Third Edition (September 2008)

This edition applies to Version 1 Release 10 of z/OS (5694-A01) and to all subsequent releases and modifications until otherwise indicated in new editions.

IBM welcomes your comments. You may send your comments to the following address.
   International Business Machines Corporation
   Attn: z/OS Communications Server Information Development
   Department AKCA, Building 501
   P.O. Box 12195, 3039 Cornwallis Road
   Research Triangle Park, North Carolina 27709-2195

You can send us comments electronically by using one of the following methods:

Fax (USA and Canada):
   1+919-254-1258
   Send the fax to “Attn: z/OS Communications Server Information Development”

Internet e-mail:
   comsvrcf@us.ibm.com

World Wide Web:

If you would like a reply, be sure to include your name, address, telephone number, or FAX number. Make sure to include the following in your comment or note:

- Title and order number of this document
- Page number or topic related to your comment

When you send information to IBM, you grant IBM a nonexclusive right to use or distribute the information in any way it believes appropriate without incurring any obligation to you.

About this document

This document helps customers write application programs that use the communications storage manager (CSM). It describes the CSM application programming interface (API). It also describes the IVTCSM macro and the programming techniques for using this macro. It is intended to be used by application programs using the high performance data transfer (HPDT) interface. Refer to the z/OS Communications Server: SNA Programmer's LU 6.2 Guide for information about how VTAM® application programs use the HPDT interface.

This document supports z/OS.e.

Who should read this document

This book is for system programmers who code authorized application programs for a System/390® or zSeries® host. This audience can include programmers who are modifying existing programs or writing new ones. The manual can also be useful to planners who are estimating the amount of work required to use the API for CSM.

You should be familiar with programming concepts and programming VTAM applications, as described in z/OS Communications Server: SNA Programming before you use the macroinstructions described in this book.

You should be familiar with the following concepts:
• Systems network architecture
• Data communications
• LU 6.2 architecture

How this document is organized

This document is divided into the following sections:
• Chapter 1, “Communications storage manager (CSM) overview,” on page 1
• Chapter 2, “CSM macroinstructions,” on page 21
• “Appendixes” provides additional information for this document.
• “Notices” contains notices and trademarks used in this document.
• “Bibliography” contains descriptions of the documents in the z/OS Communications Server library.

How to use this document

To use this document, you should be familiar with System/390 or zSeries host.

Determining whether a publication is current

As needed, IBM® updates its publications with new and changed information. For a given publication, updates to the hardcopy and associated BookManager® softcopy are usually available at the same time. Sometimes, however, the updates
to hardcopy and softcopy are available at different times. The following information describes how to determine if you are looking at the most current copy of a publication:

- At the end of a publication’s order number there is a dash followed by two digits, often referred to as the dash level. A publication with a higher dash level is more current than one with a lower dash level. For example, in the publication order number GC28-1747-07, the dash level 07 means that the publication is more current than previous levels, such as 05 or 04.
- If a hardcopy publication and a softcopy publication have the same dash level, it is possible that the softcopy publication is more current than the hardcopy publication. Check the dates shown in the Summary of Changes. The softcopy publication might have a more recently dated Summary of Changes than the hardcopy publication.
- To compare softcopy publications, you can check the last two characters of the publication’s file name (also called the book name). The higher the number, the more recent the publication. Also, next to the publication titles in the CD-ROM booklet and the readme files, there is an asterisk (*) that indicates whether a publication is new or changed.

**How to contact IBM service**

Most problems can be resolved at this Web site, where you can submit questions and problem reports electronically, as well as access a variety of diagnosis information.

For telephone assistance in problem diagnosis and resolution (in the United States or Puerto Rico), call the IBM Software Support Center anytime (1-800-IBM-SERV). You will receive a return call within 8 business hours (Monday – Friday, 8:00 a.m. – 5:00 p.m., local customer time).

Outside the United States or Puerto Rico, contact your local IBM representative or your authorized IBM supplier.

If you would like to provide feedback on this publication, see “Communicating Your Comments to IBM” on page 125.

**Conventions and terminology used in this document**

Commands in this book that can be used in both TSO and z/OS® UNIX® environments use the following conventions:

- When describing how to use the command in a TSO environment, the command is presented in uppercase (for example, NETSTAT).
- When describing how to use the command in a z/OS UNIX environment, the command is presented in bold lowercase (for example, netstat).
- When referring to the command in a general way in text, the command is presented with an initial capital letter (for example, Netstat).

All of the exit routines described in this document are installation-wide exit routines. You will see the installation-wide exit routines also called installation-wide exits, exit routines, and exits throughout this document.
The TPF logon manager, although shipped with VTAM, is an application program. Therefore, the logon manager is documented separately from VTAM.

Samples used in this book might not be updated for each release. Evaluate a sample carefully before applying it to your system.

For definitions of the terms and abbreviations used in this document, you can view the latest IBM terminology at the IBM Terminology Web site.

Clarification of notes

Information traditionally qualified as Notes is further qualified as follows:

- **Note** Supplemental detail
- **Tip** Offers shortcuts or alternative ways of performing an action; a hint
- **Guideline** Customary way to perform a procedure
- **Rule** Something you must do; limitations on your actions
- **Restriction** Indicates certain conditions are not supported; limitations on a product or facility
- **Requirement** Dependencies, prerequisites
- **Result** Indicates the outcome

How to read a syntax diagram

This section describes how to read the syntax diagrams used in this book.

- Read the diagrams from left-to-right, top-to-bottom, following the main path line. Each diagram begins on the left with double arrowheads (►►) and ends on the right with two arrowheads facing each other (►►).

```
►► Syntax Diagram
```

- If a diagram is longer than one line, the first line ends with a single arrowhead (►) and the second line begins with a single arrowhead.

```
►► First Line — OPERAND1 — OPERAND2 — OPERAND3 — OPERAND4 — OPERAND5
  ►► Second Line
```

- Required operands and values appear on the main path line.

```
►► REQUIRED_OPERAND
```

You must code required operands and values.

If there is more than one mutually exclusive required operand or value to choose from, they are stacked vertically in alphanumeric order.
• Optional operands and values appear below the main path line.

• An arrow returning to the left above an operand or value on the main path line means that the operand or value can be repeated. The comma means that each operand or value must be separated from the next by a comma.

• An arrow returning to the left above a group of operands or values means more than one can be selected, or a single one can be repeated.

• A word in all uppercase is an operand or value you must spell exactly as shown. In this example, you must code `OPERAND`.

**Note:** VTAM and IP commands are not case sensitive. You can code them in uppercase or lowercase. If the operand is shown in both uppercase and lowercase, the uppercase portion is the abbreviation (for example, OPERAnd).

If an operand or value can be abbreviated, the abbreviation is discussed in the text associated with the syntax diagram.

• If a diagram shows a character that is not alphanumeric (such as parentheses, periods, commas, and equal signs), you must code the character as part of the syntax. In this example, you must code `OPERAND=(001,0.001)`.

• If a diagram shows a blank space, you must code the blank space as part of the syntax. In this example, you must code `OPERAND=(001 FIXED)`.
• Default operands and values appear above the main path line. VTAM uses the default if you omit the operand entirely.

• A word in all lowercase italics is a variable. Where you see a variable in the syntax, you must replace it with one of its allowable names or values, as defined in the text.

• References to syntax notes appear as numbers enclosed in parentheses above the line. Do not code the parentheses or the number.

Notes:
1  An example of a syntax note.

• Some diagrams contain syntax fragments, which serve to break up diagrams that are too long, too complex, or too repetitious. Syntax fragment names are in mixed case and are shown in the diagram and in the heading of the fragment. The fragment is placed below the main diagram.

Syntax Fragment:

Prerequisite and related information

z/OS Communications Server function is described in the z/OS Communications Server library. Descriptions of those documents are listed in the Bibliography on page 117 in the back of this document.

Required information

Before using this product, you should be familiar with TCP/IP, VTAM, MVS®, and UNIX System Services.

Softcopy information

Softcopy publications are available in the following collections.
<table>
<thead>
<tr>
<th>Titles</th>
<th>Order Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS V1R10 Collection</td>
<td>SK3T-4269</td>
<td>This is the CD collection shipped with the z/OS product. It includes the libraries for z/OS V1R10, in both BookManager and PDF formats.</td>
</tr>
<tr>
<td>z/OS Software Products Collection</td>
<td>SK3T-4270</td>

**How to send your comments**

Your feedback is important in helping to provide the most accurate and high-quality information. If you have any comments about this document or any other z/OS Communications Server documentation, do one of the following:

- **Go to the z/OS contact page at [http://www.ibm.com/systems/z/os/zos/webqs.html](http://www.ibm.com/systems/z/os/zos/webqs.html).** You can enter and submit your comments in the form provided at this Web site.

- Send your comments by e-mail to comsvrcf@us.ibm.com. Be sure to include the name of the document, the part number of the document, the version of z/OS Communications Server, and, if applicable, the specific location of the text that you are commenting on (for example, a section number, a page number or a table number).
Summary of changes

Summary of changes
for SC31-8808-02
z/OS Version 1 Release 10

This document contains information previously presented in SC31–8808–01, which supports z/OS Version 1 Release 8. There are no technical or editorial updates in this version of the document.

Summary of changes
for SC31-8808-01
z/OS Version 1 Release 8

This book contains information previously presented in SC31-8808-00, which supports z/OS Version 1 Release 2.

The information in this document includes descriptions of support for both IPv4 and IPv6 networking protocols. Unless explicitly noted, descriptions of IP protocol support concern IPv4. IPv6 support is qualified within the text.

Changed information
• SNA Display CSM Enhancements, see “Monitoring CSM storage” on page 2

Deleted information
• AnyNet® function is removed from the z/OS V1R8 Communications Server product and therefore documentation describing AnyNet support has been deleted.

This book contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

You might notice changes in the style and structure of some content in this document—for example, headings that use uppercase for the first letter of initial words only, and procedures that have a different look and format. The changes are ongoing improvements to the consistency and retrievability of information in our documents.

Summary of changes
for SC31-8808-00
z/OS Version 1 Release 2

This book contains information previously presented in OS/390 V2R5 eNetwork Communications Server: CSM guide, SC31–8575.

New information
• CSM data space pages can now be backed above the 2-gigabyte real storage bar. For details, see Chapter 1, “Communications storage manager (CSM) overview,” on page 1, “IVTCSM REQUEST=CREATE_POOL” on page 40, and “IVTCSM REQUEST=GET_BUFFER” on page 62.
This book contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.
Chapter 1. Communications storage manager (CSM) overview

This chapter describes CSM and its capabilities, and includes the following sections:
- “CSM application programming interface (API)”
- “Installing, defining, and initializing CSM” on page 2
- “Monitoring CSM storage” on page 2
- “Diagnosing CSM problems” on page 4
- “Application responsibilities for using CSM” on page 5
- “Functions provided by the CSM API” on page 6

The communications storage manager (CSM) is a VTAM component that allows authorized host applications to share data with VTAM and other CSM users without the need to physically copy the data.

CSM is provided as part of the high performance data transfer (HPDT) family of services. HPDT optimizes system performance for the transfer of bulk data. By providing a means for authorized applications to share buffers, CSM improves system performance during the transfer of bulk data by reducing the processing required for data movement. As a result, the following central processing unit (CPU) resources are conserved:
- CPU cycles
- Memory bus
- Cache

CSM application programming interface (API)

CSM includes an application programming interface (API) that provides a way to:
- Obtain and return CSM buffers
- Change ownership of buffers
- Copy buffers
- Manage CSM buffers

**Requirement:** Applications must be authorized to use CSM.

The storage key for CSM buffers is key 6, fetch protected. Users set up and access data that resides in CSM buffers. These buffers are obtained from buffer pools that are identified by their buffer size and storage type as listed in Table 1.

<table>

</tbody>
</table>
Data space storage is a common area data space and is associated with the master scheduler address space. This association results in a data space that persists for the life of the system.

When an application obtains buffers from CSM, that application is considered the owner of those buffers. Based on application specifications, CSM associates buffer responsibility with an address space or a task within an address space. Applications using CSM have the responsibility of returning owned buffers so that storage is available for other users.

Ownership can be transferred to another user. When this occurs, the new owner is responsible for the return of the buffers. CSM manages buffer reclamation during termination at the task or address space level based on ownership. For detailed information about buffer reclamation during termination, see "CSM recovery for normal and abnormal termination" on page 19.

For more information about buffer ownership, see "Ownership of buffers" on page 10.

### Installing, defining, and initializing CSM

CSM is shipped and installed with the VTAM product tape. However, many CSM functions are independent of VTAM. CSM storage limits and tuning parameters are defined in the CSM parmlib member, IVTPRM00. Refer to [z/OS Communications Server: New Function Summary](#) for information about the CSM parmlib member.

CSM is initialized by the first request to create a pool of buffers and remains active for the life of the system, independent of VTAM’s status. The CREATE_POOL request could be issued by VTAM or a host application. Upon initialization, CSM reads the CSM parmlib member to determine storage limits and buffer pool related values. After CSM is initialized, it persists for the life of the system.

### Monitoring CSM storage

System operators can issue the DISPLAY CSM command to monitor CSM storage usage.

**Rule:** CSM messages always start with the message prefix IVT.

For a complete list of messages issued by CSM, refer to [z/OS Communications Server: SNA Messages](#).

The DISPLAY CSM command yields the following information:

- Amount of storage allocated to each pool
- Amount of storage allocated to each user of the pool
- If OWNERID=ALL is specified, the cumulative storage allocated to each user across all pools
- If OWNERID is not specified, the highest level of fixed storage obtained since the last DISPLAY CSM command was issued without the OWNERID parameter.
- If OWNERID is not specified, the highest level of fixed storage obtained since the IPL.
- If OWNERID is not specified, the highest level of ECSA obtained since the last DISPLAY CSM command was issued without the OWNERID parameter.
- If OWNERID is not specified, the highest level of ECSA obtained since the IPL.
- If OWNERID is not specified, the names of CSM data spaces.
• The maximum amount of fixed and ECSA storage that can be allocated by CSM and current values of fixed and ECSA storage.

Use the DISPLAY CSM command to identify a user of the pool that is consuming inordinate amounts of storage. This can happen if an application fails to free buffers that it obtained from CSM. The report of storage allocated to a user is based on the value of the user’s owner_ID parameter. This is the OWNERID operand on the DISPLAY CSM command. CSM uses the application’s address space identifier (ASID) as the OWNERID.

In some cases, the sum of the total of the storage allocated to all users of a pool might be greater than the total amount of storage allocated to a pool. This is caused by multiple buffer owners, which is a result from the creation of shared instances using the IVTCRM REQUEST=ASSIGN_BUFFER macroinstruction. The OWNERID information indicates the amount of storage that the user must free to enable the storage to be returned to the buffer pool. Issue the MODIFY CSM command to increase or decrease CSM storage limits without requiring a re-IPL.

The CSM monitor function is available to monitor CSM buffers between many components of z/OS Communications Server. IBM Software Support uses this function to help diagnose CSM storage problems.

This function is controlled using the Modify CSM command with the MONITOR operand. Valid options are MONITOR=ON, MONITOR=OFF and MONITOR=DYNAMIC. If you choose MONITOR=DYNAMIC, CSM buffer monitoring is dynamically activated and inactivated. CSM dynamically activates CSM buffer monitoring when CSM storage usage approaches the constrained level.

It dynamically inactivates CSM buffer monitoring when CSM storage returns to a level slightly lower than the normal level. The function status can be displayed using the Display CSM command with the MONITOR operand.

Use the DISPLAY CSMUSE command to evaluate the use of storage managed by CSM. Although this command is similar to the DISPLAY CSM command, it provides a lower level of detail for storage usage; therefore, this command is different than that of the DISPLAY CSM command. This command is primarily intended for IBM service. However, it can also be beneficial to the user. The display output provides detailed information about each CSM storage pool. The detailed information describes storage as it corresponds to an identifier, which is referred to as a monitor ID. Monitor IDs describe specific z/OS Communications Server components. When CSM storage is associated with (or isolated to) a specific monitor ID, then IBM service can correlate the monitor ID to a component (usage or function) of z/OS Communications Server. This information can be useful when evaluating how z/OS Communications Server is using system storage or to help diagnose storage growth. Refer to z/OS Communications Server: IP and SNA Codes for the complete description of monitor IDs. The critical level storage usage is 90% or higher of ECSA MAX or FIXED MAX values specified in CSM parmlib IVTPRM00. The normal level storage usage is 80% or below of ECSA MAX or FIXED MAX values.

CSM issues some messages when CSM storage limits are at a critical level or exceeded. In this case, the system operator can issue the MODIFY CSM command to increase the amount of fixed or ECSA storage available for CSM.

For more information about these CSM commands, refer to z/OS Communications Server: SNA Operation.
Use the DISPLAY TRL command to isolate a storage problem to a specific device. For more information, refer to [z/OS Communications Server: SNA Diagnosis Vol 1, Techniques and Procedures]. For more detail on the DISPLAY TRL command, refer to [z/OS Communications Server: SNA Customization] for more information.

CSM storage information is also provided to the performance monitor interface (PMI). This information is equivalent to the information provided for the summary format of the DISPLAY CSM command. Refer to [z/OS Communications Server: SNA Customization] for more information.

Applications using the CSM API can also request information about the status of CSM storage by issuing the IVTCSM REQUEST=RESOURCE_STATS macroinstruction.

### Diagnosing CSM problems

Use the CSM option on the VTAM internal trace (VIT) or, when VTAM is not active, the GTF trace facility to obtain trace output of application requests to CSM.

When VTAM is operational, the CSM trace facility is controlled using VIT. CSM writes records to the VIT using VTAM trace interfaces. The CSM trace option controls the generation of CSM trace records for both internal and external tracing.

When VTAM is not operational, the VIT is not available and only external tracing is provided. The external trace is generated using the VTAM GTF event ID to write trace records directly to GTF in the same format as those recorded using VIT.

CSM tracing records the parameter list information that flows across the CSM interface and key internal events (such as pool expansion and contraction) for functions that manipulate buffer states. This allows you to trace and analyze the usage history of a buffer.

The number of trace records required to represent one IVTCSM request varies based on the number of buffer operations requested. Because the information required to trace one IVTCSM request can span several CSM trace records, you can use the trace record flag field to determine whether additional trace records exist for a particular IVTCSM request. If the first bit in the trace record flag field is set to on, the trace record is continued. If VIT is not active, multiple trace records for an IVTCSM request could be interspersed with trace records of IVTCSM requests from other users. A unique trace record number correlates the continuation trace records for each IVTCSM request.

For more information about tracing events over the CSM API, refer to [z/OS Communications Server: SNA Diagnosis Vol 1, Techniques and Procedures].

### Formatting CSM dump information

Interactive Problem Control System (IPCS) dump formatters provide the following services for displaying CSM information in a dump:

- Find and display CSM data structures including all pools and their extents.
- Find and display CSM data structures for a buffer pool based on the size and source, ECSA, or data space.
- Find and display a buffer based on the input buffer token.
- Find all buffers based on an input OWNERID.
Application responsibilities for using CSM

Requirement: An application must be authorized in order to use the CSM API. This is described in \textit{z/OS Communications Server: SNA Programming}.

As system-authorized applications, all programs using CSM should be written to handle CSM storage in a responsible manner. Therefore, the application design should adhere to the following guidelines for requesting CSM services. Applications using CSM for VTAM’s high performance data transfer (HPDT) service should refer to the guidelines described in the \textit{z/OS Communications Server: SNA Programmer’s LU 6.2 Guide}.

Guidelines:

- Data in CSM storage should be modified only by the original requester of the buffers. The original requester is the application that obtained the storage using the \texttt{IVTCSM REQUEST=GET_BUFFER} macroinstruction. All other applications are considered borrowers of the buffers and must treat the data as read-only. For information about possible exceptions to this rule, see “Responsibilities of buffer ownership” on page 11 for more details.

- All programs directly referencing CSM storage must do so in the proper storage key. All CSM storage is allocated in key 6. The \texttt{IVTCSM REQUEST=COPY_DATA} macroinstruction allows data to be copied into or out of CSM storage. The authorized invoker can be in any key. Using this service might reduce the impact to the application due to storage key mismatches when CSM storage must be accessed.

- An application must not reference or use CSM storage after passing ownership of that storage to another user.

- An application that has accepted ownership of CSM storage is obligated to return the storage to CSM unless that application is passing the storage to another user. See “Ownership of buffers” on page 10 for more information. Storage is returned to CSM on the \texttt{IVTCSM REQUEST=FREE_BUFFER} macroinstruction.

- Applications should use the \texttt{IVTCSM REQUEST=RESOURCE_STATS} macroinstruction to monitor the status of CSM storage. The application must be capable of reacting to storage constraint conditions that might jeopardize the application’s or system’s operation. See “Obtaining CSM resource statistics” on page 16 for more information. The \texttt{RESOURCE_STATS} request is described on page 7.

- Generally, applications should request buffers from data space instead of ECSA to ensure that more virtual storage is available to all users of CSM. ECSA should be used only if there are special application requirements.
The application’s use of CSM should be documented so that the installation can adjust ECSA and fixed storage limits in the CSM parmlib member as necessary. This information should be available in application installation documentation so that necessary changes to the limits can be made prior to application installation.

**Functions provided by the CSM API**

This section describes the functions that a CSM user needs in order to create and use storage pools. The IVTCSM macroinstruction provides the interface for applications issuing requests to CSM.

Use the IVTCSM macroinstruction to issue the following types of requests:

- IVTCSM REQUEST=ASSIGN_BUFFER
- IVTCSM REQUEST=CHANGE_OWNER
- IVTCSM REQUEST=CHANGE_OWNER
- IVTCSM REQUEST=CREATE_POOL
- IVTCSM REQUEST=DELETE_POOL
- IVTCSM REQUEST=DUMP_INFO
- IVTCSM REQUEST=FIX_BUFFER
- IVTCSM REQUEST=FREE_BUFFER
- IVTCSM REQUEST=GET_BUFFER
- IVTCSM REQUEST=PAGE_BUFFER
- IVTCSM REQUEST=RESOURCE_STATS

See Chapter 2, “CSM macroinstructions,” on page 21 for the complete description and syntax of each request.

Table 2 contains a cross reference of IVTCSM requests and their valid input and output parameters.

### Creating and registering buffer pools

Upon application request, CSM can create buffer pools based on the size and types listed in Table 1 on page 1. A total of 15 CSM buffer pools can be created, one for each storage type and buffer size.

The structures that maintain the storage pools are created as a result of the first `IVTCSM REQUEST=CREATE_POOL` macroinstruction issued by a CSM user (this could be VTAM or a host application). The pool might or might not already exist. In either case, the application that issues the CREATE_POOL request is a registered user and can obtain buffers from that pool. CSM returns a token in the RETPTOKN parameter, which the application uses on subsequent requests buffer requests from that pool.

An application can specify buffer pool tuning parameters on the CREATE_POOL request. See “CSM buffer pool expansion and contraction” on page 17 for more information.

**Guideline:** Where possible, programs should use CSM data space instead of ECSA. Furthermore, use of 64-bit backed CSM data space is preferred to 31-bit backed CSM data space. Use data space instead of ECSA and 64-bit backed data space instead of 31-bit backed data space to benefit overall system performance.

### Requesting storage from CSM

**Requirement:** Before an application can retrieve storage from CSM, it must be registered as a user of a CSM buffer pool. See “Creating and registering buffer pools” for a description.

Table 1 on page 1 lists a summary of the available CSM buffer pools. CSM returns a pool token in the RETPTOKN parameter, which the application uses on subsequent buffer requests from that pool.

Applications obtain buffers from CSM by specifying the token of the pool with which they are registered and the number of buffers on the `IVTCSM REQUEST=GET_BUFFER` macroinstruction. CSM allocates the requested number of buffers from that pool to the application. CSM returns a buffer list. Each entry in
the buffer list contains a token and other information that the application and CSM use to reference the buffers. See [CSM buffer lists] for more information about buffer lists in CSM.

An application can obtain buffers from CSM as they are needed or manage its own pool of buffers to be retained for multiple uses. By default, buffers are returned to CSM when the current owner issues the [IVTCSM REQUEST=FREE_BUFFER] macroinstruction. An application designed to manage its own pool of buffers uses a buffer return exit routine that assumes control of the buffers after they are freed by a user.

Buffer return exit routines can receive control after buffers are released by a FREE_BUFFER request. See [Buffer return exit routine] for more information.

Restriction: GET_BUFFER requests that exceed the storage available in CSM are rejected. CSM users should monitor CSM storage use and take action to prevent critical shortages that might jeopardize the application or system operation. See [Obtaining CSM resource statistics] for more information.

**CSM buffer lists**

The following requests require that the application provide the buffer list address:

- [IVTCSM REQUEST=ASSIGN_BUFFER]
- [IVTCSM REQUEST=CHANGE_OWNER]
- [IVTCSM REQUEST=FIX_BUFFER]
- [IVTCSM REQUEST=FREE_BUFFER]
- [IVTCSM REQUEST=GET_BUFFER]
- [IVTCSM REQUEST=PAGE_BUFFER]

CSM builds a buffer list in the area provided on the BUFLIST parameter of the GET_BUFFER request. The buffer list contains, among other information, a token used by CSM to manage each buffer. The format of the CSM buffer list is described in [CSM buffer list entry (IVTBUFL)] on page 81. The IVTBUFL DSECT maps an entry in the CSM buffer list, which can be indicated by the BUFLIST, SRCLIST or TARGLIST parameters on the IVTCSM macroinstruction.

Tip: Each buffer list entry can be contiguous to the previous entry with the number of entries in the list defined by the BUFNUM operand on the request. Use the GAP parameter to separate entries.

**Fixed buffers versus pageable buffers**

Applications can specify buffers in one of the following formats:

- Guaranteed to be fixed (BUFTYPE=FIXED)
- Guaranteed to be pageable (BUFTYPE=PAGEABLE)
- Eligible to be made pageable (BUFTYPE=PAGEELIG)

**Guaranteeing that a buffer is fixed**

Some processes require buffers to be fixed into real storage. An application can specify fixed buffers (BUFTYPE=FIXED parameter) on the GET_BUFFER and ASSIGN_BUFFER requests. Availability of fixed buffers is limited by the system definitions in the installation’s CSM parmlib member. The application can obtain pageable buffers when fixed buffers are unavailable and use the FIX_BUFFER request to make the buffers fixed at a later time.
Guaranteeing that a buffer is pageable
An application can specify BUFTYPE=PAGEABLE on the GET_BUFFER and PAGE_BUFFER requests to classify buffers as guaranteed to be made pageable.

Restriction: This function can be issued only for a buffer consisting of one image. For information about creating multiple images of a buffer, see "IVTCSM REQUEST=ASSIGN_BUFFER" on page 24.

Making a buffer eligible to be paged
An application can specify BUFTYPE=PAGEELIG on the GET_BUFFER, ASSIGN_BUFFER, and PAGE_BUFFER requests in order to classify buffers as eligible to be paged. CSM can maintain a status of eligible to be paged. The actual system state of a buffer with this status can be either fixed or pageable. CSM internally monitors the level of fixed storage usage. The buffers can remain fixed unless CSM determines that the storage should be made pageable. This avoids the unnecessary overhead of fixing and freeing storage from a system perspective.

This function avoids consuming fixed storage for data that is being held in a buffer for possible use at a later time.

Requirement: If an eligible to be paged buffer must be fixed later, the application must issue the FIX_BUFFER request.

Ownership of buffers
CSM uses the address space identifier (ASID) as the basis for the OWNERID value. OWNERID can be specified on the following requests:

- IVTCSM REQUEST=ASSIGN_BUFFER
- IVTCSM REQUEST=GET_BUFFER
- IVTCSM REQUEST=CHANGE_OWNER

The owner is the application responsible for returning buffers to CSM using the IVTCSM REQUEST=FREE_BUFFER macroinstruction. CSM assigns initial buffer ownership to the original requester of the buffers. To override this assignment, specify another user’s ASID as the OWNERID on the IVTCSM REQUEST=GET_BUFFER macroinstruction. To pass ownership of CSM buffers to another, issue an IVTCSM REQUEST=CHANGE_OWNER macroinstruction.

To associate ownership of a buffer to a task, specify a TCB address on the TASKID parameter on the following requests:

- IVTCSM REQUEST=ASSIGN_BUFFER
- IVTCSM REQUEST=GET_BUFFER
- IVTCSM REQUEST=CHANGE_OWNER

If TASKID is not specified, buffer ownership is associated with the ASID.

Ownership of a buffer that has an associated buffer return exit is not actually changed due to an IVTCSM REQUEST=CHANGE_OWNER macroinstruction; the buffer is actually borrowed. The original owner of the buffer is maintained so that ownership is restored when the buffer is freed. However, if the original owner’s address space terminates before the buffer return exit is invoked, the current borrower, if one exists, becomes the new owner. If the buffer is not being borrowed, it is returned to CSM.
Responsibilities of buffer ownership

When an application obtains buffers from CSM on a VTCSM REQUEST=GET_BUFFER macroinstruction, that application is considered to be the original requester of that storage. Ownership responsibility entails either ultimately freeing the storage (on an VTCSM REQUEST=FREE_BUFFER macroinstruction) or changing ownership to another user. Failure to return the storage ultimately creates CSM storage constraint conditions.

The original requester of the storage can specify a buffer return exit routine at storage allocation time and is entitled to the return of storage without modification.

Guideline: The receiving application should consider this as read-only storage and should not modify the contents.

If written as a cooperative set of processes, applications might determine that it is acceptable to modify the data if the original application does not require the original data returned unmodified.

Restriction: Applications written in this manner must be able to guarantee that the original requester of the storage is one of the cooperative applications. If the storage allocation source is unknown to the receiver, the read-only requirement applies.

Changing ownership of a buffer

Any user that can address the buffers by using the buffer tokens provided by CSM can issue the CHANGE_OWNER request. This includes the following scenarios:

• Application A passes buffer tokens to application B. Application B issues the IVTCSM REQUEST=CHANGE_OWNER macroinstruction.
• Application A uses the IVTCSM REQUEST=CHANGE_OWNER macroinstruction to pass ownership of the buffers to application B.

Restriction: After an ownership change, the former owner of the buffers must not address the buffers except when the former owner has specified a buffer return exit. In this case, the application must not address the buffers until its exit routine is scheduled by CSM. The exit routine is scheduled when the current owner of the buffers issues the IVTCSM REQUEST=FREE_BUFFER macroinstruction.

Example

The High Performance data transfer (HPDT) interface demonstrates how two CSM users change ownership.

On an HPDT send, the application passes the buffer tokens to VTAM in an extended buffer list (XBUF_LIST) on the send request. VTAM performs the CHANGE_OWNER request. If an error occurs, VTAM notifies the application so that the application can recover buffers that were not accepted. On the receive side, VTAM passes the buffer list to the application and issues the CHANGEOWNER request.

Storage return

An application uses the IVTCSM REQUEST=FREE_BUFFER macroinstruction to release buffers back to CSM.
CSM returns the buffers to the original requester if all of the following conditions exist:

- The original requester specified a buffer return exit address on the FREERTN parameter of the IVTCSM REQUEST=GET_BUFFER macroinstruction.
- The original requester is active at the time the IVTCSM REQUEST=FREE_BUFFER macroinstruction is issued.
- The application issuing IVTCSM REQUEST=FREE_BUFFER does not specify FREETO=CSM. This parameter is intended for situations where the original requester needs to return buffers without invoking its own buffer return exit.

Optionally, the requester can specify that the buffer is to be cleared when issuing the FREE_BUFFER request. See "Clearing data from buffers" for more information.

Requirement: All storage manager GET_BUFFER and ASSIGN_BUFFER requests must have a corresponding FREE_BUFFER request before the buffer is considered available for reallocation by CSM or before a buffer return exit is invoked for a buffer obtained specifying a user free routine. This ensures that all users have finished using the buffer.

Clearing data from buffers
An application can instruct CSM to clear data from buffers that are returned to the buffer pool by specifying CLEAR=YES on the following macroinstructions:

- IVTCSM REQUEST=FREE_BUFFER
- IVTCSM REQUEST=GET_BUFFER

This passes secure data to another user such that any residual data is eliminated when that buffer has returned to the pool.

Guidelines:

- Specifying CLEAR=YES on a IVTCSM REQUEST=GET_BUFFER macroinstruction overrides a CLEAR=NO specification on a IVTCSM REQUEST=FREE_BUFFER macroinstruction.
- Specifying CLEAR=YES does not cause a buffer to be cleared that is returned to an application’s buffer return exit routine. However, if CLEAR=YES is specified, the buffer is cleared in the event that it is returned to the storage pool.

Removing registration from a pool
Because each pool can have multiple users, a storage pool is not deleted until all buffers have been returned by all users and DELETE_POOL requests have been received for each corresponding CREATE_POOL request. To deregister as the user of the pool, the application issues the IVTCSM REQUEST=DELETE_POOL macroinstruction.

Copying data to or from a CSM buffer
Applications can use the IVTCSM REQUEST=COPY_DATA macroinstruction to copy data to or from a CSM buffer or a user data area. The authorized invoker can be in any key. This request might reduce the impact to the application by reducing storage key mismatches when CSM storage must be accessed. It also assists users of CSM data space buffers by isolating the application from the addressing method used to access a data space.
The **IVTCSM REQUEST=COPY_DATA** macroinstruction allows multiple source buffers to be copied to or from one or more target buffers. The source buffers are copied to the target buffers using the source and target buffer lengths to pack data or span data across the target buffers as required.

If the cumulative length of the source buffers is greater than the cumulative length of the target buffers, the source data is truncated. The application can specify a character on the PADCHAR input parameter to pad the target buffers when the cumulative length of the source buffers is less than the cumulative length of the target buffers.

The application must supply a source buffer list and a target buffer list on the **COPY_DATA** request. This is shown in Figure 1 on page 14. The number of entries in each list does not have to be equal. Within each list, entries might or might not represent a CSM buffer. The value of the BUFL_SOURCE field dictates whether the entry represents a CSM buffer. For entries representing CSM buffers, the address that is the source or target of the copy is provided by the requester and is not required to be the actual start address of the CSM buffer. CSM validates that the specified address and length correspond to a storage area that is within the bounds of the CSM buffer. This validation is based on the size of the buffer as determined at the time the buffer pool was created.

Optionally, a user data area that is involved in the copy data operation can be access list entry token (ALET)-qualified to allow this area to reside in a data space.
Sharing buffers among multiple users

The [IVTCSM REQUEST=ASSIGN_BUFFER] macroinstruction allows a buffer to be concurrently shared between multiple users. A logical instance of the buffer is created for each user. A new physical copy of the buffer is not created. This function allows specific areas of the buffer to be allocated to different owners. This function can be used to give multiple users read access to the same data.

Tip: No serialization is provided to prevent concurrent updates by users.

A new buffer token that represents the new instance of the buffer is returned. The buffer token is the means by which this new instance of the buffer is known to CSM.

Figure 1. Example of copy data buffer list and copy results
**Requirement:** This token must be used with all other requests to CSM for the associated buffer instance.

On the ASSIGN_BUFFER request, multiple shared instances of a single buffer can be created by passing a multiple entry buffer list with the same buffer token in each entry.

**Restriction:** A request to create a new image of a buffer that is in a guaranteed to be pageable state is not permitted. This restriction guarantees that a user of a buffer that has multiple images can successfully issue a FIX_BUFFER request if necessary. Fixing a buffer requires that the entire buffer be fixed regardless of the fact that the user might only be interested in a piece of the buffer. The application can specify the BUFTYPE parameter as described in "Fixed buffers versus pageable buffers" on page 9.

**Obtaining CSM dumping information**

To debug problems associated with the application’s use of CSM buffers, it might be necessary to include CSM storage in a dump.

In order to include CSM storage in a dump, an application can use the following information:

- Dumping area containing CSM data structures, pool structures, and buffer headers:
  - Location extended common service area (ECSA)
  - Subpool 241
  - Key 6
  These areas can be included in a user dump by specifying the subpool and key on the invocation of the SDUMPX macroinstruction.

- Dumping buffers in an ECSA buffer pool:
  - Location Extended CSA (ECSA)
  - Subpools 231
  - Key 6
  The ECSA buffer pool can be included in a user dump by specifying the subpool and key on the invocation of the SDUMPX macroinstruction.

- Dumping buffers in a data space buffer pool:
  - Location common area data space (CADS) owned by the master address space
  - Key 6
  - Data space address range 4 KB-2 Gigabyte
  - Data space STOKENs and ALETs provided by IVTCSM REQUEST=DUMP_INFO.

**Guideline:** Applications should include the areas containing CSM data structures by specifying the subpools and key to reduce the amount of data included in the dump. Selective dumping is most important when dumping data in a CSM data space rather than dumping the entire 2 Gigabyte contents.

For ease of dumping CSM buffers during testing, an application can use ECSA buffers because this area can be included in a dump using the subpool and key. After the application is debugged, data space buffers can be used for the production application.

An application can request the location of information required to obtain CSM data space information in a dump on the following macroinstructions:
Obtaining The

The application can do the following:
- Specify the address of an area on the DS_INFO parameter where CSM places the address of the area containing the CSM data space information. This information is mapped by the IVTDATSP DSECT. See “CSM data space information” on page 82.
- Request the information during initialization processing and use the information throughout normal processing.

Dumping the entire data space can require a long processing time and a large amount of external recording media. Because of this, you might want to limit the amount of area dumped based on address ranges within the data space believed to be pertinent to the user. For example, use the ALETs returned by the IVTCSM REQUEST=DUMP_INFO macroinstruction to determine whether, at the time of abend, any access registers (AR) contain an ALET associated with a CSM data space. If an AR contains an ALET of a CSM data space, and the program was executing in AR mode at the time of the failure, you can dump a limited number of bytes of the data surrounding the address represented by the general register (GR) and AR pair.

Obtaining CSM resource statistics

An application can request the address of information required to monitor usage of CSM resources such as ECSA, data space and fixed storage. The address of this information is returned on the STATAREA parameter when the following macroinstructions are issued:
- IVTCSM REQUEST=CREATE_POOL
- IVTCSM REQUEST=RESOURCE_STATS

The application can request the address of the resource statistics area during initialization processing and can reference this area to obtain resource statistics throughout normal processing.

For each resource type, the following bits are defined:

**Critical**
- Indicates that CSM storage usage is at 90% of defined limits or higher.

**Constrained**
- Indicates that CSM storage usage is higher than 80% of defined limits and is approaching the constrained level (85% of defined limits). If this bit is set, the application should determine if the critical bit is also set.

**Rule:** If neither bit is set, the resource usage is considered to be normal.

**Restriction:** GET_BUFFER requests that exceed the storage available in CSM are rejected.

CSM users should monitor CSM storage use and take action to prevent critical shortages that might jeopardize the application or system operation. Actions might include:
- Freeing buffers that are no longer needed
- Selecting a different storage source for buffer pools
- Limiting usage of fixed storage
IVTSTATA DSECT maps CSM resource statistics information. See “CSM resource status area (IVTSTATA)” on page 83.

**CSM buffer pool expansion and contraction**

The MINFREE, INITBUF, and EXPBUF specifications in the CSM parmlib member, IVTPRM00, determine CSM buffer pools expansion and contraction. If these values are not specified in the CSM parmlib member, or if CSM cannot read that parmlib member during initialization, CSM uses the values specified by the application on the [IVTCSM REQUEST=CREATE_POOL] macroinstruction. If buffer pool tuning specifications are not available from either the CSM parmlib member or application request, system defaults are used.

This section describes how CMS buffer pool expansion and contraction is performed based on application settings. For more information about the CSM parmlib member, refer to [z/OS Communications Server: New Function Summary].

**Number of buffers when buffer pool is created using application settings**

When the first CREATE_POOL request is received, CSM creates a pool of buffers. The INITBUF parameter specifies the initial number of buffers created in that pool.

**Requirement:** INITBUF is required on the CREATE_POOL request.

The range for INITBUF is 0-9999. If 0 is specified, only the base pool structure is created. In this case, the pool is expanded on the first GET_BUFFER request based on the EXPBUF parameter value. If a value is specified that is outside of the range for INITBUF, one of the following values is used (depending on the size of the buffers in the pool).

<table>
<thead>
<tr>
<th>Pool size</th>
<th>Initial number of buffers (INITBUF)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4096</td>
<td>64</td>
</tr>
<tr>
<td>16384</td>
<td>32</td>
</tr>
<tr>
<td>32768</td>
<td>16</td>
</tr>
<tr>
<td>61440</td>
<td>16</td>
</tr>
<tr>
<td>184320</td>
<td>2</td>
</tr>
</tbody>
</table>

**CSM buffer pool expansion using application settings**

CSM buffer pools are expanded as needed to maintain the specified number of free buffers in the pool. The number of free buffers maintained is determined by the highest MINFREE (minimum free buffer) specifications by all users of a pool.

CSM buffer pools are expanded by the maximum of the EXPBUF (expand buffers) specifications by all users of a pool. The storage pool is expanded if the number of free buffers falls below MINFREE.

The pool is managed in extents. Expansion consists of creating a new extent with the number of buffers as determined by the EXPBUF parameters. The expansion of the pool is scheduled as a side process in order to avoid excessive pathlength on a [IVTCSM REQUEST=GET_BUFFER] macroinstruction due to inline pool expansion. In the event that pool expansion must complete to satisfy a request for buffers, the application can optionally wait for pool expansion to complete by specifying WAIT=EXPAND or WAIT=YES on the [IVTCSM REQUEST=GET_BUFFER] macroinstruction.
MINFREE parameter:

**Requirement:** MINFREE is required on the CREATE_POOL request.

The range for MINFREE is 0-9999. If a value is specified that is outside of the range for MINFREE, one of the following values is used (depending on the buffer sizes in the pool).

<table>
<thead>
<tr>
<th>Pool size</th>
<th>Minimum buffers that are free (MINFREE)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4096</td>
<td>8</td>
</tr>
<tr>
<td>16384</td>
<td>4</td>
</tr>
<tr>
<td>32768</td>
<td>2</td>
</tr>
<tr>
<td>61440</td>
<td>2</td>
</tr>
<tr>
<td>184320</td>
<td>1</td>
</tr>
</tbody>
</table>

EXPBUF parameter:

**Requirement:** EXPBUF is required on the CREATE_POOL request.

The valid range for EXPBUF depends on the size of the buffers in the pool. If a value is specified that is outside of the range for EXPBUF, one of the following values is used.

<table>
<thead>
<tr>
<th>Pool size</th>
<th>Valid range</th>
<th>Number of buffers to expand pool (EXPBUF)</th>
</tr>
</thead>
<tbody>
<tr>
<td>4096</td>
<td>1-256</td>
<td>16</td>
</tr>
<tr>
<td>16384</td>
<td>1-256</td>
<td>8</td>
</tr>
<tr>
<td>32768</td>
<td>1-128</td>
<td>4</td>
</tr>
<tr>
<td>61440</td>
<td>1-68</td>
<td>4</td>
</tr>
<tr>
<td>184320</td>
<td>1-22</td>
<td>2</td>
</tr>
</tbody>
</table>

**CSM buffer pool contraction using application settings**

CSM buffer pools contract as necessary to prevent the pools from consuming system resources permanently as the result of usage peaks. Contraction occurs when the number of buffers that are not in use exceeds one of the following values (whichever is higher):

* INITBUF
* MINFREE + 2(EXPBUF)

The pool does not contract when the number of buffers is below the level specified on the INITBUF parameter.

**Buffer return exit routine**

An application can manage its own pool of buffers to be retained for multiple uses by coding a buffer return exit routine that assumes control of the buffers after they are freed by a user. By default, buffers are returned to CSM when the current owner issues the IVTCSM REQUEST=FREE_BUFFER macroinstruction. An application that provides the address of its buffer return exit on the FREERTN parameter of the IVTCSM REQUEST=GET_BUFFER macroinstruction receives ownership when the buffers are freed by another user.
The buffer return exit routine is scheduled to execute in the address space which owns the buffer to ensure that the owning environment still exists.

The buffer return exit routine is called by a CSM routine that receives control from the SRB scheduler. The CSM routine passes the address of the parameter list to the buffer return exit routine in register 1. To map the passed parameter list, the buffer return exit routine should include a DSECT that issues the LIST form of the IVTFREE macro. For example:

```Assembly
name DSECT
IVTFREE MF=(L, listaddr)
```

The parameter list contains the address of the buffer list and the number of buffer entries in the list. The following is a sample output of the LIST form of the IVTFREE macroinstruction with a listaddr value of FREPL:

```Assembly
FREPL DS 0D ++ IVTFREE PARM LIST
FREPL_XVERSION DS XL1 ++ INPUT XVERSION
FREPL_XRSVFREEI DS CL03 ++ RESERVED XRSVFREE1
FREPL_XBUFLIST DS A ++ XBUFLIST
FREPL_XBUFNUM DS F ++ XBUFNUM
0000C FREPL EQU +-FREPL ++ LENGTH OF PLIST
```

Each buffer list entry is mapped by the IVTBUFL DSECT. The application can examine the tokens in each entry to correlate them with the buffers referenced by the original GET_BUFFER request. When a buffer return exit is driven, the pageability of the buffer might have changed. The original buffer address, token, and length remains the same.

After regaining ownership of the buffers, the application can determine whether to release the buffers back to CSM using the FREE_BUFFER request. To prevent looping, the application must not specify FREETO=USER on the FREE_BUFFER request. This would reschedule the application's buffer return exit. To return the buffers back to CSM, the buffer return exit should specify FREETO=CSM on the FREE_BUFFER request.

**CSM recovery for normal and abnormal termination**

For normal or abnormal termination, CSM users free all owned buffers prior to completing termination processing. However, this might not always be possible for abnormal termination.

To ensure that buffers are not lost as a result of normal or abnormal termination, CSM uses the following resource termination managers to reclaim buffers that are owned by the terminating environment:

- **Job Step Task Resource Termination Manager**
  - Job Step Task cleanup is performed if task is not an MVS started task (for example, batch).

- **Memory Resource Termination Manager**
  - Memory cleanup is performed whenever address space memory termination occurs.

The resource managers do the following:

- Receive control from recovery termination management (RTM) during job step task and memory termination processing
- Determine if any of the allocated buffers are owned by the terminating address space
• As appropriate, free the buffers back to the buffer pool

Additionally, CSM allows the user to associate buffers to a task. Buffers that are task-associated are reclaimed by CSM at the end of the specified task only if the task abnormally terminates. The user of the buffer is responsible for ensuring the buffers are freed during normal termination.

If a CSM user wants to provide recovery mechanisms to free buffers at events other than those provided by CSM, the user can create ESTAE/FRR recovery routines to recover at a program level or RESMGR to create a resource manager to recover at a task termination event not provided by CSM. When performing this type of processing, users must ensure that their application processing is properly synchronized with any applications to which they are passing buffers.
Chapter 2. CSM macroinstructions

This chapter describes all varieties of the IVTCSM macroinstruction and includes the following sections:

- “How the macroinstructions are described”
- “Computing environment for the CSM API” on page 22

Separate descriptions are included for each value of the REQUEST parameter. Macroinstruction descriptions are arranged alphabetically.

How the macroinstructions are described

Each macroinstruction description includes the following:

- Purpose of the macroinstruction
- General comments about the use of the macroinstruction
- The format or syntax of the macroinstruction and all parameters
- A description of each parameter
- Return and reason codes that can be returned for the macroinstruction

Syntax descriptions

The syntax for each macroinstruction uses the following format:

```
main  diagram

```

The macroinstructions are coded in the same format as assembler instructions, using name, operation, and operand fields. Refer to the IBM High Level Assembler Language Reference for MVS and VM for complete information on coding guidelines.

Operand descriptions

The name and description of each operand follows the syntax diagram. Each operand description begins with an explanation of the operand’s function.

Parameter values that are shown in uppercase bold type must be coded as they appear in the syntax. For parameter values that are shown in lowercase italic type, specify a location that is to be the source of input data or the target of output data. The location must be defined in a manner that is consistent with the indicated data type. If you wish to pass the storage address in general purpose register (2)-(12), code a valid expression for the register within parentheses. Otherwise, code an expression that is valid as a storage operand on RS-type instructions.

Tip: If a register is specified for RETCODE or RSNCODE, the output is loaded straight into the register.

To reference the parameter list within your program, use the list form of the macro, MF=(l,...), to define the parameter list structure. The listaddr value you specify becomes the name by which you can reference the structure in your program. For example, the assembler instruction LA 1,listaddr puts the parameter list address in
register. The name of the field associated with a parmlist operand opername is
listaddr_Xopername. If macroinstruction-defined values are associated with opername,
the constant for a particular value, valuenam, is listaddr_Xopername_valuenam.

Restriction: The PLISTVER operand is an exception to the rule. To reference its
field, substitute opername with the keyword VERSION. Also, the macro does not
define constants for any of the allowable PLISTVER values.

All of the executable macroinstructions pass return codes in registers, and most
indicate status information in various control block fields when they are posted
complete. For all macroinstructions that invoke CSM, the application can examine
return codes in register 15 and reason codes in register 0. Descriptions of this
status information can be found at the end of the macroinstruction description.

Computing environment for the CSM API

This section describes the environment where the IVTCSM macro is issued.

Environment

The following are required for the caller:

| Minimum authorization: | Supervisor state. Any PSW key. |
| Dispatchable unit mode: | Task or SRB. |
| Cross memory mode: | Exception: CREATE_POOL and DELETE_POOL requests
must be issued in Task Mode. |
| AMODE: | 31-bit. |
| ASC mode: | Primary. |
| Interrupt status: | Enabled for I/O and external interrupts. |
| Locks: | No locks can be held. |
| Control parameters: | Control parameters must be in the primary address space. |

Programming requirements

The user must provide a recovery environment if one is necessary during the
invocation of the IVTCSM Service, as the service does not provide a recovery
environment during all its functions.

The service provides for buffer reclamation at the following tasks:

- End-of-memory
- End-of-Job-Step-Task
- Optionally, at abnormal end-of-task

See “CSM recovery for normal and abnormal termination” on page 19 for more
information.

Restrictions

The following are caller restrictions:

- Do not use MVS page-fix services directly for buffers provided by this service.
  Establish the BUFTYPE attribute of these buffers using CSM service requests.
• Do not issue ALESERV delete for an ALET returned from CSM.

**Input register information**

Before issuing this macro, the caller must ensure that register 13 contains the address of a 72-byte standard save area in the primary address space.

**Output register information**

When control returns to the caller, the general purpose registers contain the following registers:

<table>
<thead>
<tr>
<th>Register</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Error reason code from the requested function</td>
</tr>
<tr>
<td>1</td>
<td>Used as work register by the system</td>
</tr>
<tr>
<td>2-13</td>
<td>Unchanged</td>
</tr>
<tr>
<td>14</td>
<td>Used as work register by the system</td>
</tr>
<tr>
<td>15</td>
<td>Return code from requested function</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=ASSIGN_BUFFER**

**Purpose**
This macroinstruction allows an application to request that a buffer be logically assigned to another owner (shared) in order to make multiple owners of a buffer.

**Usage**
This macroinstruction allows a buffer to be concurrently shared between multiple users. A logical instance of the buffer is created for each user. A new physical copy of the buffer is not created. This macroinstruction can be used to allow specific areas of the buffer to be allocated to different owners and to allow multiple users to have read access to the same data. No serialization is provided to prevent concurrent updates by users.

The ownership of the new instance of the buffer is assigned to the requesting application’s ASID by default. Ownership of a new instance of the buffer can be optionally qualified by specifying a TASKID on the macroinstruction. The TASKID is a TCB address with the default being no task association.

Upon completion of this macroinstruction, a new buffer token is returned representing the new instance of the buffer. The buffer token is the means by which this new instance of the buffer is known to CSM. This token must be used with all other requests to CSM for the associated buffer instance.

Multiple shared instances of a single buffer can be created by passing a multiple entry buffer list with the same buffer token in each entry.

```

24  z/OS V1R10.0 Comm Svrv: CSM Guide
Parameters

name
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

,BUFLIST=buflist
A required input parameter of an area containing a list of buffer entries. The number of entries in the list is provided by BUFNUM. An entry in the buffer list is mapped by IVTBUFL. Some of the fields defined in IVTBUFL are required as input and some are set by CSM as output fields.

Note: The buffer token representing the new buffer image is returned in the BUFL_TOKEN field as output.

The following fields in IVTBUFL are required input for this request.
• BUFL_VERSION
• BUFL_TOKEN

The following fields in IVTBUFL are returned as output by CSM for this request.
• BUFL_TYPE
• BUFL_TOKEN

To code, specify the RS-type address, or address in register (2)-(12), of a field.

,BUFNUM=bufnum
A required input parameter, specifying the number of buffers to be logically assigned.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,BUFTYPE=
An optional parameter, specifying whether the buffer images are guaranteed to be fixed, eligible to be made pageable or have the same pageable state as the buffers represented by the input token. The default is BUFTYPE=SAME.

,BUFTYPE=SAME
Indicates that the pageable state of the buffer images is the same as the buffers represented by the input token.

,BUFTYPE=PAGEELIG
Indicates that the buffer images are eligible to be made pageable.

,BUFTYPE=FIXED
Indicates that buffer images are guaranteed to be fixed.

,ERRBFLST=errbflst
An optional output parameter, specifying the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,GAP=gap}

An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are contiguous.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,MF=}

An optional input parameter that specifies the macro form.

- \texttt{MF=S} Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

- \texttt{MF=L} Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

- \texttt{MF=E} Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

- \texttt{MF=M} Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

\texttt{,list addr}

The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

\texttt{,attr}

An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary or 0D to force the parameter list to a doubleword boundary. If you do not code \texttt{attr}, the system provides a value of 0D.

\texttt{,COMPLETE}

Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

\texttt{,NOCHECK}

Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSTM in the following order:

1. Use IVTCSTM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM \texttt{...MF=(M, list-addr, NOCHECK),} specifying the parameters that you want to change.
3. Use IVTCSM \texttt{...MF=(E, list-addr, NOCHECK),} to execute the macro.

\texttt{OWNERID=ownerid}

An optional input parameter, specifying the owner to which the buffer image is to be logically assigned. If not coded, the ASID of the issuing application is assigned as the \texttt{OWNERID}.

To code, specify the RS-type address, or address in register (2)-(12), of a halfword field.

\texttt{PLISTVER=}

An optional input parameter that specifies the version of the macro. \texttt{PLISTVER} determines which parameter list the system generates. \texttt{PLISTVER} is an optional input parameter on all forms of the macro, including the list form. When using \texttt{PLISTVER}, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

\textbf{IMPLIED\_VERSION}

The lowest version that allows all parameters specified on the request to be processed. If you omit the \texttt{PLISTVER} parameter, \texttt{IMPLIED\_VERSION} is the default.

\textbf{MAX}

Code this if you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, you should always specify \texttt{PLISTVER=MAX} on the list form of the macro. Specifying \texttt{MAX} ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form. In this way, \texttt{MAX} ensures that the parameter list does not overwrite nearby storage.

\textbf{0}

Code this if you use the currently available parameters.

To code, specify one of the following:
- \texttt{IMPLIED\_VERSION}
- \texttt{MAX}
- A decimal value of 0

\texttt{RETCODE=retcode}

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{RSNCODE=rsncode}

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{TASKID=taskid}

An optional input parameter that is to contain the address of a TCB. This further qualifies the ownership of a buffer to a specific task. If \texttt{TASKID} is not specified, the buffer is not associated with a task but is instead associated with the issuing application’s ASID.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.
,THREAD=thread
An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this value is different from the THREAD value specified by other users of the CSM. This can be achieved by specifying an ECSA control block for THREAD.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

,UTILRTN=utilrtn
An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

Return codes
The following codes can be returned to the application on this macroinstruction.

Return code  Meaning
0  Request completed successfully.
4  Request did not complete successfully. See the following reason codes to determine the type of error encountered:

Reason code  Meaning
2  Requested function not supported at the present time, service has not been initialized.
7  Buffer token specified is not valid.
8  Instance ID in the input buffer token does not match that of the buffer, possible attempt to use a buffer that has been freed.
9  Real storage unavailable to provide a fixed buffer, wait not requested.
15  Assign buffer request failed because the state of the buffer is guaranteed to be pageable.
20  BUFTYPE value specified is not valid for this request.

8  System error while processing the request. See the following reason codes to determine the type of error encountered:

Reason code  Meaning
1  Unable to obtain storage for request.
6  An abend occurred while processing this request.
**IVTCMS REQUEST=CHANGE_OWNER**

**Purpose**
This macroinstruction allows the application to change the ownership of a buffer to another user.

**Usage**
This macroinstruction can be used to assume ownership of another user’s buffers or to pass ownership to another user. The new owner must have sufficient information to address the buffers. This information can be found in the CSM buffer list. The owner of a set of buffers bears the responsibility for returning them to CSM on the [IVTCMS REQUEST=FREE_BUFFER] macroinstruction.

CSM associates a set of buffers that have been retrieved from a buffer pool with the OWNERID of an application. The OWNERID is the same as the application’s ASID. Ownership of a buffer can be optionally qualified by specifying the TASKID parameter on the macroinstruction. The TASKID is a TCB address with the default being no task association.

Ownership of a buffer that has an associated buffer return exit is not actually changed due to an IVTCMS REQUEST=CHANGE_OWNER macroinstruction; the buffer is actually borrowed. The original owner of the buffer is maintained so that ownership is restored when the buffer is freed. However, if the original owner’s address space terminates before the buffer return exit is invoked, then buffers are returned to CSM.

See “Ownership of buffers” on page 10 for more information.

```
Parameters

name
   An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

,BUFLIST=buflist
   A required input parameter of an area containing a list of buffer entries. The number of entries in the list is provided by BUFNUM. Each entry in the buffer list is mapped by IVTBUFL.

The following fields in IVTBUFL are required for this request.
   • BUFL_VERSION
   • BUFL_SOURCE

Note: This field is only required when SKIPBUF=YES is specified.
   • BUFL_TOKEN

There are no fields in IVTBUFL that are returned as output by CSM for this request.

To code, specify the RS-type address, or address in register (2)-(12), of a field.

,BUFNUM=bufnum
   A required input parameter, specifying the number of buffers to change ownership.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,ERRBFLST=errbflst
   An optional output parameter containing the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,GAP=gap
   An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are contiguous.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,MF=
   An optional input parameter that specifies the macro form.

   MF=S  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.
**MF=L** Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

**MF=E** Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

**MF=M**
Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

`,list addr`
The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

`,attr`
An optional input string 1 - 60 characters in length that forces boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary or 0D to force the parameter list to a doubleword boundary. If you do not code `attr`, the system provides a value of 0D.

`,COMPLETE`
Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

`,NOCHECK`
Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

**Guidelines:** Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE), specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

`,OWNERID=value`
An optional input parameter, specifying the owner to which the buffer is to be assigned. If not coded, the ASID of the issuing application is assigned as the OWNERID.

To code, specify the RS-type address, or address in register (2)-(12), of a halfword field.

`,PLISTVER=`
An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:
**IMPLIED_VERSION**

The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

**MAX**

Code this if you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, it is recommended that you always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0

Code this if you use the currently available parameters.

To code, specify one of the following:

- IMPLIED_VERSION
- MAX
- A decimal value of 0

,**RETCODE=retcode**

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

,**RSNCODE=rsncode**

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

,**SKIPBUF=**

An optional parameter, specifying whether all entries in the buffer list should be processed. The default is SKIPBUF=NO.

- **SKIPBUF=NO**
  
  Specifies that all the entries in the buffer list are processed. No entries are skipped. The BUFL_SOURCE value is not examined.

- **SKIPBUF=YES**
  
  Specifies that the only entries in the buffer list that have a BUFL_SOURCE value indicating the user’s non-CSM storage (BUFL_UDSPACE or BUFL_USTOR) is skipped.

,**TASKID=taskid**

An optional input parameter that is to contain the address of a TCB. This further qualifies the ownership of a buffer to a specific task. If TASKID is not specified, the buffer is not associated with a task but is instead associated with the issuing application’s ASID.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

,**THREAD=thread**

An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this
value is different from the THREAD value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for THREAD.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

\[ \text{\texttt{UTILRTN=utilrtn}} \]

An optional input parameter that is issued from a utility routine. Specify the utility routine caller's address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

**Return codes**
The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

**Reason code**

<table>
<thead>

<td>Instance ID in the input buffer token does not match that of the buffer, possible attempt to use a buffer that has been freed.</td>
</tr>
<tr>
<td>24</td>
<td>ASID specified on the OWNERID parameter is not active.</td>
</tr>
</tbody>
</table>
IVTCSM REQUEST=COPY_DATA

**Purpose**
Use this macroinstruction to copy data to or from a CSM buffer or a user data area.

**Usage**
This macroinstruction assists the application by isolating it from possible storage key differences between that of the requester and that of the CSM buffer. It also assists users of CSM data space buffers by isolating the requester from the addressing method used to access a data space.

This macroinstruction allows multiple source buffers to be copied to or from one or multiple target buffers. The source buffers are copied to the target buffers using the source and target buffer lengths to pack data or span data across the target buffers as required.

If the cumulative length of the source buffers is greater than the cumulative length of the target buffers, the source data is truncated. The application can specify a character on the PADCHAR input parameter to pad the target buffers when the cumulative length of the source buffers is less than the cumulative length of the target buffers.

CSM accepts a source buffer list and a target buffer list as input. This is the same buffer list that is mapped by the IVTBUFL DSECT that is described on page "CSM buffer list entry (IVTBUFL)" on page 81. The number of entries in each list are not required to be equal. Within each list, entries might or might not represent a CSM buffer. The BUFL_SOURCE field in the entry indicates whether the entry represents a CSM buffer. For entries representing CSM buffers, the address that is the source or target of the copy is supplied by the requester and is not required to be the actual start address of the CSM buffer. CSM validates that the specified address and length corresponds to a storage area that is within the bounds of the CSM buffer. This validation is based on the size of the buffer as determined at the time the buffer pool was created.

The application can use the COPY_DATA request to copy data to or from a non-CSM data space using the ALET provided in the buffer list entry. The ALET must be valid for the address space for which it is being used.

34 z/OS V1R10.0 Comm Svr: CSM Guide
Parameters

name
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

,MF=
An optional input parameter that specifies the macro form.

MF=S  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

MF=L  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

MF=E  Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

MF=M  Use together with the list and execute forms of the macro for service routines that need to provide different options according to
user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

`list addr`

The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

`attr`

An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code `attr`, the system provides a value of 0D.

`COMPLETE`

Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

`NOCHECK`

Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSM in the following order:

1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

`PAD=`

An optional parameter that indicates if padding is to be performed. The default is PAD=NO.

`PAD=NO`

Indicates that padding is not performed.

`PAD=YES`

Indicates that padding is to be performed using the value specified by PADCHAR.

`PADCHAR=padchar`

When PAD=YES is specified, a required input parameter, specifying the character to use as pad if the cumulative target length is greater than the cumulative source length. If PAD=YES is not specified, then no padding is performed.

To code, specify the RS-type address, or address in register (2)-(12), of a 1-character field.

`PLISTVER=`

An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms.

The values are:
IMPLIED_VERSION
The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

MAX Specify when you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs. If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0 Specify when you use the currently available parameters.

To code, specify one of the following:
• IMPLIED_VERSION
• MAX
• A decimal value of 0

,RETCODE=retcode
An optional output parameter into which the return code is to be copied from GPR 15.
To code, specify the RS-type address of a fullword field, or register (2)-(12).

,RSNCODE=rsncode
An optional output parameter into which the reason code is to be copied from GPR 0.
To code, specify the RS-type address of a fullword field, or register (2)-(12).

,SRCERRL=srcerrl
An optional output parameter, specifying the number of the last buffer entry that was successfully processed in the SRCLIST.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,SRCGAP=srcgap
An optional input parameter, specifying the number of bytes used to separate buffer entries in SRCLIST. This parameter allows the buffer entries to be in discontiguous storage. If this parameter is not specified, buffer entries are in contiguous storage.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,SRCLIST=srclist
A required input parameter of an area containing a list of information about the buffers from which the data is to be copied. Each entry in the list describes a buffer and is mapped by IVTBUFL. The number of entries is equal to the number of buffers specified by SRCNUM. The buffer entry can represent a CSM buffer or a user data area.
The following fields in IVTBUFL are required as input for this request.
• BUFL_VERSION
• BUFL_SOURCE
• BUFL_TOKEN (Required only if data is being copied from a CSM buffer.)
- BUFL_ALET (Required only if required to access the data in a user data space.)
- BUFL_ADDR
- BUFL_SIZE
To code, specify the RS-type address, or address in register (2)-(12), of a field.

\SRCNUM=srcnum
A required input parameter, specifying the number of source buffers for the copy.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\TARGERRL=targerrl
An optional output parameter, specifying the number of the last buffer entry that was successfully processed in the TARGLIST. To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\TARGGAP=targgap
An optional input parameter, specifying the number of bytes used to separate buffer entries in TARGLIST. This parameter allows the buffer entries to be in discontiguous storage. If this parameter is not specified, buffer entries are in contiguous storage.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\TARGLIST=targlist
A required input parameter of an area containing a list of information about the buffers that are the target of the copy operation. Each entry in the list is a buffer entry mapped by IVTBUFL. The buffer entry can represent a CSM buffer or a user data area.
The following fields in IVTBUFL are required as input for this request.
- BUFL_VERSION
- BUFL_SOURCE
- BUFL_TOKEN (Required only if data is being copied into a CSM buffer.)
- BUFL_ALET (Required only if required to copy data into a user data space.)
- BUFL_ADDR
- BUFL_SIZE
There are no fields in IVTBUFL returned as output, by CSM, for this request.
To code, specify the RS-type address, or address in register (2)-(12), of a field.

\TARGNUM=targnum
A required input parameter, specifying the number of target buffers for the copy.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\THREAD=thread
An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this value is different from the THREAD value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for THREAD.
To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

\texttt{UTILRTN=utilrtn} 

An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\textbf{Return codes}

The following codes can be returned to the application on this macroinstruction:

\begin{tabular}{|c|l|}
\hline
\textbf{Return code} & \textbf{Meaning} \\
\hline
0 & Request completed successfully. \\
4 & Request did not complete successfully. See the following reason codes to determine the type of error encountered. \\
\hline
\end{tabular}

\begin{tabular}{|c|l|}
\hline
\textbf{Reason code} & \textbf{Meaning} \\
\hline
2 & Requested function not supported at the present time, service has not been initialized. \\
7 & Invalid buffer token specified. \\
8 & Instance ID in the input buffer token does not match that of the buffer, possible attempt to use a buffer that has been freed. \\
12 & Address and length specified on a copy data request for a source buffer descriptor is outside the bounds of the CSM buffer represented by the specified pool token. \\
13 & Address and length specified on a copy data request for a target buffer descriptor is outside the bounds of the CSM buffer represented by the specified pool token. \\
14 & Copy operation resulted in truncation of source data due to insufficient buffer space provided by the target buffer list. \\
18 & BUFL\_SOURCE value is not valid for an entry in the Source buffer list (SRCLIST). \\
19 & BUFL\_SOURCE value is not valid for an entry in the Target buffer list (TRGLIST). \\
20 & BUFTYPE value specified is not valid for this request. \\
21 & BUFSOUIRC value specified is not valid for this request. \\
22 & Source and target buffers overlap, no data has been copied. \\
\hline
\end{tabular}
**IVTCSM REQUEST=CREATE_POOL**

**Purpose**
Use this macroinstruction to allow the user to register as a user of a storage pool of buffers residing in ECSA or in a data space.

The structures to maintain the storage pools are created in response to the first CREATE_POOL request by a user of CSM. For storage pools requesting a data space as the storage type, a data space is created on the first request for a pool of this type. Multiple storage pools can exist per data space. Data space storage pools are further qualified as 31-bit backed (when fixed, the real storage frame containing the page is below the 2-gigabyte real storage bar) or 64-bit backed (when fixed, the real storage frame containing the page can be on or above the 2-gigabyte real storage bar). If a 64-bit backed pool is requested and cannot be created because the machine is not executing in z/Architecture® mode, the request is converted to a 31-bit backed request for the corresponding pool size.

On the create request, the caller specifies the size of the buffers in the pool to be created (4096, 16384, 32768, 61440, and 184320), and for dataspace pools, whether or not the pool is 31-bit backed or 64-bit backed. Only one pool of a given size exists per storage type. Requests by other callers for a pool of the same characteristics share the existing pool. The EXPBUF, INITBUF, and MINFREE values for each pool are each set to the largest value specified by any single user sharing a pool. Therefore, these values can also be adjusted downward when a user discontinues sharing a pool (that is, the user issues a DELETE_POOL request).

**Usage**
This macroinstruction should be used by an application if it subsequently requests buffers from CSM.

**Environment**
This macroinstruction must be issued in task mode; it is not allowed in cross memory mode.

**Syntax**

z/OS V1R10.0 Comm Svcr: CSM Guide
Parameters

name
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

,BACK=location
An optional parameter that applies to BUFSIZE=DSPACE. Specifies whether or not the data space storage, when fixed, can be backed above the 2-gigabyte real storage bar. BACK=31 forces the storage to be backed below the 2-gigabyte bar and BACK=64 allows the storage to be backed on or above the 2-gigabyte bar. BACK=31 is the default. If a 64-bit backed pool is requested and cannot be created because the machine is not executing in z/Architecture mode, the request is converted to a 31-bit backed request for the corresponding pool size.

,BUFSIZE=bufsize
A required input parameter, specifying the size of the buffers in the pool to be created. Valid pool sizes are 4096, 16384, 32768, 61440, and 184320. All other values specified on this parameter are rounded up to the next valid pool size. However, if BUFSIZE is greater than 184320, the CREATE_POOL request is rejected.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,BUFSIZE=
A required parameter, specifying the source of the storage from which the buffers are to be allocated.
,BUFSOURC=DSpace
Indicates that the storage pool is to be created in data space.

,BUFSOURC=ECSA
Indicates that the storage pool is to be created in ECSA.

,DS_INFO=ds_info
An optional output parameter that contains the address of an area containing the information required to dump CSM data spaces mapped by IVTDATSP.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

,EXPBUF=expbuf
A required input parameter, specifying the number of buffers by which the pool is expanded when the number of free buffers falls below the value for MINFREE or when a GET_BUFFER request needs to be satisfied.

Valid ranges for EXPBUF are listed in Table 3. If a value outside of a range is specified, then CSM uses a default value. The default values for EXPBUF are also listed in Table 3.

<td>32768</td>
<td>1 - 128</td>
<td>4</td>
</tr>
<tr>
<td>61440</td>
<td>1 - 68</td>
<td>4</td>
</tr>
<tr>
<td>184320</td>
<td>1 - 22</td>
<td>2</td>
</tr>
</tbody>
</table>

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,INITBUF=initbuf
A required input parameter, specifying the initial number of buffers to be created in the storage pool. If 0 is specified, the base pool is only created to represent the requester as a user of the pool. In this case, the pool is expanded on the first GET_BUFFER macroinstruction based on the specification for EXPBUF.

Guideline: The pool does not contract if the number of buffers currently available is below a certain value. The value is determined as the higher of INITBUF or MINFREE+(2*EXPBUF).

Valid values for INITBUF are in the range 0-9999. If a value outside of this range is specified, then CSM uses a default value. The default values for INITBUF are listed in Table 4.

Table 4. Default values for INITBUF

<table>
<thead>
<tr>
<th>Pool size</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>4096</td>
<td>64</td>
</tr>
<tr>
<td>16384</td>
<td>32</td>
</tr>
<tr>
<td>32768</td>
<td>16</td>
</tr>
<tr>
<td>61440</td>
<td>16</td>
</tr>
<tr>
<td>184320</td>
<td>2</td>
</tr>
</tbody>
</table>
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,MF=

An optional input parameter that specifies the macro form.

MF=S  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

MF=L  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require re-entrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

MF=E  the execute form of the macro. Use the execute form together with the list form of the macro for applications that require re-entrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

MF=M  Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

,list addr

The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

[attr]

An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code attr, the system provides a value of 0D.

,COMPLETE

Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

,NOCHECK

Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCMS in the following order:

1. Use IVTCMS ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCMS ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCMS ...MF=(E,list-addr,NOCHECK), to execute the macro.
MINFREE=$minfree$

A required input parameter, specifying the minimum number of buffers to be free in the pool at any time. The storage pool is expanded if the number of free buffers falls below this limit.

Valid values for MINFREE are in the range 0-999. If a value outside of this range is specified, then CSM uses a default value. The default values for MINFREE are listed in Table 5.

Table 5. Default values for MINFREE

<table>
<thead>
<tr>
<th>Pool size</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>4096</td>
<td>8</td>
</tr>
<tr>
<td>16384</td>
<td>4</td>
</tr>
<tr>
<td>32768</td>
<td>2</td>
</tr>
<tr>
<td>61440</td>
<td>2</td>
</tr>
<tr>
<td>184320</td>
<td>1</td>
</tr>
</tbody>
</table>

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

PLISTVER=

An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

**IMPLIED_VERSION**

the lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

**MAX**

Specify when you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

| 0 | Specify when you use the currently available parameters. |

To code, specify one of the following:

- IMPLIED_VERSION
- MAX
- A decimal value of 0

RETCODE=$retcode$

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

RETPTOKN=$retptoken$

An optional output parameter of an area in which the application is to receive a token representing this user of this pool. This token must be supplied as
input on the IVTCSM REQUEST=DELETE_POOL and IVTCSM REQUEST=GET_BUFFER macroinstructions, with the POOLTOKN parameter associated with this pool.

To code, specify the RS-type address, or address in register (2)-(12), of a 10-character field.

\texttt{RSCODE=rsncode}

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{STATAREA=statarea}

An optional output parameter that contains the address an area containing the resource statistics mapped by IVTSTATA.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

Return codes
The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Specified buffer size is large than supported size.</td>
</tr>
<tr>
<td>4</td>
<td>Buffer pool cannot be expanded to satisfy request.</td>
</tr>
<tr>
<td>21</td>
<td>BUFSOURC value is not valid for this request.</td>
</tr>
<tr>
<td>23</td>
<td>Unable to create the specified pool. Creation of the pool would cause the ECSA maximum limit to be exceeded.</td>
</tr>
<tr>
<td>8</td>
<td>System error while processing the request. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

<table>

<td>Unable to create another data space. Number of data spaces exceeds the maximum.</td>
</tr>
<tr>
<td>6</td>
<td>An abend occurred while processing this request.</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=DELETE_POOL**

**Purpose**
Use this macroinstruction to allow the user to indicate that it is no longer a registered user of the storage pool.

Because each pool might have multiple users, a storage pool is not deleted until all buffers have been returned by all users and delete requests have been received for each corresponding create request.

**Usage**
This macroinstruction should be used only if an IVTCSM REQUEST=CREATE_POOL macroinstruction was previously issued by the application.

**Environment**
This macroinstruction must be issued in task mode; it is not allowed in cross memory mode.

**Syntax**

```
main diagram

IVTCSM REQUEST=DELETE_POOL,POOLTOKEN=pooltoken

,RETCODE=retcode,,RSNCODE=rsncode

,PLISTVER=IMPLIED_VERSION

,MF=S

,MF=(L-,list addr
          ,OD
          ,attr
          ,COMPLETE
    )

,MF=(E-,list addr
          ,COMPLETE
    )

,MF=(M-,list addr
          ,NOCHECK
          ,COMPLETE
    )
```

**Parameters**

- **name**
  An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

- **,MF=**
  An optional input parameter that specifies the macro form.

  **MF=S** Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

  **MF=L** Specifies the list form of the macro. Use the list form together with the
execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

**MF=E** Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

**MF=M**
Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

`list addr`
The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

`attr`
An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code attr, the system provides a value of 0D.

`COMPLETE`
Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

`NOCHECK`
Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

**Guidelines:** Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

**PLISTVER**
An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

**IMPLIED_VERSION**
The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

**MAX** Specify when you want the parameter list to be the largest size
currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0 Specify when you use the currently available parameters.

To code, specify one of the following:
• IMPLIED_VERSION
• MAX
• A decimal value of 0

,POOLTOKEN=pooltoken
A required input parameter of a token representing this user of this pool. This must be the token provided to the application on the associated IVTCSM REQUEST=CREATE_POOL macroinstruction.

To code, specify the RS-type address, or address in register (2)-(12), of a 10-character field.

,RETCODE=retcode
An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

,RSNCODE=rsncode
An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

Return codes
The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<td>System error while processing the request.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>An abend occurred while processing this request.</td>
</tr>
</tbody>
</table>
IVTCSM REQUEST=DUMP_INFO

**Purpose**
Use this macroinstruction to request the address of the information required to include CSM data space information in a dump.

**Usage**
CSM returns the address of the requested information in the address provided on the DS_INFO parameter. This information is mapped by the IVTDATSP DSECT as described on page "CSM data space information (IVTDATSP)" on page 82.

**Syntax**

```
main diagram
```

```
IVTCSM REQUEST=DUMP_INFO
  ,DS_INFO=ds_info

  ,RETCODE=retcode
  ,RSNCODE=rsncode
  ,PLISTVER=IMPLIED_VERSION

  ,MF=S

  ,MF=(L-,list addr
    ,attr
  )

  ,MF=(E-,list addr
    ,COMPLETE
    ,NOCHECK
  )

  ,MF=(M-,list addr
    ,COMPLETE
    ,NOCHECK
  )
```

**Parameters**

**name**
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

**,DS_INFO=ds_info**
An optional output parameter that contains the address of an area containing the information required to dump CSM data spaces mapped by IVTDATSP.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

**,MF=**
An optional input parameter that specifies the macro form.

**MF=S**  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

**MF=L**  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code.
The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

Use MF=E to specify the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

Use MF=M together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

`list addr`

The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

`attr`

An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code `attr`, the system provides a value of 0D.

`COMPLETE`

Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

`NOCHECK`

Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

`PLISTVER=`

An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

IMPLIES_VERSION

The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIES_VERSION is the default.

MAX

Code this value if you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.
If you can tolerate the size change, always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0  Code this value if you use the currently available parameters.

To code, specify one of the following:
•  IMPLoded_VERSION
•  MAX
•  A decimal value of 0

\( \text{RETCode}=\text{retcode} \)

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\( \text{RSNCode}=\text{rsncode} \)

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

**Return codes**
The following codes can be returned to the application on this macroinstruction.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
<td>2</td>
<td>Requested function not supported at the present time, service has not been initialized.</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=FIX_BUFFER**

**Purpose**
Use this macroinstruction to allow an application to change the pageable state of a buffer to be guaranteed to be fixed.

**Usage**
If a buffer is guaranteed to be pageable or eligible to be page freed, an application can use this macroinstruction to make the buffer guaranteed to be fixed.

See “Fixed buffers versus pageable buffers” on page 9 for more information.

**Syntax**

```
main diagram

IVTCSM REQUEST=FIX_BUFFER

parameters-1

parameters-1

parameters-1

BUFLIST=buflist, BUFNUM=bufnum

,RETCODE=retcode, RSNCODE=rsncode

PLISTVER=MAX

PLISTVER=0

MF=S

OD

attr

COMPLETE

NOCHECK

MF=(L-, list addr)

MF=(E-, list addr)

MF=(M-, list addr)

,GAP=gap

,THREAD=thread

,UTILRTN=utilrtn

,WAIT=NO

,WAIT=YES
```

**Parameters**

- **name**
  An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

- **BUFLIST=buflist**
  A required input parameter of an area in which the application program is to provide a list of buffer entries. The number of entries in the list is equal to the value specified by the BUFNUM parameter. A entry in the list is mapped by IVTBUFL.
The following fields in IVTBUFL are required as input for this request.
- BUFL_VERSION
- BUFL_TOKEN

The following field in IVTBUFL is returned as output by CSM for this request.
- BUFL_TYPE

To code, specify the RS-type address, or address in register (2)-(12), of a field.

\texttt{,\texttt{BUFNUM}=bufnum}

A required input parameter, specifying the number of buffers to be made guaranteed to be fixed.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,\texttt{ERRBFLST}=errbflst}

An optional output parameter containing the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,\texttt{GAP}=gap}

An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are in contiguous storage.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,\texttt{MF}=}

An optional input parameter that specifies the macro form.

- MF=S Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.
- MF=L Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.
- MF=E Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.
- MF=M Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

\texttt{list addr}

The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).
An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code attr, the system provides a value of 0D.

\COMPLETEn
Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

\NOCHECKn
Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

\PLISTVER
An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

IMPLIED\_VERSION
The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED\_VERSION is the default.

MAX
Specify when you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0
Specify when you use the currently available parameters.

To code, specify one of the following:
- IMPLIED\_VERSION
- MAX
- A decimal value of 0

\RETCODE=\textit{retcode}
An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).
\texttt{,RSNCODE=rsncode}  
An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{,THREAD=thread}  
An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this value is different from the THREAD value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for THREAD.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

\texttt{,UTILRTN=utilrtn}  
An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\texttt{,WAIT=}  
An optional parameter, specifying whether or not the request should wait for fixed storage to become available. The default is WAIT=NO.

\texttt{,WAIT=NO}  
Specifies that this macroinstruction completes without waiting for fixed storage to become available.

\texttt{,WAIT=YES}  
Specifies that this macroinstruction is not complete until fixed storage becomes available. If fixed storage is not available, users are suspended until enough fixed storage is available to satisfy the request.

**Return codes**

The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<td>----------------------------------------------</td>
</tr>
<tr>
<td>6</td>
<td>An abend occurred while processing this request.</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=FREE_BUFFER**

**Purpose**
Use this macroinstruction to allow an application to return one or more buffers to a storage pool. It is also used to logically return a buffer that has been assigned to multiple owners. The buffer is returned to CSM when the owner of the last buffer image returns it to CSM and a buffer return exit routine was not specified during the initial allocation of the buffer.

**Usage**
An application can specify the address of a buffer return exit routine that is to receive control when the IVTCSM REQUEST=FREE_BUFFER macroinstruction is issued. See “Buffer return exit routine” on page 18 for more information. An application might optionally specify that the buffer return exit address specified when the buffer was obtained is to be overridden, allowing a buffer to be freed back to CSM that was obtained specifying a free routine address. This option is requested by specifying FREETO=CSM; it must be invoked in this manner only by the requester of the buffer that specified a free routine on the GET_BUFFER request. If others use this option, the buffer is not returned to the original owner of the buffer.

The application can optionally specify that the buffer obtained is to be cleared when it is returned to the pool on a FREE_BUFFER request. This allows secure data to be cleared after use.

All IVTCSM REQUEST=GET_BUFFER | ASSIGN_BUFFER macroinstructions must have a corresponding FREE_BUFFER request before the buffer is considered available for reallocation by CSM, or before a buffer return exit routine is invoked for a buffer obtained specifying a buffer return exit routine. This is necessary to ensure that all users have finished using the buffer.

Parameters

name

- An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

,BUFLIST=buflist
- A required input parameter of an area containing a list of buffer entries. The number of entries in the list is specified by BUFNUM. An entry in the list is mapped by IVTBUFL.

The following fields in IVTBUFL are required as input for this request:
- BUFL_VERSION
- BUFL_SOURCE (Required only when SKIPBUF=YES is specified.)
- BUFL_TOKEN

No fields in IVTBUFL are returned as output by CSM for this request.

To code, specify the RS-type address, or address in register (2)-(12), of a field.

,BUFSIZE=bufnum
- A required input parameter, specifying the number of buffer entries in the list.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,CLEAR=
- An optional parameter, specifying whether the buffer is to be cleared when returned to storage pool. The default is CLEAR=NO.

,CLEAR=NO
- Specifies that the buffer is not cleared when returned to the storage pool. If the buffer was originally allocated with a CLEAR value of YES, then CLEAR=NO is ignored by CSM, and the buffer is cleared when returned to the storage pool.

,CLEAR=YES
- Specifies that the buffer is to be cleared. Specifying CLEAR=YES does not cause a buffer to be cleared that is returned by a user-specified free routine. However, if CLEAR=YES is specified, the buffer is cleared in the event that it is returned to the storage pool.

,ERRBFLST=errbflst
- An optional output parameter, specifying the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.
An optional parameter, allowing the FREERTN parameter on the IVTCSM REQUEST=GET_BUFFER macroinstruction to be overridden. The default is FREETO=USER.

FREETO=USER
Specifies that the buffer is to be returned to the free routine specified on the GET_BUFFER request.

FREETO=CSM
Specifies that the free routine address provided when the buffer was obtained is to be overridden and the buffer is to be returned to the storage pool. This option should only be used by the original owner of the buffer.

,GAP=gap
An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are not contiguous.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

,FM=
An optional input parameter that specifies the macro form.

MF=S  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

MF=L  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter can be coded with the list form of the macro.

Use MF=E to specify the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

Use MF=M together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

,list addr
The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

,attr
An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code attr, the system provides a value of 0D.
\texttt{,COMPLETE}

Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

\texttt{,NOCHECK}

Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

**Guidelines:** Use the modify and execute forms of IVTCSM in the following order:

1. Use IVTCSM \texttt{...MF=(M,list-addr,COMPLETE)} specifying appropriate parameters, including all required ones.
2. Use IVTCSM \texttt{...MF=(M,list-addr,NOCHECK)}, specifying the parameters that you want to change.
3. Use IVTCSM \texttt{...MF=(E,list-addr,NOCHECK)}, to execute the macro.

\texttt{,PLISTVER=}

An optional input parameter that specifies the version of the macro. \texttt{PLISTVER} determines which parameter list the system generates. \texttt{PLISTVER} is an optional input parameter on all forms of the macro, including the list form. When using \texttt{PLISTVER}, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

\textbf{IMPLIED\_VERSION}

The lowest version that allows all parameters specified on the request to be processed. If you omit the \texttt{PLISTVER} parameter, \texttt{IMPLIED\_VERSION} is the default.

\textbf{MAX}

Code this value if you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, IBM recommends that you always specify \texttt{PLISTVER=MAX} on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0

Code this value if you use the currently available parameters

To code, specify one of the following:

- \texttt{IMPLIED\_VERSION}
- \texttt{MAX}
- A decimal value of 0

\texttt{,RETCODE=retcode}

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{,RSNCODE=rsncode}

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{,SKIPBUF=}

An optional parameter, specifying whether all entries in the buffer list should be processed. The default is \texttt{SKIPBUF=NO}. 

60 \textit{z/OS V1R10.0 Comm Svcr: CSM Guide}
\texttt{,SKIPBUF=NO}

Specifies that all the entries in the buffer list are processed. No entries are skipped. The \texttt{BUFL\_SOURCE} value is not examined.

\texttt{,SKIPBUF=YES}

Specifies that the only entries in the buffer list that have a \texttt{BUFL\_SOURCE} value indicating the user’s non-CSM storage (\texttt{BUFL\_UDSPACE} or \texttt{BUFL\_USTOR}) are skipped.

\texttt{,THREAD=thread}

An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this value is different from the \texttt{THREAD} value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for \texttt{THREAD}.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

\texttt{,UTILRTN=utilrtn}

An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\textbf{Return codes}

The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

\textbf{Reason code}  
<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Requested function not supported at the present time, service has not been initialized.</td>
</tr>
<tr>
<td>7</td>
<td>Pool token specified is not valid.</td>
</tr>
<tr>
<td>8</td>
<td>Instance ID in the input buffer token does not match that of the buffer, possible attempt to use a buffer that has been freed.</td>
</tr>
<tr>
<td>8</td>
<td>System error while processing the request.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>An abend occurred while processing this request.</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=GET_BUFFER**

**Purpose**

Use this macroinstruction allows an application to request one or more buffers of a given size from the CSM storage pool.

**Usage**

For the IVTCSM REQUEST=GET_BUFFER macroinstruction, CSM allocates buffers from a pre-existing pool and returns information to the requester needed to address the buffer. This includes the ALET of a buffer that resides in a data space. The value specified on the POOLTOKN parameter must be the same value returned on the RETPTOKN parameter of the IVTCSM REQUEST=CREATE_POOL macroinstruction.

The application has the option of requesting buffers that are guaranteed to be fixed, guaranteed to be pageable, or eligible to be made pageable. A pageable buffer can be obtained and used when fixed buffers are unavailable, and fixed at a later time using the IVTCSM REQUEST=FIX_BUFFER macroinstruction. For data space buffers, the pool token provided on the GET_BUFFER invocation is used to determine whether the returned buffer is backed by 31-bit or 64-bit real storage. If BACK=64 was specified on the CREATE_POOL invocation and the machine supports 64-bit backed storage, then a 64-bit backed buffer is returned. If BACK=31 was specified or taken as the default, or BACK=64 was specified but the machine is not executing in z/Architecture mode, then a 31-bit backed buffer is returned.

Ownership of the buffers is assigned to the requesting address space by default. This can be overridden by specifying OWNERID. The OWNERID is the ASID of the address space. Ownership of a buffer can be optionally qualified for a given task by specifying TASKID. The TASKID is a TCB address.

A buffer token is returned with each buffer. The buffer token is the means by which this buffer is known to CSM. This token must be used with all other requests to CSM for the associated buffer.

The application can also specify a free routine address that is to receive control when the IVTCSM REQUEST=FREE_BUFFER macroinstruction is issued for the buffer. The default is that the buffers are to be returned to CSM.

The application can also specify that the buffer obtained is to be cleared when it is returned to the pool. This provides for secure data to be cleared after processing is complete.

parameters-1

\textbf{Parameters}

\textit{name}

An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

\textit{,BUFLIST=buflist}

A required input parameter of an area containing a list of buffer entries. The number of entries in the list is equal to the value specified by the BUFSIZE parameter. An entry in the list is mapped by IVTBUFL.

The following field in IVTBUFL is required as input for this request.

- \textit{BUFL_VERSION}

The following fields in IVTBUFL are returned as output by CSM for this request.

- \textit{BUFL_SOURCE}
- \textit{BUFL_TYPE}
- \textit{BUFL_TOKEN}
- \textit{BUFL_ALET} (Returned only if the buffer was allocated from a data space.)
- \textit{BUFL_ADDR}
- \textit{BUFL_SIZE}

To code, specify the RS-type address, or address in register (2)-(12), of a field.
A required input parameter, specifying the number of buffers to be obtained.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

BUFTYPE=  
A required parameter, specifying whether the buffers are to be guaranteed to be fixed, guaranteed to be pageable or eligible to be made pageable.

BUFTYPE=PAGEELIG  
Indicates that the buffers are eligible to be made pageable.

BUFTYPE=PAGEABLE  
Indicates that the buffers are to be guaranteed to be pageable.

BUFTYPE=FIXED  
Indicates that buffers are to be guaranteed to be fixed.

CLEAR=  
An optional parameter, specifying whether the buffer is to be cleared when returned to the storage pool. The default is CLEAR=NO.

CLEAR=NO  
Specifies that the buffer is not cleared when returned to the buffer pool

CLEAR=YES  
Specifies that the buffer is cleared. Specifying CLEAR=YES does not cause a buffer to be cleared that is returned via a user-specified free routine. However, if CLEAR=YES is specified, the buffer is cleared in the event that it is returned to the storage pool.

ERRBFLST=errbflst  
An optional output parameter containing the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

FREERTN=freertn  
An optional input parameter that is to contain the address of an application routine that is to receive control when the buffer is freed. This allows the buffer to be passed to another application or product such as VTAM and to receive the buffer back when the receiver is finished. The free routine is scheduled for execution in the address space of the original owner of the buffer. See "Buffer return exit routine" on page 18 for more information.
To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

GAP=gap  
An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are contiguous.
To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

MF=  
An optional input parameter that specifies the macro form.
MF=S  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

MF=L  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter be coded with the list form of the macro.

MF=E  Specifies to specify the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

MF=M  Use together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

\list addr
   The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

\attr
   An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code \attr, the system provides a value of 0D.

\COMPLETE
   Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

\NOCHECK
   Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

\OWNERID=ownerid
   An optional input parameter, specifying the owner of the buffer being obtained.

To code, specify the RS-type address, or address in register (2)-(12), of a halfword field.

\PLISTVER=
   An optional input parameter that specifies the version of the macro. PLISTVER
determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

**IMPLIED_VERSION**

The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

**MAX**

Specify when you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0

Specify when you use the currently available parameters.

To code, specify one of the following:
- **IMPLIED_VERSION**
- **MAX**
- A decimal value of 0

',POOLTOKEN=pooltoken

A required input parameter of the token representing this user of this pool. This must be the token provided to the application on the associated IVTCSM REQUEST=CREATE_POOL macroinstruction.

To code, specify the RS-type address, or address in register (2)-(12), of a 10-character field.

',RETCODE=retcode

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

',RSNCODE=rsncode

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

',TASKID=taskid

An optional input parameter that is to contain the address of a TCB. This further qualifies the ownership of a buffer to a specific task. If TASKID is not specified, the buffer is not associated with a task but is instead associated with the issuing application’s ASID.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

',THREAD=thread

An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this
value is different from the THREAD value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for THREAD.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

\textbf{\texttt{,UTILRTN=utilrtn}}

An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is only relevant to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

\textbf{\texttt{,WAIT=}}

An optional parameter, specifying whether or not the request should wait for buffers to become available. The default is \texttt{WAIT=NO}.

\textbf{\texttt{,WAIT=NO}}

Specifies that this macroinstruction completes without waiting for an available buffer.

\textbf{\texttt{,WAIT=YES}}

Specifies that this macroinstruction does not complete until all buffers become available. If buffers are not available, users are suspended until enough buffers become available to satisfy the request.

\textbf{\texttt{,WAIT=EXPAND}}

Specifies that this macroinstruction waits for pool expansion to complete. If enough buffers are not available to satisfy the request, users are suspended until expansion completes.

\textbf{Return codes}

The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
**IVTCSM REQUEST=PAGE_BUFFER**

**Purpose**
Use this macroinstruction to allow an application to change the pageable state of a buffer.

**Usage**
An application can use this macroinstruction to make the buffer guaranteed to be pageable or eligible to be paged.

When BUFTYPE=PAGEELIG is specified on this macroinstruction, the buffer is marked as eligible to be paged. The buffer is not physically unfixed unless CSM requires real storage to satisfy another CSM request. This avoids the potential overhead of unnecessary fixing and freeing of storage.

This macroinstruction can be used to avoid consuming real storage for data that is being held in a buffer for possible use at a later time.

When BUFTYPE=PAGEABLE is specified on this macroinstruction, the buffer is marked as guaranteed to be pageable. This macroinstruction be used when a system service requires pageable storage on input. This macroinstruction can be issued only for a buffer consisting of one image. This restriction guarantees that a user of a buffer that has multiple images can successfully issue a FIX_BUFFER request if necessary. Fixing a buffer requires that the entire buffer be fixed, even if the user is interested in only a piece of the buffer.

parameters-1

![Parameters Diagram](image-url)
### Parameters

**name**
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

**BUFLIST=buflist**
A required input parameter of an area containing a list of buffer entries. The number of entries in the list is specified by BUFNUM. An entry in the buffer list is mapped by IVTBUFL.

The following fields in IVTBUFL are required as input for this request:
- BUFL_VERSION
- BUFL_TOKEN

The following field in IVTBUFL is returned as output by CSM for this request:
- BUFL_TYPE

To code, specify the RS-type address, or address in register (2)-(12), of a field.

**BUFNUM=bufnum**
A required input parameter, specifying the number of buffers to be made pageable or eligible to be paged.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

**BUFTYPE=**
A required parameter, specifying whether the buffers are to be guaranteed to be pageable or eligible to be made pageable.

- **BUFTYPE=PAGEELIG**
  Indicates that the buffers are eligible to be made pageable.

- **BUFTYPE=PAGEABLE**
  Indicates that the buffers are to be guaranteed to be pageable.

**ERRBFLST=errbflst**
An optional output parameter containing the number of the last buffer entry that was successfully processed when an error is detected during processing of the macroinstruction.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

**GAP=gap**
An optional input parameter, specifying the number of bytes used to separate buffer entries. This parameter allows the buffer entries to be in discontiguous storage. If GAP is not specified, buffer entries are contiguous.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

**MF=**
An optional input parameter that specifies the macro form.

- **MF=S**  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.
MF=L  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code. The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter be coded with the list form of the macro.

MF=E  Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

MF=M  Use this value together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

/list addr  
The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

/attr  
An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code attr, the system provides a value of 0D.

/COMPLETE  
Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

/NOCHECK  
Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

Guidelines: Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

/PLISTVER=  
An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

IMPLIED_VERSION  
The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

MAX  Code this value if you want the parameter list to be the largest size
currently possible. This size might increase from release to release and affect the amount of storage that your program needs.

If you can tolerate the size change, always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0 Code this value if you use the currently available parameters.

To code, specify one of the following:
• IMPLIED_VERSION
• MAX
• A decimal value of 0

,RETCODE=retcode
An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

,RSNCODE=rsncode
An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

,THREAD=thread
An optional input parameter, specifying a unique identifier that is placed in the CSM trace entry to correlate trace records with the application that is requesting the buffers. It is the CSM user’s responsibility to ensure that this value is different from the THREAD value specified by other users of the CSM. One way this can be achieved is by specifying an ECSA control block for THREAD.

To code, specify the RS-type address, or address in register (2)-(12), of a 4-character field.

,UTILRTN=utilrtn
An optional input parameter that is issued from a utility routine. Specify the utility routine caller’s address to be placed in the CSM trace entry. If this parameter is omitted, only the address of the CSM request issuer is placed in the CSM trace entry. This parameter is relevant only to the tracing process. It should be specified only if the CSM user requires identification of the caller of a utility routine in the CSM trace entry.

To code, specify the RS-type address, or address in register (2)-(12), of a fullword field.

Return codes
The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Requested function not supported at the present time, service has not been initialized.</td>
</tr>
</tbody>
</table>
Pool token specified is not valid.

Instance ID in the input pool token does not match that of the buffer, possible attempt to use a buffer that has been freed.

Request to make a buffer pageable denied, more than one image of the buffer exists.

BUFTYPE value specified is not valid for this request.

System error while processing the request

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unable to obtain storage for request.</td>
</tr>
<tr>
<td>6</td>
<td>An abend occurred while processing this request.</td>
</tr>
</tbody>
</table>
**IVTCSM REQUEST=RESOURCE_STATS**

**Purpose**
Use this macroinstruction to request that the address of the information required to monitor the usage of ECSA, data space, and fixed storage be returned.

**Usage**
When this macroinstruction is issued, CSM returns the address of a 4-byte area containing the status of ECSA, data space, and fixed storage resources. Applications can issue this macroinstruction during initialization processing and use the address throughout normal processing. The status information contained in this area indicates whether the use of a resource is normal, constrained, or critical. If a resource usage is determined to be constrained or critical, users of CSM can take action to prevent critical shortages that might jeopardize the application's or system's operation, including:

- Selecting a different storage source for buffer pools
- Limiting usage of fixed storage

**Syntax**
**main diagram**

![Main Diagram](image)

**Parameters**

*name*
An optional symbol, starting in column 1, that is the name on the IVTCSM macro invocation. The name must conform to the rules for an ordinary assembler language symbol.

*MF=
An optional input parameter that specifies the macro form.

**MF=S**  Specifies the standard form of the macro, which builds an inline parameter list and generates the macro invocation to transfer control to the service. MF=S is the default.

**MF=L**  Specifies the list form of the macro. Use the list form together with the execute form of the macro for applications that require reentrant code.
The list form defines an area of storage that the execute form uses to store the parameters. Only the PLISTVER parameter be coded with the list form of the macro.

**MF=E** Specifies the execute form of the macro. Use the execute form together with the list form of the macro for applications that require reentrant code. The execute form of the macro stores the parameters into the storage area defined by the list form, and generates the macro invocation to transfer control to the service.

**MF=M**
Code this value together with the list and execute forms of the macro for service routines that need to provide different options according to user-provided input. Use the list form to define a storage area; use the modify form to set the appropriate options; then use the execute form to call the service.

`list addr`
The name of a storage area to contain the parameters. For MF=S, MF=E, and MF=M, this can be an RS-type address or an address in register (1)-(12).

`attr`
An optional input string 1 - 60 characters in length that you use to force boundary alignment of the parameter list. Use a value of 0F to force the parameter list to a word boundary, or 0D to force the parameter list to a doubleword boundary. If you do not code `attr`, the system provides a value of 0D.

`,COMPLETE`
Specifies that the system is to check for required parameters and supply defaults for omitted optional parameters.

`,NOCHECK`
Specifies that the system is not to check for required parameters and is not to supply defaults for omitted optional parameters.

**Guidelines:** Use the modify and execute forms of IVTCSM in the following order:
1. Use IVTCSM ...MF=(M,list-addr,COMPLETE) specifying appropriate parameters, including all required ones.
2. Use IVTCSM ...MF=(M,list-addr,NOCHECK), specifying the parameters that you want to change.
3. Use IVTCSM ...MF=(E,list-addr,NOCHECK), to execute the macro.

`,PLISTVER=`
An optional input parameter that specifies the version of the macro. PLISTVER determines which parameter list the system generates. PLISTVER is an optional input parameter on all forms of the macro, including the list form. When using PLISTVER, specify it on all macro forms used for a request and with the same value on all of the macro forms. The values are:

**IMPLIED_VERSION**
The lowest version that allows all parameters specified on the request to be processed. If you omit the PLISTVER parameter, IMPLIED_VERSION is the default.

**MAX**
Code this value if you want the parameter list to be the largest size currently possible. This size might increase from release to release and affect the amount of storage that your program needs.
If you can tolerate the size change, you should always specify PLISTVER=MAX on the list form of the macro. Specifying MAX ensures that the list-form parameter list is always long enough to hold all the parameters you might specify on the execute form; in this way, MAX ensures that the parameter list does not overwrite nearby storage.

0  Code this value if you use the currently available parameters.

To code, specify one of the following:

- IMPLIED_VERSION
- MAX
- A decimal value of 0

\texttt{RETCODE=retcode}

An optional output parameter into which the return code is to be copied from GPR 15.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{RSCODE=rscode}

An optional output parameter into which the reason code is to be copied from GPR 0.

To code, specify the RS-type address of a fullword field, or register (2)-(12).

\texttt{STATAREA=starea}

An optional output parameter that contains the address of an area containing the resource statistics mapped by IVTSTATA.

The information returned is in a non-fetch protected area and can be accessed while executing in any storage key.

To code, specify the RS-type address, or address in register (2)-(12), of a pointer field.

**Return codes**

The following codes can be returned to the application on this macroinstruction:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Request completed successfully.</td>
</tr>
<tr>
<td>4</td>
<td>Request did not complete successfully. See the following reason codes to determine the type of error encountered.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Requested function not supported at the present time, service has not been initialized.</td>
</tr>
</tbody>
</table>
Appendix A. IVTCSM macroinstruction return and reason codes

This appendix describes return and reason codes that can be returned to an application issuing the IVTCSM macroinstruction. These codes are listed in Table 6.

Guideline: For all macroinstructions that invoke CSM, the application can examine return codes in register 15 and reason codes in register 0.

Table 6. IVTCSM macroinstruction return and reason codes

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>

Appendix B. CSM DSECTs

This appendix contains the CSM DSECTs and contains the following sections:

- “CSM buffer list entry (IVTBUFL)”
- "CSM data space information (IVTDATSP)" on page 82
- "CSM resource status area (IVTSTATA)" on page 83

For general information on the use and purpose of DSECTs, refer to z/OS Communications Server: SNA Programming.

Use the following to interpret the information in this appendix:
- DSECTs are shown as an abbreviated form of an assembler listing.
- The first column indicates the offsets within the DSECT and is the LOC column of an assembler listing. However, the object code, address columns, and statement number columns of the listing are not included.
- The source statements and comments are next to the offset column.
- All numbers in the offset column are in hexadecimal.

CSM buffer list entry (IVTBUFL)

The DSECT IVTBUFL maps an entry in the CSM buffer list that can be indicated by the BUFLIST, SRCLIST or TARGLIST parameters on the IVTCSM macroinstruction.

Requirements: The buffer list pointed to by the BUFLIST parameter is required on the following IVTCSM requests:

- IVTCSM REQUEST=ASSIGN_BUFFER
- IVTCSM REQUEST=CHANGE_OWNER
- IVTCSM REQUEST=FIX_BUFFER
- IVTCSM REQUEST=FREE_BUFFER
- IVTCSM REQUEST=GET_BUFFER
- IVTCSM REQUEST=PAGE_BUFFER

The buffer list pointed to by SRCLIST and TARGLIST is required on the IVTCSM REQUEST=COPY_DATA macroinstruction.

**CSM data space information (IVTDATSP)**

IVTDATSP maps the information required to include CSM data space buffers in a user dump. The address of this information can be optionally returned to the user on the `IVTCSC_REQUEST=CREATE_POOL` and `IVTCSC_REQUEST=DUMP_INFO` macroinstructions.

### CSM resource status area (IVTSTATA)

IVTSTATA maps the information required to monitor the usage of CSM resources such as ECSA, data space and fixed storage. The address of the information can be optionally returned to the user on the `@IVTCSM REQUEST=CREATE_POOL` and `@IVTCSM REQUEST=RESOURCE_STATS` macroinstructions.

For each resource type, the following bits are defined:
- One to indicate the usage of the resource is constrained
- One to indicate the usage is critical

If neither bit is set, the usage of the resource is considered normal. This allows CSM users to take action based on resource usage to prevent critical shortages that might jeopardize the application’s or system’s operation. Possible user actions might include selecting a different storage source for buffer pools or limiting usage of fixed storage. For information about other actions that an installation can consider to resolve resource shortages, see "Monitoring CSM storage" on page 2.

## Appendix C. Related protocol specifications

This appendix lists the related protocol specifications (RFCs) for TCP/IP. The Internet Protocol suite is still evolving through requests for comments (RFC). New protocols are being designed and implemented by researchers and are brought to the attention of the Internet community in the form of RFCs. Some of these protocols are so useful that they become recommended protocols. That is, all future implementations for TCP/IP are recommended to implement these particular functions or protocols. These become the *de facto* standards, on which the TCP/IP protocol suite is built.

You can request RFCs through electronic mail, from the automated Network Information Center (NIC) mail server, by sending a message to service@nic.ddn.mil with a subject line of RFC nnnn for text versions or a subject line of RFC nnnn.PS for PostScript versions. To request a copy of the RFC index, send a message with a subject line of RFC INDEX.

For more information, contact nic@nic.ddn.mil or at:

Government Systems, Inc.
Attn: Network Information Center
14200 Park Meadow Drive
Suite 200
Chantilly, VA  22021

Hard copies of all RFCs are available from the NIC, either individually or by subscription. Online copies are available at the following Web address:

See "Internet drafts" on page 104 for draft RFCs implemented in this and previous Communications Server releases.

Many features of TCP/IP Services are based on the following RFCs:

RFC 3948  UDP Encapsulation of IPsec ESP Packets A. Huttunen, B. Swander, V. Volpe, L. DiBurro, M. Stenberg
RFC 4001  Textual Conventions for Internet Network Addresses M. Daniele, B. Haberman, S. Routhier, J. Schoenwaelder
RFC 4007  IPv6 Scoped Address Architecture S. Deering, B. Haberman, T. Jinmei, E. Nordmark, B. Zill
RFC 4022  Management Information Base for the Transmission Control Protocol (TCP) R. Raghunarayan
RFC 4113  Management Information Base for the User Datagram Protocol (UDP) B. Fenner, J. Flick
RFC 4217  Securing FTP with TLS P. Ford-Hutchinson
RFC 4292  IP Forwarding Table MIB B. Haberman
RFC 4293  Management Information Base for the Internet Protocol (IP) S. Routhier
RFC 4301  Security Architecture for the Internet Protocol S. Kent, K. Seo
RFC 4302  IP Authentication Header S. Kent
RFC 4303  IP Encapsulating Security Payload (ESP) S. Kent
RFC 4304  Extended Sequence Number (ESN) Addendum to IPsec Domain of Interpretation (DOI) for Internet Security Association and Key Management Protocol (ISAKMP) S. Kent
RFC 4308  Cryptographic Suites for IPsec P. Hoffman
RFC 4552  Authentication/Confidentiality for OSPFv3 M. Gupta, N. Melam
RFC 4835  Cryptographic Algorithm Implementation Requirements for Encapsulating Security Payload (ESP) and Authentication Header (AH) V. Manral

Internet drafts

Internet drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Other groups may also distribute working documents as Internet drafts. You can see Internet drafts at http://www.ietf.org/ID.html

Several areas of IPv6 implementation include elements of the following Internet drafts and are subject to change during the RFC review process.

Draft  Title and Author

draft-bivens-sasp-02  Server/Application State Protocol v1 A. Bivens
draft-ietf-ipngwg-icmp-v3-07  Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification A. Conta, S. Deering
Appendix D. Architectural specifications

This appendix lists documents that provide architectural specifications for the SNA Protocol.

The APPN Implementers’ Workshop (AIW) architecture documentation includes the following architectural specifications for SNA APPN and HPR:

- APPN Architecture Reference (SG30-3422-04)
- APPN Branch Extender Architecture Reference Version 1.1
- APPN Dependent LU Requester Architecture Reference Version 1.5
- APPN Extended Border Node Architecture Reference Version 1.0
- APPN High Performance Routing Architecture Reference Version 4.0
- SNA Formats (GA27-3136-20)
- SNA Technical Overview (GC30-3073-04)

For more information, refer to the AIW documentation page at http://www.networking.ibm.com/app/aiwdoc.htm.

The following RFC also contains SNA architectural specifications:

- RFC 2353 *APPN/HPR in IP Networks APPN Implementers’ Workshop Closed Pages Document*

RFCs can be obtained from:

Government Systems, Inc.
Attn: Network Information Center
14200 Park Meadow Drive
Suite 200
Chantilly, VA 22021

Many RFCs are available online. Hardcopies of all RFCs are available from the NIC, either individually or by subscription. Online copies are available using FTP from the NIC at [http://www.rfc-editor.org/rfc.html](http://www.rfc-editor.org/rfc.html).

Use FTP to download the files, using the following format:

RFC:RFC-INDEX.TXT
RFC:RFCnnnn.TXT
RFC:RFCnnnn.PS

where:

- *nnnn* is the RFC number.
- TXT is the text format.
- PS is the postscript format.

You can also request RFCs through electronic mail, from the automated NIC mail server, by sending a message to service@nic.ddn.mil with a subject line of RFC *nnnn* for text versions or a subject line of RFC *nnnn*.*PS* for PostScript® versions. To request a copy of the RFC index, send a message with a subject line of RFC INDEX.

For more information, contact nic@nic.ddn.mil.
Appendix E. Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer, z/OS TSO/E User’s Guide, and z/OS ISPF User’s Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer/Library Server versions of z/OS books in the Internet library at [www.ibm.com/systems/z/os/zos/bkserv/](http://www.ibm.com/systems/z/os/zos/bkserv/)
Notices

IBM may not offer all of the products, services, or features discussed in this document. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing
2-31 Roppongi 3-chome, Minato-ku
Tokyo 106, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law:

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.
Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

Site Counsel
IBM Corporation
P.O. Box 12195
3039 Cornwallis Road
Research Triangle Park, North Carolina 27709-2195
U.S.A

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurement may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM’s future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

All IBM prices shown are IBM’s suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrates programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application
programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. You may copy, modify, and distribute these sample programs in any form without payment to IBM for the purposes of developing, using, marketing, or distributing application programs conforming to IBM’s application programming interfaces.

Each copy or any portion of these sample programs or any derivative work must include a copyright notice as follows:

CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

Copyright © 1995-1998 Eric Young (eay@cryptsoft.com) All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com).
The implementation was written so as to conform with Netscape's SSL.

This library is free for commercial and non-commercial use as long as the
following conditions are adhered to. The following conditions apply to all code
found in this distribution, be it the RC4, RSA, Ihash, DES, etc., code; not just the
SSL code. The SSL documentation included with this distribution is covered by the
same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young’s, and as such any Copyright notices in the code are
not to be removed. If this package is used in a product, Eric Young should be
given attribution as the author of the parts of the library used. This can be in the
form of a textual message at program startup or in documentation (online or
textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification,
are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of
   conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this
   list of conditions and the following disclaimer in the documentation and/or
   other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must
   display the following acknowledgement: "This product includes cryptographic
   software written by Eric Young (eay@cryptsoft.com)". The word 'cryptographic'
   can be left out if the routines from the library being used are not cryptographic
   related.

4. If you include any Windows specific code (or a derivative thereof) from the
   apps directory (application code) you must include acknowledgement:
   "This product includes software written by Tim Hudson (tjh@cryptsoft.com)"

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG "AS IS" AND ANY EXPRESS
OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE
IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A
PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE
AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT,
INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES
(INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE
GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS
INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY,
WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING
NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF
THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH
DAMAGE.

The license and distribution terms for any publicly available version or derivative
of this code cannot be changed. i.e. this code cannot simply be copied and put
under another distribution license [including the GNU Public License.]

This product includes cryptographic software written by Eric Young.

Permission to use, copy, modify, and distribute this software for any purpose with
or without fee is hereby granted, provided that the above copyright notice and this
permission notice appear in all copies.

CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.
Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Bibliography

This bibliography contains descriptions of the documents in the z/OS Communications Server library.

z/OS Communications Server documentation is available in the following forms:

- In softcopy on CD-ROM collections. See “Softcopy information” on page xiii.

z/OS Communications Server library updates

z/OS Communications Server information

z/OS Communications Server product information is grouped by task in the tables that follow.

Planning

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: New Function Summary</td>
<td>GC31-8771</td>
<td>This document is intended to help you plan for new IP for SNA function, whether you are migrating from a previous version or installing z/OS for the first time. It summarizes what is new in the release and identifies the suggested and required modifications needed to use the enhanced functions.</td>
</tr>
<tr>
<td>z/OS Communications Server: IPv6 Network and Application Design Guide</td>
<td>SC31-8885</td>
<td>This document is a high-level introduction to IPv6. It describes concepts of z/OS Communications Server’s support of IPv6, coexistence with IPv4, and migration issues.</td>
</tr>
</tbody>
</table>

Resource definition, configuration, and tuning

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: IP Configuration Guide</td>
<td>SC31-8775</td>
<td>This document describes the major concepts involved in understanding and configuring an IP network. Familiarity with the z/OS operating system, IP protocols, z/OS UNIX System Services, and IBM Time Sharing Option (TSO) is recommended. Use this document in conjunction with the z/OS Communications Server: IP Configuration Reference.</td>
</tr>
</tbody>
</table>
This document presents information for people who want to administer and maintain IP. Use this document in conjunction with the z/OS Communications Server: IP Configuration Guide. The information in this document includes:

- TCP/IP configuration data sets
- Configuration statements
- Translation tables
- SMF records
- Protocol number and port assignments

This document presents the major concepts involved in implementing an SNA network. Use this document in conjunction with the z/OS Communications Server: SNA Network Implementation Guide.

This document describes each SNA definition statement, start option, and macroinstruction for user tables. It also describes NCP definition statements that affect SNA. Use this document in conjunction with the z/OS Communications Server: SNA Resource Definition Reference.

This document contains sample definitions to help you implement SNA functions in your networks, and includes sample major node definitions.

This document is for system programmers and network administrators who need to prepare their network to route SNA, JES2, or JES3 printer output to remote printers using TCP/IP Services.

This document describes how to use TCP/IP applications. It contains requests that allow a user to log on to a remote host using Telnet, transfer data sets using FTP, send and receive electronic mail, print on remote printers, and authenticate network users.

This document describes the functions and commands helpful in configuring or monitoring your system. It contains system administrator’s commands, such as TSO NETSTAT, PING, TRACERTE and their UNIX counterparts. It also includes TSO and MVS commands commonly used during the IP configuration process.

This document serves as a reference for programmers and operators requiring detailed information about specific operator commands.

This document contains essential information about SNA and IP commands.
## Customization

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
</table>
| z/OS Communications Server: SNA Customization | SC31-6854 | This document enables you to customize SNA, and includes the following:  
  - Communication network management (CNM) routing table  
  - Logon-interpret routine requirements  
  - Logon manager installation-wide exit routine for the CLU search exit  
  - TSO/SNA installation-wide exit routines  
  - SNA installation-wide exit routines |

## Writing application programs

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference</td>
<td>SC31-8788</td>
<td>This document describes the syntax and semantics of program source code necessary to write your own application programming interface (API) into TCP/IP. You can use this interface as the communication base for writing your own client or server application. You can also use this document to adapt your existing applications to communicate with each other using sockets over TCP/IP.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP CICS Sockets Guide</td>
<td>SC31-8807</td>
<td>This document is for programmers who want to set up, write application programs for, and diagnose problems with the socket interface for CICS® using z/OS TCP/IP.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP IMS Sockets Guide</td>
<td>SC31-8830</td>
<td>This document is for programmers who want application programs that use the IMS™ TCP/IP application development services provided by IBM’s TCP/IP Services.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP Programmer’s Guide and Reference</td>
<td>SC31-8787</td>
<td>This document describes the syntax and semantics of a set of high-level application functions that you can use to program your own applications in a TCP/IP environment. These functions provide support for application facilities, such as user authentication, distributed databases, distributed processing, network management, and device sharing. Familiarity with the z/OS operating system, TCP/IP protocols, and IBM Time Sharing Option (TSO) is recommended.</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programming</td>
<td>SC31-8829</td>
<td>This document describes how to use SNA macroinstructions to send data to and receive data from (1) a terminal in either the same or a different domain, or (2) another application program in either the same or a different domain.</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programmer’s LU 6.2 Guide</td>
<td>SC31-8811</td>
<td>This document describes how to use the SNA LU 6.2 application programming interface for host application programs. This document applies to programs that use only LU 6.2 sessions or that use LU 6.2 sessions along with other session types. (Only LU 6.2 sessions are covered in this document.)</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programmer’s LU 6.2 Reference</td>
<td>SC31-8810</td>
<td>This document provides reference material for the SNA LU 6.2 programming interface for host application programs.</td>
</tr>
<tr>
<td>z/OS Communications Server: CSM Guide</td>
<td>SC31-8808</td>
<td>This document describes how applications use the communications storage manager.</td>

Communicating Your Comments to IBM

If you especially like or dislike anything about this document, please use one of the methods listed below to send your comments to IBM. Whichever method you choose, make sure you send your name, address, and telephone number if you would like a reply.

Feel free to comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this document. However, the comments you send should pertain to only the information in this manual and the way in which the information is presented. To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

Please send your comments to us in either of the following ways:

• If you prefer to send comments by FAX, use this number: 1+919-254-1258

• If you prefer to send comments electronically, use this address:
  – comsvrcf@us.ibm.com

• If you prefer to send comments by post, use this address:
  International Business Machines Corporation
  Attn: z/OS Communications Server Information Development
  P.O. Box 12195, 3039 Cornwallis Road
  Department AKCA, Building 501
  Research Triangle Park, North Carolina 27709-2195

Make sure to include the following in your note:

• Title and publication number of this document
• Page number or topic to which your comment applies.
