTR on a READS request for IFCID 316. See the definition in the DSNDWQAL parameter block for valid values.

User Response: Correct the invalid WQALFLTR value and reissue the request.

Explanation: An invalid value was specified for WQALFFLD on a READS request for IFCID 316. See the definition in the DSNDWQAL parameter block for valid values. This error might also be issued if WQALFLTR = X'02' is specified with WQALFFLD = 'A'.

User Response: Correct the invalid WQALFFLD value and reissue the request.
Chapter 51. X’E6……’ Abend Codes

This chapter contains Instrumentation Facility (IFI) abend codes.

00E60886

Explanation: This reason code is used to indicate that an invalid IAMQ function was passed to module DSNWVZXT. This problem should not occur.

This abend code is issued by the following CSECT: DSNWVZXT

System Action: The function requested is abended. The DB2 subsystem remains operational and the functional recovery will retry if possible.

Problem Determination: The IAMQ function requested does not match a function handled by DSNWVZXT. Analyze the dump and previous SYS1.LOGREC entries to isolate the cause of the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00E60888

Explanation: The reason code is set by the Instrumentation Accounting Facility FRR routine when an abend condition occurs during the accounting function. The reason code only appears in the VRA data of SYS1.LOGREC to indicate the WWAB block exists in the variable recording area following the standard DB2 information.

This code is issued by the following CSECT: DSNWVZSA

System Action: Depending on the number of errors the Instrumentation Accounting Facility may be turned off. The FRR will attempt a retry to RTM to keep the DB2 subsystem operational.

System Programmer Response: The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Normally the SYS1.LOGREC standard entries provide the necessary information to isolate the failing module. The WWAB control block in the variable recording area provides the resource manager RMID last called (WWABRMID) and the RMID of which resource manager Instrumentation Statistics Facility called when the failure occurred (WWABFRMS). If WWABFRMS is binary zero, then the error occurred in the Instrumentation Statistics Facility.

00E60890

Explanation: This is an informational code. One or more data rows defined with DATA CAPTURE CHANGES might not have been retrieved.

This abend code is issued by the following CSECTs: DSNILEDA, DSNWACDC

System Action: All successfully retrieved data rows defined with DATA CAPTURE CHANGES are returned in the return area. One header instance of 0185 is returned for each data row associated with a failure or warning. A reason code in field QW0185RC in the header indicates the reason for the failure or warning.

Problem Determination: Inspect the reason code in QW0185RC to determine the cause of each failure or warning.
00E60901

**Explanation:** The available buffer is not large enough to hold the largest 0185 record instance.

This abend code is issued by the following CSECT: DSNILESP

**System Action:** No data is returned.

**User Response:** Reissue the IFI READS request for IFCID 0185 with a larger return area. The suggested size of the new area is 4KB more than the original size.

00E60902

**Explanation:** The IFI READS request for IFCID 0185 is invalid. The READS request tried to retrieve captured DB2 table changes, but no data was captured for the current SQL statement.

This abend code is issued by the following CSECT: DSNILEDA

**System Action:** No data is returned.

**User Response:** Ensure that the IFI READS request follows the current SQL statement and precedes any subsequent SQL statement. Captured data must be retrieved at the time of the SQL call.

00E60903

**Explanation:** One or more data rows marked with DATA CAPTURE CHANGES were not retrieved. In addition, there is insufficient space in the return area to hold all the data in an IFI READS request for IFCID 0185. This is a combination code for 00E60900 and 00E60802.

This abend code is issued by the following CSECT: DSNILESP

**System Action:** As many complete 0185 records as can fit are returned in the return area. Also, one 0185 header record is returned for each failed data row. The reason code in field QW0185RC in the header indicates the reason for the failure.

**User Response:** Refer to the description of reason codes 00E60900 and 00E60802 for details.

00E60904

**Explanation:** The IFI READS request for IFCID 0185 could not be executed successfully because a resource was not available. Some 0185 record instances might have been returned to the return area before the problem occurred.

This abend code is issued by the following CSECT: DSNILEDA

**System Action:** The last 0185 record instance returned is type D (QW0185TP = D). Field QW0185RC contains a reason code for the specific unavailable resource. In addition, the data portion (QW0185DR) of this record instance contains the following message:

UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON reason, TYPE OF RESOURCE type, AND RESOURCE NAME name

In the message, reason is identical to field QW0185RC. The variables type and name identify the specific resource that is unavailable at the time.

**User Response:** Retrieve all returned record instances. Examine the reason code (QW0185RC) for each instance for other possible errors or warnings. Use the reason code in QW0185RC and the error message in QW0185DR to determine why the resource is unavailable. Refer to [Appendix B, “Problem determination” for an explanation of resource type codes](#). Refer to Part 4, Section 4. DB2 Codes, on page 771 for an explanation of the given reason code.

00E60A00

**Explanation:** A down-level data description was detected. A requester specified no data description to be returned in an IFI READS request for IFCID 0185. That is, the WQALCDCD field of the qualification area is set to N, but a description change (ALTER TABLE ADD) that requires a refresh of the data description occurred. This reason code does not apply to the success or failure of the IFI request, but rather to the status of the data in the IFCID 0185 record.

This abend code is issued by the following CSECT: DSNILEDS

**System Action:** This reason code is only issued once for each table within each SQL scope. The 0185 record instance that contains this reason code has the header portion only. Moreover, contents of all time stamp, log RBA, and operation code fields in the header are all zeros.

**User Response:** The requester can issue an SQL DESCRIBE to get the new description, or can consider changing the DataPropagator NonRelational (DPropNR) exit routine to set WQALCDCD to A or Y.

00E60A01

**Explanation:** The data row marked with DATA CAPTURE CHANGES is rejected by the installation-defined edit procedure 'proc-name' for the object table. This reason code does not apply to the success or failure of the IFI request, but rather the status of the data in the IFCID 0185 record.

This abend code is issued by the following CSECT: DSNILEDR

**System Action:** The following message is returned in the data area of 0185:
VIOLATION OF INSTALLATION DEFINED
EDIT PROCEDURE proc-name.
REASON CODE: reason-code

In the message, proc-name is the edit procedure name and reason-code is EXPLRC2 returned by the edit procedure.

User Response: Examine the edit procedure for any errors. If it is not an edit procedure error, determine the requirements imposed by the edit procedure.

00E60A08
Explanation: The following message is returned in the data portion of the data row area in the 0185 trace record:
COLUMN column_name ON TABLE table_name IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE.

An installation field procedure returned an error indicated by return_code for column column_name on table table_name. Use return_code to determine the problem. The return code can be:
4 Invalid value on decode
8 Invalid parameter value
12 Field procedure error on any function

Use reason_code and message_token for additional information. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

This abend code is issued by the following CSECT: DSNXRCDC

System Action: Whenever this reason code is present in the QW0185RC field in the record header, no record is returned in the data row section for this table. The message listed above takes its place. The length of the record corresponds to the message length.

Programmer Response: Correct the field procedure so that it returns values and their descriptions that are mutually consistent.

00E60A0A
Explanation: The following message was returned in the data portion of the data row area in the 0185 trace record:
AN INSTALLATION FIELD PROCEDURE HAS RETURNED A RETURN CODE IN REGISTER 15 OTHER THAN AN EXPECTED 0 OR 4

This indicates that an installation field procedure returned an unexpected error. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

This abend code is issued by the following CSECT: DSNXRCDC

System Action: Whenever this reason code is present in the QW0185RC field in the record header, no record is returned in the data row section for this table. The message listed above takes the place of the record. The length of the record corresponds to the message length.

Programmer Response: Examine the field procedure for the specific return code generated.

00E60A0B
Explanation: This is a warning code, and does not represent an error. For the corresponding data row with this reason code in field QW0185RC, a date or time column value was returned in the ISO format, even though the date/time installation option was specified as LOCAL. Invocation of local date and time exits is not supported for captured data. This reason code does not apply to the success or failure of the IFI request, but to the status of the data in the IFCID 0185 record.

This abend code is issued by the following CSECT: DSNXRCDC

System Action: A date or time column value was returned in the ISO format even though the installation option was specified as LOCAL.

Programmer Response: The requester needs to be aware that a date or time was returned in ISO format since the LOCAL date and time installation option,
which was in effect at the time of capture, is not supported for data capture.

**00E60B01**

**Explanation:** An installation field procedure wrote beyond the end of the output buffer.

This abend code is issued by the following CSECT: DSNXRCDC

**System Action:** The execution unit requests an SVC dump, and terminates abnormally.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Correct the field procedure. See the Field Procedures in Appendix B (Volume 2) of [DB2 Administration Guide](https://www.ibm.com/support/docview.ws/docid/62238).

**Problem Determination:** At the time of abend the register contents are:

- **R2** The first 4 characters of the field procedure name
- **R3** The second 4 characters of the field procedure name

**00E60B02**

**Explanation:** Invalid data was returned from the edit procedure. The data is invalid for one or more of these reasons:

- The first byte or the last byte of the input record was modified by the exit.
- The length of the edited data is greater than the maximum allowed for this row, or less than one.
- The exit returned a row that overran the output area.

This abend code is issued by the following CSECT: DSNILEDR

**System Action:** An execution unit requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws/docid/62238) for information on identifying and reporting the problem.

**00E60B03**

**Explanation:** An internal inconsistency was detected by DB2 during data propagation processing.

This abend code is issued by the following CSECTs: DSNXIBCD, DSNXIBCL, DSNXIBC2, DSNXIBGE

**System Action:** An execution unit requests an SVC dump. The execution unit then terminates abnormally.

**Operator Response:** Notify the system programmer.

**Problem Determination:** At the time of abend, register 2 points to the error message. Collect the following diagnostic items listed in Appendix B, “Problem Determination”: 1, 2, 5.

**00E60B04**

**Explanation:** During the retrieval of captured table data in preparation for propagation to IMS, an invalid data type was found. This data type is not supported for propagation from DB2 to IMS. Since the invalid data type cannot be returned to the Data Propagator (DPROP) exit routine, processing is terminated abnormally. This is an internal DB2 error.

This abend code is issued by the following CSECT: DSNXRCDC

**System Action:** An execution unit requests an SVC dump, and terminates abnormally.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The current SQL statement performed an INSERT, UPDATE, or DELETE, for a DB2 table that was defined with DATA CAPTURE CHANGES. The captured data changes are reflected in the DB2 log.

Check the captured table data information returned to DPROP for propagation to determine which data type is invalid.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com/support/docview.ws/docid/62238) for information on identifying and reporting the problem.
Chapter 52. X’E7......’ codes

00E70004

Explanation: An inconsistency has been detected in the subsystem catalog tables.

This abend reason code is issued by the following CSECTs: DSNXOCK, DSNXOLV

System Action: The application program abends.

Operator Response: Notify the system programmer or database administrator.

System Programmer Response: Notify the database administrator if appropriate. Otherwise, use the information under the Problem Determination section to resolve the problem.

Problem Determination: The module name and the name of the inconsistent subsystem catalog table can be found in the SQLCA. Refer to Part 3 of "DB2 Diagnosis Guide and Reference" for information about how to find the SQLCA.

Register 7 is the cursor table pointer and is always restricted entirely over the relational data system (RDS) subcomponent.

Dump the page set containing the inconsistent subsystem catalog using the DUMP option of the REPAIR utility.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E70005

Explanation: A relational data system (RDS) subcomponent internal inconsistency was detected.

This abend reason code is issued by the following CSECTs: Any of the RDS modules

System Action: The application program abends.

Operator Response: Notify the system programmer.

System Programmer Response: This code generates an SVC dump and SYS1.LOGREC entries. Use information from those two sources and from the Problem Determination section of this code to resolve the problem. If you suspect an error in DB2, refer to Part 2 of "DB2 Diagnosis Guide and Reference" for information on identifying and reporting the problem.

Problem Determination: The abend code can be issued by any of the RDS modules. The module name can be found in the SQLCA. SQLERRD1 in the SQLCA contains a unique code that identifies the location within the module where the error was detected. SQLERRM contains information describing the particular error.

Refer to Part 3 of "DB2 Diagnosis Guide and Reference" for information about how to find the SQLCA.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E70006

Explanation: An internal inconsistency has been reported to the relational data system (RDS) subcomponent by the RDS subcomponent of DB2.

This abend reason code is issued by the following CSECTs: Any of the RDS interpreter modules

System Action: The application program abends.

User Response: Notify the system programmer.

Operator Response: Provide a print of the SVC dump to the system programmer.

System Programmer Response: Use the information in the 'Problem Determination' section of this message to resolve the problem.

Problem Determination: The abend code may be issued by any of the RDS interpreter modules (DSNX...). The module name appears in the SQLCA. SQLERRD1 in the SQLCA contains a unique code that identifies the location within the module at which the error was detected. SQLERRM contains information describing the particular error.

Refer to Part 3 of "DB2 Diagnosis Guide and Reference" for information about how to find the SQLCA.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

00E70007

Explanation: A bad application-supplied address was encountered while trying to copy SQLCA back to the application program.

This abend reason code is issued by the following CSECT: DSNXERD

System Action: The application program abends.

System Programmer Response: Contact the application programmer.

Problem Determination: The register contents at the time of abend are as follows:

R2  A decimal code identifying the data:
  1  FRB address is bad.
  2  FRBPARM has the bad address used to locate the RDIIN.
  18  RIDICODEP has the bad address used to locate the SQLCA.
R3  The bad application data area address.
R4  The length of the data.
R5  The key of the data or the address of the CT if the SQLCA contains SQLCODE -902.
R8  The address of the FRB in the application address space (RDIIIN) or the address of the RDA if the SQLCA contains SQLCODE -902.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 or 23.

00E70009

Explanation: An invalid value or a return code(EXPLRC1) of 12 was returned by the Access Control Authorization exit routine, DSNX@XAC.

System Action: The authorization check is abended. An SVC dump is requested by DB2 functional recovery. If EXPLRC1=12, then the Access Control Authorization exit routine is no longer invoked and authorization checking is performed by DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If message DSNX210I has been issued to the System Console, retrieve the return code (EXPLRC1) and reason code (EXPLRC2) from this message and refer to the exit routine’s documentation to determine the course of action to be taken.

Problem Determination: The abend with this reason code is issued because the access control authorization exit routine returned an invalid value in one of the return fields or returned a return code (EXPLRC1) of 12. The register contents at the time of abend are set as follows:

- Register 3 points to the field that has the invalid value. This field may be in the EXPL or XAPL control block. The control block eye catcher will enable you to distinguish between the two.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 or 23.

This abend reason code is issued by the following CSECTs: DSNXACAE

00E7000A

Explanation: A relational data system (RDS) subcomponent abended because one or more parallel tasks abended.

System Action: The application program abends.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information in the Problem Determination section of this message to resolve the problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 or 23.

This abend code is issued by the RDS modules that detect abends of other parallel tasks.

This abend reason code is issued by the following CSECTs: DSNXRGF, DSNXRGN

00E7000C

Explanation: The application program supplied an invalid address.

DSNXECBDSNXEDDSNXRVBDSNXRDSNXERDSNXEVPN
DSNXROBDNSXEDDSNXELDDSNXEMP

System Action: The application program abends.

User Response: Correct the invalid address. See Problem Determination for instructions on how to determine the failing SQL statement and the bad address. Use this information to determine the application’s incorrect setting of the address. For further information, refer to Part 5 of DB2 Application Programming and SQL Guide.

Operator Response: Notify the user or system programmer.

System Programmer Response: Assist the user in determining the invalid address.

Problem Determination: At the time of abend the register contents are:

R2  A decimal code identifying the bad data:
    1 (1)  The bad FRB address used to locate the FRBPARM.
    2 (2)  FRBPARM has the bad address used to locate the RDIIIN.
    3 (3)  RDIVPARM has the bad address used to locate the SQLDA length.
    4 (4)  RDIVPARM has the bad address used to locate the SQLDABC.
R3  The bad data address.
R4  The length of the data.
R5  The key of the data.

R8  If register 2 = 8 or 9, R8 contains the address of the RDIVPARM. If register 2 = 16 or 17, R8 contains the address of the RDIAUXPA. Otherwise, R8 contains the address of the RDIN. This is the application's invocation parameter list. The address of the RDIN may not be valid if the RDIN could not be located (Register 2 = 1 or 2).

The program name identifies the failing program. The statement number refers to the statement number in the DB2 precompiler listing. The SQL statement executed can then be found in the application program's compiler/assembler listing. For example, if the statement number is 'X'00E6', refer to statement number 230 in the DB2 precompiler listing. This precompiler statement number can be cross-referenced to the program's compiler/assembler listing.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 or 23.

Use the following offsets to trace through the control blocks.

### 00E7000F

**Explanation:** A deadlock condition has been detected.

This abend reason code is issued by the following CSECT: DSNXIDPM

**System Action:** The requested operation is not performed.

**User Response:** Rerun the application.

**System Programmer Response:** If the deadlock condition becomes chronic, examine the mix of applications running to determine why the deadlock is occurring.

**Problem Determination:** The requested operation is not performed. Message DSNT375I is issued and an SQLCODE -904 is issued. For more information, refer to the SQL code or to the description of the DSNT375I message.

### 00E70010

**Explanation:** A timeout condition has been detected.

This abend reason code is issued by the following CSECT: DSNXIDPM

**System Action:** The requested operation is not performed.

**User Response:** Rerun the application.

**Problem Determination:** The requested operation is not performed. Message DSNT376I is issued and an SQLCODE -904 is issued. For more information, refer to the SQL code or to the description of the DSNT376I message.

### 00E70011

**Explanation:** During an authorization check for plan or command authorization, an execution unit switch took place to a new execution unit and the new execution unit abended.

This abend reason code is issued by the following CSECTs: Any module that invokes the DSNXCHK macro

**System Action:** The called execution unit is also abended.

**Operator Response:** Notify the system programmer. Print SYS1.LOGREC. Also print the dump from any previous dump data set if the failing module name is DSNXACKP or the dump title is 'RDS AUTHCHK'.

**System Programmer Response:** See problem determination and if you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The module issuing this abend reason code has invoked the DSNXCHK macro to perform an authorization check for either the application plan or the command authorization. The DSNXCHK macro does a cross-memory execution unit switch to module DSNXACKP. Look for a previous dump in which the failing module name is DSNXACKP, the dump title is RDS AUTHCHK, or the failure is an allocation failure.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

### 00E70012

**Explanation:** A user exit has written beyond the end of the output buffer.

This abend reason code is issued by the following CSECTs: DSNXRPCC, DSNXVTRS

**System Action:** The application program abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Correct the exit routine. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** At the time of abend the register contents are:

- R2 contains the first 4 characters of the exit routine name.
- R3 contains the next 4 characters of the exit routine name.

If the exit routine name is DSNXVDTX then DECPDLEN contains the LOCAL DATE LENGTH specified on the DB2 Installation Application Programming Defaults Panel. The exit routine wrote beyond this length in returning a local date format to DB2.

If the exit routine name is DSNXVTMX then DECPDLEN contains the LOCAL DATE LENGTH specified on the DB2 Installation Application Programming Defaults Panel. The exit routine wrote beyond this length in returning a local time format to DB2.
**00E70013**

**Explanation:** DRDS at the server site supplied an invalid address.

This abend reason code is issued by the following CSECTs:

DSNXECP  DSNXEDC  DSNXRIVB  DSNXROUT

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is a DB2 internal error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E70014**

**Explanation:** DB2 could not validate the data definition control support tables during startup.

**System Action:** The requested operation is not performed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Provide a print of the SVC dump to the system programmer. Use the information in the ‘Problem Determination’ section. The data definition control support tables could not be validated. No data definition SQL statements can be executed until these tables can be validated.

Register 2 contains the address of a message that indicates the reason for the problem. DB2 startup continues. Correct the problem if it still exists. DB2 will attempt to validate the data definition control support tables when the user attempts to execute any data definition SQL statements.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

---

**00E70015**

**Explanation:** DB2 was abnormally terminated because the Access Control Authorization exit has indicated that it is unable to process authorization checks and that DB2 should be terminated.

**System Action:** The authorization check task is abended. An SVC dump is requested by DB2 functional recovery. A message is issued to the operator console, and DB2 is terminated.

**System Programmer Response:** Use the information in the ‘Problem Determination’ section of this message to resolve the problem.

---

**00E70069**

**Explanation:** An installation error was detected while the CICS Attachment Facility was attempting to establish the connection to DB2 for your CICS transaction. This error can be caused by one of the following:

- The current CICS transaction identifier was not found in any of the resource control table (RCT) entries.
- A valid authorization name was not found using the RCT entry for this CICS transaction. The AUTH= parameter in the RCT specifies up to three sources for authorization checking. None of these yielded a valid name for checking. For example, the RACF group might have been specified, but the user was not a member of any RACF group. Or terminal identifier might have been specified, but the transaction was being run without a terminal.

This abend reason code is issued by the following CSECT: DSNCEXT1

**System Action:** The request is not processed.

**System Programmer Response:** Check the RCT table specifications for this transaction to determine if they are missing or incorrect. If modification is needed, change the RCT source and install the RCT again. Refer to Chapter 2-10, “Connecting the CICS Attachment Facility,” of the DB2 Administration Guide for more information.

**Problem Determination:** You might be able to use the DSCN DISPLAY command to check for the existence of an RCT entry for this transaction. If an entry exists, refer to the RCT source. Look at the AUTH= parameter list and determine why CICS was unable to establish a valid authorization name for checking.

---

**00E7006A**

**Explanation:** While processing your request, the IMS Attachment Facility could not identify the DB2 subsystem. The DB2 identification must be defined to the IMS control region, the DL/I batch region, and any dependent region accessing the DB2 subsystem.

This abend reason code is issued by the following CSECTs: DSNMSNO0, DSNMERR0

**System Action:** The connection is not established.

**System Programmer Response:** To make the identification to the IMS regions, you must create a subsystem member (SSM) in the IMSVS.PROCLIB library and identify the SSM to the applicable IMS

**00E7006B**

**Explanation:** The CICS or IMS Attachment Facility detected that a shutdown was in progress for the DB2 subsystem while processing your request. This might occur during initial connection processing or during subsequent requests, depending on the type of DB2 shutdown.

This abend reason code is issued by the following CSECTs: DSNCSEX1, DSNMERR0

**System Action:** The connection is not established.

**User Response:** Before you can continue, you must restart the DB2 subsystem. Contact the operator to restart the subsystem, and then resubmit your transaction.

**Operator Response:** Restart the DB2 subsystem.

**00E70081**

**Explanation:** A DROP or ALTER statement was issued but the object cannot be dropped or altered. The object is referenced by a prepared dynamic SQL statement that is currently stored in the prepared statement cache and is in use by an application.

This reason code is issued by the following CSECT: DSNXIDMH

**System Action:** The requested operation is not performed.

**Programmer Response:** The requested operation cannot be performed until there are no applications that reference the object using dynamic SQL. Ensure that other applications have quiesced or performed a commit operation. Then try the request again.

**Problem Determination:** An SQLCODE -904 is issued. The message tokens for that message report the name and type of the object that was being referenced by another application.

**00E70082**

**Explanation:** The user has reached the maximum number of outstanding stored procedures or opened cursors for the current thread.

**System Action:** No additional stored procedures may be invoked, and no more cursors are allowed to be opened.

**Programmer Response:** Applications should close cursors as soon as possible, and should issue COMMIT often to allow the stored procedure result set to be cleared.

**00E7009B**

**Explanation:** An invalid operation has been attempted on an incomplete table that was created in a previous release of DB2. The table definition is incomplete due to a missing unique index on a primary key or unique key.

The following DDL operations are not allowed:
- ALTER TABLE
- CREATE INDEX
- DROP INDEX

**System Action:** DB2 does not process the operation.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** In order to perform the operation on the object, you must use the release of DB2 in which the table was created.

**Problem Determination:** DB2 does not perform the requested operation, and issues SQL code -904. For more information, refer to Part 2, “SQL return codes,” on page 11.

**00E7009C**

**Explanation:** An attempt was made to execute a statement that depends on an unavailable catalog object. The catalog object will be available after the catalog is updated to the necessary level.

**System Action:** The operation is not allowed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** In order to perform the operation, you must update the catalog to the required level. To do this, run install job DSNTIJTC. For more information about this job, see Part 2 of [DB2 Installation Guide]

**Problem Determination:** The requested operation is not performed. SQLCODE -904 and message DSN5011 are issued. For more information, refer to Part 2, “SQL return codes,” on page 11 or to the description of the DSN5011 message in Chapter 18, “DSNT... Messages,” on page 415.

**00E7009D**

**Explanation:** The code level of the DB2 catalog is incompatible with the current code level of:

- A DB2 subsystem that is starting, or
- A datasharing group

**System Action:** DB2 cannot start. Message DSNX208E or DSNX209E is displayed on the system console to describe the problem. An SVC dump is requested for the DSNX208E problem.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Before DB2 can start, each DB2 subsystem must use a level of code
that is compatible with the catalog.

Problem Determination: DB2 does not start.
Message DSNX208 or DSNX209 display a reason code or level information that helps with problem diagnosis.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E7009E

Explanation: The object is dependent on facilities of a release of DB2 that is newer than the release that you are currently running (fall back).

This abend reason code is issued by the following CSECTs:
- DSNXIAIX
- DSNXIATB
- DSNXIATS
- DSNXICIX
- DSNXICTB
- DSNXIDIX
- DSNXIDTB
- DSNXIDTS
- DSNXOCA
- DSNXOLV

System Action: The operation is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: In order to perform the operation on the object, you must use the release of DB2 that supports the new facilities.

Problem Determination: The requested operation is not performed. An SQLCODE -904 and/or message DSNT501I is issued. Message DSNT501I describes which object has the release dependency.

00E7009F

Explanation: An error occurred while loading the catalog DDB during start-up processing.

System Action: If message DSNX204I is issued to the console, DB2 is started ACCESS(MAINT).
Otherwise, the current START command processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of SYS1.LOGREC and the SVC dump. If message DSNX204I was issued to the console, see the description of that message.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Register 2 points to a character string that describes the specific error encountered.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E70100

Explanation: This is an internal RDS error. The SQLWARN0 field does not contain a valid value while determining SQLSTATE field value. SQLWARNx fields are described in Appendix C of DB2 SQL Reference.

This abend reason code is issued by the following CSECTs: DSNXERD, DSNXEEZ

System Action: The application program ABENDs.
Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

---

**00E70105**

Explanation: This is an internal RDS error. One of the SQLWARNx fields does not contain a valid value while determining SQLSTATE field value. SQLWARNx fields are described in Appendix C of DB2 SQL Reference.

This abend reason code is issued by the following CSECTs: DSNXERD, DSNXEEZ

System Action: The application program ABENDs.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5].

---

**00E70106**

Explanation: DB2 received a functional request and encountered an internal authorization error. The function cannot be processed.

System Action: The function is rejected with this reason code. If the request was SQL, then the SQLCODE is -922.

Operator Response: Notify the system programmer.

System Programmer Response: Please call the IBM Support Center to resolve this problem.

---

**00E70110**

Explanation: The commit failed because the application was not connected to the Current Server.

This abend reason code is issued by the following CSECT: DSNXECW

System Action: The reason code or SQLCODE -900 is returned to the application which is in an unconnected state.

User Response: A previous failure has left your application in an unconnected state. Notify the system programmer that a system failure occurred during execution of your application. Any changes made in the last unit of work is rolled back. Re-run your application after determining the state of the Current Server database.

Operator Response: For Communication failure, refer to DSNL5001 message.

System Programmer Response: Diagnose the failure that left the user application in an unconnected state. See “Problem Determination” section below.

Problem Determination: Refer to the previous SQL error in the application.

---

**00E70115**

Explanation: The unit of work was placed in a state where a rollback operation is required. This can happen when an abend occurs during the execution of a stored procedure, a user defined function (UDF), or a restricted SQL operation was issued from a stored procedure.

This item is issued by the following CSECT: DSNXECW.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Correct the stored procedure or UDF, rebind it and resubmit the calling application.

---

**00E70121**

Explanation: User ID, password not valid in an IMS or CICS environment. An SQL CONNECT with user ID, password was issued from an IMS or CICS application.

System Action: The SQL CONNECT request is not processed. The application is placed in the connectable and unconnected state.

---

**00E70122**

Explanation: The user ID or password submitted on a request to CONNECT to the local DB2 exceeded the maximum length supported. The maximum length for each is 8 characters.

System Action: The SQL CONNECT request was not processed. The application is placed in the connectable and unconnected state.

---

**00E70911**

Explanation: The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back. RC00E70911 is the same as the SQLCODE -911. For more information, refer to the SQL return code.

This abend reason code is issued by the following CSECTs: DSNCEXT3, DSNMDR10

System Action: The statement cannot be executed.
The application is rolled back to the previous COMMIT.

**Operator Response:** Notify the system programmer.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [5]

---

**00E70913**

**Explanation:** The application was the victim in a deadlock or experienced a timeout. RC00E70913 is the same as the SQLCODE -913. For information, refer to the SQL return code.

This abend reason code is issued by the following CSECT: DSNXEEZ

**System Action:** The statement cannot be executed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [5]

---

**00E72008**

**Explanation:** The relational data system (RDS) sort subcomponent has determined that there is not enough storage to continue the sort process.

This abend reason code is issued by the following CSECTs:

DSNXSORI DSNXSTS DSNXSTSE DSNXSTSG

**System Action:** The application program abends.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The CT is formatted and a return code with a value of 8 is returned from the sort subcomponent to indicate a resource was unavailable. Check the SYSOUT message file for any errors detected by the sort subcomponent.

---

**00E72018**

**Explanation:** The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

This abend reason code is issued by the following CSECTs:

DSNXSIN DSNXSINE DSNXSING DSNXSMR DSNXSMRE DSNXSMRG DSNXSORI DSNXSSFE DSNXSTM DSNXSTRG DSNXSTS DSNXSTSE DSNXSTSG DSNXSWFM

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested.

**Operator Response:** Notify the system programmer. Provide a print of the SVC dump to the system programmer.

**System Programmer Response:** This is a DB2 internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The sort subcomponent has detected an internal inconsistency. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is an unique decimal code that identifies the error location and error type.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [5]

---

**00E72048**

**Explanation:** The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

This abend reason code is issued by the following CSECT: DSNXSORI

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

**Operator Response:** Notify the system programmer. Provide a print of the SVC dump to the system programmer.

**System Programmer Response:** This is a DB2 internal error. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The sort subcomponent has detected an internal inconsistency. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SPL.
- R3 is an unique decimal code that identifies the error location and error type.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1] [5]
Explanation: The relational data system (RDS) sort subcomponent has detected an internal inconsistency. This abend reason code is issued by the following CSECTs:

DSNXSMR  DSNXSMRE  DSNXSMRG

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator Response: Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The sort subcomponent has detected that the number of unsorted records input to sort did not equal the number of sorted records returned by sort minus the number of records removed from the sort by the evaluation of aggregate functions. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E72068

Explanation: The relational data system (RDS) sort subcomponent has detected an internal inconsistency. This abend reason code is issued by the following CSECTs: DSNXSMR, DSNXSMRG

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator Response: Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The sort subcomponent has detected an internal inconsistency in the merge process. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are: R2 points to the SRTCOMM.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E72088

Explanation: The relational data system (RDS) sort subcomponent has detected an internal inconsistency. This abend reason code is issued by the following CSECTs: DSNXSMIN, DSNXSINE, DSNXSMR, DSNXSMRE, DSNXSMRG, DSNXSORI, DSNXSWFM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

Operator Response: Notify the system programmer. Provide a print of the SVC dump to the system programmer.

System Programmer Response: This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The sort subcomponent has detected an error from the Data Manager. The precise problem can be determined only by analyzing the
abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is an unique decimal code that identifies the error location and error type of the Data Manager request that failed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E72098

**Explanation:** The relational data system (RDS) sort subcomponent has detected an internal inconsistency.

This abend reason code is issued by the following CSECTs:

DSNXSMRE DSNXSORI DSNXPKY DSNXPSNS DSNXSPWF DSNXSTSE

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

**Operator Response:** Notify the system programmer. Provide a print of the SVC dump to the system programmer.

**System Programmer Response:** This is a DB2 internal error. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The sort subcomponent has detected an invalid request for tag sort processing. The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is an unique decimal code that identifies the error location and error type.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E72100

**Explanation:** DB2 detected an internal inconsistency in sort during parallel query processing.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested.

**Operator Response:** Notify the system programmer. Provide a print of the SVC dump to the system programmer.

**System Programmer Response:** This is a DB2 internal error.

**Problem Determination:** Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SRTCOMM.
- R3 is an unique decimal code that identifies the error location and error type.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E72200

**Explanation:** DB2 detected an internal inconsistency in sort during parallel query processing. This is a DB2 internal error.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

**Operator Response:** Notify the system programmer. Provide a print of the SVC dump to the system programmer.

**Problem Determination:** Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The precise problem can be determined only by analyzing the abending module at the point of failure. The register contents at the time of abend are set as follows:

- R2 points to the SPL.
- R3 is an unique decimal code that identifies the error location and error type.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E73001

**Explanation:** The level of z/OS that was required for the SQL statement or DB2 utility is not currently installed. The SQL statement or utility could not be executed.

**System Action:** For a SQL statement, the statement is rejected with SQLCODE -20101 and this reason code. For a utility, the utility is rejected with message
**System Programmer Response:** Refer to the *IBM DATABASE 2 Universal Database for z/OS Program Directory* to determine the minimum level of *z/OS* that is required for the syntax that was used in the statement or utility.

---

**00E73002**

**Explanation:** The SQL statement could not be executed because of a resource unavailable condition. The resource is LE/370.

**System Action:** The SQL statement is rejected with SQLCODE -20101 and this reason code.

**System Programmer Response:** Refer to the system console for preceding errors. Correct the cause of these errors and restart the DB2 subsystem.

---

**00E73003**

**Explanation:** The SQL statement could not be executed because the statement needed a level/feature of *OS/390* that is not installed. DB2 attempted to load a required LE/370 load module and was unable to do so.

**System Action:** The SQL statement is rejected with SQLCODE -20101 and this reason code.

**System Programmer Response:** Refer to the Program Directory to determine the minimum level of *OS/390* that is required for the syntax used in the statement.

---

**00E73004**

**Explanation:** The SQL statement could not be executed because of a resource unavailable condition. The resource was an LE token.

**System Action:** The SQL statement is rejected with SQLCODE -20101 and this reason code.

**System Programmer Response:** Refer to the system console for preceding errors. Confirm that the zparm keyword LEMAX is greater than zero. If the problem is persistent, consider increasing the number of LE tokens that the DB2 subsystem is allowed to create. See the Installation Guide for more information on LE tokens.

---

**00E73005**

**Explanation:** The SQL statement or utility operation could not be completed because a hardware resource is not available.

**System Action:** The SQL statement is rejected with SQLCODE -20107 or the utility issues message DSNT500I and terminates.

**System Programmer Response:** Examine the -20107 or DSNT500I message to identify the type of hardware resource that is not available. Refer to *DB2 Program Directory, G110-8182* to determine the minimum level of hardware support that is needed for the syntax used in the statement or utility.

---

**00E79000**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure. The CALL statement was not accepted because one or more columns of the SYSIBM.SYSROUTINES catalog table for the procedure contains invalid values.

**System Action:** The statement cannot be executed. A DSNX9xx message is displayed on the MVS system console to describe the error that was detected.

**Programmer Response:** Use ALTER PROCEDURE or ALTER FUNCTION to correct the invalid column values in the SYSIBM.SYSROUTINES table.

---

**00E79001**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement was not accepted because the routine was stopped. Possible reasons are:

- the STOP PROCEDURE ACTION(REJECT) command was issued for this procedure, or
- the STOP FUNCTION ACTION(REJECT) command was issued for this user-defined function, or
- there was a previous abnormal termination of the routine.

**System Action:** The statement cannot be executed.

**Programmer Response:** If the user-written routine was stopped by an abnormal termination, correct the cause of the abnormal termination.

Use the -START PROCEDURE command to activate the stored procedure.

Use the -START FUNCTION command to activate the user-defined function.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNX9CCM, DSNX9GPL.

---

**00E79002**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement was not accepted because the procedure could not be scheduled before the installation-defined time limit expired. This can happen for any of the following reasons:

- The DB2 STOP PROCEDURE(name) or STOP FUNCTION SPECIFIC command was in effect. When this command is in effect, a user-written routine
cannot be scheduled until a DB2 START PROCEDURE or START FUNCTION SPECIFIC command is issued.

- The user-written routine could not be assigned to a TCB in the DB2-established stored procedures address space in the required time interval, because all available stored procedure TCBs were in use.
- The DB2-established stored procedures address space dispatching priority is low, resulting in delays when processing stored procedure requests. If the delays become excessive, the TCBs in the stored procedure address space do not become available to process new SQL CALL statements in a timely manner.
- The dispatching priority assigned by WLM to the caller of the user-written routine was low, which resulted in WLM not assigning the request to a TCB in a WLM-established stored procedure address space before the installation-defined time limit expired.
- The WLM application environment is quiesced so WLM will not assign the request to a WLM-established stored procedure address space.
- WLM is being used in compatibility mode, and the needed stored procedure address space has not been started using the MVS START command.

**System Action:** The statement cannot be executed.

**Programmer Response:** If the routine was stopped, use the DB2 -START PROCEDURE or -START FUNCTION command to activate the user-written routine.

If the DB2-established stored procedures address space was to be used, the cause of the timeout condition might be one of the following:

- Stored procedure or user-defined function applications might not be completing. If this occurs, the TCB used to process the stored procedure will not become available to process new stored procedure requests.
- If there are not enough stored procedure TCBs available to meet the volume of requests, increase the number of stored procedure TCBs by changing the value of the NUMTCB keyword in the JCL procedure used to start the DB2 stored procedures address space.

If a WLM-established stored procedures address space was to be used, the cause of the timeout condition might be one of the following:

- If goal mode is being used to manage the number of WLM-established stored procedure address spaces, the dispatching priority assigned to the caller of the stored procedure might be too low. If the work is of low priority, WLM might leave it queued for a longer period of time.
- The WLM application environment is quiesced. Issue MVS WLM DISPLAY APPLENV=wlmenv command to verify the status of the application environment. The MVS WLM VARY APPLENV=wlmenv,RESUME command can be used to activate the environment if it is quiesced.
- If compatibility mode is being used to manage the number of WLM-established stored procedure address spaces, then the problem might be that there are not enough address spaces or enough TCBs running in those address spaces to support the number of user-written routines being invoked. You might need to increase the number of address spaces and TCBs. You might also need to improve the dispatching priority of these address spaces to ensure that they are processing the stored procedure requests quickly enough.

**00E79004**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure. The stored procedure could not be accepted, because the DB2-established stored procedures address space is not active.

The DB2-established stored procedures address is not active for any of the following reasons:

- The DB2 module DSNZPARM specified a blank value for the name of the JCL PROC for the DB2-established stored procedure address space.
- The stored procedures address space was cancelled or intentionally terminated by the system administrator.

**System Action:** The statement cannot be executed.

**Programmer Response:** DB2 automatically starts the DB2 stored procedures address space during DB2 startup, when a nonblank value is specified for the JCL PROC for the DB2-established stored procedures address space in the DB2 module DSNZPARM. If the DB2-established stored procedures addressspace terminates while DB2 is active, you can issue the -START PROCEDURE(*) command to restart it.

**Problem Determination:** This reason code is issued by the following CSECTs: DSNX9CAL, DSNX9GPL.

---

**00E79006**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function. The statement cannot be honored, because the user-written routine’s load module is not compatible with Language Environment preinitialization environment.
00E79007

Explanation: An attempt to call a DB2 stored procedure or UDF invocation failed because the host language specified in the LANGUAGE clause of CREATE PROCEDURE or CREATE FUNCTION did not match the language reported by LE/370.

System Action: The SQL statement is rejected with SQLCODE -471 and this reason code.

System Programmer Response: Use the ALTER FUNCTION or ALTER PROCEDURE statement to correct the LANGUAGE attribute specified for the user-defined function or procedure.

00E79008

Explanation: The SQL CALL statement could not be processed. The SECURITY attribute of the user-defined function or procedure requested that a specific security environment be established. An error occurred while attempting to establish this security environment.

System Action: The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

System Programmer Response: Additional error messages might have been generated by the external security product to describe the error. Use the ALTER FUNCTION or ALTER PROCEDURE statement to modify the SECURITY attribute specified for the user-defined function or procedure.

00E7900B

Explanation: The SQL CALL statement could not be processed. DB2 determined that the user-defined function or procedure was to be run in a specific WLM-established address space, but the necessary WLM services are not available.

The user-defined function or procedure specified a non-blank WLM ENVIRONMENT attribute.

System Action: The SQL CALL statement is rejected with SQLCODE -471 and this reason code.

Programmer Response: Use the ALTER FUNCTION or ALTER PROCEDURE statement to modify the WLM ENVIRONMENT attribute specified for the user-defined function or procedure, or specify the NO WLM ENVIRONMENT clause.

System Programmer Response: Issue the START FUNCTION SPECIFIC or START PROCEDURE command to allow the altered user-defined function or procedure to be called.

00E7900C

Explanation: SQL CALL statement or user-defined function invocation could not be processed. The WLM application environment name specified for the user-written routine is not defined or is currently not available for DB2 use in the active WLM policy.

System Action: The SQL statement is rejected with SQLCODE -471 and this reason code.

Programmer Response: Use the -ALTER PROCEDURE or -ALTER FUNCTION command to update the WLM ENVIRONMENT to specify an application environment that is defined and active in the active WLM policy, or update the WLM policy to contain a valid application environment name.

If the WLM policy definition is updated, use the MVS WLM VARY command to activate this new definition.

If the WLM application environment is quiesced, use the MVS WLM VARY APPLENV- applev, RESUME command to activate the application environment.

00E7900E

Explanation: SQL CALL statement or user-defined function invocation could not be processed. The routine was invoked by another stored procedure or user-defined function which had the opposite characteristic of being WLM-managed or DB2-managed from this routine. Nesting is not allowed between DB2-managed stored procedures and WLM-managed stored procedures or user-defined functions.

System Action: The SQL statement is rejected with SQLCODE -471 and this reason code.

Programmer Response: Use the ALTER
PROCEDURE command to change the attribute to NO WLM ENVIRONMENT, or alter the invoking routine to not invoke this one.

**00E7900F**

**Explanation:** Insufficient storage space available for the parameter list to a user-defined function or stored procedure. This error is caused by a single parameter or a group of parameters requiring more contiguous storage than DB2 can obtain.

**System Action:** The SQL statement is rejected with SQLCODE -904 and this reason code.

**Programmer Response:** Validate the length of each parameter.

If LOBs are being used, consider using LOB locators instead.

**00E79010**

**Explanation:** DB2 received an SQL CALL statement for a stored procedure. The CALL statement was not accepted because one or more columns of the SYSIBM.SYSROUTINES catalog table for the procedure contains invalid values. The value of the column was valid in a prior release of DB2, but is invalid in this release of DB2.

Possible reasons for this include a LANGUAGE column with value COMPJAVA.

**System Action:** The statement cannot be performed. SQL code -471 is returned on the SQL CALL statement with this reason code.

**Programmer Response:** Use ALTER PROCEDURE to correct the invalid column in the SYSIBM.SYSROUTINES catalog table.

To migrate a LANGUAGE COMPJAVA stored procedure to LANGUAGE JAVA, use the following procedure:

1. Ensure that you have a WLM application environment that has been set up to run LANGUAGE JAVA.

2. Put the .class file containing the stored procedure code into a directory that is identified in CLASSPATH in the JAVAENV for your LANGUAGE JAVA WLM application environment. Alternatively, you may put the .class file into a Java JAR file and invoke the SQLJ.INSTALL_JAR built-in stored procedure.

3. Issue an ALTER PROCEDURE command against the stored procedure that specifies LANGUAGE JAVA and WLM ENVIRONMENT java applenv.

**00E79100**

**Explanation:** An internal DB2 error was encountered while processing a stored procedure request.

This abend reason code is issued by the following CSECTs:

DSNX9SER DSNX9STP DSNX9TEX DSNX9WTO.

**System Action:** The task encountering the error is abended.

**User Response:** Notify the system programmer.

**System Programmer Response:** This is a DB2 internal error.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**00E79101**

**Explanation:** DB2 received an unexpected return code from a WLM service.

**System Action:** A record is written to SYS1.LOGREC and an SVC dump is requested. The application program abends.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSNX9CAL, DSNX9MON

**00E79102**

**Explanation:** An error occurred while attempting a Java Native Interface function to invoke a Java stored procedure.

**System Action:** The SQL CALL statement fails with SQL code -471 and reason code 00E79102.

**Programmer Response:** Check the operator console for message DSNX961I. This message contains information about the Java error.

**00E79106**

**Explanation:** DB2 could not process an SQL CALL statement for a REXX stored procedure. There were errors associated in setting up an environment to run a REXX stored procedure. See the system console for the
associated DSNX993I message.

**System Action:** The SQL statement fails with this reason code and SQL code -471.

**Programmer Response:** Use the information provided in the DSNX993I message, and the TSO and REXX messages in ddname SYSTSPRT for diagnosis. You can find TSO and REXX message explanations in z/OS TSO/E Messages and z/OS TSO/E REXX Reference.

---

**00E79107**

**Explanation:** DB2 tried to load the Java class that is specified by SQLCODE -471 to execute a Java stored procedure. The class was not found.

**System Action:** The SQL CALL statement fails with SQLCODE -471 and this reason code.

**Programmer Response:** The third error token in the SQLERRMC field of the SQLCA for SQLCODE -471 contains the class name that was not found. The startup procedure for the stored procedure address space in which the stored procedure runs contains a JAVAENV DD statement that points to a data set. That data set must contain a CLASSPATH variable that includes the path that contains the class name for the stored procedure. The CLASSPATH variable must also include all classes that are referenced by the stored procedure class.

---

**00E79108**

**Explanation:** DB2 tried to load the Java method that is specified by SQLCODE -471 to execute a Java stored procedure. The method was not found.

**System Action:** The SQL CALL statement fails with SQLCODE -471 and this reason code.

**Programmer Response:** The third error token in the SQLERRMC field of the SQLCA for SQLCODE -471 contains the user-specified method name and the DB2-generated signature for the method that was not found. If the signature is too long to fit in the SQLERRMC field, the signature is truncated. Left bracket ([) characters in the signature display as less than (<) characters.

If the first error token in the SQLERRMC field contains the string 'main signature', the method for the stored procedure is a main method, and the stored procedure definition includes parameters with data types other than character data types.

Ensure that the SQL data types of the parameters in the stored procedure procedure definition map to the parameters in the Java method to be invoked.

In z/OS UNIX System Services, run the command `javap -s -private` on the .class file that was used to generate the Java DLL for the stored procedure. The signature of the Java method needs to match the command output.

---

**00E79109**

**Explanation:** A routine was defined to run in a WLM application environment that was not set up correctly for the language that was specified.

Java routines must be run in a WLM application environment that has been set up to run Java routines. This application environment cannot be used to run non-Java routines.

**System Action:** The SQL CALL statement SQLCODE -471 and this reason code.

**Programmer Response:** Contact the system programmer

**System Programmer Response:** Use the ALTER PROCEDURE statement if you need to change the WLM application environment.

To set up a WLM application environment to run LANGUAGE JAVA routines, add a JAVAENV DD statement to the startup procedure for the stored procedure address space. The JAVAENV DD statement specifies a data set that contains environment variables for running Java routines.

---

**00E79200**

**Explanation:** A Control Center 390 stored procedure encountered an unexpected abnormal termination or error condition.

**System Action:** The Control Center 390 stored procedure terminates, and returns a failing return code to the calling application. The Control Center 390 stored procedure retries from the abnormal termination, so DB2 will not detect that the stored procedure has abnormally terminated. The count of abnormal terminations maintained by DB2 will not be incremented for this abnormal termination.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in Control Center 390, contact IBM support.

**Problem Determination:** The error is recorded on SYS1.LOGREC, and an SVC dump is requested.
# Chapter 53. X’E8……’ codes

## 00E80001

**Explanation:** A required parameter was not passed via the MVS MGCR service which started the DB2 address space. The parameter must be the address of SCOM for the system services address space or the address on an ASCE for the database services address space or the distributed data facility address space.

This abend reason code is issued by the following CSECT: DSNYASCP

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the parameter value in error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5 8]

## 00E80002

**Explanation:** The DB2 subsystem services address space was not started by a valid subsystem or an error occurred during MVS IEFSSREQ processing.

This abend reason code is issued by the following CSECT: DSNYASCP

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of an 8-byte field that contains the following diagnostic information: bytes 1 through 4, the subsystem name; bytes 5 through 8, the contents of register 15 that contains the return code set by the MVS IEFSSREQ macro.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5 8]

## 00E80003

**Explanation:** An unsupported pending function request was detected during processing in the system services address space.

This abend reason code is issued by the following CSECT: DSNYASCP

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the pending function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]

## 00E80004

**Explanation:** An error occurred when a POST was issued from a resource manager address space to the system services address space in order to indicate that the DB2 subsystem startup function completed successfully.

This abend reason code is issued by the following CSECT: DSNYASCP

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** The system services address space might be abnormally terminating.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]
00E80005

**Explanation:** An error occurred when a POST was issued from a resource manager address space to the system services address space in order to indicate that the allied authorization function completed successfully.

This abend reason code is issued by the following CSECT: DSNYASCN

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Probable cause is that the system services address space is abnormally terminating.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E80006

**Explanation:** An unsupported pending function request was detected during processing in the resource manager address space.

This abend reason code is issued by the following CSECT: DSNYASCN

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E8000E

**Explanation:** MVS was unable to establish an ESTAE for the DB2 address space control task.

This abend reason code is issued by the following CSECT: DSNYASCN

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E80012

Explanation: An error occurred when a POST was issued from the system services address space to a resource manager address space in order to indicate the results of the MGCR invocation.

This abend reason code is issued by the following CSECT: DSNYASTR

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: The resource manager address space might be abnormally terminating.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E80013

Explanation: MVS was unable to create a resource manager address space.

This abend reason code is issued by the following CSECT: DSNYASTP

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E80031

Explanation: An unsupported input parameter was detected for allied address space initialization.

This abend reason code is issued by the following CSECT: DSNYALLI

System Action: The caller’s task is abended.

Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

00E80032

Explanation: An unsupported input parameter was detected for allied address space termination.

This abend reason code is issued by the following CSECT: DSNYALLI

System Action: The caller’s task is abended.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the parameter value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

00E80033

Explanation: This reason code accompanies a X'04F' system abend code. This module detected that the DB2 subsystem was terminating. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347.

This abend reason code is issued by the following CSECT: DSNYALLI

System Action: The caller’s task is abended with code X'04F'.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

00E8003E

Explanation: MVS was unable to establish an ESTAE in an address space about to be initialized as a DB2 allied address space.
This abend reason code is issued by the following CSECT: DSNYALLI

**System Action:** The caller’s task is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E8003F**

**Explanation:** An unsupported function request was detected by the allied address space control function.

This abend reason code is issued by the following CSECT: DSNYALLI

**System Action:** The caller’s task is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the function value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00E80041**

**Explanation:** An error occurred when a POST was issued from an allied address space to the system services address space in order to indicate a pending allied authorization request.

This abend reason code is issued by the following CSECT: DSNYAUTH

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the
address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E80051

Explanation: An error was detected in the command that was used to start the DB2 subsystem. There are two conditions that can cause this error. If the -START DB2 command is in error, this abend results.

Secondly, if the DB2 subsystem is not running (had never been started, or had been stopped), any DB2 command that is entered is interpreted as being a -START DB2 command. In this second case, the subsystem starts just long enough to discover that the command actually is not a -START DB2 command and then issues the abend.

This abend reason code is issued by the following CSECT: DSNYSTRT

System Action: The DB2 subsystem is terminated.

Operator Response: Reenter the command if it was entered in error; otherwise advise the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

This error does not cause a SYS1.LOGREC record to be written or an SVC dump to be requested. A diagnostic tool (for example, MVS SLIP) is required to get subcomponent diagnostic information.

Problem Determination: Register 9 contains the address of a 12-byte field that contains the following diagnostic information: bytes 1 through 4, the address of the buffer that contains the command used to start DB2; bytes 5 through 8, the general command processor return code; bytes 9 through 12, the IPC command processor return code, or 'FFFFFFFF' if bytes 5 through 8 contain a positive value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E80052

Explanation: A resource manager provided notification of failure during facility startup notification processing.

This abend reason code is issued by the following CSECT: DSNYSTRT

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested DB2 subsystem termination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E80053

Explanation: A resource manager provided notification of failure during release work notification processing.

This abend reason code is issued by the following CSECT: DSNYSTRT

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested DB2 subsystem termination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E80054

Explanation: The recovery manager (RM) subcomponent provided notification of an error during restart recovery processing.

This abend reason code is issued by the following CSECT: DSNYSTRT

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide
**00E80057**

**Explanation:** An error occurred while trying to start a DB2 resource manager address space. A possible cause of this problem would be a JCL error in a start up procedure. Note that the error is probably not in the address space that issued this abend.

This abend reason code is issued by the following CSECT: DSNYSTRT

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 3 4 5.

---

**00E80058**

**Explanation:** The version of DB2 that you are attempting to start is not compatible with this version of MVS. This version of DB2 requires a z/Architecture processor running z/OS V1R3 or above.

**System Action:** The DB2 subsystem is not started.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Change the DB2 start-up procedures to use a version of DB2 that is compatible with the version of MVS that you are using.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

---

**00E80059**

**Explanation:** The recovery manager (RM) subcomponent detected an error during DB2 checkpoint processing.

This abend reason code is issued by the following CSECT: DSNYSTRT

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 3 5.

---

**00E80056**

**Explanation:** During startup, DB2 was unable to access DSN6FAC in ZPARMS and therefore was unable to determine whether the distributed data facility was to be loaded.

This abend reason code is issued by the following CSECT: DSNYSTRT

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Assemble DSN6FAC and re-link-edit the DSNZPARM load module.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 1 2 3 5.

---

**and Reference** for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the return code from the recovery manager subcomponent.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 2 3 5.

---

**00E80055**

**Explanation:** The recovery manager (RM) subcomponent detected an error during DB2 checkpoint processing.

This abend reason code is issued by the following CSECT: DSNYSTRT

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the return code from the recovery manager subcomponent.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349: 2 3 5.
Problem Determination: Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E80061

Explanation: A resource manager initialization table (RMIT) that has an invalid format was detected.

This abend reason code is issued by the following CSECT: DSNYSDLB

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of an 8-byte field that contains the name of the load module in which the invalid resource manager initialization table (RMIT) format exists.

Probable cause is that the load module does not contain an RMIT or, the linkage editor entry control statement does not specify the RMIT as the module entry point.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E80081

Explanation: An invalid initialization load module list (ILML) was detected.

This abend reason code is issued by the following CSECT: DSNYSIRM

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of an 8-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

00E8007F

Explanation: An unsupported function request was detected by the application program call parameter management function.

This abend reason code is issued by the following CSECT: DSNYSPCB

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00E80084
Explanation: A resource manager provided notification of failure during subsystem startup notification processing.

This abend reason code is issued by the following CSECT: DSNYSIRM

System Action: The DB2 subsystem is terminated.
Operator Response: Verify that you entered the -START DB2 command using the correct DSNZPARM initialization parameter module. If it was not, reenter the command with the correct DSNZPARM module. Otherwise, notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested DB2 subsystem termination.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349 [2 3 5 9 16 19]

00E8008F
Explanation: An unsupported function request was detected by the resource manager initialization function.

This abend reason code is issued by the following CSECT: DSNYSIRM

System Action: The DB2 subsystem is terminated.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E80091
Explanation: An error occurred when a POST was issued from the control address space to a resource manager address space in order to indicate that DB2 shutdown is to be initiated for that address space.

This abend reason code is issued by the following CSECT: DSNYSTOP

System Action: The DB2 subsystem is terminated.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: The resource manager address space might be abnormally terminating.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E8009F
Explanation: An unsupported function request was detected by the DB2 subsystem shutdown control function.

This abend reason code is issued by the following CSECT: DSNYSTOP

System Action: The DB2 subsystem is terminated.
Operator Response: Notify the system programmer.
System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349 [2 3 5]

00E800AF
Explanation: An unsupported function request was detected by the resource manager termination function.

This abend reason code is issued by the following CSECT: DSNYSTRM
**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

---

**00E800B1**

**Explanation:** A service task could not be created during processing of the -STOP DB2 command.

This abend reason code is issued by the following CSECT: DSNYSCMD

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the return code from the create-service task function of the agent services manager (ASM) subcomponent.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

---

**00E800CE**

**Explanation:** MVS was unable to establish an ESTAE for the stop-work notification function.

This abend reason code is issued by the following CSECT: DSNYSTPW

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

---

**00E800D1**

**Explanation:** A resource manager provided notification of failure during local memory-create notification processing.

This abend reason code is issued by the following CSECT: DSNYAGCS

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the RMID of the resource manager that requested DB2 subsystem termination.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].

---

**00E800D2**

**Explanation:** An error was encountered while attempting to obtain the MVS LOCAL lock.

This abend reason code is issued by the following CSECT: DSNYAGCS

**System Action:** The DB2 subsystem is terminated.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 3 5].
00E800D3

**Explanation:** An error was encountered while attempting to release the MVS LOCAL lock.

This abend reason code is issued by the following CSECT: DSNYAGCS

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** The DB2 subsystem is unable to determine the cause of the error.

**Problem Determination:** The subcomponent that caused the error is unknown. Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E8011D

**Explanation:** An unrecovered resource (for example, a latch) was detected for a must-complete function.

This abend reason code is issued by the following CSECT: DSNYEATE

**System Action:** Termination of DB2 subsystem is initiated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E80100

**Explanation:** The DB2 subsystem was abended because the DB2 address space control task ESTAE was entered. This reason code is issued for all abend completion codes, except for the X'04E' abend completion code.

This abend reason code is issued by the following CSECT: DSNYECTE

**System Action:** Termination of the DB2 subsystem is initiated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** The allied address space task primary ESTAE detected that MVS was unable to establish the secondary ESTAE.

This abend reason code is issued by the following CSECT: DSNYEATE

**System Action:** Abnormal termination of allied address space is continued.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](https://www.ibm.com) for information on identifying and reporting the problem.
error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: 

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E8011F

Explanation: 
The allied address space task primary ESTAE was entered without a subsystem diagnostic work area (SDWA) provided by MVS.

This abend reason code is issued by the following CSECT: DSNYEATE

System Action: 
Abnormal termination of the allied address space is continued.

Operator Response: 
Notify the system programmer.

System Programmer Response: 
If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: 
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E8012D

Explanation: 
The allied address space task secondary ESTAE detected an unrecovered resource (for example, a latch) for a 'must complete' function.

This abend reason code is issued by the following CSECT: DSNYESCF

System Action: 
Abnormal termination of DB2 subsystem is initiated.

Operator Response: 
Notify the system programmer.

System Programmer Response: 
If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

Problem Determination: 
Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Appendix

**00E80140**

**Explanation:** The ESTAE that protects the stop work notification function was entered.

This abend reason code is issued by the following CSECT: DSNYESWE

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Refer to Appendix A, “CICS Transaction Abend/Dump Code,” on page 1347 for information on X’04F’ and X’04E’ abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

| 2 | 3 | 5 |

---

**00E80150**

**Explanation:** An initialization entry point list having an invalid format was detected.

This abend reason code is issued by the following CSECT: DSNYEMCL

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 12-byte field that contains the following diagnostic information: bytes 1 through 8, the name of the load module that contains the initialization entry point list with the invalid entry; bytes 9 through 12, and the entry number of the initialization entry point list.

Probable cause is that the initialization entry point list entry defines an invalid module entry point or defines a valid entry point for a module that has not been included in the loaded module.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

| 2 | 3 | 5 |

---

**00E8015F**

**Explanation:** An unsupported function request was detected by the module entry point list (MEPL) management function.

This abend reason code is issued by the following CSECT: DSNYEMCL

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA).

**Problem Determination:** Register 9 contains the address of a 4-byte field that contains the function request value.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

| 2 | 3 | 5 |
00E80160

Explanation: During DB2 startup processing, the Initialization Procedures subcomponent detected a load module with an invalid AMODE or RMODE attribute. The abend is preceded by message DSNY006I or by DSNY007I.

This abend reason code is issued by the following CSECTs:
DSNYASCP DSNYASTR DSYSIRM DSNYSTRT

System Action: Subsystem startup is terminated.

Operator Response: See message DSNY006I or message DSNY007I.

System Programmer Response: The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

See message DSNY006I or message DSNY007I.

Problem Determination: See message DSNY006I or message DSNY007I.

00E80161

Explanation: During DB2 subsystem startup processing, the Initialization Procedures subcomponent detected a load module that was not at the same version of DB2 as the subsystem being started.

This abend reason code is issued by the following CSECT: DSNYASCP

System Action: Subsystem startup is terminated.

Operator Response: See message DSNY010I.

System Programmer Response: The recovery routine for the CSECT issuing this reason code records information in the variable recording area (VRA). If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

See message DSNY010I.

Problem Determination: See message DSNY010I.

00E80170

Explanation: You requested a facility that was not loaded or started at the time DB2 started. Whether or not to load or start a facility is contained in the DSN6FAC member in ZPARMS.

This reason code is returned to the calling CSECTs by DSNYNFAC along with a return code of 8.

This is not an error in DSNYNFAC. If an error exists, it might be in the calling CSECT or in the DSN6FAC member in ZPARMS.

System Action: This is determined by the caller of DSNYNFAC.

Operator Response: Notify the system programmer.

System Programmer Response: If it can be determined that DSN6FAC is in error, assemble DSN6FAC with corrections and re-link-edit the DSNZPARM load module.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349:
Chapter 54. X’E9......’ codes

00E90101

Explanation: This reason code is issued when a DB2 directory cannot be opened. This is probably a DB2 subsystem error.

This abend reason code is issued by the module identified in the SYS1.LOGREC entry for this abend code.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a print of SYS1.LOGREC and the SVC dump.

Problem Determination: This abend results when any one of a number of DB2 internal directories cannot be opened. One customer-usable directory can also cause this abend if it cannot be opened. This is the DSNZPARM directory that is established at installation.

This directory may have a name different from that specified at installation, because the customer has the option of changing the name during installation. Ensure that the DSNZPARM directory (or its equivalent) is available to be opened.

If the DSNZPARM directory (or its equivalent) is available, the problem is a DB2 subsystem problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend is intercepted by an FRR or ESTAE for the subcomponent or module that issued the DSNZOPEN request. The module containing the abended request is identified in the SYS1.LOGREC entry. This information may be useful in communicating with IBM about the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E90201

Explanation: An incorrect parameter was encountered. This reason code is issued by module DSNZTGET in response to a DSNZGDE request. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSNZTGET

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a print of SYS1.LOGREC and the SVC dump.

Problem Determination: Locate the caller’s save area by examining register 13 in the SYS1.LOGREC register save area. Registers 0 and 1 in the caller’s save area identify the incorrect parameter(s).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E90202

Explanation: An error was found in the directory control information for a DB2 directory. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSNZTGET

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a print of SYS1.LOGREC and the SVC dump.

Problem Determination: This abend results when incorrect control information is found for any one of a number of DB2 internal directories. One customer-usable directory can also cause this abend. This is the DSNZPARM directory that is established during installation.

This directory may have a name different from that specified at installation, because the customer has the option of changing the name during installation. Ensure that the DSNZPARM directory (or its equivalent) is available.

If the DSNZPARM directory (or its equivalent) is available, the problem is a DB2 subsystem problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00E90203

Explanation: An error was found in the descriptor control information for a DB2 directory. This is probably a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSNZTGET

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.
System Programmer Response: Obtain a print of SYS1.LOGREC and the SVC dump.

Problem Determination: This abend results when the descriptor control information is incorrect for any one of a number of DB2 directories. One customer usable directory can also cause this abend. This is the DSNZPARM directory that is established at installation.

This directory may have a name different from that specified at installation, because you have the option of changing the name during installation. Ensure that the DSNZPARM directory (or its equivalent) is available.

If the DSNZPARM directory (or its equivalent) is available, the problem is a DB2 subsystem problem. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

System Programmer Response: Obtain a print of SYS1.LOGREC and the SVC dump.

Explanation: An error occurred while DB2 was attempting to create a service task during -SET SYSPARM command processing.

System Action: A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer. Collect the following materials listed in Appendix B, “Problem determination,” on page 1349:

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Explanation: A failure occurred when DB2 processed the -SET SYSPARM command. This error can be caused by inconsistent data or an internal error in DB2.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer. Collect the following materials listed in Appendix B, “Problem determination,” on page 1349:

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Explanation: DB2 has detected an error while processing the -SET SYSPARM command.

System Action: A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit abends.

Operator Response: Notify the system programmer. Collect the following materials listed in Appendix B, “Problem determination,” on page 1349:

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Chapter 55. X’F1……’ codes

The DSN1LOGP service aid can abend with user abend code X'099'. You can find the corresponding abend reason code in register 15 at the time of error.

00F1000

Explanation: An internal error has been detected in the DSN1LOGP service aid.

Operator Response: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

00F10101

Explanation: The stand-alone log read function returned an invalid RBA. See the explanation for message DSN1211E.

Operator Response: If you determine that the data set is a log data set and it is not damaged, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
Chapter 56. X'F3......’ codes

Many of the following abend reason codes are returned in register 15 at the time of an X'0Cx' system abend and not as the reason code for an X'04E’ abend. This is indicated in the descriptions that follow.

00F30001
Explanation: This reason code may be returned to subsystem-type recovery coordinators when they connect to DB2 or during processing of indoubt threads to inform the coordinator that further recovery coordination actions are required.
This reason code is not normally visible to users or operators, but may appear in DB2 traces.
This reason code is issued by the following CSECTs:
  DSN3ID30    DSN3IA0    DSN3IS0

System Action: Processing continues.

00F30002
Explanation: The requested DB2 subsystem, as specified by the subsystem name, is not active. The option to notify the requester, either via an ECB post or a SEND/MODIFY MVS command, is accepted.
This reason code is issued by the following CSECT:
  DSN3CL0X

System Action: The request to notify the caller when the subsystem is active is queued for processing during subsystem startup.
User Response: Retry the connection request after DB2 has been started.

00F30003
Explanation: An abend has occurred during an attempt to access or modify the caller-provided function request block (FRB) while executing in the caller’s PSW key.
This abend reason code is issued by the following CSECTs:
  DSNAPRH    DSNAPRX    DSN3CL0X    DSN3ID00

System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: See Problem Determination.
Problem Determination: This reason code is placed in register 15 during any access to an attachment-provided function request block (FRB). A subsequent X'0Cx' abend indicates an FRB addressability problem. This abend is probably the result of a logic error in the attachment facility.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5] 49.

00F30004
Explanation: An abend has occurred during an attempt to access the attachment-provided parameter list while executing in the caller’s PSW key.
This abend reason code is issued by the following CSECTs:
  DSNAPRH    DSNAPRX    DSN3CL0X    DSN3CT30
  DSN3CT80    DSN3EXT0    DSN3ID00    DSN3ID30
  DSN3ID80    DSN3PR00    DSN3IA0    DSN3SI30
  DSN3SI80    DSN3TR00

System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: See Problem Determination.
Problem Determination: This reason code is placed in register 15 during any access to an attachment-provided parameter list. A subsequent X'0Cx' abend indicates a parameter addressability problem.
This abend is probably the result of a logic error in the attachment facility. For call attachment users, the abend may have been caused by a bad parameter address passed to call attachment.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5] 49.

00F30005
Explanation: An error was detected during processing of a request to establish or delete a ‘termination ECB’. Either a parameter value was incorrect or an abend occurred while accessing the attachment-provided parameter list.
This reason code is issued by the following CSECT:
  DSN3EXT0
System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: See Problem Determination.

Problem Determination: For the nonabend case, either the ECB address was zero or the Request Code was not 'Establish' or 'Delete'. If the reason code is in register 15 on an abend, either the parameter list or a parameter value was not addressable in the caller's PSW key.

The error may be the result of an internal error in the attachment facility. Call attachment users should check that the supplied ECB address is not zero and that it is addressable in their PSW key.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30006
Explanation: A failure occurred while processing the 'Subsystem Name' during connection processing. In the abend case, connection processing failed when accessing the 'Subsystem Name' in the caller's PSW key. In the nonabend case, MVS was unable to locate a DB2 subsystem with the specified name.

This reason code is issued by the following CSECT: DSN3ID00

System Action: The request is not processed.
User Response: A dump should be taken in your recovery routine for abend analysis. If the named subsystem could not be found, verify that the correct subsystem name was specified. Call attachment users should note that the Translate function cannot be invoked for this reason code.
System Programmer Response: See Problem Determination.

Problem Determination: If the named subsystem could not be found, scan the MVS system log to verify that it was initialized during MVS IPL processing.

If this reason code was specified in register 15 on an abend, check that the subsystem name value is addressable in the caller's PSW key.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30007
Explanation: A failure occurred while processing the 'Connection Type' parameter during connection processing. Either the 'Connection Type' value was invalid or an abend occurred accessing the parameter using the caller's PSW key.

This reason code is issued by the following CSECTs: DSN3CL0X, DSN3ID30.

System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: See Problem Determination.

Problem Determination: For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. This failure may be due to a logic error in the attachment facility. Call attachment users should verify that the Startup ECB address is nonzero and that the ECB word is addressable in their PSW key.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30008
Explanation: A failure occurred while processing the 'Notify Message/Startup ECB' parameter during connection processing. An abend occurs while accessing the parameter or while verifying that the ECB word was addressable in the caller's PSW key. In the nonabend case, either the parameter had a zero length or the supplied ECB address was zero.

This reason code is issued by the following CSECT: DSN3CL0X

System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: See Problem Determination.

Problem Determination: For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. The failure may be due to a logic error in the attachment facility. Call attachment users should verify that the Startup ECB address is nonzero and that the ECB word is addressable in their PSW key.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30009
Explanation: A request was received to establish a termination ECB, but a termination ECB had already been established for the connected task.

This reason code is issued by the following CSECT: DSN3EXT0

System Action: The request is not processed.
**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** Obtain all dumps taken by the attachment facility or invoking application.

**Problem Determination:** This failure is probably the result of a logic error in the attachment facility.

---

**00F30010**

**Explanation:** A request was received to delete a termination ECB, but a termination ECB has not been established for the connected task. This reason code is issued by the following CSECT: DSN3EXT0

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** Obtain all dumps taken by the attachment facility or invoking application.

**Problem Determination:** This failure is probably the result of a logic error in the attachment facility.

---

**00F30011**

**Explanation:** A connection or other work request was received, but the designated DB2 subsystem is not active. If the request was to connect to the subsystem, and the Notify Message/Startup ECB was supplied, it was not accepted.

In some instances, this code may be reported if the application program issued an RRS/IDENTIFY function request and RRS/MVS was not available.

**System Action:** The request is not processed.

**User Response:** If the failure occurred on a connection request and a Notify Message/Startup ECB was provided, a dump should be taken for problem analysis. Reconnect to DB2 when the subsystem is active again.

If RRS/MVS was not available for an RRS/IDENTITY request, ensure RRS/MVS is active and retry the request.

**System Programmer Response:** Obtain all dumps taken by the attachment facility or invoking application.

**Problem Determination:** The Notify Message or Startup ECB could not be accepted for one of two reasons.

- Storage for a buffer could not be obtained, or
- The length of the Message/ECB parameter was zero.

In the latter case, the attachment facility is probably in error. If insufficient storage was available for a buffer, the size of the CSA in 24-bit storage should be increased.

---

**00F30012**

**Explanation:** The requested DB2 subsystem, as specified by the subsystem name, is not active. The option to notify the requester, either via an ECB post or a SEND/MODIFY MVS command, is accepted, but overlays a previous Notify Message/Startup ECB request.

This reason code is issued by the following CSECT: DSN3CL0X

**System Action:** The request to notify the caller when the subsystem is active is queued for processing during subsystem startup.

**User Response:** Retry the connection request after DB2 has been started.

---

**00F30013**

**Explanation:** The requester is not authorized to connect to this DB2 subsystem. This condition might indicate an attempted security violation.

This reason code is issued by the following CSECT: DSN3AUCN

**System Action:** The connection request is denied.

**User Response:** Verify that you have specified the correct RACF authorization ID. If necessary, request authorization to access the DB2 subsystem from your security administrator.

**System Programmer Response:** Examine the console/SYSLOG output for RACF messages issued when a request is denied. Refer the user to your security administrator if the user should be granted authorization to a DB2 subsystem. Refer to Part 3 (Volume 1) of *DB2 Administration Guide* for examples of how to authorize users to specific DB2 subsystems.

**Problem Determination:** During TCB connection processing, Subsystem Support invokes the RACROUTE service (causing a RACF RACHECK) to verify the authorization ID associated with the requester. If the RACF return code indicates the requester is not authorized to connect to this DB2 subsystem, the connection request is terminated with this reason code.

---

**00F30014**

**Explanation:** The requester of a Subsystem Support function (for example, ABORT) for a connection is not in the same PSW key as when the connection was created.

This abend reason code is issued by the following CSECTs:
System Action: The requester’s task is abended with code X’04E’.

User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: This failure may be the result of a logic error in the attachment facility or an intentional attempt to violate DB2 connection protocols. The error should be evaluated in the same way as a system X’0C2’ abend, an attempt by a nonprivileged program to perform privileged operations.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349:

00F30015

Explanation: The attachment facility specified an invalid combination of values for FRBRALE and FRBQUAL. No Program Request Handler exists to service the call.

This reason code is issued by the following CSECT: DSNAPRHX

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: Obtain all dumps taken by the attachment facility and requesting application.

Problem Determination: Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. FRBRALE contains the invalid value that was passed. The value passed is not consistent with the resources allocated to the connected application.

If the plan name contains blanks, an SQL call is invalid. The requester should respecify the plan name and issue the request again.

00F30017

Explanation: The attachment facility specified an invalid FRBQUAL value. The value is outside the limits of those supported for the requesting connection.

This reason code is issued by the following CSECT: DSNAPRHX

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: Obtain all dumps taken by the attachment facility and requesting application.

Problem Determination: Register 1 contains a pointer to the FRB at the entry to DSNAPRHX. FRBQUAL contains the invalid value that was passed. The value passed is not consistent with the resources allocated to the connected application.

00F30018

Explanation: The requester’s TCB is not connected to this instance of the DB2 subsystem. The TCB may have been connected to a previous instance.

This reason code is issued by the following CSECT: DSNAPRHX

System Action: The request is not processed.

User Response: Request a new connection to DB2.

System Programmer Response: See Problem Determination.

Problem Determination: This error can occur for one of the following reasons:

- The DB2 subsystem has terminated and the connected application issues a DB2 work request without reestablishing the connection after the subsystem is restarted.
- The connection has been terminated by a CANCEL THREAD command.
Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00F30019

Explanation: The requester’s primary ASID (PASID) is not equal to the home ASID (PSAAOLD).

This reason code is issued by the following CSECT: DSNAPRHX

System Action: The request is not processed.

User Response: You may want to take a dump for problem analysis. The request may be retried, but first ensure the CPU is not in cross-memory mode.

System Programmer Response: See Problem Determination.

Problem Determination: No requester of a DB2 attachment facility may be in cross-memory mode. That is, PASID must equal HASID, which must equal SASID.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00F30020

Explanation: An error was detected while processing the ‘Commit Option’ on a SSAM termination request. Either the value of the ‘Commit Option’ parameter was not valid or an abend occurred when accessing the parameter.

This abend reason code is issued by the following CSECTs:

DSN3ID80  DSN3S180  DSN3TR00

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The failure may be the result of a logic error in the attachment facility. Call Attachment users should note that only ‘SYNC’ and ‘ABRT’ are valid terminate options.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.

00F30021

Explanation: An attachment facility issued a Subsystem Support request, but provided too few or too many parameters.

This abend reason code is issued by the following CSECTs:

DSN3AB00  DSN3CM00  DSN3CT30  DSN3CT80  DSN3EXT0  DSN3ID30  DSN3ID80  DSN3PR00  DSN3RIA0  DSN3SI30  DSN3S180  DSN3SY00

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: Obtain all dumps taken by the attachment facility or by the requesting application.

Problem Determination: This failure is probably the result of a logic error in the attachment facility.

Upon entry to each of the CSECTs listed above, register 1 contains the address of the Function Request Block (FRB). FRBPCNT contains the number of passed parameters and FRBPARAM points to a list of parameter addresses. The required number of parameters is unique to the calling protocol for each CSECT.

00F30022

Explanation: An error was detected while processing the ‘Connection Name’ for a connection request. Either the value of the ‘Connection Name’ parameter was not valid or an abend occurred when accessing the parameter.

This abend reason code is issued by the following CSECT: DSN3ID30

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. A ‘Connection Name’ is invalid if it is not a printable string (e.g. binary zeros). The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349.
00F30023

**Explanation:** This reason code may be returned during connection processing if the connection name is already in use by another allied address space, but the connection type is different.

This reason code is not normally visible to users or operators, but may appear in DB2 traces. The ally attempting to connect to DB2 should have produced diagnostic information relating to the connection failure.

This reason code is issued by the following CSECT: DSN3ID30

**System Action:** The connection request is rejected.

**System Programmer Response:** Collect the diagnostics produced by the allied address space which could not connect to DB2.

**Problem Determination:** Follow the instructions indicated by the diagnostics to assure that a different connection name will be used on future attempts to connect to DB2.

00F30026

**Explanation:** The attachment facility specified an invalid FRBFVLE value. The value is outside the limits of those supported for the requesting connection.

This reason code is issued by the following CSECT: DSNAPRX

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** Obtain all dumps taken by the attachment facility and requesting application.

**Problem Determination:** Register 1 contains a pointer to the FRB at the entry to DSNAPRX. FRBFVLE contains the invalid value that was passed. The value passed must not be zero and it must be consistent with the resource requested by FRBRALE.

00F30027

**Explanation:** An error occurred while processing the 'Weighting Factor' parameter. This parameter was provided by the attachment facility on a request to allocate a DB2 plan to the application.

Either an abend occurred accessing the 'Weighting Factor' or the value of the parameter is out of range.

This abend reason code is issued by the following CSECT: DSN3CT30

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** See Problem Determination.

**Problem Determination:** For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The value of the 'Weighting Factor' must be a positive number between zero and 255. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30025

**Explanation:** A request to establish a DB2 termination ECB has completed successfully; however, DB2 is stopping. The new termination ECB might not be posted.

This reason code is issued by the following CSECT: DSN3EXT0

**System Action:** Control is returned to the attachment facility.
**00F30028**

**Explanation:** This reason code is returned when previous invocations of DB2 have set the thread into a state such that the only acceptable request that can be made for the thread is ABORT. This could occur, for example, if the ally has issued "Prepare to Commit" and DB2 returned a "No" vote on the call. In this situation, the only acceptable request for the ally to make is ABORT.

This reason code is not normally visible to users or operators, but may appear in DB2 traces. The ally may have produced diagnostics to report this condition, or it may handle this condition internally without requiring outside intervention.

This reason code is issued by the following CSECTs:
- DSN3TR00, DSN3CHM00

**System Action:** The current allied request is rejected. The state of the thread is unchanged.

**System Programmer Response:** Collect any diagnostics produced by the allied address space.

**Problem Determination:** Follow the instructions indicated by the diagnostics, if any.

---

**00F30029**

**Explanation:** This reason code is returned when a COMMIT request is received in an improper context. Either a PREPARE is required before the COMMIT request, or the connection type does not allow a COMMIT request.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This reason code is issued by the following CSECTs:
- DSN3CM00, DSN3TR00

**System Action:** The current allied request is rejected. The state of the thread is unchanged.

---

**00F30030**

**Explanation:** An abend has occurred during an attempt to access the caller-provided 'INDOUBT RESOLUTION' parameter while executing in the PSW key. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECTs: DSN3RIA0, DSN3RIM0

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

---

**00F30031**

**Explanation:** This reason code is returned when a DEALLOCATE request is received from a CICS or IMS thread, but PREPARE has already completed for the thread and either COMMIT or ABORT are the only acceptable requests.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This reason code is issued by the following CSECT: DSN3TR00

**System Action:** The current allied request is rejected. The state of the thread is unchanged. The ally issuing the DEALLOCATE request may have produced diagnostics related to this error.

**System Programmer Response:** Collect the diagnostics produced by the allied address space, if any.

**Problem Determination:** Follow the instructions indicated by the diagnostics.

---

**00F30032**

**Explanation:** An error occurred while processing the 'Indoubt Resolution' parameter. This parameter was provided by the attachment facility on a request to allocate a DB2 plan to the application.

Either an abend occurred accessing the 'Indoubt Resolution' or the value of the parameter is incorrect for this connection type.

This abend reason code is issued by the following CSECT: DSN3CT30

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** See Problem Determination.

**Problem Determination:** For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller's PSW key. For TSO, batch, and Call Attachment connections, the value of the 'Indoubt Resolution' parameter must be 'NO'. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349

---
00F30033

Explanation:  An abend has occurred during an attempt to access the 'Plan Name' parameter while executing in the caller’s PSW key.

This abend reason code is issued by the following CSECT: DSN3CT30

System Action:  The request is not processed.

User Response:  A dump should be taken for problem analysis.

System Programmer Response:  See Problem Determination.

Problem Determination:  This reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The failure may be the result of a logic error in either the attachment facility or the requesting application.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00F30034

Explanation:  The authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist.

This reason code is issued by the following CSECTs: DSN3CT30, DSN3SI30

System Action:  The request to allocate a plan to the authorization ID is denied.

User Response:  Verify that the correct plan name was specified. If this plan exists, then request execution authority to the plan from either the owner of the plan or from another person given authority to grant execution authority to the plan.

00F30035

Explanation:  An abend has occurred during an attempt to access the caller-provided authorization ID while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECT: DSN3SI30

System Action:  The request is not processed.

User Response:  A dump should be taken for problem analysis.

Problem Determination:  This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1349

00F30036

Explanation:  This reason code may be returned during connection processing for a coordinator thread if a coordinator for that connection name already exists. This may be a case of two IMS or CICS systems using the same connection name.

This reason code is not normally visible to users or operators, but may appear in DB2 traces. The abend occurring the connection name should have produced diagnostic information relating to the connection failure.

This reason code is issued by the following CSECT: DSN3ID30

System Action:  The connection request is rejected.

System Programmer Response:  Collect the diagnostics produced by the allied address space which could not connect to DB2.

Problem Determination:  Follow the instructions indicated by the diagnostics to ensure that a different connection name will be used on future attempts to connect to DB2.

00F30037

Explanation:  This reason code may be returned during connection processing for a CICS or IMS dependent (noncoordinator) thread if a coordinator for that connection name does not already exist. This may be an internal error in CICS, IMS, or the attachment package.

This reason code is not normally visible to users or operators, but may appear in DB2 traces. The abend occurring the connection name should have produced diagnostic information relating to the connection failure.

This reason code is issued by the following CSECT: DSN3ID30

System Action:  The connection request is rejected.

System Programmer Response:  Collect the diagnostics produced by the allied address space which could not connect to DB2.

Problem Determination:  Follow the instructions indicated by the diagnostics.

00F30038

Explanation:  An abend has occurred during an attempt to access the 'Correlation ID' parameter while executing in the caller’s PSW key.

This abend reason code is issued by the following CSECTs: DSN3CT30, DSN3SI30

System Action:  The request is not processed.
User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: This reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5]

00F30039 Explanation: This reason code may be returned on a PREPARE request if Network ID (NID) is specified, but NID was previously specified on the CREATE THREAD request. NID cannot be specified on both requests. This may be an internal error in CICS, IMS, or the attachment package.

This reason code is not normally visible to users or operators, but may appear in DB2 traces. The ally issuing the PREPARE to DB2 should have produced diagnostic information relating to the connection failure.

This reason code is issued by the following CSECT: DSN3PR00 System Action: The PREPARE request is rejected.

System Programmer Response: Collect the diagnostics produced by the allied address space which had the failing request.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30040 Explanation: The allocation of the plan to the connection failed. Either a resource is unavailable or the requested resource (plan) is not known to DB2.

This reason code is issued by the following CSECT: DSN3CT30 System Action: Information on the failing resource name, object type, and a Database Services reason code, that help to explain the allocation failure, are returned to the attachment facility.

User Response: Unknown plans must be bound before they can be accessed.

Call Attachment users may invoke the TRANSLATE function to move the information returned to the attachment facility into the error message field SQLERRMT in the SQLCA.

System Programmer Response: Refer to message DSNT500I for identification of unavailable resources and diagnostics to be collected. Refer to Table 3 in Appendix B, “Problem determination,” on page 1349[5] for an explanation of resource type codes.

Problem Determination: See response suggestions above.

00F30042 Explanation: An abend has occurred during an attempt to access the caller-provided recovery coordinator option while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECT: DSN3ID30 System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1]

00F30043 Explanation: A terminate request was received with the ‘Deallocate’ option, but a unit of recovery is still outstanding for the connection. Either ‘SYNC’ or ‘ABRT’ must be requested before resources can be deallocated.

This reason code is issued by the following CSECT: DSN3TR00 System Action: The termination request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: Obtain all dumps taken by the attachment facility or requesting application.

Problem Determination: This failure is probably the result of a logic error in the attachment facility or a DB2 connection management error. This reason code is placed in register 0 and the return code is placed in register 15.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1] and 82 on page 1351
00F30044

Explanation: This reason code is returned when a DEALLOCATE request is received with uncommitted work outstanding. Either the PREPARE, COMMIT sequence or an ABORT request is required.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This reason code is issued by the following CSECT: DSN3TR0

System Action: The current allied request is rejected. The state of the thread is unchanged. The ally issuing the DEALLOCATE request may have produced diagnostics related to this error.

System Programmer Response: Collect the diagnostics produced by the allied address space, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30045

Explanation: An error has occurred while attempting to locate the Unit of Recovery associated with a DISPLAY, COMMIT, or ABORT request. This is probably the result of a logic error in the requesting program.

This reason code is issued by the following CSECTs: DSN3RIA0, DSN3RIM0

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 0 and the return code is placed in register 15.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).  

---

00F30046

Explanation: A terminate request was received with the ‘Commit’ option, but this option is not supported for this connection type. Only the ‘SYNC’ or ‘ABRT’ options are valid for TSO, batch, and Call Attach connections.

This reason code is issued by the following CSECT: DSN3TR0

System Action: The termination request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: Obtain all dumps taken by the attachment facility or requesting application.

Problem Determination: This failure is probably the result of a logic error in the attachment facility.

---

00F30047

Explanation: This reason code is returned when a RECOVER INDOUBT-ABORT request is received from a CICS or IMS recovery coordinator, but the thread is already in the process of COMMITing.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This reason code is issued by the following CSECT: DSN3RIA0

System Action: The current allied request is rejected. The state of the thread is unchanged. The ally issuing the RECOVER INDOUBT-ABORT request may have produced diagnostics related to this error.

System Programmer Response: Collect the diagnostics produced by the allied address space, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

---

00F30048

Explanation: An abend has occurred during an attempt to access the attachment-provided ‘Network ID’ while executing in the caller’s PSW key.

This abend reason code is issued by the following CSECTs: DSN3CT30, DSN3PR00

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: This reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).  

---

00F30049

Explanation: A request was received to connect the requester’s TCB to a DB2 subsystem, but the TCB is already connected.

This reason code is issued by the following CSECT: DSN3ID30

System Action: The connection request is rejected.

User Response: A dump should be taken for problem analysis.
System Programmer Response: Obtain all dumps taken by the attachment facility or requesting application.

Problem Determination: The failure is probably the result of a logic error in the attachment facility.

00F30050

Explanation: A DB2 request has been received after a failure during a previous request and cleanup of the previous request did not complete. This can happen if DB2 recovery was bypassed on a previous request. This bypass occurs if the application has an enabled unlocked task (EUT) FRR active and requested a retry back to the application mainline code.

This reason code is issued by the following CSECT: DSNAPRHX

System Action: The request is not processed. DB2 will terminate the connection when the TCB terminates.

User Response: You must terminate your task. Do not attempt further DB2 requests. Do not request terminating the connection. You should request a dump for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: The diagnostic data should be examined for prior failures while processing a request for this connection. Users of the call attachment facility cannot retry from an EUT FRR routine if an error occurs during DB2 processing.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5][49]

00F30051

Explanation: This reason code is returned when a RECOVER INDOUBT request is received from a CICS or IMS recovery coordinator, but the thread is still processing in DB2 code other than EOT. The request cannot be processed at this time but may be successful if issued again later.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This reason code is issued by the following CSECT: DSN3RIA0

System Action: The current allied request is rejected. The state of the thread is unchanged. The ally issuing the RECOVER INDOUBT request may have produced diagnostics related to this error.

System Programmer Response: Collect the diagnostics produced by the allied address space, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30052

Explanation: The caller’s connection with DB2 has been terminated, because the caller’s recovery coordinator has already terminated.

This abend reason code is issued by the following CSECT: DSNAPRHX

System Action: The request has been processed by terminating the agent.

User Response: Your application program may identify to DB2 when its recovery coordinator has identified again.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5][49]

00F30053

Explanation: An error occurred while processing the ‘Current Level’ parameter. This parameter was provided by the attachment facility on a termination request.

Either an abend occurred accessing the ‘Current Level’ or the value of the parameter is invalid.

This abend reason code is issued by the following CSECTs:

DSN3CT80 DSN3ID80 DSN3I80

System Action: The request is not processed.

User Response: A dump should be taken for problem analysis.

System Programmer Response: See Problem Determination.

Problem Determination: For the abend case, this reason code is placed in register 15 to identify which parameter was not addressable in the caller’s PSW key. The value of the ‘Current Level’ parameter must be zero or a number representing the connection’s authority level. The failure is probably the result of a logic error in the attachment facility.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[5][49]

00F30054

Explanation: The value of the ‘Current Level’ parameter does not match the current authority level of the connection. This parameter was provided by the attachment facility on a termination request.

This reason code is issued by the following CSECTs:
System Action: The request is not processed.
User Response: A dump should be taken for problem analysis.
System Programmer Response: Collect all dumps taken by the attachment facility or requesting application.
Problem Determination: The failure is probably the result of a logic error in the attachment facility.

00F30055
Explanation: The maximum number of concurrent identify level agents has been exceeded.
This abend code is issued by the following CSECT: DSN3ID30
System Action: The connection request is not processed.
User Response: Attempt connection to DB2 at a later time.
System Programmer Response: Ensure that the DB2 system parameters controlling the maximum number of concurrent identities are correct. These system parameters are Max Users, Max TSO connect, and Max Batch connect on installation panel DSNTIPE.

00F30056
Explanation: An IDENTIFY request for connection to DB2 was rejected. DB2 had been started in restricted access mode. Only authorization IDs authorized to perform maintenance functions are permitted access to DB2.
This reason code is issued by the following CSECT: DSN3AUCN
System Action: The connection request is not processed.
User Response: Retry the connection request after DB2 has been restarted in full access mode.

00F30057
Explanation: An invalid application-supplied address was encountered while accessing the application-provided data.
This abend reason code is issued by the following CSECTs: DSNAET03, DSNAPRHX.
System Action: The application program is abended with code X'04E' and this reason code.
System Programmer Response: Obtain the dump printout from the application programmer. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide.

00F30058
Explanation: Access to DB2 has been denied by the site’s authorization exit.
This reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI
System Action: The request is not processed.
User Response: Contact your security administrator and request authority to access this DB2 subsystem.
System Programmer Response: No action is necessary unless the request denial was in error. If it was, the authorization exit should be tested to determine the cause of the error.

00F30059
Explanation: The return code from the authorization exit was not valid. Field EXPLARC must be set by the authorization exit to either 0 or 12.
This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI
System Action: The request is not processed.
System Programmer Response: Diagnostics obtained for the failure must be analyzed and the exit corrected.
Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

and Reference: for information on identifying and reporting the problem.

Problem Determination: The register contents at the time of abend are as follows:
R2 A decimal code identifying the bad data:
  1 FRB address is invalid.
  2 FRBPARM contains an invalid RDIN address.
  18 RDICODEP contains an invalid SQLCA address.
R3 The invalid application data area address.
R4 The address of the RDIN.
R5 The virtual storage key of the data.
R8 The address of the FRB in the application address space.

Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.
**00F30060**

**Explanation:** Upon return from an authorization exit, the returned value of the SQL ID was not equal to either the returned primary or one of the returned secondary authorization IDs.

This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The request is not processed.

**System Programmer Response:** Diagnostics obtained for the failure must be analyzed and the exit corrected.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 5]

---

**00F30061**

**Explanation:** An abend occurred while referencing the SIGNON request’s secondary authorization ID parameter provided by the attachment facility.

This abend reason code is issued by the following CSECT: DSN3SI30

**System Action:** SIGNON processing is terminated.

**System Programmer Response:** Analyze the diagnostic data to determine which attachment module may have been in error. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This reason code is placed in register 15 to identify which parameter was not addressable with the caller’s PSW key. The failure is probably the result of an error in the attachment facility.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 5]

---

**00F30062**

**Explanation:** Upon return from the SIGNON authorization exit, the returned value of the primary authorization ID is null. The first character is less than or equal to X’40’.

This abend reason code is issued by the following CSECT: DSN3AUSI

**System Action:** The request is not processed.

**System Programmer Response:** Diagnostics obtained for the failure must be analyzed and the exit corrected.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 5]

---

**00F30063**

**Explanation:** The DB2 attachment facility for IMS, CICS, or RRSAF provided a secondary authorization ID value, but no primary authorization ID value. This is a violation of the SIGNON protocol.

This abend reason code is issued by the following CSECT: DSN3SI30

**System Action:** The SIGNON request is terminated with a return code of 12 and this reason code.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 23 24 25 26 49]

This is probably an error in the attachment facility.

---

**00F30064**

**Explanation:** The DB2 attachment facility for IMS, CICS, or RRSAF did not provide a value for the primary authorization ID, and the current primary authorization ID is also null. This is a violation of the SIGNON protocol. A user’s connection must have an associated primary authorization ID.

This abend reason code is issued by the following CSECT: DSN3SI30

**System Action:** The SIGNON request is terminated with a return code of 12 and this reason code.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [2 23 24 25 26 49]

This is probably an error in the attachment facility.

---

**00F30065**

**Explanation:** An error occurred in determining the commit state of the thread.

This abend reason code is issued by the following CSECTs:

DSN3PR00 DSN3CM00 DSN3AB00

**System Action:** The caller is abended in DSN3PR00
and DSN3CM00. In DSN3AB00 a dump is taken and an abort is attempted.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced. These can be used to locate the areas for examination, especially the RAL in the dump.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30066**

**Explanation:** An abend occurred during an attempt to access the caller-provided ACEE address field while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECT: DSN3SI30

**System Action:** The sign-on request is not processed.

**User Response:** You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request that abended.

**Problem Determination:** The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30067**

**Explanation:** The caller holds a DB2 latch. This is a violation of the Authorization Services request protocol. The caller cannot hold a DB2 latch when requesting connection or sign-on services.

This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The connection or sign-on request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** A requester of connection or sign-on cannot hold a DB2 latch.

---

**00F30068**

**Explanation:** The CCB is being freed. This Authorization Service request specifies the address of a CCB that has previously been requested to be freed.

This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The connection or sign-on request is not processed.

**User Response:** A dump should be taken for program analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Authorization Service requests must be serialized. Once a request to free a given CCB is made, no subsequent Authorization Service request can be made referencing the same CCB.

Collect the following diagnostic items as described in Appendix B, “Problem determination,” on page 1349.

---

**00F30069**

**Explanation:** The exit environment is incorrect. Either the exit environment was freed after connection processing or an error occurred acquiring storage for a CCB or during connection processing.

This abend reason code is issued by the following CSECT: DSN3AUSI

**System Action:** The sign-on request is not processed.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items described in Appendix B, “Problem determination,” on page 1349.

---

**00F30070**

**Explanation:** Functional recovery for the connection or sign-on processing could not be established. The executing module could not establish its ESTAE. This can occur if the current address space has insufficient storage. This may lead to an abnormal termination of the DB2 subsystem.
This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The connection or sign-on request is not processed. The caller is abended with code X'04E' and this reason code.

**User Response:** A dump should be taken for problem analysis.

**Operator Response:** Notify the system programmer and restart DB2 if necessary.

**System Programmer Response:** Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private areas expanded.

**Problem Determination:** The caller should produce a SYS1.LOGREC entry and an SVC dump, so that the system programmer can examine the LSQA area.

Collect the following diagnostic items, described in Appendix B, “Problem determination,” on page 1349 [1 2 3 45]

---

**00F30071**

**Explanation:** A logic error has occurred. An Authorization Service request has been made that references the same CCB as a currently processing request. These requests must be serialized.

This reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The connection or sign-on request is not processed.

**User Response:** Notify the system programmer. A dump should be taken for problem analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Authorization service requests must be serialized. Once an authorization service request is made referencing a given CCB, no subsequent authorization service requests can be made referencing the same CCB until the first request completes.

Collect the following diagnostic items, described in Appendix B, “Problem determination,” on page 1349 [1 2 3 45]

---

**00F30072**

**Explanation:** The requester’s authorization ID or password could not be verified. This condition may indicate a security violation.

This reason code is issued by the following CSECT: DSN3AUCN

**System Action:** The connection request is not processed.

**User Response:** Verify that you have specified the correct RACF authorization ID and password. If necessary, request authorization to the DB2 subsystem from your security administrator.

**System Programmer Response:** Examine the console/SYSLOG output for RACF messages issued when a request is denied. Refer the user to your security administrator if the user should be granted access to a DB2 subsystem. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of DB2 Administration Guide for examples of how to authorize users for specific DB2 subsystems.

**Problem Determination:** During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the authorization ID or password could not be verified, the connection request is terminated with this reason code.

---

**00F30073**

**Explanation:** The parameter flag settings on the Authorization Service request contradict each other. One flag is set to request the build of the exit environment. The other flag is set to request the release of the exit environment. These flags are mutually exclusive.

This abend reason code is issued by the following CSECT: DSN3AUCN

**System Action:** The connection request is not processed. The caller is abended with code X'04E' and this reason code.

**User Response:** A dump should be taken for problem analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Only one of these flags can be set on when requesting connection processing.

Collect the following diagnostic items, described in Appendix B, “Problem determination,” on page 1349 [1 2 3 45]
**00F30074**

**Explanation:** There is a problem in the execution environment. Connection or sign-on was requested from an SRB-mode execution unit, but the authorization services service task that would normally be switched to does not exist.

This abend reason code is issued by the following CSECTs: DSN3AUCN, DSN3AUSI

**System Action:** The connection or sign-on request is not processed.

**User Response:** Notify the system programmer. A dump should be taken for problem analysis.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem. For failure analysis procedures.

**Problem Determination:** Determine why the authorization services service task was not created.

Collect the following diagnostic items, described in Appendix B, “Problem determination,” on page 1349.

**00F30077**

**Explanation:** A plan or package could not be executed for one of these reasons:

- It is disabled in the environment in which you attempted to run.
- The attach library that you are using is from a previous release of DB2 that does not support the ENABLE and DISABLE options of the bind operation.

This reason code is issued by the following CSECT: DSN3CT30

**System Action:** The plan or package is not executed.

**System Programmer Response:** One of the following:

- Rebind the plan or package to enable it to execute in the present environment.
- Check the SYSPKSYSTEM or SYSPKSYSPLAN catalog table to find an environment in which the plan or package can be executed.
- Correct the attach library.

**00F30078**

**Explanation:** An abend occurred during an attempt to access the caller-provided connecting system type code while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECT: DSN3ID30

**System Action:** The request is not processed.

**User Response:** A dump should be taken for problem analysis.

**Problem Determination:** This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs this register indicates which parameter caused the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

*DB2 Diagnosis Guide and Reference* refers to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.
00F30080

Explanation: CSECT DSNAPRHX was unable to cancel its ESTAE.

This abend reason code is issued by the following CSECT: DSNAPRHX

System Action: The application program is abended with code X'04E' and this reason code.

User Response: Notify the system programmer. The application may be retried.

System Programmer Response: See Problem Determination.

Problem Determination: A nonzero return code was received from the Cancel ESTAE operation. The return code has been placed into Register 2. Refer to MVS/ESA Programming: Assembler Services Reference for the meaning of the return code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30081

Explanation: An abend occurred during an attempt to access the caller-provided accounting token field while executing in the key of the caller. This is probably the result of a logic error in the requesting program.

This abend reason code is issued by the following CSECT: DSN3SI30

System Action: The SIGNON request is not processed.

User Response: You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

Problem Determination: The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30082

Explanation: This reason code is returned when the automatic bind for plan is disabled. The automatic bind is disabled through the installation process.

This reason code is issued by the following CSECT: DSN3CT30

System Action: The plan is not automatically bound.

System Programmer Response: Rebind the plan prior to execution.

00F30083

Explanation: This reason code is returned because an allied application, or its recovery routine, attempted to issue an SQL request following an abend that could not be retried (that is, CANCEL, DETACH).

This reason code is issued by the following CSECT: DSNAPRHX

System Action: Control is returned to the calling program, either the application program or its recovery routine, so that end-of-task processing can take place.

User Response: If you feel that this is a DB2 problem, notify the system programmer.

System Programmer Response: This reason code is issued because an allied application had an MVS CANCEL or DETACH issued against it and its recovery routine either retried back to the application, or did itself, try to execute another SQL statement to DB2. This call is rejected to help allow the application to be processed through end-of-task processing.

Problem Determination: If you believe that this error is not the result of the above reason, then collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30085

Explanation: The requester’s password could not be verified. This condition might indicate a security violation.

System Action: The connection request is not processed.

User Response: Verify that you specified the correct RACF password for this requester.

System Programmer Response: Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of DB2 Administration Guide for examples of how to set up the security controls for remote connection requests in the communications database.

Problem Determination: During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the password could not be verified, the connection request is terminated with this reason code.

This reason code is issued by the following CSECT: DSN3AUCN
00F30086

Explanation: The requester’s password is expired. This condition might indicate a security violation.

System Action: The connection request is not processed.

User Response: Change your password so that it is no longer expired.

System Programmer Response: Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of the DB2 Administration Guide for examples of how to set up the security controls for remote connection requests in the communications database.

Problem Determination: During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates the password expired, the connection request is terminated with this reason code.

This reason code is issued by the following CSECT: DSN3AUCN

00F30087

Explanation: The requester’s authorization ID or password could not be verified by the site’s security exit routine. This condition might indicate a security violation.

System Action: The connection request is not processed.

User Response: Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the DB2 subsystem from your security administrator.

System Programmer Response: Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of the DB2 Administration Guide for examples of how to set up the security controls for remote connection requests in the communications database.

Problem Determination: During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the site’s security exit routine failed to verify the requester, the connection request is terminated with this reason code.

This reason code is issued by the following CSECT: DSN3AUCN

00F30088

Explanation: The requester’s authorization ID was revoked. This condition might indicate a security violation.

System Action: The connection request is not processed.

User Response: Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the DB2 subsystem from your security administrator.

System Programmer Response: Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of the DB2 Administration Guide for examples of how to set up the security controls for remote connection requests in the communications database.

Problem Determination: During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the requester’s authorization ID was revoked, the connection request is terminated with this reason code.

This reason code is issued by the following CSECT: DSN3AUCN

00F30089

Explanation: The requester’s authorization ID is not defined to RACF. This condition might indicate a security violation.

System Action: The connection request is not processed.

User Response: Verify that you specified the correct RACF authorization ID and password. If necessary, request authorization to the DB2 subsystem from your security administrator.

System Programmer Response: Examine the console/SYSLOG output for RACF messages issued when a request is denied. If this error occurred during a remote connection request, examine the communications database to determine the security controls in effect for a remote connection request. Refer to Part 3 (Volume 1) of the DB2 Administration Guide for examples of how to set up the security controls for remote connection requests in the communications database.
remote connection requests in the communications database.

**Problem Determination:** During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password, if supplied, associated with the requester. If the RACF return code indicates that the requester’s authorization ID is not defined, the connection request is terminated with this reason code.

This reason code is issued by the following CSECT: DSN3AUCN

---

**00F30090**

**Explanation:** The application program issued an RRSAF SIGNON or AUTH SIGNON function request, but the application either has OPEN CURSORS or SPECIAL REGISTERS that are not in their initial state and the reuse=INITIAL rule is in effect.

**System Action:** The SIGNON or AUTH SIGNON request is not processed.

**User Response:** You can continue processing with a corrected request.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3SI30

---

**00F30091**

**Explanation:** The application program issued an RRSAF IDENTIFY function request, but RRS/MVS is not available.

**System Action:** The IDENTIFY request is not processed.

**User Response:** Retry the IDENTIFY request after RRS/MVS has been started.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3ID30

---

**00F30092**

**Explanation:** The application program issued an RRSAF SIGNON or AUTH SIGNON function request, but the application has issued an SQL request since the last invocation of SRRCMIT or SRRBACK and therefore is not at a point of consistency.

**System Action:** The SIGNON or AUTH SIGNON request is not processed.

**User Response:** You can continue processing with a corrected request.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3SI30

---

**00F30093**

**Explanation:** The application program issued an RRSAF TERMINATE THREAD or TERMINATE IDENTIFY function request, but the application has issued an SQL request since the last invocation of SRRCMIT or SRRBACK and therefore is not at a point of consistency.

**System Action:** The function request is not processed.

**User Response:** You can continue processing with a corrected request.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3CT80 DSN3ID80

---

**00F30094**

**Explanation:** During remote connection processing, Authorization Services invokes the RACROUTE service using the RACF RACINIT form to verify the authorization ID and password associated with the requester, and changes the password to a new password (if supplied). If the RACF return code indicates that the requester’s new password is invalid, the connection request is terminated with this reason code.

**System Action:** The connection request is not processed.

**User Response:** Verify that your new password value meets the installation’s requirements for new passwords.

**System Programmer Response:** Examine the console/SYSLOG output for RACF messages issued when the request was denied.

This reason code is issued by the following CSECT: DSN3AUCN

---

**00F30095**

**Explanation:** An internal error was detected in either DB2 or OS/390 RRS.

**System Action:** The application is abended. This error may, in many cases, eventually abend the DB2 subsystem.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in OS/390 RRS. Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** DB2 records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with DB2 or with OS/390 RRS.

Collect the following diagnostic items listed in Chapter 56. DB2 codes
This abend reason code is issued by the following CSECTs: DSN3SQLF, DSN3CMIT, DSN3CTX30, DSN3SPIN, DSN3SPTN, DSN3BABR, DSN3CMT2, DSN3CTXS, DSN3RRSX

00F30096

**Explanation:** An internal error was detected in either DB2 or RRS Context Services.

**System Action:** The application is abended. This error can, in many cases, eventually abend the DB2 subsystem.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in RRS. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** DB2 records the error in SYS1.LOGREC data set and requests an SVC dump. The error indicates that there can be a problem with DB2 or with OS/390 RRS Context Services. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSN3ID30, DSN3ID80, DSN3SPIN, DSN3SPTN

00F30097

**Explanation:** The context_key supplied via the CONTEXT SIGNON function of RRSASF is not associated with the current context.

**System Action:** CONTEXT SIGNON is not performed.

**User Response:** Use CTXSDTA to store the primary authid in the context data associated with the current context before invoking CONTEXT SIGNON. The context_key used to store the data must be the context_key that is passed as input to CONTEXT SIGNON.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3SI30

00F30098

**Explanation:** The CONTEXT SIGNON function of RRSASF requires OS/390 R5 or later.

**System Action:** CONTEXT SIGNON is not performed.

**User Response:** Check the release level of OS/390 that you are running on.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3SI30

00F30099

**Explanation:** The data retrieved using the context_key passed via the CONTEXT SIGNON function of RRSASF is a version not supported by DB2.

**System Action:** CONTEXT SIGNON is not performed.

**User Response:** Determine the version number supported by the DB2 release you are running. This is described in the description of CONTEXT SIGNON in the DB2 Application Programming and SQL Guide. Use CTXSDTA to store the correct version of the context data associated with the current context before invoking CONTEXT SIGNON.

**Problem Determination:** This reason code is issued by the following CSECT: DSN3SI30

00F3009A

**Explanation:** An attempt to was made to invoke the DB2 API for an agent that was currently performing syncpoint processing. This could occur if an RRSASF attached application invoked DB2 after another control task had already initiated RRS syncpoint processing for the same DB2 agent. After syncpoint processing has been initiated on behalf of an agent that is connected by RRSASF to DB2, the DB2 API may not be used to access DB2 until the syncpoint processing completes.

**System Action:** The API request is rejected.

**User Response:** Serialize the initiation of RRS syncpoint processing with the use of the DB2 API.

00F3009B

**Explanation:** The RRSASF prepare exit was invoked for a DB2 agent that is currently executing in DB2. This could occur if a control task initiated RRS syncpoint processing for a DB2 agent while an application task was accessing DB2 data using the same DB2 agent. Once a DB2 agent is active in DB2, another task may not initiate RRS syncpoint processing for the same agent.

**System Action:** DB2 returns ATRABACK to the prepare request. The DB2 agent is abended with reason 00E50013.

**User Response:** Serialize the initiation of RRS syncpoint processing with accessing DB2 data.

**Problem Determination:** An entry recording this condition is written in SYS1.LOGREC.
**00F3009C**

**Explanation:** An RRS syncpoint exit was invoked for a DB2 agent by a task different than the task currently associated with the DB2 agent and the DB2 early code module installed on the system does not support this function.

**System Action:** The RRS syncpoint request is abended. This will result in DB2 losing its connection with RRS. The DB2 subsystem must be stopped and then started again in order to establish a new connection with RRS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The version of the DB2 early code that was loaded from the LINKLIST library does not support RRS syncpoints initiated from a task that is not connected to the DB2 agent associated with the RRS unit of recovery for which syncpoint processing is being initiated. The DB2 early code must either be the DB2 V5 with APAR PQ16273 applied or the DB2 V6 early code. Make sure a compatible version of the DB2 early code will be loaded and then re-ipl the system.

**Problem Determination:** An entry recording this condition is written in SYS1.LOGREC.

---

**00F3009D**

**Explanation:** An abend occurred during an attempt to access the caller-provided user ID while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The SIGNON request is not processed.

**User Response:** You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

**Problem Determination:** The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00F3009F**

**Explanation:** An abend occurred during an attempt to access the caller-provided workstation name while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The SIGNON request is not processed.

**User Response:** You may retry from your recovery routine (ESTAE) and continue execution with the same level of capability you had before the request was abnormally terminated.

**Problem Determination:** The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1]

---

**00F300A1**

**Explanation:** The global transaction ID (XID) parameter that was provided on a SIGNON request is invalid for one of the following reasons:

- An incorrect XID value was specified
- The value was specified in an incorrect format
- If an address of a global transaction ID was specified, the length values were not within the valid range

**System Action:** The SIGNON request is not processed.

**User Response:** Correct the XID parameter on the SIGNON request.

---

**00F300A3**

**Explanation:** While executing in the PSW key of the caller, an abend occurred during an attempt to access the accounting-string parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The SIGNON request is not processed.

**User Response:** You may retry from your recovery routine (ESTAE), and continue execution with the same level of capability you had before the request was abnormally terminated.
**Problem Determination:** The reason code is placed in register 15 prior to any access to caller-provided information.

---

**00F300A4**

**Explanation:** The application program issued a CALL DSNRLI with function SIGNON, AUTH SIGNON, or CONTEXT SIGNON with a accounting-string parameter that is not supported on this version of DB2.

**User Response:** Correct the request, and continue processing.

---

**00F30101**

**Explanation:** The parameter contained in the IEFSSNx xx member used to initialize DB2 (and other subsystems) is in error. Refer to message DSN3101I for details.

The abend reason code is issued by the following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3101I.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1][2][5]

---

**00F30102**

**Explanation:** The parameter contained in the IEFSSNx xx member used to initialize DB2 (and other subsystems) is in error. The DB2 subsystem recognition character must be not be blank. For details, see message DSN3102I.

This abend code is issued by the following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3102I.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1][2][5]

---

**00F30103**

**Explanation:** The parameter contained in the IEFSSNx xx member used to initialize DB2 (and other subsystems) is in error and/or the named module is not resident in a library available during IPL. Refer to message DSN3103I for details.

This abend code is issued by the following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3103I.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1][2][5]

---

**00F30104**

**Explanation:** Module DSN3UR00 was unable to obtain the DB2 subsystem affinity table index for the named subsystem. MVS did not recognize the named subsystem. Refer to message DSN3109I for details.

This abend code is issued by the following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3109I.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1][2][5]

---

**00F30105**

**Explanation:** Module DSN3UR00 was unable to load Early module 'DSN3EPX'. Either there was an I/O error, or the named module is not resident in a library available during IPL. Refer to message DSN3105I for details.

This abend reason code is issued by the following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3105I. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349 [1][5]

---

**00F30106**

**Explanation:** A global transaction identifier from RRS could not be extracted for a SIGNON request. The SIGNON request was for a thread that indicated it was part of a global transaction, and that RRS was to provide the global transaction id.

**System Action:** The application is abended.

**Operator Response:** Collect the SYS1.LOGREC and SVCDUMP, and notify the system programmer.

**System Programmer Response:** This is probably either an error in DB2 or in RRS. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem. If RRS has terminated, restart RRS.

**Problem Determination:** Examine the SVCDUMP to determine the cause of the RRS failure. Register zero contains the return code from the RRS ATTRWID request.
**00F30107**

**Explanation:** An abnormal termination occurred during an attempt to access the caller-provided xid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

**System Action:** The SIGNON request is not processed.

**User Response:** Correct the problem and submit your job again.

**Problem Determination:** The reason code is placed in register 15 prior to any access to caller-provided information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

**00F30111**

**Explanation:** The DB2 program which establishes DB2 as an MVS subsystem during Master Scheduler initialization has determined that either its own load module or a load module loaded by it does not have the attributes AMODE(31) and RMODE(ANY). Message DSN3111I was issued just prior to the abend. This message contains the name of the load module in error.

This abend reason code is issued by the following CSECT: DSN3UR00

**System Action:** DB2 subsystem initialization is terminated.

**System Programmer Response:** See message DSN3111I.

**00F30112**

**Explanation:** DB2 is unable to register the installation-specified command prefix with MVS. The command prefix is specified in the subsystem definition parameter. The subsystem specified by ssnm in message DSN3112I is not available.

This abend reason code is issued by following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3112I.

**00F30113**

**Explanation:** DB2 detected an error in the subsystem definition parameter, which is obtained from the IEFSSNxx member of SYS1.PARMLIB. The subsystem specified by ssnm in message DSN3113I is not available. This abend reason code is issued by following CSECT: DSN3UR00

**System Programmer Response:** See message DSN3113I.

**00F30114**

**Explanation:** DB2 group attach is not supported on this release of MVS. DB2 found an installation-specified group attach name specified in the subsystem definition parameter, IEFSSNxx, but DB2 group attach is not supported on this release of MVS. DB2's group attach feature requires MVS/ESA SP4.2.2 or higher.

This abend reason code is issued by the following CSECT: DSN3UR00

**System Action:** The DB2 subsystem is not available.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Correct the subsystem definition parameter to not specify a group attach name and re-IPL.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested.

Collect the following diagnostic items: CONSOLE LOG, SVCDUMP, and LOGREC.

**00F30115**

**Explanation:** DB2 received a nonzero return code from the MVS Name/Token service IENANTCR when DB2 attempted to register the group attach name. The group attach name is specified in the subsystem definition parameter, IEFSSNxx. The DB2 subsystem is unavailable.

This abend reason code is issued by following CSECT: DSN3UR00

**System Action:** The DB2 subsystem is not available.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Contact the IBM Support Center.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC, and a DB2 dump is requested. Register 3 contains the return code, in hexadecimal, that was returned to DB2 from MVS IENANTCR Name/Token services.

Collect the following diagnostic items: CONSOLE, SVCDUMP, LOGREC.

**00F30116**

**Explanation:** The version of the DB2 early code module that you are attempting to use is not compatible with this version of MVS. This version of DB2 requires MVS/ESA.

**System Action:** The DB2 subsystem is not available.
**Operator Response:** Notify the system programmer.

**System Programmer Response:** The version of the DB2 early code that was loaded from the LINKLIST library is not compatible with the release of MVS that you are using. Change the concatenation order of the LINKLIST library so that a compatible release of DB2 early code is used.

**Problem Determination:** Diagnostic information is recorded in SYS1.LOGREC and a DB2 dump is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by following CSECT: DSN3UR00

---

**00F30120**

**Explanation:** An error occurred when DB2 invoked the Security Authorization Facility R_ticketserv callable service. DB2 attempted to use this callable service to validate a Kerberos ticket received from a remote client. DB2 generated this reason code in conjunction with message DSN35811.

**System Action:** Authentication fails.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See message DSN35811 for more information.

---

**00F30121**

**Explanation:** A DB2 internal error occurred when DB2 invoked the Security Authorization Facility R_ticketserv callable service. DB2 attempted to use this callable service to validate a Kerberos ticket received from a remote client. This reason code is generated in conjunction with message DSN35811.

**System Action:** Authentication fails. A dump should be taken for problem analysis.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** See message DSN35811 for more information. Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

---

**00F30203**

**Explanation:** This reason code is returned when a DB2 program attempts to either activate an already active SSI function code or deactivate an already inactive SSI function code.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

---

**00F30210**

**Explanation:** One of these conditions exists:

- Module DSN3RS0X received a nonzero return code from ENQ (exclusive).
- Module DSN3ENQ0 received a nonzero return code from ENQ (shared) and the indication was other than 'the task already has the resource enqueued'.

This is a serious error.
This abend reason code is issued by the following CSECTs: DSN3ENQ0, DSN3RS0X.

**System Action:** The caller is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the error return from the ENQ SVC, examine the SVC dump.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced. Register 2 at the time of the abend contains the value passed back by ENQ in register 15. This can be used to locate the response area.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 4 5].

---

**00F30211**

**Explanation:** One of the following conditions exists:

- Module DSN3DEQ0 wanted to release the resource unconditionally but did not have it to release.
- Module DSN3RS0X received a nonzero return code from DEQ and the indication was other than 'the task had not been assigned control'.

This is a serious error.

This abend reason code is issued by the following CSECTs: DSN3ENQ0, DSN3RS0X.

**System Action:** The caller is abended. The current request has probably been processed completely. However, processing serialization may not have been maintained.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the error returned from the DEQ SVC, examine the SVC dump.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced. Register 2 at the time of the abend contains the value passed back by DEQ in register 15. This can be used to locate the response area.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 4 5].

---

**00F30212**

**Explanation:** A function that is allowed only for DB2 key callers was invoked by a supervisor state caller in another key. (Problem state callers receive system X'0C2' abend completion codes instead.)

This abend reason code is issued by the following CSECT: DSN3AC0X

**System Action:** The caller is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the DB2 service module running in the wrong PSW key, examine the SVC dump.

**Problem Determination:** If the invoker is a DB2 service module, an SVC dump and associated SYS1.LOGREC entries are produced. The invoker should have been in DB2 KEY during the invocation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 4 5].

---

**00F30213**

**Explanation:** The invoker of module DSN3AC0X passed an invalid action code. The only valid codes are 0 (deactivate) and 1 (activate).

This abend reason code is issued by the following CSECT: DSN3AC0X

**System Action:** The caller is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the caller of the activate and deactivate service module, examine the SVC dump.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced by a DB2 service module. The save area chain should indicate the invoker of this service module.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 4 5].

---

**00F30214**

**Explanation:** The invoker of module DSN3AC0X passed an invalid SSOB function code. The valid codes range from 1 to 255.

This abend reason code is issued by the following CSECT: DSN3AC0X

**System Action:** The caller is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the caller of the activate and deactivate service module, examine the SVC dump.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced by a DB2 service module. The save area chain should indicate the invoker of this service module.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3 4 5].
**00F30215**

**Explanation:** The invoker of module DSN3AC0X passed an invalid 'QUEUE' parameter. The storage provided could not be modified in the DB2 PSW key.

This abend reason code is issued by the following CSECT: DSN3AC0X

**System Action:** The caller is abended with system completion code of X'0C4'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** To determine the caller of the activate and deactivate service module, examine the SVC dump.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced by a DB2 service module. The save area chain should indicate the invoker of this service module. The invoker should have set a correct parameter value before invoking module DSN3AC0X.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30216**

**Explanation:** The ASCB for the newly created DB2 subsystem services address space could not be located. The presumption is that the DB2 subsystem has not been started successfully. Further entry of commands to the DB2 subsystem results in attempts to start DB2.

This abend reason code is issued by the following CSECT: DSN3EC0X

**System Action:** The current -START command processing is terminated. Subsequent commands are processed as though this command had not been processed.

**Operator Response:** Retry the command. If the command fails again, notify the system programmer.

**System Programmer Response:** If the command fails again, request a stand-alone dump and an IPL of MVS, as this may be due to an MVS internal problem.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries are produced. The ASID passed back by the MVS command scheduler for the -START command is not valid.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30217**

**Explanation:** The console ID for the MVS console that entered the current command is not found in the MVS unit control module (UCM) structure. This is a serious error. An internal MVS START command may have been incorrectly issued by an application program that provided invalid input parameters.

This abend reason code is issued by the following CSECT: DSN3EC0X

**System Action:** The caller is abended.

**Operator Response:** Retry the -START DB2 command. If the command fails again, notify the system programmer.

**System Programmer Response:** If the command fails again, request a stand-alone dump and an IPL of MVS, as this may be due to an MVS internal problem.

**Problem Determination:** The SSOB command extension mapped by IEFSSCM contains the invalid console ID.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30218**

**Explanation:** The ERLY block for this DB2 subsystem is in error. The control word that manages command processing is in an undefined state. This is a serious error.

This abend reason code is issued by the following CSECT: DSN3EC0X

**System Action:** The current TCB is abended. Two possible reasons are:

- There is no DB2 subsystem services address space. Therefore, the initial command state can safely be set in the control word, and the current command can be treated as a 'first' (-START) command. Processing of the command continues.
- The system services address space ASID is known, but the state of the DB2 subsystem is uncertain. In this case, the command facility is considered disabled, and message DSN3108I is returned to the issuer of the command.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Examine the ERLY block field ERLYCMST. If the value of ERLYCMST is greater than 2, the field is in error.

**Problem Determination:** The calling TCB may have requested an SVC dump or created associated SYS1.LOGREC entries.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Explanation: The ERLY block for this DB2 subsystem is in error. The control word that manages EOM broadcast processing is in an undefined state. This is a serious error.

This abend reason code is issued by the following CSECT: DSN3EC0X

System Action: The calling TCB is abended.

Operator Response: Cancel DB2. (End of task processing may still work, and it does a more complete clean-up than end-of-memory processing does.) If this does not work, issue the MVS FORCE command for the DB2 address spaces. If the problem is still unresolved, request a stand-alone dump and re-IPL MVS.

System Programmer Response: Examine the ERL block field ERLYMST. If the value of ERLYMST is greater than 2, it is in error.

Problem Determination: The calling TCB may have requested an SVC dump or created associated SYS1.LOGREC entries.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

Explanation: The ERLY block for this DB2 subsystem is in error. The control word that manages identify processing is in an undefined state. This is a serious error.

This abend reason code is issued by the following CSECT: DSN3CL0X

System Action: The calling TCB is abended.

Operator Response: Stop the DB2 subsystem and reissue the -START DB2 command.

System Programmer Response: Examine the ERLY block field ERLYIDST. If the value of ERLYIDST is greater than 2, it is in error.

Problem Determination: An SVC dump and associated SYS1.LOGREC entries are produced.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

Explanation: A return code other than 0, 4, or 8 was received from the MVS internal START command processor. The presumption is that the DB2 subsystem has not been started successfully. Further entry of commands to the DB2 subsystem results in further attempts to start DB2.

This abend reason code is issued by the following CSECT: DSN3RS0X

System Action: The current -START command processing is abended. Subsequent commands are processed as though this command had not been processed.

Operator Response: Retry the command. If the command fails again, request a stand-alone dump and re-IPL MVS.

System Programmer Response: Examine the SVC dump, LOGREC entries, and the console log for indications of an MVS failure.

Problem Determination: An SVC dump and associated SYS1.LOGREC entries are produced.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

Explanation: Module DSN3RS0X could not establish an ESTAE during the processing of the first (presumed to be the -START command) command. The caller is abended. This can occur if the MVS system address space that is broadcasting the command has insufficient storage. Further entry of commands to the DB2 subsystem may result in a successful start of DB2.

This abend reason code is issued by the following CSECT: DSN3EC0X

System Action: The caller is abended (without ABDUMP). The current -START command processing is terminated. Subsequent commands are processed as though this command had not been processed.

Operator Response: Retry the command. If the command fails again, request a stand-alone dump and re-IPL MVS.

Problem Determination: A stand-alone dump is necessary.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---
DB2 subsystem may result in a successful start of DB2.
This can occur during termination if the current address space (usually system services, in case of EOM broadcast, an MVS system address space) has insufficient storage. In this case, after the DB2 subsystem has shut down, further entry of commands to the DB2 subsystem may result in a successful start of DB2.

This abend reason code is issued by the following CSECT: DSN3RS0X

**System Action:** The caller is abended (without ABDUMP). The initialization is aborted, but termination proceeds.

**Operator Response:** Retry the command. If the failure persists, a re-IPL of MVS is necessary and the system programmer should be notified. A stand-alone dump should be requested first.

**System Programmer Response:** Examine the stand-alone dump, LOGREC entries, and the console log for indications of an MVS failure.

**Problem Determination:** A stand-alone dump is necessary.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 3 5].

---

**00F3021E**

**Explanation:** Module DSN3RTSOX could not establish an ESTAE while in the process of routing control to the actual ESTAE routine. The caller (RTM) is abended. This causes the original error to percolate to a higher-level recovery routine and causes this abend to be shown in an RTM recovery environment.

This can occur if the current address space (usually an allied address space) has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3RTSOX

**System Action:** The caller is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Examine the usage and free areas in the LSQA portion of the current address space private area. If necessary, have the size of the private area expanded.

**Problem Determination:** A SYSUDUMP is requested.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 4 5].

---

**00F3021F**

**Explanation:** Module DSN3RS0X discovered that the SSVT was not set to its initial state at DB2 subsystem initialization or termination time. An abend is issued in order to record SYS1.LOGREC data and request an SVC dump.

This abend reason code is issued by the following CSECT: DSN3RS0X

**System Action:** The caller is not abended. The SSVT is reset to its initial state. Subsystem initialization or termination continues.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The SVC dump contains an image of the SSCVT and the SSVT.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3].

---

**00F30220**

**Explanation:** Module DSN3RTSOX discovered that the PRHB was not set to its initial state at DB2 subsystem initialization or termination time. An abend is issued in order to record SYS1.LOGREC data and request an SVC dump.

This abend reason code is issued by the following CSECT: DSN3RTSOX

**System Action:** The caller is not abended. The PRHB is reset to its initial state. Subsystem initialization or termination continues.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

**Problem Determination:** The associated SYS1.LOGREC entries and SVC dump contain the relevant information.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1 2 3].

---

**00F30230**

**Explanation:** The module DSN3SSLM discovered that a user exit still exists for an allied address space that is being disconnected from DB2. This is an internal error.

This abend reason code is issued by the following CSECT: DSN3SSLM

**System Action:** The connection between the allied
address space and the DB2 subsystem is terminated.

**Operator Response**: Notify the system programmer.

**System Programmer Response**: Refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination**: A previous part of the disconnection process between DB2 and an allied address space has either not completed or terminated in error. The SVC dump and associated SYS1.LOGREC entries contain the relevant material for problem analysis.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][2][5]

---

**00F30310**

**Explanation**: A nonzero return code was received from the recovery manager. It is issued by module DSN3RIA0 (application resolve-indoubt-UR) and by module DSN3RIM0 (resource manager resolve-indoubt-UR).

This abend reason code is issued by the following CSECTs: DSN3RIA0, DSN3RIM0

**System Action**: This is a DB2 error. The invoker is abended.

**Operator Response**: Notify the system programmer.

**System Programmer Response**: Collect the related materials. Determine the called recovery manager module and the module that issued the abend.

**Problem Determination**: The associated SYS1.LOGREC entry indicates which module issued the abend. Check the recovery manager resolve-indoubt exit trace for the return code.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][2][5]

---

**00F30311**

**Explanation**: Module DSN3RIM0 could not establish an ESTAE during the processing of a resolve-indoubt (RMRQ) request. This can occur if the current address space has insufficient storage. This probably leads to an abnormal termination of the DB2 subsystem.

This abend reason code is issued by the following CSECT: DSN3RIM0

**System Action**: The caller is abended (without ABDUMP).

**Operator Response**: Notify the system programmer, and restart DB2 if necessary.

**System Programmer Response**: Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

**Problem Determination**: The caller should produce a SYS1.LOGREC entry and an SVC dump, so that the system programmer can examine the LSQA area.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][2][5]

---

**00F30312**

**Explanation**: Module DSN3RIA0 could not establish an ESTAE during the processing of a resolve-indoubt-UR (RARQ) request. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3RIA0

**System Action**: The caller is abended (without ABDUMP).

**Operator Response**: Notify the system programmer.

**System Programmer Response**: Examine the usage and free areas in the local system queue area (LSQA) portion of the current address space private area. If necessary, have the size of the private area expanded.

**Problem Determination**: The caller should produce a SYS1.LOGREC entry and an SVC dump.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1][2][5]

---

**00F30313**

**Explanation**: A CCB could not be allocated. This could occur when the storage pool has no more free space available.

This abend reason code is issued by the following CSECT: DSN3RIB2

**System Action**: The request to obtain a CCB is not processed. The application program is abended with code X'04E' and this reason code.

**User Response**: A dump should be taken for problem analysis.

**System Programmer Response**: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination**: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in...
Appendix B. “Problem determination,” on page 1349

00F30400

Explanation: This reason code is returned when a DB2 program makes a duplicate request to be called when a specific SSI function code is encountered on the SSI.

This reason code is not normally visible to users or operators, but might appear in DB2 traces.

System Programmer Response: Collect the diagnostics produced by the application program reporting the failure, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30401

Explanation: This reason code is returned when a DB2 program makes a request to no longer be called when a specific SSI function code is encountered on the SSI, but the control block representing the original request to be called is busy and cannot be deleted now. The request is processed when the control block is no longer busy.

This reason code is not normally visible to users or operators, but might appear in DB2 traces.

System Programmer Response: Collect the diagnostics produced by the application program reporting the failure, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30402

Explanation: This reason code is returned when a DB2 program makes a request to no longer be called when a specific SSI function code is encountered on the SSI, but the control block representing the original request to be called cannot be found.

This reason code is not normally visible to users or operators, but might appear in DB2 traces.

System Programmer Response: Collect the diagnostics produced by the application program reporting the failure, if any.

Problem Determination: Follow the instructions indicated by the diagnostics.

00F30405

Explanation: The DB2 subsystem was abended by module DSN3SSI1 because the system services address space’s jobstep task terminated.

This abend reason code is issued by the following CSECT: DSN3SSI1

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: You can start DB2 again after it terminates.

System Programmer Response: At least one SVC dump and associated SYSLREC entries should be available. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error which should have recorded an entry in SYSLREC dumps and requested an SVC dump. Examine the SYSLREC entries and SVC dumps to determine the actual cause of the error. Refer to [DB2 abend completion codes (X'04E' and X'04F)'] on page 5 for information on X'04E' X'04F' and X'04E' X'04F' abend completion codes.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349

00F30406

Explanation: The DB2 subsystem was abended by module DSN3SSI1 because the system services address space was forced to an end-of-memory condition.

This abend reason code is issued by the following CSECT: DSN3SSI1

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: You can start DB2 again after it terminates.

System Programmer Response: At least one SVC dump and associated SYSLREC entries should be available. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYSLREC data sets and requested an SVC dump. Examine the SYSLREC entries and SVC dumps to determine the actual cause of the error. Refer to [DB2 abend completion codes (X'04E' and X'04F)'] on page 5 for information on X'04E' X'04F' and X'04E' X'04F' abend completion codes.

Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349
00F30407

Explanation: The DB2 subsystem was abended by module DSN3SSI1, because the jobstep task in a resource manager address space terminated.

This abend reason code is issued by the following CSECT: DSN3SSI1

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: You can start DB2 again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. Examine the SYS1.LOGREC entries and SVC dumps to determine the actual cause of the error. Refer to "DB2 abend completion codes (X'04E' and X'04F')" on page 5 for information on X'04F' and X'04E' abend completion codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349: 1, 2

00F30408

Explanation: The DB2 subsystem was terminated because a DB2 resource manager address space is in end-of-memory processing.

This abend reason code is issued by the following CSECT: DSN3SSI1

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 can be started again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349: 1, 3, 5

00F30409

Explanation: The DB2 subsystem was abended by module DSN3SSES, because an allied task going through either end-of-task or one of its terminating ancestor tasks was in a DB2 must-complete function or was still holding DB2 latches.

This abend reason code is issued by the following CSECT: DSN3SSES

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349: 1, 2

00F3040A

Explanation: The DB2 subsystem was abended by module DSN3SSI1, because an allied address space going through end-of-task had one or more agents that either were in a DB2 must-complete function or were still holding DB2 latches.

This abend reason code is issued by the following CSECT: DSN3SSI1

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination.” on page 1349: 1, 2
00F3040B

Explanation: See message DSN3001I.

This abend reason code is issued by the following CSECT: DSN3SSTM

System Programmer Response: See message DSN3001I.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1] 2 3.

00F3040C

Explanation: The DB2 subsystem was abended because the SSSS IEFSSREQ service agent (EB) was in a DB2 must-complete function upon return from the agent services create allied agent function.

This abend reason code is issued by the following CSECT: DSN3SSI2

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1] 2.

00F3040D

Explanation: The DB2 subsystem was abended because the SSSS IEFSSREQ service agent (EB) was in a DB2 must-complete function upon return from the agent services terminate allied agent function.

This abend reason code is issued by the following CSECTs:

DSN3ID80 DSN3SSI2 DSN3SSES

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates.

System Programmer Response: At least one SVC dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1] 2.

00F3040E

Explanation: The DB2 subsystem was abended after a failure during processing of an IDENTIFY, COMMAND, or MVS HELP subsystem interface broadcast. The recovery routine DSN3SSES attempted to clean up processing and pass the error to the caller, but was unable to do so.

This abend reason code is issued by the following CSECT: DSN3SSES

System Action: The DB2 subsystem is terminated.

Operator Response: The DB2 subsystem should be restarted.

System Programmer Response: Scan the SYS1.LOGREC entries for the initial error and subsequent abends encountered by module DSN3SSES. The ESTAE DSN3SSES is established at least three times. Repetitive errors within the ESTAE module ultimately result in a subsystem termination with this reason code.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349[1] 2.

00F3040F

Explanation: The DB2 subsystem was abended because a DB2 latch, critical to the deferred end of task (EOT) termination process, was held by an MVS dispatchable unit, normally in an allied address space, which was no longer being dispatched and was, therefore, unable to release the latch.

This DB2 termination reason code is issued by the following CSECTs:

DSN3SSES DSN3SSI1 DSN3SSI2

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates. The system programmer should be notified.

System Programmer Response: At least one SVC
dump and associated SYS1.LOGREC entries should be available. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** This is usually caused by a previous error associated with an allied address space and especially in the case where the allied address space has been forced to an end-of-memory condition.

The console output should be examined for errors associated with allied address spaces.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00F30410**

**Explanation:** The DB2 subsystem was abended, because the end-of-task listening module failed during a must-complete window. End-of-task processing is considered to be in a must-complete state until an ESTAE has been established. The ‘user’ of this ESTAE routine was the allied end-of-task listening module DSN3EOT0.

This abend reason code is issued by the following CSECT: DSN3AAES

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 may be started again after it terminates.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00F30411**

**Explanation:** The DB2 subsystem was abended because the abnormal termination of an agent failed during resolve-end-of-memory (EOM) processing for an allied address space. The ‘user’ of this ESTAE routine was the allied EOM routine DSN3EOM0.

This abend reason code is issued by the following CSECT: DSN3AAES

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer. DB2 may be started again after it terminates.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00F30412**

**Explanation:** The DB2 subsystem was abended because the abnormal termination of an agent failed during resolve-indoubt processing for an allied agent. The ‘user’ of this ESTAE routine was the resolve-indoubt-UR RMRQ routine DSN3RIM0.

This abend reason code is issued by the following CSECT: DSN3AAES

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** Notify the system programmer. DB2 may be started again after it terminates.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The recovery routine DSN3AAES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#).

---

**00F30413**

**Explanation:** The DB2 subsystem was abended because the abnormal termination of an agent failed. However, this recovery routine was unable to determine who its caller was. It should be one of the following: DSN3EOT0, DSN3EOM0, or DSN3RIM0.

This abend reason code is issued by the following CSECT: DSN3AAES

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 may be started again after it terminates.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The recovery routine
**00F30414**

**Explanation:** The DB2 subsystem was abended, because module DSN3S11 (or its caller, DSN3C10X) was unable to establish the ESTAEs during the processing of a command SSI call. This is probably an MVS problem, because these modules are executing in the MVS CONSOLE address space.

This abend reason code is issued by the following CSECT: DSN3S11

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 may be started again after it terminates. If the failure persists, request a stand-alone dump, and re-IPL MVS.

**System Programmer Response:** This can occur if the MVS system address space that is broadcasting the command has insufficient storage. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** DB2 is unable to write a SYS1.LOGREC record or request a dump. The MVS CONSOLE function should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or DB2. Other unrelated failures in the MVS CONSOLE address space would indicate an MVS problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

| 1 | 2 | 3 |

**00F30416**

**Explanation:** The DB2 subsystem was abended, because module DSN3EOM0 was unable to establish the ESTAE during the processing of an EOM for an allied address space.

This abend reason code is issued by the following CSECT: DSN3EOM0

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 may be started again after it terminates. If the failure persists, request a stand-alone dump and re-IPL MVS.

**System Programmer Response:** This can occur if the MVS master scheduler address space that is broadcasting the EOM has insufficient free virtual storage. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** DB2 is unable to write a SYS1.LOGREC record or request a dump. The MVS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or DB2. Other unrelated failures in the MVS Master Scheduler address space would indicate an MVS problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

| 1 | 2 | 3 |

**00F30415**

**Explanation:** The DB2 subsystem was abended because module DSN3S11 (or its caller, DSN3C10X) was unable to establish the ESTAEs during the processing of an EOM SSI broadcast. This is probably an MVS problem, because these modules are executing in the MVS master scheduler address space.

This abend reason code is issued by the following CSECT: DSN3S11

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 may be started again after it terminates. If the failure persists, request a stand-alone dump and re-IPL MVS.

**System Programmer Response:** This can occur if the MVS master scheduler address space has insufficient free virtual storage. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** DB2 is unable to write a SYS1.LOGREC record or request a dump. The MVS master scheduler should have produced these diagnostic aids. Examine the dump to determine whether the problem is in MVS or DB2. Other unrelated failures in the MVS Master Scheduler address space would indicate an MVS problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

| 1 | 2 | 3 |

**00F30417**

**Explanation:** The DB2 subsystem was abended because of a failure in the first end of task (FEOT) processing for a task that had established subsystem affinity to DB2.

This abend reason code is issued by the following CSECT: DSN3SES

**System Action:** The DB2 subsystem is terminated.

**Operator Response:** DB2 can be started again after it terminates.
00F30418

Explanation: The DB2 subsystem was abended because of a failure in the end-of-memory (EOM) processing for an address space that had established subsystem affinity to DB2.

This abend reason code is issued by the following CSECT: DSN3SSES

System Action: The DB2 subsystem is terminated.

Operator Response: DB2 may be started again after it terminates.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.  

00F30419

Explanation: The DB2 subsystem was abended because a DB2 latch, critical to the Deferred End of Task (EOT) Termination process, was held by an MVS dispatchable unit, normally in an allied address space, which was no longer being dispatched and was, therefore, unable to release the latch.

This abend reason code is issued by the following CSECTs:

DSN3SSES  DSN3SSI1  DSN3SSI2

System Action: The DB2 subsystem is terminated with an SVC dump.

Operator Response: DB2 may be started again after it terminates. The system programmer should be notified.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.  

00F3041A

Explanation: An ESTAE could not be established by the deferred end-of-task (EOT) processor. This error could occur only during DB2 subsystem startup. Probably, an ESTAE could not be established because of a shortage of LSQA space.

This abend reason code is issued by the following CSECT: DSN3EOTS

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: If the failure persists, increase the size of the system services address space private area.

Problem Determination: An SVC dump and associated SYS1.LOGREC entry should be available.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.  

00F3041B

Explanation: The deferred end-of-task (EOT) processor could not locate an AGNT block for the ACE of the agent in abnormal termination. This is a system error.

This abend reason code is issued by the following CSECT: DSN3EOTS

System Action: The DB2 subsystem is terminated.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.
**Problem Determination:** A SYS1.LOGREC entry and associated SVC dump were requested. Register 8 at the time of the abort contains the ACE pointer. The AGNT block whose AGNTEB field points to the EB contained within the ACE could not be located.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30429**

**Explanation:** A DB2 subsystem task (normally a service task) going through end-of-task (EOT), or one of its terminating ancestor tasks, was a DB2 must-complete function or was still holding one or more DB2 latches.

This abend reason code is issued by the following CSECT: DSN3SSI1

**System Action:** The DB2 subsystem is terminated with an SVC dump.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** At least one SVC dump and associated SYS1.LOGREC record(s) are available. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** This is usually caused by a previous error that has recorded data in SYS1.LOGREC and requested an SVC dump. The SYS1.LOGREC record(s) and SVC dump should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30450**

**Explanation:** CSECT DSN3CL0X could not establish an ESTAE during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3CL0X

**System Action:** The allied address space is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the identify request. If a dump is available, review the virtual storage manager's control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

**Problem Determination:** A dump should be produced by the allied task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**00F30451**

**Explanation:** CSECT DSN3SSI1 could not establish its ESTAEs during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3SSI1

**System Action:** The allied task is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the request. If a dump is available, review the virtual storage manager’s control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

**Problem Determination:** A dump should be produced by the allied task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00F30452**

**Explanation:** CSECT DSN3ID30 could not establish an ESTAE during the processing of an identify SSI call. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECTs: DSN3ID30, DSN3SI30

**System Action:** The allied task is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the identify request. If a dump is available, review the virtual storage manager’s control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

**Problem Determination:** A dump should be produced by the allied task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00F30453**

**Explanation:** CSECT DSN3SSI1 could not establish its ESTAEs during the processing of an SSI call other than FEOT, EOM, HELP, COMMAND, and IDENTIFY. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3SSI1

**System Action:** The allied task is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the request. If a dump is available, review the virtual storage manager’s control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

**Problem Determination:** A dump should be produced by the allied task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00F30454**

**Explanation:** After discovering an error during the processing of an SSI call, module DSN3SSI1’s retry routine found an unknown retry point when it was attempting to retry into the mainline code. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSN3SSI1

**System Action:** The allied task is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the relevant SSI call. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The recovery routine DSN3SSES has recorded data on the SYS1.LOGREC data set and requested an SVC dump. The SYS1.LOGREC entries and SVC dump(s) should be examined to determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349

---

**00F30455**

**Explanation:** CSECT DSN3ID80 could not establish its ESTAE during the processing of the identify termination request. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSN3ID80

**System Action:** The allied task is abended (without ABDUMP).

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry
the request. If a dump is available, review the virtual storage manager’s control blocks to determine if all of the private area has been allocated. If necessary, increase the private area size of the allied address space.

**Problem Determination:** A dump should be produced by the allied task.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30456**

**Explanation:** CSECT DSN3TM00 could not identify its caller. The only callers supported are: EOT, EOM, RIUR, and CNCL.

This abend reason code is issued by the following CSECT: DSN3TM00

**System Action:** The calling task is abended.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The caller’s recovery routine may record on the SYS1.LOGREC data set and request an SVC dump. Module DSN3TM00 caller’s parameter list, recorded in the trace entry, should be examined to determine the cause of the error, and new caller support should be added to DSN3TM00, if necessary.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30457**

**Explanation:** CSECT DSN3TM00 found that the agent termination did not take place after an extra termination request (DSNARARQ).

This abend reason code is issued by the following CSECT: DSN3TM00

**System Action:** The caller is abended. The caller may, in many cases, eventually abend the DB2 subsystem.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** The caller’s recovery routine records on the SYS1.LOGREC data set and requests an SVC dump. The error indicates that there may be a problem with the subsystem support subcomponent termination routines (namely DSN3ID80, DSN3SI80, and/or DSN3CT80).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30458**

**Explanation:** The DB2 subsystem is abended because a user-exit module, either DSN3@ATH or DSN3@SGN, is not link-edited with the AMODE (31) attribute.

This abend reason code is issued by the following CSECT: DSN3AM1

**System Action:** Subsystem start-up is terminated.

**Operator Response:** DB2 may be restarted after the link-edit attributes of DSN3@ATH and/or DSN3@SGN have been changed to AMODE (31) RMODE (ANY).

**System Programmer Response:** Link-edit the user-exit module, specifying the attributes AMODE (31) RMODE (ANY).

**Problem Determination:** Refer to the JCL specifying link-edit attributes for the user exit module.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30459**

**Explanation:** The DB2 connection associated with an allied TCB could not be terminated. A RARQ request to terminate the connection could not be issued because either:

- The Resource Access List (RAL) address was zero in field ACERAL, or
- The SSAM Function Vector List (FVL) address in the RAL was zero.

This abend reason code is issued by the following CSECT: DSN3TM00

**System Action:** The DB2 subsystem is terminated with a reason code of X'00F30420'.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

**Problem Determination:** This is a DB2 internal error. Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
**00F30460**

**Explanation:** The application is running in a WLM-established stored procedure address space and is attempting to connect to DB2 using a type of DB2 Attach other than RRSAF.

**System Action:** The application is abended.

**Operator Response:** Notify the system programmer.

**Programmer Response:** Modify, relink and rerun the application.

**System Programmer Response:** Use the MVS VARY WLM,APPLENV=name,REFRESH command to refresh the load module in storage.

**Problem Determination:** The problem may be that the Stored Procedure is link edited with or has loaded the DB2 call attachment facility language interface module DSNAI. Stored procedures that run in WLM-established address spaces must be link edited with or must load the RRS attachment facility language interface module DSNRLI.

This abend reason code is issued by the following CSECTs: DSN3ID30

---

**00F30461**

**Explanation:** DB2 was unable to successfully restart with OS/390 RRS because of an internal error in either DB2 or OS/390 RRS.

**System Action:** DB2 is not connected to RRS and all services dependent on that connection are unavailable. This means that applications may not connect to DB2 using RRSAF and that WLM-established address spaces may not be used for DB2 stored procedures until DB2 successfully restarts with OS/390 RRS.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Stop and then start OS/390 RRS. Stop and then start DB2. If the problem persists, perform an OS/390 RRS cold start. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSN3RRSR, DSN3RRRS.

---

**00F30501**

**Explanation:** A nonzero return code has been received from the system parameter manager (SPM) subcomponent of DB2 when attempting to read a descriptor from the DSN3DIR1 directory. This descriptor is required in order to complete processing of the active sign-on or create thread. This is a serious error.

This abend reason code is issued by the following CSECTs: DSN3CT30, DSN3SI30

**System Action:** The requester is abended, and the request is not processed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** An SVC dump should be available. Either the module issuing the abend has made an error in compounding the descriptor name (it is a concatenation of connection type and indicators representing the request type) or the descriptor, or information in the DSN3DIR1 directory is incorrect.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSN3ID50, DSN3SI30

---

**00F30502**

**Explanation:** A nonzero return code was received from agent service’s create allied agent function during an identify or sign-on request. This indicates an allocation error that should not occur for these levels of capability.

This abend reason code is issued by the following CSECTs: DSN3ID50, DSN3SI30

**System Action:** The requester is abended, and the request is not processed.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** An SVC dump and associated SYS1.LOGREC entries should be available. Examine the DB2 trace table to determine which resource manager triggered the error indication. Also, the DSN3DIR1 entry for the appropriate protocol should be checked to ensure that only SSAM is specified to participate in allocation.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

This abend reason code is issued by the following CSECTs: DSN3AM11

---

Chapter 56. DB2 codes 1287
System Action:  DB2 start-up is terminated.

System Programmer Response:  Refer to the coding procedure for DSNZPARM in Part 2 of DB2 Installation Guide.

Problem Determination:  DSN6SYSP CSECT is missing from the DSNZPARM load module.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30571

Explanation:  This reason code is returned when a DB2 program attempts to UNSPECIFY an already inactive Program Request Handler (PRH). The indicated PRH is inactive. This reason code merely provides extra information.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

00F30572

Explanation:  This reason code is returned when a DB2 program attempts to SPECIFY a Program Request Handler (PRH) and there was one already active. The new specification overlays the older specification.

This reason code is not normally visible to users or operators, but may appear in DB2 traces.

This DB2 reason code is issued by the following CSECT: DSN3SPRX

System Action:  The new specification replaces the old one.

00F30573

Explanation:  The invoker of DSN3SPRH specified an invalid value for a resource access list entry (RALE). The RALE is outside the limits of those supported by the application program support CALL routine. (The application program support CALL routine routes control to the program request handlers.)

This abend reason code is issued by the following CSECT: DSN3SPRX

System Action:  The requester is abended, and the request is not processed.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  An SVC dump and SYS1.LOGREC entry are produced by a DB2 resource manager. Register 2 at the entry contains the resource access list element (RALE) value passed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30574

Explanation:  The invoker of DSN3SPRH specified an invalid request qualifier (QUAL) value. The QUAL is outside the limits of those supported by the application program support call routine that routes control to the program request handlers (PRHs).

This abend reason code is issued by the following CSECT: DSN3SPRX

System Action:  The requester is abended, and the request is not processed.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  An SVC dump and SYS1.LOGREC entry are produced by a DB2 resource manager. Register 2 at the entry contains the QUAL value passed.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

00F30580

Explanation:  The DSN3CONN request for the EOM, first EOT or identify SSL call during the 'release-work' notification has resulted in a nonzero return code (see message DSN3580I).

This abend reason code is issued by the following CSECT: DSN3AMI2

System Action:  The requester is abended.

Operator Response:  Notify the system programmer.

System Programmer Response:  If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination:  The original return and reason code appear in the DSN3580I message issued by DSN3AMI2. An SVC dump and associated SYS1.LOGREC entries are produced by some DB2 resource manager.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00F30581

Explanation: CSECT DSN3AMI2 found an unknown type of notify message in a message buffer. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSN3AMI2

System Action: An abend is issued, and the startup/shutdown ESTAE creates a SYS1.LOGREC entry and take an SVC dump.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: Examine the SYS1.LOGREC entries and SVC dumps. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: The SVC dump that is produced contains the relevant material for problem analysis. These buffers are set up by DSN3CL0X.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][5]

00F30597

Explanation: A protocol violation has been detected for an identify request. A noncoordinator identify request has been requested from a task that is not a subtask of the active coordinator. This occurs for protocols only where TCB hierarchy must be observed (SASS) and only when a coordinator has already identified itself to DB2.

This abend reason code is issued by the following CSECT: DSN3D30

System Action: The allied task is abended, and the request is not processed.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: An SVC dump may be produced by the allied address space.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][5]

00F30598

Explanation: A protocol violation has been detected for an identify request. A noncoordinator identify request has been requested in a PSW key different from KEY of the active coordinator at its identify. This occurs only when a coordinator has already identified itself to DB2.

This abend reason code is issued by the following CSECT: DSN3D30

System Action: The allied task is abended, and the request is not processed.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

Problem Determination: This is usually caused by a previous error that has created SYS1.LOGREC entries and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][2][5]
**00F30601**

**Explanation:** Asynchronous events occurred which caused the premature termination of the thread. The thread could not be recovered.

There may be other abends or messages concerning this allied user indicating what the asynchronous events were.

This abend reason code is issued by the following CSECTs:

DSN3ID30  DSN3RIA0  DSN3RIM0

**System Action:** The allied user is abended with code X'04E' and this reason code.

**Operator Response:** The system programmer should be notified.

**System Programmer Response:** An SVC dump associated SYS1.LOGREC entries and SYSLOG should be available. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#) for information on identifying and reporting the problem.

---

**00F30610**

**Explanation:** CSECT DSN3AMT3 could not establish an ESTAE during the processing of an 'end stop-work force' notification. This can occur if the current address space (usually system services) has insufficient storage. This may lead to abnormal termination of DB2.

This abend reason code is issued by the following CSECT: DSN3AMT3

**System Action:** The caller is abended (without ABDUMP).

**Operator Response:** Notify the system programmer and, if necessary, restart DB2.

**System Programmer Response:** If necessary, increase the private area size of the failing address space.

**Problem Determination:** An SVC dump and related SYS1.LOGREC entry are requested by the initialization procedures (IP) subcomponent job-step task.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

---

**00F30602**

**Explanation:** CSECT DSNPRHDX, on the return path (normal nonerror path) from the requested function, found that the FRBUDATA flag was on. This is a DB2 subsystem error.

This abend reason code is issued by the following CSECT: DSNPRHDX

**System Action:** The requesting task gets the FRB return and reason codes as set by the requested function. The task is not abended.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The SYS1.LOGREC entries and SVC dump should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

---

**00F30801**

**Explanation:** The DB2 subsystem was abended by module DSNPRHX. DSNPRHX was called and the request was passed on to the DB2 subsystem. However, upon return, it was discovered that the requesting (calling) TCB was in a DB2 must-complete function or was still holding DB2 latches.

This abend reason code is issued by the following CSECT: DSNPRHDX

**System Action:** The DB2 subsystem is terminated. An MVS SVC dump is requested.

**Operator Response:** Notify the system programmer, and restart DB2.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** This is usually caused by a previous error that has created SYS1.LOGREC entries and requested an SVC dump. The SYS1.LOGREC entries and SVC dumps should be examined to determine the actual cause of the error.

Collect the following diagnostic items listed in [Appendix B, “Problem determination,” on page 1349](#)

---

**00F30802**

**Explanation:** CSECT DSNPRHDX could not establish its ESTAE during the processing of an application program support call. This can occur if the current address space has insufficient storage.

This abend reason code is issued by the following CSECT: DSNPRHDX

**System Action:** The allied task is abended (without ABDUMP).
**Operator Response:** Notify the system programmer.

**System Programmer Response:** The user may retry the request. If necessary, increase the private area size of the application address space.

**Problem Determination:** The allied task may have requested an SVC dump.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30805**

**Explanation:** The caller’s connection with DB2 has been terminated, because the DB2 subsystem has terminated or is in the process of terminating abnormally.

This abend reason code is issued by the following CSECT: DSNAPRHX

**System Action:** The request has may been processed or aborted.

**User Response:** The requester may identify to DB2 when it becomes operational again.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30901**

**Explanation:** DB2 has lost its cross-memory authority to an allied address space because the ally has released its authorization index.

This reason code is issued by the following CSECT: DSN3SES

**System Action:** The allied address space is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30902**

**Explanation:** DB2 has detected a recursive abend condition while processing end-of-task for a task in an allied address space.

This reason code is issued by the following CSECT: DSN3SES

**System Action:** The allied address space is terminated.

**Problem Determination:** Attempt to determine if one or more DB2 address spaces is storage-constrained. Examination of the console output for the time period preceding this condition may reveal other messages or indications that the terminating address space was storage-constrained.

---

**00F30903**

**Explanation:** An abend has occurred while processing End-of-Task for the control address space or a resource manager address space.

This reason code is issued by the following CSECT: DSN3SES

**System Action:** The address space is forced to end-of-memory with this reason code.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F30904**

**Explanation:** End-of-Task occurred for the control address space or a resource manager address space and DB2 could not establish an ESTAE to protect its processing. Insufficient storage may be the reason the ESTAE could not be established.

This reason code is issued by the following CSECT: DSN3SSE

**System Action:** The address space is forced to end-of-memory with this reason code.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference](#) for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---
00F30905

Explanation: End-of-Task occurred for the job step task in an allied address space. DB2 would normally attempt to terminate the address space’s connection to DB2 but was unable to protect its processing by establishing an ESTAE. Insufficient storage may be the reason the ESTAE could not be established.

This reason code is issued by the following CSECT: DSN3SS1

System Action: The address space is forced to end-of-memory with this reason code.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Problem Determination: Attempt to determine if one or more allied address spaces is storage-constrained. Examination of the console output for the time period preceding this condition may reveal other messages or indications that the terminating allied address space was storage-constrained.

00F33100

Explanation: The DB2 thread is ‘read-only’.

This reason code is issued by the following CSECT: DSN3PR00

System Action: A prepare issued by the application program was processed through Phase 1. DB2 discovered there were no resources modified and no need for commit or abort to be subsequently issued.

User Response: May effect a path length savings by not issuing the subsequent commit or abort which normally follows prepare. No further action is required to complete the unit of recovery; the unit of recovery is complete.

00F3AFFF

Explanation: An unrecoverable error return code was received from the RACROUTE REQUEST=VERIFY macro service. The return code was other than 0, 4, or 8.

This abend reason code is issued by the following CSECT: DSN3@SGN

System Action: The SIGNON request is abended. An SVC dump is requested by DB2 functional recovery.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The abend with this reason code is issued by the sample SIGNON exit after the implementation in the user’s installation. It indicates that an unrecoverable error occurred with the RACROUTE REQUEST=VERIFY macro service.

GPR 2 at the time of abend will contain the original RACROUTE return code from GPR 15. GPR 3 at the time of abend will contain the reason code returned by the RACROUTE macro service in GPR 0, if any.

Refer to Resource Access Control Facility (RACF) System ProgrammerS for descriptions of the RACROUTE return and reason codes.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
Chapter 57. X’F7......’ codes

00F70001
Explanation:  DB2 could not find the system parameters CSECT DSN6GRP.
System Action:  The DB2 subsystem terminates.
Operator Response:  Restart DB2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.
System Programmer Response:  Investigate the system parameters load module.
Problem Determination:  If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
This code is issued by the following CSECT: DSN7SINI

00F70002
Explanation:  DB2 data sharing was requested, but MVS was not at the required level. You must use MVS Version 5 Release 1.0 or a later release.
System Action:  The DB2 subsystem terminates.
Operator Response:  Restart DB2 on a system with MVS Version 5 Release 1.0 or a later release.
Problem Determination:  If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
This code is issued by the following CSECT: DSN7SINI

00F70003
Explanation:  The DB2 subsystem parameters specified that data sharing should be active. DB2 startup checking failed for either of two reasons:
  • The group and member names contained in the subsystem parameters are not equal to the group and member names contained in the DB2 ssrmMSTR JCL start procedure, or
  • The DB2 member is already active on another MVS system.
System Action:  DB2 terminates.
Operator Response:  Make sure the correct subsystem parameter load module name was specified for the DB2 that failed to start. Restart DB2 with the correct subsystem parameter name.
System Programmer Response:  Make sure the subsystem parameter name specified is the correct one for the DB2 subsystem and is not for a different member or group. You cannot share subsystem parameters among the members of a data sharing group. Make sure the group and member names specified in the subsystem parameters are equal to the group and member names contained in the DB2 ssrmMSTR JCL start procedure.
Problem Determination:  If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
This code is issued by the following CSECT: DSN7SINI

00F70041
Explanation:  DB2 could not find the system parameters CSECT DSN6GRP.
System Action:  The DB2 subsystem terminates.
Operator Response:  Restart DB2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.
System Programmer Response:  Investigate the system parameters load module.
Problem Determination:  If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
This code is issued by the following CSECT: DSN7GINI

00F70402
Explanation:  DB2 could not create a service task for the group basic services function.
System Action:  The DB2 subsystem terminates.
Problem Determination:  If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.
This code is issued by the following CSECT: DSN7GCTK

00F70403
Explanation:  DB2 could not find the system parameters CSECT DSN6SPRM.
System Action:  The DB2 subsystem terminates.
Operator Response:  Restart DB2 with the correct system parameters load module. If the problem reoccurs, notify the system programmer.
System Programmer Response:  Investigate the system parameters load module.
Problem Determination:  If you suspect an error in
00F70404 – 00F70409

DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This code is issued by the following CSECT:
DSN7GCHK

00F70404

Explanation: DB2 could not open the SCA member information record.

System Action: DB2 terminates.

Operator Response: Check if the CF SCA structure is allocated. Restart DB2. If the problem occurs again, notify the system programmer.

System Programmer Response: Check if correct policy is active.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This code is issued by the following CSECT:
DSN7GCHK

00F70405

Explanation: DB2 encountered an unexpected error while trying to read from or write to the shared communications area (SCA).

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSN7GJON, DSN7GRMA.

00F70406

Explanation: DB2 issued an XCF macro IXCQUERY, but it failed. (XCF is the cross-system coupling facility component of MVS.)

System Action: The DB2 subsystem terminates.

Operator Response: Check the MVS console for XCF-related error messages. Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the DB2 subsystem. If the problem reoccurs, notify the system programmer.

System Programmer Response: Investigate the reason for this unexpected error. Refer to MVS/ESA Programming: Sysplex Services Reference for information about XCF return and reason codes.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This code is issued by the following CSECT: DSN7GJON

00F70407

Explanation: This is a DB2 internal error. The member name and member ID do not match in the B SDS, the XCF function data set or the SCA structure.

System Action: The DB2 subsystem terminates.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This code is issued by the following CSECT:
DSN7GJON

00F70408

Explanation: DB2 issued an MVS XCF IXCJOIN request, but it failed. (XCF is the cross-system coupling facility component of MVS.)

System Action: The DB2 subsystem terminates.

Operator Response: Check the MVS console for XCF-related error messages. Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the DB2 subsystem. If the problem reoccurs, notify the system programmer.

System Programmer Response: Investigate the reason for this unexpected error. Refer to MVS/ESA Programming: Sysplex Services Reference for information about XCF return and reason codes.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This code is issued by the following CSECT: DSN7GJON

00F70409

Explanation: DB2 encountered an unexpected error while trying to read from or write to the local bootstrap data set (BSDS).

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem Determination: Refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSN7GJON
00F7040A

**Explanation:** DB2 detected an unexpected error during deletion of a DB2 service task.

**System Action:** DB2 terminates.

**System Programmer Response:** Investigate the problem and call the IBM support center.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSN7GTRM

---

00F70410

**Explanation:** DB2 detected an unexpected error during IRLM locking.

**System Action:** DB2 terminates.

**System Programmer Response:** Investigate the problem.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSN7GJON

---

00F70600

**Explanation:** The connection to the shared communications area (SCA) was lost.

**System Action:** DB2 terminates because DB2 data sharing cannot function without the SCA.

**User Response:** Notify the system programmer.

**System Programmer Response:** Figure out why the SCA link to this central processor complex (CPC) is lost and correct the problem. Then restart DB2.

**Problem Determination:** If there is an active SFM policy which specifies that a rebuild of the SCA should occur, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This code is issued by the following CSECT: DSN7LST3

---

00F70601

**Explanation:** The shared communications area (SCA) structure failed. DB2 initiated dynamic rebuild of the structure. However, the rebuild process failed and DB2 cannot continue without the SCA.

**System Action:** DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Correct the SCA structure and restart DB2. If all DB2s in the group terminate with this code, the next DB2s restart might do a group restart.

**Problem Determination:** This code is issued by the following CSECTs: DSN7LST2, DSN7LST3.

---

00F70602

**Explanation:** DB2 cannot connect to the shared communications area (SCA) coupling facility structure.

**System Action:** Because DB2 data sharing cannot function without the SCA, DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Refer to message DSN7506I for more information

**Problem Determination:** This abend reason code is issued by the following CSECTs: DSN7LSTK, DSN7LST2.

---

00F70603

**Explanation:** DB2 encountered an error in accessing the shared communications area (SCA) coupling facility structure.

**System Action:** Since DB2 data sharing cannot function without the SCA, DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Refer to message DSN7508I for more information.

**Problem Determination:** This code is issued by the following CSECTs: DSN7LRE1 DSN7LRO1 DSN7LWR1 DSN7LDE1

---

00F70604

**Explanation:** DB2 cannot rebuild the shared communications area (SCA) coupling facility structure.

**System Action:** Because DB2 data sharing cannot function without the SCA, DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Refer to messages DSN7506A and DSN7508I for more information.

**Problem Determination:** This abend reason code is issued by the following CSECT: DSN7LSTK

---

00F70605

**Explanation:** DB2 cannot create a needed service task. This is a DB2 internal error.

**System Action:** DB2 terminates.

**User Response:** Notify the system programmer.
System Programmer Response: Investigate the problem.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSN7LCTK

---

**00F70606**

**Explanation:** DB2 detected an unexpected error. This is a DB2 internal error.

**System Action:** DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Investigate the problem.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. This abend reason code is issued by the following CSECTs: DSN7LSUS, DSN7LEST.

---

**00F70607**

**Explanation:** DB2 detected that the shared communications area (SCA) coupling facility structure reached the directory entry limit of 200.

**System Action:** DB2 terminates because DB2 data sharing cannot function without the SCA.

**User Response:** Notify the system programmer.

**System Programmer Response:** Investigate the problem.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. This abend reason code is issued by the following CSECT: DSN7LOP1

---

**00F70608**

**Explanation:** DB2 detected an unexpected error. This is a DB2 internal error.

**System Action:** DB2 terminates.

**User Response:** Notify the system programmer.

**System Programmer Response:** Investigate the problem.

**Problem Determination:** Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. This abend reason code is issued by the following CSECTs: DSN7LOP1, DSN7LUTL.
Chapter 58. X’F9…..’ codes

An entry in the SYS1.LOGREC data set is requested for all of the following abnormal termination conditions. The SDWA variable recording area (VRA) contains the information provided by the DSNWRCRD function. When VRA space permits, the recordable section of the diagnostic data table (DDT control block) is also placed in the VRA. If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

All general command processor modules use register 10 as a base register. This may be helpful when attempting to match a register value to a module map.

---

**00F90000**

**Explanation:** A command processor has been invoked via the application program support function while the local lock of the caller’s address space was held. CSECT DSN9SCNF tried to obtain the lock in order to obtain a response message buffer, but it was unable to do so. This represents a logic error in the function that submitted the command to the application program support function.

This abend reason code is issued by the following CSECT: DSN9SCNF

**System Action:** Command execution was abended. If the command was properly entered, it may have been partially or completely executed.

**Operator Response:** Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS).

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see Chapter 58, “X’F9…..’ codes.”

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1] 2 5

---

**00F90001**

**Explanation:** A command processor has been invoked via the application program support function. CSECT DSN9SCNF obtained the LOCAL lock of the caller’s address space prior to obtaining a response message buffer, but was then unable to release the lock. This condition, if it occurs, is a serious one.

This abend reason code is issued by the following CSECT: DSN9SCNF

**System Action:** Command execution was abended. If the command was properly entered, it may have been partially or completely executed.

**Operator Response:** Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS).

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of [DB2 Diagnosis Guide and Reference] for information on identifying and reporting the problem.

**Problem Determination:** The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see Chapter 58, “X’F9…..’ codes.”

Collect the following diagnostic items listed in
Appendix B, “Problem determination,” on page 1349,1
2 5.

00F90003

Explanation: The routines of the multiple console support (MCS) service of MVS were unable to initialize.
CSECT DSN9SCN6 obtained the tokenized command (TCS) cannot be obtained from the global storage pool obtained by
CSECT DSN9SCNP. The TCS storage request is the first storage request made using this pool. This is not a user error.

This abend reason code is issued by the following CSECT: DSN9SCN7

System Action: The command was not executed.

Operator Response: Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see Chapter 58, “X’F9......’ codes,” on page 1297.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349,1
2 5.

00F90005

Explanation: A routine of the multiple console support (MCS) service of MVS was not able to create an ESTAE recovery environment. This condition is detected when the ESTAE service of MVS returns a nonzero return code. The command from the associated MCS console is not executed. Refer to the appropriate MVS publication for an explanation of ESTAE return codes.

This abend reason code is issued by the following CSECTs:

DSN9SCN5   DSN9SCN6   DSN9SCN7

System Action: Command processing is terminated.

Operator Response: Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: If available, the diagnostic data table (DDT control block) will appear in the SDWA variable recording area (VRA). For additional diagnostic information, see Chapter 58, “X’F9......’ codes,” on page 1297.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349,1
2 5.

00F90006

Explanation: The agent allocation routine was not able to allocate command processing capability to an agent. This failure occurs, because there is a damaged control block in global storage (CSA). The control block is the command global data area (CGDA). The address of the CGDA is in the general command processor RMFTRUSE field. This is not a user error.
This abend reason code is issued by the following CSECT: DSN9SCNB

**System Action:** Agent allocation is terminated.

**Operator Response:** Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed. It may be necessary to restart the attachment (IMS or CICS) or the DB2 subsystem.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see *Chapter 58, “X’F9..... codes,” on page 1297*.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F90007**

**Explanation:** The command parsing routines have attempted to update one of the command statistical counters that are kept in local storage. However, the counter control block validation field is wrong, indicating a damaged control block. The counter control block is located via the 'CGDASTA' address in the command global data area (CGDA) control block. The CGDA address is in the general command processor RMFTRUSE field. This is not a user error.

This abend reason code is issued by the following CSECT: DSN9SCN2

**System Action:** The statistical update is not completed. The statistics block address is cleared from the CGDA to prevent future failures. No further command statistical counts are maintained. Processing for the command is retried and should complete normally.

**Operator Response:** Print the contents of the SYS1.LOGREC data set. If a dump was produced, have it printed.

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see *Chapter 58, “X’F9..... codes,” on page 1297*.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

**00F90009**

**Explanation:** This reason code is used to document that CSECT DSN9SCN9 has added information to the SDWA variable recording area (VRA) following the data provided by the DSNWRCD service. If DSN9SCN9 records a failure in SYS1.LOGREC and the reason code in the VRA is not of the form X’00F9xxxx’, the reason code is changed to X’00F90009’. This is done so that anyone examining a SYS1.LOGREC entry can determine, from the reason code, what additional data has been placed in the VRA. The reason code is the first data item in the VRA, as mapped by macro IHAVRA.

This abend reason code is issued by the following CSECT: DSN9SCN9

**System Programmer Response:** If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**Problem Determination:** The diagnostic data table (DDT control block) appears in the SDWA variable recording area (VRA). For additional diagnostic information, see *Chapter 58, “X’F9..... codes,” on page 1297*.
Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Explanation: The command parsing routines attempted to obtain a descriptor using the DSNZGDGE service of the system parameter manager but the expected descriptor was not found (the DSNZGDGE return code was X’04’). All descriptors used by the parser are contained in CSECT DSN9SCNA. This failure probably indicates incorrect data in CSECT DSN9SCN.

This abend reason code is issued by the following CSECTs:

DSN9SCN4   DSN9SCN2   DSN9SCN1

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The diagnostic data table (DDT control block) appears in the subsystem diagnostic work area (SDWA) variable recording area (VRA). Register 8 contains the address of the tokenized command statement (TCS) control block, and register 9 contains the requested storage length. The TCS is the DB2 internal representation of the command text. For additional diagnostic information, see Chapter 58, “X’F9......’ codes,” on page 1297.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The diagnostic data table (DDT control block) appears in the subsystem diagnostic work area (SDWA) variable recording area (VRA). Register 8 contains the address of the tokenized command statement (TCS) control block, and register 9 contains the requested storage length. The TCS is the DB2 internal representation of the command text. For additional diagnostic information, see Chapter 58, “X’F9......’ codes,” on page 1297.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

Explanation: The command parsing routines attempted to obtain storage from the storage pool (PHB) provided on a DSN9SCN service request. Normally, this is CSA storage in the pool built by CSECT DSN9SCNP. The storage request could not be satisfied, either because no CSA storage was available or because an unreasonably large amount of storage was requested. The amount of storage requested is determined by the length of the command being parsed. Normally, it is several hundred bytes.

This abend reason code is issued by the following CSECT: DSN9SCN0

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of DB2 Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: The GCPC Diagnostic Data Table (DSNDDDT Control Block) is recorded in the Variable Recording Area of the SDWA associated with the error.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
00F9000D

**Explanation:** The command preprocessor (GCPC) start-up routine (DSN9SCNE) discovered that the ERLY block is out-of-date. This error indicates that the current early code is not yet compatible with this version of DB2; a required early code PTF is missing.

This abend reason code is issued by the following CSECT: DSN9SCNE

**System Action:** The DB2 subsystem start-up is terminated.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Check the Program Directory, apply the required early code PTF and re-IPL MVS.
Part 5. IRLM messages and codes

Chapter 61. IRLM Abend Reason Codes ...................................... 1335
Chapter 59. IRLM messages and codes

This section describes all messages, error return and reason codes, and abend reason codes issued by the internal resource lock manager (IRLM). The database management system (DBMS) referred to throughout the messages and codes is either DB2 or IMS. Some messages and codes do not apply to DB2 operations.

**IRLM messages**

This section describes messages for the resource lock manager (IRLM) subcomponent.

The messages have the form of DXRxxxa and are listed in numeric order.

**DXR** The prefix for IRLM messages.

**xxx** The numeric part of the message.

**a** An alphabetic suffix, as follows:

- **I** The message is for information only.
- **E** The message reports an error condition which might require action.
- **A** Action is required of the user before processing can continue.

IRLM will now direct messages in two ways:

1. If a UN-solicited message is to be issued, the target "console" will be the one in which IRLM was started from.
2. If a solicited message is to be issued, i.e. via "F IRLM,STATUS" opercmd, it will automatically be directed back to the console from which the modify was accepted. Even if it was a TSO session running SDSF.

All messages contain the issuing IRLM subsystem name and ID, *irlmx* where, *irlmx* is the concatenation of the IRLMNM and IRLMID specified as EXEC parameters when the IRLM was started, as shown below.

```
<table>
<thead>
<tr>
<th>IRLMNMM</th>
<th>IRLMID</th>
</tr>
</thead>
</table>
```

*Figure 3. Format of *irlmx*

- If IRLMN姆='KRLM' and IRLMID='12' then *irlmx*='KRLM012'
- If IRLMN姆='LRLM' and IRLMID='0' then *irlmx*='LRLM000'

The IRLMID is displayed as three characters in the messages.

```
|
```

*Explanation:* This message is issued in response to the following command:

```
F irlmproc,STATUS,STOR
```

A brief summary of selected storage usage is displayed where:

- **pc** this value is always YES, regardless of the value in the irlmproc or passed at startup.
- **pvt** this represents the extended private storage.
The number of IRLM control block segments below 16M. Its value is the number of control block segments.

The storage allocated to the segments in segbelow. Its value is the storage allocation specified as either xxxK for kilobytes or xxxM for megabytes.

The storage allocated to the segments in segbelow. Its value is the number of IRLM control block segments.

The number of storage segments allocated.

The storage specified as either xxxK for kilobytes or xxxM for megabytes.

The following is sample output when the parameter PC = YES:

```
DXR100I 6291002 STOR STATS
PC: YES  PVT : 1500M  LTE: 16M  RLE: 231410  RLEUSE: 20
CSA USE: ACNT: 600K  AHWM: 50K  CUR: 4362K  HWM: 5630K
ABOVE 16M: 78  4300K BELOW 16M: 44  53K
CLASS TYPE SEG5 MON TYPE SEG5 MON TYPE SEG5 MON
ACNT T-1 1 64K T-2 1 64K T-3 1 4K
PROC WRK 11 59K SRR 41 41K OTH 2 2K
MISC VAR 68 4497K N-V 6 22K FIX 2 24K
```

System Action: Processing continues normally.

```
DXR101I irlmx STATUS SCOPE=nnnnnn
SUBSYSTEMS IDENTIFIED
```

```
NAME STATUS UNITS HELD WAITING RET_LKS
ssname zzz wun reh rew rtlks
```

Explanation: This message is issued in response to the following command:

```
F irlmproc,STATUS
```

A list of DBMSs identified to the IRLM is displayed. Work unit and lock information is displayed for each DBMS.
The message variables are:

* **n**nnnnn One of the following:
  - **LOCAL**
    - SCOPE=LOCAL was specified as an EXEC parameter when the IRLM was started.
  - **GLOBAL**
    - SCOPE=GLOBAL was specified in the IRLMPROC and the IRLM is connected to a data sharing group.
  - **DISCON**
    - SCOPE=GLOBAL or SCOPE=NODISCON was specified in the IRLMPROC and the IRLM is not connected to a data sharing group.
  - **NoDISC**
    - SCOPE=NODISCON was specified in the IRLMPROC and the IRLM is connected to a data sharing group.
  - **GINIT**
    - SCOPE=GLOBAL was specified in the IRLMPROC and the IRLM is joining a data sharing group.
  - **GTERM**
    - SCOPE=GLOBAL was specified in the IRLMPROC and the IRLM is terminating from a data sharing group.

* **s**ssname
  - An eight-character DBMS name.
* **zzz**
  - One of the following:
    - **UP**
      - The DBMS is active.
    - **DOWN**
      - The DBMS failed.
    - **UP-RO**
      - The DBMS subsystem is active and is currently identified to the IRLM as a 'read-only' subsystem.
    - **UP-NS**
      - The DBMS subsystem is active and is currently identified to the IRLM as a 'no-share' subsystem.
    - **CLEANUP**
      - The IRLM drove the DBMS STATUS exit, indicating a failure condition, and is waiting for that DBMS to respond with a PURGE, indicating cleanup is complete.
    - **SFML**
      - The IRLM to which the DBMS is identified disconnected from the data sharing group. The modify locks for all the subsystems on that IRLM were retained by IRLM. All DBMSs that are identified to IRLMs disconnected from a data sharing group are listed as SFAIL by the surviving IRLMs.

* **wun**
  - The number of work units under the DBMS that are holding or waiting for a lock. No work units exist for a failed DBMS. The field is set to '...' for a failed DBMS.

* **reh**
  - The number of resources locked by the DBMS.
* **rew**
  - The number of waiting lock requests. No waiting requests are permitted for a failed DBMS. The field is set to '...' for a failed DBMS.
* **rtlks**
  - The number of retained locks held by a subsystem that failed or was running on an IRLM that failed. In most cases, retained locks are purged when a DBMS reidentifies to IRLM; therefore the number is zero for active DBMSs. However, it is possible for a DBMS to hold both active and retained locks if it is recovering from a previous failure.

If no DBMSs are identified to this IRLM, the line beginning with **ssname** is replaced with NO INFORMATION AVAILABLE.

**System Action:** Processing continues normally.

---

**DXR102I**  
irmx STATUS SUBSYSTEMS IDENTIFIED  

<table>
<thead>
<tr>
<th>XNAME</th>
<th>STATUS</th>
<th>XRET-LKS</th>
<th>IRLMID</th>
<th>IRLM_NAME</th>
<th>IRLM_LEVL</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssname</td>
<td>zzz</td>
<td>rtlks</td>
<td>id</td>
<td>iname</td>
<td>ilvel</td>
</tr>
</tbody>
</table>

**Explanation:** This message is issued in response to the following commands:

F irmprox,STATUS,ALLD  
F irmprox,STATUS,irnlmx

where **irmux** is the IRLMX + IRLMID fields as specified in the IRLMPROC whose status is requested.

A list of DBMSs identified to the IRLMs in the data sharing group is displayed.

The message variables are:

* **ssname**
  - An 8-character DBMS name.
* **zzz**
  - One of the following:
    - **UP**
      - The DBMS is active.
    - **DOWN**
      - The DBMS failed.
    - **UP-RO**
      - The DBMS subsystem is active and is currently identified to the IRLM as a 'read-only' subsystem.
    - **UP-NS**
      - The DBMS subsystem is active and is currently identified to the IRLM as a 'no-share' subsystem.
    - **CLEANUP**
      - The IRLM drove the DBMS STATUS exit, indicating a failure condition, and
is waiting for that DBMS to respond with a PURGE, indicating cleanup is complete.

**SFAIL** The IRLM to which the DBMS is identified was disconnected from the data sharing group. The modify locks for all DBMS subsystems on that IRLM were retained by IRLM. All DBMSs that are identified to IRLMs disconnected from a data sharing group are listed as SFAIL by the surviving IRLMs.

**rtlks** The number of retained locks held by a subsystem that failed or was running on an IRLM that failed. In most cases, retained locks are purged when a DBMS reidentifies to IRLM; therefore, the number is zero for active DBMSs. However, it is possible for a DBMS to hold both active and retained locks if it is recovering from a previous failure.

**id** The ID of the IRLM to which the DBMS is identified.

**iname** The name of the IRLM to which the DBMS is identified.

If no DBMSs are identified to any IRLM or to the IRLM specified, or the IRLM specified is not known, the line beginning with sssname is replaced with NO INFORMATION AVAILABLE.

**ilevl** The IRLM function level requested by the DBMS at IDENTIFY.

If the IRLM to which the DBMS was IDENTIFIED is no longer connected to the data sharing group, then the value displayed for IRLM_LEVL will be zero. The value displayed for any DBMS is determined by the APAR or PTF level applied to that DBMS.

System Action: Processing continues normally.

**DXR103I** **iname** STATUS IRLMS PARTICIPATING IN DATA SHARING GROUP FUNCTION LEVEL **glv**

<table>
<thead>
<tr>
<th>IRLM-NAME</th>
<th>IRLMID</th>
<th>STATUS</th>
<th>LEVEL</th>
<th>SERVICE</th>
<th>MIN_LEVEL</th>
<th>MIN_SERVICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>iname</td>
<td>id</td>
<td>zzz</td>
<td>lv</td>
<td>s</td>
<td>mlv</td>
<td>ms</td>
</tr>
</tbody>
</table>

Explanation: This message displays the active IRLMs in response to the following command:

*F irlmproc,STATUS,ALLI*

A list of IRLMs in the group that are actively data sharing is displayed. If not data sharing, the single IRLM is displayed.

**glv** The IRLM function level in use by all the IRLM(s) in the data sharing group.

iname A 4-character IRLM name.

id The ID of the IRLM.

zzz One of the following:

- **UP** The IRLM is active.
- **DOWN** The IRLM failed.

lv The current IRLM function level.

s The IRLM service or release that corresponds to the function level given in s

mlv The minimum IRLM function level this IRLM can coexist with.

ms The IRLM service or release that corresponds to the function level given in mlv

System Action: Processing continues normally.

**DXR104I** **iname** MAINTENANCE LEVELS

Explanations: This display is produced by the MODIFY irlmproc,STATUS,MAINT command. Maintenance levels of all IRLM load modules except DXRRL183, DXRRLFTB, DXRRLM50, and DXRRL186 are displayed to the console in two column format, showing the most recent APAR level and the compile date applied to each csect.

System Action: IRLM processing continues normally.

Operator Response: Review the maintenance level for any suspected module error or as requested by the IBM Support Center.

System Programmer Response: none

**DXR105E** **iname** STOP COMMAND REJECTED. AN IDENTIFIED SUBSYSTEM IS STILL ACTIVE

Explanations: A STOP irlmproc command was entered, but the IRLM still has active DBMSs identified.

System Action: The command is not processed, but IRLM processing continues normally.

Operator Response: Reenter the STOP command after all active DBMSs have terminated, or terminate the IRLM abnormally with the F irlmproc,ABEND command.

**DXR106E** **iname** INVALID MODIFY COMMAND PARAMETER SPECIFIED

Explanations: A MODIFY command specified the procedure name of this IRLM, but the command either contained parameter values not supported by the IRLM or did not contain a required parameter.

System Action: The command is not processed, but IRLM processing continues normally.

Operator Response: Reenter the MODIFY command with the correct parameters.
DXR107E  irlmx STORAGE NOT AVAILABLE TO PROCESS THIS COMMAND

Explanation:  The IRLM cannot obtain sufficient internal working storage to process the command.

System Action:  The command is not processed, but IRLM processing continues normally.

Operator Response:  Inform the system programmer.  Reenter the command after storage is available to process the command.

System Programmer Response:  Increase the region size specified on the IRLM startup procedure.

DXR108I  irlmx PURGE, nnnnnnn COMMAND FAILED yyyyyyy

Explanation:  A PURGE command specified either a name of an active DBMS or a name that is not known to this IRLM.

nnnnnnn  The dbmsname specified on the PURGE, dbmsname command.

yyyyyyy  The reason the purge command failed:

PURGE IN PROGRESS:
   Either another PURGE command is being processed, or the IRLM is in the process of cleaning up from the disconnection of another group member.

NAME NOT FOUND OR ACTIVE:
   The DBMS name specified cannot be found, or that DBMS is identified as an active subsystem and cannot be purged by the PURGE command.

System Action:  The command failed, but IRLM processing continues normally.

Operator Response:  Reenter the PURGE command with the correct parameters.

DXR109I  irlmx PURGE COMMAND COMPLETED FOR nnnnnnnn

Explanation:  A PURGE command completed successfully.

nnnnnnnn  The DBMS name specified on the PURGE, dbmsname command

System Action:  Processing continues normally.

DXR110I  irlmx STOP COMMAND ACCEPTED

Explanation:  The IRLM accepted the STOP command or IRLM has initiated the AUTOSTOP function and is beginning the normal shutdown process.

System Action:  The IRLM is performing shutdown processing.  The IRLM subtasks are being quiesced and detached.  If the IRLM is actively part of a data sharing group, then the other IRLMs are informed when this IRLM leaves the data sharing group.  If IRLM was autostarted by the DB2 IRLM will issue this message when the DB2 terminates.

DXR116E  irlmx INITIALIZATION FAILED, CODE=xx DETECTED BY zzzzzzzz

Explanation:  The IRLM was unable to complete initialization because of error code xx.  The name of the module that detected the failure is zzzzzzzz.

The values of xx are:

01  Unable to allocate global storage.
02  Unable to allocate local storage.
03  The IRLMID was missing or invalid.  IRLMID must be specified as a 1 to 3-digit number from 0 through 255.  The IRLMID must be unique among all IRLMs belonging to the same data sharing group (having the same GROUP parameter).  This code can also be returned if you are using a printable character (such as 'D') for the IRLM identifier.  Because of the way MVS interprets quotes, a printable character must be surrounded by enough single quotes for IRLM to determine that this is a printable character.  For the IRLMID parameter in the startup procedure, there must be seven quotes on either side of the character ('''D'''').  If you are specifying the IRLMID on the EXEC statement, there must be three quotes on either side (''''D'''').
05  The DEADLK parameter was missing or invalid.  This parameter must be specified as iii,kkkk, where iii and kkkk are 1 to 4-digit numbers from 1 through 9999.
06  An MVS subsystem SSCVT containing the name specified by the IRLMNMM parameter does not exist.  IRLM was not properly registered with MVS to use the subsystem interface.
07  Error in module zzzzzzzzz initialization.
08  Error loading IRLM modules.
09  IRLM was already started.
10  The SCOPE parameter was missing or invalid.  Either LOCAL, GLOBAL, or NODISCON must be specified.
The MAXCSA parameter was missing or invalid. This parameter must be specified with value range from 0 to 999, or blank. The value is ignored, but the parameter must be specified for compatibility.

The IRLMN parameter was missing or a length greater than 4 was specified.

The SETDIE for the initial deadlock time interval failed.

The PC parameter was specified incorrectly. The value must be YES, NO, or blank. The value is ignored, but the parameter must be specified for compatibility.

The operating system on which IRLM is attempting to start is not MVS/XA or higher.

The MAXUSRS parameter was invalid.

Invalid group name. A 1 to 8 character group name must be specified if running SCOPE=GLOBAL.

Invalid lock table name. The lock table name must be the same as the one defined in the MVS locking policy, or it must not be specified.

The CTRACE DELETE HEAD-level trace failed.

The CTRACE DEFINE HEAD-level trace failed.

More than one displayable character was specified for the IRLMID parameter.

An invalid value for the TRACE parameter is specified. The only valid values are YES and NO.

The value specified for LTE= is not in the valid range of 0-1024 or is not an even power of two. (i.e. 2,4,8,16...)

System Action: IRLM user abend 2018 is issued.

Operator Response: Notify the system programmer.

System Programmer Response: Take the following action based on the code:

01 Make global storage available to IRLM. Analyze the dump for more information.
02 Increase the region size on the IRLM startup procedure. Analyze the dump for more information.
03 Correct the IRLMID parameter on the IRLM startup procedure.
04 Correct the DEADLOK parameter on the IRLM startup procedure.
05 Verify that the IRLM startup procedure specifies the desired IRLM name. If IRLMN
specifies the desired name, verify that an MVS subsystem with that name is defined.
07 Analyze the dump to determine the problem.
08 Analyze the dump to determine the problem.
09 Verify that the IRLM startup procedure specifies the desired IRLM name.
10 Correct the SCOPE parameter on the IRLM startup procedure.
11 Correct the MAXCSA parameter on the IRLM startup procedure.
12 Correct the IRLMN parameter on the IRLM startup procedure.
13 Analyze the dump to determine the problem.
14 Correct the IRLM PC parameter.
15 IRLM must be run on an MVS/XA or higher system.
16 Correct the MAXUSRS parameter.
17 Correct the XCF group name parameter in the IRLM startup procedure.
18 Correct the lock table name parameter in the IRLM startup procedure.
19 Analyze the dump to see what is wrong with CTRACE.
20 Analyze the dump to see what is wrong with CTRACE.
21 Analyze the dump to see what is wrong with CTRACE.
22 Correct the value for the IRLMID parameter.
23 Correct the value for the TRACE parameter.
24 Correct the value for the LTE parameter and re-issue the START command.

For codes 1, 2, 6, 7, 8, 13, 18, 19, and 20, an SDUMP is also taken. The IRLM discontinued its initialization processing.

DXR117I irlmX INITIALIZATION COMPLETE

Explanation: The IRLM successfully completed initialization and is available for use. If SCOPE=GLOBAL or NODISCON is specified, message DXR132I is issued when the IRLM connects to the global environment and is capable of inter-system data sharing.

System Action: The IRLM is processing normally.

1310 Messages and Codes
**DXR121**  
*irlnx* END-OF-TASK CLEANUP SUCCESSFUL — HI-CSA *xxxxK* or *xxxxM*

**Explanation:** The IRLM end-of-task routine released all of the MVS common storage that was in use by the terminating IRLM except for storage required for EOT/EOM processing. The HI-CSA is the highest amount of CSA + ECSA allocated to the IRLM during this initialization. The value for HI-CSA is displayed as either *xxxxK* for kilobytes or *xxxxM* for megabytes.

**System Action:** The IRLM terminated processing.

**Operator Response:** None is required. Enter the *irlnproc* command to restart the IRLM.

---

**DXR122E**  
*irlnx* ABEND UNDER IRLM TCB/SRB IN MODULE *xxxxxxxx* ABEND CODE *zzzz*

**Explanation:** The IRLM experienced an unrecoverable programming error while processing under an IRLM execution unit. Global sharing with the IRLM issuing the message is inhibited.

- *xxxxxxxx* The name of the module that detected the failure.
- *zzzz* The abend code associated with the failure.

**System Action:** The IRLM is performing abnormal termination processing. An MVS SYS1.LOGREC entry and an SDUMP were requested. An abend is issued to terminate the IRLM job-step task.

**Operator Response:** Notify the system programmer. Ensure that the SYS1.DUMPxx data set containing the SDUMP is not overwritten before the dump is analyzed.

**System Programmer Response:** Use the IPCS service aid to analyze the dump to determine the cause of the failure.

---

**DXR123E**  
*irlnx* ABEND UNDER DBMS TCB/SRB IN MODULE *xxxxxxxx* ABEND CODE *zzzzz* ERROR ID *wwww*

**Explanation:** The IRLM experienced an unrecoverable programming error while processing a request executing under a DBMS execution unit. Global sharing with the IRLM issuing the message is inhibited. An MVS SYS1.LOGREC entry and an SDUMP were requested.

- *xxxxxxxx* The name of the module that detected the failure
- *zzzzz* The abend code associated with the failure
- *wwww* The error ID or dump sequence number for the associated LOGREC entry.

**System Action:** The IRLM is performing abnormal termination processing.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Use the IPCS service aid to analyze the dump to determine the cause of the failure.

---

**DXR124E**  
*irlnx* ABENDED VIA MODIFY COMMAND

**Explanation:** The IRLM terminated as a result of receiving an *f irlnproc,ABEND* command. Global sharing with the IRLM issuing the message is inhibited. An MVS SYS1.LOGREC entry was requested. If the NODUMP parameter was omitted from the MODIFY command, an SDUMP was requested. If the NODUMP option is included & the command is issued twice or there is no DBMS identified to the IRLM, a dump is taken and this message is also issued.

**System Action:** The IRLM is performing abnormal termination processing.

**Operator Response:** If an SDUMP was taken, ensure that the SYS1.DUMPxx data set containing the SDUMP is not overwritten before the dump is analyzed. Notify the system programmer.

**System Programmer Response:** Use the IPCS service aid to analyze the dump to determine the cause of the failure.

---

**DXR131I**  
*irlnx* OUT OF *xxxx* STORAGE DETECTED DURING DEADLOCK. DEADLOCK PROCESS DELAYED.

**Explanation:** IRLM detected an out-of-storage condition during deadlock detection of resolution processing. Rather than abending the IRLM, the deadlock process for this deadlock detection interval was ended before completely detecting or resolving deadlocks. If this condition is permitted to persist, undetected deadlocks might occur.

- *xxxx* The type of storage IRLM was attempting to get when the out-of-storage condition was detected. It is either ECSA for extended CSA, or PRIVATE for IRLM private storage.

**System Action:** The IRLM cleans up deadlock data structures before completing deadlock detection or resolution. Deadlock detection or resolution is attempted in one local deadlock cycle as specified on the IRLM startup procedure parameter.

**Operator Response:** Stop and restart the IRLM specifying a larger region size on the IRLM startup procedure. IRLM need not be stopped immediately and can remain up indefinitely if the volume of requests to the IRLM is reduced by limiting DBMS activity.
DXR132I  **irlmx SUCCESSFULLY JOINED THE**
**DATA SHARING GROUP WITH yyyyM**
**LOCK TABLE ENTRIES AND nnnnnnn**
**RECORD LIST ENTRIES.**

**Explanation:** The IRLM successfully connected to the
data sharing group. This includes a successful join to
the XCF group and a successful connection to the lock
structure. (XCF is the cross-system coupling facility of
MVS.) The IRLM can now participate in inter-system
data sharing.

The value yyyy represents the number of Lock Table
Entries in units of 1048576 and nnnnnnnn represents
the number of Record List Entries available in the
Coupling Facility. If the number of Lock Table Entries is
less than 1048576, yyyy will be zero. The first IRLM to
CONNECT to the group causing structure allocation
dictates these values for the group.

**System Action:** The IRLM continues operation.

---

DXR133I  **irlmx TIMOUT DURING GLOBAL**
**INITIALIZATION WAITING FOR nnnnnnn**

**Explanation:** A timeout occurred while the IRLM was
attempting global initialization. This problem usually
occurs because incorrect lock structure or XCF group
names were specified on the LOCKTAB and IRLMGRP
parameters. (XCF is the cross-system coupling facility
component of MVS.) However, anything that delays
global initialization for at least 30 seconds causes this
message to be issued. The value for nnnnnnn may be
either the irlmnm+irlmid values for an existing peer
member or 'NOEVENT'.

**System Action:** IRLM continues to issue this message
until one of the following occurs:
- Global initialization completes.
- The system programmer takes some action to abend
  the IRLM.
- IRLM abends with U2025 after an internal limit of
timeout messages is reached.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Investigate what is
delaying initialization based on the value for nnnnnnn. If
this is the name of a peer irlm, then that member is not
sending the required XCF messages to the new
member joining. This may be due to XCF messaging
problems, processing problems such as DXR167E, or
lack of XCF EVENTS. If the new joining member had
failed prior, make sure that each existing member has
issued the msgDXR137I recovery message. If 'nnnnnnn'
is NOEVENT, then the problem is most likely restricted
to the new joining member, and only a dump of this
member and XCFAS is likely to be needed. Check the
lock structure and XCF group names to ensure that the
names specified for this IRLM match the names used by
all group members. You can use XCF commands to
display the current members in the XCF group to see if
this IRLM joined successfully. If necessary, take dumps
to assist in failure analysis. Since this message can be
issued because of missing interaction with other
members, you may need dumps of peer SYSPLEX
IRLM members, along with XCFAS if 'nnnnnnn' is a
peer irlm, then take dumps of that member and the
joining member. If you wish to get the new member to
successfully join, you must terminate any peer member
whose name appears for 'nnnnnnn' before attempting to
start the new member.

---

DXR134E  **irlmx JOIN XCF GROUP wwwwwww**
**FAILED FOR GLOBAL INITIALIZATION,**
**RETURN=xx, REASON=yyyy**

**Explanation:** The IRLM cannot successfully join the
XCF group. (XCF is the cross-system coupling facility
component of MVS.)

wwwwww
- The IRLMGRP name specified on the IRLM
  startup procedure

**System Action:** IRLM does not connect to the data
sharing group. The identify request for the DBMS
attempting to identify is rejected.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Try to determine
why the IRLM cannot join. See the IXJOIN section of
MVS/ESA Programming: Sysplex Services Reference
for an explanation of the return and reason codes. If the
reason for the connection failure was corrected, restart
the IRLM and reidentify the DBMS to it.

---

DXR135E  **irlmx CONNECT TO LOCK TABLE**
**wwwwww FAILED FOR GLOBAL**
**INITIALIZATION, RETURN=xx,**
**REASON=yyyy**

**Explanation:** The IRLM cannot successfully connect
to the lock table.

wwwwww
- The lock table name passed at identify time or
  the LOCKTAB name specified on the IRLM
  startup procedure

**System Action:** IRLM does not connect to the data
sharing group. The identify request for the DBMS
attempting to identify is rejected.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Try to determine
why the IRLM cannot connect. See the IXCONN section of
MVS/ESA Programming: Sysplex Services Reference
for an explanation of the return and reason codes. If the
reason for the connection failure was corrected, restart
the IRLM and reidentify the DBMS to it.
DXR136I  
IRLM has disconnected from the data sharing group  

**Explanation:** The IRLM left the data sharing group by disconnecting from both the XCF and the lock structure. (XCF is the cross-system coupling facility component of MVS,) IRLM takes this action when all identified DBMSs have issued a QUIT request to the IRLM to terminate its active data sharing activity.

This IRLM message may also be issued by a new member that is attempting to JOIN the sysplex group while a lock structure rebuild is occurring. In this case, the disconnect is temporary, and the IRLM should connect to the group when the rebuild is completed. If it does not, a dump should be taken, and the IRLM should be terminated.

**System Action:** This IRLM disconnected from the data sharing group.

---

DXR137I  
IRLM has been disconnected from the data sharing group  

**Explanation:** IRLM IRLM has lost connectivity to the data sharing group.

IRLM  The ID of the disconnected IRLM as explained in Part 5, “IRLM messages and codes,” on page 1303.

All surviving IRLMs issue this message. The disconnected IRLM might issue the DXR136I message.

**System Action:** IRLM IRLM was disconnected from the data sharing group.

**Operator Response:** None is required on this MVS system. See the DXR136I message for the proper operator response on the disconnected system.

---

DXR138E  
IRLM query structure for lock table wwwwwwww failed for global initialization, RETURN=xx, REASON=yyyy  

**Explanation:** This message is issued when IRLM gets a nonzero return code from a QUERY to XCF for the lock structure size.

wwwwwww  The lock table name passed at identify time or the LOCKTAB name specified on the IRLM startup procedure

IRLM is unable to connect to the data sharing group if it does not have a valid structure size.

**System Action:** IRLM does not connect to the data sharing group. The identify request for the DBMS attempting to identify is rejected.

**Operator Response:** Try to determine from the return and reason codes specified in the message what the problem is with XCF. See the IXCQUERY section of MVS/ESA Programming: Sysplex Services Reference for an explanation of the return and reason codes. Restart the DBMS when the problem is fixed.

---

DXR139E  
IRLM zzzzzz REQUEST FAILED, RETURN=xx, REASON=yyyy  

**Explanation:** An IRLM request to MVS failed with an unexpected return and reason code. The request type is zzzzzz.

**System Action:** IRLM terminates with abend U2025.

**Operator Response:** Notify the system programmer

**System Programmer Response:** Use the request type, reason and return codes to find out what caused the failure. See request type ‘zzzzzz’ of MVS/ESA Programming: Sysplex Services Reference for an explanation of the return and reason codes. Save the IRLM dump for analysis by IBM service.

---

DXR140E  
IRLMID=zzz is not unique for the data sharing group it attempted to join  

**Explanation:** An IRLM attempted to join a data sharing group, but IRLMID zzz that was specified in the IRLM startup procedure was already in use by another IRLM in the group.

**System Action:** IRLM terminates with abend U2025.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Change the IRLMID in the startup procedure to a number from 1 through 255 that is not already in use by another IRLM in the data sharing group.

---

DXR141I  
IRLM the lock table wwwwwwww was allocated in a zzzzzz facility  

**Explanation:** The MVS coupling facility containing the lock table being used by IRLM is executing in zzzzzz state.

zzzzzz  Volatile or Nonvolatile

The volatile state indicates that there is no battery backup for the facility if a power failure occurs.

wwwwwww  The lock table name passed at identify time or the LOCKTAB name specified on the IRLM startup procedure.
System Action: Data sharing continues normally.
Operator Response: Notify the system programmer.
System Programmer Response: Take some action to move to a nonvolatile structure if that is desired for better availability.

**DXR142E**  
*irlmx THE LOCK STRUCTURE*  
**wwwwww 15 zzz% IN USE**

Explanation: This message shows what percent of the available capacity of the lock structure is being used by the group and can indicate that some action is needed to relieve the storage.

wwwwww  
The lock table name currently in use by the IRLM.

zzz  
One of the following values: 80, 90, 100.

System Action: This message stays on the console until the storage falls below 70% or until the operator removes the message. Data sharing continues, possibly with restrictions, depending on how full the lock structure is.

- At 80% full, data sharing continues with no restrictions, but storage is reaching a critical threshold.
- At 90% full, data sharing continues with restrictions. Only ‘must-complete’ type of requests that require lock structure storage are processed. All others that require lock structure storage are denied with an ‘out of lock structure storage’ reason code.
- At 100% full, data sharing continues with more restrictions. Any request that requires lock structure storage is denied with an ‘out of lock structure storage’ reason code.

Operator Response: Notify the system programmer if there is a concern about running out of space in the lock structure.

System Programmer Response: Take some action to increase the size of the lock structure if more space is needed. Force to completion update-type transactions to free modify locks which will in turn free some lock structure storage.

See [DB2 Data Sharing: Planning and Administration](#) for actions you can take in a DB2 environment to alleviate the storage shortage in the lock structure.

**DXR143I**  
*irlmx REBUILDING LOCK STRUCTURE*  
**BECAUSE IT HAS FAILED OR AN IRLM LOST CONNECTION TO IT**

Explanation: The lock structure failed or one or more IRLMs lost connections to it. The IRLM attempts to rebuild all the current information into the new lock structure without modifying any of the attributes.

System Action: Data sharing is stopped while rebuild is in progress. After rebuild completes successfully, data sharing continues normally. If rebuild does not succeed, IRLM disconnects from the data sharing group.

Operator Response: Notify the system programmer to repair the failed structure or connections to it.

System Programmer Response: Determine the reason for the structure or connection failure and take actions to recover the failed structure.

**DXR144I**  
*irlmx REBUILDING LOCK STRUCTURE*  
**BECAUSE ALL CONNECTIONS TO IT ARE IN USE**

Explanation: The last available connection to the lock structure was allocated. IRLM attempts to rebuild into another structure and modify the lock structure attributes to allow more connections.

System Action: Data sharing is stopped while rebuild is in progress. After rebuild completes successfully, data sharing continues normally with more connections available for the group. If rebuild does not succeed, data sharing continues but new members are not able to join the group.

Operator Response: Determine whether the group needs to be able to handle more members, and if so, change the MAXUSR parameter on the IRLMPROC.

System Programmer Response: Determine the reason why rebuild failed. Take actions to make a bigger structure available to handle the bigger group.

**DXR145I**  
*irlmx REBUILDING LOCK STRUCTURE*  
**AT OPERATORS REQUEST**

Explanation: The operator started rebuild with an MVS SETXCF command. IRLM attempts to rebuild into another structure without modifying any of the lock structure attributes.

System Action: Data sharing is stopped while rebuild is in progress. After rebuild completes successfully, data sharing continues normally. If rebuild failed, data sharing still continues normally.

Operator Response: Ensure that rebuild completes successfully. Notify the system programmer if any problem occurs during rebuild. If rebuild failed, contact the system programmer to determine why.

System Programmer Response: Determine the reason why rebuild failed. Take actions to make the desired structure available.
DXR146I irlmx REBUILD OF THE LOCK STRUCTURE COMPLETED SUCCESSFULLY WITH yyyyM HASH AND nnnnnnn RECORD LIST ENTRIES.

Explanation: The lock structure was successfully moved to another coupling facility structure. The value yyyy represents the number of Lock Table Entries in units of 1048576 and nnnnnnn represents the number of Record List Entries available in the Coupling Facility. If the number of Lock Table Entries is less than 1048576, yyyy will be zero. The first IRLM to CONNECT to the group causing structure allocation dictates these values for the group.

System Action: Data sharing continues normally.

DXR147I irlmx REBUILD OF THE LOCK STRUCTURE WAS STOPPED

Explanation: The lock structure could not be moved to another coupling facility structure. Rebuild process was terminated.

System Action: Data sharing continues normally if the old lock structure is still available. If the lock structure failed, IRLM disconnects from the group.

Operator Response: Contact the system programmer to determine why rebuild was stopped.

System Programmer Response: Determine why rebuild was stopped. Take actions to make a suitable coupling facility structure available for rebuild.

DXR148I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED BY THE OPERATOR

Explanation: The operator issued a console command to stop the rebuild.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

Operator Response: If IRLM DISCONNECT from the group, follow local recovery procedures.

System Programmer Response: Determine why the rebuild was stopped and take appropriate action to restore rebuild capability.

DXR149I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO FAILURE OF A REQUIRED IRLM IN THE GROUP

Explanation: Rebuild was stopped because one of the IRLMs involved in the rebuild has failed.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

Operator Response: If IRLM DISCONNECT from the group, follow local recovery procedures.

System Programmer Response: Determine why the bad return code was received and take appropriate action to restore rebuild capability.

DXR150I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO FAILURE OF THE NEW STRUCTURE

Explanation: Rebuild was stopped because the NEW STRUCTURE failed.

Operator Response: If IRLM DISCONNECT from the group, follow local recovery procedures.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

System Programmer Response: Determine what failure occurred on the new structure and take appropriate action to restore rebuild capability.

DXR151I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO FAILURE ON QUERY OR CONNECT OF THE NEW STRUCTURE

Explanation: Rebuild was stopped because IRLM received a bad return code on the IXCQUERY or IXLCONN request to XCF for the new structure.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

Operator Response: If IRLM DISCONNECT from the group, follow local recovery procedures.

System Programmer Response: Determine why the bad return code was received and take appropriate action to restore rebuild capability.

DXR152I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO AN OUT OF SPACE CONDITION ON THE NEW STRUCTURE

Explanation: Rebuild was stopped because the new structure contains insufficient space to hold all of the data from the old structure or from the RESTART.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

Operator Response: If IRLM DISCONNECT from the...
group, follow local recovery procedures.

System Programmer Response: Determine why the new structure was not large enough to contain all of the data from the old structure or restart. Take appropriate action to restore rebuild capability.

DXR153I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO AN UNEXPECTED RETURN CODE FROM XES SERVICES

Explanation: Rebuild was stopped because IRLM received a bad return code on a request to SLM.

System Action: The REBUILD is stopped and IRLM will either DISCONNECT from the group or continue to process under the old structure, depending on the reason rebuild was initiated.

Operator Response: If IRLM DISCONNECT from the group, follow local recovery procedures.

System Programmer Response: Determine why the return code was received from SLM and take appropriate action to restore rebuild capability.

DXR154I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO SUCCESSFUL COMPLETION OF GROUP FUNCTION LEVEL CHANGE

Explanation: IRLM started a REBUILD to establish a new group function level because a new member with a different service level is joining the group. The IRLM rebuild process then checks to see if a complete rebuild is needed to complete the group function level change. This message is issued when a complete rebuild is not needed for a successful group function level change.

System Action: The REBUILD is stopped and the new IRLM member joins the group.

DXR155I irlmx REBUILD OF LOCK STRUCTURE WAS STOPPED DUE TO UNSUCCESSFUL COMPLETION OF GROUP FUNCTION LEVEL CHANGE

Explanation: IRLM started a REBUILD to establish a new group function level because a new member with a different service level is joining the group. The IRLM rebuild process then checks to see if a complete rebuild is needed to complete the group function level change. This message is issued from the existing members when a joining member can not coexist with one or more of the existing members of the group.

System Action: The REBUILD is stopped and the new IRLM member does not join the group. The DBMS that was identifying itself to the new IRLM member is notified that the IDENTIFY failed. Message DXR157I is issued by the member that was trying to join the group or message DXR158I is issued by other members in the joining member’s behalf.

System Programmer Response: Compare the service level of the IRLM member that failed to join the group with the service level of the other IRLM members in the group. The pertinent service levels can be found by issuing the IRLM modify command “1 irlmproc, status, all” on all of the IRLMs involved.

DXR156I irlmx REBUILDING LOCK STRUCTURE TO CHANGE THE GROUP FUNCTION LEVEL

Explanation: This message is issued when IRLM starts a REBUILD to establish a new group function level when a new member with a different service level is joining the group. Later messages describe further actions IRLM takes during the process of changing the group function level.

System Action: The REBUILD is started. This allows IRLM to process a group function level change.

DXR157I irlmx FAILED TO JOIN THE DATA SHARING GROUP BECAUSE IT CANNOT COEXIST WITH AT LEAST ONE OF THE EXISTING MEMBERS

Explanation: The IRLM member, irlmx, could not coexist with one or more existing members of the group because of differences in service levels.

System Action: The REBUILD is stopped and the new IRLM member does not join the group. The DBMS that was identifying itself to the new IRLM member is notified that the IDENTIFY failed.

System Programmer Response: Compare the service level of the IRLM member that failed to join the group with the service level of the other IRLM members in the group. The pertinent service levels can be found by issuing the MVS modify command “1 irlmproc, status, all” on all the IRLMs involved.

DXR158I irlmx CANNOT COEXIST WITH AT LEAST ONE EXISTING MEMBER. ALL DBMS IDENTIFY REQUESTS TO THAT IRLM WILL BE DENIED.

Explanation: The IRLM member, irlmx, could not coexist with one or more existing members of the group because it does not have the service level that includes coexistence support.

System Action: The REBUILD is stopped and the new IRLM member is not allowed to join the group. The DBMS that was identifying itself to the new IRLM member is notified that the IDENTIFY failed.

System Programmer Response: Compare the service level of the IRLM member that failed to join the group with the service level of the other IRLM members in the group. The pertinent service levels can be found by issuing the MVS modify command “1 irlmproc, status, all” on all the IRLMs involved.
DXR162I  irlmx CYCLE NUMBER nnnnnnn
PROCESSED FOR TIMEOUT

Explanation: A TIMEOUT candidate has been
detected on at least one IRLM. If an incompatible
blocker was found, the IMS TIMEOUT EXIT has been
driven to present WAITER/BLOCKER information.

System Action: IRLM processing continues normally.
DXR162I is issued only by the Global Deadlock
Manager (GDM), the IRLM with the lowest IRLMID in
the IRLMPROC. The message will be issued once per
minute if there is at least one candidate waiter found
during the global deadlock cycle. If a cycle occurs and
no timeout waiter is found during that time, the flag is
reset and DXR162I will be issued the next time a
candidate waiter is present.

Operator Response: Based on local operational
guidelines, use RMF™ to generate a report from the
79.15 (4F 0F) SMF records with cycle number
nnnnnnnn. If the message is issued and no 79.15
records are found, one of these errors is likely to have
occurred:
1. SMF has not been enabled for the 79.15 to be cut
to the MAN* data set. Check the *.IEFU84 member
for MODNAME(ERBDSMIF) on each system.
2. SMF has not presented the 79.15 to the RMF data
space due to a set-up error in the data space. Make
sure the dataspace has been defined. Enable the
79.15 to the RMF with:
RMF,SMFBUF,RECTYPE(79)
3. The 79.15 record with cycle number nnnnnnnn was
delayed in writing. Request the same cycle number
again.
4. IRLM did not find an incompatible blocker

If the waiter cannot be identified and you wish to consult
IBM SERVICE, start the IRLM *INTERNAL* CTRACE
for subtype XCF on each member, then collect MVS
CONSOLE dumps of the IRLM(s) and their IMS DLI
and any suspicious dependent regions. If this is in a
SYSPLEX environment, you must take and save dumps
of all IRLMs with XEDATE and associated DBMS
regions. Once the dumps are captured, you may turn off
XCF tracing. If it appears to be an invalid WAIT
condition and this is a SYSPLEX environment, issue a
SETXCF REBUILD to attempt recovery. If this fails to
resume the waiter, follow local operation guidelines.

System Programmer Response: Determine if the
wait is caused by application logic, operator error, or
other factors. The most common cause is incorrect
dispatch priority. If unable to determine the cause of
the wait, contact IBM support with the documentation
above.

DXR164E  irlmx CANNOT RECOVER FOR A
FAILED MEMBER DUE TO LOSS OF
CONNECTIVITY TO THE LOCK
STRUCTURE

Explanation: IRLM detects loss of connectivity to the
lock structure during member recovery or global
initialization. IRLM is longer able to support data sharing
without the retained lock information.

System Action: Disconnect from the data sharing
group.

User Response: Notify the system programmer to
correct the problem with the coupling facility.

Problem Determination: See IXC messages to
determine the root cause of the failure and the
appropriate corrective action.

DXR165I  irlmx TERMINATED VIA IRLM MODIFY
COMMAND

Explanation: An operator issued a MODIFY
IRLM,ABEND command.

System Action: IRLM shuts down.

DXR166E  irlmx CONNECT TO LOCK STRUCTURE
FAILED FOR GLOBAL INITIALIZATION

Explanation: IRLM detects loss of connectivity to the
lock structure during member recovery or global
initialization. IRLM is longer able to support data sharing
without the retained lock information.

System Action: Disconnect from the data sharing
group.

User Response: Notify the system programmer to
correct the problem with the coupling facility.

Problem Determination: See IXC messages to
determine the root cause of the failure and the
appropriate corrective action.

DXR167E  irlmx IRLM HAS DETECTED A DELAY IN
COMPLETION OF vvvvvv PROCESS.

Explanation: IRLM has detected a delay in some
process which may prevent other DBM or IRLM
processes from running. The value for vvvvvv may be
any of the following:

ASIDxxxx
ASIDxxxx is issued when IRLM is unable to
process main latch activity for some period and
finds a DBM agent which does not appear to
be moving. May cause all symptoms below.

DPRIORTY
DPRIORTY is issued when IRLM is unable to
get its main latch for some period, but the
Health routine cannot identify any delayed
request. May cause all 's1' symptoms below.
DXR167E

MAIN_SRBB

MAIN_SRBB is issued in sysplex when irlm detects that some main latch process has been active for an extended period. May cause all 's1' symptoms below.

MAXCYCLE

MAXCYCLE is issued when IRLM is unable to process all of the waiters during a deadlock cycle because the number of waiting relationships created would require excessive SRB execution time. This can result in all S2 symptoms below.

NOTIFY_G

NOTIFY_G is issued in a sysplex when irlm detects that a peer notify has not returned for some period. May cause all 's2' symptoms below.

NOTIFY_L

NOTIFY_L is issued when IRLM finds a NOTIFY Exit drive to its DBM subsystem has not returned for some period. May cause all 's2' symptoms below.

System Action:  The IRLM continues operation. This message stays on the console until that delay is no longer detected. When all DXR167E delays are corrected, irlm issues DXR168I. The delayed completion may prevent other IRLM or DBM processes, some of which are listed below, from running. These delayed processes may cause any of the following symptoms:

- A new DBMS can't identify.
- New members might not be able to join. They will time out during global initialization and eventually terminate abnormally.
- A terminated DBMS is not resumed.
- Failed members might not get properly partitioned from the group because recovery actions for them cannot run.
- Transactions do not deadlock or time out
- REBUILD of the IRLM group will not run.
- (s2) A transaction hangs.
- (s2) Other processes contending with the hung process might also hang, potentially causing a chain reaction.
- (s2) The whole group might hang.

Operator Response: Notify the system programmer.

System Programmer Response: This delayed process may not cause a noticable problem to the users.

Note:  If no problems are observed or reported, then monitor the system for the completion of the delayed process.

If no problems are observed or reported, then just monitor the system for the completion of the delayed process. If problems with the system are observed, then take the following actions based on the variable term in the message. If you plan to pursue the problem with IBM Service, then ALWAYS capture the appropriate documentation before taking recovery actions.

ASIDxxxx

This is usually the result of low dispatch priority for some task on an over committed CPU. You can identify the task using xxxx, which is the home ASID in HEX of the detected task. IRLM will attempt to boost the task priority so that it gets CPU cycles to complete. The priority will be returned to original when exiting IRLM. If the DXR167E with this ASID remains displayed and DXR168I is not seen, then this task should be terminated to allow IRLM to return to normal processing.

DOC: To pursue any question with IBM Service, take dumps of the DBMs, IRLM, and ASID xxxx before DXR168I is issued. Also include the text of the DXR167E message from the MVS console when opening the problem report.

DRPRIORITY

This is usually the result of having an incorrect dispatch priority set for the IRLM when compared to the rest of the application tasks or DBM address spaces. Determine if this is the case, and correct the dispatching priority order.

DOC: Take dumps of this DBMs and IRLM asids before taking any action.

MAIN_SRBB

This is usually caused when there are too many waiters in a sysplex such that the IRLM deadlock SRB must execute for long periods in order to resolve all of the waiting relationships. You can continue to wait for it to complete, terminate the DBM or IRLM with the most WAITers as shown by the modify command, F irlmproc,STATUS, or try to terminate WAITing tasks.

DOC: Take dumps of 'ALL' DBMs and IRLM asids before taking any action.

MAXCYCLE

This is usually the result of an application problem or a temporary hang that allowed the number of waiters in the sysplex to become excessive (typically in the hundreds). This hang could be the result of an application deadlock occurring and not being broken quickly because global deadlock is running too slow. If the transaction rate is high, a deadlock occurs on key resources and is not detected and broken quickly, it can result in many tasks being suspended and involved in deadlocks. You might wish to consider lowering the first value of the DEADLOK parameter in the irlmproc. You should issue MODIFY irlmproc,STATUS on each member and if the
message persists, terminate the IRLM with the largest number of waiters.

DOC: Take dumps of "ALL" DBMs and IRLM asids before taking any action.

**NOTIFY_G**
This is a problem with the peer DBM or IRLM member which should issue the DXR167E with NOTIFY_L. Terminate the IRLM or DBM which issued the NOTIFY_L message.

DOC: Take dumps of all DBM and IRLM where the DXR167E is issued. If only NOTIFY_G is seen, then take dumps of all DBM and IRLM asids.

**NOTIFY_L**
This is a problem with "THIS" DBM. If this is a sysplex, then each peer member that sent a NOTIFY to this member should issue NOTIFY_G. Terminate the DBM or IRLM where NOTIFY_L is seen.

DOC: Take dumps of all DBM and IRLM where the DXR167E is issued. If only NOTIFY_G is seen, then take dumps of all DBM and IRLM asids.

**DXR168I**  *irlm* DELAYED PROCESSES NO LONGER DETECTED.

**Explanation:** This message appears if all situations reported by previous DXR167E messages have been resolved.

**System Action:** The IRLM continues operation.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Try to determine what might have caused the temporary problem based on the variable insert in the DXR167E message.

**DXR169I**  *irlm* THE STORAGE SHORTAGE FOR LOCK STRUCTURE  wwwwwwwww HAS BEEN RELIEVED.

**Explanation:** This message indicates that the storage shortage indicated by a previously reported DXR142E message is relieved. The amount of the lock structure in use has dropped below 70%.

wwwwwww
The lock table name currently in use by the IRLM.

**System Action:** IRLM resumes normal data sharing with no restrictions.

**DXR170I**  *irlm* THE LOCK STRUCTURE  wwwwwwwww IS zz% IN USE

**Explanation:** This message shows what percent of the available capacity of the lock structure is being used by the group. The values are 50%, 60% and 70%. This message is issued only once at each of the three levels of usage and gives an indication of peak usage during the execution of an IRLM subsystem.

wwwwwww
The lock table name currently in use by the IRLM.

zz One of the following values: 50, 60, 70.

**System Action:** The IRLM continues operation.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** This message is a warning that there is a potential to overcommit the storage for the lock structure named in the message. Track the occurrences of this message to determine a growth trend. If a growth pattern is detected, increase the storage size specifications for the lock structure in the coupling facility policy and activate the revised policy.

**DXR171I**  *irlm* xxxxxxxxx ARM REGISTRATION FAILED, MVS ARM RETURN CODE = yyyyyyyyy, MVS ARM REASON CODE = xxxxxxxx

**Explanation:** IRLM encountered an error using the specified MVS automatic restart manager (ARM) function. The xxxxxxxxx is the IRLM ARM element name. For data sharing environments, it is a concatenation of the IRLM group name, the IRLM subsystem name and the IRLM ID. For non-data sharing environments, it is the IRLM subsystem name and the IRLM ID.

**System Action:** IRLM continues. However, if IRLM abnormally terminates, the MVS ARM cannot automatically restart IRLM.

**System Programmer Response:** Refer to z/OS MVS Programming: Sysplex Services Reference for the function, return code, and reason code from the IXCARM request.

**DXR172I**  *irlm* xxxxxxxxx ARM READY COMPLETED, MVS ARM RETURN CODE = yyyyyyyyy, MVS ARM REASON CODE = xxxxxxxx.

**Explanation:** IRLM initialization has progressed, enabling the automatic restart manager (ARM) to restart dependent element types such as SYSDB2 or SYSIMS. xxxxxxxxx is the IRLM ARM element name. For data sharing environments, it is a concatenation of the IRLM group name, the IRLM subsystem name, and the IRLM ID. For non-data sharing environments, it is the IRLM subsystem name and the IRLM ID. If the return and
reason codes are not zero, IRLM encountered an error using the specified MVS ARM function.

**System Action:** IRLM continues. However, if the return and reason codes are not zero, and IRLM abnormally terminates, the MVS ARM cannot automatically restart IRLM.

**System Programmer Response:** Refer to z/OS MVS Programming: Sysplex Services Reference for the function, return code, and reason code from the IXCARM request.

```
DXR173I   irlmx xxxxxxxx ARM Deregistration Failed. MVS ARM Return Code = yyyyyyyyy, MVS ARM Reason Code = xxxxxxxx
```

**Explanation:** IRLM encountered an error using the specified MVS automatic restart manager (ARM) function. xxxxxxxx is the IRLM ARM element name. For data sharing environments, it is a concatenation of the IRLM group name, the IRLM subsystem name, and the IRLM ID. For non-data sharing environments, it is the IRLM subsystem name and the IRLM ID.

**System Action:** IRLM continues. However, if IRLM terminates normally or abnormally, the MVS ARM automatically restarts IRLM.

**System Programmer Response:** Refer to z/OS MVS Programming: Sysplex Services Reference for the function, return code, and reason code from the IXCARM request.

```
DXR174E   irlmx xxxxxxxx csect-name ARM Event Exit Failed
```

**Explanation:** IRLM automatic restart manager (ARM) event exit encountered an error while attempting to define the IRLM subsystem to MVS.

**System Action:** The automatic restart of the IRLM subsystem stops.

**System Programmer Response:** Refer to z/OS MVS Programming: Assembler Services Reference, Volumes 1 and 2 for return and reason codes from the IEFSSI request. To start IRLM manually, use the START irlmproc command on any system where the IRLM subsystem is defined. If IRLM is not active and AUTO START = yes for IRLM defined in DSNZPARM, then DB2 will attempt to start IRLM when DB2 is started.

```
DXR175E   irlmx IRLM is Unable to Obtain Storage - storage_type
```

**Explanation:** IRLM is attempting to acquire storage from CSA, ECSA, or extended private. However, the storage type is exhausted, or the monitored threshold has been exceeded. The IRLM command F irlmproc, STATUS, STOR can be used to display storage values. See the DB2 Command Reference for more information.

The value in field `storage_type` specifies the cause of the error:

- CSA means that the system CSA has been exhausted.
  This can be caused by:
  - too little CSA generated into the system, or
  - an unexpected peak of demand for CSA storage by the jobs and tasks running in the MVS system.

- ECSA means that the system ECSA has been exhausted.
  This can be caused by:
  - too little ECSA generated into the system, or
  - an unexpected peak of demand for ECSA storage by the jobs and tasks running in the MVS system.

- PVT means that the extended private storage threshold has been reached.
  This can be caused by:
  - lack of COMMITS
  - runaway applications
  - IRLM region size too small, or
  - a failed subsystem not recovering retained locks

**System Action:** The IRLM continues operating as best it can. This message stays on the console until IRLM is able to acquire the needed storage. Some DBMS requests might be processed successfully, some might be rejected with out of storage return and reason codes, and some might hang.

**Operator Response:** Notify the system programmer. Try to reduce the work load on the system or the number of transactions running in the DBMS.

When the out of storage condition is relieved, normal IRLM operation resumes. Because storage is unavailable, the following symptoms might occur:

- transactions might abend with out of storage indications
- message DXR167E might be issued
- transactions might hang
- other processes contending with a hung process will also hang, potentially causing a chain reaction
- the system hangs
- if in a data sharing environment:
  - the whole group might hang
  - new members might not be able to join. They will time out during global initialization and eventually terminate abnormally.
  - failed members might not get properly partitioned from the group because recovery actions for them cannot run.

**System Programmer Response:** Determine what is preventing IRLM from obtaining storage.

If CSA or ECSA was exhausted, generate more CSA or ECSA into the system or reduce the number of running
tasks that are dependent on CSA or ECSA.

If the condition is from an operational error that can be corrected without shutting down IRLM, correct it as soon as possible.

If PVT is displayed, use the IRLM command F ir1mproc,STATUS to determine how many locks are held or if there are retained locks. Also look at the output of the STATUS,STOR command to see how much private region storage was available. The IRLM command F ir1mproc,SET,PVT= can be used to increase the storage threshold. See the DB2 Command Reference for information regarding WARNING notes.

Otherwise, shut down IRLM, correct the problem, and restart IRLM.

---

**DXR176i**

**ir1m** IRLM STORAGE SHORTAGE RELIEVED

**Explanation:** This message appears if a situation reported in a previous DXR175E message has been resolved.

**System Action:** The IRLM continues operation.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Try to determine what might have caused the temporary problem as reported in a previous DXR175E message. The most likely reasons is insufficient CSA or ECSA for the combined tasks running in MVS. If possible, correct the problem without shutting down IRLM.

---

**DXR177i**

**ir1m** THE VALUE FOR nnnnnnnn IS SET TO xxxx

**Explanation:** This message is issued in response to any successful IRLM MODIFY ir1mproc,SET,cccc command.

Where current values for nnnnnnnn include:

- DEADLOCK
- LTE
- PVT
- TIMEOUT
- TRACES

**System Action:**

**DEADLOCK**

Where xxxx is a value between 100 and 5000 and represents the number of milliseconds used for the IRLM deadlock interval. The value displayed will be in even 100 millisecond increments.

If this IRLM is connected to the group, this message appears on each member currently connected as they update their control block during deadlock processing. The DEADLOCK interval frequency is changed to the number of milliseconds displayed in the message as each IRLM updates its local control blocks. The global deadlock interval is aborted and global deadlock processing reinitialized to synchronize all members.

**LTE**

Where xxxx is a value between 0 and 1024 and represents the number of Lock Task Entries available in the Coupling Facility. The value must either be zero or a power of two with each increment representing 1048576 entries.

If this IRLM is connected to the group, this message appears on each member currently connected as they update their control block during deadlock processing. The value specified with the SET command, does not take affect unless the IRLM is the first to join the group causing structure allocation.

This can be either during normal group startup or during a REBUILD. If the value specified is zero or too large for the IXQUERY policy size returned, then the IRLMPROC LTE= value is used. If the IRLMPROC LTE= value is blank, zero, or also too large, the number of entries is calculated by irlm to the nearest power of two after dividing the returned size by two.

**PVT**

The value of PVT is set to xxxx megabytes.

The system automatically adjusts xxxx to a number between 1 and 1800 if the number specified is not in this range. If the new PVT value is smaller than already in use, the command receives a syntax error message, DXR106E. No validation of the value is done to see that the address space contains the storage that is specified.

**TIMEOUT**

Where xxxx is a value between 1 and 3600 seconds. This value must be a multiple of the local deadlock parameter. If the value entered by the user is not an even multiple, the next higher multiple is used. If the value specified is out of range, the maximum or minimum is used. Since serialization is needed to change the internal timeout value, it is done during the next deadlock cycle. The DXR177i message is not issued until the input has been validated and the value changed during a deadlock cycle. The message also displays the name of the DBMS subsystem whose timeout value was changed.

**TRACES**

Where xxxx is a value between 10 and 255. Each trace buffer requires 64KB of ECSA storage. IRLM can use a maximum of 255 and a minimum number of 10 trace buffers for each trace type. The system automatically adjusts xxxx to the maximum or minimum allowed if
the value specified is out of range. The value specified does not apply if the EXTERNAL CTRACE write is active. If the number of trace buffers set by the command is less than the current buffer allocation, IRLM frees the oldest buffers until the number allocated equals the number set by the command.

**DXR179I** | **irlmx** TRACE USAGE TRACE BUFFER STORAGE IN USE: nnnnnKB MAXIMUM NUMBER OF TRACE BUFFERS ALLOWED PER TRACE TYPE: nnn TRACE TYPE ACTIVE BUFFERS IN USE CTRACE WRITER

**Explanation:** This message is issued in response to the following command:

F irlmproc,STATUS,TRACE

The message indicates the maximum number of 64KB buffers that IRLM can use for each of its subcomponent trace types.

**TRACE TYPE**

The trace types are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLM</td>
<td>Traces interactions with MVS locking component. Applicable only for data sharing.</td>
</tr>
<tr>
<td>XIT</td>
<td>Traces asynchronous interactions with the MVS locking component. Applicable only for data sharing.</td>
</tr>
<tr>
<td>XCF</td>
<td>Traces interactions with MVS cross-system coupling services. Applicable only for data sharing.</td>
</tr>
<tr>
<td>DBM</td>
<td>Traces interactions with the DBMS identified to this IRLM.</td>
</tr>
<tr>
<td>EXP</td>
<td>Traces exception conditions.</td>
</tr>
<tr>
<td>INT</td>
<td>Traces member and group events outside normal locking activity.</td>
</tr>
</tbody>
</table>

**ACTIVE**

Whether the trace is active. (You cannot deactivate the EXP and INT traces.)

**BUFFERS IN USE**

How many 64KB buffers are currently being used by this trace.

**CTRACE WRITE**

Whether the external CTRACE writer is on.

**System Action:** Processing continues normally.

**Operator Response:** Trace buffers can be set via `modify irlmproc,set,trace=nnn` command. You can activate or deactivate traces by using the TRACE CT command of MVS. You cannot turn off the EXP and INT traces. The XIT, EXP and INT are automatically activated when you start IRLM. All traces are automatically activated when TRACE=YES is specified on the IRLMPROC.

**DXR180I** | **irlmx** AUTOMATIC RESTART MANAGER IS NOT ENABLED

**Explanation:** IRLM attempts to utilize the MVS Automatic Restart Manager (ARM) function, but either the system does not have access to an ARM couple data set or the ARM is not set up in the user’s environment.

**System Action:** IRLM continues; however, if IRLM abnormally terminates, the MVS ARM cannot automatically restart IRLM.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** Determine why the system does not have access to an automatic restart manager couple data set. If there is no automatic restart manager couple data set defined, determine if the ARM should be set up so that IRLM can take advantage of the MVS ARM function. The purpose of using the ARM is to reduce the time IRLM is down. When IRLM stops abnormally, the MVS ARM will restart it automatically.

**DXR181I** | **irlmx** RUNTIMEO COMMAND DISABLED

**Explanation:** The IRLMs are doing automatic timeout detection and the command is not needed.

**System Action:** IRLM processing continues.

**DXR182I** | **irlmx** MODIFY DIAG COMMAND PROCESSED

**Explanation:** This message is issued in response to an IRLM MODIFY `irlmproc,DIAG` command.

**System Action:** IRLM processing continues.
Chapter 60. IRLM error return and reason codes

The IRLM error return and reason codes are listed below. Some return and reason codes do not apply to DB2 operation.

The values in the ‘return code’ column show the request completion status:

00  The request completed successfully.
04  The request completed successfully, but the state of lock remained unchanged.
08  The request completed un成功fully because of a system error or condition, not a problem in the request.
12  The request completed un成功fully because of a logic error in the request.
16  The request completed un成功fully because of an invalid request specification.
20  The request completed un成功fully because IRLM resources are not available.

### CHANGE request

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
</table>
| 04          | X'80'       | Ownership and/or duration was specified, but no locks were changed for one of these reasons:  
- The 'set of locks' specified included no held locks.  
- All specified locks had a duration value greater than or equal to the specified duration.  
- PSTATE=TSTATE was specified. |
<p>|             | X'20'       | Other holders of the lock exist. |
|             | X'10'       | From-duration was specified on a CHANGE ALL request, but the from-duration did not match the held-duration for at least one lock. The mismatched lock is not altered, but other locks might have been altered. |
|             | X'08'       | This lock was involved in a deadlock condition, but was not selected as the victim. |
|             | X'02'       | The CHANGE STATE request specified a 'tstate' value less restrictive than the current held state of the lock. |
|             | X'04'       | At least one other work unit holds the lock with the repeatable read (RR) attribute. |
|             | X'02'       | The work unit that submitted this lock request holds the lock with the repeatable read (RR) attribute. |</p>

Chapter 61. IRLM Abend Reason Codes

2017
Explanation: This is an internal error. IRLM processing of a request from a database management system (DBMS) failed. The IRLM issues console message DXR123E containing the error ID.
System Action: The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.
System Programmer Response: Obtain the SDUMP and check the error ID in the message. Contact the IBM Support Center for help in determining the problem.
Problem Determination: The problem usually is a program check within the IRLM code. The dump title includes a module name and an offset into the module where the ABEND was issued.

2018
Explanation: An unrecoverable error occurred during IRLM initialization. The IRLM issues console message DXR116E containing an error code.
System Action: The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested for some of the error codes.
System Programmer Response: Analyze the error code in message DXR116E to determine the reason for this failure. If you are unable to resolve the problem, contact the IBM Support Center.

2019
Explanation: This is an internal error. The IRLM detected either a destroyed storage pool or an invalid request. The IRLM issues message DXR122E to the console.
System Action: The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.
System Programmer Response: Obtain the SDUMP and contact the IBM Support Center for help in determining the problem.
Problem Determination: The dump title includes a module name and an offset into the module where the ABEND was issued.

2020
Explanation: The MVS operator requested an abnormal termination of the IRLM. The IRLM issues message DXR124E to the console.
System Action: The IRLM is terminated abnormally. If the NODUMP parameter was omitted from the command, an SDUMP is requested.
System Programmer Response: The SDUMP shows the status of the IRLM.

2022
Explanation: This is an internal error. IRLM issues this abend because one of its subtasks abended. The IRLM issues message DXR122E to the console.
System Action: The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.
System Programmer Response: Obtain the SDUMP and contact the IBM Support Center for help in determining the problem.
Problem Determination: The dump title includes a module name and an offset into the module where the ABEND was issued.

2023
Explanation: The IRLM encountered an out-of-storage condition either from a logic error, a subsystem definition error, or an error from an MVS service that must be performed for the IRLM to continue processing. The IRLM message DXR175E is issued to the console to help identify the error, followed by the DXR122E message describing the abend.
System Action: The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested and will be issued unless superceded or suppressed.
System Programmer Response: From the information in message DXR175E, determine what storage was in error and what the probable cause is. If IBM Service is required, obtain the SDUMP and contact the IBM Support Center for help in determining the problem.
Problem Determination: The dump title includes a module name and an offset into the module where the ABEND was issued.

2024
Explanation: This is an internal error. The database management system (DBMS) parameter list is invalid.
System Action: The requesting DBMS is abended with user abend 2024. The IRLM continues processing.
System Programmer Response: Obtain the dump of the requesting DBMS and contact the IBM Support Center for assistance.

2025
Explanation: This is an internal error. An IRLM request to MVS failed with an unexpected reason code.
The IRLM issues message DXR139E to the console with the failing return and reason codes. Message DXR122I is also issued.

**System Action:** The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.

**System Programmer Response:** Obtain the SDUMP and contact the IBM Support Center for help in determining the problem.

**Problem Determination:** The dump title includes a module name and an offset into the module where the ABEND was issued.

---

### 2027

**Explanation:** This is an internal error. The IRLM detected a logical inconsistency in either its processing or the local lock structure. IRLM issues message DXR122E to the console.

**System Action:** The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.

**System Programmer Response:** Obtain the SDUMP and contact the IBM Support Center for help in determining the problem.

**Problem Determination:** The dump title includes a module name and an offset into the module where the ABEND was issued.

---

### 2031

**Explanation:** This is an internal error. The IRLM requested that MVS terminate the IRLM address space because of a previous error. The IRLM issues message DXR122E to the console.

**System Action:** The IRLM terminates abnormally. An SDUMP of the IRLM address space is requested.

**System Programmer Response:** Obtain the SDUMP and contact the IBM Support Center for help in determining the problem.

**Problem Determination:** The dump title includes a module name and an offset into the module where the ABEND was issued.
Part 6. SNA codes

Chapter 62. SNA sense codes. ........................................ 1339
Chapter 62. SNA sense codes

This section describes the SNA sense codes issued by the DB2 product when an error is detected on an LU6.2 conversation. We have also included some SNA sense codes which DB2 does not issue but users often have trouble diagnosing.

There are many SNA sense codes that are not described here. For information concerning the SNA sense codes that are not included, refer to SNA Formats.

080F6051

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the remote site did not accept the security information contained in the SNA FMH5.

This abend reason code is issued by the following CSECTs:

DSNLAGNT DSNLTACC DSNLTEXC DSNLVPF5

System Action: The attempt to access the remote database resource fails, and the failure is reported to the application.

A DSNL0321 message might have been written to the console. Refer to the description of this message for further information.

User Response: Notify the communications database administrator.

System Programmer Response: If the remote site is a DB2 subsystem, refer to the DSNL030I message at the remote site for the cause of the security failure. Additionally, an ALERT is recorded in NetView (if the NetView product is available) to describe the security failure.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the security failure at the remote site.

Verify each of the following:

- The USERNAMES column of the SYSIBM.LUNAMES table at the local DB2 system must specify either 'O' or 'B', if you intend authorization IDs and PASSWORDs to be sent on LU6.2 ALLOCATE requests to the remote site.
- The authorization ID and PASSWORD sent on the LU6.2 ALLOCATE request are specified correctly in the SYSIBM.USERNAMES table.
- If you intend to translate the authorization IDs, insure the NEWAUTHID column of the SYSIBM.USERNAMES table is the authorization ID to be used at the remote site.
- If password encryption is used (ENCRYPTPSWDS='Y' in the SYSIBM.LUNAMES table), the remote site must be a DB2 subsystem.

The ENCRYPTPSWDS column of the SYSIBM.LUNAMES table must be correctly set at both the local and remote DB2 subsystems.

- The correct password is set to the remote site.
  1. For encrypted passwords, the password sent to the remote DB2 subsystem is obtained by extracting the password from the local security subsystem of the authorization ID in the NEWAUTHID column of the SYSIBM.USERNAMES.
  2. If password encryption is not used, the password is taken from the PASSWORD column of the SYSIBM.USERNAMES table.

Problem Determination: Collect the following diagnostic items listed in Appendix B. “Problem determination,” on page 1349.

080F6052

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the security subfields in the FMH5 were not formatted as required by the LU6.2 architecture.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer Response: Contact the administrator for the client system. The client system might have a software defect.

080FF00

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the password supplied to the server has expired.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer Response: Change the password at the remote database server, so that the password is no longer expired.
Problem Determination: If updating the password does not correct the problem, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][58][59][83]

080FFF01

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the password supplied to the server was incorrect.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User Response: Supply the correct password on the connection request.

Problem Determination: If supplying the correct password does not fix the problem, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][58][59][83]

080FFF02

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the userid specified on the request was revoked at the server system.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User Response: Contact the security administrator at the server to have your userid re-activated.

Problem Determination: If reactivating the userid does not correct the problem, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][58][59][83]

080FFF03

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because the userid supplied to the server was invalid.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

User Response: Supply a valid userid on your connection request.

Problem Determination: If the problem cannot be correct by changing the userid, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][58][59][83]

080FFF04

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because no userid was present in the connection request.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer Response: Contact the administrator of the client system. The client must be configured to include a userid on connection requests.

080FFF05

Explanation: An attempt to allocate a VTAM LU6.2 conversation failed because a password was not supplied in the connection request.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLVPF5.

System Action: The attempt to access the remote database resource fails, and the failure is reported to the SQL application.

Programmer Response: Contact the administrator of the client system. The client must be configured to transmit a password in the connection request.

This is known in LU6.2 as SECURITY=PGM on the ALLOCATE verb.

08120000

Explanation: A VTAM LU6.2 conversation was terminated due to a resource shortage.

This abend reason code is issued by the following CSECTs:

DSNLAGNT DSNLTACC DSNLTEXC

System Action: The LU6.2 conversation is terminated.

User Response: Notify the systems programmer.

System Programmer Response: If the site issuing this sense code is a DB2 subsystem, refer to the DSNL0301 message at the DB2 site for the cause of the failure.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349 [1][58][59][83]
084B0000

Explanation: A VTAM LU6.2 conversation was terminated due to a resource shortage.

This abend reason code is issued by the following CSECT: DSNLVRP.

System Action: The LU6.2 conversation is terminated.

User Response: Notify the systems programmer.

System Programmer Response: If the site issuing this sense code is a DB2 system, refer to the DSNL500I message at the DB2 site for the cause of the failure.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

Problem Determination: Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

084B0631

Explanation: A VTAM LU6.2 conversation was terminated due to a resource shortage.

This abend reason code is issued by the following CSECTs:

DSNLAGNT DSNLTACC DSNLTEXC

System Action: The LU6.2 conversation is terminated.

User Response: Notify the systems programmer.

System Programmer Response: If the server site issuing this sense code is a DB2 system, refer to the DSNL030I message at the DB2 site for the cause of the failure.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the resource shortage at the remote site.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

08570008

Explanation: A VTAM LU6.2 conversation is not allowed because the LU session required for the processing of the request is not active.

This sense code is issued by the following CSECTs: DSNLVRPL.

System Action: The LU6.2 conversation is terminated.

User Response: Notify the system programmer about the network failure.

System Programmer Response: If the server site issuing this sense code is a DB2 subsystem, make sure DDF is started.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the inactive DB2 subsystem.

Problem Determination: Collect the following diagnostic item listed in Appendix B, “Problem determination,” on page 1349.

08640000

Explanation: A DEALLOCATE TYPE(ABEND_PROG) verb was issued to terminate the LU6.2 conversation. This occurs when an unrecoverable error was detected during distributed database processing.

This abend reason code is issued by the following CSECTs:

DSNLAGNT DSNLDCDN DSNLCRTD DSNLCSIM DSNLCTRC DSNLTACC DSNLTEXC DSNLVPF5

System Action: An error was encountered which required the LU6.2 conversation to be terminated abnormally. The conversation is terminated using DEALLOCATE TYPE(ABEND_PROG), which is detected as a communication error at the remote site.

User Response: Notify the systems programmer.

System Programmer Response: Look for messages or SVC dumps at the site which issued the DEALLOCATE TYPE(ABEND_PROG).

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

08640001

Explanation: A DEALLOCATE TYPE(ABEND_SVC) verb was issued to terminate the LU6.2 conversation. This occurs when a remote system encounters an unrecoverable error in attempting to satisfy a distributed database request.

This abend reason code is issued by the following CSECTs:

DSNLVRQX DSNLVRWX DSNLVXAN

System Action: An error was encountered which required the LU6.2 conversation to be terminated abnormally. The conversation is terminated using DEALLOCATE TYPE(ABEND_SVC), which is detected as a communication error at the remote site.

User Response: If the site issuing the DEALLOCATE TYPE(ABEND_SVC) is a DB2 subsystem, that DB2 site is in the process of stopping the distributed data facility (DDF). You must retry your request once DDF is restarted at that site.
System Programmer Response: If the site issuing DEALLOCATE TYPE(ABEND_SVC) was not coming down, look for messages or SVC dumps at that site that would cause the conversation to be terminated.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

08640002

Explanation: An SNA conversation was terminated with an SNA ABEND_TIMER indication.

This abend reason code is issued by the following CSECT: DSNLVDDC

System Action: When communication with the coordinator of a unit of work fails and the commit/abort decision has not yet been received, DB2 uses the X'08640002' SNA sense code to terminate conversations with all other LUs involved in the unit of work. This informs the other LUs in the unit of work that a 2-phase commit communication outage occurred. All LUs involved in the unit of work are still able to determine the outcome of the unit of work, because either DB2 or the remote system performs the SNA resynchronization protocol to determine the coordinator’s decision (commit or abort) for the unit of work.

System Programmer Response: No action is required.

---

10086011

Explanation: An invalid LUWID value was detected in the data received from a remote site. When a remote site sends a request using application-directed access, the first portion of the data contains an SNA FMH5 header. This header contains the invalid LUWID.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

User Response: Notify the systems programmer.

System Programmer Response: The remote site is required to send a valid LUWID value when using application-directed access.

Verify that the remote site issuing this request is indeed attempting to start a conversation using application-directed access. It is possible that the remote site mistakenly attempted to start a conversation with DB2, using the transaction program name (TPN).

If the remote site is attempting to start a conversation using application-directed access, contact the support group for the remote site to determine why an invalid LUWID is being transmitted.

---

10086021

Explanation: A remote site sent a request that specifies an unknown transaction program name (TPN). The first message in the request contains an SNA FMH5 header, which specifies the TPN to be used.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

User Response: Notify the systems programmer.

System Programmer Response: This error is usually caused by one of these errors:

- DB2 returns this sense code to an application at a remote site when the application mistakenly routes an LU6.2 ALLOCATE request to DB2. In most cases, the remote site selected the wrong partner LU name (DB2’s LU name) on the LU6.2 ALLOCATE verb.

- A DB2 server received an invalid Transaction Program Name (TPN) from a DRDA requester. The only DRDA TPN that DB2 considers valid is X'07F6C4C2'.

- If DB2 receives this sense code from a remote site, one of the following can potentially be the cause:

  1. If you are using application-directed access, the remote site does not support application-directed access. This can occur if the remote site is a DB2 Version 2 Release 2 system, which does not support application-directed access.

  2. If you are using system-directed access, the remote site issues this sense code if it is not another DB2 site. System-directed access is only supported between DB2 subsystems. Other systems do not support this function.

  3. The SYSIBM.Locations table does not specify the correct LUNAME value for your intended destination. This causes VTAM to route your request to the wrong site, which probably does not support distributed database functions.

  4. The remote site does not support distributed two-phase commit protocols, but the VTAM APPL definition for the remote LU specifies that two-phase commit protocols are supported. This can occur if the remote site is a DB2 Version 2 system which has SYNLVL=SYNCPOINT specified in its VTAM APPL definition. For DB2 Version 2 systems, the VTAM APPL definition
statement should specify SYNCLVL=CONFIRM (the default), since DB2 Version 2 systems do not support distributed two-phase commit protocols.

If none of the above explains the failure, you must contact the support group for the remote site to determine why an invalid TPN is being transmitted.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 10086031

**Explanation:** A remote site rejected a request using system-directed access because it contained program initialization parameters (PIP) in the SNA FMH-5 header. This error indicates the remote site is not another DB2 subsystem.

This abend reason code is issued by the following CSECT: None

**System Action:** The attempt to allocate an APPC conversation is rejected.

**User Response:** The failing SQL statement specified an SQL object that was either:

- An ALIAS for a remote object
- Or a three-part name identifying a remote object.

This access method can only be used when the remote object resides on another DB2 subsystem.

If the remote object resides on a different relation database system, you must use application-directed access to access the remote object.

**System Programmer Response:** If DB2 receives this sense code when attempting to start a conversation, the SYSIBM.LOCATIONS table probably has an incorrect LUNAME value for the failing site. If the wrong LUNAME is provided, VTAM routes the request to the wrong network destination.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.

---

### 10086041

**Explanation:** An SNA FMH5 was received that requested a SYNC_LEVEL that was not consistent with the transaction program name (TPN) specified.

This abend reason code is issued by the following CSECT: DSNLVPF5

**System Action:** The attempt to allocate an APPC conversation is rejected.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

**User Response:** Notify the systems programmer.

**System Programmer Response:** The SYNC_LEVEL must be NONE.

When DB2 sends this sense code, it is usually caused by an APPC application that mistakenly routed an APPC ALLOCATE request to DB2.

If DB2 receives this sense code, the DB2 SYSIBM.LOCATIONS table probably has an incorrect LUNAME value for the failing LOCATION. This causes VTAM to route the request to the wrong destination, which can potentially be flagged in this manner.

If none of the above explains the failure, you must contact the support group for the remote site to determine why the SYNC_LEVEL is being sent incorrectly.

**Problem Determination:** Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1349.
800A0000

Explanation: A distributed database message was truncated during transmission through the network. When the data is being transmitted, the data is broken up into smaller pieces, based on the SNA RU size specified by your Communications Administrator. This error indicates that one or more device in your network could not accept messages of the size specified in the chosen RU size.

This abend reason code is issued by the following CSECT: None

System Action: The conversation is terminated.

User Response: Notify the systems programmer.

System Programmer Response: The data flowing to the failing destination specified an RU size that was too large for the network connections used to route the data. One of two actions must be taken:

1. The network connections along the path must be changed to support the largest PIU being transmitted (a PIU is 29 bytes longer than the RU size you specify).

   For VTAM channel-to-channel connections, the MAXBFRU parameter on the VTAM LINE statement is used to control this function. MAXBFRU specifies the number of 4KB buffers used to pass data over the channel. Since a PIU includes a 29 byte header, MAXBFRU must be at least 2 in order to support an RU size of 4096.

   For connections to NCP, the MAXDATA parameter on the PCCU macro must be large enough to hold an entire PIU.

2. If you would rather not change the MAXBFRU and MAXDATA values, a smaller RU size must be specified. This can be accomplished by reducing the RUSIZES parameter for each MODEENT macro used by DB2 in your LOGMODE table.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1349.
Part 7. Appendixes
## Appendix A. CICS Transaction Abend/Dump Code

### DSNC

**Explanation:** The CICS attachment facility has detected an error. This is the 4-character code that identifies the ABEND/DUMP as a CICS attachment facility request for the CICS transaction associated with the error. This ABEND/DUMP is usually associated with one of the other CICS attachment facility 'X'04E' abends.

This code is issued by the following CSECTs:
- DSNCXT1, DSNCSTOP

**System Action:** The CICS attachment facility processing proceeds as defined for the 'X'04E' system abend associated with the dump. If diagnostic information is required and the CICS attachment facility determines that the transaction should also be abended, EXEC CICS ABEND is issued using DSNC as the abend code. Otherwise dump continue, EXEC CICS DUMP, is issued with DSNC as the dump code, and a return code is placed in the application’s SQLCA.

**User Response:** Notify the system programmer.

**Operator Response:** Notify the system programmer.

**System Programmer Response:** The Problem Determination section of this message provides information in addition to the information that is related to the associated CICS attachment facility abend. Use it to assist you in determining the cause of the error.

**Problem Determination:** The reason for the error can be determined by the codes in the CLOTCFLG field of the CLOT control block, included in the dump. Explanations of codes in this field are as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Normal, no error.</td>
</tr>
<tr>
<td>04</td>
<td>RCT entry has been corrupted or overlaid. See message DSNC044.</td>
</tr>
<tr>
<td>08</td>

</table>

Collect the subtask SNAP dump and refer to the reason code found in Part 4, "Section 4. DB2 Codes," on page 771. The Problem Determination section of some reason codes refers to register contents at the time of the abend. The register contents can be found in the SNAP dump under RTM2WA SUMMARY. Register contents can also be found in the SYS1.LOGREC record.
Appendix B. Problem determination

Diagnostic items

1. Console output from the system on which the job was run, and a listing of the SYSLOG data set for the period of time spanning the failure.
2. Dynamic dump, taken to SYS1.DUMPxx data set, by DB2 (04E/04F abends).
3. SVC dump (or system dump), taken to SYS1.DUMPxx data set, as result of an operator initiated dump command or SLIP trap exit.
4. SYSABEND, SYSUDUMP, or SYSMDUMP output.
5. Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.
7. Link pack area map (LPAMAP) and nucleus load module map, obtained by executing AMBLIST.
8. Listing of the procs used to initialize DB2 address spaces.
9. Listing of DSNZPARM module used.
10. IDCAMS LISTCAT output for the ICF (VSAM) catalog containing the DB2 subsystem catalog that defined the failing index or table.
11. IDCAMS LISTCAT output showing the attributes of all of the active log data sets for the member of the DB2 member that failed.
12. VTOC listing of the DASD volume on which the failing operation occurred.
13. Dump of the index or table space that failed.
14. Listing of the results produced by the SQL statements.
15. Listing of DB2 catalog tables.
16. Contents of the BSDS (both copies if dual BSDS in use) obtained by using the DB2 print log map (DSNJU004) utility.
17. Source listing of the failing application program.
18. IRLM trace output.
19. Output of the GTF trace (if requested by IBM).
20. Listing of the DSNTRACE data set for the DSN (TSO attachment facility) session involved in the problem.
21. Listing of the ISPF log for the session involved in the problem.
22. CICS trace listing.
23. CICS attach MVS SNAP dump.
24. CICS transaction dump.
25. IMS trace output.
26. IMS dependent region and/or control region dump.
27. IMS/VS Version 1 system log information, for the period of time spanning the failure.
28. VVDS dump of the volumes containing the data set.
29. DB2 Repair dump of the requested page.
30. DSN1LOGP detail report containing log records associated with the damaged page.
31. Detailed description of events immediately prior to and during the abend.
32. SYSPRINT output, including JCL, for the application program or batch job and system messages that were issued. Make sure that MSGLEVEL=(1,1) on the JOB statement so that all diagnostic information is sent to SYSPRINT.
33. DB2 log output, including any DB2 Recovery Log Archive Tapes.
34. DB2 dump of the requested page.
35. Definitions of views and tables involved in the error.
36. Listing of the IRLM procedure.
37. Definitions of table spaces, tables, and indexes involved in the error.
38. Results from SELECT * from SYSIBM.SYSDATABASE.
39. Use IDCAMS to print from BSDS the record with key of X’16000001’.
40. DB2 Repair dump of the pages identified in DSN1014I messages.
41. CHECK utility output.
42. DB2 Repair dump of the pages identified in DSNI013I messages.
43. A copy via (DSN1COPY) of the index space or table space identified in the DSNI013I messages on tape.
44. DB2 Repair dump of the header page (page 0) for each index identified in the DSNI013I messages.
45. IMS console log.
46. UTPRINT output produced by utility invocation of SORT.
47. Repair dump of all SYSUTIL pages.
48. Dump of page set from DUMP option of REPAIR.
49. All dumps taken by the attachment facility or requesting application.
50. Console output from the system on which the job was run, and a listing of the MVS SYSLOG data set for the period from the last IPL to the time of the failure.
52. Precompiler listing of failing application program with SOURCE(YES) and XREF(YES) specified.
53. Listing of SYSIBM.SYSLGRNX and/or SYSLGRNG, and SYSIBM.SYSCOPY.
54. A copy of the DDITV02 SYSIN data set.
55. A copy of the DDOTV02 output data set.
56. The console output and the listing of the SYSLOG data set from each connected site for the period of time spanning the failure.
57. The listings of the SYS1.LOGREC data set, obtained by executing IFCEREP1 at each connected site.
58. A listing of the contents of the SYSIBM.IP NAMES and SYSIBM.LUNAMES tables at the local DB2 system and the remote DB2 system.
59. A listing of the contents of the SYSIBM.USERNAMES table at the local DB2 system and the remote DB2 system.
60. Dynamic dump, taken to SYS1.DUMPxx data set, by DB2 (04E/04F abends). Availability of this dump is dependent upon the failing environment.
61. SYSABEND, SYSUDUMP, or SYSMDUMP output. Availability of these dumps is dependent upon the failing environment.
62. A copy (via DSN1COPY) on tape of the page set containing the DB2 Directory. Alternatively, request a dump (produced by the REPAIR Utility, DSN1COPY or DSN1PRNT) of the DBD for each database identified in the DSNI013I messages.
63. Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1 and ISDASDA0.
64. A copy of the table and index taken via DSN1COPY before any recover is performed.
65. Detailed description of events prior to the abend such as recovery or other activity affecting DSNDB06.SYSDBASE, DSNDB01.DSD01, or the subject table spaces.
66. Definitions of table spaces, tables, and indexes involved in the error. The record identifiers (OBIDs) identified with each table in the table space with the error can be obtained from SYSIBM.SYSTABLES.
67. Listing of the entire table space.
68. Listing of the DBD, obtained by executing UTILITY DIAGNOSE OBD.
69. Unformatted DSN1PRNT output of the DSNDB01.DBD01 page set. Use the method described in Part 5 of [DB2 Diagnosis Guide and Reference] to locate the inconsistent DBD in the DSNDB01.DBD01 page set.
70. The results of the following SQL:
    • SELECT * FROM SYSIBM.SYSINDEXES WHERE DBID=dbid ORDER BY OBID; Where dbid is the DBID of the damaged DBD.
    • SELECT * FROM SYSIBM.SYSINDEXES WHERE DBID=dbid ORDER BY ISOBID;
• SELECT * FROM SYSIBM.SYSLINKS WHERE DBID=dbid ORDER BY OBID;
• SELECT * FROM SYSIBM.SYSTABLES WHERE DBID=dbid ORDER BY OBID;
• SELECT * FROM SYSIBM.SYSTABLESPACE WHERE DBID=dbid ORDER BY OBID;
• SELECT * FROM SYSIBM.SYSTABLESPACE WHERE DBID=dbid ORDER BY PSID.

Use the results to compare the information in the DB2 Catalog with the DBD. Determine which OBIDs are inconsistent with the DB2 Catalog. Use Part 5 of the DB2 Diagnosis Guide and Reference to analyze the DBD.

71. DSN1LOGP output with DBID (1) OBID (1F) covering the period of time in which the DBD inconsistency may have occurred. This period of time is roughly from the time of the ABEND back to the time when the DB2 Catalog and DBD were believed to be consistent.

72. A copy of the log for this period so that additional DSN1LOGP reports can be produced for problem determination.

73. The location used in the alias entry in SYSIBM.SYSTABLES.

74. The contents of the SYSIBM.LOCATIONS table.

75. The AUTHORIZATION ID, PLANNAME, and LUNAME of the thread used to select the MODENAME in the SYSIBM.MODESELECT table.

76. The contents of the SYSIBM.LOCATIONS table and the SYSIBM.MODESELECT.

77. Listing of the contents of SYSIBM.LUMODES in the communications database.

78. System log printout (obtained via MVS WRITELOG operator command) showing related VSAM/media manager messages that may appear there (usually needed only if you have a message or reason code that indicates a media manager services problem occurred).

79. A hexadecimal print of the first record of the failing DBRM.

80. The listing from the precompile job that generated the DBRM.

81. Output from the BIND attempt.

82. IMS or CICS trace and any dumps.

83. Statistics Class 4 trace record for the LUWID associated with the failing request.

84. All dumps created by this failure.

85. Job output

86. Print the contents of the SYSIBM.IPNAMES table.

87. Print the contents of the SYSIBM.IPLIST table.

Where Stands for Where Stands for

| AI  | Hash anchor ID | OI  | OBID in decimal of resource |
| ALIAS | Alias owner | OWNER | Alias owner |
| APAR | APAR number | REL | DB2 release name |
| AUTHORIZATION ID | DB2 authorization identifier | PACKAGE | Package identifier |
| BP  | Buffer pool identifier | PG  | Hexadecimal page number |
| CN  | Column name | COLN | Column number within the base table of the LOB column that has been marked invalid. |
| DIX | DBID in hexadecimal | PL  | Plan identifier |
| COLLECTION | Collection-ID of the package | PT  | Decimal partition number |
| CONTOKEN | Consistency token of the package | RCPRI | APPC primary return code |
| CR  | Creator of the object | RCSEC | APPC secondary return code |
| DB  | Database name | RD  | DB2 release dependency mark |
| DBP | Database procedure name | RELDEP | DB2 release dependency mark |
**ABEND codes associated with DSN1COPY misuse**

The following table represents the possible combinations of ABEND reason codes, CSECT-names, and ERQUAL’s that can result from the improper use of DSN1COPY. An improper use includes, but is not limited to:

- Specifying the wrong OBIDXLAT values
- Not restoring all the datasets of the table space or index space to the same level
- Restoring datasets to a level that does not match the definition in the catalog and directory
- Restoring one table space type to a different type (e.g. segmented to simple).

This table is not meant to be exhaustive, but contains the more common codes, or those that are likely to have been caused by DSN1COPY misuse. However, this does not eliminate the possibility that the occurrence of these ABEND codes can be caused by other errors, such as an inconsistent DBD, or a DB2 internal error. The numbers under 'Explanation' refer to the notes following the table.

Explanations

The following explanations are groups of inconsistencies that relate to the ABEND codes, separated by user table spaces and user index spaces. Within each group are examples of specific inconsistencies representing each group.

User Table Spaces
1. Record or field length in the data does not match the length in the OBD
   - Either the fixed lengths do not match, or the variable length of the record is greater than the maximum allowed in the OBD
2. Record OBID in the data does not agree with the OBD
   - OBD corresponding to the OBID from the data cannot be found in the DBD, or the OBD in the DBD is of a different type.
3. Number of columns in the data row does not match the OBD definition
   - An ALTER ADD COLUMN was performed, but the copy of the data is downlevel with respect to the ALTER ADD DBD.
4. Index does not match the data
   - Either the index entry does not exist for the data record, or the index entry points to a missing or bad data record.
5. Data in one table space is inconsistent with related data in another table space
   - Referential integrity; parent and dependent are in different table spaces.
6. Table space definition in the OBD is inconsistent with the data
   - SEGSIZES do not match
   - Table space type is different (simple restored into segmented)
   - Segment anchor in the OBD points to an invalid first segment (segment not allocated).
7. Table space is inconsistent within itself
   - Not all datasets are restored to the same level
   - Broken segment chains
   - Base and overflow records are not consistent.

User Index Spaces
8. Total key length in the index page or entry does not match the key length in the OBD
   - Index data restored with the wrong index or downlevel index.
9. Key length derived from data passed into the Index Manager does not match the length in the index page or entry
   - Data or index restored to inconsistent states.
10. Index OBID in the index does not agree with the OBD
    - OBD corresponding to the OBID from the index cannot be found in the DBD, or the OBD in the DBD is of a different type.
11. Index space definition in the OBD is inconsistent with the index data
    - Inconsistent subpage directory
    - Cannot find the key in the partition high-key directory
    - Keys not found.
12. Index space is inconsistent within itself
    - Not all datasets are restored to the same level
    - Index entry not connected to the root page.
13. Log RBA is unavailable for the associated table space or index space.
Appendix C. SQLSTATE Values—Common Error Codes

The information in this appendix is General-use Programming Interface and Associated Guidance Information, as defined in “Notices” on page 1391.

This appendix contains a summary of the SQLSTATE values that are produced by DB2 as an application server or requester. The SQLSTATE values are based on the SQLSTATE specifications contained in the standards: ISO/IEC 9075:1992, Database Language SQL and ANSI X3.135-1992 Database Language SQL.

Using SQLSTATE values

SQLSTATE values are returned to the application in the last five bytes of the SQLCA. Each five-character value is a return code that indicates the outcome of the most recently executed SQL statement.

SQLSTATE values are designed so that application programs can test for specific errors or classes of errors. The first character of an SQLSTATE value indicates whether the SQL statement was executed successfully or unsuccessfully (equal to or not equal to zero, respectively).

SQLSTATE values are comprised of a two-character class code value, followed by a three-character subclass code value. Class code values represent classes of successful and unsuccessful execution conditions. An application might define classes beginning with the characters ‘7’ through ‘9’ or ‘I’ through ‘Z’ and subclasses for any class beginning with the characters ‘I’ through ‘Z’.

Table 5 identifies the SQLSTATE class codes.

Appendix D. New, Changed, and Deleted Messages and Codes

This appendix lists new, changed, and deleted messages and codes to support DB2 Version 8, as follows:

- **“New messages and codes”** lists new SQL return codes, messages, and reason codes.
- **“Changed messages and codes” on page 1384** lists changed SQL return codes, messages, reason codes, and SNA codes.
- **“Deleted messages and codes” on page 1389** lists deleted SQL return codes and messages.

Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing

555 Bailey Avenue
San Jose, CA 95141-1003
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

**Programming interface information**

This information is intended to help you interpret messages issued by DB2 Universal Database for z/OS (DB2 UDB for z/OS).

This information also documents General-use Programming Interface and Associated Guidance Information provided by DB2 UDB for z/OS.

General-use programming interfaces allow the customer to write programs that obtain the services of DB2 UDB for z/OS.

General-use Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a chapter or section.

Glossary

The following terms and abbreviations are defined as they are used in the DB2 library.

A

abend. Abnormal end of task.

abend reason code. A 4-byte hexadecimal code that uniquely identifies a problem with DB2. A complete list of DB2 abend reason codes and their explanations is contained in DB2 Messages and Codes.

abnormal end of task (abend). Termination of a task, job, or subsystem because of an error condition that recovery facilities cannot resolve during execution.

access method services. The facility that is used to define and reproduce VSAM key-sequenced data sets.

access path. The path that is used to locate data that is specified in SQL statements. An access path can be indexed or sequential.

active log. The portion of the DB2 log to which log records are written as they are generated. The active log always contains the most recent log records, whereas the archive log holds those records that are older and no longer fit on the active log.

active member state. A state of a member of a data sharing group. The cross-system coupling facility identifies each active member with a group and associates the member with a particular task, address space, and z/OS system. A member that is not active has either a failed member state or a quiesced member state.

address space. A range of virtual storage pages that is identified by a number (ASID) and a collection of segment and page tables that map the virtual pages to real pages of the computer’s memory.

address space connection. The result of connecting an allied address space to DB2. Each address space that contains a task that is connected to DB2 has exactly one address space connection, even though more than one task control block (TCB) can be present. See also allied address space and task control block.

address space identifier (ASID). A unique system-assigned identifier for and address space.

administrative authority. A set of related privileges that DB2 defines. When you grant one of the administrative authorities to a person’s ID, the person has all of the privileges that are associated with that administrative authority.

after trigger. A trigger that is defined with the trigger activation time AFTER.

agent. As used in DB2, the structure that associates all processes that are involved in a DB2 unit of work. An allied agent is generally synonymous with an allied thread. System agents are units of work that process tasks that are independent of the allied agent, such as prefetch processing, deferred writes, and service tasks.

alias. An alternative name that can be used in SQL statements to refer to a table or view in the same or a remote DB2 subsystem.

allied address space. An area of storage that is external to DB2 and that is connected to DB2. An allied address space is capable of requesting DB2 services.

allied thread. A thread that originates at the local DB2 subsystem and that can access data at a remote DB2 subsystem.

allocated cursor. A cursor that is defined for stored procedure result sets by using the SQL ALLOCATE CURSOR statement.

already verified. An LU 6.2 security option that allows DB2 to provide the user’s verified authorization ID when allocating a conversation. With this option, the user is not validated by the partner DB2 subsystem.

ambiguous cursor. A database cursor that is in a plan or package that contains either PREPARE or EXECUTE IMMEDIATE SQL statements, and for which the following statements are true: the cursor is not defined with the FOR READ ONLY clause or the FOR UPDATE OF clause; the cursor is not defined on a read-only result table; the cursor is not the target of a WHERE CURRENT clause on an SQL UPDATE or DELETE statement.

American National Standards Institute (ANSI). An organization consisting of producers, consumers, and general interest groups, that establishes the procedures by which accredited organizations create and maintain voluntary industry standards in the United States.

ANSI. American National Standards Institute.

APAR. Authorized program analysis report.

APAR fix corrective service. A temporary correction of an IBM software defect. The correction is temporary, because it is usually replaced at a later date by a more permanent correction, such as a program temporary fix (PTF).

APF. Authorized program facility.

API. Application programming interface.
APPL. • batch message processing program

APPL. A VTAM® network definition statement that is used to define DB2 to VTAM as an application program that uses SNA LU 6.2 protocols.

application. A program or set of programs that performs a task; for example, a payroll application.

application-directed connection. A connection that an application manages using the SQL CONNECT statement.

application plan. The control structure that is produced during the bind process. DB2 uses the application plan to process SQL statements that it encounters during statement execution.

application process. The unit to which resources and locks are allocated. An application process involves the execution of one or more programs.

application programming interface (API). A functional interface that is supplied by the operating system or by a separately orderable licensed program that allows an application program that is written in a high-level language to use specific data or functions of the operating system or licensed program.

application requester. The component on a remote system that generates DRDA® requests for data on behalf of an application. An application requester accesses a DB2 database server using the DRDA application-directed protocol.

application server. The target of a request from a remote application. In the DB2 environment, the application server function is provided by the distributed data facility and is used to access DB2 data from remote applications.

archive log. The portion of the DB2 log that contains log records that have been copied from the active log.

ASCII. An encoding scheme that is used to represent strings in many environments, typically on PCs and workstations. Contrast with EBCDIC and Unicode.

ASID. Address space identifier.

attachment facility. An interface between DB2 and TSO, IMS, CICS, or batch address spaces. An attachment facility allows application programs to access DB2.

attribute. A characteristic of an entity. For example, in database design, the phone number of an employee is one of that employee's attributes.

authorization ID. A string that can be verified for connection to DB2 and to which a set of privileges is allowed. It can represent an individual, an organizational group, or a function, but DB2 does not determine this representation.

authorized program analysis report (APAR). A report of a problem that is caused by a suspected defect in a current release of an IBM supplied program.

authorized program facility (APF). A facility that permits the identification of programs that are authorized to use restricted functions.

automatic query rewrite. A process that examines an SQL statement that refers to one or more base tables, and, if appropriate, rewrites the query so that it performs better. This process can also determine whether to rewrite a query so that it refers to one or more materialized query tables that are derived from the source tables.

auxiliary index. An index on an auxiliary table in which each index entry refers to a LOB.

auxiliary table. A table that stores columns outside the table in which they are defined. Contrast with base table.

B

backout. The process of undoing uncommitted changes that an application process made. This might be necessary in the event of a failure on the part of an application process, or as a result of a deadlock situation.

backward log recovery. The fourth and final phase of restart processing during which DB2 scans the log in a backward direction to apply UNDO log records for all aborted changes.

base table. (1) A table that is created by the SQL CREATE TABLE statement and that holds persistent data. Contrast with result table and temporary table.

(2) A table containing a LOB column definition. The actual LOB column data is not stored with the base table. The base table contains a row identifier for each row and an indicator column for each of its LOB columns. Contrast with auxiliary table.

base table space. A table space that contains base tables.

basic predicate. A predicate that compares two values.

basic sequential access method (BSAM). An access method for storing or retrieving data blocks in a continuous sequence, using either a sequential-access or a direct-access device.

batch message processing program. In IMS, an application program that can perform batch-type processing online and can access the IMS input and output message queues.
**before trigger.** A trigger that is defined with the trigger activation time BEFORE.

**binary integer.** A basic data type that can be further classified as small integer or large integer.

**binary large object (BLOB).** A sequence of bytes where the size of the value ranges from 0 bytes to 2 GB–1. Such a string does not have an associated CCSID.

**binary string.** A sequence of bytes that is not associated with a CCSID. For example, the BLOB data type is a binary string.

**bind.** The process by which the output from the SQL precompiler is converted to a usable control structure, often called an access plan, application plan, or package. During this process, access paths to the data are selected and some authorization checking is performed. The types of bind are:

- **automatic bind.** (More correctly, automatic rebind) A process by which SQL statements are bound automatically (without a user issuing a BIND command) when an application process begins execution and the bound application plan or package it requires is not valid.
- **dynamic bind.** A process by which SQL statements are bound as they are entered.
- **incremental bind.** A process by which SQL statements are bound during the execution of an application process.
- **static bind.** A process by which SQL statements are bound after they have been precompiled. All static SQL statements are prepared for execution at the same time.

**bit data.** Data that is character type CHAR or VARCHAR and is not associated with a coded character set.

**BLOB.** Binary large object.

**block fetch.** A capability in which DB2 can retrieve, or fetch, a large set of rows together. Using block fetch can significantly reduce the number of messages that are being sent across the network. Block fetch applies only to cursors that do not update data.

**BMP.** Batch Message Processing (IMS). See batch message processing program.

**bootstrap data set (BSDS).** A VSAM data set that contains name and status information for DB2, as well as RBA range specifications, for all active and archive log data sets. It also contains passwords for the DB2 directory and catalog, and lists of conditional restart and checkpoint records.

**BSAM.** Basic sequential access method.

**BSDS.** Bootstrap data set.

**buffer pool.** Main storage that is reserved to satisfy the buffering requirements for one or more table spaces or indexes.

**built-in data type.** A data type that IBM supplies. Among the built-in data types for DB2 UDB for z/OS are string, numeric, ROWID, and datetime. Contrast with distinct type.

**built-in function.** A function that DB2 supplies. Contrast with user-defined function.

**business dimension.** A category of data, such as products or time periods, that an organization might want to analyze.

**C**

**cache structure.** A coupling facility structure that stores data that can be available to all members of a Sysplex. A DB2 data sharing group uses cache structures as group buffer pools.

**CAF.** Call attachment facility.

**call attachment facility (CAF).** A DB2 attachment facility for application programs that run in TSO or z/OS batch. The CAF is an alternative to the DSN command processor and provides greater control over the execution environment.

**call-level interface (CLI).** A callable application programming interface (API) for database access, which is an alternative to using embedded SQL. In contrast to embedded SQL, DB2 ODBC (which is based on the CLI architecture) does not require the user to precompile or bind applications, but instead provides a standard set of functions to process SQL statements and related services at run time.

**cascade delete.** The way in which DB2 enforces referential constraints when it deletes all descendent rows of a deleted parent row.

**CASE expression.** An expression that is selected based on the evaluation of one or more conditions.

**cast function.** A function that is used to convert instances of a (source) data type into instances of a different (target) data type. In general, a cast function has the name of the target data type. It has one single argument whose type is the source data type; its return type is the target data type.

**castout.** The DB2 process of writing changed pages from a group buffer pool to disk.

**castout owner.** The DB2 member that is responsible for casting out a particular page set or partition.

**catalog.** In DB2, a collection of tables that contains descriptions of objects such as tables, views, and indexes.
catalog table  •  closed application

catalog table.  Any table in the DB2 catalog.

CCSID.  Coded character set identifier.

CDB.  Communications database.

CDRA.  Character Data Representation Architecture.

CEC.  Central electronic complex. See central processor complex.

central processor (CP).  The part of the computer that contains the sequencing and processing facilities for instruction execution, initial program load, and other machine operations.

central processor complex (CPC).  A physical collection of hardware (such as an ES/3090™) that consists of main storage, one or more central processors, timers, and channels.

CFRM.  Coupling facility resource management.

CFRM policy.  A declaration by a z/OS administrator regarding the allocation rules for a coupling facility structure.

character conversion.  The process of changing characters from one encoding scheme to another.

Character Data Representation Architecture (CDRA).  An architecture that is used to achieve consistent representation, processing, and interchange of string data.

character large object (CLOB).  A sequence of bytes representing single-byte characters or a mixture of single- and double-byte characters where the size of the value can be up to 2 GB–1. In general, character large object values are used whenever a character string might exceed the limits of the VARCHAR type.

character set.  A defined set of characters.

character string.  A sequence of bytes that represent bit data, single-byte characters, or a mixture of single-byte and multibyte characters.

check constraint.  A user-defined constraint that specifies the values that specific columns of a base table can contain.

check integrity.  The condition that exists when each row in a table conforms to the check constraints that are defined on that table. Maintaining check integrity requires DB2 to enforce check constraints on operations that add or change data.

check pending.  A state of a table space or partition that prevents its use by some utilities and by some SQL statements because of rows that violate referential constraints, check constraints, or both.

checkpoint.  A point at which DB2 records internal status information on the DB2 log; the recovery process uses this information if DB2 abnormally terminates.

child lock.  For explicit hierarchical locking, a lock that is held on either a table, page, row, or a large object (LOB). Each child lock has a parent lock. See also parent lock.

CI.  Control interval.

CICS.  Represents (in this publication): CICS Transaction Server for z/OS; Customer Information Control System Transaction Server for z/OS.

CICS attachment facility.  A DB2 subcomponent that uses the z/OS subsystem interface (SSI) and cross-storage linkage to process requests from CICS to DB2 and to coordinate resource commitment.

CIFD.  Control interval definition field.

claim.  A notification to DB2 that an object is being accessed. Claims prevent drains from occurring until the claim is released, which usually occurs at a commit point. Contrast with drain.

claim class.  A specific type of object access that can be one of the following isolation levels:

- Cursor stability (CS)
- Repeatable read (RR)
- Write

claim count.  A count of the number of agents that are accessing an object.

class of service.  A VTAM term for a list of routes through a network, arranged in an order of preference for their use.

class word.  A single word that indicates the nature of a data attribute. For example, the class word PROJ indicates that the attribute identifies a project.

clause.  In SQL, a distinct part of a statement, such as a SELECT clause or a WHERE clause.

CLI.  Call-level interface.

client.  See requester.

CLIST.  Command list. A language for performing TSO tasks.

CLOB.  Character large object.

closed application.  An application that requires exclusive use of certain statements on certain DB2 objects, so that the objects are managed solely through the application’s external interface.
CLPA. Create link pack area.

classification index. An index that determines how rows are physically ordered (clustered) in a table space. If a clustering index on a partitioned table is not a partitioning index, the rows are ordered in cluster sequence within each data partition instead of spanning partitions. Prior to Version 8 of DB2 UDB for z/OS, the partitioning index was required to be the clustering index.

coded character set. A set of unambiguous rules that establish a character set and the one-to-one relationships between the characters of the set and their coded representations.

coded character set identifier (CCSID). A 16-bit number that uniquely identifies a coded representation of graphic characters. It designates an encoding scheme identifier and one or more pairs consisting of a character set identifier and an associated code page identifier.

code page. (1) A set of assignments of characters to code points. In EBCDIC, for example, the character 'A' is assigned code point 'XC1' (2), and character 'B' is assigned code point 'XC2'. Within a code page, each code point has only one specific meaning.

code point. In CDRA, a unique bit pattern that represents a character in a code page.

coexistence. During migration, the period of time in which two releases exist in the same data sharing group.

cold start. A process by which DB2 restarts without processing any log records. Contrast with warm start.

collection. A group of packages that have the same qualifier.

column. The vertical component of a table. A column has a name and a particular data type (for example, character, decimal, or integer).

column function. An operation that derives its result by using values from one or more rows. Contrast with scalar function.

"come from" checking. An LU 6.2 security option that defines a list of authorization IDs that are allowed to connect to DB2 from a partner LU.

command. A DB2 operator command or a DSN subcommand. A command is distinct from an SQL statement.

command prefix. A one- to eight-character command identifier. The command prefix distinguishes the command as belonging to an application or subsystem rather than to MVS.

command recognition character (CRC). A character that permits a z/OS console operator or an IMS subsystem user to route DB2 commands to specific DB2 subsystems.

command scope. The scope of command operation in a data sharing group. If a command has member scope, the command displays information only from the one member or affects only non-shared resources that are owned locally by that member. If a command has group scope, the command displays information from all members, affects non-shared resources that are owned locally by all members, displays information on sharable resources, or affects sharable resources.

commit. The operation that ends a unit of work by releasing locks so that the database changes that are made by that unit of work can be perceived by other processes.

commit point. A point in time when data is considered consistent.

committed phase. The second phase of the multisite update process that requests all participants to commit the effects of the logical unit of work.

common service area (CSA). In z/OS, a part of the common area that contains data areas that are addressable by all address spaces.

communications database (CDB). A set of tables in the DB2 catalog that are used to establish conversations with remote database management systems.

comparison operator. A token (such as =, >, or <) that is used to specify a relationship between two values.

composite key. An ordered set of key columns of the same table.

compression dictionary. The dictionary that controls the process of compression and decompression. This dictionary is created from the data in the table space or table space partition.

concurrency. The shared use of resources by more than one application process at the same time.

conditional restart. A DB2 restart that is directed by a user-defined conditional restart control record (CRCR).

connection. In SNA, the existence of a communication path between two partner LUs that allows information to be exchanged (for example, two DB2 subsystems that are connected and communicating by way of a conversation).

connection context. In SQLJ, a Java™ object that represents a connection to a data source.
connection declaration clause. In SQLJ, a statement that declares a connection to a data source.

connection handle. The data object containing information that is associated with a connection that DB2 ODBC manages. This includes general status information, transaction status, and diagnostic information.

connection ID. An identifier that is supplied by the attachment facility and that is associated with a specific address space connection.

consistency token. A timestamp that is used to generate the version identifier for an application. See also version.

constant. A language element that specifies an unchanging value. Constants are classified as string constants or numeric constants. Contrast with variable.

constraint. A rule that limits the values that can be inserted, deleted, or updated in a table. See referential constraint, check constraint, and unique constraint.

context. The application’s logical connection to the data source and associated internal DB2 ODBC connection information that allows the application to direct its operations to a data source. A DB2 ODBC context represents a DB2 thread.

contracting conversion. A process that occurs when the length of a converted string is smaller than that of the source string. For example, this process occurs when an EBCDIC mixed-data string that contains DBCS characters is converted to ASCII mixed data; the converted string is shorter because of the removal of the shift codes.

control interval (CI). A fixed-length area or disk in which VSAM stores records and creates distributed free space. Also, in a key-sequence data set or file, the set of records that an entry in the sequence-set index record points to. The control interval is the unit of information that VSAM transmits to or from disk. A control interval always includes an integral number of physical records.

control interval definition field (CIDF). In VSAM, a field that is located in the 4 bytes at the end of each control interval; it describes the free space, if any, in the control interval.

conversation. Communication, which is based on LU 6.2 or Advanced Program-to-Program Communication (APPC), between an application and a remote transaction program over an SNA logical unit-to-logical unit (LU-LU) session that allows communication while processing a transaction.

coordinator. The system component that coordinates the commit or rollback of a unit of work that includes work that is done on one or more other systems.

copy pool. A named set of SMS storage groups that contains data that is to be copied collectively. A copy pool is an SMS construct that lets you define which storage groups are to be copied by using FlashCopy® functions. HSM determines which volumes belong to a copy pool.

copy target. A named set of SMS storage groups that are to be used as containers for copy pool volume copies. A copy target is an SMS construct that lets you define which storage groups are to be used as containers for volumes that are copied by using FlashCopy functions.

copy version. A point-in-time FlashCopy copy that is managed by HSM. Each copy pool has a version parameter that specifies how many copy versions are maintained on disk.

correlated columns. A relationship between the value of one column and the value of another column.

correlated subquery. A subquery (part of a WHERE or HAVING clause) that is applied to a row or group of rows of a table or view that is named in an outer subselect statement.

correlation ID. An identifier that is associated with a specific thread. In TSO, it is either an authorization ID or the job name.

correlation name. An identifier that designates a table, a view, or individual rows of a table or view within a single SQL statement. It can be defined in any FROM clause or in the first clause of an UPDATE or DELETE statement.

cost category. A category into which DB2 places cost estimates for SQL statements at the time the statement is bound. A cost estimate can be placed in either of the following cost categories:
- A: Indicates that DB2 had enough information to make a cost estimate without using default values.
- B: Indicates that some condition exists for which DB2 was forced to use default values for its estimate.

The cost category is externalized in the COSTCATEGORY column of the DSN_STATEMNT_TABLE when a statement is explained.

coupling facility. A special PR/SM™ LPAR logical partition that runs the coupling facility control program and provides high-speed caching, list processing, and locking functions in a Parallel Sysplex®.

coupling facility resource management. A component of z/OS that provides the services to manage coupling facility resources in a Parallel Sysplex. This management includes the enforcement of CFRM policies to ensure that the coupling facility and structure requirements are satisfied.
CP. Central processor.

CPC. Central processor complex.

C++ member. A data object or function in a structure, union, or class.

C++ member function. An operator or function that is declared as a member of a class. A member function has access to the private and protected data members and to the member functions of objects in its class. Member functions are also called methods.

C++ object. (1) A region of storage. An object is created when a variable is defined or a new function is invoked. (2) An instance of a class.

CRC. Command recognition character.

CRCR. Conditional restart control record. See also conditional restart.

create link pack area (CLPA). An option that is used during IPL to initialize the link pack pageable area.

created temporary table. A table that holds temporary data and is defined with the SQL statement CREATE GLOBAL TEMPORARY TABLE. Information about created temporary tables is stored in the DB2 catalog, so this kind of table is persistent and can be shared across application processes. Contrast with declared temporary table. See also temporary table.

cross-memory linkage. A method for invoking a program in a different address space. The invocation is synchronous with respect to the caller.

cross-system coupling facility (XCF). A component of z/OS that provides functions to support cooperation between authorized programs that run within a Sysplex.

cross-system extended services (XES). A set of z/OS services that allow multiple instances of an application or subsystem, running on different systems in a Sysplex environment, to implement high-performance, high-availability data sharing by using a coupling facility.

CS. Cursor stability.

CSA. Common service area.

CT. Cursor table.

current data. Data within a host structure that is current with (identical to) the data within the base table.

current SQL ID. An ID that, at a single point in time, holds the privileges that are exercised when certain dynamic SQL statements run. The current SQL ID can be a primary authorization ID or a secondary authorization ID.

current status rebuild. The second phase of restart processing during which the status of the subsystem is reconstructed from information on the log.

cursor. A named control structure that an application program uses to point to a single row or multiple rows within some ordered set of rows of a result table. A cursor can be used to retrieve, update, or delete rows from a result table.

cursor sensitivity. The degree to which database updates are visible to the subsequent FETCH statements in a cursor. A cursor can be sensitive to changes that are made with positioned update and delete statements specifying the name of that cursor. A cursor can also be sensitive to changes that are made with searched update or delete statements, or with cursors other than this cursor. These changes can be made by this application process or by another application process.

cursor stability (CS). The isolation level that provides maximum concurrency without the ability to read uncommitted data. With cursor stability, a unit of work holds locks only on its uncommitted changes and on the current row of each of its cursors.

cursor table (CT). The copy of the skeleton cursor table that is used by an executing application process.

cycle. A set of tables that can be ordered so that each table is a descendent of the one before it, and the first table is a descendent of the last table. A self-referencing table is a cycle with a single member.
SQL statements are not modified and are sent unchanged to the database server.

database descriptor (DBD).  An internal representation of a DB2 database definition, which reflects the data definition that is in the DB2 catalog.  The objects that are defined in a database descriptor are table spaces, tables, indexes, index spaces, relationships, check constraints, and triggers. A DBD also contains information about accessing tables in the database.

database exception status.  An indication that something is wrong with a database. All members of a data sharing group must know and share the exception status of databases.

database identifier (DBID).  An internal identifier of the database.

database management system (DBMS).  A software system that controls the creation, organization, and modification of a database and the access to the data that is stored within it.

database request module (DBRM).  A data set member that is created by the DB2 precompiler and that contains information about SQL statements. DBRMs are used in the bind process.

database server.  The target of a request from a local application or an intermediate database server. In the DB2 environment, the database server function is provided by the distributed data facility to access DB2 data from local applications, or from a remote database server that acts as an intermediate database server.

data currency.  The state in which data that is retrieved into a host variable in your program is a copy of data in the base table.

data definition name (ddname).  The name of a data definition (DD) statement that corresponds to a data control block containing the same name.

data dictionary.  A repository of information about an organization’s application programs, databases, logical data models, users, and authorizations. A data dictionary can be manual or automated.

data-driven business rules.  Constraints on particular data values that exist as a result of requirements of the business.

Data Language/I (DL/I).  The IMS data manipulation language: a common high-level interface between a user application and IMS.

data mart.  A small data warehouse that applies to a single department or team. See also data warehouse.

data mining.  The process of collecting critical business information from a data warehouse, correlating it, and uncovering associations, patterns, and trends.

data partition.  A VSAM data set that is contained within a partitioned table space.

data-partitioned secondary index (DPSI).  A secondary index that is partitioned. The index is partitioned according to the underlying data.

data sharing.  The ability of two or more DB2 subsystems to directly access and change a single set of data.

data sharing group.  A collection of one or more DB2 subsystems that directly access and change the same data while maintaining data integrity.

data sharing member.  A DB2 subsystem that is assigned by XCF services to a data sharing group.

data source.  A local or remote relational or non-relational data manager that is capable of supporting data access via an ODBC driver that supports the ODBC APIs. In the case of DB2 UDB for z/OS, the data sources are always relational database managers.

data space.  In releases prior to DB2 UDB for z/OS, Version 8, a range of up to 2 GB of contiguous virtual storage addresses that a program can directly manipulate. Unlike an address space, a data space can hold only data; it does not contain common areas, system data, or programs.

data type.  An attribute of columns, literals, host variables, special registers, and the results of functions and expressions.

data warehouse.  A system that provides critical business information to an organization. The data warehouse system cleanses the data for accuracy and currency, and then presents the data to decision makers so that they can interpret and use it effectively and efficiently.

data.  A three-part value that designates a day, month, and year.

data duration.  A decimal integer that represents a number of years, months, and days.

datetime value.  A value of the data type DATE, TIME, or TIMESTAMP.

DBA.  Database administrator.

DBCLOB  Double-byte character large object.

DBCS.  Double-byte character set.

DBD.  Database descriptor.
DBID. Database identifier.

DBMS. Database management system.

DBRM. Database request module.

DB2 catalog. Tables that are maintained by DB2 and contain descriptions of DB2 objects, such as tables, views, and indexes.

DB2 command. An instruction to the DB2 subsystem that a user enters to start or stop DB2, to display information on current users, to start or stop databases, to display information on the status of databases, and so on.

DB2 for VSE & VM. The IBM DB2 relational database management system for the VSE and VM operating systems.

DB2I. DB2 Interactive.

DB2 Interactive (DB2I). The DB2 facility that provides for the execution of SQL statements, DB2 (operator) commands, programmer commands, and utility invocation.

DB2I Kanji Feature. The tape that contains the panels and jobs that allow a site to display DB2I panels in Kanji.

DB2 PM. DB2 Performance Monitor.

DB2 thread. The DB2 structure that describes an application’s connection, traces its progress, processes resource functions, and delimits its accessibility to DB2 resources and services.

DCLGEN. Declarations generator.

DDF. Distributed data facility.

ddbname. Data definition name.

deadlock. Unresolvable contention for the use of a resource, such as a table or an index.

declarations generator (DCLGEN). A subcomponent of DB2 that generates SQL table declarations and COBOL, C, or PL/I data structure declarations that conform to the table. The declarations are generated from DB2 system catalog information. DCLGEN is also a DSN subcommand.

declared temporary table. A table that holds temporary data and is defined with the SQL statement DECLARE GLOBAL TEMPORARY TABLE. Information about declared temporary tables is not stored in the DB2 catalog, so this kind of table is not persistent and can be used only by the application process that issued the DECLARE statement. Contrast with created temporary table. See also temporary table.

default value. A predetermined value, attribute, or option that is assumed when no other is explicitly specified.

defered embedded SQL. SQL statements that are neither fully static nor fully dynamic. Like static statements, they are embedded within an application, but like dynamic statements, they are prepared during the execution of the application.

defeed write. The process of asynchronously writing changed data pages to disk.

degree of parallelism. The number of concurrently executed operations that are initiated to process a query.

delete-connected. A table that is a dependent of table P or a dependent of a table to which delete operations from table P cascade.

defeed hole. The location on which a cursor is positioned when a row in a result table is refetched and the row no longer exists on the base table, because another cursor deleted the row between the time the cursor first included the row in the result table and the time the cursor tried to refetch it.

defeed rule. The rule that tells DB2 what to do to a dependent row when a parent row is deleted. For each relationship, the rule might be CASCADE, RESTRICT, SET NULL, or NO ACTION.

defeed trigger. A trigger that is defined with the triggering SQL operation DELETE.

delimted identifier. A sequence of characters that are enclosed within double quotation marks ("). The sequence must consist of a letter followed by zero or more characters, each of which is a letter, digit, or the underscore character (_).

delimter token. A string constant, a delimited identifier, an operator symbol, or any of the special characters that are shown in DB2 syntax diagrams.

denormalization. A key step in the task of building a physical relational database design. Denormalization is the intentional duplication of columns in multiple tables, and the consequence is increased data redundancy. Denormalization is sometimes necessary to minimize performance problems. Contrast with normalization.

dependent. An object (row, table, or table space) that has at least one parent. The object is also said to be a dependent (row, table, or table space) of its parent. See also parent row, parent table, parent table space.

dependent row. A row that contains a foreign key that matches the value of a primary key in the parent row.

dependent table. A table that is a dependent in at least one referential constraint.
DES-based authenticator  •  DRDA access

DES-based authenticator.  An authenticator that is generated using the DES algorithm.

descendant.  An object that is a dependent of an object or is the dependent of a descendant of an object.

descendant row.  A row that is dependent on another row, or a row that is a descendant of a dependent row.

descendant table.  A table that is a dependent of another table, or a table that is a descendant of a dependent table.

deterministic function.  A user-defined function whose result is dependent on the values of the input arguments. That is, successive invocations with the same input values produce the same answer. Sometimes referred to as a not-variant function. Contrast this with an nondeterministic function (sometimes called a variant function), which might not always produce the same result for the same inputs.

DFP.  Data Facility Product (in z/OS).

DFSMS.  Data Facility Storage Management Subsystem (in z/OS). Also called Storage Management Subsystem (SMS).

DFSMSdss™.  The data set services (dss) component of DFSMS (in z/OS).

DFSMShsm™.  The hierarchical storage manager (hsm) component of DFSMS (in z/OS).

dimension.  A data category such as time, products, or markets. The elements of a dimension are referred to as members. Dimensions offer a very concise, intuitive way of organizing and selecting data for retrieval, exploration, and analysis. See also dimension table.

dimension table.  The representation of a dimension in a star schema. Each row in a dimension table represents all of the attributes for a particular member of the dimension. See also dimension, star schema, and star join.

directory.  The DB2 system database that contains internal objects such as database descriptors and skeleton cursor tables.

distinct type.  A user-defined data type that is internally represented as an existing type (its source type), but is considered to be a separate and incompatible type for semantic purposes.

distributed data.  Data that resides on a DBMS other than the local system.

distributed data facility (DDF).  A set of DB2 components through which DB2 communicates with another relational database management system.

Distributed Relational Database Architecture™ (DRDA).  A connection protocol for distributed relational database processing that is used by IBM’s relational database products. DRDA includes protocols for communication between an application and a remote relational database management system, and for communication between relational database management systems. See also DRDA access.

DL/I.  Data Language/I.

DNS.  Domain name server.

document access definition (DAD).  Used to define the indexing scheme for an XML column or the mapping scheme of an XML collection. It can be used to enable an XML Extender column of an XML collection, which is XML formatted.

domain.  The set of valid values for an attribute.

domain name.  The name by which TCP/IP applications refer to a TCP/IP host within a TCP/IP network.

domain name server (DNS).  A special TCP/IP network server that manages a distributed directory that is used to map TCP/IP host names to IP addresses.

double-byte character large object (DBCLOB).  A sequence of bytes representing double-byte characters where the size of the values can be up to 2 GB. In general, DBCLOB values are used whenever a double-byte character string might exceed the limits of the VARCHAR graphic type.

double-byte character set (DBCS).  A set of characters, which are used by national languages such as Japanese and Chinese, that have more symbols than can be represented by a single byte. Each character is 2 bytes in length. Contrast with single-byte character set and multibyte character set.

double-precision floating point number.  A 64-bit approximate representation of a real number.

downstream.  The set of nodes in the syncpoint tree that is connected to the local DBMS as a participant in the execution of a two-phase commit.

DPSI.  Data-partitioned secondary index.

drain.  The act of acquiring a locked resource by quiescing access to that object.

drain lock.  A lock on a claim class that prevents a claim from occurring.

DRDA.  Distributed Relational Database Architecture.

DRDA access.  An open method of accessing distributed data that you can use to connect to another database server to execute packages that were previously bound at the server location. You use the
SQL CONNECT statement or an SQL statement with a three-part name to identify the server. Contrast with private protocol access.

**DSN.** (1) The default DB2 subsystem name. (2) The name of the TSO command processor of DB2. (3) The first three characters of DB2 module and macro names.

duration. A number that represents an interval of time. See also date duration, labeled duration, and time duration.

dynamic cursor. A named control structure that an application program uses to change the size of the result table and the order of its rows after the cursor is opened. Contrast with static cursor.

dynamic dump. A dump that is issued during the execution of a program, usually under the control of that program.

dynamic SQL. SQL statements that are prepared and executed within an application program while the program is executing. In dynamic SQL, the SQL source is contained in host language variables rather than being coded into the application program. The SQL statement can change several times during the application program’s execution.

dynamic statement cache pool. A cache, located above the 2-GB storage line, that holds dynamic statements.

**E**

EA-enabled table space. A table space or index space that is enabled for extended addressability and that contains individual partitions (or pieces, for LOB table spaces) that are greater than 4 GB.

**EB.** See exabyte.

**EBCDIC.** Extended binary coded decimal interchange code. An encoding scheme that is used to represent character data in the z/OS, VM, VSE, and iSeries™ environments. Contrast with ASCII and Unicode.

e-business. The transformation of key business processes through the use of Internet technologies.

**EDM pool.** A pool of main storage that is used for database descriptors, application plans, authorization cache, application packages.

**EID.** Event identifier.

**embedded SQL.** SQL statements that are coded within an application program. See static SQL.

enclave. In Language Environment®, an independent collection of routines, one of which is designated as the main routine. An enclave is similar to a program or run unit.

**encoding scheme.** A set of rules to represent character data (ASCII, EBCDIC, or Unicode).

**entity.** A significant object of interest to an organization.

enumerated list. A set of DB2 objects that are defined with a LISTDEF utility control statement in which pattern-matching characters (",", ",", or ") are not used.

environment. A collection of names of logical and physical resources that are used to support the performance of a function.

environment handle. In DB2 ODBC, the data object that contains global information regarding the state of the application. An environment handle must be allocated before a connection handle can be allocated. Only one environment handle can be allocated per application.

**EOM.** End of memory.

**EOT.** End of task.

**equijoin.** A join operation in which the join-condition has the form expression = expression.

**error page range.** A range of pages that are considered to be physically damaged. DB2 does not allow users to access any pages that fall within this range.

escape character. The symbol that is used to enclose an SQL delimited identifier. The escape character is the double quotation mark ("), except in COBOL applications, where the user assigns the symbol, which is either a double quotation mark or an apostrophe (’).

**ESDS.** Entry sequenced data set.

**ESMT.** External subsystem module table (in IMS).

**EUR.** IBM European Standards.

exabyte. For processor, real and virtual storage capacities and channel volume: 1,529,921,504,606,846,976 bytes or 2<sup>60</sup>.

exception table. A table that holds rows that violate referential constraints or check constraints that the CHECK DATA utility finds.

**exclusive lock.** A lock that prevents concurrently executing application processes from reading or changing data. Contrast with share lock.

**executable statement.** An SQL statement that can be embedded in an application program, dynamically prepared and executed, or issued interactively.

**execution context.** In SQLJ, a Java object that can be used to control the execution of SQL statements.
exit routine. A user-written (or IBM-provided default) program that receives control from DB2 to perform specific functions. Exit routines run as extensions of DB2.

expanding conversion. A process that occurs when the length of a converted string is greater than that of the source string. For example, this process occurs when an ASCII mixed-data string that contains DBCS characters is converted to an EBCDIC mixed-data string; the converted string is longer because of the addition of shift codes.

explicit hierarchical locking. Locking that is used to make the parent-child relationship between resources known to IRLM. This kind of locking avoids global locking overhead when no inter-DB2 interest exists on a resource.

exposed name. A correlation name or a table or view name for which a correlation name is not specified. Names that are specified in a FROM clause are exposed or non-exposed.

expression. An operand or a collection of operators and operands that yields a single value.

extended recovery facility (XRF). A facility that minimizes the effect of failures in z/OS, VTAM, the host processor, or high-availability applications during sessions between high-availability applications and designated terminals. This facility provides an alternative subsystem to take over sessions from the failing subsystem.

Extensible Markup Language (XML). A standard metalanguage for defining markup languages that is a subset of Standardized General Markup Language (SGML). The less complex nature of XML makes it easier to write applications that handle document types, to author and manage structured information, and to transmit and share structured information across diverse computing environments.

external function. A function for which the body is written in a programming language that takes scalar argument values and produces a scalar result for each invocation. Contrast with sourced function, built-in function, and SQL function.

external procedure. A user-written application program that can be invoked with the SQL CALL statement, which is written in a programming language. Contrast with SQL procedure.

external routine. A user-defined function or stored procedure that is based on code that is written in an external programming language.

external subsystem module table (ESMT). In IMS, the table that specifies which attachment modules must be loaded.

failed member state. A state of a member of a data sharing group. When a member fails, the XCF permanently records the failed member state. This state usually means that the member’s task, address space, or z/OS system terminated before the state changed from active to quiesced.

fallback. The process of returning to a previous release of DB2 after attempting or completing migration to a current release.

false global lock contention. A contention indication from the coupling facility when multiple lock names are hashed to the same indicator and when no real contention exists.

fan set. A direct physical access path to data, which is provided by an index, hash, or link; a fan set is the means by which the data manager supports the ordering of data.

federated database. The combination of a DB2 Universal Database server (in Linux, UNIX®, and Windows® environments) and multiple data sources to which the server sends queries. In a federated database system, a client application can use a single SQL statement to join data that is distributed across multiple database management systems and can view the data as if it were local.

fetch orientation. The specification of the desired placement of the cursor as part of a FETCH statement (for example, BEFORE, AFTER, NEXT, PRIOR, CURRENT, FIRST, LAST, ABSOLUTE, and RELATIVE).

field procedure. A user-written exit routine that is designed to receive a single value and transform (encode or decode) it in any way the user can specify.

filter factor. A number between zero and one that estimates the proportion of rows in a table for which a predicate is true.

fixed-length string. A character or graphic string whose length is specified and cannot be changed. Contrast with varying-length string.

FlashCopy. A function on the IBM Enterprise Storage Server® that can create a point-in-time copy of data while an application is running.

foreign key. A column or set of columns in a dependent table of a constraint relationship. The key must have the same number of columns, with the same descriptions, as the primary key of the parent table. Each foreign key value must either match a parent key value in the related parent table or be null.

forest. An ordered set of subtrees of XML nodes.
**forget**. In a two-phase commit operation, (1) the vote that is sent to the prepare phase when the participant has not modified any data. The forget vote allows a participant to release locks and forget about the logical unit of work. This is also referred to as the read-only vote. (2) The response to the committed request in the second phase of the operation.

**forward log recovery.** The third phase of restart processing during which DB2 processes the log in a forward direction to apply all REDO log records.

**free space.** The total amount of unused space in a page; that is, the space that is not used to store records or control information is free space.

**full outer join.** The result of a join operation that includes the matched rows of both tables that are being joined and preserves the unmatched rows of both tables. See also join.

**fullselect.** A subselect, a values-clause, or a number of both that are combined by set operators. Fullselect specifies a result table. If UNIsion is not used, the result of the fullselect is the result of the specified subselect.

**fully escaped mapping.** A mapping from an SQL identifier to an XML name when the SQL identifier is a column name.

**function.** A mapping, which is embodied as a program (the function body) that is invocable by means of zero or more input values (arguments) to a single value (the result). See also column function and scalar function.

Functions can be user-defined, built-in, or generated by DB2. (See also built-in function, cast function, external function, sourced function, SQL function, and user-defined function.)

**function definer.** The authorization ID of the owner of the schema of the function that is specified in the CREATE FUNCTION statement.

**function implementer.** The authorization ID of the owner of the function program and function package.

**function package.** A package that results from binding the DBRM for a function program.

**function package owner.** The authorization ID of the user who binds the function program’s DBRM into a function package.

**function resolution.** The process, internal to the DBMS, by which a function invocation is bound to a particular function instance. This process uses the function name, the data types of the arguments, and a list of the applicable schema names (called the SQL path) to make the selection. This process is sometimes called function selection.

**function selection.** See function resolution.

**function signature.** The logical concatenation of a fully qualified function name with the data types of all of its parameters.

**G**

**GB.** Gigabyte (1 073 741 824 bytes).

**GBP.** Group buffer pool.

**GBP-dependent.** The status of a page set or page set partition that is dependent on the group buffer pool. Either read/write interest is active among DB2 subsystems for this page set, or the page set has changed pages in the group buffer pool that have not yet been cast out to disk.

**generalized trace facility (GTF).** A z/OS service program that records significant system events such as I/O interrupts, SVC interrupts, program interrupts, or external interrupts.

**generic resource name.** A name that VTAM uses to represent several application programs that provide the same function in order to handle session distribution and balancing in a Sysplex environment.

**getpage.** An operation in which DB2 accesses a data page.

**global lock.** A lock that provides concurrency control within and among DB2 subsystems. The scope of the lock is across all DB2 subsystems of a data sharing group.

**global lock contention.** Conflicts on locking requests between different DB2 members of a data sharing group when those members are trying to serialize shared resources.

**governor.** See resource limit facility.

**graphic string.** A sequence of DBCS characters.

**gross lock.** The shared, update, or exclusive mode locks on a table, partition, or table space.

**group buffer pool (GBP).** A coupling facility cache structure that is used by a data sharing group to cache data and to ensure that the data is consistent for all members.

**group buffer pool duplexing.** The ability to write data to two instances of a group buffer pool structure: a primary group buffer pool and a secondary group buffer pool. z/OS publications refer to these instances as the “old” (for primary) and “new” (for secondary) structures.

**group level.** The release level of a data sharing group, which is established when the first member migrates to a new release.
group name • IMS

**group name.** The z/OS XCF identifier for a data sharing group.

**group restart.** A restart of at least one member of a data sharing group after the loss of either locks or the shared communications area.

**GTF.** Generalized trace facility.

**H**

**handle.** In DB2 ODBC, a variable that refers to a data structure and associated resources. See also statement handle, connection handle, and environment handle.

**help panel.** A screen of information that presents tutorial text to assist a user at the workstation or terminal.

**heuristic damage.** The inconsistency in data between one or more participants that results when a heuristic decision to resolve an indoubt LUW at one or more participants differs from the decision that is recorded at the coordinator.

**heuristic decision.** A decision that forces indoubt resolution at a participant by means other than automatic resynchronization between coordinator and participant.

**hole.** A row of the result table that cannot be accessed because of a delete or an update that has been performed on the row. See also delete hole and update hole.

**home address space.** The area of storage that z/OS currently recognizes as dispatched.

**host.** The set of programs and resources that are available on a given TCP/IP instance.

**host expression.** A Java variable or expression that is referenced by SQL clauses in an SQLJ application program.

**host identifier.** A name that is declared in the host program.

**host language.** A programming language in which you can embed SQL statements.

**host program.** An application program that is written in a host language and that contains embedded SQL statements.

**host structure.** In an application program, a structure that is referenced by embedded SQL statements.

**host variable.** In an application program, an application variable that is referenced by embedded SQL statements.

**host variable array.** An array of elements, each of which corresponds to a value for a column. The dimension of the array determines the maximum number of rows for which the array can be used.

**HSM.** Hierarchical storage manager.

**HTML.** Hypertext Markup Language, a standard method for presenting Web data to users.

**HTTP.** Hypertext Transfer Protocol, a communication protocol that the Web uses.

**I**

**ICF.** Integrated catalog facility.

**IDCAMS.** An IBM program that is used to process access method services commands. It can be invoked as a job or jobstep, from a TSO terminal, or from within a user’s application program.

**IDCAMS LISTCAT.** A facility for obtaining information that is contained in the access method services catalog.

**identify.** A request that an attachment service program in an address space that is separate from DB2 issues through the z/OS subsystem interface to inform DB2 of its existence and to initiate the process of becoming connected to DB2.

**identity column.** A column that provides a way for DB2 to automatically generate a numeric value for each row. The generated values are unique if cycling is not used. Identity columns are defined with the AS IDENTITY clause. Uniqueness of values can be ensured by defining a unique index that contains only the identity column. A table can have no more than one identity column.

**IFCID.** Instrumentation facility component identifier.

**IFI.** Instrumentation facility interface.

**IFI call.** An invocation of the instrumentation facility interface (IFI) by means of one of its defined functions.

**IFP.** IMS Fast Path.

**image copy.** An exact reproduction of all or part of a table space. DB2 provides utility programs to make full image copies (to copy the entire table space) or incremental image copies (to copy only those pages that have been modified since the last image copy).

**implied forget.** In the presumed-abort protocol, an implied response of forget to the second-phase committed request from the coordinator. The response is implied when the participant responds to any subsequent request from the coordinator.

**IMS.** Information Management System.
**IMS attachment facility.** A DB2 subcomponent that uses z/OS subsystem interface (SSI) protocols and cross-memory linkage to process requests from IMS to DB2 and to coordinate resource commitment.

**IMS DB.** Information Management System Database.

**IMS TM.** Information Management System Transaction Manager.

**in-abort.** A status of a unit of recovery. If DB2 fails after a unit of recovery begins to be rolled back, but before the process is complete, DB2 continues to back out the changes during restart.

**in-commit.** A status of a unit of recovery. If DB2 fails after beginning its phase 2 commit processing, it “knows,” when restarted, that changes made to data are consistent. Such units of recovery are termed *in-commit*.

**independent.** An object (row, table, or table space) that is neither a parent nor a dependent of another object.

**index.** A set of pointers that are logically ordered by the values of a key. Indexes can provide faster access to data and can enforce uniqueness on the rows in a table.

**index-controlled partitioning.** A type of partitioning in which partition boundaries for a partitioned table are controlled by values that are specified on the CREATE INDEX statement. Partition limits are saved in the LIMITKEY column of the SYSIBM.SYSINDEXPART catalog table.

**index key.** The set of columns in a table that is used to determine the order of index entries.

**index partition.** A VSAM data set that is contained within a partitioning index space.

**index space.** A page set that is used to store the entries of one index.

**indicator column.** A 4-byte value that is stored in a base table in place of a LOB column.

**indicator variable.** A variable that is used to represent the null value in an application program. If the value for the selected column is null, a negative value is placed in the indicator variable.

**indoubt.** A status of a unit of recovery. If DB2 fails after it has finished its phase 1 commit processing and before it has started phase 2, only the commit coordinator knows if an individual unit of recovery is to be committed or rolled back. At emergency restart, if DB2 lacks the information it needs to make this decision, the status of the unit of recovery is *indoubt* until DB2 obtains this information from the coordinator. More than one unit of recovery can be indoubt at restart.

**indoubt resolution.** The process of resolving the status of an indoubt logical unit of work to either the committed or the rollback state.

**inflight.** A status of a unit of recovery. If DB2 fails before its unit of recovery completes phase 1 of the commit process, it merely backs out the updates of its unit of recovery at restart. These units of recovery are termed *inflight*.

**inheritance.** The passing downstream of class resources or attributes from a parent class in the class hierarchy to a child class.

**initialization file.** For DB2 ODBC applications, a file containing values that can be set to adjust the performance of the database manager.

**inline copy.** A copy that is produced by the LOAD or REORG utility. The data set that the inline copy produces is logically equivalent to a full image copy that is produced by running the COPY utility with read-only access (SHRLEVEL REFERENCE).

**inner join.** The result of a join operation that includes only the matched rows of both tables that are being joined. See also *join*.

**inoperative package.** A package that cannot be used because one or more user-defined functions or procedures that the package depends on were dropped. Such a package must be explicitly rebound. Contrast with *invalid package*.

**insensitive cursor.** A cursor that is not sensitive to inserts, updates, or deletes that are made to the underlying rows of a result table after the result table has been materialized.

**insert trigger.** A trigger that is defined with the triggering SQL operation INSERT.

**install.** The process of preparing a DB2 subsystem to operate as a z/OS subsystem.

**installation verification scenario.** A sequence of operations that exercises the main DB2 functions and tests whether DB2 was correctly installed.

**instrumentation facility component identifier (IFCID).** A value that names and identifies a trace record of an event that can be traced. As a parameter on the START TRACe and MODIFY TRACe commands, it specifies that the corresponding event is to be traced.

**instrumentation facility interface (IFI).** A programming interface that enables programs to obtain online trace data about DB2, to submit DB2 commands, and to pass data to DB2.
**Interactive System Productivity Facility (ISPF)**. An IBM licensed program that provides interactive dialog services in a z/OS environment.

**inter-DB2 R/W interest**. A property of data in a table space, index, or partition that has been opened by more than one member of a data sharing group and that has been opened for writing by at least one of those members.

**intermediate database server**. The target of a request from a local application or a remote application requester that is forwarded to another database server. In the DB2 environment, the remote request is forwarded transparently to another database server if the object that is referenced by a three-part name does not reference the local location.

**International Organization for Standardization**. An international body charged with creating standards to facilitate the exchange of goods and services as well as cooperation in intellectual, scientific, technological, and economic activity.

**invalid package**. A package that depends on an object (other than a user-defined function) that is dropped. Such a package is implicitly rebound on invocation. Contrast with **inoperative package**.

**invariant character set**. (1) A character set, such as the syntactic character set, whose code point assignments do not change from code page to code page. (2) A minimum set of characters that is available as part of all character sets.

**IP address**. A 4-byte value that uniquely identifies a TCP/IP host.

**IRLM**. Internal resource lock manager.

**ISO**. International Organization for Standardization.

**isolation level**. The degree to which a unit of work is isolated from the updating operations of other units of work. See also **cursor stability**, **read stability**, **repeatable read**, and **uncommitted read**.

**ISPF**. Interactive System Productivity Facility.

**ISPF/PDF**. Interactive System Productivity Facility/Program Development Facility.

**iterator**. In SQLJ, an object that contains the result set of a query. An iterator is equivalent to a cursor in other host languages.

**iterator declaration clause**. In SQLJ, a statement that generates an iterator declaration class. An iterator is an object of an iterator declaration class.

**Japanese Industrial Standard**. An encoding scheme that is used to process Japanese characters.

**JAR**. Java Archive.

**Java Archive (JAR)**. A file format that is used for aggregating many files into a single file.

**JCL**. Job control language.

**JDBC**. A Sun Microsystems database application programming interface (API) for Java that allows programs to access database management systems by using callable SQL. JDBC does not require the use of an SQL preprocessor. In addition, JDBC provides an architecture that lets users add modules called **database drivers**, which link the application to their choice of database management systems at run time.

**JES**. Job Entry Subsystem.

**JIS**. Japanese Industrial Standard.

**job control language (JCL)**. A control language that is used to identify a job to an operating system and to describe the job’s requirements.

**Job Entry Subsystem (JES)**. An IBM licensed program that receives jobs into the system and processes all output data that is produced by the jobs.

**join**. A relational operation that allows retrieval of data from two or more tables based on matching column values. See also **equijoin**, **full outer join**, **inner join**, **left outer join**, **outer join**, and **right outer join**.

**K**

**KB**. Kilobyte (1024 bytes).

**Kerberos**. A network authentication protocol that is designed to provide strong authentication for client/server applications by using secret-key cryptography.

**Kerberos ticket**. A transparent application mechanism that transmits the identity of an initiating principal to its target. A simple ticket contains the principal’s identity, a session key, a timestamp, and other information, which is sealed using the target’s secret key.
**key.** A column or an ordered collection of columns that is identified in the description of a table, index, or referential constraint. The same column can be part of more than one key.

**key sequenced data set (KDS).** A VSAM file or data set whose records are loaded in key sequence and controlled by an index.

**keyword.** In SQL, a name that identifies an option that is used in an SQL statement.

**KDS.** Key sequenced data set.

**labeled duration.** A number that represents a duration of years, months, days, hours, minutes, seconds, or microseconds.

**large object (LOB).** A sequence of bytes representing bit data, single-byte characters, double-byte characters, or a mixture of single- and double-byte characters. A LOB can be up to 2 GB–1 byte in length. See also **BLOB, CLOB, and DBCLOB.**

**last agent optimization.** An optimized commit flow for either presumed-nothing or presumed-abort protocols in which the last agent, or final participant, becomes the commit coordinator. This flow saves at least one message.

**latch.** A DB2 internal mechanism for controlling concurrent events or the use of system resources.

**LCID.** Log control interval definition.

**LDS.** Linear data set.

**leaf page.** A page that contains pairs of keys and RIDs and that points to actual data. Contrast with **nonleaf page.**

**left outer join.** The result of a join operation that includes the matched rows of both tables that are being joined, and that preserves the unmatched rows of the first table. See also **join.**

**limit key.** The highest value of the index key for a partition.

**linear data set (LDS).** A VSAM data set that contains data but no control information. A linear data set can be accessed as a byte addressable string in virtual storage.

**linkage editor.** A computer program for creating load modules from one or more object modules or load modules by resolving cross references among the modules and, if necessary, adjusting addresses.

**link edit.** The action of creating a loadable computer program using a linkage editor.

**list.** A type of object, which DB2 utilities can process, that identifies multiple table spaces, multiple index spaces, or both. A list is defined with the LISTDEF utility control statement.

**list structure.** A coupling facility structure that lets data be shared and manipulated as elements of a queue.

**LLE.** Load list element.

**L-lock.** Logical lock.

**load list element.** A z/OS control block that controls the loading and deleting of a particular load module based on entry point names.

**load module.** A program unit that is suitable for loading into main storage for execution. The output of a linkage editor.

**LOB.** Large object.

**LOB locator.** A mechanism that allows an application program to manipulate a large object value in the database system. A LOB locator is a fullword integer value that represents a single LOB value. An application program retrieves a LOB locator into a host variable and can then apply SQL operations to the associated LOB value using the locator.

**LOB lock.** A lock on a LOB value.

**LOB table space.** A table space in an auxiliary table that contains all the data for a particular LOB column in the related base table.

**local.** A way of referring to any object that the local DB2 subsystem maintains. A **local table,** for example, is a table that is maintained by the local DB2 subsystem. Contrast with **remote.**

**locale.** The definition of a subset of a user’s environment that combines a CCSID and characters that are defined for a specific language and country.

**local lock.** A lock that provides intra-DB2 concurrency control, but not inter-DB2 concurrency control; that is, its scope is a single DB2.

**local subsystem.** The unique relational DBMS to which the user or application program is directly connected (in the case of DB2, by one of the DB2 attachment facilities).

**location.** The unique name of a database server. An application uses the location name to access a DB2 database server. A database alias can be used to override the location name when accessing a remote server.

**location alias.** Another name by which a database server identifies itself in the network. Applications can use this name to access a DB2 database server.
lock • LUW

lock. A means of controlling concurrent events or access to data. DB2 locking is performed by the IRLM.

lock duration. The interval over which a DB2 lock is held.

lock escalation. The promotion of a lock from a row, page, or LOB lock to a table space lock because the number of page locks that are concurrently held on a given resource exceeds a preset limit.

locking. The process by which the integrity of data is ensured. Locking prevents concurrent users from accessing inconsistent data.

lock mode. A representation for the type of access that concurrently running programs can have to a resource that a DB2 lock is holding.

lock object. The resource that is controlled by a DB2 lock.

lock promotion. The process of changing the size or mode of a DB2 lock to a higher, more restrictive level.

lock size. The amount of data that is controlled by a DB2 lock on table data; the value can be a row, a page, a LOB, a partition, a table, or a table space.

lock structure. A coupling facility data structure that is composed of a series of lock entries to support shared and exclusive locking for logical resources.

log. A collection of records that describe the events that occur during DB2 execution and that indicate their sequence. The information thus recorded is used for recovery in the event of a failure during DB2 execution.

log control interval definition. A suffix of the physical log record that tells how record segments are placed in the physical control interval.

logical claim. A claim on a logical partition of a nonpartitioning index.

logical data modeling. The process of documenting the comprehensive business information requirements in an accurate and consistent format. Data modeling is the first task of designing a database.

logical drain. A drain on a logical partition of a nonpartitioning index.

logical index partition. The set of all keys that reference the same data partition.

logical lock (L-lock). The lock type that transactions use to control intra- and inter-DB2 data concurrency between transactions. Contrast with physical lock (P-lock).

logically complete. A state in which the concurrent copy process is finished with the initialization of the target objects that are being copied. The target objects are available for update.

logical page list (LPL). A list of pages that are in error and that cannot be referenced by applications until the pages are recovered. The page is in logical error because the actual media (coupling facility or disk) might not contain any errors. Usually a connection to the media has been lost.

logical partition. A set of key or RID pairs in a nonpartitioning index that are associated with a particular partition.

logical recovery pending (LRECP). The state in which the data and the index keys that reference the data are inconsistent.

logical unit (LU). An access point through which an application program accesses the SNA network in order to communicate with another application program.

logical unit of work (LUW). The processing that a program performs between synchronization points.

logical unit of work identifier (LUWID). A name that uniquely identifies a thread within a network. This name consists of a fully-qualified LU network name, an LUW instance number, and an LUW sequence number.

log initialization. The first phase of restart processing during which DB2 attempts to locate the current end of the log.

log record header (LRH). A prefix, in every logical record, that contains control information.

log record sequence number (LRSN). A unique identifier for a log record that is associated with a data sharing member. DB2 uses the LRSN for recovery in the data sharing environment.

log truncation. A process by which an explicit starting RBA is established. This RBA is the point at which the next byte of log data is to be written.

LPL. Logical page list.

LRECP. Logical recovery pending.

LRH. Log record header.

LRSN. Log record sequence number.

LU. Logical unit.

LU name. Logical unit name, which is the name by which VTAM refers to a node in a network. Contrast with location name.

LUW. Logical unit of work.
LUWID. Logical unit of work identifier.

M

mapping table. A table that the REORG utility uses to map the associations of the RIDs of data records in the original copy and in the shadow copy. This table is created by the user.

mass delete. The deletion of all rows of a table.

master terminal. The IMS logical terminal that has complete control of IMS resources during online operations.

master terminal operator (MTO). See master terminal.

materialize. (1) The process of putting rows from a view or nested table expression into a work file for additional processing by a query. 
(2) The placement of a LOB value into contiguous storage. Because LOB values can be very large, DB2 avoids materializing LOB data until doing so becomes absolutely necessary.

materialized query table. A table that is used to contain information that is derived and can be summarized from one or more source tables.

MB. Megabyte (1 048 576 bytes).

MBCS. Multibyte character set. UTF-8 is an example of an MBCS. Characters in UTF-8 can range from 1 to 4 bytes in DB2.

member name. The z/OS XCF identifier for a particular DB2 subsystem in a data sharing group.

menu. A displayed list of available functions for selection by the operator. A menu is sometimes called a menu panel.

metalanguage. A language that is used to create other specialized languages.

migration. The process of converting a subsystem with a previous release of DB2 to an updated or current release. In this process, you can acquire the functions of the updated or current release without losing the data that you created on the previous release.

mixed data string. A character string that can contain both single-byte and double-byte characters.

MLPA. Modified link pack area.

MODEENT. A VTAM macro instruction that associates a logon mode name with a set of parameters representing session protocols. A set of MODEENT macro instructions defines a logon mode table.

modeling database. A DB2 database that you create on your workstation that you use to model a DB2 UDB for z/OS subsystem, which can then be evaluated by the Index Advisor.

mode name. A VTAM name for the collection of physical and logical characteristics and attributes of a session.

modify locks. An L-lock or P-lock with a MODIFY attribute. A list of these active locks is kept at all times in the coupling facility lock structure. If the requesting DB2 subsystem fails, that DB2 subsystem’s modify locks are converted to retained locks.

MPP. Message processing program (in IMS).

MTO. Master terminal operator.

multibyte character set (MBCS). A character set that represents single characters with more than a single byte. Contrast with single-byte character set and double-byte character set. See also Unicode.

multidimensional analysis. The process of assessing and evaluating an enterprise on more than one level.

Multiple Virtual Storage. An element of the z/OS operating system. This element is also called the Base Control Program (BCP).

multisite update. Distributed relational database processing in which data is updated in more than one location within a single unit of work.

multithreading. Multiple TCBs that are executing one copy of DB2 ODBC code concurrently (sharing a processor) or in parallel (on separate central processors).

must-complete. A state during DB2 processing in which the entire operation must be completed to maintain data integrity.

mutex. Pthread mutual exclusion; a lock. A Pthread mutex variable is used as a locking mechanism to allow serialization of critical sections of code by temporarily blocking the execution of all but one thread.

MVS. See Multiple Virtual Storage.

N

negotiable lock. A lock whose mode can be downgraded, by agreement among contending users, to be compatible to all. A physical lock is an example of a negotiable lock.

nested table expression. A fullselect in a FROM clause (surrounded by parentheses).
network identifier (NID). The network ID that is assigned by IMS or CICS, or if the connection type is RRSAF, the RRS unit of recovery ID (URID).

NID. Network identifier.

nonleaf page. A page that contains keys and page numbers of other pages in the index (either leaf or nonleaf pages). Nonleaf pages never point to actual data.

nonpartitioned index. An index that is not physically partitioned. Both partitioning indexes and secondary indexes can be nonpartitioned.

nonscrollable cursor. A cursor that can be moved only in a forward direction. Nonscrollable cursors are sometimes called forward-only cursors or serial cursors.

normalization. A key step in the task of building a logical relational database design. Normalization helps you avoid redundancies and inconsistencies in your data. An entity is normalized if it meets a set of constraints for a particular normal form (first normal form, second normal form, and so on). Contrast with denormalization.

nondeterministic function. A user-defined function whose result is not solely dependent on the values of the input arguments. That is, successive invocations with the same argument values can produce a different answer. This type of function is sometimes called a variant function. Contrast this with a deterministic function (sometimes called a not-variant function), which always produces the same result for the same inputs.

not-variant function. See deterministic function.

NPSI. See nonpartitioned secondary index.

NRE. Network recovery element.

NUL. The null character (‘\0’), which is represented by the value X’00’. In C, this character denotes the end of a string.

null. A special value that indicates the absence of information.

NULLIF. A scalar function that evaluates two passed expressions, returning either NULL if the arguments are equal or the value of the first argument if they are not.

null-terminated host variable. A varying-length host variable in which the end of the data is indicated by a null terminator.

null terminator. In C, the value that indicates the end of a string. For EBCDIC, ASCII, and Unicode UTF-8 strings, the null terminator is a single-byte value (X’00’). For Unicode UCS-2 (wide) strings, the null terminator is a double-byte value (X’0000’).

OASN (origin application schedule number). In IMS, a 4-byte number that is assigned sequentially to each IMS schedule since the last cold start of IMS. The OASN is used as an identifier for a unit of work. In an 8-byte format, the first 4 bytes contain the schedule number and the last 4 bytes contain the number of IMS sync points (commit points) during the current schedule. The OASN is part of the NID for an IMS connection.

ODBC. Open Database Connectivity.

ODBC driver. A dynamically-linked library (DLL) that implements ODBC function calls and interacts with a database source.

OBID. Data object identifier.

Open Database Connectivity (ODBC). A Microsoft® database application programming interface (API) for C that allows access to database management systems by using callable SQL. ODBC does not require the use of an SQL preprocessor. In addition, ODBC provides an architecture that lets users add modules called database drivers, which link the application to their choice of database management systems at run time. This means that applications no longer need to be directly linked to the modules of all the database management systems that are supported.

ordinary identifier. An uppercase letter followed by zero or more characters, each of which is an uppercase letter, a digit, or the underscore character. An ordinary identifier must not be a reserved word.

ordinary token. A numeric constant, an ordinary identifier, a host identifier, or a keyword.

originating task. In a parallel group, the primary agent that receives data from other execution units (referred to as parallel tasks) that are executing portions of the query in parallel.

OS/390 OpenEdition® Distributed Computing Environment (OS/390 OE DCE). A set of technologies that are provided by the Open Software Foundation to implement distributed computing.

outer join. The result of a join operation that includes the matched rows of both tables that are being joined and preserves some or all of the unmatched rows of the tables that are being joined. See also join.

overloaded function. A function name for which multiple function instances exist.
package. An object containing a set of SQL statements that have been statically bound and that is available for processing. A package is sometimes also called an application package.

package list. An ordered list of package names that may be used to extend an application plan.

package name. The name of an object that is created by a BIND PACKAGE or REBIND PACKAGE command. The object is a bound version of a database request module (DBRM). The name consists of a location name, a collection ID, a package ID, and a version ID.

page. A unit of storage within a table space (4 KB, 8 KB, 16 KB, or 32 KB) or index space (4 KB). In a table space, a page contains one or more rows of a table. In a LOB table space, a LOB value can span more than one page, but no more than one LOB value is stored on a page.

page set. Another way to refer to a table space or index space. Each page set consists of a collection of VSAM data sets.

page set recovery pending (PSRCP). A restrictive state of an index space. In this case, the entire page set must be recovered. Recovery of a logical part is prohibited.

panel. A predefined display image that defines the locations and characteristics of display fields on a display surface (for example, a menu panel).

parallel complex. A cluster of machines that work together to handle multiple transactions and applications.

parallel group. A set of consecutive operations that execute in parallel and that have the same number of parallel tasks.

parallel I/O processing. A form of I/O processing in which DB2 initiates multiple concurrent requests for a single user query and performs I/O processing concurrently (in parallel) on multiple data partitions.

parallelism assistant. In Sysplex query parallelism, a DB2 subsystem that helps to process parts of a parallel query that originates on another DB2 subsystem in the data sharing group.

parallelism coordinator. In Sysplex query parallelism, the DB2 subsystem from which the parallel query originates.

Parallel Sysplex. A set of z/OS systems that communicate and cooperate with each other through certain multisystem hardware components and software services to process customer workloads.

package • partitioned table space

parallel task. The execution unit that is dynamically created to process a query in parallel. A parallel task is implemented by a z/OS service request block.

parameter marker. A question mark (?) that appears in a statement string of a dynamic SQL statement. The question mark can appear where a host variable could appear if the statement string were a static SQL statement.

parameter-name. An SQL identifier that designates a parameter in an SQL procedure or an SQL function.

parent key. A primary key or unique key in the parent table of a referential constraint. The values of a parent key determine the valid values of the foreign key in the referential constraint.

parent lock. For explicit hierarchical locking, a lock that is held on a resource that might have child locks that are lower in the hierarchy. A parent lock is usually the table space lock or the partition intent lock. See also child lock.

parent row. A row whose primary key value is the foreign key value of a dependent row.

parent table. A table whose primary key is referenced by the foreign key of a dependent table.

parent table space. A table space that contains a parent table. A table space containing a dependent of that table is a dependent table space.

participant. An entity other than the commit coordinator that takes part in the commit process. The term participant is synonymous with agent in SNA.

partition. A portion of a page set. Each partition corresponds to a single, independently extendable data set. Partitions can be extended to a maximum size of 1, 2, or 4 GB, depending on the number of partitions in the partitioned page set. All partitions of a given page set have the same maximum size.

partitioned data set (PDS). A data set in disk storage that is divided into partitions, which are called members. Each partition can contain a program, part of a program, or data. The term partitioned data set is synonymous with program library.

partitioned index. An index that is physically partitioned. Both partitioning indexes and secondary indexes can be partitioned.

partitioned page set. A partitioned table space or an index space. Header pages, space map pages, data pages, and index pages reference data only within the scope of the partition.

partitioned table space. A table space that is subdivided into parts (based on index key range), each of which can be processed independently by utilities.
partitioning index. An index in which the leftmost columns are the partitioning columns of the table. The index can be partitioned or nonpartitioned.

partition pruning. The removal from consideration of inapplicable partitions through setting up predicates in a query on a partitioned table to access only certain partitions to satisfy the query.

partner logical unit. An access point in the SNA network that is connected to the local DB2 subsystem by way of a VTAM conversation.

path. See SQL path.

PCT. Program control table (in CICS).

PDS. Partitioned data set.

piece. A data set of a nonpartitioned page set.

physical claim. A claim on an entire nonpartitioning index.

physical consistency. The state of a page that is not in a partially changed state.

physical drain. A drain on an entire nonpartitioning index.

physical lock (P-lock). A type of lock that DB2 acquires to provide consistency of data that is cached in different DB2 subsystems. Physical locks are used only in data sharing environments. Contrast with logical lock (L-lock).

physical lock contention. Conflicting states of the requesters for a physical lock. See also negotiable lock.

physically complete. The state in which the concurrent copy process is completed and the output data set has been created.

plan. See application plan.

plan allocation. The process of allocating DB2 resources to a plan in preparation for execution.

plan member. The bound copy of a DBRM that is identified in the member clause.

plan name. The name of an application plan.

plan segmentation. The dividing of each plan into sections. When a section is needed, it is independently brought into the EDM pool.

P-lock. Physical lock.

PLT. Program list table (in CICS).

point of consistency. A time when all recoverable data that an application accesses is consistent with other data. The term point of consistency is synonymous with sync point or commit point.

policy. See CFRM policy.

Portable Operating System Interface (POSIX). The IEEE operating system interface standard, which defines the Pthread standard of threading. See also Pthread.

POSIX. Portable Operating System Interface.

postponed abort UR. A unit of recovery that was in-flight or in-abort, was interrupted by system failure or cancellation, and did not complete backout during restart.

PPT. (1) Processing program table (in CICS). (2) Program properties table (in z/OS).

precision. In SQL, the total number of digits in a decimal number (called the size in the C language). In the C language, the number of digits to the right of the decimal point (called the scale in SQL). The DB2 library uses the SQL terms.

precompilation. A processing of application programs containing SQL statements that takes place before compilation. SQL statements are replaced with statements that are recognized by the host language compiler. Output from this precompilation includes source code that can be submitted to the compiler and the database request module (DBRM) that is input to the bind process.

predicate. An element of a search condition that expresses or implies a comparison operation.

prefix. A code at the beginning of a message or record.

preformat. The process of preparing a VSAM ESDS for DB2 use, by writing specific data patterns.

prepare. The first phase of a two-phase commit process in which all participants are requested to prepare for commit.

prepared SQL statement. A named object that is the executable form of an SQL statement that has been processed by the PREPARE statement.

presumed-abort. An optimization of the presumed-nothing two-phase commit protocol that reduces the number of recovery log records, the duration of state maintenance, and the number of messages between coordinator and participant. The optimization also modifies the indoubt resolution responsibility.

presumed-nothing. The standard two-phase commit protocol that defines coordinator and participant responsibilities, relative to logical unit of work states, recovery logging, and indoubt resolution.

primary authorization ID. The authorization ID that is used to identify the application process to DB2.
**primary group buffer pool.** For a duplexed group buffer pool, the structure that is used to maintain the coherency of cached data. This structure is used for page registration and cross-invalidation. The z/OS equivalent is *old* structure. Compare with *secondary group buffer pool*.

**primary index.** An index that enforces the uniqueness of a primary key.

**primary key.** In a relational database, a unique, nonnull key that is part of the definition of a table. A table cannot be defined as a parent unless it has a unique key or primary key.

**principal.** An entity that can communicate securely with another entity. In Kerberos, principals are represented as entries in the Kerberos registry database and include users, servers, computers, and others.

**principal name.** The name by which a principal is known to the DCE security services.

**private connection.** A communications connection that is specific to DB2.

**private protocol access.** A method of accessing distributed data by which you can direct a query to another DB2 system. Contrast with *DRDA access*.

**private protocol connection.** A DB2 private connection of the application process. See also *private connection*.

**privilege.** The capability of performing a specific function, sometimes on a specific object. The types of privileges are:
- *explicit privileges*, which have names and are held as the result of *SQL GRANT* and *REVOKE* statements. For example, the *SELECT privilege*.
- *implicit privileges*, which accompany the ownership of an object, such as the privilege to drop a synonym that one owns, or the holding of an authority, such as the privilege of SYSADM authority to terminate any utility job.

**privilege set.** For the installation SYSADM ID, the set of all possible privileges. For any other authorization ID, the set of all privileges that are recorded for that ID in the DB2 catalog.

**process.** In DB2, the unit to which DB2 allocates resources and locks. Sometimes called an *application process*, a process involves the execution of one or more programs. The execution of an SQL statement is always associated with some process. The means of initiating and terminating a process are dependent on the environment.

**program.** A single, compilable collection of executable statements in a programming language.

**program temporary fix (PTF).** A solution or bypass of a problem that is diagnosed as a result of a defect in a current unaltered release of a licensed program. An authorized program analysis report (APAR) fix is corrective service for an existing problem. A PTF is preventive service for problems that might be encountered by other users of the product. A PTF is *temporary*, because a permanent fix is usually not incorporated into the product until its next release.

**protected conversation.** A VTAM conversation that supports two-phase commit flows.

**PSRCP.** Page set recovery pending.

**PTF.** Program temporary fix.

**Pthread.** The POSIX threading standard model for splitting an application into subtasks. The Pthread standard includes functions for creating threads, terminating threads, synchronizing threads through locking, and other thread control facilities.

**Q**

**QMF™.** Query Management Facility.

**QSAM.** Queued sequential access method.

**query.** A component of certain SQL statements that specifies a result table.

**query block.** The part of a query that is represented by one of the *FROM* clauses. Each *FROM* clause can have multiple query blocks, depending on DB2’s internal processing of the query.

**query CP parallelism.** Parallel execution of a single query, which is accomplished by using multiple tasks. See also *Sysplex query parallelism*.

**query I/O parallelism.** Parallel access of data, which is accomplished by triggering multiple I/O requests within a single query.

**queued sequential access method (QSAM).** An extended version of the basic sequential access method (BSAM). When this method is used, a queue of data blocks is formed. Input data blocks await processing, and output data blocks await transfer to auxiliary storage or to an output device.

**quiesce point.** A point at which data is consistent as a result of running the DB2 QUIESCE utility.

**quiesced member state.** A state of a member of a data sharing group. An active member becomes quiesced when a STOP DB2 command takes effect without a failure. If the member's task, address space, or z/OS system fails before the command takes effect, the member state is failed.
RACF • referential integrity

**RACF.** Resource Access Control Facility, which is a component of the z/OS Security Server.

**RAMAC®.** IBM family of enterprise disk storage system products.

**RBA.** Relative byte address.

**RCT.** Resource control table (in CICS attachment facility).

**RDB.** Relational database.

**RDBMS.** Relational database management system.

**RDBNAM.** Relational database name.

**RDF.** Record definition field.

**read stability (RS).** An isolation level that is similar to repeatable read but does not completely isolate an application process from all other concurrently executing application processes. Under level RS, an application that issues the same query more than once might read additional rows that were inserted and committed by a concurrently executing application process.

**rebind.** The creation of a new application plan for an application program that has been bound previously. If, for example, you have added an index for a table that your application accesses, you must rebind the application in order to take advantage of that index.

**rebuild.** The process of reallocating a coupling facility structure. For the shared communications area (SCA) and lock structure, the structure is repopulated; for the group buffer pool, changed pages are usually cast out to disk, and the new structure is populated only with changed pages that were not successfully cast out.

**RECFM.** Record format.

**record.** The storage representation of a row or other data.

**record identifier (RID).** A unique identifier that DB2 uses internally to identify a row of data in a table. Compare with row ID.

**record identifier (RID) pool.** An area of main storage that is used for sorting record identifiers during list-prefetch processing.

**record length.** The sum of the length of all the columns in a table, which is the length of the data as it is physically stored in the database. Records can be fixed length or varying length, depending on how the columns are defined. If all columns are fixed-length columns, the record is a fixed-length record. If one or more columns are varying-length columns, the record is a varying-length column.

** Recoverable Resource Manager Services attachment facility (RRSAF).** A DB2 subcomponent that uses Resource Recovery Services to coordinate resource commitment between DB2 and all other resource managers that also use RRS in a z/OS system.

**recovery.** The process of rebuilding databases after a system failure.

**recovery log.** A collection of records that describes the events that occur during DB2 execution and indicates their sequence. The recorded information is used for recovery in the event of a failure during DB2 execution.

**recovery manager.** (1) A subcomponent that supplies coordination services that control the interaction of DB2 resource managers during commit, abort, checkpoint, and restart processes. The recovery manager also supports the recovery mechanisms of other subsystems (for example, IMS) by acting as a participant in the other subsystem's process for protecting data that has reached a point of consistency. (2) A coordinator or a participant (or both), in the execution of a two-phase commit, that can access a recovery log that maintains the state of the logical unit of work and names the immediate upstream coordinator and downstream participants.

**recovery pending (RECP).** A condition that prevents SQL access to a table space that needs to be recovered.

**recovery token.** An identifier for an element that is used in recovery (for example, NID or URID).

**RECP.** Recovery pending.

**redo.** A state of a unit of recovery that indicates that changes are to be reapplied to the disk media to ensure data integrity.

**reentrant.** Executable code that can reside in storage as one shared copy for all threads. Reentrant code is not self-modifying and provides separate storage areas for each thread. Reentrancy is a compiler and operating system concept, and reentrancy alone is not enough to guarantee logically consistent results when multithreading. See also threadsafe.

**referential constraint.** The requirement thatnonnull values of a designated foreign key are valid only if they equal values of the primary key of a designated table.

**referential integrity.** The state of a database in which all values of all foreign keys are valid. Maintaining referential integrity requires the enforcement of referential constraints on all operations that change the data in a table on which the referential constraints are defined.

1418 Messages and Codes
referential structure. A set of tables and relationships that includes at least one table and, for every table in the set, all the relationships in which that table participates and all the tables to which it is related.

refresh age. The time duration between the current time and the time during which a materialized query table was last refreshed.

registry. See registry database.

registry database. A database of security information about principals, groups, organizations, accounts, and security policies.

relational database (RDB). A database that can be perceived as a set of tables and manipulated in accordance with the relational model of data.

relational database management system (RDBMS). A collection of hardware and software that organizes and provides access to a relational database.

relational database name (RDBNAME). A unique identifier for an RDBMS within a network. In DB2, this must be the value in the LOCATION column of table SYSIBM.Locations in the CDB. DB2 publications refer to the name of another RDBMS as a LOCATION value or a location name.

relationship. A defined connection between the rows of a table or the rows of two tables. A relationship is the internal representation of a referential constraint.

relative byte address (RBA). The offset of a data record or control interval from the beginning of the storage space that is allocated to the data set or file to which it belongs.

remigration. The process of returning to a current release of DB2 following a fallback to a previous release. This procedure constitutes another migration process.

remote. Any object that is maintained by a remote DB2 subsystem (that is, by a DB2 subsystem other than the local one). A remote view, for example, is a view that is maintained by a remote DB2 subsystem. Contrast with local.

remote attach request. A request by a remote location to attach to the local DB2 subsystem. Specifically, the request that is sent is an SNA Function Management Header 5.

remote subsystem. Any relational DBMS, except the local subsystem, with which the user or application can communicate. The subsystem need not be remote in any physical sense, and might even operate on the same processor under the same z/OS system.

reoptimization. The DB2 process of reconsidering the access path of an SQL statement at run time; during reoptimization, DB2 uses the values of host variables, parameter markers, or special registers.

REORG pending (REORP). A condition that restricts SQL access and most utility access to an object that must be reorganized.

REORP. REORG pending.

repeatable read (RR). The isolation level that provides maximum protection from other executing application programs. When an application program executes with repeatable read protection, rows that the program references cannot be changed by other programs until the program reaches a commit point.

repeating group. A situation in which an entity includes multiple attributes that are inherently the same. The presence of a repeating group violates the requirement of first normal form. In an entity that satisfies the requirement of first normal form, each attribute is independent and unique in its meaning and its name. See also normalization.

replay detection mechanism. A method that allows a principal to detect whether a request is a valid request from a source that can be trusted or whether an untrustworthy entity has captured information from a previous exchange and is replaying the information exchange to gain access to the principal.

request commit. The vote that is submitted to the prepare phase if the participant has modified data and is prepared to commit or roll back.

requester. The source of a request to access data at a remote server. In the DB2 environment, the requester function is provided by the distributed data facility.

resource. The object of a lock or claim, which could be a table space, an index space, a data partition, an index partition, or a logical partition.

resource allocation. The part of plan allocation that deals specifically with the database resources.

resource control table (RCT). A construct of the CICS attachment facility, created by site-provided macro parameters, that defines authorization and access attributes for transactions or transaction groups.

resource definition online. A CICS feature that you use to define CICS resources online without assembling tables.

resource limit facility (RLF). A portion of DB2 code that prevents dynamic manipulative SQL statements from exceeding specified time limits. The resource limit facility is sometimes called the governor.

resource limit specification table (RLST). A site-defined table that specifies the limits to be enforced by the resource limit facility.
resource manager • scale

resource manager. (1) A function that is responsible for managing a particular resource and that guarantees the consistency of all updates made to recoverable resources within a logical unit of work. The resource that is being managed can be physical (for example, disk or main storage) or logical (for example, a particular type of system service). (2) A participant, in the execution of a two-phase commit, that has recoverable resources that could have been modified. The resource manager has access to a recovery log so that it can commit or roll back the effects of the logical unit of work to the recoverable resources.

restart pending (RESTP). A restrictive state of a page set or partition that indicates that restart (backout) work needs to be performed on the object. All access to the page set or partition is denied except for access by the:
• RECOVER POSTPONED command
• Automatic online backout (which DB2 invokes after restart if the system parameter LBACKOUT=AUTO)

RESTP. Restart pending.

result set. The set of rows that a stored procedure returns to a client application.

result set locator. A 4-byte value that DB2 uses to uniquely identify a query result set that a stored procedure returns.

result table. The set of rows that are specified by a SELECT statement.

retained lock. A MODIFY lock that a DB2 subsystem was holding at the time of a subsystem failure. The lock is retained in the coupling facility lock structure across a DB2 failure.

RID. Record identifier.

RID pool. Record identifier pool.

right outer join. The result of a join operation that includes the matched rows of both tables that are being joined and preserves the unmatched rows of the second join operand. See also join.

RLF. Resource limit facility.

RLST. Resource limit specification table.

RMID. Resource manager identifier.

RO. Read-only access.

rollback. The process of restoring data that was changed by SQL statements to the state at its last commit point. All locks are freed. Contrast with commit.

root page. The index page that is at the highest level (or the beginning point) in an index.

to.

routine. A term that refers to either a user-defined function or a stored procedure.

row. The horizontal component of a table. A row consists of a sequence of values, one for each column of the table.

ROWID. Row identifier.

row identifier (ROWID). A value that uniquely identifies a row. This value is stored with the row and never changes.

row lock. A lock on a single row of data.

rowset. A set of rows for which a cursor position is established.

rowset cursor. A cursor that is defined so that one or more rows can be returned as a rowset for a single FETCH statement, and the cursor is positioned on the set of rows that is fetched.

rowset-positioned access. The ability to retrieve multiple rows from a single FETCH statement.

row-positioned access. The ability to retrieve a single row from a single FETCH statement.

row trigger. A trigger that is defined with the trigger granularity FOR EACH ROW.

RRE. Residual recovery entry (in IMS).

RRSAF. Recoverable Resource Manager Services attachment facility.

RS. Read stability.

RTT. Resource translation table.

RURE. Restart URE.

S

savepoint. A named entity that represents the state of data and schemas at a particular point in time within a unit of work. SQL statements exist to set a savepoint, release a savepoint, and restore data and schemas to the state that the savepoint represents. The restoration of data and schemas to a savepoint is usually referred to as rolling back to a savepoint.

SBCS. Single-byte character set.

SCA. Shared communications area.

scalar function. An SQL operation that produces a single value from another value and is expressed as a function name, followed by a list of arguments that are enclosed in parentheses. Contrast with column function.

scale. In SQL, the number of digits to the right of the decimal point (called the precision in the C language). The DB2 library uses the SQL definition.
schema.  (1) The organization or structure of a database. (2) A logical grouping for user-defined functions, distinct types, triggers, and stored procedures. When an object of one of these types is created, it is assigned to one schema, which is determined by the name of the object. For example, the following statement creates a distinct type T in schema C:

```
CREATE DISTINCT TYPE C.T ... 
```

scrollability. The ability to use a cursor to fetch in either a forward or backward direction. The FETCH statement supports multiple fetch orientations to indicate the new position of the cursor. See also fetch orientation.

scrollable cursor. A cursor that can be moved in both a forward and a backward direction.

SDWA. System diagnostic work area.

search condition. A criterion for selecting rows from a table. A search condition consists of one or more predicates.

secondary authorization ID. An authorization ID that has been associated with a primary authorization ID by an authorization exit routine.

secondary group buffer pool. For a duplexed group buffer pool, the structure that is used to back up changed pages that are written to the primary group buffer pool. No page registration or cross-invalidation occurs using the secondary group buffer pool. The z/OS equivalent is new structure.

secondary index. A nonpartitioning index on a partitioned table.

section. The segment of a plan or package that contains the executable structures for a single SQL statement. For most SQL statements, one section in the plan exists for each SQL statement in the source program. However, for cursor-related statements, the DECLARE, OPEN, FETCH, and CLOSE statements reference the same section because they each refer to the SELECT statement that is named in the DECLARE CURSOR statement. SQL statements such as COMMIT, ROLLBACK, and some SET statements do not use a section.

segment. A group of pages that holds rows of a single table. See also segmented table space.

segmented table space. A table space that is divided into equal-sized groups of pages called segments. Segments are assigned to tables so that rows of different tables are never stored in the same segment.

self-referencing constraint. A referential constraint that defines a relationship in which a table is a dependent of itself.

sensitive cursor. A cursor that is sensitive to changes that are made to the database after the result table has been materialized.

sequence. A user-defined object that generates a sequence of numeric values according to user specifications.

sequential data set. A non-DB2 data set whose records are organized on the basis of their successive physical positions, such as on magnetic tape. Several of the DB2 database utilities require sequential data sets.

sequential prefetch. A mechanism that triggers consecutive asynchronous I/O operations. Pages are fetched before they are required, and several pages are read with a single I/O operation.

serial cursor. A cursor that can be moved only in a forward direction.

serialized profile. A Java object that contains SQL statements and descriptions of host variables. The SQLJ translator produces a serialized profile for each connection context.

server. The target of a request from a remote requester. In the DB2 environment, the server function is provided by the distributed data facility, which is used to access DB2 data from remote applications.

service class. An eight-character identifier that is used by the z/OS Workload Manager to associate user performance goals with a particular DDF thread or stored procedure. A service class is also used to classify work on parallelism assistants.

service request block. A unit of work that is scheduled to execute in another address space.

session. A link between two nodes in a VTAM network.

session protocols. The available set of SNA communication requests and responses.

shared communications area (SCA). A coupling facility list structure that a DB2 data sharing group uses for inter-DB2 communication.

share lock. A lock that prevents concurrently executing application processes from changing data, but not from reading data. Contrast with exclusive lock.

shift-in character. A special control character (X'0F') that is used in EBCDIC systems to denote that the subsequent bytes represent SBCS characters. See also shift-out character.
shift-out character. A special control character (X'0E') that is used in EBCDIC systems to denote that the subsequent bytes, up to the next shift-in control character, represent DBCS characters. See also shift-in character.

sign-on. A request that is made on behalf of an individual CICS or IMS application process by an attachment facility to enable DB2 to verify that it is authorized to use DB2 resources.

simple page set. A nonpartitioned page set. A simple page set initially consists of a single data set (page set piece). If and when that data set is extended to 2 GB, another data set is created, and so on, up to a total of 32 data sets. DB2 considers the data sets to be a single contiguous linear address space containing a maximum of 64 GB. Data is stored in the next available location within this address space without regard to any partitioning scheme.

simple table space. A table space that is neither partitioned nor segmented.

single-byte character set (SBCS). A set of characters in which each character is represented by a single byte. Contrast with double-byte character set or multibyte character set.

single-precision floating point number. A 32-bit approximate representation of a real number.

size. In the C language, the total number of digits in a decimal number (called the precision in SQL). The DB2 library uses the SQL term.

SMF. System Management Facilities.

SMP/E. System Modification Program/Extended.

SMS. Storage Management Subsystem.

SNA. Systems Network Architecture.

SNA network. The part of a network that conforms to the formats and protocols of Systems Network Architecture (SNA).

socket. A callable TCP/IP programming interface that TCP/IP network applications use to communicate with remote TCP/IP partners.

sourced function. A function that is implemented by another built-in or user-defined function that is already known to the database manager. This function can be a scalar function or a column (aggregating) function; it returns a single value from a set of values (for example, MAX or AVG). Contrast with built-in function, external function, and SQL function.

source program. A set of host language statements and SQL statements that is processed by an SQL precompiler.

source table. A table that can be a base table, a view, a table expression, or a user-defined table function.

source type. An existing type that DB2 uses to internally represent a distinct type.

space. A sequence of one or more blank characters.

special register. A storage area that DB2 defines for an application process to use for storing information that can be referenced in SQL statements. Examples of special registers are USER and CURRENT DATE.

specific function name. A particular user-defined function that is known to the database manager by its specific name. Many specific user-defined functions can have the same function name. When a user-defined function is defined to the database, every function is assigned a specific name that is unique within its schema. Either the user can provide this name, or a default name is used.

SPUFI. SQL Processor Using File Input.

SQL. Structured Query Language.

SQL authorization ID (SQL ID). The authorization ID that is used for checking dynamic SQL statements in some situations.

SQLCA. SQL communication area.

SQL communication area (SQLCA). A structure that is used to provide an application program with information about the execution of its SQL statements.

SQL connection. An association between an application process and a local or remote application server or database server.

SQLDA. SQL descriptor area.

SQL descriptor area (SQLDA). A structure that describes input variables, output variables, or the columns of a result table.

SQL escape character. The symbol that is used to enclose an SQL delimited identifier. This symbol is the double quotation mark ("). See also escape character.

SQL function. A user-defined function in which the CREATE FUNCTION statement contains the source code. The source code is a single SQL expression that evaluates to a single value. The SQL user-defined function can return only one parameter.

SQL ID. SQL authorization ID.

SQLJ. Structured Query Language (SQL) that is embedded in the Java programming language.

SQL path. An ordered list of schema names that are used in the resolution of unqualified references to user-defined functions, distinct types, and stored
procedures. In dynamic SQL, the current path is found in the CURRENT PATH special register. In static SQL, it is defined in the PATH bind option.

**SQL procedure.** A user-written program that can be invoked with the SQL CALL statement. Contrast with external procedure.

**SQL processing conversation.** Any conversation that requires access of DB2 data, either through an application or by dynamic query requests.

**SQL Processor Using File Input (SPUFI).** A facility of the TSO attachment subcomponent that enables the DB2I user to execute SQL statements without embedding them in an application program.

**SQL return code.** Either SQLCODE or SQLSTATE.

**SQL routine.** A user-defined function or stored procedure that is based on code that is written in SQL.

**SQL statement coprocessor.** An alternative to the DB2 precompiler that lets the user process SQL statements at compile time. The user invokes an SQL statement coprocessor by specifying a compiler option.

**SQL string delimiter.** A symbol that is used to enclose an SQL string constant. The SQL string delimiter is the apostrophe ('), except in COBOL applications, where the user assigns the symbol, which is either an apostrophe or a double quotation mark (").

**SRB.** Service request block.

**SSI.** Subsystem interface (in z/OS).

**SSM.** Subsystem member (in IMS).

**stand-alone.** An attribute of a program that means that it is capable of executing separately from DB2, without using DB2 services.

**star join.** A method of joining a dimension column of a fact table to the key column of the corresponding dimension table. See also join, dimension, and star schema.

**star schema.** The combination of a fact table (which contains most of the data) and a number of dimension tables. See also star join, dimension, and dimension table.

**statement handle.** In DB2 ODBC, the data object that contains information about an SQL statement that is managed by DB2 ODBC. This includes information such as dynamic arguments, bindings for dynamic arguments and columns, cursor information, result values, and status information. Each statement handle is associated with the connection handle.

**statement string.** For a dynamic SQL statement, the character string form of the statement.

**statement trigger.** A trigger that is defined with the trigger granularity FOR EACH STATEMENT.

**static cursor.** A named control structure that does not change the size of the result table or the order of its rows after an application opens the cursor. Contrast with dynamic cursor.

**static SQL.** SQL statements, embedded within a program, that are prepared during the program preparation process (before the program is executed). After being prepared, the SQL statement does not change (although values of host variables that are specified by the statement might change).

**storage group.** A named set of disks on which DB2 data can be stored.

**stored procedure.** A user-written application program that can be invoked through the use of the SQL CALL statement.

**string.** See character string or graphic string.

**strong typing.** A process that guarantees that only user-defined functions and operations that are defined on a distinct type can be applied to that type. For example, you cannot directly compare two currency types, such as Canadian dollars and U.S. dollars. But you can provide a user-defined function to convert one currency to the other and then do the comparison.

**structure.** (1) A name that refers collectively to different types of DB2 objects, such as tables, databases, views, indexes, and table spaces. (2) A construct that uses z/OS to map and manage storage on a coupling facility. See also cache structure, list structure, or lock structure.

**Structured Query Language (SQL).** A standardized language for defining and manipulating data in a relational database.

**structure owner.** In relation to group buffer pools, the DB2 member that is responsible for the following activities:

- Coordinating rebuild, checkpoint, and damage assessment processing
- Monitoring the group buffer pool threshold and notifying castout owners when the threshold has been reached

**subcomponent.** A group of closely related DB2 modules that work together to provide a general function.

**subject table.** The table for which a trigger is created. When the defined triggering event occurs on this table, the trigger is activated.

**subpage.** The unit into which a physical index page can be divided.
subquery • table space

subquery. A SELECT statement within the WHERE or HAVING clause of another SQL statement; a nested SQL statement.

subselect. That form of a query that does not include an ORDER BY clause, an UPDATE clause, or UNION operators.

substitution character. A unique character that is substituted during character conversion for any characters in the source program that do not have a match in the target coding representation.

subsystem. A distinct instance of a relational database management system (RDBMS).

surrogate pair. A coded representation for a single character that consists of a sequence of two 16-bit code units, in which the first value of the pair is a high-surrogate code unit in the range U+D800 through U+DBFF, and the second value is a low-surrogate code unit in the range U+DC00 through U+DFFF. Surrogate pairs provide an extension mechanism for encoding 917 476 characters without requiring the use of 32-bit characters.

SVC dump. A dump that is issued when a z/OS or a DB2 functional recovery routine detects an error.

sync point. See commit point.

syncpoint tree. The tree of recovery managers and resource managers that are involved in a logical unit of work, starting with the recovery manager, that make the final commit decision.

synonym. In SQL, an alternative name for a table or view. Synonyms can be used to refer only to objects at the subsystem in which the synonym is defined.

syntactic character set. A set of 81 graphic characters that are registered in the IBM registry as character set 00640. This set was originally recommended to the programming language community to be used for syntactic purposes toward maximizing portability and interchangeability across systems and country boundaries. It is contained in most of the primary registered character sets, with a few exceptions. See also invariant character set.

Sysplex. See Parallel Sysplex.

Sysplex query parallelism. Parallel execution of a single query that is accomplished by using multiple tasks on more than one DB2 subsystem. See also query CP parallelism.

system administrator. The person at a computer installation who designs, controls, and manages the use of the computer system.

system agent. A work request that DB2 creates internally such as prefetch processing, deferred writes, and service tasks.

system conversation. The conversation that two DB2 subsystems must establish to process system messages before any distributed processing can begin.

system diagnostic work area (SDWA). The data that is recorded in a SYS1.LOGREC entry that describes a program or hardware error.

system-directed connection. A connection that a relational DBMS manages by processing SQL statements with three-part names.

System Modification Program/Extended (SMP/E). A z/OS tool for making software changes in programming systems (such as DB2) and for controlling those changes.

Systems Network Architecture (SNA). The description of the logical structure, formats, protocols, and operational sequences for transmitting information through and controlling the configuration and operation of networks.

SYS1.DUMPxx data set. A data set that contains a system dump (in z/OS).

SYS1.LOGREC. A service aid that contains important information about program and hardware errors (in z/OS).

T

table. A named data object consisting of a specific number of columns and some number of unordered rows. See also base table or temporary table.

table-controlled partitioning. A type of partitioning in which partition boundaries for a partitioned table are controlled by values that are defined in the CREATE TABLE statement. Partition limits are saved in the LIMITKEY_INTERNAL column of the SYSIBM SYSTABLEPART catalog table.

table function. A function that receives a set of arguments and returns a table to the SQL statement that references the function. A table function can be referenced only in the FROM clause of a subselect.

table locator. A mechanism that allows access to trigger transition tables in the FROM clause of SELECT statements, in the subselect of INSERT statements, or from within user-defined functions. A table locator is a fullword integer value that represents a transition table.

table space. A page set that is used to store the records in one or more tables.
**table space set.** A set of table spaces and partitions that should be recovered together for one of these reasons:

- Each of them contains a table that is a parent or descendent of a table in one of the others.
- The set contains a base table and associated auxiliary tables.

A table space set can contain both types of relationships.

**task control block (TCB).** A z/OS control block that is used to communicate information about tasks within an address space that are connected to DB2. See also address space connection.

**TB.** Terabyte (1 099 511 627 776 bytes).

**TCB.** Task control block (in z/OS).

**TCP/IP.** A network communication protocol that computer systems use to exchange information across telecommunication links.

**TCP/IP port.** A 2-byte value that identifies an end user or a TCP/IP network application within a TCP/IP host.

**template.** A DB2 utilities output data set descriptor that is used for dynamic allocation. A template is defined by the TEMPLATE utility control statement.

**temporary table.** A table that holds temporary data. Temporary tables are useful for holding or sorting intermediate results from queries that contain a large number of rows. The two types of temporary table, which are created by different SQL statements, are the created temporary table and the declared temporary table. Contrast with result table. See also created temporary table and declared temporary table.

**Terminal Monitor Program (TMP).** A program that provides an interface between terminal users and command processors and has access to many system services (in z/OS).

**thread.** The DB2 structure that describes an application’s connection, traces its progress, processes resource functions, and delimits its accessibility to DB2 resources and services. Most DB2 functions execute under a thread structure. See also allied thread and database access thread.

**threadsafe.** A characteristic of code that allows multithreading both by providing private storage areas for each thread, and by properly serializing shared (global) storage areas.

**three-part name.** The full name of a table, view, or alias. It consists of a location name, authorization ID, and an object name, separated by a period.

**time.** A three-part value that designates a time of day in hours, minutes, and seconds.

**time duration.** A decimal integer that represents a number of hours, minutes, and seconds.

**timeout.** Abnormal termination of either the DB2 subsystem or of an application because of the unavailability of resources. Installation specifications are set to determine both the amount of time DB2 is to wait for IRLM services after starting, and the amount of time IRLM is to wait if a resource that an application requests is unavailable. If either of these time specifications is exceeded, a timeout is declared.

**Time-Sharing Option (TSO).** An option in MVS that provides interactive time sharing from remote terminals.

**timestamp.** A seven-part value that consists of a date and time. The timestamp is expressed in years, months, days, hours, minutes, seconds, and microseconds.

**TMP.** Terminal Monitor Program.

**to-do.** A state of a unit of recovery that indicates that the unit of recovery’s changes to recoverable DB2 resources are indoubt and must either be applied to the disk media or backed out, as determined by the commit coordinator.

**trace.** A DB2 facility that provides the ability to monitor and collect DB2 monitoring, auditing, performance, accounting, statistics, and serviceability (global) data.

**transaction lock.** A lock that is used to control concurrent execution of SQL statements.

**transaction program name.** In SNA LU 6.2 conversations, the name of the program at the remote logical unit that is to be the other half of the conversation.

**transient XML data type.** A data type for XML values that exists only during query processing.

**transition table.** A temporary table that contains all the affected rows of the subject table in their state before or after the triggering event occurs. Triggered SQL statements in the trigger definition can reference the table of changed rows in the old state or the new state.

**transition variable.** A variable that contains a column value of the affected row of the subject table in its state before or after the triggering event occurs. Triggered SQL statements in the trigger definition can reference the set of old values or the set of new values.

**tree structure.** A data structure that represents entities in nodes, with a most one parent node for each node, and with only one root node.

**trigger.** A set of SQL statements that are stored in a DB2 database and executed when a certain event occurs in a DB2 table.
trigger activation • unit of recovery

trigger activation. The process that occurs when the trigger event that is defined in a trigger definition is executed. Trigger activation consists of the evaluation of the triggered action condition and conditional execution of the triggered SQL statements.

trigger activation time. An indication in the trigger definition of whether the trigger should be activated before or after the triggered event.

trigger body. The set of SQL statements that is executed when a trigger is activated and its triggered action condition evaluates to true. A trigger body is also called triggered SQL statements.

trigger cascading. The process that occurs when the triggered action of a trigger causes the activation of another trigger.

triggered action. The SQL logic that is performed when a trigger is activated. The triggered action consists of an optional triggered action condition and a set of triggered SQL statements that are executed only if the condition evaluates to true.

triggered action condition. An optional part of the triggered action. This Boolean condition appears as a WHEN clause and specifies a condition on DB2 evaluates to determine if the triggered SQL statements should be executed.

triggered SQL statements. The set of SQL statements that is executed when a trigger is activated and its triggered action condition evaluates to true. Triggered SQL statements are also called the trigger body.

trigger granularity. A characteristic of a trigger, which determines whether the trigger is activated:
• Only once for the triggering SQL statement
• Once for each row that the SQL statement modifies

triggering event. The specified operation in a trigger definition that causes the activation of that trigger. The triggering event is comprised of a triggering operation (INSERT, UPDATE, or DELETE) and a subject table on which the operation is performed.

triggering SQL operation. The SQL operation that causes a trigger to be activated when performed on the subject table.

trigger package. A package that is created when a CREATE TRIGGER statement is executed. The package is executed when the trigger is activated.

TSO. Time-Sharing Option.

TSO attachment facility. A DB2 facility consisting of the DSN command processor and DB2I. Applications that are not written for the CICS or IMS environments can run under the TSO attachment facility.

typed parameter marker. A parameter marker that is specified along with its target data type. It has the general form:

CAST( ? AS data-type)

type 1 indexes. Indexes that were created by a release of DB2 before DB2 Version 4 or that are specified as type 1 indexes in Version 4. Contrast with type 2 indexes. As of Version 8, type 1 indexes are no longer supported.

type 2 indexes. Indexes that are created on a release of DB2 after Version 7 or that are specified as type 2 indexes in Version 4 or later.

U

UCS-2. Universal Character Set, coded in 2 octets, which means that characters are represented in 16-bits per character.

UDF. User-defined function.

UDT. User-defined data type. In DB2 UDB for z/OS, the term distinct type is used instead of user-defined data type. See distinct type.

uncommitted read (UR). The isolation level that allows an application to read uncommitted data.

underlying view. The view on which another view is directly or indirectly defined.

undo. A state of a unit of recovery that indicates that the changes that the unit of recovery made to recoverable DB2 resources must be backed out.

Unicode. A standard that parallels the ISO-10646 standard. Several implementations of the Unicode standard exist, all of which have the ability to represent a large percentage of the characters that are contained in the many scripts that are used throughout the world.

uniform resource locator (URL). A Web address, which offers a way of naming and locating specific items on the Web.

union. An SQL operation that combines the results of two SELECT statements. Unions are often used to merge lists of values that are obtained from several tables.

unique constraint. An SQL rule that no two values in a primary key, or in the key of a unique index, can be the same.

unique index. An index that ensures that no identical key values are stored in a column or a set of columns in a table.

unit of recovery. A recoverable sequence of operations within a single resource manager, such as an instance of DB2. Contrast with unit of work.
unit of recovery identifier (URID). The LOGRBA of
the first log record for a unit of recovery. The URID also
appears in all subsequent log records for that unit of
recovery.

unit of work. A recoverable sequence of operations
within an application process. At any time, an
application process is a single unit of work, but the life
of an application process can involve many units of
work as a result of commit or rollback operations. In a
multisite update operation, a single unit of work can
include several units of recovery. Contrast with unit of
recovery.

Universal Unique Identifier (UUID). An identifier that
is immutable and unique across time and space (in z/OS).

unlock. The act of releasing an object or system
resource that was previously locked and returning it to
general availability within DB2.

untyped parameter marker. A parameter marker that
is specified without its target data type. It has the form
of a single question mark (?).

updatability. The ability of a cursor to perform
positioned updates and deletes. The updatability of a
cursor can be influenced by the SELECT statement and
the cursor sensitivity option that is specified on the
DECLARE CURSOR statement.

update hole. The location on which a cursor is
positioned when a row in a result table is fetched again
and the new values no longer satisfy the search
condition. DB2 marks a row in the result table as an
update hole when an update to the corresponding row
in the database causes that row to no longer qualify for
the result table.

update trigger. A trigger that is defined with the
triggering SQL operation UPDATE.

upstream. The node in the syncpoint tree that is
responsible, in addition to other recovery or resource
managers, for coordinating the execution of a two-phase
commit.

UR. Uncommitted read.

URE. Unit of recovery element.

URID. Unit of recovery identifier.

URL. Uniform resource locator.

user-defined data type (UDT). See distinct type.

user-defined function (UDF). A function that is
defined to DB2 by using the CREATE FUNCTION
statement and that can be referenced thereafter in SQL
statements. A user-defined function can be an external
function, a sourced function, or an SQL function.
Contrast with built-in function.

user view. In logical data modeling, a model or
representation of critical information that the business
requires.

UTF-8. Unicode Transformation Format, 8-bit encoding
form, which is designed for ease of use with existing
ASCII-based systems. The CCSID value for data in
UTF-8 format is 1208. DB2 UDB for z/OS supports
UTF-8 in mixed data fields.

UTF-16. Unicode Transformation Format, 16-bit
encoding form, which is designed to provide code
values for over a million characters and a superset of
UCS-2. The CCSID value for data in UTF-16 format is
1200. DB2 UDB for z/OS supports UTF-16 in graphic
data fields.

UUID. Universal Unique Identifier.

V

value. The smallest unit of data that is manipulated in
SQL.

variable. A data element that specifies a value that
can be changed. A COBOL elementary data item is an
element of a variable. Contrast with constant.

variant function. See nondeterministic function.

varying-length string. A character or graphic string
whose length varies within set limits. Contrast with
fixed-length string.

version. A member of a set of similar programs,
DBRM, packages, or LOBs.

A version of a program is the source code that is
produced by precompiling the program. The program
version is identified by the program name and a
timestamp (consistency token).

A version of a DBRM is the DBRM that is produced
by precompiling a program. The DBRM version is
identified by the same program name and timestamp
as a corresponding program version.

A version of a package is the result of binding a
DBRM within a particular database system. The
package version is identified by the same program
name and consistency token as the DBRM.

A version of a LOB is a copy of a LOB value at a
point in time. The version number for a LOB is
stored in the auxiliary index entry for the LOB.

view. An alternative representation of data from one or
more tables. A view can include all or some of the
columns that are contained in tables on which it is
defined.

view check option. An option that specifies whether
every row that is inserted or updated through a view
must conform to the definition of that view. A view check
option can be specified with the WITH CASCADED
Virtual Storage Access Method (VSAM) • z/OS Distributed Computing Environment (z/OS DCE)

CHECK OPTION, WITH CHECK OPTION, or WITH LOCAL CHECK OPTION clauses of the CREATE VIEW statement.

Virtual Storage Access Method (VSAM). An access method for direct or sequential processing of fixed- and varying-length records on disk devices. The records in a VSAM data set or file can be organized in logical sequence by a key field (key sequence), in the physical sequence in which they are written on the data set or file (entry-sequence), or by relative-record number (in z/OS).

Virtual Telecommunications Access Method (VTAM). An IBM licensed program that controls communication and the flow of data in an SNA network (in z/OS).

volatile table. A table for which SQL operations choose index access whenever possible.

VSAM. Virtual Storage Access Method.

VTAM. Virtual Telecommunication Access Method (in z/OS).

W

warm start. The normal DB2 restart process, which involves reading and processing log records so that data that is under the control of DB2 is consistent. Contrast with cold start.

WLM application environment. A z/OS Workload Manager attribute that is associated with one or more stored procedures. The WLM application environment determines the address space in which a given DB2 stored procedure runs.

write to operator (WTO). An optional user-coded service that allows a message to be written to the system console operator informing the operator of errors and unusual system conditions that might need to be corrected (in z/OS).

WTO. Write to operator.

WTOR. Write to operator (WTO) with reply.

X

XCF. See cross-system coupling facility.

XES. See cross-system extended services.

XML. See Extensible Markup Language.

XML attribute. A name-value pair within a tagged XML element that modifies certain features of the element.

XML element. A logical structure in an XML document that is delimited by a start and an end tag.

XML node. The smallest unit of valid, complete structure in a document. For example, a node can represent an element, an attribute, or a text string.

XML publishing functions. Functions that return XML values from SQL values.

X/Open. An independent, worldwide open systems organization that is supported by most of the world’s largest information systems suppliers, user organizations, and software companies. X/Open’s goal is to increase the portability of applications by combining existing and emerging standards.

XRF. Extended recovery facility.

z/OS. An operating system for the eServer™ product line that supports 64-bit real and virtual storage.

z/OS Distributed Computing Environment (z/OS DCE). A set of technologies that are provided by the Open Software Foundation to implement distributed computing.
Bibliography

DB2 Universal Database for z/OS Version 8
product information:

The following information about Version 8 of DB2 UDB for z/OS is available in both printed and softcopy formats:

- **DB2 Administration Guide**, SC18-7413
- **DB2 Application Programming and SQL Guide**, SC18-7415
- **DB2 Application Programming Guide and Reference for Java**, SC18-7414
- **DB2 Command Reference**, SC18-7416
- **DB2 Data Sharing: Planning and Administration**, SC18-7417
- **DB2 Diagnosis Guide and Reference**, LY37-3201
- **DB2 Diagnostic Quick Reference Card**, LY37-3202
- **DB2 Installation Guide**, GC18-7418
- **DB2 Licensed Program Specifications**, GC18-7420
- **DB2 Messages and Codes**, GC18-7422
- **DB2 ODBC Guide and Reference**, SC18-7423
- **DB2 Reference Summary**, SX26-3853
- **DB2 Release Planning Guide**, SC18-7425
- **DB2 SQL Reference**, SC18-7426
- **DB2 Utility Guide and Reference**, SC18-7427
- **DB2 What's New?**, GC18-7428
- **DB2 XML Extender for z/OS Administration and Programming**, SC18-7431
- **Program Directory for IBM DB2 Universal Database for z/OS**, GI10-8566

The following information is provided in softcopy format only:

- **DB2 Image, Audio, and Video Extenders Administration and Programming** (Version 7 level)
- **DB2 Net Search Extender Administration and Programming Guide** (Version 7 level)
- **DB2 RACF Access Control Module Guide** (Version 8 level)
- **DB2 Reference for Remote DRDA Requesters and Servers** (Version 8 level)
- **DB2 Text Extender Administration and Programming** (Version 7 level)

You can find DB2 UDB for z/OS information on the library Web page at www.ibm.com/db2/zos/v8books.html

The preceding information is published by IBM. One additional book, which is written by IBM and published by Pearson Education, Inc., is The Official Introduction to DB2 UDB for z/OS, ISBN 0-13-147750-1. This book provides an overview of the Version 8 DB2 UDB for z/OS product and is recommended reading for people who are preparing to take Certification Exam 700: DB2 UDB V8.1 Family Fundamentals.
