About this document

This document describes the Internet Protocol (IP) messages that occur in z/OS Communications Server. The information in this document supports both IPv6 and IPv4. Unless explicitly noted, information describes IPv4 networking protocol. IPv6 support is qualified in the text.

For information about how to set up, initialize, and customize your Transmission Control Protocol/Internet Protocol (TCP/IP) services system, see the z/OS Communications Server: IP Configuration Reference, the z/OS Communications Server: IP Configuration Guide and the z/OS Communications Server: IP Programmer’s Guide and Reference. For information about how to use the applications on your TCP/IP system, see z/OS Communications Server: IP User’s Guide and Commands.

This document refers to Communications Server data sets by their default SMP/E distribution library name. Your installation might, however, have different names for these data sets where allowed by SMP/E, your installation personnel, or administration staff. For instance, this document refers to samples in SEZAINST library as simply in SEZAINST. Your installation might choose a data set name of SYS1.SEZAINST, CS390.SEZAINST or other high level qualifiers for the data set name.

Who should read this document

This document assists TCP/IP operators, system programmers, and users to:

- Analyze a problem
- Classify the problem as a specific type
- Describe the problem to the IBM® software support center

Familiarity with TCP/IP concepts and terms is assumed.

How this document is organized

The messages are listed in alphanumeric order by message ID. For each message ID, the books contains the text and a description of the message. This book contains the following chapters:

- Chapter 2, “EZZ0xxx messages,” on page 7 contains messages in the EZZ0xxx range.
- Chapter 3, “EZZ2xxx messages,” on page 135 contains messages in the EZZ2xxx range.
- Chapter 4, “EZZ3xxx messages,” on page 201 contains messages in the EZZ3xxx range.
- Chapter 5, “EZZ4xxx messages,” on page 245 contains messages in the EZZ4xxx range.
- Chapter 6, “EZZ6xxx messages,” on page 271 contains messages in the EZZ6xxx range.
- Chapter 7, “EZZ7xxx messages,” on page 405 contains messages in the EZZ7xxx range.
Chapter 8, “EZZ8xxxx messages,” on page 531 contains messages in the EZZ8xxxx range.

Chapter 9, “EZZ9xxxx messages,” on page 745 contains messages in the EZZ9xxxx range.

Chapter 10, “SNMxxxxx messages,” on page 915 contains messages in the SNMxxxxx range.

Appendix A, “Related protocol specifications,” on page 931 lists the related protocol specifications for TCP/IP.

Appendix B, “Accessibility,” on page 955 describes accessibility features to help users with physical disabilities.

“Notices” on page 957 contains notices and trademarks used in this document.

“Bibliography” on page 967 contains descriptions of the documents in the z/OS Communications Server library.

---

How to use this document

To use this document, you should be familiar with z/OS TCP/IP Services and the TCP/IP suite of protocols.

Determining whether a publication is current

As needed, IBM updates its publications with new and changed information. For a given publication, updates to the hardcopy and associated BookManager® softcopy are usually available at the same time. Sometimes, however, the updates to hardcopy and softcopy are available at different times. The following information describes how to determine if you are looking at the most current copy of a publication:

- At the end of a publication’s order number there is a dash followed by two digits, often referred to as the dash level. A publication with a higher dash level is more current than one with a lower dash level. For example, in the publication order number GC28-1747-07, the dash level 07 means that the publication is more current than previous levels, such as 05 or 04.

- If a hardcopy publication and a softcopy publication have the same dash level, it is possible that the softcopy publication is more current than the hardcopy publication. Check the dates shown in the Summary of Changes. The softcopy publication might have a more recently dated Summary of Changes than the hardcopy publication.

- To compare softcopy publications, you can check the last 2 characters of the publication’s file name (also called the book name). The higher the number, the more recent the publication. Also, next to the publication titles in the CD-ROM booklet and the readme files, there is an asterisk (*) that indicates whether a publication is new or changed.

How to contact IBM service

Most problems can be resolved at this website, where you can submit questions and problem reports electronically, and access a variety of diagnosis information.

For telephone assistance in problem diagnosis and resolution (in the United States or Puerto Rico), call the IBM Software Support Center anytime (1-800-IBM-SERV). You will receive a return call within 8 business hours (Monday – Friday, 8:00 a.m. – 5:00 p.m., local customer time).

---
Outside the United States or Puerto Rico, contact your local IBM representative or your authorized IBM supplier.

If you would like to provide feedback on this publication, see “Communicating your comments to IBM” on page 971.

Conventions and terminology that are used in this document

Commands in this book that can be used in both TSO and z/OS UNIX environments use the following conventions:

- When describing how to use the command in a TSO environment, the command is presented in uppercase (for example, NETSTAT).
- When describing how to use the command in a z/OS UNIX environment, the command is presented in bold lowercase (for example, netstat).
- When referring to the command in a general way in text, the command is presented with an initial capital letter (for example, Netstat).

All the exit routines described in this document are installation-wide exit routines. The installation-wide exit routines also called installation-wide exits, exit routines, and exits throughout this document.

The TPF logon manager, although included with VTAM®, is an application program; therefore, the logon manager is documented separately from VTAM.

Samples used in this book might not be updated for each release. Evaluate a sample carefully before applying it to your system.

Note: In this information, you might see the term RDMA network interface card (RNIC) that is used to refer to the IBM 10GbE RoCE Express® feature.

For definitions of the terms and abbreviations that are used in this document, you can view the latest IBM terminology at the IBM Terminology website.

Clarification of notes

Information traditionally qualified as Notes is further qualified as follows:

- Note: Supplemental detail
- Tip: Offers shortcuts or alternative ways of performing an action; a hint
- Guideline: Customary way to perform a procedure
- Rule: Something you must do; limitations on your actions
- Restriction: Indicates certain conditions are not supported; limitations on a product or facility
- Requirement: Dependencies, prerequisites
- Result: Indicates the outcome
Prerequisite and related information

*z/OS Communications Server function is described in the z/OS Communications Server library. Descriptions of those documents are listed in “Bibliography” on page 967 in the back of this document.

Required information

Before using this product, you should be familiar with TCP/IP, VTAM, MVS™, and UNIX System Services.

Softcopy information

Softcopy publications are available in the following collection.

<table>
<thead>
<tr>
<th>Titles</th>
<th>Order Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM System z Redbooks Collection</td>
<td>SK3T-7876</td>
<td>The IBM Redbooks® publications selected for this CD series are taken from the IBM Redbooks inventory of over 800 books. All the Redbooks publications that are of interest to the System z® platform professional are identified by their authors and are included in this collection. The System z subject areas range from e-business application development and enablement to hardware, networking, Linux, solutions, security, parallel sysplex, and many others. For more information about the Redbooks publications, see <a href="http://www-03.ibm.com/systems/z/os/zos/zfavorites/">http://www-03.ibm.com/systems/z/os/zos/zfavorites/</a></td>
</tr>
</tbody>
</table>

Other documents

This information explains how z/OS references information in other documents.

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see [z/OS Information Roadmap](SA23-2299). The Roadmap describes what level of documents are supplied with each release of z/OS Communications Server, and also describes each z/OS publication.

To find the complete z/OS library, including the z/OS Information Center, see [www.ibm.com/systems/z/os/zos/bkserv/](http://www.ibm.com/systems/z/os/zos/bkserv/)

Relevant RFCs are listed in an appendix of the IP documents. Architectural specifications for the SNA protocol are listed in an appendix of the SNA documents.

The following table lists documents that might be helpful to readers.

<table>

**The z/OS Basic Skills Information Center**

The z/OS Basic Skills Information Center is a web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS systems programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

- Provide basic education and information about z/OS without charge
- Shorten the time it takes for people to become productive on the mainframe
- Make it easier for new people to learn z/OS

To access the z/OS Basic Skills Information Center, open your web browser to the following website, which is available to all users (no login required):

http://publib.boulder.ibm.com/infocenter/zos/basics/index.jsp
Summary of changes

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Changes made in z/OS Version 2 Release 1, as updated September 2014

This document contains information previously presented in z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM), SC27-3657-00, which supported z/OS Version 2 Release 1.

Summary of changes for z/OS Version 2 Release 1

For specifics on the enhancements for z/OS Version 2, Release 1, see the following publications:

- z/OS Summary of Message and Interface Changes
- z/OS Introduction and Release Guide
- z/OS Planning for Installation
- z/OS Migration
Chapter 1. IP message standards introduction

This topic contains the following information about IP message standards:

- “Message text formats”
- “Message description formats” on page 3
- “Message routing codes” on page 4
- “Message descriptor codes” on page 5
- “Message groups” on page 6

Message text formats

Most IP messages are preceded by an identifier, as illustrated in Figure 1.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>EZA1450I</td>
<td>IBM FTP version</td>
</tr>
<tr>

<td>Minor Error code: code</td>
</tr>
</tbody>
</table>

Figure 1. Sample IP message format

Message identifiers

All message identifiers include the following sections:

- Prefix
- Message number
- Message type code

See Figure 2 on page 2 for a sample IP message identifier.
Prefix
Message identifiers include a prefix that identifies the source of the message. The following message prefixes are used by TCP/IP and its associated applications:

- EZA
- EZAIN
- EZAOP
- EZB
- EZBH
- EZD
- EZY
- EZYF
- EZIP
- EZYM
- EZYT
- EZYX
- EZZ
- SNM

Message number
Message identifiers include a unique 2- through 4-digit message number.

Message type code
The following type codes are used in IP messages:

A Action
The message indicates that an action is required.

E Eventual Action
You must eventually take some action to correct a problem. The system continues processing without waiting for a response.

I Information
The message is for your information. This type code can be used to notify you of an error. No response is necessary, but you might need to take some action.

S Severe Error
The message is for a system programmer.
Syntax notation in message text

In this documentation, IP messages are described with the following syntax notation:

Non-highlighted characters
Represent the actual text of the message.

italic characters
Represent message variables. The variables are replaced by their values in the actual message.

Braces {}
Represent a group of text strings, only one of which is displayed in the actual message. The text strings are separated by or-signs (|) in the braces.
The braces and or-signs are not displayed in the actual message.

Brackets [ ]
Represent optional messages or optional parts of a message. Optional messages or optional parts of a message are displayed only under certain circumstances that are described in the "Explanation" section of the message. If an optional part has more than one possible value, or-signs separate the possibilities.
The brackets and or-signs are not displayed in the actual message.

Message description formats

A message consists of several sections. Not all sections are used for each message. For messages that are issued as a group, the "Explanation" section of the first message usually contains a complete description of the other messages in the group.

Explanation
Explains why the message was issued and describes all text and variables in the message.

System action
Explains the system state after the message was issued. This section also indicates whether the system is waiting for a reply.

Operator response
Describes actions that the operator can or must take at the console.

System programmer response
Suggests actions, programming changes, or system definition changes that isolate or correct errors or improve the efficiency of the system.

User response
Describes actions that the user can or must take at the terminal.

Problem determination
Additional instructions for determining the cause of the problem, searching problem databases, and if necessary, reporting the problem to the IBM support center. These instructions are for system programmers who can troubleshoot problems.

Source
Element, product, or component that issued the message.
Module

Module or modules that issued the message.

Automation

Indicates whether the message is a candidate for automation.

Example

Example of the message with variable fields replaced with actual values, perhaps in context with other messages.

Message routing codes

Routing codes determine where a message is displayed. More than one routing code might be assigned to the message. With multiple-console support, each console operator receives the messages related only to the commands entered at that console or to the functions assigned to that console, regardless of the routing codes assigned to those messages. If a message that is routed to a particular console cannot be issued at that console, that message is issued at the master console.

The following routing codes are used in IP messages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Master Console Action</strong>: This message indicates a change in the system status and demands action by the master console operator.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Master Console Information</strong>: This message indicates a change in the system status. Such a message does not demand action, but alerts the master console operator to a condition that might require action. This routing code is used for any message that indicates job status, and also for processor and problem program messages to the master console operator.</td>
</tr>
<tr>
<td>3</td>
<td><strong>Tape Pool</strong>: This message specifies the status of a tape unit or reel, the disposition of a tape reel, or other tape-oriented information. For example, this can be a message which requests that tapes be mounted.</td>
</tr>
<tr>
<td>4</td>
<td><strong>Direct Access Pool</strong>: This message specifies the status of a direct access unit or pack, the disposition of a disk pack, or other direct-access-oriented information. For example, this can be a message which requests that disks be mounted.</td>
</tr>
<tr>
<td>5</td>
<td><strong>Tape Library</strong>: This message specifies the tape library information. For example, this can be a message which requests, by volume serial numbers, that tapes be obtained for system or programmer use.</td>
</tr>
<tr>
<td>6</td>
<td><strong>Disk Library</strong>: This message specifies the disk library information. For example, this can be a message which requests, by volume serial numbers, that disk packs be obtained for system or programmer use.</td>
</tr>
<tr>
<td>7</td>
<td><strong>Unit Record Pool</strong>: This message specifies the unit-record equipment information. For example, this can be a message which requests that printer trains be mounted.</td>
</tr>
<tr>
<td>8</td>
<td><strong>Teleprocessing Control</strong>: This message specifies the status or the disposition of data communication equipment. For example, this can be a message that indicates line errors.</td>
</tr>
<tr>
<td>9</td>
<td><strong>System Security</strong>: This message is associated with security checking. For example, this can be a message that requires a reply that is specifying a password.</td>
</tr>
</tbody>
</table>
10 **System Error Maintenance**: This message indicates either a system error, or an input/output error that cannot be corrected. It also indicates a message that is associated with system maintenance.

11 **Programmer Information**: This message is for the problem programmer. This routing code is used only when the program that issued the message cannot route the message to the programmer by using the system-output data set facility. The message is displayed in the system output message class of the job.

12 **Emulators**: This message is issued by an emulator program.

13 Reserved for customer use.

14 Reserved for customer use.

15 Reserved for customer use.

16 Reserved for future expansion.

---

### Message descriptor codes

Descriptor codes describe the kind of message being issued. These codes, with message routing codes, determine how a message is to be printed or displayed and how a message is to be deleted from a display device. Descriptor codes 1 – 7 are mutually exclusive; only one such code is assigned to a message. Descriptor codes 8 – 10 can be displayed with any other descriptor codes.

The following descriptor codes are used in IP messages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>System Failure</strong>: This message indicates that an error that cannot be corrected occurs. To continue, the operator must restart the system.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Immediate Action Required</strong>: This message requires an immediate action by the operator. The action is required because the message issuer is in a wait state until the action is taken, or because system performance is degraded until the action is taken.</td>
</tr>
<tr>
<td>3</td>
<td><strong>Eventual Action Required</strong>: This message requires an eventual action by the operator. The task does not await completion of the action.</td>
</tr>
<tr>
<td>4</td>
<td><strong>System Status</strong>: This message indicates the status of a system task or of a hardware unit.</td>
</tr>
<tr>
<td>5</td>
<td><strong>Immediate Command Response</strong>: This message is issued as an immediate response to a system command. The completion of the response is not dependent on another system action or task.</td>
</tr>
<tr>
<td>6</td>
<td><strong>Job Status</strong>: This message contains status information regarding the job or job step.</td>
</tr>
<tr>
<td>7</td>
<td><strong>Application Program/Processor</strong>: This message is issued when a program is in problem mode.</td>
</tr>
<tr>
<td>8</td>
<td><strong>Out-of-Line Message</strong>: This message is one of a group of messages to be displayed out of line. If the device support cannot print a message out of line, the code is ignored, and the message is printed in line with other messages.</td>
</tr>
<tr>
<td>9</td>
<td><strong>Request of the Operator</strong>: This message is written in response to a request of the operator for information by the DEVSERV, MONITOR commands, and other operating system commands.</td>
</tr>
</tbody>
</table>
This message is issued in response to a TRACK command.

Critical Eventual Action Required: This message indicates that a critical event has occurred and must eventually be followed by an action. The message remains on the screen until the action is taken.

Important Information: This message contains important information that must be displayed at the console, but does not require any action in response.

Reserved.

Message groups

A message group contains two or more messages that are displayed together in response to a specific command or error condition. The following example is a message group.

EZZ8453I jobtype STORAGE
EZZ8454I jobname STORAGE CURRENT MAXIMUM LIMIT
EZZ2018I location
EZZ8455I storagetype current maximum limit
EZZ8459I DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY

In most cases, the "Explanation" section of the first message in the group contains an example of the group and information about all messages in the group. The message descriptions of members of the group refer back to the first message for complete information.
Chapter 2. EZZ0xxx messages

EZZ0053I Command cmd completed successfully

Explanation: The command either finished without error or was successfully accepted for processing.

In the message text:

```
cmd
    The command that finished without error or was successfully accepted for processing.
```

The following are examples of commands for which this message might indicate that the command was successfully accepted for processing:

- DISPLAY TCPIP,OSAINFO
- VARY TCPIP,SYSPLEX,LEAVEGROUP
- VARY TCPIP,START
- VARY TCPIP,STOP

These commands are processed asynchronously, so the command output might be displayed prior to or after this message is issued.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

Module: EZACFC00, EZACFYAC

Example:

```
EZZ0053I Command DISPLAY TCPIP,,OSAINFO completed successfully
```

Procedure name: parseCmd

---

EZZ0054I Error: Command cmd did not complete successfully

Explanation: The processing of the VARY TCPIP command did not complete successfully.

System action: TCP/IP continues.

Operator response: Check the system log or the SYERROR DD file specified in your TCPIP procedure for possible reasons.

System programmer response: None.

Module: EZACFC00, EZACDSTR

Procedure name: parseCmd

---

EZZ0056I parm1 SYNTAX ERROR: REQUIRED PARAMETER parm2 MISSING OR VALUE IS INCORRECT FOR statement_type statement_name

Explanation: The parm2 value is required to process the parm1 value. The parm2 value was either missing or had an incorrect value.

In the message text:

```
parm1
    The parameter that requires the parm2 value to be coded correctly.

parm2
    The parameter that is missing or has an incorrect value.
```
**EZZ0059I**

*statement_type*

The type of statement on which the parm2 value is missing or has an incorrect value.

*statement_name*

The name of the statement that is in error. If the *statement_type* value is INTERFACE, the INTERFACE statement that is in error has this value specified for the interface name parameter. If the *statement_type* value is LINK, the LINK statement that is in error has this value specified for the link name parameter.

**System action:** TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.wss?uid=swg27013768) for more information about how the parm2 value should be correctly coded under the specified statement.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TCP/IP Module: EZACFPAR, EZACFPV6

**Routing code:** 2,8

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

EZZ0056I WORKLOADQ SYNTAX ERROR: REQUIRED PARAMETER VMAC MISSING OR VALUE IS INCORRECT FOR INTERFACE NSQDIO11

---

**EZZ0059I** *cmd command failed: reason*

**Explanation:** The command failed for the reason indicated.

In the message text:

*cmd*

The command that failed.

*reason*

The reason that the command failed. The following are the commands for which this message is issued with the possible *reason* values:

- **VARY TCPIP,OBEYFILE**
  
  **INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2-errno2**
  
  An internal command that was issued to TCP/IP failed.

- **OMPROUTE NOT ACTIVE**
  
  The OMPROUTE task is not active.

- **DISPLAY TCPIP,OSAINFO**

- **CANNOT OBTAIN TCP/IP PRIVATE STORAGE**
  
  The command could not obtain private storage in the TCP/IP address space for processing.

- **INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2-errno2**
  
  An internal command that was issued to TCP/IP failed.

- **VARY DROP**

- **INCORRECT CONNECTION NUMBER number**
  
  The connection number specified cannot be dropped.
INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2=errno2
An internal command that was issued to TCP/IP failed.

• VARY TCPIP,OBEYFILE

NOT AUTHORIZED
Your user ID does not have proper authorization to the MVS.VARY.TCPIP,OBEYFILE RACF® resource.

OMPROUTE NOT ACTIVE
The OMPROUTE task is not active.

SEE PREVIOUS MESSAGES
There were error messages generated while processing your profile.

System action: TCP/IP continues.

Operator response:
• For the DISPLAY TCPIP,OMPROUTE command, the following are operator responses for the possible reason values:

INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2=errno2
Check the status of the OMPROUTE started task or its internal socket connection to TCPIP. The OMPROUTE task might not yet have completed initialization or the socket connection might be down.

ero is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
errno2 is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

OMPROUTE NOT ACTIVE
Start the OMPROUTE task or wait for the task to complete its initialization. Then reissue the command.

 • For the DISPLAY TCPIP,OSAINFO command, the following are operator responses for the possible reason values:

CANNOT OBTAIN TCP/IP PRIVATE STORAGE
Resolve storage constraints with the TCP/IP address space private storage before reissuing the command. See “link to Diagnosing storage abends and storage growth” in IP Diagnosis Guide.

INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2=errno2
An internal command that was issued to TCP/IP failed. Report the error to the IBM software support center.

number is the number of the internal command.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
errno2 is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

• For the VARY DROP command, the following are operator responses for the possible reason values:

INCORRECT CONNECTION NUMBER number
Issue the onetstat command with the -c option to find the correct connection number. Specify a correct connection number and resubmit the command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.

INTERNAL COMMAND number FAILED ERRNO=errno ERRNO2=errno2
An internal command was issued to TCP/IP. Report the error to the IBM software support center.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
errno2 is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

• For the VARY TCPIP,OBEYFILE command, the following are operator responses for the possible reason values:
EZZ0060I  •  EZZ0061I

NOT AUTHORIZED
Make sure that your user ID has the MVS.VARY.TCPIP.OBEYFILE defined in the RACF profile and resubmit
the command.

SEE PREVIOUS MESSAGES
Error messages generated while processing your profile were written to the system log. Correct the errors and
resubmit the command.

System programmer response:  None.
Module:  EZACDOSA, EZACFC00, EZACFMS1, EZACFYAC

EZZ0060I  PROCESSING COMMAND cmd
Explanation:  TCP/IP is about to process the command.
System action:  TCP/IP continues.
Operator response:  None.
System programmer response:  None.
Module:  EZACFC00
Procedure name:  parseCmds

EZZ0061I  VARY SYNTAXCHECK COMMAND BEGINNING
Explanation:  You entered a VARY TCPIP,,SYNTAXCHECK command at the console to analyze a profile data set for
syntax errors. TCP/IP has started processing the profile data set that you specified on the command.
This message might be followed by one or more messages that indicate that syntax errors were found in the profile
data set.
You will know that syntax checking is complete when you see the following message:
EZZ0065I  VARY SYNTAXCHECK COMMAND COMPLETE
System action:  Processing continues. No other commands will be processed until syntax checking is complete.
Operator response:  None.
System programmer response:  None.
User response:  Not applicable.
Problem determination:  Not applicable.
Source:  z/OS Communications Server TCP/IP: Configuration and Initialization
Module:  EZACFYAC
Routing code:  *
Descriptor code:  5
Automation:  This message is directed to the console.
Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to
adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
Example:

```
vary tcpip,,syntaxcheck,user.tcpparms(traceon)
EZZ0060I  PROCESSING COMMAND: VARY TCPIP,,SYNTAXCHECK,
  USER.TCPPARMS(TRACEON)
EZZ0061I  VARY SYNTAXCHECK COMMAND BEGINNING
EZZ0065I  VARY SYNTAXCHECK COMMAND COMPLETE
EZZ0309I  OPENED SYNTAXCHECK FILE 'USER.TCPPARMS(TRACEON)'
EZZ0309I  PROFILE PROCESSING BEGINNING FOR
  'USER.TCPPARMS(TRACEON)'
```
EZZ0062I VARY SYNTAXCHECK FOUND NO ERRORS

Explanation: You entered a VARY TCPIP,,SYNTAXCHECK command to analyze a profile data set for syntax errors. The command processing has completed. No syntax errors were detected.

For more information about the VARY TCPIP,,SYNTAXCHECK command, see VARY TCPIP,,SYNTAXCHECK in z/OS Communications Server: IP System Administrator's Commands

System action: Processing continues.

Operator response: No action is needed.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFYAC

Routing code: *

Descriptor code: 5

Automation: This message is directed to the console.

Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
v tcpip,,syntaxcheck,usr.tcpparms(traceoff)
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYNTAXCHECK, USER.TCPPARMS(TRACEOFF)
EZZ0061I VARY SYNTAXCHECK COMMAND BEGINNING
EZZ0300I OPENED SYNTAXCHECK FILE 'USER.TCPPARMS(TRACEOFF)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'USER.TCPPARMS(TRACEOFF)'
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'USER.TCPPARMS(TRACEOFF)'
EZZ0062I VARY SYNTAXCHECK FOUND NO ERRORS
EZZ0065I VARY SYNTAXCHECK COMMAND COMPLETE

EZZ0063I VARY SYNTAXCHECK COMMAND FAILED: SEE PREVIOUS MESSAGES

Explanation: You entered a VARY TCPIP,,SYNTAXCHECK command to analyze a profile data set for syntax errors. One or more errors prevented the command from completing successfully.

For more information about the VARY TCPIP,,SYNTAXCHECK command, see VARY TCPIP,,SYNTAXCHECK in z/OS Communications Server: IP System Administrator's Commands

System action: Processing continues.

Operator response: Save the system log for problem determination and contact the system programmer.

System programmer response: Inspect the system log for configuration error messages that were issued after message EZZI0061I and before this message. Correct the errors that are indicated. Issue the VARY TCPIP,,SYNTAXCHECK command again.

User response: No action is needed.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Configuration and Initialization

OR AUTHPORT WAS EXPECTED
EZZ0318I SHAREPORT WAS FOUND COMPLETE FOR FILE
'USER.TCPPARMS(M0313)'
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE
'USER.TCPPARMS(M0313)'
EZZ0064I VARY SYNTAXCHECK FOUND ERRORS: SEE PREVIOUS MESSAGES
EZZ0065I VARY SYNTAXCHECK COMMAND COMPLETE
```

**EZZ0061I** VALUE OF AUTOLOG PARMSTRING ON LINE **line_number** WAS TRUNCATED

**Explanation:** You coded the AUTOLOG statement PARMSTRING parameter in a profile data set, but the length of the value you specified exceeded the maximum length allowed for that parameter.

In the message text:

```
line_number
```

The line in the TCP/IP profile where the PARMSTRING value was found

**System action:** Profile processing continues. TCP/IP truncates the value of the AUTOLOG statement PARMSTRING parameter to the maximum length allowed.

This message is displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing. Correct the error before using the profile data set as an initial profile or as a VARY TCPIP,OBEYFILE profile.

**Operator response:** Report the error to the system programmer.

**System programmer response:** Check the profile statement on line **line_number** and specify a shorter PARMSTRING value. See [AUTOLOG statement in z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SSLVMB_8.5.1/com.ibm.zos/VSE/book/zicsysadm/index.html) for more information.
User response: No action is needed.
Problem determination: See the system programmer response.
Source: z/OS Communications Server TCP/IP: Configuration and Initialization
Module: EZACFPAL
Routing code: *
Descriptor code: 5
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors.

This message can appear during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
```
v tcpip,,syt,user1.temp
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,SYNT,USER1.TEMP
EZZ0061I VARY SYNTAXCHECK COMMAND BEGINNING
EZZ0300I OPENED SYNTAXCHECK FILE 'USER1.TEMP'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'USER1.TEMP'
EZZ0066I VALUE OF AUTOLOG PARMSTRING ON LINE 3 WAS TRUNCATED
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'USER1.TEMP'
EZZ0064I VARY SYNTAXCHECK FOUND ERRORS: SEE PREVIOUS MESSAGES
EZZ0065I VARY SYNTAXCHECK COMMAND COMPLETE
```

Explanation: This message is displayed in response to the DISPLAY TCPIP,,HELP,TRACE command and shows the format of the DISPLAY TCPIP,,TRACE command.

System action: Processing continues.
Operator response: No action is needed.
System programmer response: No action is needed.

Automation: This message is directed to the console but is not a candidate for automation.
Example: Not applicable.

Explanation: This message is displayed in response to the DISPLAY TCPIP,,HELP,SYNTAXCHECK command and shows the format of the VARY TCPIP,,SYNTAXCHECK command.

System action: Processing continues.
Operator response: No action is needed.
System programmer response: No action is needed.
User response: Not applicable.

Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP
EZ0145I

**Explanation:** A PORT profile statement was configured that contains an entry that specified a UNRSV protocol and job name that were already configured on this or a previous PORT statement and are currently active. You cannot configure a new PORT statement UNRSV entry that matches the protocol and job name of an existing UNRSV entry.

In the message text:

- **protocol**
  The protocol specified on a new UNRSV entry on a PORT statement. The values are either TCP or UDP.

- **jobname**
  The job name specified on a new UNRSV entry on a PORT statement. The value is either an MVS job name or 0 - 7 characters followed by an asterisk (*).

**System action:** The PORT statement entry that contained the conflict is ignored. Other entries on the same PORT statement are processed. Profile processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** If the existing PORT statement UNRSV entry is correct, remove the conflicting entry from the PORT statement. You do not need to reprocess the PORT statement.

If the conflicting PORT statement UNRSV entry is correct, change the existing PORT UNRSV entry. Perform the following steps to change an existing PORT statement UNRSV entry.

1. Delete the existing PORT statement UNRSV entry using the DELETE PORT profile statement.
2. Configure a new PORT statement with a new UNRSV entry for the protocol and job name.
3. Issue a VARY TCPIP,OBEYFILE command with a profile that contains the DELETE PORT and changed PORT statements.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** ezacms1.c

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

**Example:** Assume you specify the following PORT statement:

```
5  PORT
6  UNRSV UDP HANK $AF RES1
7  UNRSV TCP FRED WHENLISTEN
8  UNRSV UDP HANK $AF RES2
9  8000  TCP $*
```

The following message is issued:

```
EZ0145I PORT UNRSV UDP HANK IS ALREADY CONFIGURED
```
The entry on line 8 is ignored, but the entries on lines 6, 7 and 9 are processed.

**Explanation:** The DENY keyword was specified on a PORT statement UNRSV entry that specifies a specific job name or that specifies a job name consisting of 1 - 7 characters followed by an asterisk (*). DENY can be specified only on an UNRSV entry with the job name value *.

In the message text:

`lineno`

The line number in the profile data set that contains the incorrect specification.

**System action:** The entire PORT statement is ignored. Profile processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:**
1. Make one of these changes to correct the error:
   - Remove the incorrect UNRSV entry from the PORT statement.
   - Delete the DENY keyword.
   - Change the job name to *
2. If this message was displayed as a result of a VARY TCPIP,,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue a VARY TCPIP,,OBEYFILE command with a profile that contains the entire PORT statement.

See the [PORT statement](z/OS V2R1.0 Communications Server: IP Configuration Reference) for more information.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** ezacfppt.c

**Routing code:** 10

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

```
EZZ0146I PORT STATEMENT KEYWORD DENY ON LINE 15 CAN ONLY BE USED WITH A JOBNAME OF *
```

**Explanation:** An access control keyword was specified on an UNRSV entry on a PORT statement. The specified access control does not match the type of access control for unreserved ports that is in effect because of a previous UNRSV TCP entry on this or a previous PORT statement. Every PORT UNRSV entry for the TCP protocol must specify the same access control option or must use the same access control option as the default value. You cannot specify WHENLISTEN on some entries and WHENBIND on other entries.

In the message text:

`access_ctl1`

The access control that is specified on the new UNRSV TCP entry on a PORT statement. The values are either WHENBIND or WHENLISTEN.
The access control that is already in effect. The values are either WHENBIND or WHENLISTEN.

**System action:** The PORT statement entry that contains the conflict is ignored. Other entries on the same PORT statement are processed. Profile processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** If the access control specified on the conflicting UNRSV entry is incorrect, issue a VARY TCPIP,OBEYFILE command with a profile that contains a new PORT statement with the corrected entry.

If the access control specified on the conflicting UNRSV entry is correct, change the access control on all existing PORT UNRSV TCP entries to be correct. Every PORT UNRSV entry for the TCP protocol must specify the same access control option or must use the same access control option as the default value.

Perform the following steps to change the active access control for the TCP protocol.

1. Delete all existing PORT statement UNRSV TCP entries using the DELETE PORT profile statement.
2. Configure new PORT statement UNRSV TCP entries that specify the other access control.
3. Issue a VARY TCPIP,OBEYFILE command with a profile that contains the DELETE PORT and changed PORT statements.

See the [DELETE statement](https://www.ibm.com) and [PORT statement](https://www.ibm.com) in z/OS Communications Server: IP Configuration Reference for more information.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** ezacms1.c

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

**Example:** Assume you specify the following PORT statement:

```
5 PORT
6 UNRSV TCP FRED WHENLISTEN
7 UNRSV TCP JOHN WHENBIND
8 9000 TCP *
```

The following message is issued:

```
EZZ0147I PORT STATEMENT KEYWORD WHENBIND CONFLICTS WITH CURRENT ACCESS CONTROL OF WHENLISTEN
```

The entry on line 7 is ignored, but the entries on lines 6 and 8 are processed.

```
EZZ0148I PORT STATEMENT KEYWORD WHENLISTEN ON LINE lineno IS NOT VALID FOR UDP PROTOCOL
```

**Explanation:** The WHENLISTEN keyword was specified on a PORT statement UNRSV entry that specifies the UDP protocol. The WHENLISTEN keyword is a valid access control only for the TCP protocol; it is not valid for the UDP protocol. The WHENBIND keyword is the only valid access control (and is the default value) for the UDP protocol.

In the message text:

`lineno`

The line number in the profile data set that contains the error.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, the entire PORT statement is ignored. Profile processing continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
EZZ0149I

Operator response: Contact the system programmer.

System programmer response:
1. Correct the statement with one of these changes:
   - Remove the incorrect UNRSV entry from the PORT statement.
   - Change the access control to WHENBIND.
   - Change the protocol to TCP.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the VARY TCPIP,SYNTAXCHECK command again to verify that you have removed all syntax errors from the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command with a profile that contains the entire PORT statement.

See the PORT statement in z/OS Communications Server: IP Configuration Reference for more information.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization
Module: ezacfppt.c
Routing code: 10
Descriptor code: 12
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing. This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0148I PORT STATEMENT KEYWORD WHENLISTEN ON LINE 8 IS NOT VALID FOR UDP PROTOCOL

---

EZZ0149I  D...NETSTAT,ALL<,SERVER> <,APPLD=|CLIENT=|IPADDR=|IPPORT=|PORT=|NOTN3270> <,FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,ALL command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

User response: None.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization
Module: EZACDHLP
Routing code: *
Descriptor code: 5
Automation: This message is directed to the console from which the DISPLAY TCPIP,HELP,ALL command was issued.

Example: Not applicable.
EZ0150I CONFIGURATION: SIGACTION() FAILED FOR signal : reason

Explanation: The Configuration component encountered an error attempting to set up the signal handler for the signal specified by signal. reason is the error returned by the C runtime library for the failing sigaction() call. If the signal handler is not correctly enabled, the subagent will continue processing, but certain functions controlled by the failing signal will not function properly. Functions controlled by the signals are:

SIGABND
handler controls error reporting and cleanup functions when an abend occurs. If sigaction fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up. The Configuration component might not be automatically restarted.

SIGTERM
handler controls cleanup of resources during termination. If sigaction fails for SIGTERM, the Configuration component will not be automatically restarted when a SIGTERM is received.

SIGPIPE
handler controls cleanup of resources during termination. If sigaction fails for SIGPIPE, the configuration component will not be automatically restarted when a SIGPIPE is received.

System action: Processing continues; however, the functions controlled by the failing signal will not function properly.
Operator response: None.
System programmer response: None.
Module: EZACFMMN
Procedure name: main

EZ0151I CONFIGURATION: RESTART SCHEDULED

Explanation: An attempt was made to automatically restart the Configuration component following a severe error, which caused the Configuration component to terminate. This message is preceded by an error message indicating why the Configuration component was terminated.

System action: An automatic restart of the Configuration component is attempted.
Operator response: None.
System programmer response: None.
Module: EZACFMMN
Procedure name: cfTermHandler, cfAbendHandler

EZ0152I CONFIGURATION: SHUTDOWN IN PROGRESS

Explanation: The Configuration component is permanently ending due to an error too severe to attempt an automatic restart.

System action: The Configuration component is ended.
Operator response: Contact the system programmer.
System programmer response: This message is preceded by one or more error messages indicating the error that caused the Configuration component to be ended.
Module: EZACFMMN
Procedure name: cfAbendHandler

EZ0153I CONFIGURATION: POSSIBLE RESTART LOOP DETECTED

Explanation: An error occurred in the Configuration component that caused a restart to be attempted. The restart processing determined that the configuration component had already been restarted multiple times in a short time span and therefore ended the restart processing to prevent a restart loop from occurring.
**EZ0154I • EZ0156I**

**System action:** The Configuration component is ended. In order to restart the Configuration component, TCP/IP must be stopped and restarted.

**Operator response:** This message will be preceded by several error messages, which will indicate the errors that occurred in the Configuration component that caused the Configuration component to be restarted. No new configurations will be accepted until TCP/IP is stopped and restarted.

**System programmer response:** This message will be preceded by several error messages, which will indicate the errors that occurred in the Configuration component to cause the Configuration component to be restarted. Correct the errors indicated by the previous error messages, then stop and restart TCP/IP to restart the Configuration component.

**Module:** EZACFMMN

**Procedure name:** cfAbendHandler

---

**EZ0154I  CONFIGURATION: UNABLE TO OPEN MESSAGE CATALOG "cfmsg.cat" - errmsg rrsn**

**Explanation:** The configuration component was unable to open the configuration message catalog "cfmsg.cat" in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/%L/%N".

errmsg describes the Return Code.

rc is the decimal Return Code returned by catopen(). Return Codes are listed and described in the z/OS UNIX System Services Messages and Codes.

rrsn is the hexadecimal reason code returned by catopen(). Reason Codes are listed and described in the z/OS UNIX System Services Messages and Codes.

**System action:** The configuration component will use the internal default messages instead of the messages from the external message catalog.

**Operator response:** If you want to use the external message catalog, contact the system programmer to correct the error. If the default messages are acceptable, no action is necessary.

**System programmer response:** Install the current level of the Configuration message catalog then restart TCPIP to gain access to the message catalog. If the problem persists, contact the IBM software support center.

**Module:** EZACFMMN

**Procedure name:** main

---

**EZ0155I  CONFIGURATION: UNABLE TO OPEN ddname DD - errno**

**Explanation:** The configuration component attempted to open the data set specified by the indicated DD statement but was unable to open it.

errno is the hexadecimal z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

**System action:** The data set will not be opened.

**Operator response:** If use of the ddname DD statement is required, correct the indicated error. If writing messages to the control log using syslog() is acceptable, no action is necessary.

**System programmer response:** If use of the data set specified on ddname is required, correct the indicated error. If writing messages to the control log using syslog() is acceptable, no action is necessary.

**Module:** EZACFMMN

**Procedure name:** main

---

**EZ0156I  INITIAL PROFILE HANDLING RESULTED IN ERRORS: TERMINATING TCPIP**

**Explanation:** An internal error occurred when handling the initial profile. This error prevents TCP/IP from continuing. TCP/IP generated error messages to the system log. See these messages to determine the reason why TCP/IP is being terminated.
Operator response: Error messages generated while handling the initial profile were written to the system log. Contact the system programmer.

System programmer response: Error messages generated while handling the initial profile were written to the system log.

Module: EZACFMMN

Procedure name: main

EZZ0157I  CONFIGURATION: state

Explanation: The configuration component might have terminated because of an abend or a SIGTERM condition.
The SIGPIPE handler controls cleanup of resources during termination. If sigaction fails for SIGPIPE, the configuration component will not be automatically restarted when SIGPIPE is received.
Depending on the severity of the error, TCP/IP might continue without the configuration component being active or TCP/IP might terminate.
state describes the state of the configuration component if a termination occurred.

System action: TCP/IP continues or is terminated.

Operator response: The configuration component terminated. Contact the system programmer.

System programmer response: If state was UNABLE TO GET HOSTNAME, ensure that VMCF is fully initialized before starting TCP/IP. Avoid sharing TCPIP.DATA files between JES nodes. Ensure that there is a separate TCPIP.DATA file for each TCP/IP.

Module: EZACFMMN

Procedure name: doErrorRecovery, main

EZZ0158I  SELECTEX FAILED: errno=errno errnojr=errnojr

Explanation: An internal error occurred in TCP/IP configuration processing.
errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.
errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: The Configuration component will try to take a dump of the TCP/IP address space and then abend.

Operator response: Contact the system programmer.

System programmer response: Report the error to the IBM software support center.

Module: EZACFMMN

Procedure name: main

EZZ0160I  CONFIGURATION: MESSAGE CATALOG FOUND ON PATH path WITH TIMESTAMP cat_timestamp IS OUT OF DATE - MODULE TIMESTAMP mod_timestamp - USING DEFAULT MSGS

Explanation: The configuration component determined that the message catalog "cfmsg.cat" found on path is out of date. The time stamp found in the message catalog is for an earlier time than that needed by the configuration component load module.
path is the z/OS UNIX path for the message catalog.
cat_timestamp is the message catalog time stamp in the format: yyyy ddd hh:mm UTC.
mod_timestamp is the message catalog time stamp that was used when the configuration component modules were compiled in the format: yyyy ddd hh:mm UTC.

System action: The configuration component will use the internal default messages instead of the messages from the external message catalog.
**EZ0161I • EZ0162I**

**Operator response:** If you want to use the external message catalog, contact the system programmer to correct the error.

If the default messages are acceptable, no action is necessary.

**System programmer response:** An out-of-date message catalog can be caused by any of the following conditions:
- The wrong z/OS UNIX file system was mounted.
- The NLSPATH environment variable was pointing to an old catalog.
- The service update for the new catalog failed.

If the problem cannot be corrected, contact the IBM software support center.

**Module:** EZACFMMN

**Procedure name:** main

```
EZ0161I  AUTOLOG: MESSAGE CATALOG FOUND ON PATH path WITH TIMESTAMP cat_timestamp IS OUT OF DATE - MODULE TIMESTAMP mod_timestamp - USING DEFAULT MSGS
```

**Explanation:** The autolog task determined that the message catalog "cfmsg.cat" found on path is out of date. The time stamp found in the message catalog is for an earlier time than that needed by the autolog load module.

- path is the z/OS UNIX path for the message catalog.
- cat_timestamp is the message catalog time stamp in the format: yyyy ddd hh:mm UTC.
- mod_timestamp is the message catalog time stamp that was used when the autolog module was compiled in the format: yyyy ddd hh:mm UTC.

**System action:** The autolog task will use the internal default messages instead of the messages from the external message catalog.

**Operator response:** If you want to use the external message catalog, contact the system programmer to correct the error.

If the default messages are acceptable, no action is necessary.

**System programmer response:** An out-of-date message catalog can be caused by any of the following conditions:
- The wrong z/OS UNIX file system was mounted.
- The NLSPATH environment variable was pointing to an old catalog.
- The service update for the new catalog failed.

If the problem cannot be corrected, then contact the IBM software support center.

**Module:** EZACFALG

**Procedure name:** main

```
EZ0162I  HOST NAME FOR tcpstackname IS hostname
```

**Explanation:** This message displays the host name for a TCP/IP stack.

The host name is determined in the following way:

1. The name on the stack's TCPIP.DATA HOSTNAME statement is used. The z/OS UNIX search order is used to find the stack's TCPIP.DATA statements. See information about the search orders that are used in the z/OS UNIX environment in z/OS Communications Server: IP Configuration Guide for a description of this search order.
2. If there is no valid HOSTNAME statement, the VMCF node name with which VMCF was started is used.
3. If VMCF was not active when the stack was started, the CVTSNAME value (the SYSNAME=value in IEASYSxx that was IPLed) is used.

In the message text:

- tcpstackname
  - The name of the TCP/IP stack.
hostname

The TCP/IP stack's host name.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

EZZ0165I

System action: TCP/IP continues.
Operator response: None
System programmer response:
1. Update the profile to include only one DEFADDRTABLE statement.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue VARY TCPIP,OBEYFILE with the updated profile.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Configuration & Initialization
Module: EZACFPAR
Routing code: 10
Descriptor code: 12
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0164I DEFADDRTABLE STATEMENT ON LINE 185 IS IGNORED - DEFADDRTABLE WAS ALREADY SPECIFIED

EZZ0165I VIPADISTRIBUTE PARAMETER DESTIP ALL ON LINE linenum CANNOT BE SPECIFIED WHEN DISTMETHOD IS HOTSTANDBY

Explanation: The DESTIP ALL parameter cannot be used on a VIPADISTRIBUTE DEFINE statement that has a distribution method of HOTSTANDBY.

In the message text:
linenum
The line number in the configuration file on which the parameter is specified.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues. The VIPADISTRIBUTE DEFINE statement is rejected.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.
System programmer response: Perform the following steps to correct the problem:
1. Remove DESTIP ALL from the VIPADISTRIBUTE DEFINE statement or change the distribution method to one that is not HOTSTANDBY.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference
User response: Not applicable.
Problem determination: Not applicable.

**EZZ0209I**  
Telnet server configuration statements ignored in TCPIP

Explanation: While the TCPIP profile was being processed, one or more of the following Telnet configuration statements were found:

- BeginVtam/EndVtam
- TelnetGlobals/EndTelnetGlobals
- TelnetParms/EndTelnetParms

The Telnet server is not supported in the TCPIP address space. All Telnet configuration statements are ignored.

System action: TCPIP continues.

Operator response: Save the system log for problem determination and contact the system programmer.

System programmer response: Review the EZZ0309I messages to determine which data sets contain the TCPIP profile statements. Remove any BeginVtam/EndVtam, TelnetGlobals/EndTelnetGlobals, or TelnetParms/EndTelnetParms statements from these data sets. If the Telnet configuration statements are in separate data sets, remove the INCLUDE statements for these data sets from the TCPIP profile. See the information about Telnet in its own address space in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/SSLTBK_2.2.0/com.ibm.zos.v2r2.mhceic2.doc/config.html).

User response: Not applicable.

Problem determination: Not applicable.

EZZ0300I  Opened ftype file fname

Explanation: The file was opened for the specified type of processing.

System action: Profile processing continues.

Operator response: None.
System programmer response: None.
Module: EZACFPFP
Procedure name: findInitProfile, openObeyFile, processInclude

EZZ0301I  Dataset name dsn incorrect

Explanation: The data set name does not conform to MVS data set naming conventions.

System action: Configuration processing ends for that data set.

Operator response: Correct the data set name and continue.
System programmer response: None.
Module: EZACFD00, EZACFPFP
Procedure name: openObeyFile, processInclude
EZZ0302I  End of File encountered
Explanation:  The end of file was found before all configuration processing could be completed.
System action:  Profile processing ends.
Operator response:  Correct the previous statement and rerun the profile.
System programmer response:  None.
Module:  EZACFPAR
Procedure name:  parseFile

EZZ0303I  ftype file contains errors
Explanation:  The indicated file contains errors.
System action:  Configuration processing continues.
Operator response:  Correct the errors in the data set and continue.
System programmer response:  None.
Module:  EZACFYAC, EZACFPPR
Procedure name:  processInclude, handleInitialProfile, processObeyFile

EZZ0304I  Resuming processing of file dsn
Explanation:  Completed processing of an include file. The original configuration file continues.
System action:  The file that contained the include statement continues.
Operator response:  Correct the problems in the include file and rerun.
System programmer response:  None.
Module:  EZACFYAC
Procedure name:  processInclude

EZZ0305I  Cannot open file dsn
Explanation:  The indicated file cannot be opened.
System action:  Profile processing cannot be done for the data set.
Operator response:  Correct the open failure and rerun the profile.
System programmer response:  None.
Module:  EZACFPPR
Procedure name:  processInclude, processObeyFile

EZZ0306I  Attempted recursive include of dsn on line lineno
Explanation:  A file cannot be included multiple times for the same configuration file processing.
System action:  The file is not included.
Operator response:  Correct the include statement and rerun the profile.
System programmer response:  None.
Module:  EZACFPPR
Procedure name:  processInclude
**EZ0307I**

**EZ0307I  CONFIGURATION: An internal error occurred, the reason code is reason_code**

**Explanation:** An error occurred in the configuration component.

`reason_code` is one of the following:

-1  Selectex call failed for the Autolog task. The Autolog task will be shut down.

-4  Internal error occurred. This will be one of the following:

  • The call to get the telnet socket/port failed.
  • Telnet error when trying to retrieve the stack jobname from TSEB (no TSEB found.)

-5  Should not occur - internal Telnet error.

-15  Storage obtain failed.

-17  Header contained invalid data. This might be a version or request type that is not valid.

-18  Header length invalid.

-20  Bad contact type in header. The contact value must be either INIT_CONTACT, RECONTACT, or RESYNC. The connection is closed.

-22  Buffer too small to receive data. Input buffer is not large enough to be a protocol header.

-23  Buffer too small to be valid. Output buffer is not large enough for a response header.

-24  Bad subtype in buffer. Subtype in response does not match subtype in request.

-25  Address less than or equal to zero or Telnet client state not valid to send QUIESCE.

-26  Data in response is invalid. Telnet error in QUIESCE response.

-27  Socket descriptor too large.

-28  Socket descriptor too large.

-50  User tokens were not equal on a RESYNC request.

-52  Maximum number of retries reached for profile processing on RECONTACT.

-60  Cannot fine TSEB in main entry point for configuration subtask. Configuration task will be shut down.

-61  Cannot fine TSDB in main entry point for configuration subtask. Configuration task will be shut down.

-62  Cannot fine TSDX in main entry point for configuration subtask. Configuration task will be shut down.

-63  Socket call failed. Error trying to open the socket to the stack when processing a start or stop device.

-64  Storage obtain failed. Error when attempting to get a buffer for ioctl when processing a start or stop device.

-65  Storage obtain failed. Error when attempting to get a buffer for ioctl when processing initial device.

-66  Storage obtain failed. Error when attempting to get a buffer for ioctl when processing the VARY TCPIP,OBEYFILE command.

-67  Setibmopt failed while processing a start or stop device. In order to have more than one TCP/IP stack connected to z/OS UNIX, the z/OS UNIX must be configured for Common INET (CINET.) Processing is terminated.

-68  Autolog initialization failed.

-69  Cannot find TSEB in main entry point for Autolog subtask. Autolog task will be shut down.

-70  Cannot find TSDB in main entry point for Autolog subtask. Autolog task will be shut down.

-71  Cannot find TSDX in main entry point for Autolog subtask. Autolog task will be shut down.

-72  Autolog error recovery failed.

**System action:** TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error described by error_code. Report Internal errors to the IBM software support center.
Module: EZACFMMN, EZACFPAR
Procedure name: main, handleInitialProfile, processObeyFile

EZZ0309I Profile processing beginning for dsn
Explanation: Profile processing beginning.
System action: Profile processing continues.
Operator response: None.
System programmer response: None.
Module: EZACFPAR, EZACFYAC
Procedure name: parseFile

EZZ0310I File dsn contains no statements
Explanation: The file contains no statements.
System action: None.
Operator response: Ensure that the data set name was correctly entered and contains valid statements.
System programmer response: None.
Module: EZACFYAC
Procedure name: parseFile

EZZ0311I The statement statement on line lineno is obsolete
Explanation: The statement is obsolete. This usually indicates that an unmodified profile from a prior release is being used.
System action: Profile processing continues.
Operator response: None.
System programmer response: None.
Module: EZACFPAR, EZACFYAC
Procedure name: parseFile

EZZ0312I The statement or argument on line lineno contains an incorrect value value
Explanation: An incorrect value was specified.
System action: Profile processing continues. However, the statement or argument is not defined properly and will be ignored.
For read_buffers or write_buffers of a CDLC device, the amount of buffer space used for either the read or write size must be less than 64K. Therefore for a buffer size of 4096, a maximum of 15 buffers can be reserved. For a size of 2048, a maximum 31 buffers can be used. For a size of 1024, a maximum 63 buffers can be used.
This message can be issued when defining a supernet route on the GATEWAY or BEGINROUTES statement if IPCONFIG VARSUBNETTING has not yet been set.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
System programmer response: None.
Module: EZACFPAR, EZACFMS1, EZACFATM
Procedure name: parseFile
EZZ0313I  The option option in statement statement on line lineno is not supported in this release
Explanation:  The option is not supported in this release.
System action:  Profile processing continues.
Operator response:  Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
System programmer response:  None.
Module:  EZACFPAR, EZACFPPT, EZACFATM
Procedure name:  parseFile

EZZ0314I  Extraneous parameter parm found on line lineno
Explanation:  The parameter was used incorrectly.
System action:  The parameter is ignored.
Operator response:  Correct the parameter and rerun the profile.
System programmer response:  None.
Module:  EZACFPAR
Procedure name:  parseFile

EZZ0315I  D...TELNET,HNGROUP <,PORT=ALL|XNUM|XNUM1..XNUM2|BASIC|SECURE> <,PROFILE=XPRFID|CURR|ACT|ALL> <,ID=XHNGNM,<SUMM|DET>> <,MAX=XNN|>
Explanation:  This message is the result of the DISPLAY TCPIP,,HELP,HNGROUP command and shows the format of the command.
System action:  TCP/IP continues.
Operator response:  For more information about the command, see z/OS Communications Server: IP System Administrator's Commands
System programmer response:  None.
Module:  EZACDHLP
Procedure name:  parseFile

EZZ0316I  Profile processing complete for file dsn
Explanation:  Profile processing complete for the specified data set.
System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  EZACFPAR, EZACFYAC
Procedure name:  parseFile

EZZ0318I  value was found on line lineno and parameter was expected
Explanation:  The expected parameter was not found.
System action:  Profile processing continues. However, the statement is not defined correctly and is ignored. If the statement consists of a block of definitions (for example, VIPADYNAMIC or SRCIP statements), then the remaining block after the syntax error is ignored.
Operator response:  Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
**EZZ0319I** The Entry entry value value is an incorrect parameter parameter on statement statement on line lineno

Explanation: The value is incorrect.

System action: The value is ignored. Profile processing continues.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference

System programmer response: None.

Module: EZACFPAR, EZACFATM, EZACFPAL, EZACFPPT, EZACFPIT

**EZZ0320I** Command value val on line lineno is too long

Explanation: The value is too long.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, profile processing continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference

System programmer response: None.

Module: EZACFPAR, EZACDSTR, EZACFPPT, EZACFPIT

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: parseFile

Example:

```
EZZ0320I DEVICE NAME VALUE DEVICE1234 ON LINE 83 IS TOO LONG
```

**EZZ0321I** Internal command number failed errno=errno errnojr=errnojr on line lineno

Explanation: An internal error occurred in TCP/IP configuration processing.

`errno` is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.

`errnojr` is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: The statement fails.

Operator response: Contact the system programmer.

System programmer response: Report the error to the IBM Software Support Center.

Module: EZACFMS1

Procedure name: parseFile
EZZ0322I • EZZ0323I

**EZZ0322I**  
**keyword value value not valid on line lineno, replacement used**

**Explanation:**  The value is incorrect, the replacement value (which might be either the default value or the closest allowed value) is used instead.

**System action:**  This message can also be displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects an error in a profile data set. No changes are applied to the active configuration. Correct the error before using the profile data set as an initial profile or as a VARY TCPIP,,OBEYFILE profile.

**Operator response:**  Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: IP Configuration Reference](../).

**System programmer response:**  None.

**Module:**  EZACFPAR, EZACFPIT, EZACFATM, EZACFPAL, EZACFPPT

**Procedure name:**  parseFile

---

**EZZ0323I**  
**Statement statement on line lineno had no entries**

**Explanation:**  The statement had no entries. This might have been caused by a statement that had a syntax error in the first entry. This might also be a syntactically correct statement that was coded with no entries.

In the message text:

- **statement**:  The statement type that had no entries. Possible values are: HOME, GATEWAY, BEGINROUTES, AUTOLOG, NETACCESS, BSDROUTINGPARMS, SRCIP, IPSEC, DEFADDRRABLE, and TRANSLATE.

- **lineno**:  The line number where the statement was found.

**System action:**  If processing an initial profile or a VARY TCPIP,,OBEYFILE command:

- If this is a HOME statement and it is the first HOME statement in a profile, the NULL HOME statement will delete all existing HOME entries from the active configuration. Similarly, if this is the first GATEWAY, BEGINROUTES, AUTOLOG, NETACCESS, or TRANSLATE statement, all existing entries of that type are deleted.
- If this is not the first such statement in a profile, or if the statement is not identified above, the action depends on the statement. See the [z/OS Communications Server: IP Configuration Reference](../) for more information.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects an empty statement in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

**Operator response:**  Save the console log, and report the error to the system programmer.

**System programmer response:**

1. If you want to delete all existing HOME, GATEWAY, BEGINROUTES, AUTOLOG, NETACCESS, BSDROUTINGPARMS, or TRANSLATE entries from the active configuration, verify that this statement is the first statement of that type in the profile.
2. If you do not want to delete all existing entries, make one of these changes to correct the error:
   - Remove the statement from the profile.
   - Add entries to the statement.
   - Correct syntax errors in existing entries for that statement. Inspect the console log for prior messages that indicate syntax errors in the statement’s entries.
3. If this statement deleted all entries and that was your intention, no further action is needed.
4. If this message is displayed as a result of VARY TCPIP,,SYNTAXCHECK processing, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue VARY TCPIP,,OBEYFILE with the corrected profile.

**Module:**  EZACFPAR, EZACFPAL

**Automation:**  This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** parseFile

**Example:**

EZZ0323I BEGINROUTES STATEMENT ON LINE 57 HAD NO ENTRIES

---

**EZZ0324I**  Unrecognized statement *statement* found on line *lineno*

**Explanation:** The statement is unrecognized.

This error might have been caused by a problem on the previous line or command such as:

- Incomplete parameter information.
- Extraneous parameter information.
- Mistyped keyword parameters.

**System action:** Profile processing continues. However, the statement is not defined properly and will be ignored.

**Operator response:** Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: IP Configuration Reference](#).

**System programmer response:** None.

**Module:** EZACFYAC

**Procedure name:** parseFile

---

**EZZ0325I**  Initial profile could not be found

**Explanation:** The initial profile could not be found.

**System action:** Profile processing ends. TCP/IP ends.

**Operator response:** Update the files used for initial profile processing. Consult the [z/OS Communications Server: IP Configuration Reference](#).

**System programmer response:** TCP/IP ends.

**Module:** EZACFPPR

**Procedure name:** HandleInitialProfile

---

**EZZ0326I**  *statement1* conflicts with *statement2* value *value* used on line *lineno*

**Explanation:** The value is incorrect.

**System action:** If processing an initial profile or a VARY TCPIP,,OBEYFILE command, profile processing continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: IP Configuration Reference](#).

**Module:** EZACFATM, EZACFMS1, EZACFPPT

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
**EZ0327I**

Procedure name: parseFile

Example:

EZZ0326I NOAUTOLOG CONFLICTS WITH PORT VALUE RESERVED USED ON LINE 54

---

**EZ0327I  Type id on line lineno is already defined**

Explanation: Configuration processing encountered a definition item that is the same type and has the same ID as a definition item that is already defined. Multiple items of this type cannot be defined with the same ID.

In the message text:

- **Type**: type of definition item that is already defined with the same ID. Possible values are:
  - **ATMARPSV**: An ATMARP server, to resolve ATMARP requests for a logical IP subnet (LIS), specified on an ATMARPSV statement.
  - **ATMLIS**: An ATM logical IP subnet (LIS) specified on an ATMLIS statement.
  - **ATMPVC**: A permanent virtual circuit (PVC), to be used by an ATM link, specified on an ATMPVC statement.
  - **BEGINROUTES ROUTE BLOCK ENTRY**: A route specified in a BEGINROUTES block.
  - **DEVICE NAME**: A device specified on a DEVICE statement.
  - **GATEWAY GATE LIST ENTRY NUNBER**: A route specified on a GATEWAY statement.
  - **INTERFACE NAME**: An interface specified on an INTERFACE statement.
  - **IP ADDRESS**: An IP address specified on a HOME or INTERFACE statement.
  - **LINK NAME**: A link specified on a LINK statement.

- **id**: The ID for the definition item that was already defined. When the type value is:
  - **ATMARPSV**: The value specified for the arpsrv_name parameter of the ATMARPSV statement.
  - **ATMLIS**: The value specified for the lis_name parameter of the ATMLIS statement.
  - **ATMPVC**: The value specified for the pvc_name parameter of the ATMPVC statement.
  - **BEGINROUTES ROUTE BLOCK ENTRY**: This value is not included in the message text.
  - **DEVICE NAME**: The value specified for the device_name parameter of the DEVICE statement.
  - **GATEWAY GATE LIST ENTRY NUMBER**: The location of the route on the GATEWAY statement.
  - **INTERFACE NAME**: The value specified for the intf_name parameter of the INTERFACE statement.
  - **IP ADDRESS**: The value specified for the internet_addr parameter of the HOME statement or for the ipv4_address or ipv6_address parameter of the INTERFACE statement.
LINK NAME
   The value specified for the link_name parameter of the LINK statement.

lineno
   The line number in the TCP/IP profile where the definition statement was encountered.

System action: Profile processing continues. The specified definition item is ignored. When the type value is:

BEGINROUTES ROUTE BLOCK ENTRY
   Other routes specified in the BEGINROUTES block are not ignored.

GATEWAY GATE LIST ENTRY NUMBER
   Other routes specified on the GATEWAY statement are not ignored.

IP ADDRESS
   The system action is based on where the IP address was specified. If it was specified on the HOME
   statement, other IP addresses specified on the HOME statement are not ignored. If it was specified on the
   INTERFACE statement, the interface definition is accepted, but the IP address is ignored. If the INTERFACE
   statement is defining an IPv6 interface, other IP addresses specified on the INTERFACE statement are not
   ignored.

Operator response: Contact the system programmer.

System programmer response: Correct the statement and, if appropriate, rerun the profile. When the type value is:

ATMLIS
   If you were attempting to change the value specified for the subnet_value or subnet_mask parameter on the
   ATMLIS statement, delete and then redefine the ATMLIS with the new value.

INTERFACE NAME
   If you were attempting to assign the interface to a new port after deleting the previous interface definition,
   stop and restart the TCP/IP stack to reassign the interface.

IP ADDRESS
   If the IP address was specified on the INTERFACE statement for an IPv4 interface, delete the interface
   definition before you redefine the interface with the correct IP address. If the IP address was specified on the
   INTERFACE statement for an IPv6 interface, either delete the interface before you redefine the interface with
   the correct IP address or add the correct IP address to the interface using the ADDADDR option of the
   INTERFACE statement.

LINK NAME
   If you were attempting to assign the link to a new device after deleting the previous link definition, stop
   and restart the TCP/IP stack to reassign the link.

For more information about the statement, see the z/OS Communications Server: IP Configuration Reference

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFMS1

Routing code: 10

Descriptor code: 12

Automation: Not applicable.

Example:
EZ20327I INTERFACE NAME OSALNK2 ON LINE 53 IS ALREADY DEFINED

EZ20328I Type name on line lineno has not been defined or has been deleted

Explanation: The name was not defined or was deleted.

System action: Profile processing continues. However, the statement is not defined properly and will be ignored.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFMS1

Procedure name: parseFile

---

EZ0329I Linkname Linkname is not defined but is used for BSDRouting on line lineno

Explanation: Linkname Linkname is not defined but is used for BSDRouting on line lineno.

System action: The statement is not processed. All BSDRouting statements that follow are not processed.

Operator response: Define the Linkname or remove it from BSDRouting Parms.

System programmer response: None.

Module: EZACFMS1

Procedure name: parseFile

---

EZ0330I On line lineno an attempt was made to define more type1 to type2 devname than is allowed by the device

Explanation: The device specified has more links already defined than the device type supports. For example, CTC devices can have at most one link. LCS devices can have a link statement for each adapter.

To configure multiple INTERFACE statements for the same OSA-Express QDIO port name, use the INTERFACE statement and adhere to the multiple VLAN configuration rules. See the OSA VLAN information in z/OS Communications Server: IP Configuration Guide for more about these configuration rules.

System action: Profile processing continues. However, the statement is not defined properly and will be ignored.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFMS1

Procedure name: parseFile

---

EZ0331I No home address assigned to link linkname

Explanation: The link was defined but no home address was given for it. No TCP/IP traffic can flow over this link.

System action: TCP/IP continues.

Operator response: Assign a home address for the link using the HOME statement. Rerun the profile.

System programmer response: None.

Module: EZACFMS1

Procedure name: parseFile

---

EZ0332I DD:PROFILE not found. Continuing profile search

Explanation: Either there was no //PROFILE DD JCL card specified in the TCP/IP cataloged procedure or the //PROFILE DD JCL card specified could not be opened.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

Module: EZACFPPR

Procedure name: parseFile
EZZ0333I  Linkname Linkname is not defined with BSDROUTINGPARMS information

Explanation:  Linkname Linkname is not defined with BSDROUTINGPARMS information. If BSDROUTINGPARMS are used, each linkname should be defined once in the BSDROUTINGPARMS statement. The link will get default BSDROUTINGPARMS information.

System action:  TCP/IP continues.
Operator response:  Use onetstat -d to determine if the default BSDROUTINGPARMS information is what is required.
System programmer response:  None.
Module:  EZACFMS1
Procedure name:  parseFile

EZZ0334I  IP forwarding is disabled

Explanation:  The status of IP forwarding is displayed. IP forwarding can be disabled by specifying the value NODATAGRAMFWD on the IPCONFIG statement.

System action:  TCP/IP continues.
Operator response:  None.
System programmer response:  None.
Module:  EZACFMS1
Procedure name:  parseFile

EZZ0335I  ICMP < will | will not > ignore redirects

Explanation:  The state of ICMP redirects is displayed.

System action:  TCP/IP continues.
Operator response:  None.
System programmer response:  None.
Module:  EZACFMS1
Procedure name:  parseFile

EZZ0336I  <A limit | No limit> on incoming UDP datagram queue set

Explanation:  The limit on incoming UDP datagram queue is displayed.

System action:  TCP/IP continues.
Operator response:  None.
System programmer response:  None.
Module:  EZACFMS1
Procedure name:  parseFile

EZZ0337I  CLAWUSEDOUBLENOP is < set | cleared >

Explanation:  The status of CLAWUSEDOUBLENOP is displayed.

System action:  TCP/IP continues.
Operator response:  None.
System programmer response:  None.
Module:  EZACFMS1
**EZZ0338I • EZZ0341I**

**Procedure name:** parseFile

---

**EZZ0338I**  
વ<TCP | UDP> **ports 1 thru 1023** <are | are not> reserved

**Explanation:** The status of the TCP or UDP restricted ports is displayed.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0339I** More messages were found than can be reported

**Explanation:** The semantic processing at the end of the profile completes many configuration checks. These include LINKs without HOME statements, BSD routing checks, etc. This message is issued when more of these conditions exist than can be reported.

**System action:** TCP/IP continues.

**Operator response:** Check previous error messages, correct the problems that exist, and rerun the profile to receive the messages that could not be reported during this profile processing.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0340I** BSDROUTINGPARMS destination address dest_addr for link linkname is incorrect

**Explanation:** The BSDROUTINGPARM destination address for the specified link is incorrect. If the link is a CTC or any other point to point link, the destination address must be a host address. If the link is not a point to point link, then the destination address must be a network or subnetwork address.

**System action:** TCP/IP continues. TCP/IP ignores the statement.

**Operator response:** Correct the statement. Rerun the profile.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0341I** Configuration component cannot modify TCP/IP configuration errno=errno errnojr=errnojr

**Explanation:** A prior internal error eliminated the ability of the configuration component to modify the TCP/IP stack.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**System action:** TCP/IP continues with the configuration unchanged. If this is the initial profile, TCP/IP ends.

**Operator response:** Contact the system programmer.

**System programmer response:** The stack configuration remains unchanged. The only way to circumvent the prior internal error problem is to stop TCP/IP and restart it. If the error occurs on the initial profile, the TCP/IP will not start up.

**Module:** EZACFPAR
Procedure name: parseFile

**EZZ0342I** DELETE PORT/PORTRANGE failed on line *lineno*

**Explanation:** One of the following occurred:
- The port was never defined
- The port was defined, but then deleted
- The port define attributes do not agree with the delete attributes
  For example, a PORTRANGE was used to define the port, but a DELETE PORT was used to delete the port.

**System action:** TCP/IP continues.

**Operator response:** Correct the statement and rerun the profile.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0343I** Mismatched *statement* on line *lineno*

**Explanation:** The characteristic used on the specified line conflicts with a previous definition. One of the following occurred:
- A Translate statement specified a network address not supported by the linkname used.
- An ATMARPSV statement specified a pvc name that is defined to a link name that is not defined to the ATMARPSV logical IP subnetwork.

**Operator response:** Correct the statement. Rerun the profile.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0344I** Permanent loopback address 127.0.0.1 specified on line *lineno* cannot be added to the HOME list

**Explanation:** The HOME list entry on the specified line used the permanent loopback IP address 127.0.0.1. The permanent loopback IP address 127.0.0.1 cannot be added to the HOME list.

**In the message text:**

*line_number*
- The line in the TCP/IP profile where the error was found

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the statement. Rerun the profile.

**Module:** EZACFPAR

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** parseFile

---

Chapter 2. EZZ0xxx messages  39
Example:
EZZ0344I PERMANENT LOOPBACK ADDRESS 127.0.0.1 SPECIFIED ON LINE 97 CANNOT BE ADDED TO THE HOME LIST

EZZ0345I STOPONCLAWERROR is < enabled | disabled>
Explanation: The status of STOPONCLAWERROR is displayed. After STOPONCLAWERROR is enabled it cannot be disabled.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: parseFile

EZZ0348I Gate list entry number routenum on line lineno for destination destaddr is unreachable through interface intfaceaddr on interface
Explanation: The specified gate list entry in the GATEWAY statement on the line specified is in error. The destination address is unreachable through the specified interface using any known routes.
System action: Profile processing continues. However, the statement is not defined properly and will be ignored.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
System programmer response: None.
Module: EZACFMS1
Procedure name: getData

EZZ0350I Sysplex routing support is status
Explanation: The status of Sysplex routing support is displayed, where status is either: ENABLED or DISABLED.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: getData

EZZ0351I SourceVipa support is status
Explanation: The status of SourceVipa support is displayed, where status is either: ENABLED or DISABLED.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: getData

EZZ0353I Device devicename on line lineno is devstate
Explanation: An attempt to change the state of a device failed because of the reason stated.
System action: Profile processing continues. However, the statement is not defined properly and will be ignored.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFMS1

Procedure name: getData

---

**EZ0354I** Type name on line lineno is redefined

Explanation: The name had been previously defined and the new definition was used in its place.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

Module: EZACFMS1

Procedure name: parseFile

---

**EZ0355I** DISPLAY TCPIP,,HELP,CONN:

Explanation: This message is the result of the DISPLAY TCPIP,,HELP,CONN command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: parseFile

---

**EZ0356I** A and B are mutually exclusive: A on line lineno {accepted|ignored}

Explanation: Two parameters are mutually exclusive. The statement is accepted or ignored.

In the message text:

- **lineno**
  - The line in the TCP/IP profile where the error was found
- **A**
  - The parameter that is accepted or ignored
- **B**
  - The parameter that is in conflict with A
- **accepted|ignored**
  - The action taken when processing an initial profile or a VARY TCPIP,,OBEYFILE command

System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, profile processing continues.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Correct the statement at line lineno and rerun the profile.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY
TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** parseFile

**Example:**

EZZ0356I GATEWAY AND BEGINROUTES ARE MUTUALLY EXCLUSIVE: GATEWAY ON LINE 86 IGNORED

**Explanation:** This message is the result of issuing the DISPLAY TCPIP,,HELP,HELP command.

---

EZZ0382I D...NETSTAT,HOME,<,INTFNAME=><,FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY TCPIP,,HELP,HOME command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: parseFile

---

EZZ0395I statement name ON LINE lineno FAILED BECAUSE reason

Explanation: The command failed for the reason indicated.

In the message text:

statement
   The profile statement that failed.

name
   The name specified on the profile statement.

lineno
   The line number in the profile data set where the statement was found.

reason
   The reason can be one of the following:

A CONFIGURATION ERROR HAS OCCURRED
   One of the following errors occurred during DELETE PORT/PORTRANGE processing:
      • The port define attributes do not agree with the delete attributes. For example, a PORTRANGE was used to define the port, but a DELETE PORT was used to delete the port.
      • An internal configuration error occurred.

A LINK REFERENCES THE ATMLIS
   An ATM LINK statement referenced this ATMLIS.

AN ATMARPSV REFERENCES THE ATMLIS
   An ATMARPSV statement referenced this ATMLIS.

A VIPA DEVICE CANNOT BE STOPPED OR STARTED
   A VIPA device is started when defined and can never be stopped.

DEVICE HAS A LINK DEFINED
   The device has a link defined.

DEVICE IS ACTIVE
   The device is active.

INTERFACE IS ACTIVE
   The interface is not in a valid state to be deleted. The interface must be deactivated.

INTERFACE IS A DYNAMIC VIPA
   The name specified on a DELETE DEVICE, DELETE LINK, or INTERFACE DELETE statement is a dynamic VIPA.
INTERFACE IS DEFINED AS A SOURCE VIPA INTERFACE
    The interface is specified on the SOURCEVIPAINTERFACE keyword for another interface and therefore cannot be deleted.

LINK IS ACTIVE
    The link is active.

LINK STATE NOT VALID
    The device or link is not in a valid state to be deleted.

LINK TYPE NOT VALID
    The link type for the specified name is not valid for the statement.

THE ATMARPSV IS BUSY
    The ATMARPSV cannot be deleted when it is in use.

THE ATMPVC IS USED BY AN ATMARPSV
    The ATMPVC cannot be deleted until the ATMARPSV that specifies it is deleted.

THE LINK HAS PVCs DEFINED
    An ATMPVC statement has a PVC to this link defined.

System action:  TCP/IP continues.
Operator response: None.
System programmer response: See the following based on reason indicated:

A CONFIGURATION ERROR HAS OCCURRED
    Determine if the DELETE PORT/PORTRANGE statement is correct:
    • If the statement is incorrect, correct it and use the VARY TCPIP,OBEYFILE command to delete the PORT/PORTRANGE.
    • If the statement is correct, the problem is because of an internal configuration error. Exception CTRACE records were written at the time of the error. Contact the IBM Support Center with the CTRACE records and message information.

A LINK REFERENCES THE ATMLIS
    The ATM LINK must be deleted before the ATMLIS can be deleted. The VARY TCPIP,OBEYFILE command can be issued to delete the ATM LINK.

AN ATMARPSV REFERENCES THE ATMLIS
    ATMARPSV must be deleted before the ATMLIS can be deleted. The VARY TCPIP,OBEYFILE command can be issued to delete the ATMARPSV.

A VIPA DEVICE CANNOT BE STOPPED OR STARTED
    No action.

DEVICE HAS A LINK DEFINED
    The link must be deleted before the device can be deleted. The VARY TCPIP,OBEYFILE command can be used to delete the link.

DEVICE IS ACTIVE
    The device must be stopped before it can be deleted. The VARY TCPIP,STOP command can be issued to stop the device.

INTERFACE IS A DYNAMIC VIPA
    You must use the VIPADELETE statement to delete a dynamic VIPA.

LINK STATE IS NOT VALID
    The link is in use. If this message was issued in response to an attempt to delete a link, the link IP address might still be defined. You must delete the link IP address from the HOME list before the link can be deleted. To remove the link IP address from the HOME list, use the VARY TCPIP,OBEYFILE command with a profile that contains a HOME statement that does not include the home IP address that is associated with the link that you want to delete. If you specify the updated HOME statement and the DELETE LINK statement in the same VARY TCPIP,OBEYFILE data set, the HOME statement must precede the DELETE LINK statement.

THE ATARPSV IS BUSY
    No action.
THE ATMPVC IS USED BY AN ATMARPSV
ATMARPSV must be deleted before ATMPVC can be deleted. The VARY TCPIP,OBEYFILE command can be issued to delete the ATMARPSV.

THE LINK HAS PVCS DEFINED
The PVC must be deleted before the link can be deleted. The VARY TCPIP,OBEYFILE command can be issued to delete the PVC.

Module: EZACFMS1
Procedure name: ioctlmsg

EZZ0396I SNMP SUBAGENT < ALREADY STARTED | ALREADY STOPPED >
Explanation: The state of the SNMP subagent was not changed. Either SACONFIG ENABLED was specified and the subagent was already active, or SACONFIG DISABLED was specified but the subagent was not active.
System action: Profile processing continues.
Operator response: None.
System programmer response: None.
Module: EZACFPAR
Procedure name: parseFile

EZZ0397I ATMLIS listname OPTIONS ON LINE lineno ARE UPDATED.
Explanation: The ATMLIS options entered on the line specified were updated.
System action: Profile processing continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: parseFile

EZZ0398I link SUBNET MASK value ON LINE lineno IS NOT IN CIDR FORMAT
Explanation: The specified link's mask address value is not in Classless Inter-Domain Routing (CIDR) format. CIDR format requires that a mask be consecutive bits of ones then zero or more zeros. It cannot have more ones following the zeros.
System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, profile processing continues.
This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
Operator response: Contact the system programmer.
System programmer response: Correct the statement on line lineno and run the profile again.
Module: EZACFPAR
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
Procedure name: parseFile
Example:

EZZ0398I LINKA SUBNET MASK 240.255.255.0 ON LINE 76 IS NOT IN CIDR FORMAT
**EZ0401I • EZ0600I**

**EZ0401I**  event IN FILE: filename ON LINE: lineno AT: token

Explanation: The specified event occurred while processing the file. The token shown was found at the specified line number in the named file. The actual event might be associated with this token, the previous token, or the previous statement.

In the message text:

- **event**: The event that caused the error.
- **filename**: The configuration file where the event occurred.
- **lineno**: The line number in the configuration file where the event occurred.
- **token**: The token in the configuration file that was being processed when the event occurred.

System action: Profile processing continues.

Operator response: If an error is indicated, correct the statement.

System programmer response: None.

Module: EZACFPTV, EZACFP, EZACFPAR, EZACFPV6

Example:

```
EZ0401I SYNTAX ERROR IN FILE: DD:PROFILE ON LINE: 96 AT: 'BADVAL'
```

Procedure name: Telnet/Vtam parser

**EZ0402I**  num correct statement(s) were attempted from file: filename

Explanation: The module found the indicated number of syntactically correct statements in the indicated file.

System action: Profile processing continues.

Operator response: None.

System programmer response: None.

Module: EZACFPTV

Procedure name: Telnet/Vtam parser

**EZ0600I**  statement_type statement_parms EXISTING PORT RESERVATION CONFLICTS WITH NEW PORT RESERVATION

Explanation: A new PORT or PORTRANGE reservation statement conflicts with an already defined port or port range reservation.

In the message text:

- **statement_type**: The type of port reservation statement that conflicts with the new reservation statement. This value is either PORT or PORTRANGE.
- **statement_parms**: The parameters specified on the existing PORT or PORTRANGE reservation.

System action: Profile processing continues. However, the new port reservation is ignored.

Operator response: Ensure that the PORT and PORTRANGE statements in the TCP/IP profile specify unique ports or port ranges.

System programmer response: Not applicable.

User response: Not applicable.

Problem determination: Not applicable.
Example:
EZZ0600I PORTRANGE 4400-4599 USER1* EXISTING PORT RESERVATION CONFLICTS WITH NEW PORT RESERVATION

Explanation: This message is a result of specifying the GLOBALCONFIG TCPIPSTATISTICS parameter in the TCP/IP profile.
recv_count is the number of IP requests received.
out_count is the number of IP requests sent.
for_count is the number of IP datagrams forwarded.
System action: TCP/IP is being shutdown.
Operator response: None.
System programmer response: None.

Explanation: The number of IP reassembly requests received and failed, and IP fragments created and failed are displayed. This is a result of specifying the GLOBALCONFIG TCPIPSTATISTICS parameter in the TCP/IP profile.
req reqReasmFails reqFragCreats reqFragFails frag_fails
System action: TCP/IP is being shutdown.
Operator response: None.
System programmer response: None.

Explanation: The number of ICMP redirect messages received and sent, and UDP datagrams received and sent are displayed. This is a result of specifying the GLOBALCONFIG TCPIPSTATISTICS parameter in the TCP/IP profile.
icmpInMsgs icmp_out icmpOutMsgs icmp_out udpInDatagrams udp_in udpOutDatagrams udp_out
System action: TCP/IP is being shutdown.
Operator response: None.
System programmer response: None.

Explanation: The number of tcp segments received, segments sent, and segments retransmitted are displayed. This is a result of specifying the GLOBALCONFIG TCPIPSTATISTICS parameter in the TCP/IP profile.
tcpInSegs tcp_out tcpOutSegs tcp_out tcpRetransSegs tcp_re
System action: TCP/IP is being shutdown.
Operator response: None.
System programmer response: None.
EZZ0605I  LINK linkname HAS INCOMPATIBLE BSDROUTINGPARMS SUBNET MASK mask, DESTINATION ADDRESS dest AND HOME IPADDRESS home

Explanation: The link specified has incompatible subnet mask, destination address and HOME ipaddress.

System action: TCP/IP continues.

Operator response: Correct the BsdRoutingParms and HOME statements. Rerun the profile.

System programmer response: None.

Module: EZACFMS1
Procedure name: parseFile

EZZ0608I  LINK linkname HAS LIS lisname WITH ATMLIS SUBNET MASK/VALUE submsk/subval THAT DOES NOT AGREE WITH HOME ADDRESS ipaddr

Explanation: The specified link's LIS was defined with the ATMLIS subnet and value. But the specified HOME address used for this LINK is not in that network. The LINK will not be available for SVC traffic.

System action: TCP/IP continues.

Operator response: Correct the statement. Rerun the profile.

System programmer response: None.

Module: EZACFMS1
Procedure name: parseFile

EZZ0609I  stmttype stmtname IS UNREFERENCED BY ANY stmttype2 STATEMENT. IT WAS DELETED

Explanation: The specified ATMLIS or ATMARPSV statement is unreferenced. The ATMLIS was defined but never used on a LINK statement. Therefore, that ATMLIS and all ATMARPSV's that reference that ATMLIS cannot be used by TCP/IP. Therefore the ATMLIS or ATMARPSV was deleted from TCP/IP.

System action: TCP/IP continues.

Operator response: Correct the statement. Rerun the profile.

System programmer response: None.

Module: EZACFMS1
Procedure name: parseFile

EZZ0610I  keyword VALUE value NOT VALID ON LINE lineno, replacement USED

Explanation: The value is incorrect, the replacement value (which might be either the default value or the closest allowed value) is used instead.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, the replacement value is used. Processing continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP
profile errors that are reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** parseFile

**Example:**

EZZ0610I VARIANCEM VALUE 200 NOT VALID ON LINE 110, 2.000 USED

---

**EZZ0611I**

`type1 val1 on line lineno HAS BEEN USED PREVIOUSLY FOR type2 val2`

**Explanation:** The value used on the specified line cannot be used again for the specified type. For example, two LINKs on an ATM DEVICE cannot use the same LIS.

**System action:** Profile processing continues. However, the statement is not defined properly and will be ignored.

**Operator response:** Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSECG1_8.4.1/com.ibm.zos.v1r12.cic1_driver_doc/zh_zos840_com.html).

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

---

**EZZ0612I**

`HOME ADDRESS val1 FOR type name ON LINE lineno REPLACES THE PREVIOUS ADDRESS`

**Explanation:** The Home or Interface statement on the specified line replaced the previously defined IP address for the specified interface. The TCP/IP profile that was processed specifies an IP address for the interface in more than one location.

In the message text:

`val1`

The IP address configured on the Home or Interface statement on the specified line.

`type`

The `type` value is one of the following:

- **LINK**
  
  The home address is for an interface that was defined using the Device, Link, and Home statements.

- **INTERFACE**
  
  The home address is for an interface that was defined using the Interface statement.

`name`

The name specified on the Link or Interface statement when the interface was defined.

`lineno`

The TCP/IP profile line number on which the statement that defines the home IP address was encountered.

**System action:** Profile processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the profile by specifying an IP address for the interface in only one location, and rerun the profile.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** [z/OS Communications Server TCP/IP: Configuration & Initialization](https://www.ibm.com/support/knowledgecenter/SSECG1_8.4.1/com.ibm.zos.v1r12.cic1_driver_doc/zh_zos840_com.html)

**Module:** EZACFMS1

**Routing code:** 10
EZZ0613I • EZZ0615I

Descriptor code: 12
Automation: Not applicable.
Example:
EZZ0612I HOME ADDRESS 9.1.2.3 FOR INTERFACE OSALNK1 ON LINE 35 REPLACES THE PREVIOUS ADDRESS

EZZ0613I TCPIPSTATISTICS IS status
Explanation: The status of GLOBALCONFIG TCPIPSTATISTICS is displayed. The status value is either ENABLED or DISABLED.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: parseFile

EZZ0614I TCPCONFIG TCPMAXRCVBUFSIZE VALUE value IS LESS THAN TCPRCVBUFSIZE VALUE specified - defaults USED.
Explanation: TCPCONFIG TCPMAXRCVBUFSIZE value specified is less than the TCPRCVBUFSIZE value that is specified.
In the message text:
value
  The TCPMAXRCVBUFSIZE value that you specified
specified
  The TCPRCVBUFSIZE value that you specified
defaults
  The TCPRCVBUFSIZE value that TCP/IP will use
System action: This message is displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.
When this message is issued during initial profile or VARY TCPIP,,OBEYFILE processing, TCP/IP continues, using the default values for TCPRCVBUFSIZE and TCPMAXRCVBUFSIZE.
Operator response: None.
System programmer response: Correct the error and rerun the profile.
Module: EZACFPAR
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
Procedure name: parseFile

EZZ0615I MULTIPATH SUPPORT IS DISABLED
Explanation: Multipath support is disabled for all route tables. If the stack is using policy-based routing, multipath support can be enabled for a policy-based route table using the RouteTable statement in the policy configuration. See the policy-based routing (Routing) policy statements information in z/OS Communications Server: IP Configuration Reference for information about the RouteTable policy statement.
If there are multiple equal-cost paths to a destination, then TCP/IP uses the first path found for all IP packets to that destination.
**EZ0616I • EZ0617I**

**Procedure name:**  
ioctlmsg

---

**EZ0616I**  
TCPCONFIG (TCPMAXRCVBUFSIZE | TCPRCVBUFSIZE) VALUE SPECIFIED IS (LESS | GREATER) THAN (TCPRCVBUFSIZE | TCPMAXRCVBUFSIZE) VALUE DEFINED - THE VALUE IS IGNORED.

**Explanation:**  
Either TCPCONFIG TCPMAXRCVBUFSIZE value is less than TCPRCVBUFSIZE value that is defined, or TCPCONFIG TCPRCVBUFSIZE value is greater than TCPMAXRCVBUFSIZE value that is defined.

**System action:**  
TCP/IP continues.

**Operator response:**  
None.

**System programmer response:**  
None.

**Module:**  
EZACFMS1

**Procedure name:**  
parseFile

---

**EZ0617I**  
HOME ADDRESS val1 FOR type name ON LINE lineno IS A RESERVED IP ADDRESS

**Explanation:**  
The Home or Interface statement on the specified line uses a reserved IP address for the specified interface. The home address is not assigned.

In the message text:

val1  
The IP address configured on the Home or Interface statement on the specified line.

type  
The type value is one of the following:

**LINK**  
The home address is for an interface that was defined using the Device, Link, and Home statements.

**INTERFACE**  
The home address is for an interface that was defined using the Interface statement.

name  
The name specified on the Link or Interface statement when the interface was defined.

lineno  
The TCP/IP profile line number on which the statement that defines the home IP address was encountered.

**System action:**  
Profile processing continues; however, the specified interface does not have a home IP address defined.

**Operator response:**  
Contact the system programmer.

**System programmer response:**  
Correct the profile by using an unreserved IP address for the specified interface and rerun the profile.

**User response:**  
Not applicable.

**Problem determination:**  
Not applicable.

**Source:**  
z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:**  
EZACFMS1

**Routing code:**  
10

**Descriptor code:**

**Automation:** Not applicable.

**Example:**

EZ0617I HOME ADDRESS 127.0.0.255 FOR INTERFACE OSALNK1 ON LINE 53 IS A RESERVED IP ADDRESS

---

**EZ0618I**  
**THE DEFINITION OF INTERFACE name ON LINE linenum DOES NOT CONFORM TO THE RULES FOR MULTIPLE VLANS**

**Explanation:** An attempt was made to define an interface by using the INTERFACE statement but the parameters on the statement do not conform to the multiple VLAN configuration rules. See [OSA VLAN] or [HiperSockets and VLAN] in [z/OS Communications Server: IP Configuration Guide] for more information about these configuration rules.

If the stack detects that a multiple VLAN configuration rule was not followed, the stack issues this message in conjunction with message EZD0044I to identify the specific rule that was not followed. See [message EZD0044I] in [z/OS Communications Server: IP Messages Volume 2 (EZB, EZD)] for more information.

In the message text:

- **name**  
  The interface name specified on the INTERFACE statement

- **linenum**  
  The line number in the initial profile or the VARY TCPIP,OBEYFILE command data set where the error was found

**System action:** Profile processing continues. The statement is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the INTERFACE statement and issue the VARY TCPIP,OBEYFILE command to rerun the configuration statement. See [z/OS Communications Server: IP Configuration Reference] for more information about the statement.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFMS1

**Routing code:** *

**Descriptor code:** 5

**Automation:** Not applicable.

**Example:**

THE DEFINITION OF INTERFACE OSAEXP1 ON LINE 10 DOES NOT CONFORM TO THE RULES FOR MULTIPLE VLANS

---

**EZ0619I**  
**type name USES DUPLICATE HOME ADDRESS addr**

**Explanation:** Two or more interfaces have the same IP address. If both interfaces are active at the same time, the results are unpredictable.

In the message text:

- **type**  
  The type value is one of the following:
  
  **LINK**  
  The home address is for an interface that was defined using the Device, Link, and Home statements.

  **INTERFACE**  
  The home address is for an interface that was defined using the Interface statement.

- **name**  
  The name that was specified on the Link or Interface statement when the interface was defined.

---

56  
z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
**addr**

The home IP address that is duplicated on two or more interfaces.

**System action:** Profile processing continues. Results are unpredictable because multiple interfaces are defined with the same home IP address.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the profile by specifying a unique home IP address for each interface and rerun the profile.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFMS1

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

**Example:**

```
EZZ0619I INTERFACE OSALNK2 USES DUPLICATE HOME ADDRESS 15.3.76.2
```

**EZZ0620I**  LINK `lnkname` ON DEVICE `devname` USES DUPLICATE ADAPTER NUMBER `number`

**Explanation:** Two or more links have the same adapter number.

**System action:** Profile processing continues. However, the statement is not defined properly and will be ignored.

**Operator response:** Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: New Function Summary](https://www.ibm.com/docs/en/zos-Commns-Srvcs?topic=newfunction-summary) Change one of the adapter numbers to a different number before starting the device to avoid a start device error.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** parseFile

**EZZ0621I** AUTOLOG FORCING `jobname`, REASON: `reason`

**Explanation:** Autolog processing determined that `jobname` is currently active and will issue MVS CANCEL command for the `jobname`.

The Autolog function issues this message during the following processing:

- During TCP/IP initialization when Autolog is trying to start the MVS procedures specified on the AUTOLOG profile statement, and a job with the procedure name is still active.
- During the Autolog monitoring function when there is a TCP or UDP port reservation for one of the jobs started by the AUTOLOG profile statement, but the job does not currently have a TCP listening socket or UDP socket bound to the port.

**System action:** Autolog processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFALG

**Procedure name:** parseFile
**EZZ0622I**  AUTOLOG FORCING jobname - DUMP PROVIDED, REASON: reason

**Explanation:** Autolog processing determined that jobname is currently active and will issue MVS CANCEL command for the jobname. CANCELWITHDUMP was coded on the AUTOLOG statement, and an MVS dump is provided with the CANCEL.

The Autolog function issues this message during the following processing:

- During TCP/IP initialization when Autolog is trying to start the MVS procedures specified on the AUTOLOG profile statement, and a job with the procedure name is still active.
- During the Autolog monitoring function when there is a TCP or UDP port reservation for one of the jobs started by the AUTOLOG profile statement, but the job does not currently have a TCP listening socket or UDP socket bound to the port.

See [AUTOLOG statement in z/OS Communications Server: IP Configuration Reference](z/OS Communications Server: New Function Summary) for more information about the Autolog function.

**System action:** Autolog processing continues.

**Operator response:** Correct the statement and rerun the profile. For more information about the statement, see the [z/OS Communications Server: New Function Summary](z/OS Communications Server: New Function Summary).

**System programmer response:** None.

**Module:** EZACFALG

**Procedure name:** parseFile

---

**EZZ0623I**  PATH MTU DISCOVERY SUPPORT IS status

**Explanation:** The status of PATH MTU Discovery support is displayed, where status is either: ENABLED or DISABLED. If PATHMTUDISCOVERY was coded on the IPCONFIG statement, then support status is enabled. If Path MTU Discovery support is enabled, then TCP/IP will dynamically discover the Path MTU (PMTU), which is the minimum of the MTUs of each hop in the path, necessary to prevent fragmentation of datagrams sent on that path. If NOPATHMTUDISCOVERY was coded on the IPCONFIG statement, then support status is disabled and large datagrams might be fragmented.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** getData

---

**EZZ0624I**  DYNAMIC XCF DEFINITIONS ARE status

**Explanation:** The status of Dynamic XCF definitions are displayed, where status is either: ENABLED or DISABLED. If DYNAMICXCF was coded on the IPCONFIG statement, then support status is enabled. If NODYNAMICXCF was coded on the IPCONFIG statement, then support status is disabled.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** getData

---

**EZZ0625I**  IPCONFIG DYNAMICXCF FAILED BECAUSE XCF DYNAMIC DEVICES STILL ACTIVE

**Explanation:** The IP address specified on the DYNAMICXCF option of the IPCONFIG configuration statement is different than was previously specified. This indicates that the IP address for existing devices created by XCF dynamics should be changed. The failure occurred because an XCF device was still active. All devices generated by
XCF dynamics must be stopped before the IP address change is performed.

**System action:** TCP/IP continues.

**Operator response:** Issue DISPLAY TCPIP,procname,NETSTAT,DEV to get a list of all of the currently defined devices. The names of devices generated by XCF Dynamics can either be IUTSAMEH, IUTIQDIO or the cpname of another VTAM in the sysplex. Once all of the names have been determined, issue VARY TCPIP,STOP commands for each of the devices.

**System programmer response:** None.

**Module:** EZACFMS1

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile

---

**EZ0627I**

`D...OMPROUTE,OSPF,<(LIST,<ALL|AREAS|INTERFACES|NBMA|NEIGHBORS|VLINKS>)|LSA|AREASUM|EXTERNAL|DATABASE|DBSIZE|INTERFACE|NEIGHBOR|ROUTERS|STATISTICS>`

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,OSPF command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile

---

**EZ0628I**

`D...OMPROUTE,RIP,<(LIST,<ALL|INTERFACES|ACCEPTED>)|INTERFACE|FILTERS>`

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,RIP command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile

---

**EZ0629I**

`D...OMPROUTE,RTTABLE,<,PRTABLE=PRNAME>,<,DELETED | DEST=IP_ADDR>`

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,RTTABLE command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.
**EZ0630I • EZ0632I**

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile

---

**EZ0630I** D...NETSTAT,CACHINFO,<FORMAT=LONG | SHORT>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,CACHINFO command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

---

**EZ0631I** <GATE | ROUTE> LIST REFERENCES LINKS WITH NO HOME ADDRESSES

**Explanation:** The gate list entries in the GATEWAY statement or the route list entries in the BEGINROUTES block reference link names with no home addresses. Each routing definition provided by an invalid gate or route list entry is ignored. SEE PREVIOUS MESSAGES - there were error messages generated while processing your profile.

**System action:** TCP/IP continues.

**Operator response:** Assign a home address for each link referenced in the gate or route list using the HOME statement. Rerun the profile.

---

**EZ0632I** MULTIPATH type SUPPORT IS ENABLED

**Explanation:** Multipath support is enabled for all route tables. If the stack is using policy-based routing, the RouteTable statement in the policy configuration can be used to disable multipath support for a policy-based route table or to enable a different type of multipath support for a policy-based route table. See the information about policy-based routing (Routing) policy statements in z/OS Communications Server: IP Configuration Reference.

In the message text:

**type**

The type of multipath support that is enabled. Possible values are:

**PERCONNECTION**

After a round-robin route is selected, connection-oriented or connectionless-oriented IP packets using the same association always use the same route, as long as that route is active.

**PERPACKET**

Connection-oriented or connectionless-oriented IP packets using the same source and destination address pair do not always use the same route, but do use all possible active routes to that destination host.

In general, multipath routing provides the routing distribution that is required to balance the network use of outbound packets. Multipath routing requires that multiple equal-cost routes be defined. These routes are either defined statically or added dynamically by routing protocols. If MULTIPATH is specified without any subparameters, the default is PERCONNECTION.

**System action:** TCP/IP continues.

**Operator response:** None.
System programmer response: None.
Module: EZACFMS1
Procedure name: getData

EZZ0635I  VIPA ip address IS NOT IN NET net WITH MASK subnet mask

Explanation: All of the VIPAs in a single VIPADYNAMIC VIPDEFINE list must be in the same net. The indicated IP address was not in the same net, so it was deleted from the list that was in error. Other addresses in the list are processed. The required net is identified by the network prefix net and the address mask mask.

System action: None.
Operator response: If the IP address was incorrectly specified, correct the error and try the command or activation again. Rerun the profile.

System programmer response: None.
Module: EZACFMS1
Procedure name: parseFile

EZZ0636I  D...NETSTAT,VIPADYN,<DVIPA | VIPAROUTE>,<,FORMAT=LONG | SHORT>
D...SYSPLEX,VIPADYN,<IPADDR>=<,MAX=>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,VIPADYN command and shows the format of the command.

System action: TCP/IP continues.
Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.
Module: EZACDHLP
Procedure name: parseFile

EZZ0637I  D...SYSPLEX,(VIPADYN | PORTS | GROUP)
V...SYSPLEX,(LEAVEGROUP | JOINGROUP | DEACTIVATE | REACTIVATE | QUIESCE | RESUME)

Explanation: This message is the result of the DISPLAY TCPIP,HELP,SYSPLEX command and shows the format of the command.

System action: TCP/IP continues.
Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.
Module: EZACDHLP
Procedure name: parseFile

EZZ0638I  PERMANENT LOOPBACK ADDRESS 127.0.0.1 SPECIFIED ON LINE lineno CANNOT BE USED IN A vipad STATEMENT

Explanation: The permanent loopback IP address 127.0.0.1 that is specified on line lineno cannot be used on a vipad (VIPADEFINE, VIPABACKUP, VIPARANGE, VIPADELETE, or VIPADISTRIBUTE) statement.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
EZZ0639I • EZZ0641I

Operator response: Correct the statement. Rerun the profile.

System programmer response: None.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: parseFile

Example:
EZZ0638I PERMANENT LOOPBACK ADDRESS 127.0.0.1 SPECIFIED ON LINE 68 CANNOT BE USED IN A VIPABACKUP STATEMENT

EZZ0639I ATMENABLED PARAMETER IS OBSOLETE, OSAENABLED USED

Explanation: The ATMENABLED parameter on the SACONFIG statement is obsolete. This usually indicates that an unmodified profile from a prior release is being used. The ATMENABLED parameter was replaced by the OSAENABLED parameter. This includes the original ATMENABLED support, and support for SNMP management information from OSA-Express Ethernet devices. See SACONFIG statement in z/OS Communications Server: IP Configuration Reference for more information about OSAENABLED and OSADISABLED parameters.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, profile processing continues as if the new OSAENABLED parameter had been specified.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, correct the error before using the profile data set as an initial profile or as a VARY TCPIP,OBEYFILE profile.

Otherwise, if you want SNMP management information for ATM OSA-2 or OSA-Express Ethernet devices, no action is required.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: parseFile

EZZ0641I IP FORWARDING type SUPPORT IS ENABLED

Explanation: The status of IP Forwarding is displayed, where type is one of the following:

- FWDMULTIPATH
- PERPACKET
- NOFWDMULTIPATH

Forwarding can be specified on the IPCONFIG (DATAGRAMFWD) statement.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.
Module: EZACFMS1

Procedure name: parseFile

EZZ0642I V...OSAENTA,...(SEE PUBLICATION FOR KEYWORDS)

Explanation: This message is the result of the DISPLAY,TCPIP,,HELP,OSAENTA command and shows the format of the command.

System action: TCP/IP continues.

Operator response: See the VARY TCPIP,,OSAENTA command in z/OS Communications Server: IP System Administrator's Commands for more information about the command.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: TCP/IP stack

Module: EZACDHLP

Routing code: 2,8

Descriptor code: 12

Example:
DISPLAY TCPIP,,HELP,OSAENTA
EZZ0642I V...OSAENTA,...(SEE PUBLICATION FOR KEYWORDS)

EZZ0650I <IP ADDRESS | ADDRESS MASK> 0.0.0.0 INCORRECT ON LINE lineno

Explanation: An incorrect IP address or address mask of 0.0.0.0 was specified on line lineno

In the message text:

lineno

The line in the TCP/IP profile where the error was found

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: Check the profile statement at line lineno and specify a valid IP address.

Module: EZACFPPT, EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP, OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: parseFile

Example:
EZZ0650I IP ADDRESS  0.0.0.0 INCORRECT ON LINE 35

EZZ0651I NUMBER OF MASK BITS SPECIFIED ON LINE lineno IS INCORRECT

Explanation: The number of mask bits specified was incorrect. This number must be in the range of 1–32.

lineno

The line in the TCP/IP profile where the number of mask bits was found

System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY
TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** None.

**System programmer response:** Check the profile statement at line `lineno` and respecify a valid number of mask bits.

**Module:** EZACFPAR

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** parseFile

**Example:**

```
EZZ0651I NUMBER OF MASK BITS SPECIFIED ON LINE 55 IS INCORRECT
```

---

**EZZ0652I**

`D...NETSTAT,ACCESS,NETWORK<,FORMAT=LONG|SHORT>`

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,`keyword` command and shows the format of the command.

`D...STOR,MODULE=XMODID`

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,`keyword` command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** For more information about the command, see [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com/support/knowledgecenter/en/SS9578_2.2.1/...).

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile
EZZ0655I PORT number protocol IS ALREADY RESERVED
Explanation: The PORT specified is already reserved.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
System programmer response: None.
Module: EZACFMS1
Procedure name: parseFile

EZZ0656I THE '=' SIGN IS NOT ALLOWED FOR default_type statement ENTRY
Explanation: An equal sign (=) cannot be specified on a ROUTE or GATEWAY statement corresponding to a DEFAULT or DEFAULT6 route entry.
In the message text:

default_type
Either DEFAULT or DEFAULT6
statement
Either ROUTE or GATEWAY
System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, profile processing continues, but this route entry is ignored.
This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
Operator response: Contact the system programmer.
System programmer response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
Module: EZACFPAR
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
Procedure name: parseFile
Example:
EZZ0656I THE '=' SIGN IS NOT ALLOWED FOR DEFAULT ROUTE ENTRY

EZZ0657I ROUTE LIST ENTRY ON LINE lineno FOR DESTINATION destaddr IS UNREACHABLE THROUGH INTERFACE intfacedaddr ON interface
Explanation: The route list entry in the ROUTE block on the line specified is in error. The destination address is unreachable through the specified interface using any known routes.
System action: Profile processing continues. However, the statement is not defined properly and will be ignored.
Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference
System programmer response: None.
Module: EZACFMS1
EZZ0658I  PARTIAL IP ADDRESS ip_addr NOT ALLOWED ON ROUTE ENTRY STATEMENT ON LINE lineno

Explanation: The specified route list entry in the ROUTE block on the line specified is in error. A fully qualified IP address must be specified.

In the message text:

ip_addr  IP address that was specified that is not a fully-qualified IP address.
lineno  The line in the TCP/IP profile where the IP address was found.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, profile processing continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0658I  PARTIAL IP ADDRESS 9.67.1 NOT ALLOWED ON ROUTE ENTRY STATEMENT ON LINE 38

EZZ0659I  D...NETSTAT,VCRT<,DETAIL><,IPADDR=|IPPORT=|PORT=>,<FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: parseFile

EZZ0660I  D...NETSTAT,VDPT<,DETAIL><,IPADDR=|IPPORT=|PORT=>,<FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: parseFile
EZZ0661I  function FOR PROFILE dsn FAILED: rc/rsn, errmsg

Explanation: TCP/IP was unable to open or read the profile data set dsn because of an error. This message can be issued during the following:

- initial profile processing (the first profile data set referenced during TCP/IP initialization)
- INCLUDE profile statement processing
- processing of the profile data set specified on a VARY TCPIP,OBEYFILE command
- processing of the profile data set specified on a VARY TCPIP,SYNTAXCHECK command

In the message text:

- **function**
  - The Language Environment® function that failed
- **dsn**
  - The name of the input Profile data set that is being processed
- **rc/rsn**
  - The decimal return code and hexadecimal reason code from the Language Environment function that failed
- **errormsg**
  - Describes the error

**System action:** If the error occurs during initial profile processing and no profile data set was found using the normal search order, TCP/IP ends. Otherwise, TCP/IP continues but the current profile data set cannot be processed.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by the rc/rsn. See the [z/OS UNIX System Services Messages and Codes](https://publib.boulder.ibm.com/infocenter/lnovm/v2r2/topic/com.ibm.zos.mvs/lnovmmsgc.htm) for rc/rsn explanations.

**Module:** EZACFPPR

**Procedure name:** cffopen2

---

EZZ0662I  OPEN OF INTERNAL HIPERSPACE MEMORY FILE FAILED: errmsg, dspservrc/dspservrsn

Explanation: TCP/IP was unable to open an internal hiperspace memory file to process a profile data set. Use the information in errmsg, dspservrc/dspservrsn to determine the reason for the failure.

In the message text:

- **errmsg**
  - The Language Environment message that explains the error
- **dspservrc**
  - The hexadecimal return code from the MVS DSPSERV function that failed
- **dspservrsn**
  - The hexadecimal reason code from the MVS DSPSERV function that failed

**System action:** If this error occurs, TCP/IP attempts to use a temporary z/OS UNIX file for profile processing. Execution continues.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by the error information. See the [z/OS Language Environment Debugging Guide](https://publib.boulder.ibm.com/infocenter/lnovm/v2r2/topic/com.ibm.zos.mvs/lnovmdbg.htm) for errmsg explanations. See the [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](https://publib.boulder.ibm.com/infocenter/lnovm/v2r2/topic/com.ibm.zos.mvs/lnovm珲t.htm) for MVS DSPSERV return/reason code explanations. If the error cannot be corrected because of constraints in the customer's environment, this message can be ignored.

**Module:** EZACFPPR

**Procedure name:** cffopen2
**EZZ0663I** OPEN OF INTERNAL TEMPORARY HFS FILE FAILED: rc/rsn, errmsg

**Explanation:** TCP/IP tried to open an internal temporary z/OS UNIX file in either the directory specified by the TMPDIR environment variable or, if TMPDIR is not defined, in the /tmp directory, to process a profile data set. The open failed. Use the information in rc/rsn and errmsg to determine the reason for the failure.

In the message text:

- **rc/rsn**
  - The decimal return code and hexadecimal reason code from the Language Environment function that failed
- **errmsg**
  - Describes the error

**System action:** If the error occurs during initial profile processing, TCP/IP ends. Otherwise, TCP/IP continues, but the current VARY command cannot be processed.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by the rc/rsn. See the z/OS UNIX System Services Messages and Codes for rc/rsn explanations.

**Module:** EZACFPPR

**Procedure name:** cffopen2

---

**EZZ0664I** function FOR INTERNAL HIPERSPACE MEMORY FILE FAILED: errmsg, hspservrc/hspservrsn

**Explanation:** TCP/IP tried to execute function function against an internal hiperspace memory file while processing a TCP/IP profile, but the function failed. Use the information in errmsg and hspservrc/hspservrsn to determine the reason for the failure.

In the message text:

- **function**
  - The Language Environment function that failed
- **errmsg**
  - The Language Environment message that explains the error
- **hspservrc**
  - The hexadecimal return code from the MVS HSPSERV function that failed
- **hspservrsn**
  - The hexadecimal reason code from the MVS HSPSERV function that failed

**System action:** If this error occurs, TCP/IP attempts to use a temporary z/OS UNIX file for profile processing. Execution continues.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by the error information. See the z/OS Language Environment Debugging Guide for errmsg explanations. See the z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG for MVS HSPSERV return/reason code explanations.

**Module:** EZACFPPR

**Procedure name:** cffopen2
The decimal return code and hexadecimal reason code from the Language Environment function that failed.

Describes the error.

**System action:** If the error occurs during initial profile processing, TCP/IP ends. Otherwise, TCP/IP continues but the current VARY command cannot be processed.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by the `rc/rsn`. See the **z/OS UNIX System Services Messages and Codes** for `rc/rsn` explanations.

**Module:** EZACFPPR

**Procedure name:** cffopen2

---

**EZ0666I**  
**OPEN OF INTERNAL COMMAND FILE FAILED:** `rc`, `errormsg`

**Explanation:** The TCP/IP command processor was unable to open an internal file used to process commands because of the error indicated by `rc`.

`rc` is the decimal return code from the Language Environment `fopen()` function.

`errormsg` describes the error.

**System action:** TCP/IP continues, but no DISPLAY or VARY commands will be processed.

**Operator response:** None.

**System programmer response:** See the **z/OS UNIX System Services Messages and Codes** for an explanation of the `rc` value. See the **z/OS Language Environment Debugging Guide** for `errormsg` explanations.

**Module:** EZACFMMN, EZACFC00

**Procedure name:** main, parseCmds

---

**EZ0667I**  
**FUNCTION FOR INTERNAL COMMAND FILE FAILED:** `rc`, `errormsg`

**Explanation:** TCP/IP tried to execute function `function` against an internal command file but the function failed because of `rc`. This message can be issued during DISPLAY/VARY TCPIP command processing.

`function` is the Language Environment function that failed.

`rc` is the decimal return code from the Language Environment function.

`errormsg` describes the error.

**System action:** TCP/IP continues but the current command cannot be processed.

**Operator response:** None.

**System programmer response:** If possible, correct the error indicated by `rc`. See the **z/OS UNIX System Services Messages and Codes** for `rc` explanations. See the **z/OS Language Environment Debugging Guide** for `errormsg` explanations. If the error cannot be corrected, report the error to the IBM software support center.

**Module:** EZACFC00

**Procedure name:** parseCmds

---

**EZ0671I**  
**NOT ENOUGH SPACE IN TMPDIR OR /TMP HFS DIRECTORY FOR PROFILE/OBEYFILE PROCESSING**

**Explanation:** While processing a TCP/IP profile, TCP/IP received an out-of-space error on a temporary internal z/OS UNIX file used in the processing. The temporary z/OS UNIX file is located either in the directory specified by the TMPDIR environment variable or, if TMPDIR is not defined, in the /tmp directory.

**System action:** If the error occurs during initial profile processing, TCP/IP ends. Otherwise, TCP/IP continues, but the current VARY command is not processed.
EZ0672I  •  EZ0683I

Operator response: None.

System programmer response: Ensure that there is enough space to process the profile, in either the directory specified by the TMPDIR environment variable or, if TMPDIR is not defined, in the /tmp directory.

Module: EZACFPPR
Procedure name: cffopen2

---

EZ0672I  THE SOCKET CALL function FOR THE AUTOLOG TASK FAILED: rc/rsn - errmsg

Explanation: The autolog task issued a SETIBMOPT, SOCKET or IOCTL function call that failed.

function is the Language Environment function that failed.
rc is the decimal return code from the Language Environment function that failed. Return Codes are listed and described in the z/OS UNIX System Services Messages and Codes.
rsn is the hexadecimal reason code from the Language Environment function that failed. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes.
errmsg is a message that explains the meaning of the return code.

System action: The autolog task ends and cannot be restarted until TCPIP is restarted.
Operator response: None.
System programmer response: If possible, correct the error indicated by the rc/rsn.

Module: EZACFALG
Procedure name: main, do_BEGINPROFILE

---

EZZ0683I  GLOBALCONFIG parm CONTAINS AN INCORRECT VALUE value

Explanation: A parameter on the GLOBALCONFIG profile statement contains an incorrect value.
parm is the parameter for which an incorrect value was specified.
value is the specified incorrect value. Two possible reasons that value is incorrect are:
• The value is outside of the acceptable range.
• The value is in the acceptable range, but would cause an immediate storage shortage because the amount of storage currently allocated is greater than or equal to 80% of the specified value.

System action: Profile processing continues. However, the parameter value is not defined properly and will be ignored.
Operator response: None.
System programmer response: Correct the statement and rerun the profile. See the GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference for more information.

Module: EZACFMS1
Procedure name: ioctlmsg
**EZZ0684I**  CANNOT ENABLE DVIPSEC SUPPORT AFTER TCPIP IS ACTIVE

**Explanation:** DVIPSEC is an option that can be specified on the IPSEC statement. This option is valid only on an initial profile. This message is displayed if IPSEC DVIPSEC is coded in a data set referenced by a VARY TCPIP,OBEYFILE command.

**System action:** TCP/IP ignores the statement. TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** If the DVIPSEC function is needed, then shut down TCP/IP. Code IPSEC DVIPSEC with IPCONFIG IPSECURITY in your initial profile and start TCP/IP again. If IP security and the DVIPSEC function are needed for IPv6 DVPAs, also code IPCONFIG6 IPSECURITY.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0685I**  D...NETSTAT,STATS<,PROTOCOL=>,<,FORMAT=LONG | SHORT>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

**System action:** TCPIP continues.

**Operator response:** See [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com/support/knowledgecenter) for more information.

**System programmer response:** None.

**Module:** EZACDHLP

**Procedure name:** parseFile

---

**EZZ0686I**  parameter VALUE IN BEGINROUTE BLOCK ON LINE lineno CONFLICTS WITH PREVIOUS ROUTE DEFINITIONS

**Explanation:** While processing a BEGINROUTES block that starts on line number `lineno`, a route definition was encountered that conflicts with a previous route definition.

`parameter` is the conflicting parameter, and its values are:

- **REPLACEABLE**
  A replaceable route was defined to a destination to which a NOREPLACEABLE route has already been defined in this BEGINROUTES block. A mixture of replaceable and non-replaceable routes cannot be defined to the same destination.

- **NOREPLACEABLE**
  A non-replaceable route was defined to a destination to which a replaceable route has already been defined in this BEGINROUTES block. A mixture of replaceable and non-replaceable routes cannot be defined to the same destination.

`lineno` is the line number at which the BEGINROUTES block starts.

**System action:** The route definition is rejected and processing continues with the next route defined in the BEGINROUTES block.

**Operator response:** Contact the system programmer

**System programmer response:** Correct the statement and rerun the profile. For more information about the BEGINROUTES block, see the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter).

**Module:** EZACFMS1

**Procedure name:** ioctlmessage
ROUTE LIST ENTRY entrynum ON LINE linenum FOR DESTINATION destaddr CONFLICTS WITH SYSPLEX DISTRIBUTOR TARGET DVIPA

Explanation: Replaceable static routes cannot be defined to an address that corresponds to a dynamic VIPA for which this stack is a sysplex distributor target.

entrynum is the BEGINROUTES block entry that is in error.
linenum is the line on which the BEGINROUTES block begins

destaddr is the destination IP address for which the replaceable static route definition failed.

System action: The incorrect route definition is rejected. Processing continues with the next route defined in the BEGINROUTES block.

Operator response: Correct the route definition.
System programmer response: Correct the route definition.

Module: EZACFMS1
Procedure name: ioctlmsg

IQDIO ROUTING IS status

Explanation: This message shows the status of IQDIO ROUTING.

status is one of the following:

ENABLED
The IPCONFIG IQDIOROUTING parm was processed successfully and iQDIO routing is in effect.

DISABLED
iQDIO routing is not in effect. Either the IPCONFIG NOIQDIOROUTING parm was specified, or the VARY TCPIP,OBEYFILE command data set with the IPCONFIG NODATAGRAMFWD parameter was processed.
iQDIO routing cannot be performed without datagram forwarding.

System action: TCP/IP continues.
Operator response: None.
System programmer response: None.

Module: EZACFMS1
Procedure name: getData

CANNOT ENABLE IQDIO ROUTING - reason

Explanation: iQDIO routing cannot be enabled.

reason is one of the following:

IP Forwarding is disabled
iQDIO routing cannot be enabled if IP forwarding is disabled (IPCONFIG NODATAGRAMFWD).

IP security is active
iQDIO routing cannot be enabled if IP security support is enabled (IPCONFIG IPSECURITY).

iQDIO Accelerator is active
iQDIO Routing cannot be enabled by issuing the VARY TCPIP,OBEYFILE command with IPCONFIG IQDIOROUTING specified because IPCONFIG QDIOACCELERATOR is currently active.

Processor is not Hipersocket capable
iQDIO routing cannot be enabled if the processor on which TCP/IP is running is not capable of sending data using HiperSockets™.

TCPIP activated with NOIQDIOROUTING
iQDIO routing cannot be enabled by issuing the VARY TCPIP,OBEYFILE command with IPCONFIG IQDIOROUTING specified because IPCONFIG NOIQDIOROUTING and IPCONFIG NOQDIOACCELERATOR were both specified at TCP/IP initialization.
System action: TCP/IP continues.
Operator response: None.
System programmer response: No action is necessary for any reason value except the following:

**QDIO Accelerator is active**

Specify IPCONFIG NOQDIOACCELERATOR in the VARY TCPIP,OBEYFILE command data set and reissue the VARY TCPIP,OBEYFILE command.

Module: EZACFMS1
Procedure name: getData

---

**EZ0690I**  
D...NETSTAT,IDS<,PROTOCOL=<SUMMARY>,<,FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

System action: TCPIP continues.
Operator response: See the [z/OS Communications Server: IP System Administrator's Commands](z/OSCommunicationsServer:IPSystemAdministrator'sCommands) for more information.
System programmer response: None.
Module: EZACFHLP
Procedure name: parseFile

---

**EZ0691I**  
DEVICE NAME devname ON LINE linenum DOES NOT HAVE A VALID CHPID

Explanation: The device name contains a chpid that is not valid. The device name must be configured using the reserved prefix IUTIQDxx, where the suffix 'xx' must be equal to the hexadecimal value of the required IQD CHPID (00 - FF).

In the message text:

devname  
The device name that is incorrect

linenum  
The line number where the error occurred

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Correct the device name, specifying a valid chpid.

System programmer response: See [DEVICE and LINK - MPCIPA OSA-Express QDIO devices](DEVICEandLINK-MPCIPAOSAExpressQDIOdevices) and [INTERFACE - IPAQENET6 OSA-Express QDIO interfaces](INTERFACEIPAQENET6OSAExpressQDIOinterfaces) in [z/OS Communications Server: IP Configuration Reference](z/OSCommunicationsServer:IPConfigurationReference) for more information about the MPCIPA device.
Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: parseFile

Example:

EZ0691I DEVICE NAME DEV391 ON LINE 67 DOES NOT HAVE A VALID CHPID
EZZ0692I • EZZ0696I

**EZZ0692I**  CLASS D IP ADDRESS *ipaddr* NOT ALLOWED ON LINE *linenum*

**Explanation:** A class D IP address was specified on a HOME list entry on line *linenum*. This is not allowed.

In the message text:

*ipaddr*

  The IP address that was specified

*linenum*

  The line number where the IP address was specified

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but not all entries on the HOME list are processed.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** None.

**System programmer response:** Check the profile statement on line *linenum* and specify a valid IP address that is not class D.

**Module:** EZACFPAR, EZACFPV6

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** Parsefile, processInterface

**Example:**

EZZ0692I CLASS D IP ADDRESS 224.1.1.1 NOT ALLOWED ON LINE 87

---

**EZZ0695I**  configstmt STATEMENT ON LINE *lineno* NOT VALID - IPV6 SUPPORT IS NOT ENABLED

**Explanation:** This message warns the user that a configuration statement is not valid because the stack is not enabled for IPv6.

*configstmt* is one of the following:

- PKTTRACE
- INTERFACE
- IPCONFIG6
- PORT

*lineno* is the line number in the profile where the error is found.

**System action:** TCP/IP continues but the statement in error is ignored.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFPAR

**Procedure name:** parseFile

---

**EZZ0696I**  stmt_or_cmd NOT VALID - IPV6 SUPPORT IS NOT ENABLED

**Explanation:** A configuration statement or command is not valid because the stack is not enabled for IPv6.

*stmt_or_cmd* is one of the following:

- PKTTRACE command
- IPv6 ROUTE statement

---

74  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
The IPCONFIG FORMAT keyword only applies to stacks that are not enabled for IPv6. If the stack is enabled for IPv6, then the FORMAT keyword has no meaning.

The status of IPv6 forwarding is displayed. IPv6 forwarding can be disabled by specifying NODATAGRAMFWD on the IPCONFIG6 statement.

The status of ICMPv6 redirects is displayed.

type is either FWDMULTIPATH PERPACKET or NOFWDMULTIPATH.
EZZ0702I  IPV6 SOURCEVIPA SUPPORT IS  status
Explanation: The status of IPv6 SourceVipa supports is displayed.
status is either ENABLED or DISABLED
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: ioctlmsg

EZZ0703I  IPV6 MULTIPATH SUPPORT IS DISABLED
Explanation: The status of IPv6 Multipath support is displayed. If Multipath support is disabled and there are multiple equal-cost paths to a destination, then TCP/IP will use the first path found for all IPv6 packets to that destination.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: ioctlmsg

EZZ0704I  IPV6 MULTIPATH type SUPPORT IS ENABLED
Explanation: IPv6 Multipath support is enabled. In general, multpath routing provides the routing distribution necessary to balance the network utilization of outbound packets. Multpath routing requires the definition of multiple equal-cost routes, which are either defined statically or added dynamically by routing protocols. If IPCONFIG6 MULTIPATH is specified without any subparameters, the default is PERCONNECTION.
type is either PERCONNECTION or PERPACKET.
System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: ioctlmsg

EZZ0705I  D...NETSTAT,ND<,IPADDR=>,<,FORMAT=LONG|SHORT>
Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.
System action: TCPIP continues.
Operator response: See the z/OS Communications Server: IP System Administrator's Commands for more information about the DISPLAY TCPIP,HELP command.
System programmer response: None.
Module: EZACDHLP
Procedure name: parseFile
EZZ0706I  TCPSTACKSOURCEVIPA IS IGNORED - SOURCEVIPA IS NOT ENABLED

Explanation: The TCPSTACKSOURCEVIPA parameter was specified on an IPCONFIG Profile statement but SOURCEVIPA is not enabled. SOURCEVIPA must be enabled for the TCPSTACKSOURCEVIPA function to be enabled.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: If you want TCPSTACKSOURCEVIPA support then respecify the IPCONFIG statement with the SOURCEVIPA parameter.

Module: EZACFMS1

Procedure name: ioctlmsg

EZZ0707I  keyword1 AND keyword2 ARE MUTUALLY EXCLUSIVE ON SAME configstmt STATEMENT - STATEMENT IS IGNORED

Explanation: The keywords specified on the configstmt statement are mutually exclusive. The statement is ignored.

keyword1 and keyword2 are the IP Configuration keywords specified on the configstmt statement.

configstmt is the IP Configuration statement where the error was found.

System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues, but the statement in error is ignored.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration statement in error.

Module: EZACYAC, EZACFPV6, EZACFPSE

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: Not applicable.

Example:

EZZ0707I PORTNAME AND CHPID ARE MUTUALLY EXCLUSIVE ON SAME INTERFACE STATEMENT - STATEMENT IS IGNORED

EZZ0708I  PERMANENT LOOPBACK ADDRESS ipaddr ON LINE lineno CANNOT BE SPECIFIED

Explanation: A permanent loopback address cannot be specified on the configuration statement at the specified line number in the TCP/IP profile.

In the message text:

ipaddr  The IPv4 or IPv6 permanent loopback address (127.0.0.1 or ::1)

lineno  The line number in the profile or the VARY TCPIP,,OBEYFILE command data set where the error was found

System action: TCP/IP ignores the statement. TCP/IP continues.

This message is displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

Operator response: Contact the system programmer.
System programmer response: Correct the statement. Rerun the profile.

Module: EZACFPV6, EZACFPR2

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface, processSourceIP

Example:

EZZ0708I PERMANENT LOOPBACK ADDRESS ::1 ON LINE 27 CANNOT BE SPECIFIED

---

EZZ0709I LINK LOCAL ADDRESS OF ipv6addr ON LINE lineno CANNOT BE SPECIFIED

Explanation: A link local address cannot be specified on the IP Configuration statement at line lineno.

In the message text:

ipv6addr
  The IPv6 address
lineno
  The line number in the profile where the error was found

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Correct the statement and rerun the profile.

Module: EZACFPV6

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:

EZZ0709I LINK LOCAL ADDRESS OF FE80::7 ON LINE 98 CANNOT BE SPECIFIED

---

EZZ0710I MULTICAST ADDRESS OF ipaddr ON LINE lineno CANNOT BE SPECIFIED

Explanation: A multicast address cannot be specified on the IP Configuration statement at line lineno.

In the message text:

ipaddr
  The IPv4 or IPv6 multicast address
lineno
  The line number in the profile where the error was found

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the statement. Rerun the profile.

**Module:** EZACFPV6

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** ProcessInterface

**Example:**

EZZ0710I MULTICAST ADDRESS OF FF02::1 ON LINE 52 CANNOT BE SPECIFIED

---

**EZZ0711I**  
**IP ADDRESS ipv6addr NO LONGER DEPRECATED**

**Explanation:** The IP address specified on the INTERFACE statement is no longer deprecated. This will happen when the user codes an INTERFACE ADDRipv6addr for a previously deprecated address.  

*ipv6addr* is the IPv6 address.  

See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBWReferences/ipcfgref/index.html) for more information about the INTERFACE statement.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0713I**  
**IPV4-MAPPED IPV6 ADDRESS OF ipv6addr ON LINE lineno CANNOT BE SPECIFIED**

**Explanation:** An IPv4-mapped IPv6 address cannot be specified on the IP configuration statement at line lineno.

In the message text:

*ipv6addr*  
The IPv6 address

*lineno*  
The line number in the profile where the error was found

See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SSLTBWReferences/ipcfgref/index.html) for more information about the IP configuration statement where the error was found.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the statement.

If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command to rerun the configuration statement.

**Module:** EZACFPV6
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:
EZZ0713I IPV4-MAPPED IPV6 ADDRESS OF ::FFFF:192.0.2.128 ON LINE 82 CANNOT BE SPECIFIED

EZZ0714I IPV4-COMPATIBLE IPV6 ADDRESS OF ipv6addr ON LINE lineno CANNOT BE SPECIFIED

Explanation: An IPv4-compatible IPv6 address cannot be specified on the IP configuration statement at line lineno.

In the message text:
ipv6addr
The IPv6 address
lineno
The line number in the profile where the error was found

See the z/OS Communications Server: IP Configuration Reference for more information about the IP configuration statement where the error was found.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:
• Correct the statement.
• If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command to rerun the configuration statement.

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:
EZZ0713I IPV4-MAPPED IPV6 ADDRESS OF ::101.54.74.229 ON LINE 67 CANNOT BE SPECIFIED

EZZ0714I IPV6 ADDRESS ON LINE lineno IS NOT VALID

Explanation: An IPv6 address that was not valid was specified on the IP configuration statement at line lineno.

In the message text:
lineno
The line number in the profile where the error was found

See the z/OS Communications Server: IP Configuration Reference for more information about the IP configuration statement where the error was found.
System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:

- Correct the statement.
- If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors from the profile. Otherwise, use the VARY TCPIP,OBEYFILE command to rerun the configuration statement.

Module: EZACFV6

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:
EZZ0715I IPv6 ADDRESS ON LINE 42 IS NOT VALID

**EZZ0716I** parm PARAMETER ON LINElineno IS OBSOLETE

**Explanation:** The parameter specified is obsolete.

In the message text:

- **parm**
  - The IP configuration parameter that is obsolete

- **lineno**
  - The line number in the profile where the parameter was found

See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/docs/en/zos/2.4.0?topic=ip-config-ref) for more information about the IP configuration statement where the error was found.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the configuration parameter is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:**

- Correct the statement.
- If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors from the profile. Otherwise, use the VARY TCPIP,OBEYFILE command to rerun the configuration statement.

Module: EZACFPPT

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processPort
EZZ0717I • EZZ0718I

Example:
EZZ0716I FIREWALL PARAMETER ON LINE 67 IS OBSOLETE

EZZ0717I configstmt STATEMENT ON LINE lineno WILL BE RETIRED IN A FUTURE RELEASE

Explanation: The IP configuration statement indicated by configstmt will be retired in a future release. See the description of configstmt in the z/OS Communications Server: IP Configuration Reference for more information about other configuration statements that can be used in place of configstmt.

In the message text:

configstmt
   The name of the configuration statement
lineno
   The line number in the profile or the VARY TCPIP,OBEYFILE command data set where the statement was found

System action: The statement is processed and TCP/IP continues.

Operator response: None.

System programmer response: None.

Module: EZACFPAR

Procedure name: parseFile

EZZ0718I INTERFACE interfacename ON LINE lineno IS interface_state

Explanation: An attempt to change the state of the interface failed because of the reason stated.

In the message text:

interfacename
   The interface name.
lineno
   The line number in the profile or the VARY TCPIP,OBEYFILE command data set where the statement was found.

interface_state
   The reason for the failure. Possible values are:

   ALREADY STARTED
      An attempt was made to start an interface that was already started.

   ALREADY STOPPED
      An attempt was made to stop an interface that was already stopped.

   NOT ELIGIBLE TO BE STARTED
      An attempt was made to start an Internal Queued Direct extension (IQDX) interface before starting the associated OSA-Express for zBx (OSX) interface.

System action: TCP/IP continues.

Operator response:
• If the interface_state value is not eligible to be started, start the associated OSX interface.
• For all other interface_state values, do nothing.

System programmer response: None.

Module: EZACFMS1

Procedure name: ioctlmsg

Example: None.
EZZ0719I ROUTER ADVERTISEMENT HOP LIMIT VALUES WILL BE IGNORED

Explanation: Router advertisement hop limit values will be ignored. This is a result of coding IGNOREROUTERHOPLIMIT on the IPCONFIG6 statement. See the z/OS Communications Server: IP Configuration Reference for more information about the IPCONFIG6 statement.

System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: ioctlMsg

EZZ0720I ROUTER ADVERTISEMENT HOP LIMIT VALUES WILL NOT BE IGNORED

Explanation: Router advertisement hop limit values will not be ignored. This is a result of coding NOIGNOREROUTERHOPLIMIT on the IPCONFIG6 statement. See the z/OS Communications Server: IP Configuration Reference for more information about the IPCONFIG6 statement.

System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Module: EZACFMS1
Procedure name: ioctlMsg

EZZ0721I ON LINE linenum AN ATTEMPT WAS MADE TO DEFINE MORE INTERFACES FOR type name THAN IS ALLOWED

Explanation: The maximum number of interfaces have already been defined for the specified OSA-Express port. The message is issued for the following case:
A DEVICE statement and an IPv4 INTERFACE statement for OSA-Express QDIO point to the same OSA portname.

Note: On the DEVICE statement, the portname is the device_name.
In the message text:

linenum
  The line number in the profile or the VARY TCPIP,OBEYFILE command data set where the error was found.
type
  The PORTNAME parameter on the INTERFACE statement. PORTNAME is used to specify the PORT name contained in the TRLE definition for the QDIO interface.
name
  The port name that is specified on the INTERFACE statement for OSA-Express QDIO.

System action: Profile processing continues. The statement is ignored.
Operator response: Contact the system programmer.
System programmer response: Correct the statement and use the VARY TCPIP,OBEYFILE command to rerun the configuration statement. See the z/OS Communications Server: IP Configuration Reference for more information about the statement.
Module: EZACFMS1
Procedure name: parseFile
Example:
ON LINE 10 AN ATTEMPT WAS MADE TO DEFINE MORE INTERFACES FOR PORT NAME OSAQDIO2 THAN IS ALLOWED
EZZ0722I  V..PURGECACHE,XNAME
Explanation:  This message is the result of the DISPLAY TCPIP,,HELP,PURGECACHE command.
System action:  TCP/IP continues.
Operator response:  For more information about the command, see the z/OS Communications Server: IP System Administrator’s Commands.
System programmer response:  None.
Module:  EZACDHLP
Procedure name:  parseFile

EZZ0723I  CANNOT DELETE ALL IP ADDRESSES ON INTERFACE intf_name
Explanation:  You cannot use INTERFACE DELADDR to delete all IP addresses that are defined to a virtual interface.
intf_name is the interface name on the INTERFACE statement where DELADDR is being attempted.
System action:  TCP/IP continues, but all IP addresses that were specified on INTERFACE DELADDR for intf_name have not been deleted.
Operator response:  Contact the system programmer.
System programmer response:  Correct the statement and use the VARY TCPIP,,OBEYFILE command to rerun the configuration statement.
Module:  EZACFMS1
Procedure name:  ioctlMsg

EZZ0724I  IPv6 ADDRESS OF ipv6addr ON LINE lineno CANNOT BE SPECIFIED
Explanation:  The unspecified IPv6 address cannot be used on the IP configuration statement at line lineno.
In the message text:
ipv6addr
  The unspecified IPv6 address
lineno
  The line number in the profile or the VARY TCPIP,,OBEYFILE command data set where the address is not allowed
System action:  If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.
This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.
Operator response:  Contact the system programmer.
System programmer response:
  • Correct the statement. See the z/OS Communications Server: IP Configuration Reference for more information about the statement that is in error.
  • If this message was displayed as a result of a VARY TCPIP,,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, use the VARY TCPIP,,OBEYFILE command to rerun the configuration statement.
Module:  EZACFPv6
Automation:  This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your
automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** processInterface

**Example:**
EZZ0724I IPV6 ADDRESS OF :: ON LINE 92 CANNOT BE SPECIFIED

---

**EZZ0726I RESERVED IPv6 ADDRESS OF ipv6addr ON LINE lineno CANNOT BE SPECIFIED**

**Explanation:** A reserved IPv6 address cannot be specified on the IP configuration statement at line lineno.

A reserved IPv6 address is one of the following:

- Universal/local bit is set (bit 71).
- Individual/group bit is set (bit 72).
- The first four bytes of the interface ID are X'00005EFE'.
- The first 57 bits of interface ID, except universal/local and individual/group bits, are set to 1 (for example, FCFFFFFFFFFFFF8/57).

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP ignores the statement. TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:**

- Correct the statement.
- If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, use the VARY TCPIP,OBEYFILE command to rerun the configuration statement.

**Module:** EZACFPV6

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** processInterface

---

**EZZ0729I MISSING REQUIRED /PREFIX ON LINE lineno**

**Explanation:** The NETACCESS or VIPARANGE statement has an IPv6 address defined without a prefix length specified. All IPv6 addresses require a prefix length.

In the message text:

- `lineno` The line number where the error was found

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.
System programmer response:
- In the profile that had the error, add the prefix length to the IPv6 address on the NETACCESS or VIPARANGE statement.
- If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command using this profile.

Module: EZACFPAR, EZACFPVA

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: rdparser

Example:

EZZ0729I MISSING REQUIRED /PREFIX ON LINE 47

---

NETACCESS STATEMENT DEFINED WITHOUT DEFAULT ENTRY

Explanation: A NETACCESS statement was defined without a DEFAULT entry. All IP addresses should be defined in a security zone, but in an MLACTIVE environment, all IP addresses must be defined in a security zone. Any request to receive or send to an IP address that is not defined in a security zone fails in an MLACTIVE environment. You should always configure DEFAULT to ensure that a zone is found for all IP addresses.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:
- Add a DEFAULT entry to the NETACCESS statement. See NETACCESS statement in z/OS Communications Server: IP Configuration Reference for more information.
- If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command using this profile.

Module: EZACFPAR

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: rdparser

---

LINK linkname HAS INCOMPATIBLE VALUES WITH A PREVIOUSLY DEFINED INTERFACE STATEMENT DEFINED FOR THE SAME ADAPTER

Explanation: The LINK statement is rejected because it contains values that are inconsistent with an INTERFACE statement previously defined for the same adapter.

linkname is the link name with the incompatible value.

System action: Processing continues and the LINK statement is ignored.

Operator response: Change the adapter values on the LINK statement to match the values on the INTERFACE statement that uses the same adapter. See z/OS Communications Server: IP Configuration Reference for more information about the LINK statement.
EZ0732I INTERFACE interface_name HAS INCOMPATIBLE VALUES WITH A PREVIOUSLY DEFINED LINK STATEMENT DEFINED FOR THE SAME ADAPTER

Explanation: The INTERFACE statement is rejected because it contains values that are inconsistent with a LINK statement previously defined for the same adapter. 

interface_name is the interface name with the incompatible value.

System action: Processing continues and the INTERFACE statement is ignored.

Operator response: Change the adapter values on the INTERFACE statement to match the values on the LINK statement that uses the same adapter. See z/OS Communications Server: IP Configuration Reference for more information about the INTERFACE statement.

System programmer response: None.

Module: EZACFMS1

Procedure name: ioctlmsg

EZ0733I DATA SET NAME dsname INCORRECT - MEMBER NAME WAS NOT SPECIFIED FOR A PDS

Explanation: A VARY TCPIP,OBEYFILE command or a VARY TCPIP,SYNTAXCHECK command was issued specifying a data set name that is a partitioned data set (PDS) or library. However, the member name was not specified.

For example, the operator issued VARY TCPIP,O,DSN=USER10.PDS, when VARY TCPIP,O,DSN=USER10.PDS(TEST) should instead have been issued.

In the message text:

dsname

The name of the data set

System action: TCP/IP continues.

Operator response: Reissue the VARY command specifying a PDS or library with a member name. See z/OS Communications Server: IP System Administrator's Commands for more information about the VARY TCPIP,OBEYFILE and VARY TCPIP,SYNTAXCHECK commands.

System programmer response: None.

Module: EZACFPPR

Procedure name: cffopen2

EZ0734I DEVICE device_name CANNOT BE REDEFINED WITH A DIFFERENT DEVICE TYPE

Explanation: You cannot define a DEVICE with the same name as one that was previously deleted using a different device protocol.

device_name is the name of the device.

System action: Processing continues.

Operator response: Contact the system programmer.

System programmer response: Change the name of the device.

Module: EZACFMS1

Procedure name: ioctlmsg
EZZ0735I  LINK link_name CANNOT BE REDEFINED WITH A DIFFERENT LINK TYPE

Explanation: You cannot define a LINK with the same name as one that was previously deleted using a different link protocol.

link_name is the name of the link.

System action: Processing continues.

Operator response: Contact the system programmer.

System programmer response: Change the name of the link.

Module: EZACFMSI

Procedure name: ioctlmsg

EZZ0736I  INTERFACE interface_name CANNOT BE REDEFINED WITH A DIFFERENT INTERFACE TYPE

Explanation: You cannot define an INTERFACE with the same name as one that was previously deleted using a different interface protocol.

interface_name is the name of the interface.

System action: Processing continues.

Operator response: Contact the system programmer.

System programmer response: Change the name of the interface.

Module: EZACFMSI

Procedure name: ioctlmsg

EZZ0737I  parm OPTION IN stmt STATEMENT ON LINE lineno IS NOT SUPPORTED FOR IPV6 ADDRESSES

Explanation: This parameter is not supported for IPv6 addresses. It is ignored.

parm is the configuration parameter.

stmt is the configuration statement.

lineno is the line number where the parameter is found.

System action: TCP/IP continues. The statement is processed but the unsupported configuration parameter is ignored.

Operator response: Change the parameter value on the configuration statement with a VARY TCPIP,OBEYFILE command. See z/OS Communications Server: IP Configuration Reference for more information about the configuration statement.

System programmer response: None.

Module: EZACFPAR

Procedure name: rdparser

EZZ0738I  stmt parm VALUE sub_parm NOT VALID ON LINE lineno - default_parm USED

Explanation: A statement parameter value is not valid for this configuration statement. A default parameter will be used.

stmt is the configuration statement.

parm is the configuration parameter.

sub_parm is the associated sub-parameter that is not valid for this configuration.

lineno is the line number where the sub-parameter is found.

default_parm is the default parameter that will be in effect.

System action: TCP/IP continues.
Operator response: If you do not want the default parameter, change the parameter value on the configuration statement using a VARY TCPIP,OBEYFILE command.

System programmer response: None.

Module: EZACFPAR

Procedure name: rdparser

---

**EZZ0739I** IPv6 DYNAMIC XCF DEFINITIONS ARE `status`

Explanation: This message displays the status of the IPv6 dynamic XCF definitions.

`status` is either ENABLED or DISABLED. If DYNAMICXCF was coded on the IPCONFIG6 statement, then support status is enabled. If NODYNAMICXCF was coded, then support status is disabled.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

Module: EZACFM51

Procedure name: ioctlmsg

---

**EZZ0741I** configstmt_parm on line lineno not valid - IPv6 support is not enabled

Explanation: This message indicates that a configuration statement parameter is not valid because the stack is not enabled for IPv6.

In the message text:

`configstmt_parm`

The configuration statement and parameter that is valid only when IPv6 is enabled.

`lineno`

The line number of the profile or the VARY TCPIP,OBEYFILE command data set where the error was found.

System action: TCP/IP continues but the statement that is in error is ignored.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: Not applicable.

Module: EZACFPVA, EZACFPR2

Routing code: 10

Descriptor code: 12

Example: If the stack is not enabled for IPv6 and VIPADELETE INTFNAME1 is coded in the profile or the VARY TCPIP,OBEYFILE command data set on line 5, the following message is issued.

---

**EZZ0742I** CANNOT MODIFY DYNAMICXCF ON IPCONFIG6 AFTER IT HAS BEEN ENABLED

Explanation: IPv6 Dynamic XCF support cannot be changed by using a VARY TCPIP,OBEYFILE command. See z/OS Communications Server: New Function Summary for more information.

System action: TCP/IP continues. The IPCONFIG6 DYNAMICXCF statement is ignored.

Operator response: Contact the system programmer.

System programmer response: If you want to change the IPCONFIG6 DYNAMICXCF address, you must first stop TCPIP, code a new IPCONFIG6 DYNAMICXCF statement in the initial profile, and start TCPIP again.

Module: EZACFPV6
**EZZ0743I • EZZ0749I**

**Procedure name:** processIpconfig6

**EZZ0743I** D...OMPROUTE,IPV6RIP, <ALL | ACCEPTED | FILTERS | (INTERFACE<,NAME=IF_NAME>)>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLW

**Procedure name:** processIpconfig6

**EZZ0744I** D...OMPROUTE,GENERIC, <(LIST,<ALL | INTERFACES>) | INTERFACE>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLW

**Procedure name:** parseFile

**EZZ0745I** D...OMPROUTE,GENERIC6, <ALL | (INTERFACE<,NAME=IF_NAME>)>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLW

**Procedure name:** parseFile

**EZZ0746I** D...OMPROUTE,RT6TABLE<,PRTABLE=PRNAME><,DELETED | DEST=IP_ADDR>

**Explanation:** This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDHLW

**Procedure name:** parseFile

**EZZ0749I** VIPADISTRIBUTE parm ON LINE linenum CANNOT BE SPECIFIED WITH AN IPV4 ADDRESS

**Explanation:** The specified parameter cannot be used on a VIPADISTRIBUTE DEFINE statement if the statement specifies an IPv4 address.

In the message text:

`parm`

A parameter on the VIPADISTRIBUTE DEFINE statement
The line number in the configuration file on which the parameter is specified.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues. The VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:**
1. Make one of these changes to correct the problem:
   - Remove the specified parameter from the VIPADISTRIBUTE DEFINE statement.
   - Change the IPv4 address to an IPv6 interface. See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFPVA

**Routing code:** 8

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

EZZ0749I VIPADISTRIBUTE ENCAP ON LINE 35 CANNOT BE SPECIFIED WITH AN IPV4 ADDRESS

---

EZZ0750I IP SECURITY INITIALIZATION FAILED WITH RETURN CODE rc REASON CODE rsn

**Explanation:** An error occurred while initializing the IP security function.

rc and rsn can occur in the following combinations:

<table>
<thead>
<tr>
<th>rc</th>
<th>rsn</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>12</td>
<td>Unable to allocate storage for IP security global structures.</td>
</tr>
<tr>
<td>24</td>
<td>12</td>
<td>Storage allocation failure occurred during crypto initialization.</td>
</tr>
<tr>
<td>24</td>
<td>20</td>
<td>Storage allocation failure occurred while initializing the default filters.</td>
</tr>
</tbody>
</table>

**System action:** TCP/IP ends.

**Operator response:** Contact the system programmer.

**System programmer response:** See the table of rc and rsn values to correct the error.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg
**EZZ0751I**  CANNOT START IPv4 SECURITY AFTER TCPIP IS ACTIVE.

**Explanation:** The VARY TCPIP,OBEYFILE command was issued including the IPSECURITY parameter on the IPCONFIG statement. IPv4 Security can be started only from an initial profile.

**System action:** TCP/IP continues but the IPSECURITY parameter is ignored.

**Operator response:** If you want to enable IP security then contact the system programmer.

**System programmer response:** To enable IP security, update the initial profile to include the IPSECURITY parameter on the IPCONFIG statement and halt and restart TCP/IP.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0752I**  LOAD FAILED FOR THE IP SECURITY LOAD MODULE

**Explanation:** The IP security program load module, EZAFWALL, could not be loaded.

**System action:** TCP/IP ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the load module is available.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0753I**  IPv4 SECURITY SUPPORT IS ENABLED

**Explanation:** The IPv4 Security function was successfully enabled in the TCP/IP stack.

**System action:** TCP/IP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0754I**  IPSEC STATEMENT WAS NOT PROCESSED BECAUSE IP SECURITY IS NOT ENABLED

**Explanation:** An IPSEC statement was configured in the profile but the IPSecurity parameter was not coded on the IPCONFIG statement in the initial profile.

**System action:** TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** If you want to enable IP security, then update the initial profile to include the IPSECURITY parameter on the IPCONFIG statement and halt and restart TCP/IP.

**Module:** EZACFMS1

**Procedure name:** ioctlmsg

---

**EZZ0757I**  IPSEC STATEMENT ON LINE **lineno** IS IGNORED BECAUSE IPSEC WAS ALREADY SPECIFIED

**Explanation:** An IPSEC statement was already specified in this profile or VARY TCPIP,OBEYFILE command. The subsequent IPSEC statement on line **lineno** is ignored.

In the message text:

```
**lineno**
```

The line number where the ignored IPSEC statement was specified

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.
This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY
TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active
configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Determine which IPSEC statement is correct and change the profile.

**Module:** EZACFPSE

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP
profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY
TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your
automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** process IPSecurity

**Example:**

EZZ0757I IPSEC STATEMENT ON LINE 71 IS IGNORED BECAUSE IPSEC WAS ALREADY SPECIFIED

---

**EZ0758I  configstmt PARAMETER ON LINE lineno WILL BE RETIRED IN A FUTURE RELEASE**

**Explanation:** A parameter on the IP configuration statement indicated by configstmt will be retired in a future
release.

In the message text:

configstmt
  The configuration statement parameter. The configuration statement parameters are described in Z/OS
  Communications Server: IP Configuration Reference

lineno
  The line number where the parameter was found.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, the statement is processed
and TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY
TCPIP,SYNTAXCHECK command detects this parameter in a profile data set. No changes are applied to the active
configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** See the Z/OS Communications Server: IP Configuration Reference for information
about other ways to configure TCP/IP with the information represented by this parameter.

**Module:** EZACFPAR

**Procedure name:** parseFile

**Example:**

EZZ0758I VIPARANGE MOVEABLE DISRUPTIVE PARAMETER ON LINE 78 WILL BE RETIRED IN A FUTURE RELEASE

---

**EZ0759I  CANNOT MODIFY DYNAMICXCF ON IPCONFIG AFTER IT HAS BEEN ENABLED**

**Explanation:** Dynamic XCF support cannot be changed by using a VARY TCPIP,OBEYFILE command. See the
IPCONFIG statement in Z/OS Communications Server: IP Configuration Reference for more information.

**System action:** TCP/IP continues. The IPCONFIG DYNAMICXCF statement is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** If you want to change the IPCONFIG DYNAMICXCF parameters, stop TCP/IP, code
a new IPCONFIG DYNAMICXCF statement in the initial profile, and restart TCP/IP.

**Module:** EZACFMSI

**Procedure name:** ioctlmsg
EZZ0760I IPV6 TCPSTACKSOURCEVIPA IS IGNORED - IPV6 SOURCEVIPA IS NOT ENABLED

Explanation: The TCPSTACKSOURCEVIPA parameter was specified on an IPCONFIG6 profile statement but SOURCEVIPA is not enabled. SOURCEVIPA must be enabled for the TCPSTACKSOURCEVIPA function to be enabled. See the IPCONFIG6 statement in z/OS Communications Server: IP Configuration Reference for more information.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: If you want TCPSTACKSOURCEVIPA support, use the VARY TCPIP,OBEYFILE command to respecify the IPCONFIG6 statement with the SOURCEVIPA parameter.

Module: EZACFMS1

Procedure name: ioctlMsg

EZZ0761I statement PARAMETER parm ON LINE lineno WAS ALREADY SPECIFIED

Explanation: A parameter was specified on an IP Configuration statement more than once.

In the message text:

statement
  The IP Configuration statement in error

parm
  The statement parameter that was specified more than once in the same statement

lineno
  The line number where the configuration error was found

The configuration statements are described in z/OS Communications Server: IP Configuration Reference.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:
1. Correct the statement.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command using this profile.

Module: EZACFPV6

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:

EZZ0761I LINK PARAMETER MONSYSPLEX ON LINE 68 WAS ALREADY SPECIFIED
EZZ0762I  GLOBALCONFIG MLSCHKTERM WAS IGNORED - CONSISTENCY CHECK ERRORS

Explanation: The stack performed a multilevel security consistency check on the current configuration and detected problems. The new profile that is being processed included a GLOBALCONFIG change from NOMLSCHKTERMINATE to MLSCHKTERMINATE.

System action: TCP/IP continues but this change is ignored.

Operator response: Correct the MLSCHK problems reported in the TCP/IP joblog and then resubmit the GLOBALCONFIG MLSCHKTERMINATE change.

System programmer response: None.

Module: EZACFMS1

Procedure name: ioctlMsg

---

EZZ0763I  CANNOT ENABLE IPV4 MULTIPATH PERPACKET SUPPORT WHEN IPV4 SECURITY IS ENABLED

Explanation: Both IPv4 multipath perpacket and IPv4 security support cannot be enabled.

System action: TCP/IP continues. IPv4 multipath support is disabled.

Operator response: Contact the system programmer.

System programmer response: If you want to use IPv4 multipath support in conjunction with IPv4 security, enable multipath perconnection support by coding IPCONFIG MULTIPATH PERCONNECTION in the profile and issuing the VARY TCPIP, OBEYFILE command.

Module: EZACFMS1

Procedure name: ioctlMsg

---

EZZ0764I  GLOBALCONFIG NOMLSCHKTERM WAS IGNORED - MLACTIVE MLSTABLE AND NOMLQUIET ARE SET

Explanation: GLOBALCONFIG NOMLSCHKTERM was specified in the VARY TCPIP, OBEYFILE command data set. Changing from MLSCHKTERM to NOMLSCHKTERM is not allowed when RACF options are set to MLACTIVE MLSTABLE and NOMLQUIET.

System action: TCP/IP continues.

Operator response: Either change the GLOBALCONFIG statement in the VARY TCPIP, OBEYFILE command data set to MLSCHKTERM or contact the system programmer.

System programmer response: If you must change the RACF options MLACTIVE MLSTABLE or NOMLQUIET, see z/OS Planning for Multilevel Security and the Common Criteria.

Module: EZACFMS1

Procedure name: ioctlMsg

---

EZZ0765I  SOURCEVIPainterface vipaname on line lineno IS NOT A VALID VIPA DEFINITION

Explanation: The SOURCEVIPainterface vipaname that was specified on the INTERFACE statement is not an IPv6 virtual link or an IPv6 virtual interface.

vipaname is the name coded on the SOURCEVIPainterface parameter of the INTERFACE statement. This VIPA must be a static VIPA.

lineno is the line number where the configuration statement was found.

System action: TCP/IP continues, but the INTERFACE statement is not processed.

Operator response: Contact the system programmer.

System programmer response: Correct or create the IPv4 virtual link or IPv6 virtual interface definition for vipaname and issue a VARY TCPIP, OBEYFILE command. See the z/OS Communications Server: IP Configuration Reference for information about the INTERFACE statement.
EZ0766I • EZ0768I

Module: ioctlmsg
Procedure name: EZACFMS1

---

**EZ0766I**  NETACCESS STATEMENT WAS IGNORED - MLACTIVE MLSTABLE AND NOMLQUIET ARE SET

**Explanation:** A NETACCESS statement was specified in the VARY TCPIP,OBEYFILE command data set. Changes to the NETACCESS configuration are not allowed when RACF options are set to MLACTIVE, MLSTABLE, and NOMLQUIET.

**System action:** TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the RACF options and then reissue the VARY TCPIP,OBEYFILE command. To change the RACF options of MLACTIVE, MLSTABLE, or NOMLQUIET, see [z/OS Planning for Multilevel Security and the Common Criteria](https://www.ibm.com/support/docview.wss?uid=swg21357719).

Module: EZACFMS1
Procedure name: ioctlMsg

---

**EZ0767I**  DUPLICATE JOBNAME ENTRY *jobname* ON SRCIP STATEMENT

**Explanation:** A duplicate JOBNAME entry was found on the SRCIP statement with the same IP address type. For example, either both entries specify IPv4 addresses or both entries specify IPv6 IP addresses.

**System action:** TCP/IP continues. The first JOBNAME entry will be in effect. Any duplicate JOBNAME entries will be ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the SRCIP statement and issue a VARY TCPIP,OBEYFILE command with the updated profile. The SRCIP configuration statement is described in [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.wss?uid=swg21357719).

Module: ioctlmsg
Procedure name: EZACFMS1

---

**EZ0768I**  IPV4 ADDRESS OF *ipv4_address* ON LINE *lineno* CANNOT BE SPECIFIED

**Explanation:** The IPv4 address that was specified is not valid. The following IPv4 addresses are not valid:

- Broadcast (255.255.255.255)
- Class E (An IPv4 address in the range of 240.0.0.0 - 247.255.255.255)

In the message text:

- *ipv4_address* The IPv4 address that is not valid
- *lineno* The line number in the profile where the IP address is found

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the IP address. Configuration statements and valid IPv4 addresses are described in the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.wss?uid=swg21357719).

If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to
verify that you have corrected all syntax errors in the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command using this profile.

**Module:** EZACFPR2

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** processSrcIp

**Example:**

EZZ0768I IPV4 ADDRESS OF 241.1.0.9 ON LINE 23 CANNOT BE SPECIFIED

---

**EZZ0769I** SRCIP STATEMENT ON LINE **lineno** IS IGNORED - SRCIP HAS ALREADY BEEN SPECIFIED

**Explanation:** An SRCIP statement has already been specified in the profile. The subsequent SRCIP statement on line **lineno** is ignored.

In the message text:

**lineno**

The line number where the SRCIP statement was found

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error, and run the profile again. See SRCIP statement in z/OS Communications Server: IP Configuration Reference for more information.

**Module:** processSourceIP

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Procedure name:** EZACFPR2

**Example:**

EZZ0769I SRCIP STATEMENT ON LINE 105 IS IGNORED - SRCIP HAS ALREADY BEEN SPECIFIED

---

**EZZ0770I** D...NETSTAT,SRCIP<,FORMAT=LONG|SHORT>

**Explanation:** This message is a result of the DISPLAY TCPIP,HELP;SRCIP command.

**System action:** TCP/IP continues.

**Operator response:** For more information about the command, see the z/OS Communications Server: IP System Administrator's Commands.

**System programmer response:** None

**Module:** EZACDHLP

**Procedure name:** cdHelp
EZZ0771I  INTERFACE interface_name SYNTAX ERROR: REQUIRED PARAMETER parameter MISSING

Explanation: A required parameter is missing on the INTERFACE definition.

In the message text:

interface_name
- The name of the INTERFACE

parameter
- The required parameter that is missing from the definition

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, the incorrectly defined statement is ignored and processing continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Correct the statement and rerun the profile. For more information about the statement, see the z/OS Communications Server: IP Configuration Reference.

System programmer response: None.

Module: EZACFPV6

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Procedure name: processInterface

Example:

EZZ0771I INTERFACE OSA1 SYNTAX ERROR: REQUIRED PARAMETER IPADDR MISSING

EZZ0772I DISPLAY OMPROUTE,IPV6OSPF,
<ALL | AREASUM | DATABASE | DBSIZE | EXTERNAL | INTERFACE | LSA | NEIGHBOR | ROUTERS | STATISTICS | VLINK>

Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the DISPLAY OMPROUTE command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: cdHelp

EZZ0773I VARY SYSPLEX,LEAVEGROUP

Explanation: This message is the result of the DISPLAY TCPIP,HELP,keyword command and shows the format of the command.

System action: TCP/IP continues.

Operator response: For more information about the VARY SYSPLEX command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDHLP

Procedure name: cdHelp
EZZ0774I AUTOREJOIN HAS BEEN DISABLED BECAUSE RECOVERY WAS NOT CONFIGURED

Explanation: The GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is valid only if the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active. Because NORECOVERY is active, AUTOREJOIN is disabled (NOAUTOREJOIN is active).

System action: TCP/IP continues. If sysplex problem detection detects a problem, the stack will not leave the TCP/IP sysplex group.

Operator response: If AUTOREJOIN is wanted, invoke the VARY TCPIP,OBEYFILE command and reference a data set that contains the GLOBALCONFIG SYSPLEXMONITOR RECOVERY AUTOREJOIN profile statement. The stack will automatically leave the TCP/IP sysplex group whenever sysplex problem detection detects a problem, and the stack will automatically rejoin the TCP/IP sysplex group when the problem is cleared.

See the GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference for a definition of the SYSPLEXMONITOR parameter.

System programmer response: None.

Module: EZBTIGBL

Procedure name: EZBTIEPR

EZZ0775I DYNROUTE HAS BEEN DISABLED BECAUSE MONINTERFACE WAS NOT CONFIGURED

Explanation: The GLOBALCONFIG SYSPLEXMONITOR DYNROUTE option is valid only if the GLOBALCONFIG SYSPLEXMONITOR MONINTERFACE option is active. Because the NOMONINTERFACE option is active, the DYNROUTE option is disabled (NODYNROUTE option is active).

System action: TCP/IP continues. The TCP/IP stack is not monitoring for the presence of dynamic routes over monitored interfaces.

Operator response: Contact the system programmer.

System programmer response: If you want to specify the DYNROUTE option, invoke the VARY TCPIP,OBEYFILE command and reference a data set that contains the GLOBALCONFIG SYSPLEXMONITOR MONINTERFACE DYNROUTE profile statement. The TCP/IP stack will monitor for the presence of dynamic routes over monitored interfaces. See the GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference for a definition of the SYSPLEXMONITOR parameter.

User response: Not applicable.

Problem determination: Not applicable.

Module: EZACFMS1

Example: None.

EZZ0777I DISPLAY HELP TTLS,<,CONN=|GROUP>,<,DETAIL>,<,FORMAT=LONG|SHORT>

Explanation: This message is the result of the DISPLAY HELP TTLS command and shows the format of the command.

System action: TCP/IP continues.

Operator response: See DISPLAY TCPIP,HELP in z/OS Communications Server: IP System Administrator's Commands for information about the DISPLAY HELP TTLS command.

System programmer response: None.

Module: EZACDHLP

Procedure name: cdHelp
EZZ0778I  V...SYSPLEX,JOINGROUP
Explanation: This message is a result of the DISPLAY TCPIP,,HELP,JOINGROUP command.
System action: TCP/IP continues.
Operator response: See DISPLAY TCPIP,,HELP in z/OS Communications Server: IP System Administrator's Commands for information about the DISPLAY TCPIP,,HELP,JOINGROUP command.
Module: EZACDHLP
Procedure name: cdHelp

EZZ0779I  V...SYSPLEX,DEACTIVATE,DVIPA=XDVIPA
Explanation: This message is a result of the DISPLAY TCPIP,,HELP,DEACTIVATE command.
System action: TCP/IP continues
Operator response: See DISPLAY TCPIP,,HELP in z/OS Communications Server: IP System Administrator's Commands for information about the DISPLAY TCPIP,,HELP,DEACTIVATE command.
Module: EZACDHLP
Procedure name: cdHelp

EZZ0780I  V...SYSPLEX,REACTIVATE,DVIPA=XDVIPA
Explanation: This message is a result of the DISPLAY TCPIP,,HELP,REACTIVATE command.
System action: TCP/IP continues.
Operator response: See DISPLAY TCPIP,,HELP in z/OS Communications Server: IP System Administrator's Commands for information about the DISPLAY TCPIP,,HELP,REACTIVATE command.
Module: EZACDHLP
Procedure name: cdHelp

EZZ0781I  VARIABLE SUBNETTING SUPPORT IS ALWAYS ENABLED IN TCP/IP
Explanation: The IPCONFIG VARSUBNETTING parameter or IPCONFIG NOVARSUBNETTING parameter was specified in the TCP/IP profile. The VARSUBNETTING parameters are no longer used because variable subnetting support in TCP/IP is always enabled.
System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues.
This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.
Operator response: Contact the system programmer.
System programmer response: Remove the IPCONFIG VARSUBNETTING or IPCONFIG NOVARSUBNETTING parameter from the TCP/IP profile.
Module: EZACFPAR
Procedure name: rdparser

EZZ0782I  VIPADISTRIBUTE PARAMETER DESTIP ALL ON LINE linenum CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED
Explanation: The DESTIP ALL parameter cannot be specified on a VIPADISTRIBUTE DEFINE statement if ENCAP is specified.
In the message text:
linenum
The line number in the configuration file on which the ENCAP parameter is specified.
**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:**

1. To correct the problem, do one of the following:
   - Change the VIPADISTRIBUTE DEFINE statement to specify the DESTIP parameter with specific IPv6 addresses.
   - Remove the ENCAP parameter.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise,
   a. If you removed the ENCAP parameter from the statement,
      1) Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA.
      2) Specify those VIPADISTRIBUTE DEFINE statements again but without the ENCAP parameter.
   b. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFPVA

**Routing code:** 8

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

EZZ0782I VIPADISTRIBUTE PARAMETER DESTIP ALL ON LINE 19 CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED

---

**EZZ0783I**

VIPADISTRIBUTE DYNAMIC PORTS CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED WITH THE TIER1 PARAMETER ON LINE `linenum`

**Explanation:** A VIPADISTRIBUTE DEFINE statement with the ENCAP parameter was found, but the statement did not specify a PORT parameter. An unspecified PORT parameter indicates that dynamic port processing is to be used.

In the message text:

`linenum`

The line number in the configuration file on which the TIER1 parameter is specified

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.
System programmer response:

1. Do one of the following steps to correct the problem:
   - Add a PORT parameter.
   - Remove the ENCAP parameter from the VIPADISTRIBUTE DEFINE statement.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise,
   a. If you removed the ENCAP parameter from the statement,
      1) Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA.
      2) Issue a VIPADELETE statement for the DVIPA.
   b. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the [VIPADYNAMIC statement](z/OS Communications Server: IP Configuration Reference) for more information about the VIPADYNAMIC statement parameters.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFPVA

Routing code: 8

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:

```
EZZ0783I VIPADISTRIBUTE DYNAMIC PORTS CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED WITH THE TIER1 PARAMETER ON LINE 19
```

**EZZ0784I** VIPADISTRIBUTE *parm* ON LINE *linenum* IS IGNORED WHEN ENCAP IS SPECIFIED

Explanation: The specified parameter cannot be used on a VIPADISTRIBUTE DEFINE statement that specifies the ENCAP parameter. The parameter is ignored.

In the message text:

- *parm* The parameter on the VIPADISTRIBUTE DEFINE statement
- *linenum* The line number in the configuration file on which the parameter is specified

System action: TCP/IP continues. The statement is processed, but the specified configuration parameter is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:

1. Make one of these changes to correct the statement:
   - Remove the specified parameter from the VIPADISTRIBUTE DEFINE statement.
   - Remove both the TIER1 and ENCAP parameters.

See [VIPADYNAMIC statement](z/OS Communications Server: IP Configuration Reference) for more information about valid VIPADYNAMIC statement parameters.
2. If this message was displayed as a result of a VARY TCPIP,,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile.

Otherwise:

a. If you removed the TIER1 and ENCAP parameters from the statement do the following:
   1) Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA.
   2) Issue a VIPADELETE statement for the DVIPA.

b. Issue the VARY TCPIP,,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

Problem determination: Not applicable.

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also appear during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:

EZZ0784I VIPADISTRIBUTE OPTLOCAL ON LINE 11 IS IGNORED WHEN ENCAP IS SPECIFIED

EZZ0785I VIPADISTRIBUTE DISTMETHOD OF distmeth ON LINE linenum CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED

Explanation: A VIPADISTRIBUTE DEFINE statement that specifies the ENCAP parameter cannot specify SERVERWLM or BASEWLM as the DISTMETHOD value.

In the message text:

distmeth
   The distribution method

linenum
   The line number in the configuration file on which the distribution method is specified

System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:

1. Make one of these changes to correct the statement:
   • Change the VIPADISTRIBUTE DEFINE statement to specify a DISTMETHOD value other than SERVERWLM or BASEWLM.
   • Remove the TIER1 and ENCAP parameters.

2. If this message was displayed as a result of VARY TCPIP,,SYNTAXCHECK processing, issue the command again to verify that you have corrected all syntax errors in the profile.

Otherwise:
a. If you removed the TIER1 and ENCAP parameters from the statement, do the following steps:
   1) Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for
      this DVIPA.
   2) Issue a VIPADELETE statement for the DVIPA.

b. Issue the VARY TCPIP,,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration
Reference.

User response: Not applicable.

Problem determination: Not applicable.

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP
profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY
TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your
automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0785I VIPADISTRIBUTE DISTMETHOD OF BASEWLM ON LINE 14 CANNOT BE SPECIFIED WHEN ENCAP IS SPECIFIED

EZZ0786I IPV6 SECURITY SUPPORT IS ENABLED

Explanation: The IP security function for IPv6 was successfully enabled in the TCP/IP stack.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP

Module: EZACFMS1

Example: None.

EZZ0787I IPSEC6RULE STATEMENT WAS NOT PROCESSED BECAUSE IPV6 SECURITY IS NOT ENABLED

Explanation: The profile contained an IPSEC6RULE statement but the IPCONFIG6 IPSECURITY parameter was not specified.

System action: TCPIP rejects the IPSEC6RULE statement.

Operator response: Contact the system programmer.

System programmer response: Update the TCP/IP profile to include the IPSECURITY parameter on the
IPCONFIG6 statement and restart TCP/IP. See the IPCONFIG6 statement in z/OS Communications Server: IP
Configuration Reference for more information about the IPCONFIG6 statement syntax.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP
Module: EZACFMS1
Example: None.

EZZ0788I  CANNOT START IPV6 SECURITY AFTER TCPIP IS ACTIVE

Explanation: The VARY TCPIP,OBEYFILE command was issued for a set of profile statements that included an
IPCONFIG6 statement with the IPSECURITY parameter. IP security can be started only from an initial profile.

System action: TCP/IP continues but the IPSECURITY parameter is ignored.

Operator response: Contact the system programmer.

System programmer response: To enable IP security for IPv6, update the TCP/IP profile to include the IPSECURITY
parameter on the IPCONFIG6 statement and restart TCP/IP. See the IPCONFIG6 statement in z/OS Communications
Server: IP Configuration Reference for more information about the IPCONFIG6 statement syntax.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP
Module: EZACFMS1
Example: None.

EZZ0789I  IPV6 SECURITY SUPPORT IS DISABLED BECAUSE IPV4 SECURITY IS NOT ENABLED

Explanation: The TCP/IP profile specified the IPSECURITY parameter on the IPCONFIG6 statement but did not
specify the IPSECURITY parameter on the IPCONFIG statement.

System action: TCP/IP ignores the IPSECURITY parameter on the IPCONFIG6 statement.

Operator response: Contact the system programmer.

System programmer response: To enable IP security for IPv6, update the TCP/IP profile to also enable IP security
for IPv4 (by including the IPSECURITY parameter on the IPCONFIG statement) and restart TCP/IP. See the
IPCONFIG statement in z/OS Communications Server: IP Configuration Reference for more information about the
IPCONFIG statement syntax.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP
Module: EZACFMS1
Example: None.

EZZ0790I  CANNOT SPECIFY parameter ON statement AFTER TCPIP IS ACTIVE

Explanation: The parameter value cannot be specified on the statement specified by the statement value after initial
TCP/IP profile processing is complete.

In the message text:

parameter
   A parameter on a TCP/IP profile statement.

statement
   The incorrect TCP/IP profile statement.

System action: TCP/IP continues. The incorrect statement is ignored.

Operator response: If you want to change the value of the parameter specified by the parameter value on the
statement, stop TCP/IP and restart it with a TCP/IP profile containing the statement specified by the statement value
with the changed value for the parameter value.

System programmer response: None.
EZZ0791I  DUPLICATE DESTINATION ENTRY destaddr ON SRCIP STATEMENT

Explanation: A duplicate DESTINATION entry was found on the SRCIP statement.

In the message text:

destaddr

The duplicate destination address, or destination address and prefix length, specified on the SRCIP DESTINATION entry. If a prefix length was specified, the subnet address that results from applying the prefix length to the destination address is the same as a subnet address that resulted from a previous entry in the SRCIP statement block.

System action: TCP/IP continues. The first DESTINATION entry is in effect. Any duplicate DESTINATION entries are ignored.

Operator response: Contact the system programmer.

System programmer response: Correct the SRCIP statement and issue a VARY TCPIP,OBEYFILE command with the
EZZ0794I TOO MANY keyword FILTER VALUES DEFINED FOR OSAENTA portname ON LINE lineno

Explanation: The OSAENTA statement or VARY TCPIP,OSAENTA command specified an additional keyword value for the OSA-Express network traffic analyzer trace function. The keyword value was the ninth value specified, and only eight values are allowed.

In the message text:

keyword  The keyword that caused the maximum number of values to be exceeded.

portname  The name of the OSAENTA port.

lineno  The line number of the statement in error.

System action: The definition of the OSAENTA interface is not updated for any parameters specified on that OSAENTA command or statement.

Operator response: Use the Netstat DEvlinks/-d command to view the current values associated with the OSAENTA interface. Contact the system programmer with the Netstat output. For more information about the Netstat DEvlinks/-d command, see the [Netstat DEvlinks/-d report](https://www.ibm.com) in [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com).

System programmer response: Clear the old values by specifying keyword=* on the OSAENTA statement or on the VARY TCPIP,OSAENTA command, and then reissue the OSAENTA statements or VARY TCPIP,OSAENTA commands with no more than eight keyword values. See the OSAENTA statement information in [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com) and the VARY TCPIP,OSAENTA command information in [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com).

User response: Not applicable.

Problem determination: Not applicable.

EZZ0794I TOO MANY PORTNUM FILTER VALUES DEFINED FOR OSAENTA OSA1 ON LINE 9
```
EZZ0795I  Virtual MAC address vmacaddr on line lineno is not allowed

Explanation:  The specified Virtual MAC (VMAC) address is not allowed.

In the message text:

vmacaddr
  The VMAC address that was coded on the LINK or INTERFACE statement. The following values are not allowed for a VMAC address:
  • Any VMAC address where bit 6 of the first byte (the universal/local flag - 'U' bit) is zero.
  • Any VMAC address where bit 7 of the first byte (the group/individual flag - 'G' bit) is nonzero.

lineno
  The line number where the statement was found.

System action:  If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the interface or link definition that contained the VMAC address is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response:  Contact the system programmer.

System programmer response:  Change the VMAC address on the LINK or INTERFACE statement. See DEVICE and LINK - MPCIPA OSA-Express QDIO devices and INTERFACE - IPAQENET6 OSA-Express QDIO interfaces in z/OS Communications Server: IP Configuration Reference for more information.

User response:  Not applicable.

Problem determination:  Not applicable.

---

**EZZ0797I**  EXPLICITBINDPORTRANGE has limited support in a CINET environment

**Explanation:** Specifying the EXPLICITBINDPORTRANGE parameter on the GLOBALCONFIG statement might not have the expected outcome when the TCP/IP stack is configured to be in a common INET (CINET) environment. Application requests to bind to INADDR_ANY and the unspecified IPv6 address (in6addr_any) and port 0 might not result in successful connection setup, unless one of the following criteria are met:

- CINET has been configured but only a single TCP/IP stack is active at any time.
- Multiple TCP/IP stacks are active but all applications that perform bind requests to INADDR_ANY and in6addr_any and port 0 have affinity to a specific TCP/IP stack.

**System action:** TCP/IP profile processing continues. Application requests to bind to INADDR_ANY and in6addr_any and port 0 might not result in successful connection setup, unless the specified criteria are met.

**Operator response:** Contact the system programmer.

**System programmer response:** To ensure that the connection setup is always successful when you are using distributed DVIPAs that are specified on SRCIP rules destination configure an explicit bind port range. You must also configure your system so that the stack is not part of a CINET environment or ensure that the specified criteria are met.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP

**Module:** EZACFPAR

**Routing code:** 10

**Descriptor code:** 12

**Example:** Not applicable.

---

**EZZ0798I**  VIPADISTRIBUTE WITH BOTH DESTIP ALL AND WEIGHT KEYWORD IS REJECTED FOR dvipa

**Explanation:** Both the DESTIP ALL keyword and the WEIGHT keyword were specified on the same VIPADISTRIBUTE statement. The WEIGHT and ALL keywords are mutually exclusive keywords on the VIPADISTRIBUTE statement.

In the message text:

dvipa

The IPv4 address or the IPv6 interface name specified on the VIPADISTRIBUTE statement

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:**

1. Change the VIPADISTRIBUTE statement in one of the following ways:
   - Remove the WEIGHT keyword (and associated value).
   - Explicitly list each target system with their associated WEIGHT keywords.

2. If this message was displayed as a result of VARY TCPIP,SYNTAXCHECK processing, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command with the updated profile.

**User response:** Not applicable.

**Problem determination:** Not applicable.
EZZ0799I

Source: z/OS Communications Server TCP/IP
Module: EZACFPVA
Routing code: 8
Descriptor code: 12
Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ006I and before EZZ006SI.

Example: The following VIPADISTRIBUTE statement is rejected because both the ALL and WEIGHT keywords are specified:

VIPADISTRIBUTE 201.2.10.11 PORT 4011 DESTIP ALL WEIGHT 20
VIPADISTRIBUTE DISTMETHOD WEIGHTEDACTIVE 201.2.10.11 PORT 4011 DESTIP ALL WEIGHT 20

EZZ0799I VIPADISTRIBUTE WEIGHT IGNORED WHEN DISTMETHOD IS NOT WEIGHTEDACTIVE

Explanation: The VIPADISTRIBUTE statement WEIGHT keyword is valid only when the DISTMETHOD parameter value is WEIGHTEDACTIVE. The WEIGHT keyword is ignored.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command:
1. Make one of these changes to correct the statement:
   a. Remove the WEIGHT parameter.
   b. Change the DISTMETHOD parameter to WEIGHTEDACTIVE.
2. Issue the VARY TCPIP,SYNTAXCHECK command again to verify that you have corrected all syntax errors in the profile.
   Otherwise, to use the WEIGHT keyword, do the following steps:
   a. Change the VIPADISTRIBUTE statement to specify a DISTMETHOD parameter value WEIGHTEDACTIVE in the original profile.
   b. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

User response: Not applicable.

Problem determination: Not applicable.

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ006I and before EZZ006SI.

Example: Not applicable.
**EZZ0800I** VIPADISTRIBUTE PROCTYPE IS NOT VALID BECAUSE DISTMETHOD IS NOT EQUAL TO BASEWLM

**Explanation:** The VIPADISTRIBUTE statement PROCTYPE parameter is valid only when the DISTMETHOD parameter value is BASEWLM.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command:
1. Change the VIPADISTRIBUTE statement to contain only one of these keywords.
2. Issue the command again to verify that you have corrected all syntax errors in the profile.

Otherwise,
1. Correct the original profile statement in the VIPADYNAMIC block to contain only one of these keywords.
2. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP

**Module:** EZBCFPVA

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:** The following VIPADISTRIBUTE statement would be rejected because PROCTYPE was specified with a DISTMETHOD parameter value other than BASEWLM:
VIPADISTRIBUTE PROCTYPE DISTMETHOD ROUNDROBIN 201.2.10.11 PORT 4011 DESTIP ALL
VIPADISTRIBUTE PROCTYPE CP 10 ZAAP 90 DISTMETHOD ROUNDROBIN 201.2.10.11 PORT 4011 DESTIP ALL

**EZZ0801I** VIPADISTRIBUTE PROCTYPE PARAMETER WITH ALL VALUES SET TO ZERO IS NOT VALID

**Explanation:** The VIPADISTRIBUTE statement PROCTYPE parameter values must not all be configured to the value 0.

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** To change the PROCTYPE parameter values, do the following steps:
1. Correct the original profile statement in the VIPADYNAMIC block.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.
**EZZ0802I • EZZ0804I**

**EZ08071 • EZ08081**

Routing code: 8
Descriptor code: 12
Example:

EZ08081I ZIIP IPSECURITY IS DISABLED

**EZ08071**  GLOBALCONFIG ZIIP IQDIOMULTIWRITE IS IGNORED - HIPERSOCKETS MULTIPLE WRITE IS NOT ENABLED

Explanation: The TCP/IP profile specified the GLOBALCONFIG statement with a ZIIP parameter and the IQDIOMULTIWRITE subparameter to offload the HiperSockets multiple write workload to the IBM System z Integrated Information Processor (zIIP) on a System z9 or later server. However, HiperSockets multiple write support (GLOBALCONFIG IQDMULTIWRITE) is not configured.

System action: TCP/IP continues. The GLOBALCONFIG ZIIP IQDIOMULTIWRITE request is ignored.

Operator response: Contact the system programmer.

System programmer response: If you want to offload the HiperSockets multiple write workload to zIIP, specify both the ZIIP IQDIOMULTIWRITE subparameter and the IQDMULTIWRITE parameter on the GLOBALCONFIG statement and use the VARY TCPIP,OBEYFILE command to process a profile that contains the statement.

If you do not want to offload the HiperSockets multiple write workload to zIIP, remove the GLOBALCONFIG ZIIP IQDIOMULTIWRITE subparameter from the profile to avoid this message in the future. See the GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference for more information.

User response: Not applicable.

Problem determination: Not applicable.

Automation: Not applicable.
Example: Not applicable.

**EZ08081**  VIPADISTRIBUTE parameter ON LINE lineno IS NOT VALID BECAUSE THE SPECIFIED DISTMETHOD IS NOT SERVERWLM

Explanation: The parameter value and the DISTMETHOD parameter are specified on a VIPADISTRIBUTE profile statement, but the DISTMETHOD parameter value is not SERVERWLM. The parameter value is valid only when the DISTMETHOD parameter specifies SERVERWLM.

In the message text:

- **parameter**
  A parameter on the VIPADISTRIBUTE profile statement
- **lineno**
  The line number in the profile data set that contains the incorrect specification

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, the VIPADISTRIBUTE statement and any subsequent statements in the VIPADYNAMIC block are ignored. Profile processing continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:
1. Correct the VIPADYNAMIC block by doing one of the following:
   - Remove the incorrect VIPADISTRIBUTE statement from the VIPADYNAMIC block.
• Correct the VIPADISTRIBUTE statement by deleting the parameter that is not valid or by changing the DISTMETHOD parameter value to SERVERWLM.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command with a profile that contains the entire VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

Problem determination: Not applicable.

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0808I VIPADISTRIBUTE PROCXCOST ON LINE 15 IS NOT VALID BECAUSE THE SPECIFIED DISTMETHOD IS NOT SERVERWLM

**EZZ0809I**

* stmt parm PARAMETER ON LINE linenum IGNORED WHEN TIER1, TIER2 OR CPCSCOPE ARE SPECIFIED*

Explanation: The specified parameter is not valid for this configuration statement when the TIER1, TIER2, or CPCSCOPE parameter is specified on the same statement. The parameter is ignored.

In the message text:

*stmt*  
The VIPADYNAMIC block statement

*parm*  
The parameter on the specified statement

*linenum*  
The line number in the configuration file on which the parameter is specified

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues. The statement is processed but the specified configuration parameter is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Do the following steps to correct the problem:

1. Remove the specified parameter from the VIPABACKUP or VIPADEFINE statement or remove the TIER1, TIER2, or CPCSCOPE parameter.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile.

   Otherwise, do the following:

   a. If you removed the TIER1, TIER2 or CPCSCOPE parameter, issue a VIPADElete command for the DVIPA.

   b. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.
See the information about the VIPADYNAMIC statement in "z/OS Communications Server: IP Configuration Reference".

User response: Not applicable.

Problem determination: Not applicable.

Example:

EZZ0809I VIPADEFINE SERVICEMGR PARAMETER ON LINE 35 IGNORED WHEN TIER1, TIER2 OR CPCSCOPE ARE SPECIFIED

EZZ0810I VIPADISTRIBUTE DISTMETHOD OF distmeth ON LINE linenum IS MUTUALLY EXCLUSIVE WITH THE TIER1 PARAMETER

Explanation: A VIPADISTRIBUTED DEFINE statement that specifies the TIER1 parameter cannot specify SERVERWLM or BASEWLM as the DISTMETHOD value.

In the message text:

- **distmeth**
  - The distribution method

- **linenum**
  - The line number in the configuration file on which the distribution method is specified

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response:

1. Make one of these changes to the VIPADISTRIBUTE DEFINE statement:
   - Specify a DISTMETHOD value other than SERVERWLM or BASEWLM.
   - Remove the TIER1 parameter.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise,
   a. If you removed the TIER1 parameter from the VIPADISTRIBUTE statement:
      1) Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA.
      2) Issue a VIPADELETE statement for the DVIPA.
   b. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in "z/OS Communications Server: IP Configuration Reference".

User response: Not applicable.

Problem determination: Not applicable.
EZZ08111

VIPADISTRIBUTE PARAMETER parm1 ON LINE linenum IS MUTUALLY EXCLUSIVE WITH PARAMETER parm2

Explanation: A VIPADISTRIBUTE DEFINE statement that specifies parameter parm1 cannot also specify parameter parm2.

In the message text:

parm1  
A parameter on the VIPADISTRIBUTE DEFINE statement

linenum  
The line number in the configuration file on which the parm1 or the parm2 parameter is specified

parm2  
A parameter on the VIPADISTRIBUTE DEFINE statement

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command. TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Do the following steps to correct the problem:

1. Remove one of the mutually exclusive parameters from the VIPADISTRIBUTE DEFINE statement.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile.
   Otherwise, issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

EZZ0817I QDIO ACCELERATOR IS ENABLED

EZZ0818I CANNOT ENABLE QDIO ACCELERATOR - reason

Explanation: QDIO accelerator cannot be enabled for the specified reason.

In the message text:

reason
The reason for the error. The reason value can be one of the following:

IQDIO Routing is active
QDIO accelerator cannot be enabled by issuing the VARY TCPIP,OBEYFILE command with the IPCONFIG QDIOACCELERATOR parameter specified because the IPCONFIG IQDIOROUTING parameter was already specified.

TCP/IP stack activated with NOQDIOACCELERATOR
The QDIO accelerator cannot be enabled by issuing the VARY TCPIP,OBEYFILE command with IPCONFIG QDIOACCELERATOR specified because IPCONFIG NOQDIOACCELERATOR and IPCONFIG NOIQDIOROUTING were both specified at TCP/IP initialization.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: The response depends on the reason value:

IQDIO Routing is active
Specify IPCONFIG NOIQDIOROUTING in the VARY TCPIP,OBEYFILE command data set and reissue the VARY TCPIP,OBEYFILE command.

TCP/IP stack activated with NOQDIOACCELERATOR
Specify the IPCONFIG QDIOACCELERATOR parameter in the TCP/IP profile and restart the stack.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP

Module: EZACFMS1

Routing code: *
EZZ0819I  QDIO ACCELERATOR IS ENABLED FOR SYSPLEX DISTRIBUTOR ONLY

Explanation: The QDIOACCELERATOR parameter was specified on the IPCONFIG statement in the TCP/IP profile; however, NODATAGRAMFWD was also specified on the IPCONFIG statement. Only Sysplex Distributor traffic will be accelerated because NODATAGRAMFWD disables IP forwarding.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: If you want only Sysplex Distributor traffic to be accelerated, then no response is required. If you also want IP forwarding traffic to be accelerated, then issue the VARY TCPIP,OBEYFILE command to specify the IPCONFIG DATAGRAMFWD parameter or add the IPCONFIG DATAGRAMFWD parameter to the TCP/IP profile.

User response: Not applicable.

Problem determination: Not applicable.

EZZ0822I  <,DNSADDR=><,HOSTNAME=><,IPADDR=><,FORMAT=LONG|SHORT>

EZZ0823I  VIPADISTRIBUTE PARAMETER DESTIP ALL ON LINE linenumber IS NOT VALID WHEN GRE IS SPECIFIED

Explanation: The DESTIP ALL parameter cannot be specified on the same VIPADISTRIBUTE DEFINE statement as the GRE parameter.

In the message text:

linenum

The line number in the configuration file on which the problem was detected
**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** To correct the problem, make one of the following changes:

- Specify addresses for the DESTIP parameter:
  
  Re-issue the VIPADISTRIBUTE DEFINE statement with the DESTIP parameter, specifying IP addresses instead of ALL.

- Remove the GRE parameter:
  
  1. Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA. (This action is not needed for VARY TCPIP,SYNTAXCHECK processing.)
  2. Re-issue the VIPADISTRIBUTE DEFINE statements without the GRE parameter.

- Remove the TIER1 and GRE parameters:
  
  1. Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA, and issue a VIPADELETE for the DVIPA. (This action is not needed for VARY TCPIP,SYNTAXCHECK processing.)
  2. Issue a VIPADEFINE statement for the DVIPA with TIER2 or no Tier parameter, and the VIPADISTRIBUTE DEFINE statements with the corresponding tier (TIER2 or none) and without the GRE parameter.

If this message was displayed as a result of VARY SYNTAXCHECK processing, issue the command again after updating the profile to verify that you have corrected all syntax errors in the profile.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFPVA

**Routing code:** 8

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

VIPADISTRIBUTE PARAMETER DESTIP ALL ON LINE 35 IS NOT VALID WHEN GRE IS SPECIFIED

**EZ0824I**

VIPADISTRIBUTE parm ON LINE linenum CAN BE SPECIFIED ONLY WHEN GRE IS SPECIFIED TIER1 AND EITHER GRE OR ENCAP ARE SPECIFIED

**Explanation:** The specified parameter was found on a VIPADISTRIBUTE DEFINE statement that did not also specify the TIER1 parameter and either the GRE or ENCAP parameters.

In the message text:

- **parm** The parameter specified on the VIPADISTRIBUTE DEFINE statement
- **linenum** The line number in the configuration file at which the problem was detected

**System action:** If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.
This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** To correct the problem, make one of these changes:

- Remove the specified parameter:
  Re-issue the VIPADISTRIBUTE DEFINE statement with the specified parameter removed.

- Add the TIER1 parameter (if not already specified) and add either the GRE or ENCAP parameter.
  1. Issue VIPADISTRIBUTE DELETE statements for all previous VIPADISTRIBUTE DEFINE statements for this DVIPA. Issue a VIPADELETE for the DVIPA. (These actions are not needed for VARY TCPIP,,SYNTAXCHECK processing.)
  2. Re-issue a VIPADEFHE statement for the DVIPA with the TIER1 parameter, and re-issue the VIPADISTRIBUTE DEFINE statements with the TIER1 and either the GRE or ENCAP parameter.

If this message was displayed as a result of VARY TCPIP,,SYNTAXCHECK processing, issue the command again after updating the profile to verify that you have corrected all syntax errors in the profile.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** EZACFPVA

**Routing code:** 8

**Descriptor code:** 12

**Automation:** This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

**Example:**

EZZ0824I VIPADISTRIBUTE DISTMETHOD TARGCONTROLLED ON LINE 24 CAN BE SPECIFIED ONLY WHEN TIER1 AND EITHER GRE OR ENCAP ARE SPECIFIED

---

**EZZ0826I**

PREFERRED AND BACKUP PARAMETERS ARE REQUIRED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

**Explanation:** Because the distribution method is HOTSTANDBY, there must be exactly one DESTIP address that is specified as PREFERRED and at least one DESTIP address that is specified as BACKUP.

**System action:** If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE statement is ignored.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Do the following steps to correct the problem:

1. Add the missing parameters on the configuration statement.
2. If this message was displayed as a result of a VARY TCPIP,,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue the VARY TCPIP,,OBEYFILE command with the changed configuration statement.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.
User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFPVA

Routing code: 10

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:

EZZ0826I PREFERRED AND BACKUP PARAMETERS ARE REQUIRED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

EZZ0827I EXACTLY ONE PREFERRED AND AT LEAST ONE BACKUP ARE REQUIRED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

Explanation: Because the distribution method is HOTSTANDBY there must be exactly one DESTIP address that is specified as PREFERRED and at least one DESTIP address that is specified as the BACKUP.

System action: If processing an initial profile or VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Do the following steps to correct the problem:

1. Make one of these changes to the statement:
   - Correct the statement so that there is exactly one DESTIP address that is PREFERRED and at least one DESTIP address that is BACKUP on the VIPADISTRIBUTE statement for distribution method of HOTSTANDBY.
   - Remove the PREFERRED or BACKUP parameters or both parameters, and change the distribution method to something other than HOTSTANDBY.

2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have corrected all syntax errors in the profile. Otherwise, issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference

User response: Contact the system programmer.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.
EZZ0828I • EZZ0829I

Example:
EZZ0827I EXACTLY ONE PREFERRED AND AT LEAST ONE BACKUP ARE REQUIRED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

EZZ0828I VIPADISTRIBUTE parm ON LINE linenum IS IGNORED WHEN DISTMETHOD IS HOTSTANDBY

Explanation: The specified parameter cannot be used on a VIPADISTRIBUTE DEFINE statement when the HOTSTANDBY distribution method is specified. The parameter is ignored.

In the message text:

parm
The parameter on the VIPADISTRIBUTE DEFINE statement

linenum
The line number in the configuration file on which the parameter is specified

System action: If processing an initial profile or VARY TCPIP,OBEYFILE command, TCP/IP continues. The VIPADISTRIBUTE DEFINE statement is accepted, but the parameter is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Take the following steps to correct the problem:
1. Remove the specified parameter from the VIPADISTRIBUTE DEFINE statement.
2. If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, issue the command again to verify that you have removed all syntax errors from the profile. Otherwise, issue a VARY TCPIP,OBEYFILE command using this profile.

User response: Not applicable.

Problem determination: Not applicable.

Module: EZACFPVA

Routing code: 10

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0828I VIPADISTRIBUTE TIMEDAFFINITY ON LINE 5 IS IGNORED WHEN DISTMETHOD IS HOTSTANDBY

EZZ0829I MORE THAN 31 BACKUPS WERE SPECIFIED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

Explanation: While processing a profile data set, TCP/IP found a VIPADISTRIBUTE statement that specified more than thirty one addresses as BACKUP addresses. Because the distribution method is HOTSTANDBY, there must be exactly one DESTIP address that is PREFERRED and at least one DESTIP address that is coded as BACKUP. Thirty-one is the maximum number of DESTIP addresses that may be specified as BACKUP addresses.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.
Operator response: Contact the system programmer.

System programmer response: If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, correct the error before using the profile data set as an initial profile or as a VARY TCPIP,OBEYFILE profile.

Otherwise, do the following steps to correct the problem:
1. Correct the statement so that there are 31 or fewer BACKUP DESTIP addresses specified on the VIPADISTRIBUTE DESTIP statement.
2. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFPVA

Routing code: 10

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also appear during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0829I MORE THAN 31 BACKUPS WERE SPECIFIED ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

EZZ0830I PREFERRED AND BACKUP IP ADDRESSES MUST BE UNIQUE ON THE VIPADISTRIBUTE STATEMENT WHEN DISTMETHOD IS HOTSTANDBY

Explanation: Because the distribution method is HOTSTANDBY there must be exactly one DESTIP address that is specified as PREFERRED and at least one DESTIP address that is specified as BACKUP. The PREFERRED and BACKUP IP addresses must be unique. This message was issued because an IP address was specified as both the PREFERRED and the BACKUP DESTIP address.

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, TCP/IP continues, but the VIPADISTRIBUTE DEFINE statement is ignored.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, correct the error before using the profile data set as an initial profile or as a VARY TCPIP,OBEYFILE profile. Otherwise, do the following steps to correct the problem:
1. Correct the statement so that the VIPADISTRIBUTE DESTIP PREFERRED and the BACKUP IP addresses are unique.
2. Issue the VARY TCPIP,OBEYFILE command with the changed VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

Problem determination: Not applicable.

Chapter 2. EZZ0xxx messages 129
EZZ0831I

Module: EZACFPVA
Routing code: 10
Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,SYNTAXCHECK processing. Because the VARY TCPIP,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0830I PREFERRED AND BACKUP IP ADDRESSES MUST BE UNIQUIE ON THE VIPADISTRIBUTE STATEMENT
WHEN DISTMETHOD IS HOTSTANDBY

EZZ0831I VIPADISTRIBUTE keyword ON LINE lineno IS NOT VALID BECAUSE THE SPECIFIED
DISTMETHOD IS NOT HOTSTANDBY

Explanation: The indicated keyword and the DISTMETHOD keyword are specified on a VIPADISTRIBUTE profile statement. However, the DISTMETHOD parameter is not HOTSTANDBY. The specified keyword is valid only when the DISTMETHOD is HOTSTANDBY.

In the message text:

- **keyword**
  - The keyword that is not valid

- **lineno**
  - The line number in the profile data set that contains the keyword that is not valid

System action: If processing an initial profile or a VARY TCPIP,OBEYFILE command, the VIPADISTRIBUTE statement and any subsequent statements in the VIPADYNAMIC block are ignored. Profile processing continues.

This message is also displayed as part of VARY TCPIP,SYNTAXCHECK processing when the VARY TCPIP,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: If this message was displayed as a result of a VARY TCPIP,SYNTAXCHECK command, correct the error before using the profile data set as an initial profile or as a VARY TCPIP,OBEYFILE profile.

Otherwise:
1. If the VIPADISTRIBUTE statement is not needed, remove it from the VIPADYNAMIC block.

   If the statement is needed, delete the keyword that is not valid or change the DISTMETHOD parameter value to HOTSTANDBY.

2. Then issue a VARY TCPIP,OBEYFILE command that specifies a data set file that contains the entire VIPADYNAMIC block.

See the information about the VIPADYNAMIC statement in z/OS Communications Server: IP Configuration Reference.

User response: Not applicable.

Problem determination: Not applicable

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: ezacfpva
Routing code: 10
Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,OBEYFILE processing.
This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0831I VIPADISTRIBUTE AUTOSWITCHBACK ON LINE 15 IS NOT VALID BECAUSE THE SPECIFIED DISTMETHOD IS NOT HOTSTANDBY

Example:
EZZ0832I parm1 ON LINE linenum MUST BE SPECIFIED IMMEDIATELY AFTER parm2

Explanation: While processing a TCP/IP profile, a parameter that must be specified immediately after another parameter was found in a different location. The statement is ignored.

In the message text:

parm1
The parameter that was found at an incorrect location

linenum
The line number in the configuration file where the error was found

parm2
The parameter after which the incorrectly located parameter must be specified

System action: If processing an initial profile or a VARY TCPIP,,OBEYFILE command, TCP/IP continues, but the statement is ignored.

This message is also displayed as part of VARY TCPIP,,SYNTAXCHECK processing when the VARY TCPIP,,SYNTAXCHECK command detects this error in a profile data set. No changes are applied to the active configuration by VARY TCPIP,,SYNTAXCHECK processing.

Operator response: Contact the system programmer.

System programmer response: Move the incorrectly located parameter to the correct location in the statement and rerun the profile. See the z/OS Communications Server: IP Configuration Reference for more information.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Configuration & Initialization

Module: EZACFPV6

Routing code: 8

Descriptor code: 12

Automation: This message is directed to the console. You can use automation to detect and respond to TCP/IP profile errors reported during initial profile and VARY TCPIP,,OBEYFILE processing.

This message can also be displayed during VARY TCPIP,,SYNTAXCHECK processing. Because the VARY TCPIP,,SYNTAXCHECK command does not affect the active configuration, you might want to adjust your automation to ignore the configuration messages that are displayed after EZZ0061I and before EZZ0065I.

Example:
EZZ0832I CHPIDTYPE ON LINE 98 MUST BE SPECIFIED IMMEDIATELY AFTER IPAQENET

Example:
EZZ0833I D...OSAINFO,INTFNAME=<,BASE><,BULKDATA><,REGADDRS><,SYSDIST><,MAX=>

Explanation: This message is the result of the DISPLAY TCPIP,,HELP,OSAINFO command and shows the format of the command.

System action: TCP/IP continues.

Operator response: See the information about the DISPLAY TCPIP,,OSAINFO command in z/OS Communications Server: IP System Administrator's Commands for a detailed description of the command.

System programmer response: No action is needed
EZZ0835I • EZZ0836I

User response: No action is needed.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP

Automation: Not applicable.
Example: Not applicable.

EZZ0835I CANNOT MODIFY statement : parameters

Explanation: The VARY TCPIP,OBEYFILE command was invoked to modify the value of a TCP/IP profile statement parameter, but the value can only be set in the TCP/IP initial profile. See TCP/IP profile (PROFILE.TCPIP) and configuration statements in z/OS Communications Server: IP Configuration Reference for information about the statement and parameters mentioned in the message.

In the message text:

statement
The TCP/IP profile statement whose parameter values cannot be modified.

parameters
The parameters whose values cannot be modified.

System action: TCP/IP continues but the parameter is ignored.
Operator response: Contact the system programmer.
System programmer response: Specify the value on the profile statement in the TCP/IP initial profile and restart TCP/IP.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Configuration & Initialization
Module: EZACFMS1
Routing code: *
Descriptor code: 5
Automation: Not applicable.
Example:
EZZ0835I CANNOT MODIFY IPCONFIG6 : IPSECURITY OSMSECCLASS

EZZ0836I DUPLICATE PFID pfidnum SPECIFIED ON GLOBALCONFIG STATEMENT ON LINE linenum

Explanation: A duplicate Peripheral Component Interconnect Express (PCIe) function ID number was coded on the SMCR PFID parameter on the GLOBALCONFIG statement.

In the message text:

pfidnum
The PFID value that is duplicated

linenum
The line number in the TCP/IP profile data set where the error was detected

System action: TCP/IP profile processing continues but the GLOBALCONFIG statement is ignored.
Operator response: Contact the system programmer.
System programmer response: Correct or remove the duplicate pfidnum value from the SMCR PFID parameter on
linenum, then instruct the operator to issue a VARY TCPIP,OBEYFILE command to activate the corrected profile.

See [GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference](https://www.ibm.com) for more information.

**User response:** None.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration and Initialization

**Module:** ezacfpars

**Routing code:** Not applicable.

**Descriptor code:** Not applicable.

**Automation:** This message is not a candidate for automation.

**Example:**

```
EZZ0836I DUPLICATE PFID 0018 SPECIFIED ON GLOBALCONFIG STATEMENT ON LINE 38
```

---

**EZ0837I** MORE THAN maxnum PFIDS SPECIFIED ON GLOBALCONFIG STATEMENT ON LINE linenum

**Explanation:** More Peripheral Component Interconnect Express (PCIe) function ID values were specified on the SMCR PFID parameter on the GLOBALCONFIG statement than are currently supported.

In the message text:

maxnum

The maximum number of PFID values that can be coded on the SMCR PFID parameter

linenum

The line number in the TCP/IP profile data set where the error was detected

**System action:** TCP/IP profile processing continues but the GLOBALCONFIG statement is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Remove the extra PFID values from the SMCR PFID parameter on linenum, then instruct the operator to issue a VARY TCPIP,OBEYFILE command to activate the corrected profile.

See [GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference](https://www.ibm.com) for more information.

**User response:** None.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration and Initialization

**Module:** ezacfpars

**Routing code:** Not applicable.

**Automation:** This message is not a candidate for automation.

**Example:**

```
EZZ0837I MORE THAN 16 PFIDS SPECIFIED ON GLOBALCONFIG STATEMENT ON LINE 39
```

---

**EZ0838I** CANNOT DELETE PFID pfidnum ON GLOBALCONFIG STATEMENT BECAUSE INTERFACE inftname IS ACTIVE

**Explanation:** A VARY TCPIP,OBEYFILE command specified a data set that contains the SMCR parameter on the GLOBALCONFIG statement. The set of PFIDs specified on the SMCR parameter completely replaces the previously defined set of PFIDs, but this set of PFID values did not include a PFID value that corresponds to an active IBM 10GbE RoCE Express interface. You must stop a 10GbE RoCE Express interface before its PFID value can be removed from the set of PFIDs.

In the message text:
The PFID value that is to be deleted

The name of the corresponding 10GbE RoCE Express interface

TCP/IP profile processing continues for the remainder of the GLOBALCONFIG statement, but the new set of PFID values is ignored.

Contact the system programmer.

Take one of the following actions:

• If you want to delete pfidnum, instruct the operator to issue the VARY TCPIP,STOP,intfname command to stop the 10GbE RoCE Express interface.

• If you do not want to delete pfidnum, correct the SMCR parameter on the GLOBALCONFIG statement, in the obeyfile, to include pfidnum. See GLOBALCONFIG profile statement in z/OS Communications Server: IP Configuration Reference for more information.

After you take the corrective action, instruct the operator to reissue the VARY OBEYFILE command.

None.

This message is not a candidate for automation.

EZZ0838I CANNOT DELETE PFID 0018 ON GLOBALCONFIG STATEMENT BECAUSE INTERFACE EZARIUT10018 IS ACTIVE
Chapter 3. EZZ2xxxx messages

EZZ2350I  MVS TCP/IP NETSTAT  versionRelease  TCPIP Name: tcpipname  timestamp

Explanation: This message displays the current version, release, TCP/IP stack name and the local time for the command. The message is followed by the output for the requested command report. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of the Netstat command report, see the description of the TSO NETSTAT option report in the TSO NETSTAT section of z/OS Communications Server: IP System Administrator's Commands.

System action: The TSO NETSTAT command continues.

Operator response: None.

System programmer response: None.

Module: EZACDNE0, EZACDNE6

Procedure name: procALL(), procALLC(), procARP(), procBYTE(), procCLIE(), procCNFG(), procCONN(), procDEVL(), procDVCf(), procGATE(), procHOME(), procIDS(), procPORT(), procROUT(), procSLAP(), procSOCK(), procSTAT(), procTELN(), procUP(), procVCRT(), procVDPT(), procVIPA(), procALL6(), procALLC6(), procBYTE6(), procCNFG6(), procCONN6(), procDEVL6(), procDVCf6(), procHOME6(), procND6(), procPORT6(), procROUT6(), procSLAP6(), procSOCK6(), procSTAT6(), procTELN6(), procVCRT6(), procVDPT6(), procVIPA6()

EZZ2351I  Incorrect option: option.

Explanation: You specified an incorrect option.

System action: The Netstat program halts and exits.

Operator response: Correct the syntax of the incorrect option, and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDNET

Procedure name: parsONet or parsTNet

EZZ2352I  Missing parameter after option option.

Explanation: You specified an option option without a value.

System action: The Netstat program halts and exits.

Operator response: Specify a parameter after option, and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE

Procedure name: parsONet, parsTNet

EZZ2353I  Extraneous parameter parameter.

Explanation: You specified an extraneous parameter.

System action: The Netstat program halts and exits.

Operator response: Correct the syntax of the incorrect parameter, and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.
EZZ2354I • EZZ2357I

Module: EZACDONE, EZACDTNE
Procedure name: parsONet, parsTNet

EZZ2354I Incorrect integer parameter parameter or the integer is over its maximum value

Explanation: You specified a parameter that is not numeric when a numeric parameter was expected, or the value is over its maximum.

System action: The Netstat program halts and exits.

Operator response: Correct the syntax of the incorrect parameter, and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE
Procedure name: tokValCh, optArgCh, filtVchk

EZZ2355I argument specified for parameter must be Length characters or less.

Explanation: You specified an incorrect parameter argument.

System action: The Netstat program halts and exits.

Operator response: Specify an argument less than or equal to 8 characters and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE
Procedure name: filtVchk, keyValCh

EZZ2356I More than one option was specified.

Explanation: You specified more than one option option.

System action: The Netstat program halts and exits.

Operator response: Remove extraneous option and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE
Procedure name: parsONet or parsTNet

EZZ2357I You specified more than the maximum of number filter values.

Explanation: You specified more than the maximum of number filter values.

number is the maximum number of filter values allowed. The maximum is either 1 for the HOSTName/-H, INTFName/-K, POLicyn/-Y filter option, or 6 for the rest of Netstat filter options.

System action: The Netstat program halts and exits.

Operator response: Remove extraneous filter values and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE
Procedure name: filtVchk, keyValCh
EZZ2359I Filter options can be done only with options reports.

Explanation: Filter options are not supported on the Netstat report option you requested.

System action: The Netstat program halts and exits.

Operator response: Specify filter options with a correct report option and resubmit the Netstat command.

The correct options for NETSTAT are ALL, ALLConn, BYTEinfo, CLients, CONn, DEVlinks, Gate, HOme, ND, ROUTe, SLAP, TElnet, VCRT, VDPT, REPORT, and STACK are valid output options.

The correct options for onetstat are -A, -a, -b, -c, -d, -e, -g, -h, -j, -n, -r, -t, -O and -V.

For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE

Procedure name: parsONet or parsTNet

---

EZZ2360I Filter option filtopt can be done only with option report.

Explanation: This filter option is not supported on the Netstat report option you requested.

System action: The Netstat program halts and exits.

Operator response: Specify filter options with a correct report option and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE

Procedure name: parsONet or parsTNet

---

EZZ2364I Incorrect prefix length prefixLen.

Explanation: You specified an incorrect prefix length. For an IPv4 address, the prefix length range is 1–32 and for an IPv6 address, the prefix length range is 1–128.

prefixLen is the prefix length.

System action: The Netstat program halts and exits.

Operator response: Specify a correct prefix length and reissue the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, and EZACDTNE

Procedure name: parsONET() and parsTNET()

---

EZZ2365I Incorrect IP address ipaddress.

Explanation: You specified an incorrect IP address. This message will also be issued if a wildcard character is specified for the options that do not support it.

System action: The Netstat program halts and exits.

Operator response: Specify a correct IP address and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.

Module: EZACDONE, EZACDTNE, EZACDDNE, EZACDNEQ, EZACDNE1, EZACDNE2, EZACDNE6

Procedure name: parsONet, parsTNet, cdDne, procGate, setIpAddr, setIpAddr6, procND
EZZ2366I Incorrect subnet mask subnetMask.
Explanation: You specified an incorrect subnet mask.
System action: The Netstat program halts and exits.
Operator response: Specify a correct subnet mask and resubmit the Netstat command. For information about the Netstat command, see /OS Communications Server: IP System Administrator's Commands
System programmer response: None.
Module: EZACDNE1
Procedure name: setIpAddr

EZZ2367I Parenthesis but no search criteria
Explanation: You specified a parenthesis but no search criteria.
System action: The NETSTAT program halts and exits.
Operator response: Specify search criteria or remove the parenthesis and resubmit the NETSTAT command. For information about the NETSTAT command, see /OS Communications Server: IP System Administrator's Commands
System programmer response: None.
Module: EZACDTNE
Procedure name: parsTNET

EZZ2369I Onetstat is a z/OS UNIX shell command and must be issued from the z/OS UNIX shell.
Explanation: The onetstat command was not issued from a z/OS UNIX shell as required.
System action: The onetstat program halts and exits.
Operator response: Reissue the command from a z/OS UNIX shell. For information about the onetstat, see /OS Communications Server: IP System Administrator's Commands
System programmer response: None.
Module: EZACDONE
Procedure name: main

EZZ2370I ioctl failed with error : error (errno errnojr).
Explanation: The Netstat issued the SIOCGIBMOPT ioctl for the ioctl subtype. The ioctl call failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in /OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the /OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: The Netstat program halts and exits.
Operator response: Correct the indicated error. See the /OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.
System programmer response: Correct the indicated error. See the /OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.
Module: EZACDNE0, EZACDNE1, EZACDNE2, EZACDNE6
Procedure name: getIcmpInfo, getIpInfo, getTcpInfo, getUdpInfo, getDatCfg, getGlbCfg, getIpCfg, getTcpCfg, getUdpCfg, getHomeList, getIfTab, getIfData, getPktTab, getTcpProcName, getTcpCnnTable, getTcpCnn2Table, getUdpListen, getMvsMibStruct, getPostList, getAutoLogList, getRtTable, getCachData, getIdsInfo, getIdsTcp, getIdsUdp, getDVipaCfg, getDVipaList, getDVCRT, getDVDP, getNetAccTbl, getQoSPerfTbl, getcmpInfo6,
getIpInfo6, getIpCfg6, getTcpCnnTable6, getTcpCnn2Table6, getUdpListen6, getRtTable6, procARP, procDROP, procDROP6, procND

**EZZ2371I**  *devicename*, specified for link *linkname*, was not found.

**Explanation:** The Netstat command processor was parsing the TCP/IP interface table to get the -d option response information. A link record was found that had a link name of *linkname* and a device name of *devicename*, but the TCP/IP interface table did not contain a device record for that device.

**System action:** The Netstat program continues.

**Operator response:** This problem could occur if a device or link was added to TCPIP while the Netstat was processing the interface table. Try the Netstat request again. If the problem persists, check the PROFILE.TCPIP file and ensure that the device definition for the listed device is specified in the file correctly. If the PROFILE.TCPIP file appears to be correct contact the IBM software support center.

**System programmer response:** Check the PROFILE.TCPIP file and ensure that the device definition for the listed device is specified in the file correctly. If the PROFILE.TCPIP file appears to be correct contact the IBM software support center.

**Module:** EZACDNE0, EZACDNE6

**Procedure name:** procDEVL, procDEV6

---

**EZZ2372I** Incorrect connection number connId.

**Explanation:** You specified an incorrect connection number.

**System action:** The Netstat program halts and exits.

**Operator response:** To find the correct connection number, issue onetstat -c. Specify a correct connection number and resubmit the Netstat command. For information about the Netstat command, see [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.2.7/com.ibm.zos.r22.jesbüg.nd/TWICSM0044.htm).

**System programmer response:** None.

**Module:** EZACDNE0, EZACDNE6

**Procedure name:** procDROP, procDEV6

---

**EZZ2373I** NETSTAT: DROP connection process failed RACF authorization checking

**Explanation:** You attempted to drop a connection, but your user ID does not have MVS.VARY.TCPIP.DROP defined in the RACF profile.

**System action:** The Netstat program halts and exits.

**Operator response:** Make sure that your user ID has the MVS.VARY.TCPIP.DROP defined in the RACF profile and resubmit the Netstat command. For information about the Netstat command, see [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.2.7/com.ibm.zos.r22.jesbüg.nd/TWICSM0044.htm).

**System programmer response:** None.

**Module:** EZACDNE1

**Procedure name:** netAuthCheck

---

**EZZ2374I** Unable to open message catalog catalogfilename : error

**Explanation:** Netstat was unable to open the message catalog *catalogfilename* in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/". If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.
System programmer response: If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.

Module: EZACDONE, EZACDTNE

Procedure name: main

EZZ2375I sigaction() failed for signal : reason

Explanation: The onetstat encountered an error attempting to set up the signal handler for the signal specified by signal. reason is the error returned by the C runtime library for the failing sigaction() call. If the signal handler is not correctly enabled, the Onetstat will continue processing, but certain functions controlled by the failing signal will not function properly. Functions controlled by the signals are:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIGABND</td>
<td>handler controls error reporting and cleanup functions when an abend occurs. If sigaction fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up.</td>
</tr>
<tr>
<td>SIGTERM</td>
<td>handler controls cleanup of resources during termination. If sigaction fails for SIGTERM, certain resources might not be properly cleaned up when a SIGTERM is received.</td>
</tr>
</tbody>
</table>

System action: Processing continues; however, the functions controlled by the failing signal will not function properly.

Operator response: None.

System programmer response: None.

Module: EZACDONE, EZACDTNE

Procedure name: main

EZZ2376I Could not determine the TCPIPjobname, using default of 'INET'

Explanation: Onetstat called the z/OS UNIX service __iptcpn() to retrieve the resolver supplied TCPIPjobname and failed. Onetstat could not determine the jobname for the TCP/IP stack. A default value of 'INET' will be used for TCPIPjobname.

System action: The onetstat program continues.

Operator response: None.

System programmer response: In an INET environment, no action is necessary. In a CINET environment, for onetstat to communicate with a particular stack, the TCPIPjobname should be set in the appropriate resolver configuration file or data set. Make sure that the TCPIPjobname statement in the appropriate resolver configuration file or data set is correct and resubmit the onetstat command. For more information about the search order for locating the resolver configuration file or data set, see the "z/OS Communications Server: IP Configuration Guide". The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their jobnames. The onetstat -p option can be used to explicitly select a TCP/IP instance by specifying its jobname.

Module: EZACDONE, EZACDTNE

Procedure name: main

EZZ2377I Could not establish affinity with tcpipname (error_code/reason) - can not provide the requested option information

Explanation: Onetstat called setibmopt() to associate itself with the TCPIP instance tcpipname, and failed with the displayed error_code and reason. The requested option information cannot be provided.

System action: The onetstat program halts and exits.

Operator response: Correct the error indicated by error_code and reason and reissue the onetstat command. For onetstat to communicate with a particular stack, the tcpipname (as determined by system variable TCPIPjobname)
must match the TYPE operand that was specified on the FILESYSTYPE statement or the NAME operand of the
SUBFILESYSTYPE statement that defined in the BPXPRMxx parmlib member. For more information about the
customizing the BPXPRMxx parmlib member, see [z/OS UNIX System Services Planning]. The DISPLAY TCPIP
operator command can be used to display all started TCP/IP instances and their jobnames. The onetstat -p option
can be used to explicitly select a TCP/IP instance by specifying its jobname.

**System programmer response:** Correct the error indicated by `error_code` and `reason` and reissue the onetstat
command. For onetstat to communicate with a particular stack, the `tcpipname` (as determined by system variable
`TCPIPjobname`) must match the TYPE operand that was specified on the FILESYSTYPE statement or the NAME
operand of the SUBFILESYSTYPE statement that defined in the BPXPRMxx parmlib member. For more information
about the customizing the BPXPRMxx parmlib member, see [z/OS UNIX System Services Planning]. The DISPLAY
TCPIP operator command can be used to display all started TCP/IP instances and their jobnames. The onetstat -p
option can be used to explicitly select a TCP/IP instance by specifying its jobname.

**Module:** EZACDONE, EZACDTNE

**Procedure name:** main

---

**EZZ2378I** Termination request is received. The program is interrupted.

**Explanation:** This message is displayed when a termination request is received while the onetstat command is in
progress.

**System action:** The onetstat program halts and exits.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDONE, EZACDTNE

**Procedure name:** termHand

---

**EZZ2379I** Command abend with `abendcode, reasoncode`.

**Explanation:** This message is displayed when an internal programming error caused onetstat program to be
abnormally terminated.

**System action:** The onetstat program halts and exits.

**Operator response:** If possible, re-create the problem with `-z` option to collect debug information and forward the
results to the TCPIP administrator.

**System programmer response:** The abend information will be written to the syslog output. Contact the IBM
software support center with the syslog output.

**Module:** EZACDONE, EZACDTNE

**Procedure name:** abndHand

---

**EZZ2380I** Could not open file `filename` for writing (`error_code`/`reason`).

**Explanation:** NETSTAT called fopen() to open the file `filename` and failed with the displayed `error_code` and `reason`.
The requested option information cannot be provided.

**System action:** The NETSTAT program halts and exits.

**Operator response:** Correct the error indicated by `error_code` and `reason` and reissue the NETSTAT command. For
information about the fopen(), see [z/OS XL C/C++ Programming Guide].

**System programmer response:** Correct the error indicated by `error_code` and `reason` and reissue the NETSTAT
command. For information about the fopen(), see [z/OS XL C/C++ Programming Guide].

**Module:** EZACDTNE

**Procedure name:** parsTNet
EZZ2381I Incorrect option argument: argument.
Explanation: You specified an incorrect option argument.
System action: The Netstat program halts and exits.
Operator response: Correct the syntax of the incorrect option argument, and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.
System programmer response: None.
Module: EZACDONE, EZACDTNE
Procedure name: parsONet or parsTNet

EZZ2382I Unable to open type socket to tcpipname: error
Explanation: The Netstat must open a UDP or RAW socket to TCP/IP in order to retrieve the requested information from TCP/IP. The Netstat's attempt to open the socket failed due to the specified error.
System action: The Netstat program halts and exits.
Operator response: Correct the problem indicated by error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.
System programmer response: Correct the problem indicated by error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.
Module: EZACDONE, EZACDTNE
Procedure name: openSock

EZZ2383I Cannot provide the SHORT format Netstat option report for the IPv6 enabled stack tcpipname
Explanation: The user requested the SHORT format Netstat option report for the stack tcpipname. Because the tcpipname stack is IPv6 enabled, a SHORT format report is not allowed.
option is the Netstat option.
tcipname is the TCP/IP stack name.
System action: The Netstat program halts and exits.
Operator response: Reissue the Netstat command without the FORMAT option or with the FORMAT LONG option. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.
System programmer response: None.
Module: EZACDDNE, EZACDONE, and EZACDTNE
Procedure name: main()

EZZ2384I Missing close quotation for DSN name.
Explanation: You specified a fully qualified DSN name without a close quotation.
System action: The NETSTAT program halts and exits.
Operator response: Correct the syntax of the incorrect DSN name, and resubmit the NETSTAT command. For information about the NETSTAT command, see z/OS Communications Server: IP System Administrator's Commands.
System programmer response: None.
Module: EZACDTNE
Procedure name: parsTNet
EZZ2385I  Access to Netstat option denied - SAF RC is safrc

Explanation: The user attempted to execute Netstat option, but the user ID is not authorized to the Netstat security product profile for option.

option is the Netstat option.

safrc is the hexadecimal SAF return code.

System action: The Netstat program halts and exits.

Operator response: Contact the system programmer.

System programmer response: Locate the specified return code in your installed host security product's documentation to determine the cause of the error. If you are using the z/OS Security Server (RACF) as your security product, the SAF return code is documented in the z/OS Security Server RACROUTE Macro Reference in the section about return codes for the RACROUTE REQUEST=AUTH function. Your installed host security product might have issued messages regarding the failure. See the z/OS Communications Server: IP System Administrator's Commands for more information about the Netstat security product resource name definitions.

Module: EZACDNE1

Procedure name: netAuthCheck

EZZ2386I  Failure in Netstat authorization processing - Function code is functioncode RC is rc

Explanation: The Netstat authorization process failed.

functioncode is the function code.

rc is the return code.

System action: The Netstat program halts and exits.

Operator response: Contact the system programmer.

System programmer response: If TCP/IP CTRACE was active when the problem occurred, CTRACE records should be written at the time of the error. Otherwise, re-create the problem with CTRACE active for option IOCTL. Contact the IBM Support Center with the CTRACE records and message information.

Module: EZACDNE1

Procedure name: netAuthCheck, netioctl

EZZ2387I  TCP/IP proname is not active

Explanation: The Netstat command attempted to retrieve information from the TCP/IP stack proname, but this stack is not currently active.

proname is the TCP/IP name.

System action: The Netstat program halts and exits.

Operator response: Contact the system programmer.

System programmer response: Start the TCP/IP stack named proname, and reissue Netstat command.

Module: EZACDNE1

Procedure name: netAuthCheck, netioctl

EZZ2388I  function failed due to error h_errno

Explanation: The function function issued by the onetstat command failed with error h_errno. Possible causes of the problem are an error in specifying the configuration file for the Resolver, or that the Resolver address space was not started.

function is the C/C++ Run-Time function that failed.

h_errno is one of the following errors:
HOST_NOT_FOUND
TRY_AGAIN
NO_RECOVERY
NO_DATA

System action: For some function failures, the onetstat command ends. For other function failures, the onetstat command continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the Resolver address space is started. See the z/OS Communications Server: IP Configuration Guide for information about starting the Resolver address space. If this does not resolve the problem, correct the error indicated by the h_errno value. See the z/OS XL C/C++ Runtime Library Reference for a description of the h_errno for the function that failed.

Module: EZACDONE

Procedure name: main

Unable to provide reqInfo information because tcpipname is not IPv6 enabled

Explanation: The user requested the reqInfo information for the stack tcpipname. Because the tcpipname stack is not IPv6 enabled, the requested information is not available.

reqInfo is the requested information.
tcpipname is the TCP/IP stack name.

System action: The Netstat program halts and exits.

Operator response: The requested information is only available on an IPv6 enabled stack. If you need the requested information, reissue the Netstat command against an IPv6 enabled stack. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDDNE, EZACDONE, and EZACDTNE

Procedure name: main()

Unknown host name

Explanation: getaddrinfo() could not resolve the specified host name to an IP address.

name is the host name specified on the command line.

System action: The Netstat program halts and exits.

Operator response: To determine the problem:

• Correct the syntax of the host name and resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.

• Ensure that the specified host name is valid. If the host name looks correct, contact the system programmer to verify the host address.

• Use the IP address, if it is known.

System programmer response: None.

Module: EZACDONE, EZACDTNE

Procedure name: getIpAddr()

Cannot obtain storage to process option request

Explanation: If the Netstat command was invoked from either TSO or the z/OS UNIX shell, then Netstat requested storage from the TSO user address space and the request failed. If the Netstat command was invoked from the MVS console, then Netstat requested storage from the TCP/IP private area and the request failed.
option is the requested Netstat option.

System action:  The Netstat program halts and exits.

Operator response:  This might be a temporary condition because of increased activity in the address space. Subsequent Netstat requests might succeed. If this problem continues, contact the system programmer.

System programmer response:  If the TSO or z/OS UNIX shell Netstat command is used, it might be necessary to increase the TSO user region size and recycle the TSO user ID. If the DISPLAY TCPIP,Netstat command, or VARY TCPIP,DROP command is used from the MVS console, it might be necessary to increase the TCP/IP stack region size and recycle the TCP/IP stack. If this error continues to occur, dump the address space, collect any available supporting documentation, and contact the IBM software support center.

Module:  EZACDNE0, EZACDNE6

Procedure name:  procACCN(), procALL, procALLC(), procARP(), procBYTE(), procCACH(), procCLIE(), procCNFG(), procCONN(), procDEVL(), procDROP(), procDVCF(), procGATE(), procHOME(), procIDS(), procPORT(), procROUT(), procSLAP(), procSOCK(), procSTAT(), procTELN(), procUP(), procVDRT(), procVDPT(), procVIPA(), procACCN6(), procALL6(), procALLC6(), procBYTE6(), procCACH6(), procCNFG6(), procCONN6(), procDEVL6(), procDROP6(), procDVCF6(), procHOME6(), procIDS6(), procND6(), procPORT6(), procROUT6(), procSLAP6(), procSOCK6(), procSTAT6(), procTELN6(), procVDRT6(), procVDPT6(), procVIPA6()

EZZ2392I Incorrect filter value specification filterValue

Explanation:  You specified an incorrect filter value. For IPPort/-B filter, the filterValue value must be in the format ipAddress+portNumber. For example, from TSO, to display connection information about all connections using IP address 127.0.0.1 and port 21, enter the NETSTAT CONN (IPPORT 127.0.0.1+21 command.

System action:  The Netstat program halts and exits.

Operator response:  Specify a correct filter value then resubmit the Netstat command. For information about the Netstat command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response:  None.

User response:  Not applicable.

Problem determination:  Not applicable.

Module:  EZACDONE, EZACDTE

Example:  None.

EZZ2393I Resolver call failed with error : error (errno / errnojr).

Explanation:  Netstat attempted to retrieve the resolver cache information by using a resolver call, but this call failed with the specified error.

In the message text:

error

Describes the meaning of errno.

errno

The UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

errnojr

The hexadecimal UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  The Netstat program halts and exits.

Operator response:  Contact the system programmer

System programmer response:  Correct the error indicated by the error, errno, and errnojr values.

User response:  Not applicable.
EZZ2394I

Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Netstat
Module: EZACDNE2
Routing code: Not applicable.
Descriptor code: Not applicable.
Automation: Not applicable.
Example:
EZZ2393I Resolver call failed with error : Resolver is not active ( 112 / 78BB0122 )

EZZ2394I Netstat was expecting cat_name to be at service level service_level and expected_time - Netstat is using default messages

Explanation: Netstat opened the message catalog successfully, but the message catalog was not at the level that Netstat expected. This message specifies the timestamp and service level that Netstat expects to find. Netstat will use the default messages instead of the messages from the message catalog.

In the message text:
cat_name
   The name of the catalog that Netstat opened.
service_level
   The FMID or PTF of the message catalog that Netstat expected to find.
expected_time
   The timestamp that Netstat expected to find in the message catalog. The expected_time value is in the following format:
   yyyy ddd hh:mmUTC
   Where:
   yyyy is the year
   ddd is the day (001 - 365)
   hh is the hour (01 - 24)
   mm is the minute (01 - 60)

System action: Netstat continues.

Operator response: Contact the system programmer.

System programmer response: To resolve this problem, do the following:
1. Locate the message catalog. The default location for the message catalog is the /usr/lpp/tcpip/lib/nls/msg/C/ directory. If the NLSPATH environment variable is being used, the message catalog can be found in one of the directories that is specified for NLSPATH.
2. Examine the message catalog to find the timestamp and service level of the catalog. The timestamp is on the first line of the message catalog. The service level can be found by searching for the first line with EZASERVICE as the first word. The message is in the format EZASERVICE Service level is cat_level. The cat_level is the service level of the message catalog.
3. After you find the timestamp and service level of the message catalog, perform the following steps:
   a. If you are customizing the message catalog, be sure to include the timestamp. See the information about customizing message catalogs in z/OS Communications Server: IP Configuration Guide for more information about translating message catalogs.
   b. If the service level message cannot be found, the message catalog is from a z/OS release before z/OS V1R12. Verify that the correct file system was mounted. The df directory_path command, for example df /usr/lpp/tcpip/lib/nls/msg/C/, can be used to determine which file system is mounted for the message catalog directory.
   c. Compare the timestamp and service level of the message catalog to the timestamp and service level shown in this message.
If the two service levels are the same, contact IBM software support center.

Use the service levels to determine why the mismatch occurred and correct the error. Possible causes are:

- A PTF was not applied successfully.
- The file system that is mounted does not contain the updated message catalog.
- The SEZALOAD library does not contain the updated Netstat program.
- The SEZALOAD library and the file system are not at the same release level.

User response: Contact the system programmer.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Netstat

Module: ezacdne, ezacdone, ezacddne

Routing code: *

Descriptor code: *

Automation: If you are automating on Netstat console commands, automation routines need to be aware of this message. If the automation does not handle the default netstat messages, the automation might need to not process the netstat output. You might want to automate on this message to notify the system programmer about this problem.

Example:

EZZ2394I Netstat was expecting netmsg.cat to be at service level HIP61C0 and 2010 041 03:53 UTC - Netstat is using default messages

---

EZZ2500I NETSTAT versionRelease

Explanation: This message displays the current version and release for the command. The message is followed by the output for the requested command report. For a detailed description of the report, see the TSO NETSTAT section of the z/OS Communications Server: IP System Administrator's Commands.

System action: The Display Netstat command continues.

Operator response: None.

System programmer response: None.

Module: EZACDNE0, EZACDNE6

Procedure name: procACCN(), procALLC(), procARP(), procBYTE(), procCNFG(), procDEVL(), procDVCF(), procHOME(), procIDS(), procPORT(), procROUT(), procSOCK(), procSTAT(), procVCR(), procVDPT(), procVIPA()
EZZ2503I ALL VIPADYNAMIC CONFIGURATION FOR tcpstackname IS CURRENTLY INACTIVE

Explanation: A Netstat VIPADCFG/-F display command was issued. The stack is not a member of a TCP/IP sysplex group. The VIPADYNAMIC configuration that is being displayed is currently inactive.

tcpstackname is the name of the TCP/IP stack.

System action: The Netstat command continues

System programmer response: None.

Module: EZACDNE0, EZACDNE6

Procedure name: procDVCF, procDVCF6

EZZ2505I VIPADYNAMIC CONFIGURATION INFORMATION IS NOT AVAILABLE WHILE tcpstackname IS DELAYING SYSPLEX PROFILE PROCESSING

Explanation: A Netstat VIPADCFG/-F display command was issued. Processing of the VIPADYNAMIC configuration was delayed and no configuration information can be displayed until processing has completed. A prior message (EZD1166E) identifies the reason for the delay.

tcpstackname is the name of the TCP/IP stack.

System action: The Netstat command ends without displaying the VIPADYNAMIC configuration data.

System programmer response: None.

Module: EZACDNE0, EZACDNE6

Procedure name: procDVCF, procDVCF6

EZZ2578I  See the message explanation.

**Explanation:** This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2579I  See the message explanation.

**Explanation:** This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2580I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2581I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2582I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2583I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2584I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2585I  See the message explanation.

Explanation: This is a TSO NETSTAT ALLCONN or CONN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALLConn/-a report or the Netstat COnn/-c report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2586I  See the message explanation.

Explanation: This is a TSO NETSTAT ALLCONN or CONN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALLConn/-a report or the Netstat COnn/-c report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2587I  See the message explanation.

Explanation: This is a TSO NETSTAT ALLCONN or CONN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALLConn/-a report or the Netstat COnn/-c report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2589I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT 
options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the 
input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS 
Communications Server: IP System Administrator’s Commands

EZZ2591I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL, ALLCONN, or CONN option response. This message is displayed only 
for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP 
stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the 
Netstat ALL/-A report, the Netstat ALLConn/-a report, or the Netstat CONn/-c report in z/OS Communications 
Server: IP System Administrator’s Commands

EZZ2594I  See the message explanation.

Explanation:  This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT 
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled 
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARp/-R 
report in z/OS Communications Server: IP System Administrator’s Commands

EZZ2595I  See the message explanation.

Explanation:  This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT 
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled 
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARp/-R 
report in z/OS Communications Server: IP System Administrator’s Commands

EZZ2596I  See the message explanation.

Explanation:  This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT 
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled 
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARp/-R 
report in z/OS Communications Server: IP System Administrator’s Commands

EZZ2599I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT 
options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the 
input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS 
Communications Server: IP System Administrator’s Commands
EZZ2597I • EZZ2604I

EZZ2597I  See the message explanation.

Explanation: This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARP/-R report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2598I  See the message explanation.

Explanation: This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARP/-R report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2599I  See the message explanation.

Explanation: This is a TSO NETSTAT ARP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ARP/-R report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2600I  See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2601I  See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2602I  See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2603I  See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2604I  See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator’s Commands.
See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT BYTEINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat BYTEinfo/-b report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT ALL option response. This message is displayed only for TSO NETSTAT options in which TSO profiles are set to the value PROFILE MSGID and IPv6 is not enabled. For a description of the input parameters and output fields of this Netstat option response, see the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2614I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2615I  See the message explanation.

Explanation: This is a TSO NETSTAT CLIENTS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Clients/-e report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2616I  See the message explanation.

Explanation: This is a TSO NETSTAT CLIENTS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Clients/-e report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2617I  See the message explanation.

Explanation: This is a TSO NETSTAT CLIENTS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Clients/-e report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2618I  See the message explanation.

Explanation: This is a TSO NETSTAT CLIENTS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Clients/-e report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2619I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Stats/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2620I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Stats/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2621I  See the message explanation.

Explanation: This is a TSO NETSTAT UP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Clients/-e report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2630I See the message explanation.

Explanation: This is a TSO NETSTAT GATE or ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report or the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2631I See the message explanation.

Explanation: This is a TSO NETSTAT GATE or ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report or the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2632I See the message explanation.

Explanation: This is a TSO NETSTAT GATE or ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report or the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2633I See the message explanation.

Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2634I See the message explanation.

Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2635I See the message explanation.

Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2636I See the message explanation.

Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2637I See the message explanation.

Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2638I  See the message explanation.
Explanation: This is a TSO NETSTAT GATE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat Gate/-g report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2639I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2640I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2641I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2642I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2643I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2644I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2645I  See the message explanation.
Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.
**EZZ2646I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2647I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2648I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2649I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2650I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2651I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2652I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

**EZZ2653I**  
See the message explanation.

**Explanation:** This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUT/-r report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUT/-r report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUT/-r report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator’s Commands.
EZZ2672I  See the message explanation.

Explanation:  This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2673I  See the message explanation.

Explanation:  This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2674I  See the message explanation.

Explanation:  This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2675I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2676I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2684I  See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2685I  See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2686I  See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2687I  See the message explanation.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2688I  See the message explanation.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2700I  See the message explanation.

Explanation: This is a TSO NETSTAT HOME option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat HOme/-h report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2701I  See the message explanation.

Explanation: This is a TSO NETSTAT HOME option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat HOme/-h report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2702I  See the message explanation.

Explanation: This is a TSO NETSTAT HOME option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat HOme/-h report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2703I  See the message explanation.

Explanation: This is a TSO NETSTAT HOME option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat HOme/-h report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2704I  See the message explanation.

Explanation: This is a TSO NETSTAT HOME option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat HOme/-h report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2708I  See the message explanation.

Explanation: This is a TSO NETSTAT SOCKETS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SOCKets/-s report in z/OS Communications Server: IP System Administrator's Commands.
See the message explanation.

**Explanation:** This is a TSO NETSTAT SOCKETS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SOCKets/-s report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT SOCKETS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SOCKets/-s report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT SOCKETS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SOCKets/-s report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2719I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2720I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2721I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2722I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2723I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2724I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2725I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2726I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2727I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2728I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2729I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2730I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2731I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2732I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2733I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2734I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2735I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2736I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2737I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2738I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2739I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2740I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2741I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2742I  See the message explanation.

**Explanation:** This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2743I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2744I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2745I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2746I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2747I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2748I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2749I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2750I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2751I    See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2752I    See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2753I    See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2754I    See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2755I    See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2756I    See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2757I    See the message explanation.

Explanation:  This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

Chapter 3. EZZ2xxxx messages    171
EZZ2759I  See the message explanation.

Explanation: This is a TSO NETSTAT ROUTE option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ROUTe/-r report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2760I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2761I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2762I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2763I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2764I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2765I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2766I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2767I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2768I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2769I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2770I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2771I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2772I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2773I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2774I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2794I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2795I  See the message explanation.

Explanation: This is a TSO NETSTAT PORTLIST option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat PORTList/-o report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2796I  See the message explanation.

Explanation: This is a TSO NETSTAT PORTLIST option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat PORTList/-o report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2797I  See the message explanation.

Explanation: This is a TSO NETSTAT PORTLIST option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat PORTList/-o report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2798I  See the message explanation.

Explanation: This is a TSO NETSTAT PORTLIST option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat PORTList/-o report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2799I  See the message explanation.

Explanation:  This is a TSO NETSTAT PORTLIST option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat PORTList/-o report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2800I  See the message explanation.

Explanation:  This is a TSO NETSTAT TELNET option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat TELnet/-t report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2801I  See the message explanation.

Explanation:  This is a TSO NETSTAT TELNET option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat TELnet/-t report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2802I  See the message explanation.

Explanation:  This is a TSO NETSTAT TELNET option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat TELnet/-t report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2803I  See the message explanation.

Explanation:  This is a TSO NETSTAT TELNET option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat TELnet/-t report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2804I  See the message explanation.

Explanation:  This is a TSO NETSTAT TELNET option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat TELnet/-t report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2808I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALL/-A report or Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2809I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALL/-A report or Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator’s Commands.
EZZ2810I • EZZ2816I

EZZ2810I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2811I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2812I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2813I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2814I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2815I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

EZZ2816I  See the message explanation.

Explanation:  This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
ALL/-A report or Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator’s
Commands.

178  Z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
EZZ2817I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALL/-A report or Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2818I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALL/-A report or Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2819I  See the message explanation.

Explanation: This is a TSO NETSTAT ALL or DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat ALL/-A report or Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2820I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2821I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2822I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2823I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2824I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEVlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2825I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2826I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2827I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2828I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2829I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/DEvlinks/-d report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2830I  See the message explanation.

Explanation:  This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/CACHinfo/-C report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2831I  See the message explanation.

Explanation:  This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/CACHinfo/-C report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2832I  See the message explanation.

Explanation:  This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat/CACHinfo/-C report in z/OS Communications Server: IP System Administrator's Commands.
See the message explanation.

Explanation: This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CACHinfo/-C report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CACHinfo/-C report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CACHinfo/-C report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CACHinfo/-C report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT CACHINFO option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CACHinfo/-C report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator’s Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator’s Commands.
EZZ2842I • EZZ2849I

EZZ2842I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2843I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2844I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2845I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2846I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2847I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2848I  See the message explanation.
Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT
options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled
for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j
report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2853I  See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2854I  See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2855I  See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2856I  See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2857I  See the message explanation.

Explanation: This is a TSO NETSTAT SLAP option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat SLAP/-j report in z/OS Communications Server: IP System Administrator's Commands.
See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2894I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2895I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2896I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2897I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2898I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2899I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2900I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2901I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO
NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is
not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat
CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2902I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2903I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2904I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADCFG/-F report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2905I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADCFG/-F report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2906I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADCFG/-F report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2907I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADCFG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADCFG/-F report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2908I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADyn option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ2909I  See the message explanation.

Explanation: This is a TSO NETSTAT VIPADyn option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator’s Commands.
EZZ2910I See the message explanation.

Explanation: This is a TSO NETSTAT VIPADYN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2911I See the message explanation.

Explanation: This is a TSO NETSTAT VIPADYN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2912I See the message explanation.

Explanation: This is a TSO NETSTAT VIPADYN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2913I See the message explanation.

Explanation: This is a TSO NETSTAT VIPADYN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2914I See the message explanation.

Explanation: This is a TSO NETSTAT VIPADYN option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VIPADyn/-v report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2916I See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2917I See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2918I See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2919I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2920I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2921I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2922I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2923I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2924I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2925I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2926I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2927I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2928I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2929I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2930I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2931I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2932I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2934I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2935I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2936I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2937I  See the message explanation.

Explanation: This is a TSO NETSTAT VCRT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VCRT/-V report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2938I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2939I  See the message explanation.

Explanation: This is a TSO NETSTAT VDPT option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat VDPT/-O report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2940I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2941I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2942I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2943I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2944I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2945I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2946I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2947I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2948I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2949I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2950I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2951I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2952I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2953I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2954I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2955I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2956I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2957I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2958I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2959I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2960I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2961I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2962I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2963I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2964I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2965I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2966I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2967I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ2968I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2969I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2970I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2971I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2972I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2973I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2974I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ2975I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

Chapter 4. EZZ3xxxx messages

EZZ3000I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3001I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3002I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3003I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3004I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3005I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3006I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ3008I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3009I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3010I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3011I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3012I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3013I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3014I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3015I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.
EZZ3024I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3025I  See the message explanation.

Explanation: This is a TSO NETSTAT STATS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat STATS/-S report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3026I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3027I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3028I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3029I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3030I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3031I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.
See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.
**EZZ3040I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3041I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3042I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3043I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3044I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3045I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3046I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).

**EZZ3047I** See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the [Netstat IDS/-k report](z/OS Communications Server: IP System Administrator's Commands).
See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

See the message explanation.
EZZ3056I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3057I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3058I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3059I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3060I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3061I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3062I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3063I  See the message explanation.

Explanation: This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in z/OS Communications Server: IP System Administrator's Commands.
EZZ3064I  See the message explanation.

Explanation:  This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3065I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3066I  See the message explanation.

Explanation:  This is a TSO NETSTAT IDS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat IDS/-k report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3067I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3068I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3069I  See the message explanation.

Explanation:  This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat DEvlinks/-d report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3070I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator's Commands.

EZZ3071I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator's Commands.
EZZ3072I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3073I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3074I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3075I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3076I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.

EZZ3077I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in z/OS Communications Server: IP System Administrator's Commands.
EZZ3088I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat DEVLINKS/-d` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3089I  See the message explanation.

Explanation: This is a TSO NETSTAT DEVLINKS option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat DEVLINKS/-d` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3090I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3091I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3092I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3093I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3095I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.

EZZ3096I  See the message explanation.

Explanation: This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the `Netstat CONFIG/-f` report in z/OS Communications Server: IP System Administrator’s Commands.
EZZ3097I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator’s Commands.

EZZ3098I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator’s Commands.

EZZ3099I  See the message explanation.

Explanation:  This is a TSO NETSTAT CONFIG option response. This message is displayed only for TSO NETSTAT options in which the TSO user ID profiles are set to the value PROFILE MSGID and the TCP/IP stack is not enabled for IPv6 processing. For a description of the output fields of this Netstat option response, see the Netstat CONFIG/-f report in Z/OS Communications Server: IP System Administrator’s Commands.

EZZ3105I  function failed due to error h_errno

Explanation:  The function function issued by the ping command failed with error h_errno. Possible causes of the problem are an error in specifying the configuration file for the Resolver, or that the Resolver address space was not started.

function is the C/C++ Run-Time function that failed.

h_errno is one of the following errors:

1   HOST_NOT_FOUND
2   TRY_AGAIN
3   NO_RECOVERY
4   NO_DATA

System action:  For some function failures, the ping command ends. For other function failures, the ping command continues.

Operator response:  Contact the system programmer.

System programmer response:  Ensure that the Resolver address space is started. See the Z/OS Communications Server: IP Configuration Guide for information about starting the Resolver address space. If this does not resolve the problem, correct the error indicated by the h_errno value. See the Z/OS XL C/C++ Runtime Library Reference for a description of the h_errno for the function that failed.

Module:  EZACDPIN

Procedure name:  pingMain

EZZ3107I  ping is a z/OS UNIX shell command and must be issued from a z/OS UNIX shell.

Explanation:  The ping command was not issued from a z/OS UNIX shell, as required.

System action:  The ping program halts and exits.

Operator response:  Reissue the command from a z/OS UNIX shell. See the Ping information in Z/OS Communications Server: IP System Administrator’s Commands.

System programmer response:  None.

Module:  EZACDOPN

Procedure name:  main
EZZ3108I  •  EZZ3111I

EZZ3108I  Unable to open message catalog "pingmsg.cat" : error

Explanation:  Ping was unable to open the message catalog "pingmsg.cat" in the message catalog directory. The
default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/
msg/%L/%N".

System action:  Ping will use the internal default messages instead of the message from the external message
catalog.

Operator response:  If use of the external message catalog is required, correct the indicated error. If the default
messages are acceptable, no action is necessary.

System programmer response:  If use of the external message catalog is required, correct the indicated error. If the
default messages are acceptable, no action is necessary.

Module:  EZACDOPN, EZACDTPN

Procedure name:  main

EZZ3109I  Extraneous parameter parameter.

Explanation:  You specified an extraneous parameter.

System action:  The Ping program halts and exits.

Operator response:  Correct the syntax of the incorrect parameter and resubmit the Ping command. See the Ping
information in z/OS Communications Server: IP System Administrator's Commands.

System programmer response:  None.

Module:  EZACDOPN, EZACDTPN

Procedure name:  parsOPIN, parsTPIN

EZZ3110I  Unknown option option.

Explanation:  You specified an unknown option.

System action:  The Ping program halts and exits.

Operator response:  Check the unknown option for misspellings or other problems. Correct the option and resubmit
the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands.
Also consult related MAIN pages and the online help, if available.

System programmer response:  None.

Module:  EZACDOPN, EZACDTPN

Procedure name:  parsOPIN, parsTPIN

EZZ3111I  Unknown host name.

Explanation:  The host name specified could not be resolved to an IP address.

System action:  The Ping program halts and exits.

Operator response:
1.  Correct the syntax of the host name and resubmit the Ping command. See the Ping information in z/OS
Communications Server: IP System Administrator's Commands.

2.  Check that the specified host name is valid. If the host name looks correct, contact the system programmer to
verify the host address.

3.  Use the IP address, if it is known.

System programmer response:  None.

Module:  EZACDPIN

Procedure name:  procHost

**EZZ3115I** Unable to open RAW socket: error

Explanation: The Ping attempted to open a raw socket to issue an ICMP Echo request for the Ping function. The Ping was unable to open the raw socket for the reason specified by error.

System action: The Ping program halts and exits.

Operator response: Correct the error indicated. See the [Z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview.wss?uid=swg21453650) for further explanation of the socket errors.

System programmer response: Correct the error indicated. See the [Z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview.wss?uid=swg21453650) for further explanation of the socket errors.

Tip: The most probable error is EDC5139I Operation not permitted. If you receive that error, ensure that PING is defined under AUTHCMD NAMES in the IKJTSOxx member of SYS1.PARMLIB.

Module: EZACDPIN

Procedure name: openSock

**EZZ3116I** sigaction() failed for signal : reason

Explanation: The Ping program encountered an error attempting to set up the signal handler for the signal specified by signal.

reason is the error returned by the C run-time library for the failing sigaction() call. If the signal handler is not correctly enabled, the Ping program will continue processing, but certain functions controlled by the failing signal...
will not function properly. Functions controlled by the signals are:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIGABND</td>
<td>handler controls error reporting and cleanup functions when an abend occurs. If sigaction fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up.</td>
</tr>
<tr>
<td>SIGTERM</td>
<td>handler controls cleanup of resources during termination. If sigaction fails for SIGTERM, certain resources might not be properly cleaned up when a SIGTERM is received.</td>
</tr>
</tbody>
</table>

**System action:** Processing continues; however, the functions controlled by the failing signal will not function properly.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDOPN, EZACDTPN

**Procedure name:** main

---

**EZZ3117I** Termination request is received. The program is interrupted.

**Explanation:** This message is displayed when a termination request is received while the Ping command is in progress.

**System action:** The Ping program halts and exits.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDPIN

**Procedure name:** termHand

---

**EZZ3118I** Command abend with abendcode, reasoncode.

**Explanation:** This message is displayed when an internal programming error caused Ping program to be abnormally terminated.

**System action:** The Ping program halts and exits.

**Operator response:** Contact the system programmer.

**System programmer response:** Contact the IBM software support center with the CEEDUMP output from your system.

**Module:** EZACDPIN

**Procedure name:** abndHand

---

**EZZ3119I** Interaction attention request is received. The program is interrupted.

**Explanation:** This message is displayed when an interaction attention request is received while the Ping command is in progress.

216  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
EZZ3120I  Could not establish affinity with tcpipname (error_code/reason)

Explanation: Ping called setibmopt() to associate itself with the TCPIP instance tcpipname, and failed with the displayed error_code and reason.

System action: The Ping program halts and exits.

Operator response: Correct the error indicated by error_code and reason and reissue the Ping command. For Ping to communicate with a particular stack, the tcpipname (as determined by system variable TCPIPjobname) must match the TYPE operand that was specified on the FILESYSTYPE statement or the NAME operand of the SUBFILESYSTYPE statement that was defined in the BPXPRMxx parmlib member. For more information about customizing the BPXPRMxx parmlib member, see z/OS UNIX System Services Planning. The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their job names.

System programmer response: Correct the error indicated by error_code and reason and reissue the Ping command. For Ping to communicate with a particular stack, the tcpipname (as determined by system variable TCPIPjobname) must match the TYPE operand that was specified on the FILESYSTYPE statement or the NAME operand of the SUBFILESYSTYPE statement that was defined in the BPXPRMxx parmlib member. For more information about customizing the BPXPRMxx parmlib member, see z/OS UNIX System Services Planning. The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their job names.

Module: EZACDPIN

Procedure name: pingMain

EZZ3121I  Executing under single stack configuration of INET. The option option ignored

Explanation: The Ping command was issued from an environmental shell that is configured for INET. In an INET configuration, there can be only one TCP/IP (for example, AF_INET type) stack connected to an environmental shell. The Ping program continues but ignores the option option.

option is the Ping option that was ignored.

System action: The Ping program continued.

Operator response: None.

System programmer response: None.

Module: EZACDPIN

Procedure name: pingMain

EZZ3122I  argument specified for parameter must be Length characters or less.

Explanation: You specified an incorrect parameter argument.

System action: The Ping program halts and exits.

Operator response: Specify an argument less than or equal to requested characters and resubmit the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands

System programmer response: None.

Module: EZACDPIN, EZACDOPN, EZACETPN

Procedure name: proclNTF, parsOPIN, parsTPIN

EZZ3123I  Could not determine the TCPIPjobname, using default of 'INET'

Explanation: The oping command was invoked with the -i option, but without the -p option to specify a TCP/IP instance name. The command called the __iptcpn() to retrieve the resolver supplied TCPIPjobname and failed. Oping could not determine the jobname for the TCP/IP stack. A default value of 'INET' will be used for TCPIPjobname.

System action: The oping program continues.

Operator response: None.

System programmer response: In an INET environment, no action is necessary. In a CINET environment, for oping
to communicate with a particular stack, either the TCPIPJjobname should be set in the appropriate resolver configuration file or data set, or the command should be reissued, supplying the TCP/IP instance name on the -p option. For more information about the search order for locating the resolver configuration file or data set, see the z/OS Communications Server: IP Configuration Guide. The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their job names. The oping -p option can be used to explicitly select a TCP/IP instance by specifying its jobname.

System programmer response: None.
Module: EZACDPIN
Procedure name: pingMain

EZZ3125I The interface interface was not found in the HOME list for tcpname.

Explanation: Either the interface interface was specified on the INTF/-i option but was not defined to the TCP/IP instance named tcpname or the interface is an OSM interface but the user ID did not have RACF authority to use that interface. If the TCP/IP instance name is 'TCPIP' this could mean that Ping is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

System action: The Ping program halts and exits.
Operator response: Verify that the value specified for the INTF/-i option is defined to the TCP/IP instance named tcpname. For an OSM interface, verify that the user ID has the RACF authority to use that interface. For more information about OSM interface authorization, see OSM Access Control in z/OS Communications Server: IP Configuration Guide. You can use the Netstat command to verify the interfaces defined to a TCP/IP instance. Reissue the Ping command with a valid value for the INTF/-i option. For more information about Ping, see z/OS Communications Server: IP System Administrator’s Commands.

System programmer response: None.
Module: EZACDPIN
Procedure name: getIFindx

EZZ3127I Interface interface for tcpname can not be specified for the option option.

Explanation: The Ping command was invoked with the option option to specify the interface on which to send out the Ping packets. The interface interface was found in the HOME list of the TCP/IP instance name tcpname, but the interface type cannot be specified for the option option.

If the TCP/IP instance name is 'TCPIP' this could mean that Ping is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

option is the Ping option that was specified.

System action: The Ping program halts and exits.
Operator response: Ensure that the interface specified for the option option is not a VIPA link or loopback link and reissue the command.

System programmer response: None.
Module: EZACDPIN
Procedure name: getIFindx

EZZ3127I More than one IP address ipaddr found for tcpname.

Explanation: The Ping command was invoked with an IP address specified for the INTF/-i option but there is more than one interface defined to the TCP/IP instance tcpname with IP address ipaddr. If the TCP/IP instance name is 'TCPIP' this could mean that Ping is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

System action: The Ping program halts and exits.
Operator response: Reissue the Ping command with a valid value for the INTF/-i option.
System programmer response: None.
Module: EZACDPIN
Procedure name: getIFindx

EZZ3129I IPv4-mapped IPv6 address not supported
Explanation: IPv4-mapped IPv6 addresses are not supported for the Ping command.
System action: The Ping program halts and exits.
Operator response: Correct the IP address specification and reissue the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands
System programmer response: None.

Module: EZACDPIN
Procedure name: procHOST, procSRIP, procINTF

EZZ3130I Incorrect option value specified
Explanation: You specified an incorrect option value.
option is the command option for which the incorrect value was specified.
System action: The Ping program halts and exits.
Operator response: Correct the option value and reissue the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands
System programmer response: None.

Module: EZACDPIN
Procedure name: procSRIP, procINTF, getIFindx

EZZ3131I Found parenthesis but no options
Explanation: You specified a parenthesis without specifying any options.
System action: The Ping program halts and exits.
Operator response: Specify options or remove the parenthesis and reissue the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands
System programmer response: None.

Module: EZACDTPN
Procedure name: parsTPIN

EZZ3132I Unable to retrieve HOME list for tcpname - description (return_code / reason_code)
Explanation: The command was unable to obtain the HOME list from TCP/IP stack tcpname. If the TCP/IP stack name is TCPIP this might mean that the command is executing in an INET environment and is not aware of the actual name of the TCP/IP stack that is being used.
tcpname is the name of the TCP/IP stack from which Ping tried to obtain the HOME list.
description describes the meaning of the return code.
return_code is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes
reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.
System action: The Ping program halts and exits.
Operator response: Contact the system programmer.
EZZ3133I • EZZ3134I

**System programmer response:** If the *return_code* and *reason_code* were set by the TCP/IP stack, re-create the problem with CTRACE options RAW, PFS, and IOCTL active. Contact the IBM software support center with the CTRACE. If the *return_code* and *reason_code* were not set by the TCP/IP stack, contact the product that set the *return_code* and *reason_code* for assistance.

**Module:** EZACDPIN

**Procedure name:** getIFindx

---

**EZZ3133I** Mismatched IP address type values

**Explanation:** The command found a mismatch in IP address type (that is, IPv4 or IPv6) between some of the IP address values specified. IP address type can be specified with the ADDRTYPE/-A option; or by providing an IP address as the destination host, SRCIP/-s option value, or INTF/-i option value. If a LINK or INTERFACE name was specified for the INTF/-i option value, the command will verify that the LINK or INTERFACE is of the same IP address type as the host or other IP address options specified.

**System action:** The Ping program halts and exits.

**Operator response:** Verify that the values specified for destination host, and the ADDRTYPE/-A, SRCIP/-s, or INTF/-i options, are all of the same IP address type, IPv4 or IPv6.

**System programmer response:** None.

**Module:** EZACDPIN

**Procedure name:** pingMain, procHOST, procSRIP, procINTF

---

**EZZ3134I** The *option1* option value *value* could not be used with the *option2* option.

**Explanation:** You specified a value for a ping command option that cannot be specified with another option.

In the message text:

*option1*

A Ping command option.

*value*

The value specified for *option1*.

*option2*

A Ping command option.

**System action:** The Ping command ends.

**Operator response:** Correct the option and resubmit the Ping command. See the Ping information in z/OS Communications Server: IP System Administrator's Commands. Also consult related MAN pages and the online help, if available.

**System programmer response:** None.

**User response:** Not applicable.

**Example:**

EZZ3134I The Count option value 0 could not be used with the Verbose option
EZZ3134I The -c option value 0 could not be used with the -v option

---
EZZ3200I SNMP subagent: Internal Error code

Explanation: The subagent encountered an internal programming error.

code is one of the following:

01 mkDPIopen failed
02 failure parsing dpi packet (DPIopen)
03 no DPI response to DPI open
04 agent rejected the Open request - reason unknown
05 subagent not authorized to agent
06 DPIget_fd_for_handle failed
07 failure during mkDPIregister
08 failure parsing DPI packet (DPIregister)
09 Sever error processing packet
0A subagent could not get TSEB address
0B subagent could not get TSDB address
0C subagent could not get TSDX address
0D subagent control block pointer was NULL

System action: An automatic restart of the subagent is attempted.

Operator response: If possible, re-create the problem with subagent trace level 4. Contact the TCPIP administrator.

System programmer response: Error information will be written to the Syslog Daemon (syslogd) output file. Contact your IBM support center with the syslogd output.

Module: EZASADPI.C

Procedure name: do_connect_and_open, do_register, call_function, main

EZZ3201I SNMP subagent: duplicate subagent identifier error

Explanation: The SNMP Agent rejected the DPI open request from the subagent because another subagent has already connected to the Agent using the same subagent identifier.

System action: An automatic restart of the subagent is attempted.

Operator response: The subagent identifier for the MVS SNMP subagent is 1.3.6.1.4.1.2.11.7.2. Ensure that no user DPI programs are using this subagent identifier.

System programmer response: The subagent identifier for the MVS SNMP subagent is 1.3.6.1.4.1.2.11.7.2. Ensure that no user DPI programs are using this subagent identifier.

Module: EZASADPI.C

Procedure name: do_connect_and_open

EZZ3202I SNMP SUBAGENT: INITIALIZATION COMPLETE

Explanation: The SNMP subagent completed initialization and is ready to start processing requests.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASADPI.C

Procedure name: main
EZZ3203I  SNMP SUBAGENT: RESTART SCHEDULED

Explanation:  An attempt was made to automatically restart the SNMP subagent following a severe error that caused the SNMP subagent to be ended. This message is preceded by an error message indicating why the SNMP subagent was ended.

System action:  An automatic restart of the subagent is attempted.

Operator response:  None.

System programmer response:  None.

Module:  EZASADPLC

Procedure name:  exitsuba

EZZ3204I  SNMP subagent: sigaction() failed for signal : reason

Explanation:  The SNMP subagent encountered an error attempting to set up the signal handler for the signal specified by signal, reason is the error returned by the C runtime library for the failing sigaction() call. If the signal handler is not correctly enabled, the subagent will continue processing, but certain functions controlled by the failing signal will not function properly. Functions controlled by the signals are:

SIGABND
   Handler controls error reporting and cleanup functions when an abend occurs. If sigaction fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up. The subagent might not be automatically restarted.

SIGTERM
   handler controls cleanup of resources during termination. If sigaction fails for SIGTERM, the subagent will not be automatically restarted when a SIGTERM is received.

SIGPIPE
   handler allows the subagent to detect when the connection to the SNMP agent was terminated by the agent (for example, if the agent times out while waiting for the subagent response and closes the connection). If sigaction fails for SIGPIPE, subagent might either hang or terminate without restart.

System action:  Processing continues; however, the functions controlled by the failing signal will not function properly.

Operator response:  None.

System programmer response:  None.

Module:  EZASADPLC

Procedure name:  main

EZZ3205I  SNMP SUBAGENT: SHUTDOWN IN PROGRESS

Explanation:  The SNMP TCP/IP subagent is permanently ending. This could be caused by one of the following events:

- An MVS STOP command was issued for the TCP/IP address space. The SNMP TCP/IP subagent is automatically started at TCP/IP initialization unless SACONFIG DISABLED is specified in the TCP/IP Profile data set. When the TCP/IP address space is stopped, the subagent issues this message and then ends.
- A VARY TCPIP,OBEYFILE command was issued and the profile data set contained the SACONFIG DISABLED profile statement to stop the SNMP TCP/IP subagent.
- The SNMP subagent encountered an error too severe to attempt automatic restart.

System action:  The SNMP TCP/IP subagent ends.

Operator response:  If the message is issued because of an MVS STOP command or a VARY TCPIP,OBEYFILE command, no action is necessary. Otherwise, contact the system programmer.

System programmer response:  If the message is issued because of an MVS STOP command or a VARY TCPIP,OBEYFILE command, no action is necessary. If this message occurs following an unrecoverable SNMP TCP/IP subagent error, it will be preceded by one or more error messages that indicate the error that caused the SNMP
TCP/IP subagent to end. Correct the errors listed by the previous error messages. TCP/IP might need to be stopped and restarted to restart the SNMP TCP/IP subagent.

Module: EZASADPLC
Procedure name: main, endsuba, exitsuba, abndhand

EZZ3206I SNMP subagent: unable to open UDP socket to TCPIP: error

Explanation: The SNMP subagent must open a UDP socket to TCP/IP in order to retrieve the SNMP variable information from TCP/IP. The subagent's attempt to open the UDP socket failed due to the specified error.

System action: An automatic restart of the subagent is attempted.

Operator response: Correct the problem indicated by error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

System programmer response: Correct the problem indicated by error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

Module: EZASADPLC
Procedure name: main

EZZ3207I SNMP subagent: possible restart loop detected

Explanation: An error occurred in the SNMP subagent that caused a restart to be attempted. The restart processing determined that the subagent had already been restarted multiple times in a short time span and therefore ended the restart processing to prevent a restart loop from occurring.

System action: The SNMP subagent is ended. In order to restart the SNMP subagent, TCP/IP must be stopped and restarted. The MIB variables provided by the subagent will be unavailable until TCP/IP is restarted.

Operator response: This message will be preceded by several error messages, which will indicate the errors that occurred in the SNMP subagent to cause the subagent to be restarted. Correct the errors indicated by the previous error messages, then stop and restart TCP/IP to restart the SNMP subagent.

System programmer response: This message will be preceded by several error messages, which will indicate the errors that occurred in the SNMP subagent to cause the subagent to be restarted. Correct the errors indicated by the previous error messages, then stop and restart TCP/IP to restart the SNMP subagent.

Module: EZASADPLC
Procedure name: main, exitsuba, abndhand

EZZ3208I SNMP subagent: ioctl failed with error: error

Explanation: The subagent issued the SIOCGIBMOPT ioctl for the ioctl subtype. The ioctl call failed with the specified error.

System action: The subagent is unable to process the request for the MIB variable. An error response is returned to the Agent.

Operator response: Correct the indicated error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

System programmer response: Correct the indicated error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

Module: EZASAIOC.C
Procedure name: getIPPltime, sd_get_icmp_tbl, sd_get_ifEntry_tbl, sd_get_ip_tbl, sd_get_ipAddrEntry_tbl, sd_get_ipForwardEntry_tbl, sd_get_ipNetToMediaEntry_tbl, sd_get_tcp_tbl, sd_get_tcpConnEntry_tbl, sd_get_udp_tbl, sd_get_udpEntry_tbl, sd_get_netman_tbls, sd_get_mvsSys_tbl, sd_get_mvsPortEntry_tbl, sd_set_ip_tbl, sd_set_mvs_tbl, sd_set_tcp_tbl, sd_set_udp_tbl, sd_set_primaryInterface, sd_set_ifAdminStatus, sd_drop_tcpConn, sd_drop_udpConn, lookup_linkName, do_beginProfile, do_endProfile
EZZ3209I  SNMP subagent: device device_name, specified for link link_name, was not found

Explanation: The SNMP subagent was parsing the TCP/IP interfaces table to build the SNMP interfaces MIB variable table. A link record was found that had a linkname of link_name and a device name of device_name, but the TCP/IP interfaces table did not contain a device record for that device.

System action: The subagent continues processing the interfaces table, but a stack table entry will not be made for the link in error.

Operator response: This problem could occur if a device or link was added to TCPIP while the subagent was processing the interfaces table. Try the SNMP request again. If the problem persists, contact the TCP/IP administrator.

System programmer response: Check the PROFILE.TCPIP file and ensure that the device definition for the listed device is specified in the file correctly. If the PROFILE.TCPIP file appears to be correct contact your IBM software support center.

Module: EZASAIOC.C
Procedure name: sd_get_ifEntry_tbl

EZZ3210I  SNMP subagent: interface index index not found in SNMP interfaces table

Explanation: The SNMP subagent was parsing the TCP/IP interfaces data table to add the interface counters to the SNMP interfaces MIB records built from processing the TCP/IP interfaces table. An interface data record was found that did not have a corresponding interface record.

System action: The subagent continues processing the interfaces data table, but the SNMP interfaces MIB table will not contain data for the listed link.

Operator response: This problem could occur if a device or link was added to TCPIP while the subagent was processing the interfaces table. Try the SNMP request again. If the problem persists, contact the TCP/IP Administrator.

System programmer response: Check the PROFILE.TCPIP file and ensure that the device definition for the listed device is specified in the file correctly. If the PROFILE.TCPIP file appears to be correct contact your IBM software support center.

Module: EZASAIOC.C
Procedure name: sd_get_ifEntry_tbl

EZZ3211I  SNMP subagent: unable to open ping port: error

Explanation: The subagent attempted to open a raw socket in order to issue an ICMP Echo request for the remote ping function. The subagent was unable to open the raw socket for the reason specified by error.

System action: The subagent will not be able to perform the remote ping request and will return an error for the remote ping MIB variable.

Operator response: Correct the error indicated. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

System programmer response: Correct the error indicated. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

Module: EZASARPG.C
Procedure name: mkPINGport

EZZ3212I  SNMP subagent: unable to open message catalog "subamsg.cat": error

Explanation: The subagent attempted to open the subagent message catalog "subamsg.cat" in the message catalog directory, but was unable to open the catalog. The subagent message catalog should have been installed in the /usr/lib/nls/msg/C message catalog directory.

System action: The subagent will use the internal default messages instead of the external message catalog.

Operator response: If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.
System programmer response: If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.

Module: EZASADPLC

Procedure name: main

EZZ3213I SNMP subagent: waiting for group mib_tree

Explanation: One of the following events occurred:
- The SNMP TCP/IP subagent attempted to register the specified MIB tree, mib_tree, but another DPI subagent had already registered the requested MIB tree with a higher priority.
- The TCP/IP subagent had successfully registered the specified MIB tree, but the Agent received a later registration from another subagent that requested a higher priority than that with which the TCP/IP subagent was currently registered.

As a result, the Agent sends SNMP requests for the MIB tree to the subagent that registered with the higher priority, instead of to the TCP/IP subagent.

If the mib_tree value is 1.3.6.1.2.1.10.7.2. (which is the SNMP dot3StatsTable table from RFC 2665), the message was probably issued because the OSA-Express Direct subagent is active. The dot3StatsTable table is supported by both the TCP/IP subagent and the OSA-Express Direct subagent. The OSA-Express Direct subagent, started by procedure IOBSNMP, supports more types of OSA features in the dot3StatsTable table than the TCP/IP subagent. Therefore, if the OSA-Express Direct subagent is active, it supports the dot3StatsTable table. If any SNMP requests are received for data from the dot3StatsTable table, the SNMP Agent passes the requests on to the OSA-Express Direct subagent to be processed. If the OSA-Express Direct subagent is active, the TCP/IP subagent writes message EZZ3213I to the syslog daemon, to indicate that it is currently waiting to support the dot3StatsTable table. This is normal processing and does not indicate a problem. If the OSA-Express Direct subagent ends, then the TCP/IP subagent supports the dot3StatsTable table and the SNMP Agent will send SNMP requests for this table to the TCP/IP subagent.

System action: The TCP/IP subagent continues to process for the other MIB trees supported by the TCP/IP subagent. If the MIB tree becomes available at a later time, the TCP/IP subagent will begin processing for that MIB tree.

Operator response: If it is acceptable that a DPI subagent program other than the SNMP TCP/IP subagent provides the processing for the MIB variables in the specified MIB tree, than no action is necessary. Otherwise, the other DPI subagent must be ended for the SNMP TCP/IP subagent to provide the processing for the variables in the specified MIB tree. If the mib_tree value is 1.3.6.1.2.1.10.7.2., then the message was probably issued because the OSA-Express Direct subagent is active and supporting the dot3StatsTable table. Because the OSA-Express Direct subagent is the preferred supporter of the dot3StatsTable table, this does not indicate a problem.

If you need to determine which DPI subagent is currently providing the processing for the mib_tree value, you can use the following z/OS UNIX snmp commands:

**snmp -h host -v walk saTindex**
Find the entries whose index value starts with the mib_tree value from the message. In the case of the dot3StatsTable table, the entries could appear as:

```
saTindex.1.3.6.1.2.1.10.7.2.0 = 4
saTindex.1.3.6.1.2.1.10.7.2.1 = 2
```

The .0 at the end of the index value indicates that a DPI subagent registered for the MIB tree value with a priority of 0. This is the highest priority. Use this entry's saTIndex value of 4 in the next snmp command.

**snmp -h host -v get saDescription.4**
This command returns: saDescription.4 = OSA subagent

This information enables you to determine that the OSA-Express Direct subagent is the DPI agent that registered for the MIB tree with a higher priority.

System programmer response: None.

Module: EZASADPLC

Procedure name: do_register, do_unreg
EZZ3214I • EZZ3217I

EZZ3214I  SNMP subagent: group mib_tree unregistered by Manager

Explanation: The SNMP subagent received a notification that the MIB tree mib_tree was unregistered. This action was initiated by a request from an SNMP Manager.

System action: The subagent will continue processing for the other MIB trees supported by the subagent. The variables under the MIB tree unregistered by the SNMP Manager will no longer be available.

Operator response: If it is acceptable that the specified MIB tree is no longer available, then no action is necessary. To regain the unregistered MIB tree, the SNMP subagent must be closed by an SNMP Manager. Do this by setting the saStatus for the SNMP subagent to invalid (2). This will cause the SNMP subagent to disconnect from the Agent, then reconnect and reregister all of its supported MIB trees, including any that were previously unregistered by an SNMP Manager request.

System programmer response: None.

Module: EZASADPLC
Procedure name: do_unreg

EZZ3215I  SNMP SUBAGENT: COULD NOT ESTABLISH AFFINITY WITH tcpip_name (error_code/reason)

Explanation: The SNMP subagent attempted to use the z/OS UNIX socket call, setibmopt(), to associate itself with the TCP/IP instance tcpip_name. This TCP/IP name should be the started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) of the TCP/IP instance under which the SNMP subagent is initializing. The setibmopt call failed with the displayed error_code and reason.

System action: The SNMP subagent ends.

Operator response: Most likely, the TCP/IP instance's name was not defined correctly to OMVS. Check the SUBFILESTYPE NAME for the corresponding TCP/IP instance in the BPXPRMxx member that was used to configure OMVS. Ensure that the TCP/IP started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) matches the SUBFILESTYPE NAME. Recycle OMVS or TCP/IP if a change is necessary. The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their names. If none of the above error conditions exist contact the system programmer.

System programmer response: Correct the error indicated by error_code and reason.

Module: EZASADPLC
Procedure name: main

EZZ3216I  SNMP SUBAGENT: LOST CONNECTION TO SNMP AGENT

Explanation: The SNMP subagent was connected to the SNMP Agent, but the connection was broken.

System action: The subagent will try to reconnect to the SNMP Agent until successfully reconnected.

Operator response: If the SNMP Agent job is not active, restart the SNMP Agent. If the SNMP Agent is currently active, the SNMP subagent should automatically reconnect to the agent. If it does not, stop the SNMP Agent and restart it.

System programmer response: If the SNMP Agent job is not active, restart the SNMP Agent. If the SNMP Agent is currently active, the SNMP subagent should automatically reconnect to the agent. If it does not, stop the SNMP Agent and restart it.

Module: EZASADPLC
Procedure name: do_open_and_register

EZZ3217I  SNMP SUBAGENT: RECONNECTED TO SNMP AGENT

Explanation: The SNMP subagent reconnected to the SNMP Agent after detecting that the prior connection had been broken.

System action: The subagent waits for requests.

Operator response: None.
EZZ3218I  SNMP SUBAGENT: CONNECTED TO OSA/SF
Explanation:  The SNMP subagent connected to the OSA/SF program.
System action:  The subagent waits for requests.
Operator response:  None.
System programmer response:  None.
Module:  EZASADPLC
Procedure name:  do_open_and_register

EZZ3219I  SNMP SUBAGENT: DISCONNECTED FROM OSA/SF
Explanation:  The SNMP subagent had been connected to the OSA/SF program, but detected an error while attempting to communicate with OSA/SF. The OSA/SF connection is ended.
System action:  The subagent will try to recontact the OSA/SF program
Operator response:  Ensure that the OSA/SF program and ATM device are active. If possible, re-create the problem with subagent trace level 4. Contact the TCPIP administrator.
System programmer response:  The trace messages should indicate the error that caused the subagent to disconnect from the OSA/SF program. If possible, correct the indicated error. If necessary, contact the IBM software support center with the syslogd output.
Module:  EZASAAATM.C
Procedure name:  initAtm

EZZ3220I  SNMP subagent: Using loopback to connect to agent
Explanation:  The TCP/IP subagent was unable to resolve the local host address and is using the loopback address to connect to the snmp agent instead of the host address.
The TCP/IP subagent uses the gethostid() socket function to retrieve the local host address. The IP address returned by this function is the primary interface address of the TCP/IP stack associated with the subagent. If the returned IP address is loopback, or the gethostid() function fails, then the subagent will use loopback to connect to the SNMP agent and will issue this message.
System action:  The subagent will try to connect to the agent using the loopback address.
Operator response:  Contact the TCP/IP administrator.
System programmer response:  If the TCP/IP subagent should not use loopback to connect to the agent, ensure that there is a non-loopback IP address defined as the primary interface to the TCP/IP stack associated with the subagent. The primary interface is either the first LINK in the HOME list, or the LINK specified on a PRIMARYINTERFACE Profile statement. You can use the TSO NETSTAT HOME or z/OS UNIX Netstat -h commands to determine which LINK is the primary interface for a stack.
If the loopback address is used to connect to the agent, and a password other than the snmp agent's "-c" default password is used by the subagent when connecting, then the password used by the subagent must be defined for the loopback address 127.0.0.1 in the SNMP agent's PW.SRC or SNMPD.CONF file. The trace messages will indicate the error that the subagent received when attempting to retrieve the primary interface IP address. If necessary, contact your IBM software support center with the syslogd output.
Module:  EZASADPLC
Procedure name:  do_gethostid

Chapter 4. EZZ3xxx messages  227
SNMP SUBAGENT: SET REQUESTS status

Explanation: This message displays the current status of SNMP SET requests, where status is either: ENABLED or DISABLED. If the status is ENABLED, the SNMP subagent will accept SNMP SET requests. If the status is DISABLED, the SNMP subagent will reject SNMP SET requests.

This value can be set by specifying the required parameter on the SACONFIG Profile statement. See the z/OS Communications Server: IP Configuration Reference for a description of the SACONFIG statement. This message will be issued during SNMP subagent initialization and whenever the value is changed dynamically using the VARY TCPIP,OBEYFILE command.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASADPI.C
Procedure name: main

SNMP Subagent: no Netman response for linkname (seqnum)

Explanation: When an SNMP command is issued for an object from one of the ibm3172 MIB tables, and this table’s cachetime expired, the subagent attempts to retrieve the information for a 3172 device or link from the 3172 ICP. The subagent then waits 30 seconds for a response from the 3172. If this response is not received in 30 seconds, the subagent writes this message to the syslog daemon indicating the linkname and the sequence number, seqnum, for the failing request.

System action: The subagent fails the request for the object from the ibm3172 MIB table and waits for the next request.

Operator response: If possible, re-create the problem with subagent trace level 3 and TCP/IP CTRACE active for options LCS, VTAM and VTAMDATA. Contact the TCPIP administrator.

System programmer response: Verify that the 3172 indicated by linkname is active. The subagent trace will be written to the Syslog Daemon (syslogd) output file. See the z/OS Communications Server: IP Diagnosis Guide for information about obtaining the output of the CTRACE. Contact your IBM support center with the syslogd and CTRACE output.

Module: EZASAIOC.C
Procedure name: sd_get_ibm3172_tbls

SNMP Subagent: Netman request failed for linkname rc netman_rc (seqnum)

Explanation: When an SNMP command is issued for an object from one of the ibm3172 MIB tables, and this table’s cachetime expired, the subagent attempts to retrieve the information for a 3172 device or link from the 3172 ICP. If the return code from the 3172 ICP is not zero, the subagent writes this message to the syslog daemon indicating the linkname, the netman_rc, and the sequence number, seqnum, of the failing request.

System action: The subagent fails the request for the object from the ibm3172 MIB table and waits for the next request.

Operator response: If possible, re-create the problem with subagent trace level 3 and TCP/IP CTRACE active for options LCS, VTAM and VTAMDATA. Contact the TCPIP administrator.

System programmer response: Verify that the 3172 indicated by linkname is active. The subagent trace will be written to the Syslog Daemon (syslogd) output file. See the z/OS Communications Server: IP Diagnosis Guide for information about obtaining the output of the CTRACE. Contact your IBM support center with the syslogd and CTRACE output.

Module: EZASAIOC.C
Procedure name: sd_get_ibm3172_tbls
EZZ3224I SNMP SUBAGENT: IP FORWARDING IS DISABLED

Explanation: IP forwarding support is disabled. The state of IP forwarding support was changed as the result of an SNMP SET request on either the ipForwarding or the ibmMvsIpForwarding MIB objects.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3225I SNMP SUBAGENT: ICMP (WILL | WILL NOT) IGNORE REDIRECTS

Explanation: The state of ICMP redirects is displayed. The state was changed as the result of an SNMP SET request on the ibmMvsIgnoreRedirect MIB object.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3226I SNMP SUBAGENT: (A LIMIT | NO LIMIT) ON INCOMING UDP DATAGRAM QUEUE SET

Explanation: The limit on the incoming UDP datagram queue is displayed. The state was changed as the result of an SNMP SET request on the ibmMvsNoUdpQueueLimit MIB object.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3227I SNMP SUBAGENT: MULTIPATH SUPPORT IS DISABLED

Explanation: The state of MULTIPATH support is changed as the result of an SNMP SET request on the ibmMvsMultipathType MIB object.

If there are multiple equal-cost paths to a destination, then TCP/IP will use the first path found for all IP packets to that destination.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3228I SNMP SUBAGENT: PATH MTU DISCOVERY SUPPORT IS status

Explanation: The status of Path MTU Discovery support is displayed, where status is either: ENABLED or DISABLED. If Path MTU Discovery support is enabled, then TCP/IP will dynamically discover the Path MTU(PMTU), which is the minimum of the MTUs of each hop in the path, necessary to prevent fragmentation of datagrams sent on that path.

If Path MTU Discovery support is disabled, then large datagrams might be fragmented.
The state of Path MTU Discovery support is changed as the result of an SNMP SET request on the ibmMvsPathMtuDscEnabled MIB object.

**System action:** The subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASAIOC.C

**Procedure name:** do_endProfile

---

**EZ3229I** SNMP SUBAGENT: MULTIPATH \textit{type} SUPPORT IS ENABLED

**Explanation:** Multipath support is enabled, where \textit{type} is either: PERCONNECTION, or PERPACKET. In general, multipath routing provides the routing distribution necessary to balance the network utilization of outbound packets. Multipath routing requires the definition of multiple equal-cost routes, which are either defined statically or added dynamically by routing protocols. If MULTIPATH is specified without any subparameters, the default is PERCONNECTION.

The state of MULTIPATH support is changed as the result of an SNMP SET request on the ibmMvsMultipathType MIB object.

**System action:** The subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASAIOC.C

**Procedure name:** do_endProfile

---

**EZ3230I** SNMP SUBAGENT: IP FORWARDING \textit{type} SUPPORT IS ENABLED

**Explanation:** The state of IP forwarding support is changed as the result of an SNMP SET request on either the ipForwarding or ibmMvsIpForwarding MIB object. IP forwarding support is enabled, where \textit{type} is either: NOFWDMULTIPATH, or FWDMULTIPATH PERPACKET.

**System action:** The subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASAIOC.C

**Procedure name:** do_endProfile

---

**EZ3231I** SNMP SUBAGENT: CANNOT OBTAIN STORAGE TO PROCESS REQUEST

**Explanation:** The SNMP TCP/IP subagent requested storage from the TCP/IP private area and that request has failed. This message will appear every 15 minutes for as long as the subagent cannot obtain enough storage to process requests.

**System action:** The current SNMP request fails but the SNMP TCP/IP Subagent continues.

**Operator response:** This might be a temporary condition because of increased activity in the TCP/IP address space. Subsequent requests to the subagent might succeed. If this problem continues, contact the system programmer.

**System programmer response:** Determine the requested storage failure type and size by obtaining a subagent level 1 trace. The trace can be activated by doing a VARY TCP/IP,OBEYFILE command with a TCP/IP profile statement of ITRACE ON SUBAGENT 1. It might be necessary to increase the TCP/IP stack region size and recycle the TCP/IP stack. If this error continues to occur, dump the TCP/IP address space, collect any available supporting documentation, and contact the IBM software support center.

**Module:** EZASADPLC

**Procedure name:** noBufsExpired
EZZ3232I  SNMP SUBAGENT: IPV6 FORWARDING IS DISABLED ON tcpname

Explanation: IPv6 forwarding support is disabled on the TCP/IP stack indicated by tcpname. The state of IPv6 forwarding support was changed as the result of an SNMP SET request on the ip6Forwarding or ibmMvsIp6Forwarding MIB object.

tcpname is the name of the TCP/IP stack.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3233I  SNMP SUBAGENT: IPV6 FORWARDING type SUPPORT IS ENABLED ON tcpname

Explanation: IPv6 forwarding support is enabled on the TCP/IP stack indicated by tcpname. The state of IPv6 forwarding support was changed as the result of an SNMP SET request on the ip6Forwarding or ibmMvsIp6Forwarding MIB object.

type is the type of IPv6 forwarding that was enabled. type can either be NOFWDMULTIPATH or FWDMULTIPATH PERPACKET.

tcpname is the name of the TCP/IP stack.

System action: The subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3234I  SNMP SUBAGENT: ICMPV6 REDIRECTS WILL BE IGNORED ON tcpname

Explanation: ICMPv6 Redirect packets will be ignored on tcpname. An SNMP SET request on the ibmMvsIp6IgnoreRedirect MIB object changed the way that TCP/IP processes ICMPv6 Redirect packets.

tcpname is the name of the TCP/IP stack.

System action: The TCP/IP subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3235I  SNMP SUBAGENT: ICMPV6 REDIRECTS WILL NOT BE IGNORED ON tcpname

Explanation: ICMPv6 Redirect packets will not be ignored on the TCP/IP stack indicated by tcpname. An SNMP SET request on the ibmMvsIp6IgnoreRedirect MIB object changed the way that TCP/IP processes ICMPv6 Redirect packets.

tcpname is the name of the TCP/IP stack.

System action: The TCP/IP subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C
Procedure name: do_endProfile

EZZ3236I   SNMP SUBAGENT: ROUTER ADVERTISEMENT HOP LIMIT VALUES WILL BE IGNORED ON tcpname

Explanation: Router advertisement hop limit values will be ignored on tcpname. An SNMP SET request on the ibmMvslp6IgnoreRtrHopLimit MIB object changed the way that TCP/IP processes router advertisement hop limit values.

tcpname is the name of the TCP/IP stack.

System action: The TCP/IP subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3237I   SNMP SUBAGENT: ROUTER ADVERTISEMENT HOP LIMIT VALUES WILL NOT BE IGNORED ON tcpname

Explanation: Router advertisement hop limit values will not be ignored on tcpname. An SNMP SET request on the ibmMvslp6IgnoreRtrHopLimit MIB object changed the way that TCP/IP processes router advertisement hop limit values.

tcpname is the name of the TCP/IP stack.

System action: The TCP/IP subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3238I   SNMP SUBAGENT: IPV6 MULTIPATH SUPPORT IS DISABLED ON tcpname

Explanation: IPv6 Multipath support is disabled on tcpname. When Multipath support is enabled and there are multiple equal-cost paths to a destination, then TCP/IP will use the first path found for all IPv6 packets to that destination. An SNMP SET request on the ibmMvslp6MultipathType MIB object changed the Multipath processing of the TCP/IP stack.

tcpname is the name of the TCP/IP stack.

System action: The TCP/IP subagent waits for requests.

Operator response: None.

System programmer response: None.

Module: EZASAIOC.C

Procedure name: do_endProfile

EZZ3239I   SNMP SUBAGENT: IPV6 MULTIPATH type SUPPORT IS ENABLED ON tcpname

Explanation: IPv6 Multipath support is enabled on tcpname. Multipath routing provides the routing distribution necessary to balance the network utilization of outbound packets. Multipath routing requires the definition of multiple equal-cost routes that are either defined statically or added dynamically by routing protocols. An SNMP SET request on the ibmMvslp6MultipathType MIB object changed the Multipath processing of the TCP/IP stack.

type is either PERCONNECTION or PERPACKET.

tcpname is the name of the TCP/IP stack.
**EZ3250I • EZ3252I**

**System action:** The TCP/IP subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASAIAC.C

**Procedure name:** do_endProfile

---

**EZ3250I** THE MODIFY COMMAND IS NOT SUPPORTED.

**Explanation:** The TCPIP address space no longer supports the MODIFY command.

**System action:** TCPIP continues.

**Operator response:** A VARY operator command might be issued instead. See the [z/OS Communications Server: IP System Administrator’s Commands](https://publibz.boulder.ibm.com/infocenter/zos/v2r12/topic/com.ibm.zos.r12.doc/zosip909.html) for assistance.

**System programmer response:** None.

---

**EZ3251I** job name IS NOT ACCEPTING VARY OR DISPLAY COMMANDS AT THIS TIME.

**Explanation:** The internal state of this TCPIP instance indicates it cannot currently accept VARY or DISPLAY commands. Either TCPIP is not fully initialized, the Configuration component abnormally terminated, or TCPIP is terminating. The command request cannot be completed.

*job name* is the name of job associated with the procedure that was used to start TCPIP.

**System action:** TCPIP continues.

**Operator response:** Reissue the command. If the problem persists, save the system log and notify the system programmer.

**System programmer response:** Either TCPIP was in the process of terminating or there is a problem with the configuration component. The configuration component might either not be initialized or has abended and could not recover. If configuration cannot initialize, TCPIP will not start. Examine the system log to determine whether or not the configuration component abended and whether or not it was related to a correctable system configuration error. See the [z/OS Communications Server: IP Diagnosis Guide](https://publibz.boulder.ibm.com/infocenter/zos/v2r12/topic/com.ibm.zos.r12.doc/zosip909.html) for assistance.

---

**EZ3252I** ERROR returncode IN ALLOCATING STORAGE FOR CONTROL BLOCK cbname

**Explanation:** An error occurred while attempting to allocate storage for the control block specified. The return code from the STORAGE OBTAIN is provided.

$returncode$ is the return code from the storage allocation routine. See the [z/OS MVS Programming: Assembler Services Reference IAR-XCT](https://publibz.boulder.ibm.com/infocenter/zos/v2r12/topic/com.ibm.zos.r12.doc/zosip909.html) for a description of the STORAGE OBTAIN return codes.

$cbname$ is the name of the control block for which the storage could not be obtained. The possible names are:

- SATQ - SNMP Subagent TrapQ block
- CDMQ - VARY/DISPLAY Command Request block
- SATQHEAD - SNMP Subagent TrapQ Header block
- SANQHEAD - SNMP Subagent NetmQ Header block

**System action:** If the storage was for a CDMQ control block, TCPIP or Telnet continues but the command process ends. If the storage was for a TRAPQ control block, the trap will not be generated.

**Operator response:** Notify the system programmer of the problem.

**System programmer response:** The storage allocation attempt was for storage in common. Expanding the CSA might alleviate the problem. See the [z/OS MVS Initialization and Tuning Guide](https://publibz.boulder.ibm.com/infocenter/zos/v2r12/topic/com.ibm.zos.r12.doc/zosip909.html) for allocating more CSA.
EZZ3253I  •  EZZ3300I

EZZ3253I  ERROR returncode IN RELEASING STORAGE FOR CONTROL BLOCK cbname

Explanation:  An error occurred while attempting to release storage for the control block specified. The return code from the STORAGE RELEASE is provided.

returncode is the return code from the storage routine, [AR-XCT] for a description of the STORAGE RELEASE return codes.

cbname is the name of the control block for which the storage release failed. The possible names are:
- SATQ - SNMP Subagent TrapQ block
- SANQ - SNMP Subagent NetmQ block
- CDMQ - VARY/DISPLAY Command Request block
- CDMH - VARY/DISPLAY Command Header block

System action:  TCPIP continues.

Operator response:  Notify the system programmer of the problem.

System programmer response:  This is an internal error. Contact the IBM software support center.

EZZ3255I  taskname HAS NOT BEEN STARTED DUE TO ERROR returncode ATTEMPTING TO function

Explanation:  During TCPIP or Telnet initialization, a failure occurred while attempting to start the component specified.

taskname is the name of the task that was to be started. The possible names are:
- EZACDMSM - Command Manager
- EZACFMMN - Configuration
- EZASASUB - SNMP Subagent

returncode is the return code from the system call specified.

function is the function that was attempted.

System action:  TCPIP or Telnet continues or ends based on the task that failed to initialize. If the task is EZACFMMN or EZACDMSM, TCPIP or Telnet was not initialized. If the task is EZASASUB, the SNMP Subagent will not be available but TCPIP or Telnet is initialized.

Operator response:  Notify the system programmer.

System programmer response:  Turn on ITRACE for the component specified and restart TCPIPor Telnet. Gather the documentation and contact the IBM software support center. For information about ITRACE, see the [Z/OS Communications Server: IP Configuration Reference].

EZZ3300I  osnmp is unable to open message catalog "snmpclim.cat" : error

Explanation:  osnmp was unable to open the osnmp message catalog, snmpclim.cat, in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/%L/%N".

System action:  osnmp will use the internal default messages instead of the message from the external message catalog.

Operator response:  If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.

System programmer response:  If use of the external message catalog is required, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access. See the [Z/OS XL C/C++ Runtime Library Reference] for more information about the catopen() function call. Information regarding the NLSPATH environment variable can be found in [Z/OS UNIX System Services Programming Tools]. If the default messages are acceptable, no action is necessary.

Module:  snmp

Procedure name:  main
EZZ3301I  Error return from api

Explanation: The call to the specified routine failed. This is an internal error.

System action: osnmp ends.

Operator response: Reissue the command specifying -d 4. Collect the trace output and report the problem to the system programmer.

System programmer response: Check that TCP/IP is running. Restart TCP/IP if necessary. Make sure your system is configured correctly. See z/OS Communications Server: IP Configuration Reference for configuration information. If your system is configured correctly then contact the IBM software support center for assistance.

Module: snmp

Procedure name: main

---

EZZ3303I  Error finding network address for host

Explanation: An IP address could not be obtained for the host specified by the -h parameter.

System action: osnmp ends.

Operator response: Verify that the host name is correct and reissue the command. If the error continues, reissue the command with the target IP address instead of the name. Notify the system programmer if the problem persists.

System programmer response: Determine if the name server and/or HOSTS.SITEINFO are correct. See the z/OS Communications Server: IP Configuration Guide for more information about configuring the Domain Name System or the Site Table.

Module: snmp

Procedure name: main

---

EZZ3304I  Error finding local host name, errno = errno Using loopback address 127.0.0.1

Explanation: A call to gethostname() failed. The loopback IP address 127.0.0.1 will be used as the host address.

(errno) is the text of the z/OS UNIX System Services return code that describes the error. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

System action: osnmp ends.

Operator response: Inform the system programmer of the problem.

System programmer response: Check the configuration of your default TCP/IP transport provider. If your default transport provider is TCP/IP, check the TCPIPDATA data set for a valid HOSTNAME keyword. The TCP/IP stack configuration component uses the z/OS UNIX search order to locate the TCPIPDATA HOSTNAME statement to determine the stack host name. See search orders used in the z/OS UNIX environment in z/OS Communications Server: IP Configuration Guide for a description of this search order. If your default TCP/IP transport provider is AnyNet®, check the AnyNet ENVVAR data set for a valid HOSTNAME keyword.

Module: snmp

Procedure name: main

---

EZZ3305I  Error finding source local host address : name

Explanation: The IP address of the local host could not be obtained.

System action: osnmp ends.

Operator response: Inform the system programmer of the problem.

System programmer response: Check the configuration of your default TCP/IP transport provider. If your default transport provider is TCP/IP, check the TCPIP.PROFILE data set for a valid HOME LIST specification. If your default TCP/IP transport provider is AnyNet, check the AnyNet configuration initialization procedure for a valid ISTSKIFC command.

Module: snmp
EZZ3306I  Error converting name to Entity

Explanation: An error occurred when attempting to convert the destination name specified by the -h parameter to an internal destination Entity.

System action: osnmp ends.

Operator response: If the name specified by the -h parameter was not entered correctly, correct the error and reissue the command. Otherwise, there might be a configuration problem. Notify the system programmer of the problem.

System programmer response: Check the configuration of your default TCP/IP transport provider. If your default transport provider is TCP/IP, check the TCPIPDATA data set for a valid HOSTNAME keyword. If your default TCP/IP transport provider is AnyNet, check the AnyNet ENVVAR data set for a valid HOSTNAME keyword.

Module: snmp

Procedure name: main

EZZ3307I  Memory Allocation failed

Explanation: An allocation of C heap storage failed. There is insufficient memory to continue processing.

System action: osnmp ends.

Operator response: If the request contained a large list of variables and/or variable/value pairs, shorten the list and reissue the command.

System programmer response: None.

Module: snmp or wsnmpmgr

Procedure name: various

EZZ3308I  Set function requires variable name/value pair(s)

Explanation: When issuing an snmp set, a variable name and a variable value must be specified.

System action: osnmp ends.

Operator response: Correct the syntax and reissue the command. Issue osnmp -? for the correct syntax.

System programmer response: None.

Module: snmp

Procedure name: main

EZZ3309I  Only one variable allowed for functionname function

Explanation: More than one variable was specified with either the walk or the bulkwalk function. Only one is allowed.

System action: The command ends.

Operator response: Correct the syntax and reissue the command. Issue osnmp -? for the correct syntax.

System programmer response: None.

Module: snmp

Procedure name: main

EZZ3310I  Timeout after number seconds

Explanation: The response to the snmp request was not received before the timeout value was reached.

System action: osnmp ends.
Operator response: Reissue the command by setting a larger timeout value using the \texttt{-t} parameter. If the problem persists, contact the system programmer.

System programmer response: Determine if the snmp agent at the target is active. Start it if necessary. If the problem persists, issue the osnmp command with \texttt{-d 4} debug and contact the IBM software support center.

Module: snmp
Procedure name: main

\begin{verbatim}
EZZ3311I  Option option was entered without a value.
Explanation: The option specified was entered without providing a value.
System action: osnmp ends.
Operator response: Correct the syntax and reissue the command. Issue osnmp \texttt{-?} for the correct syntax.
System programmer response: None.
Module: snmp
Procedure name: main
\end{verbatim}

\begin{verbatim}
EZZ3312I  number is not a valid timeout value, ignored
Explanation: The timeout value was not valid. Either it was not a number or it was zero.
System action: osnmp continues. The parameter is ignored.
Operator response: None.
System programmer response: None.
Module: snmp
Procedure name: main
\end{verbatim}

\begin{verbatim}
EZZ3313I  Unsupported function: name
Explanation: A function was entered that is not known to the command.
System action: osnmp ends.
Operator response: Correct the syntax and reissue the command. Issue osnmp \texttt{-?} for the command syntax.
System programmer response: None.
Module: snmp
Procedure name: main
\end{verbatim}

\begin{verbatim}
EZZ3314I  Function name requires at least one variable
Explanation: The function specified requires at least one variable, none were entered.
System action: osnmp ends.
Operator response: Correct the syntax and reissue the command. Issue osnmp \texttt{-?} for the command syntax.
System programmer response: None.
Module: snmp
Procedure name: main
\end{verbatim}
EZZ3315I  A type request was received. The program is action.
Explanation: This message is displayed when either a termination signal or an interruption signal was received from LE/370 while osnmp was executing.
System action: osnmp ends.
Operator response: None.
System programmer response: None.
Module: snmp
Procedure name: termHand

EZZ3316I  Command abended with abendcode, reasoncode.
Explanation: This message is displayed when an abend occurred while the osnmp command was in progress.
abendcode is the MVS Abend code. MVS abend codes are described in the z/OS MVS System Codes.
reasoncode is the reason code associated with this abendcode. They are listed in the description of the abend code in the z/OS MVS System Codes.
System action: osnmp ends.
Operator response: Correct the error indicated by abendcode and reasoncode and reissue the command.
System programmer response: None.
Module: snmp
Procedure name: abndHand

EZZ3317I  sigaction() failed for signal : reason.
Explanation: osnmp encountered an error attempting to set up the signal handler for the signal specified by signal. reason is the error returned by the C runtime library for the failing sigaction() call. If the signal handler is not correctly enabled, osnmp will continue processing, but certain functions controlled by the failing signal will not function properly. Functions controlled by the signals are:
SIGABND
handler controls error reporting and cleanup functions when an abend occurs. If sigaction fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up.
SIGTERM
handler controls cleanup of resources during termination. If sigaction fails for SIGTERM, certain resources might not be properly cleaned up when a SIGTERM is received.
SIGINT
handler controls cleanup of resources during interactive attention. If sigaction fails for SIGINT, certain resources might not be properly cleaned up when a SIGINT is received.
System action: Processing continues; however, the functions controlled by the failing signal will not function properly.
Operator response: None.
System programmer response: None.
Module: snmp
Procedure name: main
EZZ3318I  Unrecognized SMI type: type

Explanation: osnmp encountered an MIB object value type, type, that is not supported in the osnmp list of SMI types either when creating an SNMP packet or when decoding a packet that was received. Either the type is not in the osnmp list of SMI types or the type is not supported for the SNMP request type. For example, set operations are not allowed on Counter64 objects.

System action: osnmp ends.

Operator response: Repeat the SNMP request that generated the unrecognized type and collect traces. For the osnmp command, use the -d 4 level of traces to ensure that packets are traced. If the error is encountered when the osnmp command receives a packet from an SNMP agent, collect traces from the originating SNMP agent that contains the generated packets. Report the problem to the system programmer.

System programmer response: Collect the traces and contact the IBM software support center.

Module: snmp

Procedure name: SnmpPrintValue

EZZ3319I  variable is not a valid variable.instance

Explanation: The syntax of a variable name or ObjectID is not correct or a variable name, not an instance of the variable was entered. The correct syntax is one of the following:
- varName.n, where varName is alphanumeric, starting with an alphabetic (a-z) character (such as, sysDescr.0).
- n.n...n, where n is one or more digits (such as, 1.3.6.1.2.1.1.1.0).

System action: osnmp ends.

Operator response: Reissue the command with the correct syntax or instance.

System programmer response: None.

Module: wsnmpmgr

Procedure name: snmp_fill_varBind

EZZ3320I  variable variable is not found in any local MIB

Explanation: The variable specified was not found in either the MIB compiled into the osnmp command or in the MIBS.DATA file.

System action: The command ends.

Operator response: If the variable specified is incorrect, correct it and reissue the command. If the variable is correct, reissue the command using the object identifier instead of the textual name.

System programmer response: Consider adding additional objects to the MIBS.DATA file. See z/OS Communications Server: IP Configuration Guide for more information.

Module: wsnmpmgr

Procedure name: snmp_fill_varBind

EZZ3321I  Error in MIBS.DATA file, lineno: error

Explanation: While the command processor was reading the MIBS.DATA file, it encountered an error in the file on the line specified. The possible errors are:

- line too long
  Each line in the file must be no longer than 2048. The line specified is longer.

- missing field(s)
  One or more fields are missing from the file. The format of the file is:
  character_object_name  object_identifier  object_type
unrecognized type
   The value in the object_type field is not one of the expected types. See the section about configuring the
   OSNMP command in the z/OS Communications Server: IP Configuration Reference for a list of
   object_types.

System action: The line is ignored and osnmp continues.
Operator response: Correct the error indicated and reissue the command.
System programmer response: None.
Module: snmp_mtable
Procedure name: main

EZZ3322I value is not numeric
Explanation: The value must be numeric.
System action: The command ends.
Operator response: Correct the syntax and reissue the command.
System programmer response: None.
Module: wsnmpmgr
Procedure name: snmp_fill_varBind

EZZ3323I value value is out of range
Explanation: The value entered is outside the range defined by the command syntax or the SMI type.
System action: The command ends.
Operator response: Correct the syntax and reissue the command.
System programmer response: None.
Module: wsnmpmgr, snmp
Procedure name: snmp_fill_varBind, init_args

EZZ3324I value is not a valid IP address
Explanation: The IP address specified is not syntactically correct.
System action: The command ends.
Operator response: Correct the value and reissue the command.
System programmer response: None.
Module: wsnmpmgr
Procedure name: snmp_fill_varBind

EZZ3325I value is not a valid OID
Explanation: The OID specified is not syntactically correct.
System action: The command ends.
Operator response: Correct the value and reissue the command.
System programmer response: None.
Module: wsnmpmgr
Procedure name: snmp_fill_varBind
EZZ3326I Variables cannot be specified with the TRAP function
Explanation: A variable was specified after the TRAP function. Variables are not applicable when specifying TRAP.
System action: osnmp ends.
Operator response: Correct the syntax and reissue the command.
System programmer response: None.
Module: snmp
Procedure name: main

EZZ3327I No valid PDUs returned on this function request
Explanation: A request was made to walk a MIB tree via a walk or a bulkwalk request. The next variable in the tree did not have the same prefix as the variable specified on the command. The PDU was thrown away.
System action: osnmp ends.
Operator response: Reissue the command specifying a valid MIB tree prefix.
System programmer response: None.
Module: snmp
Procedure name: main

EZZ3328I -p allowed only with TRAP function
Explanation: The -p option is valid only when specified with the TRAP function. The function specified was not TRAP.
System action: osnmp ends.
Operator response: Reissue the command with out the -p option.
System programmer response: None.
Module: snmp
Procedure name: main

EZZ3329I portnumber is not a valid port number
Explanation: Port numbers must be in the range 1 - 65535. The port number specified was not in the range.
System action: osnmp ends.
Operator response: Correct the port number and reissue the command.
System programmer response: None.
Module: snmp
Procedure name: main

EZZ3330I SET request failed. No values changed.
Explanation: A SET request failed. The object on which the failure occurred and the reason for the failure are indicated in the object list displayed prior to this message. If multiple objects were to be changed on the same SET request, no values will be changed if any of the objects are in error. The object list will, however, display the values passed in on the SET request, instead of the resulting values.
System action: osnmp ends.
Operator response: Reissue a valid SET command.
System programmer response: None.
Module: snmp
Procedure name: main

EZZ3332I Only -d option is valid with findname.
Explanation: The user entered an invalid option with function findname. Only the -d option is allowed.
System action: The osnmp command is terminated.
Operator response: Reissue osnmp findname with only the -d (debug) as an allowable option.
System programmer response: None.
Module: snmp
Procedure name: init_args

EZZ3334I Unrecognized valuetype in file filename (Line linenumber)
Explanation: An unrecognized value was encountered while processing the specified configuration file at the indicated line.
System action: The line is ignored, and the osnmp command continues processing.
Operator response: Contact the system programmer.
System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.
Module: ws_confi
Procedure name: win_db_read_config_file

EZZ3335I Valuetype too long in file filename (Line linenumber)
Explanation: An error was encountered processing the specified configuration file at the indicated line. The value for the indicated field is too long.
System action: The line is ignored, and the osnmp command continues processing.
Operator response: Contact the system programmer.
System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.
Module: ws_confi
Procedure name: win_db_read_config_file

EZZ3336I Valuetype too short in file filename (Line linenumber)
Explanation: An error was encountered processing the specified configuration file at the indicated line. The value for the indicated field is too short.
System action: The line is ignored, and the osnmp command continues processing.
Operator response: Contact the system programmer.
System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.
Module: ws_confi
Procedure name: win_db_read_config_file

EZZ3337I Entry in file filename (Line linenumber) should have at least number fields.
Explanation: An entry in the configuration file should have at least as many fields as indicated. Different administrative models require different number of fields.
System action: The line is ignored, and the osnmp command continues processing.
Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.

Module: ws_conf

Procedure name: win_db_read_config_file

EZZ3338I keytype in filename (Line linenumber) has an incorrect length.

Explanation: The indicated key is not the correct length.

System action: The line is ignored, and the osnmp command continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.

Module: ws_conf

Procedure name: win_db_read_config_file

EZZ3339I Error in filename (Line linenumber) - Line too long.

Explanation: While the command processor was reading the command configuration file, it encountered a line that was too long.

System action: The line is ignored, and the osnmp command continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.

Module: ws_conf

Procedure name: win_db_read_config_file

EZZ3340I Error processing filename (Line linenumber).

Explanation: The osnmp command encountered an error while processing the specified line.

System action: The line is ignored, and the osnmp command continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.

Module: ws_conf

Procedure name: win_db_read_config_file

EZZ3341I Line number linenumber in the filename file has a network address or host name which is not valid.

Explanation: The network address at the specified line number is not in dotted decimal notation(www.xxx.xxx.xxx.xxx), or the host name specified is not valid.

System action: The line is ignored, and the osnmp command continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference.

Module: ws_conf

Procedure name: win_db_read_config_file
EZZ3342I • EZZ3344I

EZZ3342I Line number linenumber in the filename file has a port number which is not valid.

Explanation: The port number at the specified line number is not valid.

System action: The line is ignored, and the osnmp command continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Reference

Module: ws_confi

Procedure name: win_db_read_config_file

EZZ3343I Report received: exception counter MIB object

Explanation: A report PDU was received, indicating than an exception condition occurred. The name of the MIB object incremented for this exception is displayed. Reports are typically issued when the configuration at the osnmp command is not consistent with the configuration at the target agent. For example, the user name in the request might not be configured at the agent or the authentication and/or privacy keys might not be valid.

System action: The osnmp command displays error messages and ends.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. For information about configuring the osnmp command, see the z/OS Communications Server: IP Configuration Guide

Module: ws_util

Procedure name: sd_win_display_report

EZZ3344I Cannot send to IPv6 address IP_address on socket socket

Explanation: OSNMP could not open the specified socket with IPv6 support, so it cannot communicate with the IPv6 agent. This is because the TCP/IP stack is not running with IPv6 support.

IP_address is the IP address of the SNMP agent with which the osnmp command is trying to communicate.

socket is the socket descriptor used for communication.

System action: The osnmp command ends.

Operator response: Issue the command again with the -d 4 debug option and contact the system programmer with the resulting debug information.

System programmer response: Ensure that the TCP/IP stack is configured to support IPv6, restart TCP/IP, and issue the osnmp command again. If the problem persists, contact the IBM software support center with the debug information.

Module: S_CO_IP.C

Procedure name: send_snmp_communication_data_to_ip
Chapter 5. EZZ4xxx messages

EZZ4200I  TCP/IP INITIALIZATION COMPLETE FOR jobname
Explanation: Initialization completed successfully for TCP/IP.
jobname is the jobname associated with the procedure used to start TCP/IP.
System action: The TCP/IP initialized.
Operator response: None.
System programmer response: None.
Module: EZBITINI

EZZ4201I  TCP/IP TERMINATION COMPLETE FOR jobname
Explanation: This TCP/IP terminated.
jobname is the jobname associated with the procedure used to start TCP/IP.
System action: The TCP/IP procedure ends.
Operator response: None.
System programmer response: None.
Module: EZBITINI

EZZ4202I  z/OS UNIX - TCP/IP CONNECTION ESTABLISHED FOR jobname
Explanation: This TCP/IP established a connection with z/OS UNIX System Services.
jobname is the jobname associated with the procedure used to start TCP/IP.
System action: The TCP/IP procedure established a connection with z/OS UNIX System Services.
Operator response: None.
System programmer response: None.
Module: EZBTIPFS

EZZ4203I  z/OS UNIX - TCP/IP CONNECTION ERROR FOR jobname-function name,function type,return value,return code,reason code
Explanation: This TCP/IP failed to established a connection with z/OS UNIX System Services.
jobname is the jobname associated with the procedure used to start TCP/IP.
function name is the name of the function that failed while trying to establish the connection with z/OS UNIX System Services. See the z/OS UNIX System Services Programming: Assembler Callable Services Reference for more information about the function that failed and the return value.
function type is the particular type for this function.
return value is the return value from the function attempted. See the z/OS UNIX System Services Programming: Assembler Callable Services Reference for more information about the function that failed and the return value.
return code is the return code from the function attempted. See the z/OS UNIX System Services Messages and Codes for a list of the return codes.
reason code is the reason code from the function attempted. See the z/OS UNIX System Services Messages and Codes for a list of the reason codes.
System action: The TCP/IP failed to initialize.
Operator response: Contact the system programmer.

System programmer response: There are a few customization errors that could cause TCP/IP to not be able to connect with z/OS UNIX System Services. The TCP/IP jobname was not specified correctly and does not match one in the BPXPRMxx member that z/OS UNIX System Services is using. z/OS UNIX System Services was not configured with a CINET definition. The user ID associated with the TCP/IP started procedure does not have the proper z/OS UNIX System Services authorization. Collect any supporting documentation and dumps, if available, and contact the IBM software support.

Module: EZBTIPPS

EZZ4204I  TCP/IP INITIALIZATION FOR *jobname* FAILED.
Explanation: Initialization failed for TCP/IP.

/jobname is the jobname associated with the procedure used to start TCP/IP.

System action: This TCP/IP failed to initialize.

Operator response: This message should be preceded by more specific error messages. Correct the errors indicated by the preceding messages.

System programmer response: This message should be preceded by more specific error messages. Correct the errors indicated by the preceding messages.

Module: EZBITINI

EZZ4205I  *proc* INITIALIZATION UNABLE TO START *jobname* REASON: *reason*.
Explanation: This TCP/IP or Telnet could not be started because one was already started with the same name, the maximum number of eight TCP/IPs or Telnets were already started, or a TCP/IP is already active in an INET configuration.

*proc* is the procedure that could not initialize. It is either TCPIP or Telnet.

*jobname* is the jobname associated with the procedure used to start TCP/IP or Telnet.

*reason* will be one of the following:

TCPIP ALREADY EXISTS
A TCP/IP with this jobname was already started on this system.

TELNET ALREADY EXISTS
TELNET with this jobname was already started on this system.

MAXIMUM OF 8 TCPIPS ALREADY STARTED
The maximum number of TCP/IPs have already been started on this system.

MAXIMUM OF 8 TELNETS ALREADY STARTED
The maximum number of Telnets have already been started on this system.

TCPIP ALREADY ACTIVE IN INET CONFIGURATION
A TCP/IP is already active. Only one TCP/IP can be active in an INET configuration.

System action: This TCP/IP or Telnet failed to initialize.

Operator response: Determine if the correct TCP/IP or Telnet jobname was used to start TCP/IP or Telnet.

System programmer response: Take the action based on the specific failure explanation. The system programmer should either verify unique TCP/IP or Telnet jobnames, verify that eight or less TCP/IPs or Telnets have been started, or verify that common inet is properly coded in BPXPRMxx if a multiple stack environment is desirable.

Module: EZBITINI

EZZ4206I  TCP/IP INITIALIZATION FOR *jobname* UNABLE TO OBTAIN CSM STORAGE. STORAGE TYPE: *type* DATASPACE ECSA RETURN CODE: *return code* REASON CODE: *reason code*
Explanation: TCP/IP initialization failed trying to obtain CSM storage.

/jobname is the jobname associated with the procedure used to start TCP/IP.
type is the storage type and will be one of the following:

**DATASPACE**
TCP/IP failed to obtain CSM dataspace storage.

**ECSA**
TCP/IP failed to obtain CSM ECSA storage.

**return code** is the return code from the IVTCSM REQUEST(CREATE_POOL) macro invocation

**reason code** is the reason code from the IVTCSM REQUEST(CREATE_POOL) macro invocation

**System action:** This TCP/IP will fail to initialize.

**Operator response:** Determine from the return and reason codes from the CSM invocation as to why TCP/IP was unable to obtain the storage. See [z/OS Communications Server: CSM Guide](https://www.ibm.com/support/knowledgecenter/SSWTC7_5.3.0/com.ibm.zos.v53.messages.file_351.doc) for return code documentation.

**System programmer response:** Determine why the storage could not be obtained. Make sure that VTAM was started and is at the appropriate level.

**Module:** EZBITINI

---

**EZ4207I proc** INITIALIZATION FOR **jobname** ENiticTED AN ENVIRONMENT ERROR. (NOT RUNNING AS A STARTED PROCEDURE. | NOT RUNNING IN KEY 6)

**Explanation:** TCP/IP or Telnet initialization failed because it detected it was not running in the correct environment.

**proc** is the procedure that could not initialize. It is either TCPIP or Telnet.

**jobname** is the jobname associated with the procedure used to start TCP/IP or Telnet.

**error** is one of the following:

**NOT RUNNING AS A STARTED PROCEDURE.**
TCP/IP or Telnet detected it was not running as a started procedure.

**NOT RUNNING IN KEY 6**
TCP/IP or Telnet detected it was not running in the correct key.

**System action:** This TCP/IP or Telnet will fail to initialize.

**Operator response:** Response depends on the value of **error**:

**NOT RUNNING AS A STARTED PROCEDURE.**
Only try to run TCP/IP or Telnet as a started procedure.

**NOT RUNNING IN KEY 6**
Make sure that all libraries in the linklist concatenation (including any STEPLIBs or JOBLIBs) are APF-authorized.

**System programmer response:** Response depends on the value of **error**:

**NOT RUNNING AS A STARTED PROCEDURE.**
Only try to run TCP/IP or Telnet as a started procedure.

**NOT RUNNING IN KEY 6**
Make sure that all libraries in the linklist concatenation (including any STEPLIBs or JOBLIBs) are APF-authorized.

**Module:** EZBITINI

---

**EZ4208I BPX1SDD FAILED WITH RETURN CODE: return code, REASON CODE: reason code. THE SNMP SUBAGENT IS NOT AVAILABLE.**

**Explanation:** A call to z/OS UNIX System Services routine BPX1SDD failed with the return and reason code provided. The SNMP subagent cannot be initialized and will not be available.

**return code** is the return code from BPX1SDD.

**reason code** is the reason code from BPX1SDD.

**System action:** This TCP/IP continues.
**EZZ4209I • EZZ4210I**

**Operator response:** Try to determine why BPX1SDD failed from the return code and the reason code provided. This information is found in the [z/OS UNIX System Services Programming: Assembler Callable Services Reference](#) publication.

**System programmer response:** Contact your IBM support center for assistance.

**Module:** EZBITINI

---

**EZZ4209I**  CTRACE OPTION ctrace option IS NOT VALID

**Explanation:** In response to the TRACE CT command one of the options value is not supported by TCP/IP. 

`ctrace option` is the unrecognized CTRACE option.

**System action:** The CTRACE request is terminated with message ITT004I.

**Operator response:** Reissue the TRACE CT command and specify a valid option value. Supported trace options can be found in the [z/OS Communications Server: IP Diagnosis Guide](#)

**Module:** EZBCTSSM

---

**EZZ4210I**  CTRACE DEFINE FAILED FOR parmlib member name, RETURN CODE: return code REASON CODE:
reason code COMPONENT: component_name

**Explanation:** The request to define a component trace for a TCP/IP server failed. The return codes and reason codes are defined in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#)

In the message text:

`parmlib member name`

The default CTRACE Parmlib member name.

`return code`

The return code from the CTRACE DEFINE macro invocation.

See [CTRACE — Define a User Application to the Component Trace Service](#) in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#) for the return code and reason code explanations for the different CTrace functions.

`reason code`

The reason code from the CTRACE DEFINE macro invocation. If the `reason_code` value is 77003004, the virtual storage for the trace buffers was not available.

See [CTRACE — Define a User Application to the Component Trace Service](#) in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#) for the return code and reason code explanations for the different CTrace functions.

`component_name`

The CTRACE component name.

**System action:** For all possible servers, parmlib member names, and components, the system retries with the defaults for the component.

**Operator response:** Contact the system programmer to correct the parmlib member.

**System programmer response:** Correct the parmlib member and restart the server or issue the TRACE CT,ON,COMP=component_name,PARM=parmlib_member command to update the server. Issue the DISPLAY TRACE,COMP=component_name,SUBLEVEL command to display the status of the trace.

**Module:** EZBCCINI, EZBCTINI, EZBRECTI

**Example:**

EZZ4210I  CTRACE DEFINE FAILED FOR CTIEZB00  RETURN CODE: 0000000C  REASON CODE: 00001301

**COMPONENT:** SYSTCPIP
EZZ4211I BLDL FOR MODULE modname FAILED, RETURN CODE: return_code

Explanation: A BLDL macro call to locate a load module failed with the return code provided. TCP/IP cannot complete its initialization.

modname is the name of the load module that the BLDL macro call attempted to locate.

return_code is the return code from the BLDL macro.

System action: TCP/IP ends.

Operator response: Contact the system programmer.

System programmer response: Try to determine why the BLDL failed from the return code provided. This information is found in the z/OS DFSMS Macro Instructions for Data Sets publication. Verify that the load module exists in data set SEZALOAD. You should also verify that SEZALOAD is either in the default MVS link list or that it is explicitly specified as a STEPLIB DD card on the started procedure JCL used to start this TCP/IP instance. If no problems are found, collect any available supporting documentation and dumps, and contact the IBM software support center.

Module: EZBITINI

EZZ4213I COULD NOT OBTAIN CSA STORAGE, RETURN CODE: return_code

Explanation: A STORAGE (OBTAIN) system call for CSA storage failed with the return code provided. TCP/IP cannot complete its initialization.

return_code is the return code from the STORAGE (OBTAIN) macro.

System action: TCP/IP ends.

Operator response: Contact the system programmer.

System programmer response: Try to determine why the STORAGE (OBTAIN) call failed from the return code provided. This information is found in the z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO publication. If the return code indicates that insufficient storage or system resources were available, correct the problem and restart TCP/IP. Otherwise, collect any available supporting documentation and dumps, and contact the IBM software support center.

Module: EZBITINI

EZZ4214I STORAGE RELEASE FOR CSA FAILED, RETURN CODE: return_code

Explanation: An unexpected internal error occurred while trying to free CSA storage. The return code from the STORAGE (RELEASE) system service is provided.

return_code is the return code from the STORAGE (RELEASE) macro.

System action: TCP/IP Continues.

Operator response: Contact the system programmer.

System programmer response: Collect any available supporting documentation and dumps, and contact the IBM software support center.

Module: EZBITINI

EZZ4215I proc ABEND - DUMPING

Explanation: TCP/IP or Telnet recovery was entered, and a dump will be taken.

In the message text:

proc

The procedure that is dumping. The proc value is either TCP/IP or Telnet.

System action: TCP/IP or Telnet continues.

Operator response: Contact the system programmer.
System programmer response: Collect any available supporting documentation and dumps, and contact the IBM software support center.

Module: EZBITDRC

EZZ4216I  proc ABEND, DUMP SUPPRESSED DUE TO A PREVIOUS ERROR
Explanation: TCP/IP recovery was entered, but no dump will be taken due to a previous abend by this work unit.
proc is the procedure whose dump was suppressed. It is either TCP/IP or Telnet.
System action: TCP/IP or Telnet Continues.
Operator response: Contact the system programmer.
System programmer response: Collect any available supporting documentation and dumps, and contact the IBM software support center.
Module: EZBITDRC

EZZ4217I  SYNTAX ERROR IN PARAMETERS SPECIFIED ON PARMS KEYWORD FOR jobname
Explanation: A syntax error was detected on the PARMS= statement in the started task procedure for TCP/IP.
Message EZZ4218I follows this message with an indication of where the syntax error was detected. All parameters after the syntax error are ignored. Parameters prior to the syntax error were processed successfully.
jobname is the jobname associated with the procedure used to start TCP/IP.
System action: TCP/IP continues its initialization process.
Operator response: Correct the parameters in error and restart TCP/IP if necessary.
System programmer response: Correct the parameters in error and restart TCP/IP if necessary.
Module: EZBITINI

EZZ4218I  PARAMETERS BEGINNING WITH param WILL BE IGNORED
Explanation: A syntax error was detected in the parameter specified in the message text. All parameters after the parameter in error are ignored. This is the next message after the message EZZ4217I. Please see EZZ4217I for the further information.
param is the parameter in error in the PARMS= statement of the started task procedure for TCP/IP.
System action: TCP/IP continues its initialization process.
Operator response: Correct the parameters in error and restart TCP/IP if necessary.
System programmer response: Correct the parameters in error and restart TCP/IP if necessary.
Module: EZBITINI

EZZ4219I  ASSEMBLER SERVICE service_name COMPLETED WITH RETURN CODE return_code REASON CODE reason_code
Explanation: The specified system service completed with a nonzero return code. The hexadecimal return and reason code are shown.
service_name is the name of the assembler service.
return_code is the return code of the called service.
reason_code is the reason code of the called service.
System action: TCP/IP continues if possible.
Operator response: Check the system service return and reason code in the z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN. When the problem is resolved, restart TCP/IP if it terminated.
System programmer response: Correct the error as indicated by the z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN. For the service name DSPSERV CREATE and reason code 6C000611, a
SCOPE=COMMON request failed. The IEASYSxx parameter MAXCAD limits the number of SCOPE=COMMON dataspaces available.

Module: EZBCTINI

**EZZ4220I**  
**type** DUPLICATE DUMP SUPPRESSED BY DAE

**Explanation:** TCP/IP recovery was entered and a dump was requested, but the dump was suppressed by the Dump Analysis Elimination (DAE) facility of MVS because the system has SUPPRESS or SUPPRESSALL specified for DAE and the dump symptoms matched a previous dump that was taken.

In the message text:

**type**  
The dump type. The value of **type** is either TCP/IP or Telnet.

**System action:** Processing continues with no dump taken.

**System programmer response:** This error matches the symptoms of a dump that was taken previously. See the [dump suppression chapter](https://www.ibm.com) of *z/OS MVS Diagnosis: Tools and Service Aids* for information about DAE and how to locate the records of the matching dumps.

**User response:** Contact the system programmer

Module: EZBITDRD

**Procedure name:** None.

**EZZ4221I**  
**ARM FUNCTION** function name FAILED FOR jobname, RC=return code, RSN=reason code

**Explanation:** The TCP/IP stack, whose name appears in the message, issued the named Automatic Restart Manager function but the function failed.

**function name** is the name of the ARM function that failed.

**jobname** is the jobname associated with the procedure used to start TCP/IP.

**return code** is the return code from the function attempted.

**reason code** is the reason code from the function attempted.

**System action:** TCP/IP continues.

**Operator response:** Contact the system programmer.

**System programmer response:** The return code and reason code values in the message belong to the MVS Automatic Restart Manager and are documented under the IXCARM macro in the *z/OS MVS Programming: Sysplex Services Reference* manual. Correct the problem indicated by the return and reason codes.

Module: EZBTDIINI

**EZZ4222I**  
**XCF SERVICE** service_name FAILED FOR jobname GROUP groupname, RC=return_code, RSN=reason_code

**Explanation:** The TCP/IP stack, whose name appears in the message, issued the named XCF Communication Macro, but the macro failed.

**service_name** is the name of the XCF Communication Macro that failed.

**jobname** is the jobname associated with the procedure used to start TCP/IP.

**groupname** is the XCF group name specified.

**return_code** is the return code from the XCF Service attempted.

**reason_code** is the reason code from the XCF Service attempted.

**System action:** TCP/IP continues but XCF services will not be available.

**Operator response:** Contact the system programmer.

**System programmer response:** The **return_code** and **reason_code** values in the message belong to MVS XCF Services
and are documented under the corresponding macro in z/OS MVS Programming: Sysplex Services Reference.
TCP/IP Services, which require XCF messaging, will not function. Correct the problem indicated by return code and reason code, and restart the TCP/IP Stack.

Module: main
Procedure name: EZBXFINI

EZZ4223I TCP/IP DUMP NOT TAKEN - SDUMPX RETURN CODE ret REASON CODE rsn

Explanation: Message EZZ4215I was issued by TCP/IP recovery when a dump was scheduled to be taken. However, the SDUMPX macro failed with the specified return and reason codes that indicate that the dump was not taken.

In the message text:

ret
The return code from the SDUMPX macro.

rsn
The reason code from the SDUMPX macro.

See z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU for an explanation of the return code and reason code for the SDUMPX macro.

Note: When ret is 14 and rsn is 0, this indicates a failure to allocate an area of common storage needed to wait for the completion of the dump collection processing. An attempt is still made to collect the dump, but a resultant message EZZ4220I or EZZ4223I will not exist if it fails.

System action: TCP/IP continues processing. No dump is taken.

Operator response: Contact the system programmer.

System programmer response: Use the return code and reason code to determine why the dump was not taken.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: TCP/IP stack

Module: EZBITDRC, EZBFVNR, EZBITDRD

Routing code: 2,8

Descriptor code: 12

Example:
EZZ4215I TCP/IP ABEND - DUMPING
EZZ4223I TCP/IP DUMP NOT TAKEN - SDUMPX RETURN CODE 08 REASON CODE 0C

EZZ4247I FUNCTION function_name FAILED FOR appl_name user_id RC = return_code RSN = reason_code

Explanation: An error occurred during the processing of a TMI connection.

function_name is the name of the function that failed while processing a TMI connection with z/OS z/OS UNIX System Services. See the z/OS UNIX System Services Programming: Assembler Callable Services Reference for more information about the function that failed and the return code. If the function_name is RACROUTE then the return code and reason code are described in z/OS Security Server RACROUTE Macro Reference.

appl_name is the name of associated application server.

user_id is the user ID of the client connected to the application server.

return_code is the z/OS UNIX System Services return code. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.
**System action:** The connection with the application is ended.

**Operator response:** Contact the system programmer.

**System programmer response:** See the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview/index.wss?uid=swg21427118) for an explanation of the return code and reason code.

**Module:** EZBCTTMI

**Procedure name:** SocketError

---

**EZ4248E** \(`\text{jobname}`\) WAITING FOR PAGENT TTLS POLICY

**Explanation:** The initial TCP/IP profile specified TCPCONFIG TTLS. The stack is waiting for the receipt of the Application Transparent Transport Layer Security (AT-TLS) policy statements. Only users with at least READ permission to the SERVAUTH class EZB.INITSTACK.sysname.tcpname resource profile will be able to open sockets before AT-TLS policy is installed.

In the message text:

`\text{jobname}`

The name of the job that is the policy statements.

**System action:** The message will clear and connections will no longer be blocked when the AT-TLS policy statements have been received.

**Operator response:** Verify that Policy Agent is active using the DISPLAY A,L command. If Policy Agent is active, contact the system programmer.

**System programmer response:** Confirm that AT-TLS policy is required on this TCP/IP stack.

If AT-TLS policy is required and Policy Agent is active, verify that valid AT-TLS policy statements are included in the policy definition. AT-TLS policy statements that are not valid are indicated by message EZZ8438I. See [Policy Agent and policy applications](https://www.ibm.com/support/docview/index.wss?uid=swg21427122) in [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview/index.wss?uid=swg21427122) for information about AT-TLS policy statements.

If AT-TLS policy is not required, modify the TCP/IP profile to specify TCPCONFIG NOTTLS. See TCPCONFIG statement in [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview/index.wss?uid=swg21427122) for information about the NOTTLS parameter.

**Module:** EZBTIMDF

**Procedure name:** EZBTPPS

---

**EZ4249I** \(`\text{jobname}`\) INSTALLED TTLS POLICY HAS NO RULES

**Explanation:** The TCP/IP profile specified TCPCONFIG TTLS. Application Transparent Transport Layer Security (AT-TLS) policy that contains no rules was received and installed by the TCP/IP stack.

`\text{jobname}` is the name of the TCP/IP stack that received and installed AT-TLS policy that contains no rules.

**System action:** TCP/IP continues. AT-TLS will not secure any connections.

**Operator response:** Contact the system programmer.

**System programmer response:** Determine whether AT-TLS is required on this TCP/IP stack. If AT-TLS is not required, remove the TCPCONFIG TTLS specification from the TCP/IP profile. If AT-TLS is required, include valid AT-TLS statements in the policy definition. See [AT-TLS Policy Statements](https://www.ibm.com/support/docview/index.wss?uid=swg21427122) in [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview/index.wss?uid=swg21427122) for information about AT-TLS policy definition.

**Module:** EZBTIMDF

**Procedure name:** EZBIPPC, EZBTCEPR

---

**EZ4250I** AT-TLS SERVICES ARE AVAILABLE FOR `tcpname`

**Explanation:** The Application Transparent Transport Layer Security (AT-TLS) policies configured in Policy Agent have been successfully installed for the stack specified by the `tcpname` value.

In the message text:
**tcpname**

The name of the TCP/IP stack for which the AT-TLS services are in effect.

**System action:** TCP/IP processing continues. When a new TCP connection is being established, the stack searches for a matching AT-TLS policy. If no matching policy is found, the connection is established without using AT-TLS services.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Configuration & Initialization

**Module:** ezbtipfs

**Routing code:** 2,8

**Descriptor code:** 12

**Automation:** This message goes to console and syslog. It is issued when message EZZ4248E is deleted and indicates that TCP connections for users without READ permission to the SERVAUTH class EZB.INITSTACK.sysname.tcpname resource profile will no longer be blocked.

**Example:**

EZZ4250I AT-TLS SERVICES ARE AVAILABLE FOR TCPCS1

---

**EZZ4300I** CLAW DEVICE **device_name**: INCORRECT ADAPTER MICROCODE VERSION **version**

**Explanation:** An incorrect version of the microcode was loaded onto the CLAW adapter in the workstation.

**device_name** is the name of the device.

**version** is the version level of the adapter microcode.

**System action:** TCPIP does not start the CLAW device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** Obtain the correct level of the CLAW microcode and restart the CLAW adapter.

Restart the CLAW device.

---

**EZZ4301I** CLAW DEVICE **device_name**: RECEIVED HOST NAME **received_host_name** ADAPTER NAME **received_adapter_name** EXPECTED HOST NAME **expected_host_name** ADAPTER NAME **expected_adapter_name**

**Explanation:** The CLAW device parameters in the TCPIP profile do not match the CLAW adapter configuration parameters.

**device_name** is the name of the device.

**received_host_name** is the host name received from the CLAW device.

**received_adapter_name** is the adapter name received from the CLAW device.

**expected_host_name** is the host name expected from the CLAW device.

**expected_adapter_name** is the adapter name expected from the CLAW device.

**System action:** TCPIP does not start the CLAW device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** Correct the host and adapter name parameters in either the CLAW adapter configuration or the CLAW DEVICE statement in the TCPIP profile. Use the VARY TCPIP command to restart the CLAW device.

---
### EZZ4302I

**CLAW DEVICE** *device_name*: **ADAPTER RECEIVE SIZE OF** *adapter_receive_size* **IS SMALLER THAN** **HOST TRANSMIT SIZE OF** *host_transmit_size*

**Explanation:** The CLAW device parameters in the TCPIP profile do not match the CLAW adapter configuration parameters. The write buffer size on the CLAW DEVICE statement is larger than the CLAW adapter receive buffer size.

*device_name* is the name of the device.

*adapter_receive_size* is the size of data that the CLAW device can receive.

*host_transmit_size* is the size of data that TCP/IP can send to the CLAW device.

**System action:** TCPIP does not start the CLAW device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** Correct the buffer size in either the CLAW adapter configuration or the CLAW DEVICE statement in the TCPIP profile. Use the VARY TCPIP command to restart the CLAW device.

### EZZ4303I

**CLAW DEVICE** *device_name*: **ADAPTER TRANSMIT SIZE OF** *adapter_transmit_size* **IS GREATER THAN HOST RECEIVE SIZE OF** *host_receive_size*

**Explanation:** The CLAW device parameters in the TCPIP profile do not match the CLAW adapter configuration parameters. The read buffer size on the CLAW DEVICE statement is smaller than the CLAW adapter transmit buffer size.

*device_name* is the name of the device.

*adapter_transmit_size* is the size of data that the CLAW device can send.

*host_receive_size* is the size of data that TCP/IP can receive from the CLAW device.

**System action:** TCPIP does not start the CLAW device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** Correct the buffer size in either the CLAW adapter configuration or the CLAW DEVICE statement in the TCPIP profile. Use the VARY TCPIP command to restart the CLAW device.

### EZZ4304I

**LCS DEVICE** *device_name*: **ERROR** *lanstats_error_code* **IN GETTING HOME HARDWARE ADDRESS FOR LINK** *link_name*, **CHECK LINK_NUMBER ON LINK STATEMENT.**

**Explanation:** The LCS device reported that no LAN adapter is physically installed in the slot identified by *link_number* on the TCPIP LINK statement.

*device_name* is the name of the device.

*lanstats_error_code* is the error code as reported on the LCS Lanstats flow.

*link_name* is the name of the link.

**System action:** TCPIP does not initialize the LCS link.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** Verify that the *link_number*, as specified on the LINK statement, matches the slot position in the LCS device. If necessary, correct the *link_number* parameter on the LINK statement, and restart the LCS device. See the LCS device documentation for more information about the *lanstats_error_code*.

### EZZ4305I

**UNABLE TO RECOVER DEVICE** *device_name*

**Explanation:** Recovery attempts for the device were unsuccessful. The original error (which initiated the recovery action) is described in message EZZ4310I. Either message EZZ4306I or EZZ4307I will also accompany this message, describing why recovery attempts were abandoned.

*device_name* is the name of the device.

**System action:** The device is left in the Not Ready state.
EZZ4306I • EZZ4309I

Operator response: Perform the action described for EZZ4310I.
System programmer response: Perform the action described for EZZ4310I.

EZZ4306I  REASON: REACHED UNSUCCESSFUL RETRY THRESHOLD

Explanation: This message accompanies EZZ4305I and EZZ4310I or EZZ4346I and EZZ4338I. Recovery attempts were unsuccessful at returning the device to the Ready state.

System action: The device is left in the Not Ready state.
Operator response: Perform the action described for EZZ4310I or EZZ4338I.
System programmer response: Perform the action described for EZZ4310I or EZZ4338I.

EZZ4307I  REASON: ERROR ENCOUNTERED AFTER REACTIVATION

Explanation: This message accompanies EZZ4305I and EZZ4310I or EZZ4346I and EZZ4338I. Recovery attempts were successful at returning the device to the Ready state, but an error was detected on the device immediately following reactivation.

System action: The device is left in the Not Ready state.
Operator response: Perform the action described for EZZ4310I or EZZ4338I.
System programmer response: Perform the action described for EZZ4310I or EZZ4338I.

EZZ4308I  ERROR: CODE=error_code DURING link_control_function DEVICE device_name. DIAGNOSTIC CODE: internal_diagnostic_code

Explanation: The Link Layer detected an error during activation of the device.

error_code is the status code for the link layer.
link_control_function is the function that is being performed on the device.
device_name is the name of the device.
internal_diagnostic_code is the internal diagnostic code for use by IBM.

System action: TCP/IP deactivates the device.
Operator response: Consult the Data Link Control (DLC) Status Codes chapter in z/OS Communications Server: IP and SNA Codes for a description of the status code for the link layer. If applicable, correct the hardware problem and restart the device. If the last 4 digits if the error code are 3332, then the most likely reason is that one of the devices is offline. If the last 4 digits if the error code are 3016, then the most likely reason is that the TRLE definition for the device is not active.

System programmer response: Perform the action described in z/OS Communications Server: IP and SNA Codes for the indicated status code.

EZZ4309I  ATTEMPTING TO RECOVER DEVICE device_name

Explanation: An error was detected on the device, as reported by message EZZ4310I, and the link layer is attempting to recover the device. If the recovery attempt is successful, either message EZZ4313I or EZZ4314I will accompany this message. If the recovery attempt is unsuccessful, message EZZ4305I will be issued.

device_name is the name of the device.

System action: TCP/IP attempts to recover the device.
Operator response: If accompanied by message EZZ4305I, device recovery was unsuccessful. Perform the action described for EZZ4310I. If accompanied by EZZ4313I or EZZ4314I, recovery of the device was successful, and no further action is necessary. If neither EZZ4305I nor EZZ4313I/EZZ4314I is issued, TCP/IP is awaiting a "ready" indication from the device. (This is typically seen on CTC devices, where the remote TCP/IP image is either down or has not yet issued a START DEV for the CTC connection.)
EZZ4310I  ERROR: CODE=error_code REPORTED ON DEVICE device_name. DIAGNOSTIC CODE: internal_diagnostic_code

Explanation: The Link Layer detected an error during operation of the device. The error was reported asynchronous to execution of any Link Control function.

error_code is the status code for the link layer.

device_name is the name of the device.

internal_diagnostic_code is the internal diagnostic code for use by IBM.

System action: TCP/IP marks the device inactive.

Operator response: VTAM message IST1578I might be issued in conjunction with this message. See the Data Link Control (DLC) status codes in z/OS Communications Server: IP and SNA Codes for a description of the status code for the link layer. If applicable, correct the hardware problem and restart the device.

System programmer response: Perform the action described in z/OS Communications Server: IP and SNA Codes for the indicated status code.

EZZ4311I  LINK link_name HAS FAILED ON DEVICE device_name

Explanation: TCPIP received a STOP LAN signal from the LAN adapter indicating that this link is not available. This can occur if a cable becomes unplugged.

link_name is the name of the link.

device_name is the name of the device.

System action: TCPIP attempts to reactivate the link.

Operator response: Check the LAN adapter for this link and ensure that all cables are properly connected. If necessary, stop and restart the device.

System programmer response: None.

EZZ4312I  LCS DEVICE device_name: ERROR start_lan_return_code IN STARTING LAN ADAPTER FOR LINK link_name

Explanation: The LAN adapter was not successfully started. Possible reasons are:

• There is an error on the LINK statement in the TCPIP profile.
• The LAN adapter is not connected to a live LAN.

device_name is the name of the device.

start_lan_return_code is the return code on LCS Start LAN.

link_name is the name of the link.

System action: TCPIP does not initialize the LCS link.

Operator response: Inform the system programmer about the error.

System programmer response:

• Verify that the link_number on the LINK statement matches the slot position in the LCS device. If necessary, correct the link_number parameter on the LINK statement, and restart the LCS device.
• Verify that the LAN adapter is connected to a live LAN.

See the documentation for your LCS device for more information about the start_lan_return_code.
EZZ4313I  INITIALIZATION COMPLETE FOR DEVICE device_name
Explanation: TCPIP successfully started the device.
device_name is the name of the device.
System action: The device is ready for use with TCPIP.
Operator response: None.
System programmer response: None.

EZZ4314I  INITIALIZATION COMPLETE FOR DEVICE device_name, LINK link_name
Explanation: TCPIP successfully started the specified link for the specified device.
device_name is the name of the device.
link_name is the name of the link.
System action: The link is ready for use with TCPIP.
Operator response: None.
System programmer response: None.

EZZ4315I  DEACTIVATION COMPLETE FOR DEVICE device_name
Explanation: TCPIP deactivated the device.
device_name is the name of the device.
System action: The device and its links are no longer available for use with TCPIP.
Operator response: If the device is needed by TCPIP, use the VARY TCPIP command to restart the device.
System programmer response: None.

EZZ4316I  NO HOME IP ADDRESS DEFINED FOR CDLC DEVICE device_name
Explanation: TCPIP cannot setup the CDLC link because there is no local IP address defined for the CDLC link.
device_name is the name of the device.
System action: TCPIP deactivates the CDLC device.
Operator response: Inform the system programmer about the error.
System programmer response: Correct the TCPIP profile to specify a home entry for the CDLC link. Use the VARY TCPIP command to update the home list and restart the CDLC device.

EZZ4317I  INITIALIZATION COMPLETE FOR PVC pvc_name FOR DEVICE device_name
Explanation: TCPIP successfully activated the specified PVC for the specified device.
pvc_name is the name of the permanent virtual circuit.
device_name is the name of the device.
System action: The PVC connection is ready for use with TCPIP.
Operator response: None.
System programmer response: None.

EZZ4318I  DEACTIVATION COMPLETE FOR PVC pvc_name FOR DEVICE device_name
Explanation: TCPIP successfully deactivated the specified PVC for the specified device in response to a DELETE ATMPVC statement.
pvc_name is the name of the permanent virtual circuit.
**System action:** The PVC is no longer available for use with TCPIP.

**Operator response:** None.

**System programmer response:** None.

---

**EZZ4319I**

**ERROR:** CODE=error_code DURING link_control_function PVC pvc_name FOR DEVICE device_name.

**DIAGNOSTIC CODE:** internal_diagnostic_code

**Explanation:** The Link Layer detected an error during activation of the PVC.

- **error_code** is the status code for the link layer.
- **link_control_function** is the function that is being performed on the PVC.
- **pvc_name** is the name of the PVC.
- **device_name** is the name of the device.

**System action:** TCP/IP does not activate the PVC.

**Operator response:** Consult the Data Link Control (DLC) Status Codes chapter in [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/servers/z/os/mainframe/library) for a description of the status code for the link layer. If applicable, correct the hardware problem and restart the ATM device to activate the PVC.

**System programmer response:** Perform the action described in [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/servers/z/os/mainframe/library) for the indicated status code.

---

**EZZ4320I**

**ERROR:** CODE=error_code DURING link_control_function SVC CONNECTION TO ip_address FOR DEVICE device_name.

**DIAGNOSTIC CODE:** internal_diagnostic_code

**Explanation:** The Link Layer detected an error during activation of the SVC for an ATM device.

- **error_code** is the status code for the link layer.
- **link_control_function** is the function that is being performed on the SVC.
- **ip_address** is the destination IP address.
- **device_name** is the name of the device.

**System action:** TCP/IP does not activate the SVC.

**Operator response:** If the diagnostic code is a value other than 4, then consult the Data Link Control (DLC) Status Codes chapter in [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/servers/z/os/mainframe/library) for a description of the status code for the link layer. If applicable, correct the hardware problem and restart the ATM device. If the diagnostic code is 4, then the first byte of the error code is a Coding Standard, the third byte of the error code is a Cause Location, and the fourth byte of the error code is a hexadecimal Cause Code. Consult the ATM Network-Generated Cause and Diagnostic Codes chapter in [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/servers/z/os/mainframe/library) for a description of these codes. If applicable, correct the hardware problem and restart the ATM device.

**System programmer response:** Perform the action described in [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/servers/z/os/mainframe/library) for the indicated status code.

---

**EZZ4321I**

**ERROR:** CODE=error_code DURING link_control_function CONNECTION TO ip_address FOR DEVICE device_name.

**DIAGNOSTIC CODE:** internal_diagnostic_code

**Explanation:** The Link Layer detected an error during activation of a VC for an MPCPTP device.

- **error_code** is the status code for the link layer.
- **link_control_function** is the function that is being performed on the VC.
- **ip_address** is the destination IP address.

**System programer response:** None.
device_name is the name of the device.

internal_diagnostic_code is the internal diagnostic code for use by IBM.

System action: TCP/IP does not activate the VC.

Operator response: Consult the Data Link Control (DLC) Status Codes chapter in z/OS Communications Server: IP and SNA Codes for a description of the status code for the link layer. If applicable, correct the hardware problem and restart the MPCPTP device.

System programmer response: Perform the action described in z/OS Communications Server: IP and SNA Codes for the indicated status code.

EZZ4322I  CONNECTION CLEARED FOR PVC pvc_name, DEVICE device_name, CODE= cause_code, ATTEMPTING TO RECOVER

Explanation: TCPIP been notified that the specified PVC connection for the specified device is no longer active.

pvc_name is the name of the permanent virtual circuit.

device_name is the name of the device.

cause_code is the Clear Cause Code.

System action: TCPIP will attempt to recover the PVC connection.

Operator response: None.

System programmer response: None.

EZZ4323I  CONNECTION TO ip_address CLEARED FOR DEVICE device_name

Explanation: TCPIP been notified that the MPCPTP connection to the specified IP address for the specified device is no longer active.

ip_address is the destination IP address.

device_name is the name of the device.

System action: The specified connection is no longer available for use with TCPIP.

Operator response: None.

System programmer response: None.

EZZ4324I  CONNECTION TO ip_address ACTIVE FOR DEVICE device_name

Explanation: The MPCPTP connection to the specified IP address for the specified device is now active.

ip_address is the destination IP address.

device_name is the name of the device.

System action: The specified connection is now available for use with TCPIP.

Operator response: None.

System programmer response: None.

EZZ4325I  PVC CONNECTION CLEARED - pvc_name FOR DEVICE device_name HAS DUPLICATE IP ADDRESS ip_address

Explanation: TCPIP cleared a PVC connection having a duplicate IP address.

pvc_name is the name of the permanent virtual circuit.

device_name is the name of the device.

ip_address is the destination IP address.

System action: The PVC connection has been cleared.
Operator response: Inform the system programmer about the error.

System programmer response: Correct the duplicate IP address.

---

**EZZ4326I**  
**ERROR**  
**start_lan_error_code**  
**STARTING LAN ADAPTER FOR DEVICE**  
**device_name**  

**Explanation:** The adapter reported an error during activation of the MPCIPA device.

- **start_lan_error_code** is the error code reported by the adapter.
- **device_name** is the name of the device.

**System action:** TCP/IP does not start the MPCIPA device. If the return code is X'E080', then TCP/IP delays device activation until the LAN comes online. Otherwise, TCP/IP deactivates the MPCIPA device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** See [OSA Reject Codes and Internal Errors in zEnterprise System and System z10](https://www.ibm.com) and [OSA-Express Customer’s Guide and Reference](https://www.ibm.com) for information about the OSA Reject Codes and a description of the error. Ensure that the OSA configuration is correct. If necessary, correct the OSA configuration and restart the device.

---

**EZZ4327I**  
**ERROR**  
**setip_error_code**  
**REGISTERING IP ADDRESS**  
**ip_address**  
**FOR DEVICE**  
**device_name**  

**Explanation:** The adapter reported an error attempting to register an IP address with the device.

- **setip_error_code** is the error code reported by the adapter.
- **ip_address** is the IP address.
- **device_name** is the name of the device.

**System action:** If this is the home IP address for this MPCIPA device, then TCP/IP does not start the MPCIPA device.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** See [OSA Reject Codes and Internal Errors in zEnterprise System and System z10](https://www.ibm.com) and [OSA-Express Customer’s Guide and Reference](https://www.ibm.com) for information about the OSA Reject Codes and a description of the error. If the error indicates that the IP address is already in use, then change one of your IP addresses so that all IP addresses are unique and restart the device.

---

**EZZ4328I**  
**ERROR**  
**setrouting_error_code**  
**SETTING ROUTING FOR DEVICE**  
**device_name**  

**Explanation:** The adapter reported an error attempting to register this TCP/IP instance as the primary or secondary router for this MPCIPA device. The most likely reason is that the routing attribute (PRIROUTER) specified in the TCPIP profile has already been registered for this device by another TCP/IP instance.

- **setrouting_error_code** is the error code reported by the adapter.
- **device_name** is the name of the device.

**System action:** TCP/IP starts the device, but with the NONROUTER attribute.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** See [OSA Reject Codes and Internal Errors in zEnterprise System and System z10](https://www.ibm.com) and [OSA-Express Customer’s Guide and Reference](https://www.ibm.com) for information about the OSA Reject Codes and a description of the error. If the error indicates that another TCP/IP instance has already registered for this routing attribute, then check the TCPIP profiles and ensure that only one TCP/IP instance using this device is defined as PRIROUTER. Correct the TCPIP profiles and restart the device.

---

**EZZ4330E**  
**TCP/IP DEVICE START(S) WAITING FOR VTAM**

**Explanation:** TCP/IP cannot process Start Device commands until VTAM initialization completes.

**System action:** TCP/IP queues all Start Device commands and will process them when VTAM initialization completes.

**Operator response:** Start VTAM.
ERROR ESTABLISHING PACKED CLAW CONTROL LINK FOR DEVICE *dev_name* –
ATTEMPTING TO ACTIVATE IN UNPACKED MODE

**Explanation:** The RESPONSE or CONFIRM signal from the device indicated the device does not support CLAW Packing.

*dev_name* is the name of the device.

**System action:** TCP/IP invokes CLAW connection establishment in UNPACKED mode.

**Operator response:** Inform the system programmer about this message.

**System programmer response:** If the device does support CLAW Packing, review and correct the CLAW configuration statements in the device. If the device does not support CLAW Packing, remove the PACKED keyword from the z/OS CLAW Device Statement.

**Procedure name:** main

ERROR *errorcode* DURING PACKED CLAW SIGNALLING FOR DEVICE *dev_name* –
DEACTIVATING THE DEVICE

**Explanation:** The RESPONSE or CONFIRM signal from the device indicated an unrecoverable error during packed CLAW signalling. The device is deactivated.

*errorcode* is the error code reported on the Packed CLAW control flow.

*dev_name* is the name of the device.

**System action:** TCP/IP returns the device to the INACTIVE state.

**Operator response:** Inform the system programmer about this message and the error code received.

**System programmer response:** For error code hex B4, verify that the device is configured with a CLAW MTU of 4092. For device error codes other than hex B4, contact the vendor that supplied the CLAW device.

**Procedure name:** main

ERROR INSTALLING REPLACEABLE STATIC ROUTE TO *dest* USING *gateway* MASK *mask* –
REASON *reason* TABLE *table*

**Explanation:** Because all dynamic routes to the destination were removed, the IP layer attempted to add a replaceable static route to the specified route table. The add failed for the reason given.

In the message text:

*dest*  
The IP address of the route destination.

*gateway*  
The IP address of the route gateway, 0.0.0.0 if directly connected.

*mask*  
The subnet mask of the destination.

*reason*  
The reason the add failed and is one of the following:

2  
The interface that the route uses is not valid.

3  
The route was defined incorrectly.

*table*  
The name of the route table into which the route was being added. Possible values are:

- EZBMAIN (for the main route table)
- The name of a policy-based route table

**System action:** The failing route is not added to the TCP/IP route table, and processing continues. Other defined replaceable static routes might be added to the TCP/IP route table. The definition of the failed replaceable static route is retained and TCP/IP might attempt to add it again, if there are no other ways to reach the destination.
Operator response: Contact the system programmer.

System programmer response: Response depends on reason code:

2 Verify the interface name used on the ROUTE statement of the replaceable static route.

3 Correct invalid syntax on the ROUTE statement of the replaceable static route.

User response: Not applicable.

Problem determination: Not applicable

Source: z/OS Communications Server TCP/IP

Module: IPV4RTE

Routing code: 2

Descriptor code: 12

Example:
EZZ4333I ERROR INSTALLING REPLACEABLE STATIC ROUTE TO 9.1.1.2 USING 9.1.1.1
   MASK 255.255.255.0 - REASON 2 TABLE EZBMAIN

EZZ4334I ERROR SETTING VLAN USER PRIORITY FOR DEVICE devicename

Explanation: An OSA-Express error occurred while setting the VLAN user priority for the device.

System action: The device remains active but VLAN user priorities are not used.

Operator response: Inform the system programmer about the error.

System programmer response: Contact OSA Express service support

Module: ProcessIpaV1ControlPacket

Procedure name: EZBIFIND

EZZ4335I SETTING VLAN USER PRIORITY NOT SUPPORTED FOR DEVICE devicename

Explanation: Cannot set the VLAN user priority for this device. The OSA-Express device does not have the correct microcode level.

System action: The device remains active but VLAN user priorities are not used.

Operator response: Inform the system programmer about the error.

System programmer response: Contact OSA-Express support

Module: EZBIFSVL

Procedure name: EZBIFIND

EZZ4336I ERROR DURING link_control_function INTERFACE interface_name - CODE error_code DIAGNOSTIC CODE internal_diagnostic_code

Explanation: The Link Layer detected an error during activation of the interface.

link_control_function is the function that is being performed on the interface.

interface_name is the name of the interface.

error_code is the Data Link Control (DLC) status code for the link layer.

internal_diagnostic_code is an internal diagnostic code for use by IBM.

System action: TCP/IP deactivates the interface.

Operator response: If the last 4 digits of the error code are X'3016', the most likely reason for the error is that the TRLE definition for the interface is not active. In this case, activate the TRLE and restart the interface. Otherwise, inform the system programmer about the error.

System programmer response: See the z/OS Communications Server: IP and SNA Codes for information about
Data Link Control (DLC) status codes for the link layer and perform the action described for the indicated status code. If applicable, correct the hardware problem and restart the interface.

**Module:** TCPIP  
**Procedure name:** EZBIFIUT

---

**EZ4337I • EZ4339I**

Data Link Control (DLC) status codes for the link layer and perform the action described for the indicated status code. If applicable, correct the hardware problem and restart the interface.

**Module:** TCPIP  
**Procedure name:** EZBIFIUT

---

**EZ4337I • ATTEMPTING TO RECOVER INTERFACE interface_name**

**Explanation:** An error was detected on the interface, as reported by message EZ4338I, and the link layer is attempting to recover the interface. If the recovery attempt is successful, message EZ4340I will accompany this message. If the recovery attempt is unsuccessful, message EZ4346I will be issued.

*interface_name* is the name of the interface.

**System action:** TCP/IP attempts to recover the interface.

**Operator response:** If accompanied by message EZ4346I, interface recovery was unsuccessful. Perform the action described for EZ4338I. If accompanied by EZ4340I, recovery of the interface was successful, and no further action is necessary.

**System programmer response:** None.

**Module:** TCPIP  
**Procedure name:** EZBIFIUT

---

**EZ4338I • ERROR REPORTED ON INTERFACE interface_name • CODE error_code • DIAGNOSTIC CODE internal_diagnostic_code**

**Explanation:** The Link Layer detected an error during the operation of the interface. The error was reported asynchronous to execution of any Link Control function.

*interface_name* is the name of the interface.

*error_code* is the Data Link Control (DLC) status code for the link layer.

*internal_diagnostic_code* is an internal diagnostic code for use by IBM.

**System action:** TCP/IP marks the interface inactive.

**Operator response:** Inform the system programmer about the error.

VTAM message IST1578I might be issued in conjunction with this message.

**System programmer response:** See the [z/OS Communications Server: IP and SNA Codes](https://publib.boulder.ibm.com/infocenter/comserver/v2r1/index.jsp?topic=/com.ibm.zos.doc/ippmsg.htm) for information about Data Link Control (DLC) status codes for the link layer and perform the action described for the indicated status code. If applicable, correct the hardware problem and restart the interface.

**Module:** TCPIP  
**Procedure name:** EZBIFIUT

---

**EZ4339I • INTERFACE interface_name FAILED - ADAPTER SIGNAL RECEIVED**

**Explanation:** TCP/IP received a STOP LAN signal from the LAN adapter indicating that this interface is not available. One reason for this message is that a cable became unplugged.

*interface_name* is the name of the interface.

**System action:** TCP/IP attempts to restart the LAN adapter.

**Operator response:** Check the LAN adapter for this link and ensure that all cables are properly connected. If necessary, stop and restart the interface.

**System programmer response:** None.

**Module:** TCPIP  
**Procedure name:** EZBIFIND

*z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)*
EZZ4340I  INITIALIZATION COMPLETE FOR INTERFACE  interface_name
Explanation:  TCPIP successfully started the interface.
interface_name is the name of the interface.
System action:  The interface is ready for use with TCPIP.
Operator response:  None.
System programmer response:  None.
Module:  TCPIP
Procedure name:  EZBIFIND

EZZ4341I  DEACTIVATION COMPLETE FOR INTERFACE  interface_name
Explanation:  TCPIP deactivated the interface.
interface_name is the name of the interface.
System action:  The interface is no longer available for use with TCPIP.
Operator response:  If the interface is needed by TCPIP, use the VARY TCPIP command to restart the interface.
System programmer response:  None.
Module:  TCPIP
Procedure name:  EZBIFIUT

EZZ4342I  ERROR  start_lan_error_code  STARTING LAN ADAPTER FOR INTERFACE  interface_name
Explanation:  The adapter reported an error during activation of the interface.
start_lan_error_code is the error code reported by the adapter.
interface_name is the name of the interface.
System action:  If the error code is X'EO80', TCP/IP delays interface activation until the LAN comes online. Otherwise, TCP/IP deactivates the interface.
Operator response:  Inform the system programmer about the error.
System programmer response:  See OSA Reject Codes and Internal Errors in zEnterprise System and System z10 OSA-Express Customer's Guide and Reference for information about the OSA Reject Codes and a description of the error. Ensure that the OSA configuration is correct. If necessary, correct the OSA configuration and restart the interface.

Procedure name:  EZBIFIND

EZZ4343I  ERROR  setip_error_code  REGISTERING IP ADDRESS  ip_address  FOR INTERFACE  interface_name
Explanation:  The adapter reported an error while attempting to register an IP address with the interface.
setip_error_code is the error code reported by the adapter.
ip_address is the IP address.
interface_name is the name of the interface.
System action:  If this is the link local IP address for this interface, TCP/IP deactivates the interface. Otherwise, TCP/IP leaves the interface active.
Operator response:  Inform the system programmer about the error.
System programmer response:  See OSA Reject Codes and Internal Errors in zEnterprise System and System z10 OSA-Express Customer's Guide and Reference for information about the OSA Reject Codes and a description of the error.
error. If the error indicates that the IP address is already in use, ensure that your IP addresses are unique and restart the interface.

Module: TCPIP
Procedure name: EZBIFIND

---

**EZZ4344I**  ERROR  setrouting_error_code  SETTING ROUTING FOR INTERFACE interface_name

**Explanation:** The adapter reported an error while attempting to register this TCP/IP instance as the primary or secondary router for this interface. The most likely reason for the error is that the routing attribute (PRIROUTER or SECROUTER) specified in the TCPIP profile has already been registered for this interface by another TCP/IP instance.

setrouting_error_code is the error code reported by the adapter.

interface_name is the name of the interface.

**System action:** TCP/IP starts the interface, but with the NONROUTER attribute.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** See OSA Reject Codes and Internal Errors in zEnterprise System and System z10 OSA-Express Customer's Guide and Reference for information about the OSA Reject Codes and a description of the error. If the error indicates that another TCP/IP instance has already registered for this routing attribute, check the TCPIP profiles and ensure that only one TCP/IP instance using this interface is defined as PRIROUTER and only one TCP/IP instance is defined as SECROUTER. Correct the TCPIP profiles and restart the interface.

Module: TCPIP
Procedure name: EZBIFIND

---

**EZZ4345I**  INTERFACE takeover_interface_name  HAS TAKEN OVER ND RESPONSIBILITY FOR INACTIVE INTERFACE inactive_interface_name

**Explanation:** An interface became inactive and TCP/IP detected another active interface on the same physical network that can take over Neighbor Discovery (ND) responsibility for the inactive interface.

takeover_interface_name is the name of the interface that took over the ND responsibility.

inactive_interface_name is the name of the inactive interface.

**System action:** TCP/IP assigns ND responsibility for the inactive interface to the takeover interface. TCP/IP sends a gratuitous neighbor advertisement for the IP address of the inactive interface and uses the takeover interface to reply to neighbor solicitation requests on behalf of the inactive interface. If the inactive interface becomes active again, TCP/IP will reassign the ND responsibility to that interface.

**Operator response:** None.

**System programmer response:** None.

Module: TCPIP
Procedure name: EZBIFIND

---

**EZZ4346I**  UNABLE TO RECOVER INTERFACE interface_name

**Explanation:** Recovery attempts for the interface were unsuccessful. The original error, which initiated the recovery action, is described in message EZZ4338I. Either message EZZ4306I or EZZ4307I will also accompany this message, describing why recovery attempts were abandoned.

interface_name is the name of the interface.

**System action:** The interface remains inactive.

**Operator response:** Perform the action described for EZZ4338I.

**System programmer response:** Perform the action described for EZZ4338I.

Module: TCPIP
Procedure name: EZBIFIUT

EZ4347I INTERFACE interface_name DOES NOT SUPPORT IPV6

Explanation: TCPIP cannot activate this interface because the adapter does not support IPv6.

interface_name is the name of the interface.

System action: The interface remains inactive.

Operator response: Contact system programmer.

System programmer response: Perform one of the following actions:

- For an IPAQENET6 interface, ensure that the adapter that corresponds to this INTERFACE definition supports IPv6, and restart the interface.
- For an MPCPTP6 interface, ensure that the remote node is configured for IPv6 support, and restart the interface.
- Change the TCPIP profile to remove the INTERFACE definition.

Module: TCPIP

Procedure name: EZBIFIND

EZ4348I ERROR INSTALLING REPLACEABLE STATIC ROUTE TO dest/prefix_len USING gateway - REASON reason TABLE table

Explanation: Because all dynamic routes to the destination were removed, the IP layer attempted to add a saved replaceable static route to the specified routing table. The add failed for the reason given.

In the message text:

- dest/prefix_len: The IP address and prefix length of the route destination.
- gateway: The IP address of the route gateway. The gateway value is two colons (:) if it is directly connected.
- reason: The reason the add failed; this value is one of the following:
  - 2: The interface that the route uses is not valid.
  - 3: The route was defined incorrectly.
- table: The name of the routing table into which the route was being added. table is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: The failing route is not added to the TCP/IP route table, and processing continues. Other defined replaceable static routes might be added to the TCP/IP route table. The definition of the failed replaceable static route is retained and TCP/IP might attempt to add it again, if there are no other ways to reach the destination.

Operator response: Contact the system programmer.

System programmer response: Response depends on reason code:

- 2: Verify the interface name used on the ROUTE statement of the replaceable static route.
- 3: Correct invalid syntax on the ROUTE statement of the replaceable static route.

User response: Not applicable.

Problem determination: Not applicable.

Example:
EZZ4348I ERROR INSTALLING REPLACEABLE STATIC ROUTE TO 2001:DB8:10::87:1/128
USING 2001:DB8:10::11:1:2 - REASON 2 TABLE EZBMAIN

EZZ4349I LINK linkname IS NOT BROADCAST CAPABLE

Explanation: A link for an MPCIPA device has been activated with the IPBCAST parameter, indicating broadcast capability was requested. However, the device is not broadcast capable.

linkname is the name of the link that is not broadcast capable.

System action: TCP/IP allows the link to activate, but broadcast support for this link will be set to no. No broadcast packets can be sent or received over this link.

Operator response: None.

System programmer response: Install the latest level of OSA-Express microcode and restart the interface.

Module: EZBIFIND

Procedure name: *

EZZ4350I AN EXCESSIVE NUMBER OF HALF-OPEN CONNECTIONS ARE QUEUED FOR LISTENING PORT: listen port

Explanation: An excessive number of half-open connections have been queued for the specified listening port. Many half-open connections are created when connection requests are received from a remote host but that remote host does not acknowledge the connection acknowledgments sent by TCPIP in a timely fashion. It is possible that this condition is caused by a denial of service attack on that port.

listen port is the Listening Port Number.

System action: TCP/IP will automatically implement a connection acceptance algorithm to minimize the impact of these incomplete connection requests.

Operator response: Contact the system programmer.

System programmer response: Contact your security administrator about this possible denial of service attack.

Module: EZBTCRDE

EZZ4360I jobname ECSA CONSTRAINED

Explanation: This message is issued when ECSA storage usage is at or higher than 80% of the ECSALIMIT parameter on the GLOBALCONFIG statement. TCP/IP removes the message when storage usage drops below 75% of the ECSALIMIT.

jobname is the jobname associated with the procedure used to start TCP/IP.

System action: Processing continues. Subsequent storage requests might fail.

Operator response: Issue DISPLAY TCPIP,STOR command to determine current storage usage and limits. Save the system log and request a dump for problem determination. See the z/OS Communications Server: IP Diagnosis Guide for more information.

System programmer response: Verify that the ECSALIMIT value is correct. If necessary, increase the limit on GLOBALCONFIG with a VARY TCPIP,OBEYFILE command.

Module: TCPIP

Procedure name: EZBITSCU

EZZ4361I jobname ECSA CRITICAL

Explanation: This message is issued when ECSA storage usage is at or higher than 90% of the ECSALIMIT parameter on the GLOBALCONFIG statement. TCP/IP removes the message when storage usage drops below 85% of the ECSALIMIT.

jobname is the jobname associated with the procedure used to start TCP/IP.
EZZ4362I • EZZ4364I

**System action:** Processing continues. Subsequent storage requests might fail.

**Operator response:** Issue **DISPLAY TCPIP,STOR** command to determine current storage usage and limits. Save the system log and request a dump for problem determination. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.2.0/com.ibm.zos.v2r2.iseries.doc.mgmt.cpc.932/html/diag/tcpipziseries.htm) for more information.

**System programmer response:** Verify that the ECSALIMIT value is correct. If necessary, increase the limit on GLOBALCONFIG with a **VARY TCPIP,OBEYFILE** command.

**Module:** TCPIP

**Procedure name:** EZBITSCU

---

**EZZ4362I**  
**jobname** ECSA EXHAUSTED

**Explanation:** This message is issued when an ECSA storage allocation fails, or the ECSA storage usage reaches 98% of the ECSALIMIT parameter on the GLOBALCONFIG statement.

**jobname** is the jobname associated with the procedure used to start TCP/IP.

**System action:** Processing continues. Subsequent storage requests might fail.

**Operator response:** Issue **DISPLAY TCPIP,STOR** command to determine current storage usage and limits. Save the system log and request a dump for problem determination. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.2.0/com.ibm.zos.v2r2.iseries.doc.mgmt.cpc.932/html/diag/tcpipziseries.htm) for more information.

**System programmer response:** Verify that the ECSALIMIT value is correct. If necessary, increase the limit on GLOBALCONFIG with a **VARY TCPIP,OBEYFILE** command. If system ECSA is too small, update system parmlib member IEASY9xx. See the [z/OS MVS Initialization and Tuning Reference](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.2.0/com.ibm.zos.v2r2.iseries.doc.sysinit.932/html/sysinit/zh028.html) for information about the CSA parameter.

Chapter 6. EZZ6xxx messages

**EZZ6001I**  jobname SERVER STARTED

**Explanation:** Basic Telnet infrastructure has successfully started. After this point, the specified profile can be processed.

In the message text:

*jobname*

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the *jobname* value TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

**System action:** Processing continues.

**System programmer response:** None.

**User response:** None

**Module:** EZBTNINI

**Procedure name:** Start_SubComponents

---

**EZZ6002I**  jobname STORAGE FAILURE FOR - *text*

**Explanation:** The Telnet Server attempted to allocate the indicated required storage but none is available.

*jobname* is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the *jobname* value TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

*text* is one of the following:

**MASTER CONTROL BLOCK, RSN = n**

The Telnet Server attempted to obtain storage for its main control block but none is available.

**CLIENT CONNECTION BLOCK, RSN = n**

The Telnet Server attempted to obtain storage for a Client Connection Block but none is available.

**CONN DROP PROCESS, RSN = n**

The Telnet Server attempted to drop a connection but could not obtain the storage necessary to complete the drop process. Stopping the port might clean up the connections. Use the VARY TCPIP,OBEYFILE command to restart the port.

**TCPIP TOKEN SERVICES, RSN = n**

The Telnet Server attempted to obtain storage for the client connection token services but none is available.

**System action:** Telnet Server does not start or the connection request fails.

**Operator response:** Contact the system programmer to diagnose this error.

**System programmer response:** If this error continues to occur after confirming that there is enough storage in your system, contact your IBM software support center.

**Module:** EZAZMTNS

**Procedure name:** TCP/IP

© Copyright IBM Corp. 2000, 2014
EZZ603I  jobname text
Explanation: The Telnet Server is currently in the indicated state for this port.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the
procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1.
If you start the TN3270 server, the jobname value is TN3270.

text is one of the following:

LISTENING ON PORT n
Telnet Server initialization is complete for the indicated port and is listening on that port.

QUIESCED ON PORT n
Telnet Server quiesced for the indicated port.
Existing connections continue to support traffic. To resume new connection acceptance, issue
VARY TCPIP,,TELNET,RESUME,PORT=n

RESUMED ON PORT n
Telnet Server resumed for the indicated port.

System action: If the port was quiesced automatically because of an accept failure, the server will automatically
attempt to resume the port periodically.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: TCP/IP

EZZ605I  jobname text,rsn = rsncode
Explanation: The Telnet Configuration task, SSL task, or SNMP Subagent task failed to set up correctly.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the
procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1.
If you start the TN3270 server, the jobname value is TN3270.

text is one of the following:

TELNET SNMP SUBAGENT TASK ATTACH FAILED
The Telnet Server attempted to create its SNMP subagent task but the MVS ATTACH service failed.

TELNET SNMP SUBAGENT TASK FAILED TO INITIALIZE
The Telnet Server SNMP Subagent task failed to initialize.

TELNET SNMP SUBAGENT TASK RESTART ATTEMPTED
The Telnet Server SNMP Subagent task failed and is attempting to restart.

TELNET SNMP SUBAGENT TASK TERMINATED
The Telnet Server SNMP Subagent task terminated.

TELNET COMMAND TASK ATTACH FAILED
The Telnet Server attempted to create its command control task, but the MVS ATTACH service failed.

TELNET COMMAND TASK FAILED TO INITIALIZE
The Telnet Server Command Control task failed to initialize.

TELNET COMMAND TASK RESTART ATTEMPTED
The Telnet Server Command Control task failed and is attempting to restart.

TELNET COMMAND TASK TERMINATED
The Telnet Server Command Control task terminated unexpectedly during Telnet initialization.

TELNET SSL TASK ATTACH FAILED
The Telnet Server attempted to create its SSL task, but the MVS ATTACH service failed.
TELNET SSL TASK WAS SUCCESSFULLY REATTACHED
The Telnet Server SSL task was successfully reattached.

TELNET SSL TASK RESTART ATTEMPTED
The Telnet Server SSL task failed and is attempting to restart.

TELNET SSL TASK TERMINATED
The Telnet Server SSL task terminated 3 times in 10 minutes. No new SSL connections can initialize.

rsncode
The return code from MVS ATTACHX process if the attach of the task failed. Otherwise, the reason value is one of the values documented in the description of message EZZ6035I.

System action: Telnet Server profile and command processing might not be available, SSL connections might fail to initialize, or SNMP management data might not be available.

Operator response: Contact the system programmer to diagnose this error.

System programmer response: If unable to determine the cause of the task failure, contact the IBM software support center.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Telnet

Module: EZAZMTNS

Routing code: 2,8

Descriptor code: 4

Example:
EZZ6005I jobname SNMP SUBAGENT TASK TERMINATED, RSN = 0

This message will be displayed when the SNMP subagent is disabled in the profile.

EZZ6006I jobname CANNOT LISTEN ON PORT n, text

Explanation: The Telnet Server attempted to listen on a port but is unable to do so.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

text is the following:

CONNECTION MANAGER TERMINATED, RSN = n
The Telnet Server port listening task terminated unexpectedly.

System action: Telnet Server command processor is active but will not accept client connections on the indicated port.

Operator response: Contact the system programmer to diagnose this error.

System programmer response: If unable to determine the cause of the task failure, contact your IBM software support center.

Module: EZAZMTNS

Procedure name: TCP/IP

EZZ6007I jobname LU/PRT GROUP lugroup REACHED pct % OF CAPACITY

Explanation: The number of LUs in use from this LU group reached the specified capacity warning level. The limit is specified as a percentage of the total number of LUs in the group. When this threshold is reached, the message is not displayed again until the next time the threshold is reached after the in-use count drops to 10% of the total below the threshold amount. For example, a group of 200 LUs with a capacity warning level of 75% will report meeting the threshold when 150 LUs are in use. When the number of in-use LUs drops below 130 LUs, Telnet will report again.
when the in-use count reaches 150. If the in-use count drops to only 140 and then rises over 150, no message will be
issued. This is done to reduce the messages issued when the in-use count moves slightly below and above the
threshold amount.

In the message text:

`jobname`

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure
that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the `jobname` value TNSRV1. If you start the TN3270 server, the `jobname`
value is TN3270

System action: When the LuGroup pool becomes full, connections using this LU group will be rejected.

Operator response: Contact the System Programmer.

System programmer response: Add LUs to the LuGroup and update Telnet by issuing the VARY TCPIP, OBEYFILE
command.

Module: EZAZMTNS

Procedure name: TCP/IP

---

EZZ6008I  `jobname` STOPPING

Explanation: The Telnet Server was directly requested to stop, or TCP/IP is stopping.

In the message text:

`jobname`

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure
that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the `jobname` value TNSRV1. If you start the TN3270 server, the `jobname`
value is TN3270

System action: Telnet Server ends.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: TCP/IP

---

EZZ6009I  `jobname` SERVER STOPPED

Explanation: The Telnet Server terminated.

In the message text:

`jobname`

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure
that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the `jobname` value TNSRV1. If you start the TN3270 server, the `jobname`
value is TN3270

System action: Telnet Server terminated.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: TCP/IP
Explanation: The Telnet Connection manager task ended for the port indicated. Telnet is no longer accepting connection requests for this port.

In the message text:

*Jobname*

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

System action: None.
Operator response: None.
System programmer response: None.
Module: EZAZMTNS
Procedure name: TCP/IP

Explanation: z/OS UNIX System Services callable service was unable to complete successfully.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

requested_service is the name of the requested service to perform.

rc is the return code of the requested service.

rsn is the reason code of the requested service. For REGISTER and DEREGISTER services, the last half of the reported Reason Code is the z/OS UNIX System Services reason code.

System action: None.
Operator response: Contact the system programmer to diagnose the problem.
Module: EZAZMTNS
Procedure name: TCP/IP

Explanation: z/OS UNIX System Services callable service was unable to complete successfully.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

reqserv is the name of the requested service to perform.

reqfunc is the name of the requested function to perform.

rc is the return code of the requested service.

rsn is the reason code of the requested service.

System action: None.
Operator response: Contact the system programmer to diagnose the problem.
System programmer response: See the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/docs/en/zos-messages?topic=system-pending-enrollment-failed) for an explanation of the rc and the rsn. See the [Steps for defining security for a user ID and associating the user ID with the Telnet procedure](https://www.ibm.com/docs/en/zos-security?topic=security-sso-procedure)
EZZ6015I TELNET CONFIGURATION CONNECTION LOST

Explanation: Telnet lost the connection to the TCP/IP configuration component.

System action: Periodically, the Telnet Server will attempt to regain the connection automatically.

Operator response: None.

System programmer response: Contact the IBM software support center if the problem persists.

Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6017I jobname ALREADY requested_service ON PORT n

Explanation: Telnet is already in the required state, no action taken.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

requested_service is the name of the requested service to perform.

System action: None.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6018I jobname PROFILE text

Explanation: The Telnet Server profile was read in and updated successfully.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

text is one of the following:

UPDATE COMPLETE FOR PORT n
The Telnet Profile was updated.

TESTMODE COMPLETE FOR PORT n
The Telnet Profile TESTMODE is complete.

System action: Telnet Server and TCP/IP continue to run.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS
Procedure name: TCP/IP
**EZZ6020I**  jobname LISTENING ON ALL AVAILABLE STACKS ON PORT pnum

**Explanation:** The Telnet server recognized that a new TCPIP stack started on this system. The Telnet server is now accepting connections on the new stack and all other common INET (CINET) stacks for port pnum.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

pnum is the port on which the Telnet server is listening.

**System action:** Telnet server continues.

**Operator response:** Contact the system programmer.

**System programmer response:** None, unless stack affinity is required. If stack affinity is required, code the TCPIPJOBNAME parameter in TELNETGLOBALS to bind the Telnet server to a specific TCPIP stack.

**Module:** EZAZMTNS

**Procedure name:** EZBTTMST

---

**EZZ6022I**  TELNET CONFIGURATION RECONNECT text

**Explanation:** Telnet lost its connection with the TCP/IP Configuration task and is attempting to reconnect.

text is one of the following:

SUCCESSFUL
The Telnet Server was able to reestablish a connection with TCP/IP Configuration. Telnet profiles and commands can again be processed.

IN PROGRESS
The Telnet Server is attempting to reestablish a connection with TCP/IP. A connection is required to process Telnet profiles or commands. If reconnection does not complete, contact the IBM software support center.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAZMTNS

**Procedure name:** TCP/IP

---

**EZZ6023I**  jobname CODEPAGE CONVERSION FROM ascii_codepage_name TO ebcdic_codepage_name FAILED: text

**Explanation:** The requested ASCII to EBCDIC codepage conversions failed.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

ascii_codepage_name is either the first name coded on the CODEPAGE statement or the default.

ebcdic_codepage_name is either the second name coded on the CODEPAGE statement or the default.

text is one of the following:

START ERROR
The Telnet Server encountered an error starting codepage translation.

TRANSLATION ERROR
The Telnet Server encountered an error performing codepage translation.

**System action:** None.

**Operator response:** Contact the system programmer to diagnose this error.

**System programmer response:** Verify that the code pages specified are correct, compatible, and on your system. Ensure that the Unicode data sets (for example, SYS1.SCUNTBL) are available and not renamed.
**EZ6024I • EZ6027I**

**Module:** EZAZMTNS  
**Procedure name:** TCP/IP

---

**EZ6024I**  
jobname CODEPAGE CONVERSION FROM ascii_codepage_name TO ebcic_codpage_name WAS SUCCESSFUL.

**Explanation:** Telnet Server successfully translated the Codepages.

*jobname* is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the *jobname* value TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

*ascii_codepage_name* is either the first name coded on the CODEPAGE statement or the default.

*ebcic_codpage_name* is either the second name coded on the CODEPAGE statement or the default.

**System action:** None.  
**Operator response:** None.  
**System programmer response:** None.

---

**EZ6026I**  
jobname TRANSFORM INITIALIZED ON PORT n

**Explanation:** The Telnet Server DBCS Transform was successfully initialized.

In the message text:

*jobname*  
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the *jobname* value TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

**System action:** Telnet Server and TCPIP continue to run.  
**Operator response:** None.  
**System programmer response:** None.

---

**EZ6027I**  
jobname TRANSFORM INITIALIZATION FAILED, RC: rc

**Explanation:** The Telnet Server DBCS Transform failed initialization. The most probable reasons are:  
- The transform load module could not be found or loaded.  
- The error message file, TNDBCSER DD statement, is missing.

In the message text:

*jobname*  
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the *jobname* value TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

**System action:** Telnet Server and TCPIP continue to run.  
**Operator response:** Contact the system programmer to diagnose this error.
System programmer response: Verify that the transform load module or the error message file can be found by Telnet.

Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6028I  jobname TRANSFORM HAS ENDED
Explanation: The Telnet Server DBCS Transform ended either normally or abnormally.

In the message text:

jobname
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270

System action: Telnet Server and TCPIP might not continue to run.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6034I  jobname CONN connid LU luname action object
Message Format:
EZZ6034I TELNET CONN connid LU luname action object
   IPADDR..PORT: ipaddr..port module

Explanation: This message gives a summary status for all connections.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

connid is the TCP/IP connection ID.

luname is the name of the LU representing the client. To avoid flooding your console, the DEBUG option EXCEPTION will set the luname to MULTIPLE if action is CONN DROP and more than one connection was dropped for the same reason in a 15 second interval.

action is one of the following:

ACCEPTED
A connection request was accepted on the server port indicated.

NEGOTIATED
Connection negotiation finished and the connection type is specified.

IN SESSION
A session was established on this connection. The Appl name is specified.

SESS DROP
The session on this connection was dropped for one of the reasons listed under object.

CONN DROP
The connection was dropped for one of the reasons listed under object. The CONN DROP message is issued for error conditions and inactivity reasons whether or not DEBUG is coded. If DEBUG EXCEPTION or NO DEBUG is coded, and more than one connection is dropped for the same reason in 15 seconds, a single message with luname of MULTIPLE will be issued. This is done to reduce console flooding. If you want to see a message for each connection that is being dropped, specify the DEBUG SUMMARY statement. See the z/OS Communications Server: IP Configuration Guide for more information about Telnet Diagnostics.
object is one of the following:

- If action is ACCEPTED, object is the Telnet server port number.
- If action is NEGOTIATED, object is the connection mode.
- If action is IN SESSION, object is the name of the host application.
- If action is SESS DROP or CONN DROP, object is one of the following reasons:
  
  **ABEND (X'0C')**
  An abnormal end occurred in the Telnet code.

  **ASCDROP (X'15')**
  The associated terminal LU was dropped while the DROPASSOCPRINTER option was in effect, causing the printer to be dropped.

  **CHEKCLNT (X'18')**
  The client did not respond to a TIMEMARK option in the time specified on CheckClientConn.

  **CLNTDISC (X'02')**
  The user or client emulator disconnected from the connection.

  **CLOSEERR (X'10')**
  An error occurred during close processing.

  **ERR code (X'09')**
  A Telnet error occurred. See message [EZZ6035I](#) for a complete list of the return codes.

  **INACT-K (X'05')**
  The KEEPINACTIVE timer detected no session activity for the specified time.

  **INACT-P (X'04')**
  The PRTINACTIVE timer detected no session activity for the specified time.

  **INACT-PF (X'1A')**
  The PROFILEINACTIVE timer detected no session activity for the specified time for the connection associated with a non-current profile.

  **INACT-S (X'03')**
  The INACTIVE timer detected no session activity for the specified time.

  **LUNRCONN (X'1C')**
  The CONNECTTIMEOUT timer on the LU name requester (LUNR) did not detect an administrative connection to the LUNS for the specified period of time. All connections waiting for an LU allocation from the LU name server (LUNS) are dropped and all ports with shared LU group definitions are quiesced. Ports are automatically resumed when the administrative connection is reestablished.

  **LUNRRCVR (X'1B')**
  The RECOVERYTIMEOUT timer on the LU name requester (LUNR) did not detect an administrative connection to the LUNS for the specified period of time. All connections using shared LU names are dropped.

  **LUXABEND (X'17')**
  An abnormal end occurred in LUEXIT code used by the connection.

  **NSEXIT (X'07')**
  The Telnet LU NSEXIT is being driven because of session breakage.

  **QSTIMER (X'19')**
  The SNA application did not send a BIND request to the waiting Telnet connection in the time specified on the QSESSION parameter.

  **STOPPORT (X'12')**
  The port was stopped by an operator command.

  **STOPTRAN (X'13')**
  The transform task was ended by an operator command or an error.

  **SYSLOGOFF (X'16')**
  The user issued a SYSREQ LOGOFF command and the LUSESSIONPEND option was not specified.
TIMEMARK (X'06')
A TIMEMARK request was not answered by the client in the specified time indicating a lost connection.

TKOVER (X'0A')
The connection and session are ending because they are being taken over by another connection.

TKOVER-R (X'0B')
The connection is ending because it is being taken over by another connection. The session remains active.

TPEND (X'08')
The Telnet LU TPEND exit is being driven because of a forced close of the host application.

TRANCLOS (X'14')
The Transform task found an error and is closing the connection.

UNBIND (X'01')
The user issued a normal LOGOFF command from the host application.

UNBIND02 (X'0E')
The session ended but issued a CLSDST-PAS command to another application.

UNBINDQS (X'0F')
The session ended but it is in a chain of QSESSION sessions. Telnet will wait for one of the earlier sessions to initiate another session.

UNKNOWN (X'0D')
Close is occurring for some reason other than any listed previously.

USSLGOFF (X'11')
The user issued a LOGOFF command from the USS screen.

ipaddr..port is the client IP address and port number.

module is the detecting module if the connection was dropped because of a Telnet error.

System action: None.
Operator response: None.
System programmer response: None.
Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6035I jobname DEBUG type level
Explanation: A diagnostic message was displayed for debugging purposes.
In the message text:

jobname
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

type and level
The type value and the level value can be one of the following combinations.
• If the type value is CONN, the level value will be one of the following.
  – EXCEPTION or DETAIL
    EZZ6035I jobname DEBUG CONN level
    IP..PORT: ipaddr..port
    CONN: connid L: luname MOD: modname
    RCODE: rcode-instance description
    PARM1: parm PARM2: parm PARM3: parm
  – TRACE
EZZ6035I

EZZ6035I jobname DEBUG CONN TRACE
IP..PORT: ipaddr..port
CONN: connid LU: luname MOD: modname
dir tracedata
PARM1: parm PARM2: parm PARM3: parm

• If the type value is TASK, the level value will be the following.
  – EXCEPTION or DETAIL
    EZZ6035I jobname DEBUG TASK level
    TASK: taskname MOD: modname
    RCODE: rcode-instance description
    PARM1: parm PARM2: parm PARM3: parm

• If the type value is CONFIG, the level value will be one of the following.
  – EXCEPTION
    EZZ6035I jobname DEBUG CONFIG EXCEPTION
    LINE: line MOD: modname
    RCODE: rcode-instance description
    PARM1: parm PARM2: parm PARM3: parm
  – TRACE
    EZZ6035I jobname DEBUG CONFIG TRACE
    LINE: line MOD: modname
    profdata
    PARM1: parm PARM2: parm PARM3: parm

ipaddr..port
   The client IP address and port number if appropriate.

connid
   The connection ID assigned by the TCPIP stack.

luname
   The name of the Telnet LU representing the client.

line
   The line number in the profile of the statement generating the message. If the statement includes several lines,
   such as TELNETPARMS, the line number indicates the first line of the lines that comprise the statement. The
   "N/A" value indicates that a problem was found after profile processing was complete.

modname
   The name of the module reporting the error. For trace entries, this field is used as a source and destination field.

dir
   The direction of the data flow.

tracedata
   The first 48 bytes of data that was sent or received from the client or the VTAM application. The request
   parameter list (RPL) is included, if applicable. If the tracedata value is a BIND, the entire BIND is included.

profdata
   The profdata value can be one of the following:
   profstdata
      All the parameters following the statement name.
   profcbdata
      The structured data passed to the Telnet database.

parm
   The value for PARM1, PARM2, or PARM3, which provides additional information specific to the message the
   type value and level value combination.
   • If the type value and level values are CONN EXCEPTION, CONN DETAIL, TASK EXCEPTION, TASK DETAIL,
     and CONFIG EXCEPTION, then the parm value is specific to the rcode value: see the description of the rcode
     value.
   • If the type value and level values are CONN TRACE, then PARM1 is the length, in hexadecimal, of the data
     being traced. PARM2 and PARM3 are not used.
If the `type` value and `level` values are CONFIG TRACE of the configuration statement, PARM1 is the number of words following the statement, PARM2 is not used, and PARM3 is the statement itself.

If the `type` value and `level` values are CONFIG TRACE of the configuration control block, PARM1 is the number of bytes, in hexadecimal, in the structure passed, PARM2 is the Telnet internal code for the statement, and PARM3 is the statement itself.

`instance`
The instance number of the error in the module.

`rcode` and `description`
The `rcode` value is the return code and the `description` value is the text of the return code. The code might indicate an error or it might indicate normal processing. The following are the `rcode` and `description` values:

**0000 OK**
No errors encountered.

**0008 Storage obtain request failed.**
This might be caused by a low storage condition or by parameters that were not valid being passed on the storage request. Verify storage availability. In some cases, the PARM1 value is the size of the storage request. If storage is available, contact the IBM software support center.

**0009 Storage release request failed.**
This might be caused by trying to free the same storage more than once or by passing parameters that are not valid on the storage request. If a storage release failure occurs, contact the IBM software support center.

**000A IOCTL request failed.**
Telnet issues an IOCTL request to update information used by the NETSTAT display command. The PARM1 value is the IOCTL return value, the PARM2 value is the IOCTL return code, and the PARM3 value is the IOCTL reason code. If an IOCTL failure occurs, contact the IBM software support center.

**000B Available return code.**
This return code is not used and is available for future use.

**000C Timer request failed.**
Telnet requested a timer and the request failed. Contact the IBM software support center.

**000D Lock obtain request failed.**
A lock-obtain failure is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center.

**000E Lock release request failed.**
A lock-release failure is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center.

**000F CVB is invalid.**
The CVB control block represents the client connection. A CVB that is not valid is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center.

**0010 Allocation of a message control block failed.**
Message control blocks are used to move data traffic between VTAM and the client. If an allocation failure occurs, contact the IBM software support center.

**0011 Work element Queue and Post request failed.**
Internal Telnet work element processing failed. Contact the IBM software support center. PARM1 might contain an additional failure code to assist IBM software support to resolve the problem.

**0012 Internal list request failed.**
Internal list processing failed. Contact the IBM software support center.

**0013 Available return code.**
This return code is not used and is available for future use.

**0014 CVB lock obtain request failed.**
Lock processing of the CVB control block failed. This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center.
0015 CVB lock release request failed.
   Lock processing of the CVB control block failed. This event is sometimes part of normal processing when a
   connection is being dropped. If this event is reported at other times, contact the IBM software support
   center.

0016 CVB token is invalid.
   The token for lock processing of the CVB control block is not valid. This event is sometimes part of normal
   processing when a connection is being dropped. If this event is reported at other times, contact the IBM
   software support center.

0017 Available return code.
   This return code is not used and is available for future use.

0018 Available return code.
   This return code is not used and is available for future use.

0019 CVB token does not match master token.
   The CVB token used by a particular process does not match the token stored in the Telnet tables. This event
   is sometimes part of normal processing when a session or connection is being dropped. If this event is
   reported at other times, contact the IBM software support center.

001A Telnet timer has been canceled.
   The timers used for the INACTIVE and SCANINTERVAL options are canceled when the port is being
   stopped. If this event is reported at other times, contact the IBM software support center.

001B Takeover target is invalid.
   Takeover was attempted on a target that cannot be taken over. A probable cause is that the profile used by
   the target did not specify takeover. Issue a detailed display of the original target connection. Check the
   profile flags to determine whether takeover is supported. If takeover is supported, contact the IBM software
   support center.

001C Copy of a message control block failed.
   Message control blocks are used to move data traffic between VTAM and the client. If a copy failure occurs,
   contact the IBM software support center.

001D Duplication of a message control block failed.
   Message control blocks are used to move data traffic between VTAM and the client. If a duplication failure
   occurs, contact the IBM software support center.

001E Internal Patricia tree process failed.
   Internal Patricia tree processing failed during registration work. A possible cause is a takeover timing
   condition. Try the connection again. If the problem persists, contact the IBM software support center. PARM1
   might contain an additional failure code to assist IBM software support to resolve the problem.

001F OE Dub Process failed.
   Telnet initialization for socket setup failed with the BPX Dub process. Contact the IBM software support
   center. The PARM1 value is the z/OS UNIX System Services (USS) return value, the PARM2 value is the
   USS return code, and the PARM3 value is the USS reason code. They are defined in the z/OS UNIX System
   Services Messages and Codes.

0020 Dynamic LU tree creation failed.
   The creation of the dynamic LU tree needed to track LU usage failed during Telnet initialization. Contact the
   IBM software support center.

0021 Patricia Tree ADD failed for IP node.
   Internal Patricia Tree processing failed during profile IP node processing. An internal return code is saved in
   PARM1. If the problem persists, contact the IBM software support center.

0022 Patricia Tree DELETE failed for IP node.
   Internal Patricia Tree processing failed during profile IP node processing. An internal return code is saved in
   PARM1. If the problem persists, contact the IBM software support center.

0023 Patricia Tree CREATE failed for IP node.
   Internal Patricia Tree processing failed during profile IP node processing. An internal return code is saved in
   PARM1. If the problem persists, contact the IBM software support center.
0024 **Patricia Tree token is invalid.**
Internal Patricia Tree processing failed during profile IP node processing. An internal return code is saved in PARM1. If the problem persists, contact the IBM software support center.

0025 **Takeover target is closing.**
The target for connection or session takeover is in the process of closing. The takeover will not occur. The connection attempting the takeover should try the connection request again after receiving this message.

0026 **Load of EZBTTMST load module failed.**
Telnet Connection Manager load module could not be loaded. The most probable cause is that the load module is not part of the system library that is accessible to Telnet. The PARM1 value is the system completion code and the PARM2 value is the reason code. If the load module is accessible to Telnet, contact the IBM software support center.

0027 **Load of EZBTPGUE load module failed.**
Telnet User Exit Interface load module could not be loaded. The most probable cause is that the load module is not part of the system library that is accessible to Telnet. The PARM1 value is the system completion code and the PARM2 value is the reason code. If the load module is accessible to Telnet, contact the IBM software support center.

0028 **Event should not occur. Call IBM service.**
An event occurred in Telnet that should not have occurred. Contact the IBM software support center.

0029 **Debug process called without setting up DUCB.**
A TnDebug invocation occurred without first invoking the TnDebug entry with either the TASK or CONN option.

1001 **Client disconnected from the connection.**
The user or client emulator tried to end the connection by initiating a disconnection. If this return code is unexpected, analyze the client to determine why the client initiated a disconnection. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code. These values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com) or they might be set to an SSL/TLS error code. The SSL/TLS error codes are defined under return code 6002.

1002 **Close socket request failed.**
This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com).

1003 **A TCP/IP receive data request failed.**
This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com).

1004 **A close request is already in progress.**
A second close was attempted. The first close will continue and the second close will be ignored. If the first close does not complete, contact the IBM software support center.

1005 **A Cancel socket I/O request failed.**
This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com).

1006 **A TCP/IP send data request failed.**
This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com).

1007 **Socket fastpath setup failed.**
Telnet connection sockets are defined as fastpath to improve performance. If fastpath setup failure occurs, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com).
1008 A Get Hostname by IP address request failed.
Telnet attempted to find the host name of the client but failed. The most probable cause is that the system
DNS is not set up correctly. Ensure that the correct TCPIP.DATA statements are being used. Telnet uses the
MVS search order. See z/OS Communications Server: IP Configuration Guide for information about the
TCPIP.DATA file and search order. If this return code is unexpected, contact the IBM software support
center. If the return code is part of a WLM failure message and Telnet is running in its own address space,
the probable cause is that there is no affinity to a particular TCP/IP stack. Use the TCPIPJOBNAME
parameter statement in the TELNETGLOBALS statement block to set affinity to a specific TCP/IP stack. The
PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason
code; these values are defined in z/OS UNIX System Services Messages and Codes.

1009 Takeover has failed.
The new client has failed takeover, probably because the old client is still active. This return code is for
tracking purposes and does not necessarily indicate a problem. The PARM3 value is the takeover type that
was attempted.

100A Connection type of NONE was specified.
The profile option CONNTYPE NONE was specified indicating that no connections are allowed. If this
result was not intended, reconfigure the Telnet profile.

100B Unexpected SSL handshake encountered.
An SSL handshake header was encountered on a basic port or the client immediately entered an SSL
handshake for a CONNTYPE option value other than SECURE or ANY. Verify that the client and port
settings are compatible.

100C A TCP/IP send immediate request failed.
This event is sometimes part of normal processing when a connection is being dropped. If this event is
reported at other times, contact the IBM software support center. The PARM1 value is the return value, the
PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in z/OS
UNIX System Services Messages and Codes.

100D TCP/IP async send did not complete immediately.
A probable cause is a blocked socket. This condition should affect only the client that cannot accept
additional data. If the entire server is affected, contact the IBM software support center. The PARM1 value is
the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values
are defined in z/OS UNIX System Services Messages and Codes.

100E The transform task is not available.
The DBCS transform task is not available to perform the requested transformations. Either the
DBCSRTRANSFORM statement is missing, the load module did not get loaded, or the load module was
removed because of an error. If an error occurred, contact the IBM software support center.

100F A send was issued without any data.
A request to send data to the client was issued but data was not specified. Contact the IBM software support
center.

1010 The socket was dropped.
This event was probably caused by the operator. If not, contact the IBM software support center. The
PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason
code; these values are defined in z/OS UNIX System Services Messages and Codes.

1011 The transform request in PARM1 is invalid.
The transform request is not a valid request that can be handled by the transform process. Contact the IBM
software support center. The request is reported in PARM1.

1012 A client doing a takeover is closing.
A new client began the close process while waiting for the takeover timer to expire. The new connection will
finish closing after the takeover timer expires. If this return code is unexpected, contact the IBM software
support center.

1013 Takeover already in progress.
A new client attempted to take over a connection that already is being taken over by another connection.
Only one connection at a time can try to take over a connection.

1014 Takeover has started.
A new client began the takeover process. This return code is for tracking purposes and does not indicate a
problem. The PARM1 value is the takeover time value specified on the particular takeover parameter in hexadecimal form. The PARM3 value is the type of takeover attempted.

1015 Takeover not specified on original client PROF.
A new client attempted to take over a connection but the original connection does not allow takeover. Takeover must be specified on the profile used by the original connection. The new client might not be attempting takeover and instead accidentally chose an LU already in use. In this case, the client should use a different LU name.

1016 Port Task setup failed.
The setup of the port task failed. The port will not be available. The task was set up and the Port task code began to run, but an error occurred during initialization. The PARM1 value is the port task return code. the PARM2 value is the hexadecimal value of the port number. Contact the IBM software support center.

1017 Attach of the Port task failed.
The MVS macro, ATTACH, failed to attach the port task during Telnet initialization. The PARM1 value is the ATTACH return code. The PARM2 value is the hexadecimal value of the port number. Contact the IBM software support center.

1018 The Port task has ended in error.
The port task ended because of one of the following error conditions.
- Instance 01 indicates that the task was set up correctly and that later an error occurred. The PARM1 value is the port task return code.
- Instance 02 indicates that the task was set up, but the port task code never ran. The PARM1 value is a system completion code.
- Instance 03 indicates that the task was set up, the port task code was initialized, but an error quickly occurred. The PARM1 value is the port task return code.

In all cases, the PARM2 value is the hexadecimal value of the port number. Contact the IBM software support center.

1019 The connection ID could not be obtained.
The request by Telnet to get the connection ID for this connection failed. The connection request will fail. Contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in z/OS UNIX System Services Messages and Codes.

101A Setup of Out Of Band data handling failed.
The request by Telnet to handle out-of-band data inline failed. The connection request will fail. Contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code; these values are defined in z/OS UNIX System Services Messages and Codes.

101B The linkname table could not be obtained.
The request by Telnet to get the TCP/IP stack link name table failed. The connection will continue but any profile mappings based on the link name will fail. Contact the IBM software support center.

101C Send data to the client.
The Debug Trace option was selected, resulting in trace messages for two connections. The PARM1 value is the total length sent.

101D Receive data from the client.
The Debug Trace option was selected, resulting in trace messages for two connections. The PARM1 value is the total length received.

101E The profile control block could not be found.
The most probable cause is that all the port profiles are qualified and the connection request has a different destination IP address or link name than any that are defined. If only the qualified port destinations are to be used, then this is probably not an error. In that situation you can create a non-qualified profile to cover unexpected connections.

101F There are no current profiles available.
There are no profiles available for the connection to use. Contact the IBM software support Center.
1020 The main connection CB could not be obtained.
The control block structure that manages connections could not be obtained. The most probable cause is that storage is not available. Verify that storage is available. If a storage shortage is not the problem, contact the IBM software support center.

1021 The takeover connection is now invalid.
While the connection that is being taken over is closing, the takeover connection became unusable. The most probable cause is that the connection is being disconnected by the user. The PARM1 value is an additional failure code to assist IBM software support to resolve the problem.

1022 VTAM Appl sent Bind before negotiation complete.
TKO takeover is in process and the VTAM application tried to start a session before the TKO Taker negotiations were complete. This event can cause many timing problems. The takeover will end and the client will be disconnected.

1023 Telnet does not support the exit type.
The Telnet common exit processor was given control to process an exit type other than an interpret exit or LU name exit. This event should not occur. Contact the IBM software support center. The PARM1 value is the exit type code that was attempted.

1024 Adding Userid information for keep LU failed.
While the LU is being unassigned, the client identifier user ID information could not be saved. The most probable cause is a storage shortage. If a storage shortage is not a problem, contact the IBM software support center.

1025 Adding hostname information for keep LU failed.
While the LU is being unassigned, the client identifier host name information could not be saved. The most probable cause is a storage shortage. If a storage shortage is not a problem, contact the IBM software support center.

1026 Adding IP addr information for keep LU failed.
While the LU is being unassigned, the client identifier IP address information could not be saved. The most probable cause is a storage shortage. If a storage shortage is not a problem, contact the IBM software support center.

1027 Last send not ACKed. Stack drops connection.
The request by Telnet to send to the client did not get an acknowledgement in the maximum retry limit. The connection is reset by the stack.

1028 Failed to get SecLabel for Incoming connection.
The request by Telnet to get the security label value of the incoming connection failed. The security label option is required for TN3270 because multilevel security has been activated in the security server.

1029 The zonename table could not be obtained.
The request by Telnet to get the TCP/IP stack zone name table failed. The connection will continue but the zone ID of this connection will not be known. Contact the IBM software support center.

102A Takeover attempted with a different IP address.
A new client attempted a session reconnect takeover using a different IP address than the original connection. SAMEIPADDR was specified for takeover on the original connection.

102B Socket initialization failed. No retry.
The socket initialization failed and will not be tried again. Message EZZ6011I should have been issued before the debug message with this code. Message EZZ6011I should describe why the socket did not initialize.

102C Socket initialization failed. Will retry.
The socket initialization failed but will be tried again in 10 seconds and then tried again indefinitely with progressively longer wait periods. The most probable reason for retry is that Telnet is running in its own address space tried to open a socket to a TCP/IP stack that is not active.

102D TCPIP environment changed. Port cannot start.
Telnet detected an IPv4 or IPv6 environment change or a CINET or INET environment change since the last port was opened. Stop and restart the Telnet server when an environment change is made.
102E Telnet could not get TCPIP stack information.
Telnet running in its own address space could not retrieve the identity of the TCPIP stack for the
connection that was just established. The connection will complete but displays that are dependent on the
owning stack of the connection will not function.

1030 TLS ioctl failed for query or init HS.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the
reason code for the ioctl failure.

1031 BPX1FCT failed changing socket blocking status.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the
reason code for the ioctl failure.

1032 The connection state is invalid for CONNTYPE.
The PARM2 value is the CONNTYPE statement value and the PARM3 value is the connection status.

1033 Cleartext received when CONNTYPE is secure.
Cleartext data is either already on the TCPIP receive queue when the handshake starts or it arrives while
waiting for the handshake to start. The CONNTYPE statement does not allow negotiation to a basic
connection.

1034 The Poll for write to detect HS complete failed.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the
reason code for the ioctl failure.

1035 Policy is invalid for the CONNTYPE specified.
The PARM2 value is the CONNTYPE statement value and the PARM3 value is the policy status.

1036 Takeover target uses different connection type.
A new client attempted a session reconnect takeover of a connection of a different connection type. The
takeover attempt fails. This error might occur when SAMECONNTYPE is specified for the original
connection and one of the following is true:
• A secure connection attempted to take over a basic connection.
• A secure connection that was using client authentication attempted to take over a secure connection that
did not use client authentication.

2001 ACB mismatch during Bind processing.
The ACB address in the bind does not match the ACB representing the connection. If the application does
not appear to be at fault, contact the IBM software support center. A VTAM internal trace in addition to the
Telnet debug information will be needed.

2002 Available return code.
This return code is not used and is available for future use.

2003 Available return code.
This return code is not used and is available for future use.

2004 Available return code.
This return code is not used and is available for future use.

2005 The session is not a SNA session.
Session verification indicates this is not a SNA session but this session is attempting to perform a SNA-type
function. If you require SNA function, change the Devicetype logmode.

2006 Error writing SMF record.
An error occurred while attempting to write an SMF record. Contact the IBM software support center.
PARM1 might contain the SMF return code to assist IBM software support to resolve the problem.

2007 VTAM macro RECEIVE failed.
This event is sometimes part of normal processing when a session or connection is being ended. If this event
is reported at other times, contact the IBM software support center. The PARM1 value is the return value,
the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLdbk2; these values are
defined in z/OS Communications Server: SNA Programming.
2008 A response to VTAM failed.
An error occurred while attempting to send a response to VTAM. This event is sometimes part of normal processing when a session or connection is being ended. If this event is reported at other times, contact the IBM software support center.

2009 Sending UNBIND to client failed.
A probable cause is a BIND was not already sent to the client. Verify that the application is sending the correct sequence of BINDs and UNBINDs. If the application does not appear to be at fault, contact the IBM software support center. The PARM1 value is an additional return code indicating why the SEND failed.

200A NSEXIT was driven for a BIND failure.
The Telnet LU network services exit was driven, which indicates that a BIND request failed. Review VTAM messages for possible causes.

200B Sending BIND to client failed.
A probable cause is a BIND that was already sent to the client. Verify that the application is sending the correct sequence of BINDs and UNBINDs. If the application does not appear to be at fault, contact the IBM software support center. The PARM1 value is an additional return code indicating why the SEND failed.

200C RPLRQR,RPLSTSN not valid for TS profile 2/3.
The RPLRQR and RPLSTSN profiles are not valid for TS profiles 2 or 3. Because these are the only profiles that the Telnet server supports, this error should not occur. If this error does occur, analyze why the host application is sending these requests and change the application.

200D Received BIND while already bound.
Verify that the application is sending the correct sequence of BINDs and UNBINDs. If the application does not appear to be at fault, contact the IBM software support center.

200E Invalid TERMSSESS type encountered.
The VTAM macro TERMSSESS was requested with an internal function code that was not valid. Contact the IBM software support center.

200F VTAM macro TERMSSESS failed.
This event is sometimes part of normal processing when a session or connection is being ended. If this event is reported at other times, contact the IBM software support center. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2010 VTAM macro OPNSEC failed.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2011 VTAM macro REQSSESS failed.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2012 VTAM macro CLOSE ACB failed.
PARM1 and PARM2 might be set to return code and reason code respectively, which are defined in z/OS Communications Server: SNA Programming.

2013 VTAM macro OPEN ACB failed.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the ACB error flag value; these values are defined in z/OS Communications Server: SNA Programming. The most probable cause is that the LU is not active in VTAM. Issue D NET,ID=luname to see the VTAM status of the LU.

2014 VTAM macro SETLOGON failed.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2015 NSEXIT was driven for session cleanup.
A probable cause is that the host application was deactivated. Review VTAM messages for other possible causes.

2016 NSEXIT was driven for a CINIT failure.
The Telnet LU network services exit was driven, which indicates that a CINIT request failed. Review VTAM messages for possible causes.
2017 NSEXIT was driven for a CTERM failure.
The Telnet LU network services exit was driven, which indicates that a CTERM request failed. Review VTAM messages for possible causes.

2018 NSEXIT was driven for an UNBIND failure.
The Telnet LU network services exit was driven, which indicates that an UNBIND request failed. Review VTAM messages for possible causes.

2019 Session does not exist.
Session verification determined that a session no longer exists. The attempted function is not performed. This event is sometimes part of normal processing when a session is ended. If this event is reported at other times, contact the IBM software support center.

201A Session data queue is being purged.
The host application sent a CLEAR option to purge the data queue. New data cannot be added until the CLEAR option is complete.

201B Available return code.
This return code is not used and is available for future use.

201C Available return code.
This return code is not used and is available for future use.

201D Available return code.
This return code is not used and is available for future use.

201E Available return code.
This return code is not used and is available for future use.

201F Available return code.
This return code is not used and is available for future use.

2020 VTAM RECEIVE macro requested invalid function.
Request parameter list (RPL) verification determined that an unrecognized function was attempted during the VTAM RECEIVE process. Verify that the application is sending valid RPL requests. If the application does not appear to be at fault, contact the IBM software support center. A VTAM internal trace in addition to the Telnet debug information will be needed.

2021 Available return code.
This return code is not used and is available for future use.

2022 Already pending response. SNA protocol error.
This return code is caused by an APPL sending in a definite response required RU and a response is already pending from the client. The session is terminated.

2023 Retry scheduled for RPL request.
A probable cause for the failure is a temporary storage shortage in VTAM. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2024 RPL length specified but RPL area is zero.
Request parameter list (RPL) verification determined that the RPL length field is set but the RPL area field is 0. Storage corruption is the probable reason. Contact the IBM software support center.

2025 Available return code.
This return code is not used and is available for future use.

2026 Available return code.
This return code is not used and is available for future use.

2027 Maximum retries exceeded for VTAM RPL.
A probable cause for the failure is a temporary storage shortage in VTAM. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2028 Available return code.
This return code is not used and is available for future use.
2029 VTAM RPL posted with nonzero RPLrtncd/RPLfdbk2.
A minor error was reported in a VTAM RPL request. The session will not be ended. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

202A VTAM RPL returned negative response.
A negative response was returned from a VTAM RPL macro. The session will be ended. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

202B Available return code.
This return code is not used and is available for future use.

202C Available return code.
This return code is not used and is available for future use.

202D VTAM macro SEND expedited failed.
SHUTC and SIGNAL are expedited RPLs. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

202E VTAM macroREQSESS failed. Already in session.
The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

202F BIND for printer received with invalid LU.
The BIND received from the host application did not specify an LU1 or an LU3. Determine why the application sent a BIND that was not valid.

2030 Sending a response to VTAM when none expected.
The client sent a response to Telnet that should be passed through to VTAM. In this case, Telnet does not expect that the application should be sent a response. This event is sometimes part of normal processing when a connection is being dropped. If this event is reported at other times, contact the IBM software support center.

2031 Abnormal termination of request.
VTAM abnormally terminated a request because an error was detected while the request was being processed or because a session, task, or address space error occurred. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd or /RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2032 Receive negative response and continue process.
A negative response was received from the host application with a sense code that indicates that the session should not be ended.

2033 Send data attempted without having SDT.
A send data request is rejected because a start data traffic (SDT) request was not received. Either the initial SDT was not received or a CLEAR was received and a new SDT was not received.

2034 Specified maximum ReqSess attempts exceeded.
The connection appears to be in a CLSDST PASS loop. The number of request session attempts in a 10-second period exceeded the number specified on the MAXREQSESS statement or the default. The PARM1 value is the limit value in hexadecimal format. The count is incremented when a BIND is received from the host application.

2035 UNBIND or CLEAR ended a RECEIVE request.
The VTAM application issued an UNBIND or CLEAR request that ended the RECEIVE RPL request. The connection is kept, waiting for the follow-up process from the application. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the RPLrtncd and RPLfdbk2; these values are defined in z/OS Communications Server: SNA Programming.

2036 Send data to the VTAM application.
The Debug trace option was selected, causing trace messages for two connections. The PARM1 value is the total length sent.
2037 Receive data from the VTAM application.
The Debug trace option was selected, causing trace messages for two connections. The PARM1 value is the
total length sent.

2038 BIND specifying delayed response mode received.
The BIND received from the host application specifies delayed response mode. Although this BIND will be
accepted, the Telnet server does not support delayed response mode. Multiple outstanding requests for
definite responses from the host application can cause sessions to be stalled. Determine why the application
sent the BIND with delayed response mode specified.

2039 Receive BIND from the VTAM application.
The Debug trace option was selected, which caused trace messages for two connections. The PARM1 value
is the total length sent. The PARM2 value is the Request/Response header (RH) fields.

2040 Receive UNBIND from the VTAM application.
The Debug trace option was selected, which caused trace messages for two connections. The PARM1 value
is the total length sent. The PARM2 value is the RH fields.

2041 Issue TERMSESS to the VTAM application.
The Debug trace option was selected, which caused trace messages for two connections. The PARM1 value
is the total length sent. The PARM2 value is the RH fields.

2042 LU Group Invalid in MLS Environment.
The LU group has been flagged as being not valid in the current multilevel security environment. Either an
LU exit does not have an LU or the first LU defined for the LU group does not have a security label value
defined in the security server.

2043 Issue SETLOGON to the VTAM application.
The Debug trace option was selected, which caused trace messages for two connections. The PARM1 value
is the total length sent. The PARM2 value is the RH fields.

2044 OPEN ACB failed twice for a TN3270E LUNAME.
A TN3270E connection receives the LU name allocated as soon as the device type is known. If this LU name
is not active in VTAM when the OPEN ACB macro is processed, the OPEN fails. The LU name is
deactivated now, but the LU name remains associated with the connection because the client knows the LU
name. If the client enters a new application, OPEN ACB will fail again. When this occurs, the connection
will be dropped with the 2044 error code to prevent a loop with a screen scraper program running.

2045 VTAM SCIP exit rejects APPL data. Conn Closing.
An application sent data to the SCIP exit of the Telnet LU representing the connection. The connection is
closing and the data is rejected. The connection might be closing only the session, but the data was sent
before the Telnet LU was ready to receive more data. If this timing condition exists, review the function of
the application as a partner with a Telnet LU.

3001 The LU is in use and cannot be inactivated.
The LU name being deactivated is in use by a Telnet connection. The LU name cannot be deactivated while
it is in use.

3002 The LU was inactive before the request was made.
The LU name specified was already inactive before the INACT or assignment request was made. The LU
name must be activated before it can be used.

3003 LUs are all in use.
The specific LU requested is in use or a generic request mapped to an LUGROUP or DEFAULTLUS pool
that has no LUs available. Verify that the profile mapping statements are correct and that sufficient LUs are
available. TN3270E connections are assigned LUs whether or not a session is established. Be sure to account
for this additional LU usage by adding additional LUs, if necessary. The PARM3 value might be the LU
group name or the exact LU name for which the assignment failed. If multiple LU groups or exact LU
names are mapped to the client identifier, only the last name will be displayed, which indicates that
assignment failed for all mappings. If the reporting module is EZBTXUTL, the PARM2 value is the LU
group name and the PARM3 value is the LUNR system and job name.

3004 LU is not available.
There is not an LU mapping for this client or, the connection requests a specific LU, there is not an LU
definition that matches the LU name on the request. Verify that the profile mapping statements are correct.
3005 Database error - Invalid database header.
    A database header that was not valid was detected. A probable cause is storage corruption. Contact the IBM
    software support center.

3006 Specific requests are only valid in TN3270E.
    A specific LU connection request was attempted on a non-TN3270E connection. Verify that NOTN3270E is
    not coded and check the client to confirm a TN3270E connection was requested. Some clients allow a
    specific LU request on a TN3270 connection that is not supported on this server.

3007 Invalid map index has been detected.
    LU map index verification detected an error. Contact the IBM software support center.

3008 Invalid application index has been detected.
    Application LU map index verification detected an error. Contact the IBM software support center.

3009 Available return code.
    This return code is not used and is available for future use.

300A Invalid bundle index has been detected.
    An internal index that was not valid was detected. Contact the IBM software support center.

300B Telnet LU not in use.
    Telnet attempted to make an LU that is not registered as being in use available during close processing.
    Contact the IBM software support center.

300C Database headers in the TCFG are corrupted.
    One or more database headers in the profile control block, TCFG, are corrupted. Contact the IBM software
    support center.

300D The LU is not associated with this connection.
    The close process is attempting to make an LU available that Telnet expects to be associated with the
    connection. In fact, no LU was associated with the connection. Contact the IBM software support center.

300E Invalid indices have been detected in the TCFG.
    The profile control block, TCFG, has one or more indices that are not valid. A probable cause is storage
    corruption. Contact the IBM software support center.

300F Linkname Lookup failed.
    During profile processing, a client identifier was checked to determine whether it was a link name. In this
    case, the name on the profile mapping statement is not a link name.

3010 Lookup request is invalid.
    An internal lookup request is not valid. Contact the IBM software support center.

3011 Application name is required.
    An application name is required for a session to be established. This return code is part of normal
    processing whenever a USSMSG10 or solicitor panel is sent to the client. This error can also occur when the
    user did not enter an application name when prompted to do so.

3012 Application name is invalid.
    The application name entered by the user is not valid, based on the ALLOWAPPL or RESTRICTAPPL
    statements in the profile. Be sure that the user is requesting a valid name. Also, be sure that any applications
    that are the target of a CLSDST PASS macro are in the profile table. For example, a logon to TSO causes a
    CLSDST PASS to TSO0001. An ALLOWAPPL TSO* statement is required for the second TSO application
    name to be valid.

3013 Application name has a syntax error.
    The application name entered by the user contains a syntax error. Application names must be 1-8 characters
    in length. The first character must be one of the following: A-Z @ $#. The second through eighth character
    must be one of the following: A-Z 0-9 @ # $.

3014 Userid is required.
    The application name requested by the user is a RESTRICTAPPL statement. The USERID specified is not
    listed on the RESTRICTAPPL statement.

3015 Userid and password are required.
    The application name requested by the user is a RESTRICTAPPL statement that requires the entry of a user
    ID and password before the session can be established.
3016 **Password is required.**
The application name requested by the user is a RESTRICTAPPL statement that requires the entry of a password before the session can be established.

3017 **Password is invalid.**
The password entered by the user is not valid. Reenter the correct password or contact your local system or security administrator.

3018 **Password is expired.**
The password entered by the user has expired. The user needs to enter a new password.

3019 **Password is revoked.**
The password entered by the user was revoked. Contact your local system or security administrator.

301A **Password not in the security program.**
The password entered by the user could not be found in the security system. Contact your local system or security administrator.

301B **Password failed in the security program.**
The password entered by the user failed in the security system for an unknown reason. Contact your local system or security administrator.

301C **Password failed in the security system group.**
The password entered by the user was not part of the security system group. Contact your local system or security administrator.

301D **System security password group revoked.**
The user ID entered by the user is part of a group that was revoked. Contact your local system or security administrator.

301E **Password change requires old and new password.**
When changing a password, both the old and new passwords must be entered.

301F **New password is invalid.**
When changing a password, the new password must meet certain password formatting rules. Contact your local system or security administrator for details.

3020 **New password change failed.**
An unknown failure occurred while trying to change the password. Contact your local system or security administrator.

3021 **Associated printer already in use.**
The associated printer is already in use by another Telnet connection. Try specifying another printer name or wait until the other connection is dropped.

3022 **Associated terminal is invalid.**
The terminal LU specified on the associated printer connect request is not valid. The terminal LU name used for the association is not a valid terminal LU name. Using a client trace or DEBUG TRACE, verify that the correct terminal LU name is on the associated connect request. If it is, contact the IBM software support center.

3023 **Associated printer list size is incorrect.**
The printer LU group and the terminal LU group must be the same size. The number of single entries must match, the number of bundle entries must match, and the number in each bundle must match. Verify that the LUGROUP and associated PRTGROUP pools do have the required one-to-one match-ups required.

3024 **Available return code.**
This return code is not used and is available for future use.

3025 **System security request is invalid.**
Telnet issued a system security request that was not valid. Contact the IBM software support center.

3026 **System security STAT request failed.**
CLIENTAUTH SAFCERT statement requested but the security product is not active. Ensure that the security product is active before using CLIENTAUTH SAFCERT. The PARM1 value is the return code, the PARM2 value is the SAF return code, and the PARM3 value is the SAF reason code from the RACROUTE FASTAUTH request.
3027 Client not authorized to use the port.
   CLIENTAUTH SAFCERT was specified for the connection. The user ID associated with the client certificate
does not have read access to the port resource and the connection is closed.

   The PARM1 value is the return code, the PARM2 value is the SAF return code, and the PARM3 value is the
SAF reason code from the RACROUTE FASTAUTH request. Contact your local system or security
administrator if this client requires access.

3028 System security client certification failed.
   CLIENTAUTH SAFCERT was specified for the connection and the client certificate is not registered with the
security product. Contact your local system or security administrator if this client requires access. The
PARM1 value is the SAF return code.

3029 INITACEE is not available.
   CLIENTAUTH SAFCERT was specified for the connection. However, the security product does not support
client certificate queries. Contact your local system or security administrator.

302A Associated connect request is invalid.
   The associated connect request is invalid. The requester might not be a printer or the associated LU name is
blank.

302B Associated terminal LU is not assigned.
   The terminal LU must be assigned before the printer can issue an associated connect request. The LU is not
assigned.

302C No printer group associated with Terminal LU.
   An associated connect request was received that contained a terminal LU name that does not have an
associated printer. A probable cause is that the terminal LU was mapped to an LU group on an LUMAP
statement that does not have an associated printer pool defined. Verify that the client is using an LU from
an LUMAP statement that has an associated printer pool defined.

302D LU lookup confirmation failed.
   Lookup is often performed more than once. For example, a TN3270E connection is assigned an LU during
connection negotiation. Later, another lookup is performed that includes the application name. These later
lookups confirm that the LU assigned earlier is still correct. In this case, confirmation failed. Contact the IBM
software support center.

302E TakeoverRecon with a different APPL attempted.
   An end user is attempting a session reconnect takeover and is specifying a different application name than
the original session used. The original session is dropped and takeover is performed without the reconnect
function.

302F System security user profile not defined.
   The user profile is not defined in the system security application. Contact your local system or security
administrator.

3030 TakeoverRecon with a different USERID attempted.
   An end user is attempting a session reconnect takeover and is specifying a different user ID than the
original session used. The original session is dropped and takeover is performed without the reconnect
function.

3031 Specified different applname when DEFONLY coded.
   The default application name on the DEFAULTAPPL, PRTDEFAULTAPPL, LINEMODEAPPL, or
LUMAP-DEFAPPL statement has DEFONLY coded. This means that the user can log on only to that
application. In this case, the user attempted to log on to a different application name from a USS screen or
the solicitor panel. These screens can be sent because of a logon error, logoff of a logappl session, or logoff
of a session when FIRSTONLY is coded.

3032 Invalid Client Identifier type.
   An internal error caused an invalid client identifier to be used. The PARM1 value is the hexadecimal value
of the client identifier. Contact the IBM software support center.

3033 Invalid Object type.
   An internal error caused an invalid object to be used. The PARM1 value is the hexadecimal value of the
client identifier. Contact the IBM software support center.
3034 **The Object group has no entries.**
   An object group has no valid object entries. The PARM3 value is the group name. Determine the errors in
   the group and try the profile again.

3035 **The Client Identifier has no entries.**
   A client identifier has no valid client identifier entries. If the client identifier is a group, the PARM3 value is
   the group name. Any mapping statement using this client identifier will fail. Correct the client identifier
   errors in the group or on the mapping statement and try the profile again.

3036 **Invalid parms were encountered.**
   Invalid parameters were encountered while processing the statement. Review the syntax for the statement in
   the [Z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/servers/zseries/zos/bkserv/).

3037 **Invalid mapping statement.**
   An internal error caused an invalid mapping statement to be used. The PARM1 value is the hexadecimal
   value of the mapping statement. Contact the IBM software support center.

3038 **Mapping of the Client Identifier failed.**
   A valid client identifier could not be found for this mapping statement. The most probable cause is using a
   Group name before the group is identified.

3039 **Mapping of the Object failed.**
   A valid object could not be found for this mapping statement. The most probable cause a group name was
   used before the group was identified.

303A **The mapping statement is a duplicate.**
   The mapping statement is an exact duplicate of an earlier mapping statement.

303B **Object mapped to Client Identifier is replaced.**
   The DEFAULTAPPL, PRTDEFAULTAPPL, LINEMODEAPPL, USSTCP, and INTERPTCP options allow only
   one object to be mapped to a client identifier. An earlier statement mapped a different object to the client
   identifier on the current line. The PARM1 value is the old object name and the PARM3 value is the new
   object name.

303C **A hash entry was not found.**
   No host name, link name, or user ID hash table entry was found during delete processing. If the problem
   continues, contact the IBM software support center.

303D **Available return code.**
   This return code is not used and is available for future use.

303E **Invalid LU name from LU exit, client, or profile.**
   The connection request being processed is ended because the name is not valid. If the LU name was
   assigned by an LU exit, correct the exit to avoid the naming error. If the LU name was requested by the
   client, either the name specified at the client is incorrect or a group name was specified and the group name
   does not exist in the profile. Check the name specified at the client. If the name is correct, verify that the LU
   group name exists in the current profile. If the LU name was on a mapping statement, either the name was
   specified incorrectly or the name is a group name but the group was not created before the mapping
   statement was processed.

303F **Invalid LUGROUP name.**
   The LU group name specified on the ALLOWAPPL or RESTRICTAPPL statement is not valid. The probable
   cause is that the LU group was not defined earlier. The PARM3 value is the LU Group name that is not
   valid.

3040 **Multiple LUGROUPs were specified. Last one used.**
   Multiple LU groups were defined on the ALLOWAPPL or RESTRICTAPPL statement. The last LU group
   specified is used and is contained in the PARM3 value.

3041 **LUG parameter is used instead of single LUs.**
   One or more LU groups were defined along with single LUs on the ALLOWAPPL or RESTRICTAPPL
   statement. The last LU group specified is used and is contained in the PARM3 value.

3042 **The LU being activated is not on inactive list.**
   The LU name being activated is not on the inactive list and therefore cannot be activated. Use the
   INACTLUS display command to determine which LU names are inactive.
3043 No LU in mapped groups for KEEPLU or TKOGENLU.
   Either the KEEPLU function or the Generic Takeover function is using a suggested LU that does not match any LU in the mapped LU groups for this connection. The saved LU name for the original connection might have been saved based on the SSL user ID or host name and the LU group mappings might be based on the IP address. This can cause a mismatch. The PARM1 value is the LU name that did not match in any LU group mapped to the connection.

3044 User id longer than express logon symbolic.
   The user ID that was returned by security lookup for express logon is longer than the symbolic user ID field. A seven character symbolic user ID was being used but an eight character user ID was returned. The length of the user ID that is returned must be equal to or shorter than the length of the symbolic user ID. Either use the seven character symbolic user ID or use seven or shorter character IDs.

3045 Duplicate RESTRICTAPPL userid. Last one is used.
   The same user ID was specified more than once on the RESTRICTAPPL statement. The PARM3 value is the duplicated user ID.

3046 Available return code.
   This return code is not used and is available for future use.

3047 Available return code.
   This return code is not used and is available for future use.

3048 Allowappl name invalid. Already a Restrictappl.
   The application name contained in the PARM3 value was already defined as a RESTRICTAPPL statement and cannot now be defined as an ALLOWAPPL. Be sure that the application name is correct on each statement.

3049 Invalid Object Function.
   An invalid object function, contained in PARM1, was requested during database processing. Contact the IBM software support center.

304A Invalid Client ID Function.
   An invalid client ID function, contained in PARM1, was requested during database processing. Contact the IBM software support center.

304B Same name Allowappl is being replaced.
   An earlier ALLOWAPPL statement with the same application name that is in the PARM3 value is being replaced by the current statement. Be sure that each statement has the correct application name specified.

304C Same name Restrictappl is being replaced.
   An earlier RESTRICTAPPL statement with the same application name that is in the PARM3 value is being replaced by the current statement. Be sure that each statement has the correct application name specified.

304D LU range lower base does not match upper base.
   The LU range shown in the PARM3 value does not have the same base portion in the lower and upper range names.

304E LU range lower base is higher than upper base.
   The lower base LU name in the LU range shown in the PARM3 value has a higher value than the upper base LU name in the range. Correct the range so that the lower base LU name has a lower value than the upper base LU name.

304F LU range variant larger than 4B. Range ignored.
   The LU range shown in the PARM3 value will generate a range larger than 4294967296 (4B), which is invalid. Reduce the range to be less than 4294967296 (4B).

3050 LU range started as numeric. cannot have alpha.
   The LU range shown in the PARM3 value is assumed to be numeric but an alphabetic character was found in the variant portion. Change the range so that it contains only numeric characters.

3051 LU range started as alpha. cannot have numeric.
   The LU range shown in the PARM3 value is assumed to be alphabetic but a numeric character was found in the variant portion. Change the range so that it contains only alphabetic characters.
3052 This LUMAP replaces earlier LUMAP with same LU.
The LU or group name contained in the PARM3 value is used in an earlier LUMAP statement with different parameters. The current statement replaces the earlier statement. Be sure that each statement is coded correctly.

3053 Client ID already used, cannot be used again.
The client identifier contained in PARM1 was used earlier. If the identifier was used in a group, the PARM3 value is the previous group name. The original identifier is used and this entry is ignored. Be sure that each was coded correctly. When the Client ID is an IP address, PARM1 will contain the hexadecimal value of the last 4 bytes only.

3054 An internal error caused Inactivation failure.
An internal error did not allow the LU inactivation to complete. The most probable causes are storage shortage or corruption of a data structure. Contact the IBM software support center.

3055 Available return code.
This return code is not used and is available for future use.

3056 The LuMap LuGroup does not contain assigned LU.
The LU group assigned to the connection now does not contain the LU name that was already assigned to the connection. This event is probably caused by having multiple LUMAP statements for the same client identifier, which can change based on the application name chosen.

3057 The Appl LuGroup does not contain assigned LU.
The LUs assigned to the chosen application do not match the LU name that was already assigned to the connection. This event is probably caused by having LUs listed in the LU group on the LUMAP statement that are not listed in the LU group (or LU list) assigned to the application.

3058 An invalid range was specified.
The range specified during storage cleanup was not found. The most probable cause is storage corruption. Contact the IBM software support center.

3059 No ParmsGroup defined for PMAP on LU/PRTMAP.
An LUMAP or PRTMAP statement specified an associated ParmsGroup statement using the PMAP parameter. The associated ParmsGroup name could not be found. The associated ParmsGroup statement must be defined before the mapping statement.

305A The password was successfully changed.
The Telnet solicitor panel was used to change an existing password. The change was successful.

305B The requested LU is kept for another client.
The LU name requested cannot be used now because it is being kept for another client that has previously used the LU name. When the KEEPPLU statement time expires, the LU will be available to other clients.

305C Earlier ParmsGroup map replaced with this one.
The same ParmsGroup statement was mapped to the same client identifier more than once. The last mapping is used to concatenate the parameter values.

305D Assoc printer/terminal LU profile mismatch.
The printer connection must be assigned the same profile as the terminal LU. The printer connection will be rejected if a VARY TCPIP,OBEYFILE command update is performed between the terminal LU connections and the printer connection or if the printer connects to a port different from the terminal LU port.

305E No common LU name in both LUMAP & APPL LU sets.
The LU group or single LU defined to the connection by the LUMAP statement or default LU group does not contain an LU name that matches any LU associated with the application by the ALLOWAPPL or RESTRICTAPPL-USER statement.

305F The LU is already locked. Pass to next LU.
The LU that was selected is already locked by another process. The generic search immediately passes to the next LU.

3060 WLMCLUSTERNAME must have stack affinity.
The WLMCLUSTERNAME parameter statement has been coded. When this parameter is specified, the TCPIPJOBNAME parameter statement must also be coded to ensure stack affinity.
3061 Profile is being cleaned up but has connections.
A profile is being cleaned up when the port is ending. A connection count check was performed to ensure that all connections were cleaned up, but the check found that not all connections were cleaned up. Contact the IBM software support center.

3062 LU is inactive on LUNR.
A shared LU was assigned to a connection on the LUNR. The LU was already marked as inactive on the LUNR. The LU will be marked as inactive on the LUNS. The LU must be activated on the LUNR and the LUNS before it can be assigned again.

3063 LU is active on LUNR.
A shared LU was assigned to a connection on the LUNR. The LU was already marked as active on the LUNR. The LU will be marked as inactive on the LUNS. Ensure that the LU is not defined in any nonshared groups on the LUNR. The LU must be activated on the LUNS before it can be assigned again.

3064 LU is not known to VTAM on LUNR.
A shared LU was assigned to a connection on the LUNR. The LU was not known to VTAM and the session could not be opened using this LU. The LU will be marked as inactive on the LUNS. The LU must be defined to VTAM on the LUNR and activated on the LUNS before it can be assigned again.

3065 LU is already active to VTAM on LUNR.
A shared LU was assigned to a connection on the LUNR. The LU was already active to VTAM and the session could not be opened using this LU. The LU will be marked as inactive on the LUNS. Ensure that the LU is not locally defined to any other LUNR. The LU must be activated on the LUNS before it can be assigned again.

3066 Incorrect use of VREQ continuation.
An internal error occurred while processing a configuration statement. Contact the IBM software support center.

4001 Available return code.
This return code is not used and is available for future use.

4002 TN3270E header is in error.
The TN3270E header in the message received from the client contains an error. Using a client trace, analyze the header. If the header seems to be correct, contact the IBM software support center.

4003 SSCP LU data is invalid.
Telnet received 3270 data, a response, or is still in session when the connection is in SSCP-LU mode. Use a client trace or a DEBUG CONN TRACE statement to verify that the client does not send 3270 data or a response after issuing a SYSREQ statement to change to SSCP-LU mode.

4004 TN3270E subfunction was not negotiated.
The function requested by the client in the TN3270E header was not negotiated to be supported during connection startup. Use a client trace or DEBUG TRACE statement to identify the unsupported function and determine why the client is requesting a function that is not supported.

4005 TN3270E datatype is not supported.
Telnet does not accept BIND, UNBIND, or NVT data from the client. Determine why the client is sending this data.

4006 Data received from the client is invalid.
Probable causes include receiving a TN3270E header with no data or receiving a response with an invalid flag value. See RFC 2355 for valid response values. Using a client trace or DEBUG TRACE, determine which data is not valid and why the client is sending this data. See Appendix A, “Related protocol specifications,” on page 931 for information about accessing RFCs.

4007 VTAM Rsp received but previous rsp not complete.
A response was received from VTAM before an earlier response was completed. Contact the IBM software support center.

4008 VTAM Rsp received but was not expected.
A response was received from VTAM but Telnet was not expecting a response. Contact the IBM software support center and provide a VTAM internal trace and the Telnet debug information.

4009 Negative VTAM Rsp is invalid.
A negative response from VTAM was received with sense information that is not valid, according to RFC
2355. Determine why the application sent the invalid sense information and change the application. See Appendix A, “Related protocol specifications,” on page 931 for information about accessing RFCs.

400A Printer data is invalid.
Telnet received either SCS data or 3270 data. These datatypes are not supported by the client, according to connection negotiation. Check the client to determine whether the data type option can be turned on or off. Otherwise, use a client trace or DEBUG TRACE during connection setup to verify what options are supported.

400B No data to send to the client.
A request parameter list (RPL) was received from VTAM. Telnet determined that no data is available to send to the client. Contact the IBM software support center.

400C BIND being sent to the client is invalid.
Probable causes are a BIND was already sent to the client or the BIND is zero length. Verify that the application is sending the correct sequence of BINDs and UNBINDs. If the application does not appear to be at fault, contact the IBM software support center.

400D UNBIND being sent to the client is invalid.
Probable causes are an UNBIND was already sent to the client, a BIND was never sent, or the UNBIND is zero length. Verify that the application is sending the correct sequence of BINDs and UNBINDs. If the application does not appear to be at fault, contact the IBM software support center.

400E Attempt to send BIND to client in SSCP-LU mode.
A request to send a BIND to the client is refused because the connection is in SSCP-LU mode. The client cannot accept binds.

400F Amount of data exceeded MAXRECEIVE value.
The amount of data received without an end-of-record indicator exceeded the value coded on the MAXRECEIVE statement or it exceeded the default value. A probable cause is a broken client is in a send loop or a corrupted data length that is large was used.

4010 Number of data packets exceeded MAXVTAMSENDQ.
A data packet in Telnet is created when an end-of-record indicator is received. Then, the data packet is sent to the host application or is queued if the application cannot accept the data. In this case, the queue count exceeded the value coded on the MAXVTAMSENDQ statement or it exceeded the default value. A probable cause is an application that is not receiving data is stalled. Determine why the host application is not receiving data.

4011 Negative response from client received.
This special case occurs when the original BIND sent to the client does not allow exception responses. Most clients require that a BIND that is received allows exception responses. To avoid numerous connection drops, Telnet adds an exception response to the bind if one is not already specified. In this case, an exception response was returned from the client. Telnet knows that the application is not able to handle the exception and ends the session. Determine why the client found exception with the data it received.

4012 Invalid Send attempted while negotiating conn.
This special case occurs when a VTAM send request is attempted before negotiation complete. The client is usually a line-mode client that sends a carriage return or line feed before the negotiation is complete. The client will be disconnected.

4013 SNA sense error.
SNA sense data was expected in the data from the client, but the data length was not long enough to contain the SNA sense code.

4014 Client negotiation loop detected.
This special case occurs when a given client loops sends the same negotiation command to the Telnet server. The client will be disconnected. Use a client trace or DEBUG TRACE to identify the command that is repeated and determine why the client is in a negotiation loop.

4015 Client Sending in multiple USS/SOL messages.
This case occurs when a client starts sending many USS or Solicitor inputs in a single packet. This can cause severe server stalls or overhead. This return code serves as a hot IO detection for USSMSG or Solicitor processing. Use a client trace to identify the command that is repeated and determine why the client is in a loop. The client is disconnected.
4016 MAXRUCHAIN exceeded for session
The host application has exceeded the number of RUs specified by the MAXRUCHAIN value before ending the current RU chain. Modify the application to send a smaller RU chain or increase the MAXRUCHAIN value.

4017 TVLU not found
This special case occurs when a SNA BIND is received following a CLSDST PASS and the corresponding Telnet LU cannot be located. A probable cause is that Telnet LU cleanup is occurred at the same time that the BIND was received. If the problem persists, contact the IBM Software Support Center.

4018 Amount of data exceeded MAXTCPSENDQ
When data arrives at Telnet from VTAM, the storage is queued for delivery to the client. This return code is set if the amount of storage queued exceeds the value specified by MAXTCPSENDQ. A probable cause is an application sending data to the client too quickly.

5001 Invalid TN3270E function code while negotiating.
The client is requesting an TN3270E function code that is not valid during function negotiation. Change the client so that it does not request the function that is not valid. Use a client trace or DEBUG TRACE to determine which invalid function codes are being requested.

5002 Invalid TN3270E function during negotiation.
The client is requesting an invalid TN3270E function that is not valid during function negotiation. Use a client trace or DEBUG TRACE to determine which invalid function is being requested.

5003 Printer negotiation does not allow SCS or DATA.
During connection negotiation with a printer, neither SCS nor DATA datatypes were negotiated. The client must support at least one of these datatypes to accept printer data from Telnet.

5004 WILL or DO command request rejected.
A Telnet command request from the client is unknown to the server and will be rejected. The PARM1 value is either the WILL (X'FB') command or the DO (X'FD') command and the PARM2 value is the option code.

5005 End-of-Record negotiation option failed.
A failure occurred during negotiation. Contact the IBM software support center.

5006 Transmit Binary negotiation option failed.
A failure occurred during negotiation. Contact the IBM software support center.

5007 Terminal being taken over is inactive.
A probable cause is that the original LU is deactivated. Issue an INACTLUS display command to confirm that the LU is not active.

5008 An unknown TN3270E subnegotiation detected.
An unknown TN3270E subnegotiation was received from the client. Use a client trace or DEBUG TRACE to determine which subnegotiation is in error.

5009 An unknown negotiation error was detected.
A negotiation error was detected by Telnet but is not a known error type. Use a client trace or DEBUG TRACE to determine which negotiation command is in error.

500A An unexpected new environment command detected.
An unexpected command for the new environment function was received from the client. Use a client trace or DEBUG TRACE to determine what negotiation command is in error.

500B An invalid TN3270E command detected.
An invalid TN3270E command was received from the client. Use a client trace or DEBUG TRACE to determine which negotiation command is in error.

500C An invalid SSL takeover attempt detected.
An end user is attempting a takeover of a connection that uses SSL. The new connection does not use SSL. The takeover will be ended and the client disconnected.

500D Telnet Server does not support TN3270 printer.
A client connected with a TN3270 connection type is trying to emulate a printer. This event is not supported by Telnet. Only TN3270E connections can support printer emulation. The client is disconnected.
6001 SSL/TLS failure while getting client ID.
Get ClientID request failed during SSL processing. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code from the get clientid request. Contact the IBM software support center.

6002 SSL/TLS handshake failed.
The SSL handshake with client failed. The PARM1 value is the hexadecimal error return code and the PARM3 value is the function. If the return code that you receive is not listed below or if you cannot determine the cause of the failure, see [z/OS Cryptographic Services System SSL Programming]. These SSL function return codes are listed as decimal values in [z/OS Cryptographic Services System SSL Programming] and are passed to Telnet by System SSL. The key ring file name is case sensitive. When adding the key ring name to the Telnet profile, be sure that you use the correct case. If KEYRING SAF was specified in the TN3270 profile, ensure that the TN3270 server has access to the IRR.DIGTCERT.LISTRING resource in the FACILITY class.

If PARM1 is one of the following values, try the appropriate action before calling the IBM software support center.

108 (X'6C')
The System SSL library (SGSKLOAD) could not be loaded. Ensure that TCP has access to this library.

401 (X'191')
The certificate is expired.

402 (X'192')
None of the encryption algorithms requested by the client are supported for this port. If the ENCRYPT block is coded in the TELNETPARMS block, verify that all necessary algorithms are included. Ensure that the correct level of client code is installed on the client.

403 (X'193')
A valid server certificate was not found. If KEYRING SAF was specified in the TN3270 profile, do the following:
• Ensure that the server and signer certificates in the key ring are defined as trusted.
• If the key ring includes certificate authority or site certificates, ensure that the TN3270 server has control access to the IRR.DIGTCERT.LISTRING resource in the FACILITY class.
• If the certificates were added with the ICSF option, ensure that appropriate access was given to the CSFSERV resources.

405 (X'195')
The certificate type is not supported.

410 (X'19A')
An SSL message was incorrectly formatted. The following are some situations that might cause this error:
• If you are using client authentication, the client certificate was rejected during the SSL handshake. Possible problems are: The certificate expired, the certificate is not issued by a trusted CA, the certificate is in the Certificate Revocation List (CRL).
• If you are using client authentication, this message might occur if the certificate is not immediately available to the client. The client will reconnect when the client certificate is available.

414 (X'19E')
The certificate is not valid.

420 (X'1A4')
The connection was closed by the peer. If you are using client authentication, some clients disconnect when the server requests the client certificate and will reconnect when the client certificate is available.

428 (X'1AC')
No key was found for the server certificate.

437 (X'1B5')
All data has been sent by the client and no more data will be sent. The connection will be closed.
For other errors, see z/OS Cryptographic Services System SSL Programming.

**6003 SSL/TLS client authentication failed.**
Client authentication was requested but the client did not provide a valid certificate. Either the client did not provide a certificate or the server does not consider the client certificate to be valid. The certificate of the CA that issued the client certificate must be in the key ring of the server and must be trusted. Also, ensure that the client certificate is not expired. PARM1 might contain the system security return code for the handshake. The PARM3 value might contain the function that was being processed when the error occurred.

**6004 SSL/TLS initialization failed.**
The system security interface task is not initialized. Look for an earlier DEBUG message to determine why the system security initialization task failed.

**6005 SSL/TLS READ failed.**
An error occurred while system SSL was reading data. The PARM1 value is the return code. Contact the IBM software support center.

**6006 SSL/TLS Give Socket failed.**
The give socket process failed during the SSL/TLS handshake. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code from the give request respectively. Contact the IBM software support center.

**6007 SSL/TLS Take Socket failed.**
The take socket process failed during the SSL/TLS handshake. The PARM1 value is the return value, the PARM2 value is the return code, and the PARM3 value is the reason code from the take request respectively. Contact the IBM software support center.

**6008 SSL/TLS SEND failed.**
An error occurred during a send request. The PARM1 value is the return value and the PARM2 value is the return code. The PARM3 value might contain the reason code. Contact the IBM software support center.

**6009 SSL/TLS userid mismatch.**
On takeover reconnect, the user ID associated with the client certificate did not match the original value.

**600A SSL/TLS client authentication mismatch.**
A takeover reconnect was attempted with a reduced CLIENTAUTH level. Ensure that the correct level of client code is installed on the takeover client.

**600B SSL/TLS invalid negotiation subcommand.**
During negotiated SSL/TLS, a subcommand other than StartTLS_Follows was received. The protocol used by the client might not match that used by the server. Use a client trace or DEBUG TRACE to verify that the client is using the correct SSL negotiation.

**600C SSL/TLS unexpected negotiation command.**
A StartTLS_Follows subcommand was received but negotiated SSL/TLS had not been requested by the server. The protocol used by client might not match that used by the server. Use a client trace or DEBUG TRACE to verify that the client is using the correct security negotiation.

**600D Negotiated SSL/TLS rejected by client.**
The negotiated SSL/TLS is rejected by the client. The Telnet server attempted to negotiate SSL/TLS but the client responded with a WONT STARTTLS message. The CONNTYPE for this connection is SECURE or NEGTSECURE. Because a secure connection is required and the client did not attempt to enter an SSL connection, the connection is closed.

**600E SSL/TLS handshake timed out.**
The time required for the client to respond to the handshake request exceeded the value coded on the SSLTIMEOUT statement or it exceeded the default. This might be expected if CONNTYPE SECURE is specified for the connection and the client uses the negotiated security protocol. Otherwise, increase the time to wait or determine why the client is not responding quickly enough.

**600F System SSL initialization failed.**
The setup of the security interface task failed. Secure ports will not be available, but basic Telnet is available. The Telnet interface task was set up, code began to run, but an error occurred during initialization. The PARM1 value is the hexadecimal security task return code. If the return code in PARM1 you receive is not listed below or if you cannot determine the cause of the failure, see z/OS Cryptographic Services System SSL Programming. These SSL function return codes are listed as decimal values in z/OS Cryptographic Services System SSL Programming and are passed to Telnet by System SSL. The key ring file name is case
sensitive. When adding the key ring name to the Telnet profile, be sure that the correct case is used. If KEYRING SAF was specified in the TN3270 profile, ensure that the TN3270 server has access to the IRR.DIGTCERT.LISTRING resource in the FACILITY class.

If PARM1 is one of the following values, try the appropriate action before calling the IBM software support center.

**102 (X'66')**

Key ring file I/O error. The cause of the error can be one of the following:

- Unable to read the key ring file required for secure communications
- Secure communications cannot continue

Verify that the z/OS UNIX file system is operating correctly and ensure that the file permissions on the key ring file are correct.

**103 (X'67')**

Key ring file bad format. The cause of the error can be one of the following:

- The key ring file format is incorrect
- Secure communications cannot continue

Ensure that the key ring file is correct.

**201 (X'C9')**

Key ring file bad password. The cause of the error can be one of the following:

- The password is incorrect or no stash file is found.
- Your cryptography hardware and ICSF are active but the TCP user ID was not given access to the RACF CSFSERV class resources.

Ensure that a stash password file was created. If the password was changed recently, ensure that the stash file was re-created. If cryptography hardware is installed, ensure that TCP was permitted to the RACF CSFSERV resources.

**202 (X'CA')**

Key ring file open failed. The cause of the error can be one of the following:

- Unable to open the key ring file or the key ring password stash file, which is required for secure communications. If the CRLLDAPSERVER option is specified, the LDAP server might not be accessible.
- Secure communications cannot continue.

Verify that the z/OS UNIX file system is operating correctly. If a z/OS UNIX key ring is used, verify that the stash file is in the same directory as the key ring file. If the key ring file is an MVS data set, verify that the stash file is also an MVS data set. Ensure that the file permissions on the key ring file are correct. Verify that the LDAP server, if specified, can be accessed from this stack.

**401 (X'191')**

The default certificate in the key ring file has expired or is outside the valid date range. The cause of the error might be that the default certificate in the key ring file is no longer valid.

Refresh the certificate in the key ring file.

**408 (X'198')**

See return code 201(X'C9').

**428 (X'1AC')**

No private key. The cause of the error might be that the private key for the server certificate is not in the key ring file.

Ensure that the key ring contains both the server certificate and private key.

For other errors, see [z/OS Cryptographic Services System SSL Programming](https://www.ibm.com/docs/en/zos-cryptographic-services/2.2.0?topic=ssl-ssl-programming)
EZZ6035I

6010 Attach of the security interface task failed.
The MVS macro, ATTACH, failed to attach the SSL task during Telnet initialization. The PARM1 value is the ATTACH return code. Contact the IBM software support center.

6011 The security interface task has ended in error.
The security interface task ended as the result of an error condition. Instance 01 indicates that the task was set up correctly and at some later time, an error occurred. The PARM1 value is the interface task return code. Instance 02 indicates that the task was set up, but the interface task code never ran. The PARM1 value is a system completion code. The SSL task will be reattached up to three times in 10 minutes. See message EZZ6005I for the status of the reattachment. If it still fails, new connections cannot initialize for SSL. Failure might also indicate that the task was set up, the interface task code was initialized, but an error quickly occurred. The PARM1 value is the interface task return code. Contact the IBM software support center.

6012 ISTENINI could not be loaded.
The ISTENINI module used by TN3270 security support could not be loaded. The PARM1 value is the return code from the LOAD. Ensure that ISTENINI is accessible and APF authorized. Secure ports will not come online. Basic ports are not affected.

6013 CEEPIPI environments could not be initialized.
The CEEPIPI environment used by TN3270 security support could not be initialized. The PARM1 value is an additional internal return code useful to IBM Support. Secure ports will not come online. Basic ports are not affected. Contact the IBM software support center.

6014 CEEPIPI environments could not be expanded.
The CEEPIPI environment used by TN3270 security support could not be expanded. The PARM1 value is an additional internal return code useful to IBM Support. There are more encryption requests than the current C environments created by Telnet can handle. Processing will continue, but response time might be degraded. The most probable reason additional CEEPIPI environments could not be increased is that the required storage is not available.

6015 SSL/TLS HANDSHAKE WRITE complete not immediate.
The system SSL write command during the HANDSHAKE process is issued asynchronously. Because this process is running in TCB mode, a SUSPEND command cannot be issued without blocking all other handshake processes. Ensure that the stack buffer size is at least 1024 bytes to prevent this. The session setup will fail and disconnect the client.

6016 Passticket could not be obtained.
An attempt to obtain a Passticket from RACF failed for an Express Logon macro. The PARM1 value is the SafRC from RACF, if it is available. Contact the IBM software support center.

6017 The Telnet SSL task abended.
An abend occurred in EZBTTSSL. The function will attempt to recover without the abend. The connection being processed might be disconnected with this reason code. If three failures occur in 10 minutes the task will end. See message EZZ6035I return code 6011 for a possible reason. If possible, the task will then be reattached. Look for message EZZ6005I for more information. If the problem continues, contact the IBM software support center.

6018 The Client initiated a second SSL/TLS handshake.
A client using a secure connection is in session with the SSL/TLS handshake complete. The client initiates another handshake request. The Telnet server does not support this condition. The client is disconnected.

6019 SSL handshake after SSL handshake expired.
An SSL handshake header was encountered after the SSL handshake expired. Increase the setting for the SSLTIMEOUT parameter or determine why the client is not responding quickly enough.

601A Available return code.
This return code is not used and is available for future use.

601B Available return code.
This return code is not used and is available for future use.

601C Available return code.
This return code is not used and is available for future use.

601D Available return code.
This return code is not used and is available for future use.
601E Available return code.
   This return code is not used and is available for future use.

601F KEYRING is required on a Secure Port.
   A secure port was defined in TelnetParms but the KEYRING option was not specified in either the
   TelnetGlobals statement or the TelnetParms statement.

6020 The KEYRING name is invalid.
   The name might be different from the name used with current active profiles. Use the profile display
   command to determine whether a key ring is defined. The name might not be valid because it is different
   from the one already accepted for the profile that is being processed.

6021 The SSL parameter is invalid on non-Secure Port.
   SSL parameters are not valid on basic ports. It is assumed that the port was meant to be secure because of
   the SSL parameter specified. If it is intended to be basic, remove the SSL parameter.

6022 The SSL Encryption value is invalid.
   The SSL Encryption value contained in the PARM3 value is not valid compared to the values supported by
   the SSL subsystem. These values can be identified by displaying the Telnet defaults using the object display
   and specifying ID="DEFAULT.

6023 The Encryption statement has no valid values.
   All values specified are not valid or no values were specified. At least one valid value must be specified to
   allow the profile to process successfully.

6024 KEYRING type SAF specified but SAF unavailable.
   The KEYRING statement was specified a SAF name but the secure access facility is not available. Ensure
   that the SAF product (such as RACF) is available and reprocess the profile.

6025 ClientAuth SAF specified but SAF unavailable.
   The ClientAuth statement specified SAFcert but the secure access facility is not available. Ensure that the
   SAF product (such as RACF) is available and reprocess the profile.

6026 ClientAuth SAF specified but SAFcert unavailable.
   The client authentication portion of the secure access facility is not available. Basic SAF might be available
   even when the client authentication is not available. Ensure that client authentication is available and
   reprocess the profile.

6027 Global SSL Parm ignored on basic/TTLS port.
   Global SSL parameters cannot sift down to basic ports. To avoid this message when a mixture of basic and
   secure ports are defined, specify the SSL parameters in the TelnetParms blocks instead of in TelnetGlobals.

6028 ParmsGroup SSL Parm ignored on basic/TTLS port.
   SSL parameters have no affect on basic ports and are ignored in ParmsGroup statements. If the BeginVtam
   block defines both basic and secure ports the message can be avoided by splitting the BeginVtam block into
   two blocks, one for basic and one for secure. If the BeginVtam block defines only basic ports, remove the
   SSL parameters.

6029 The CRL LDAP SERVER name is invalid.
   The CRL LDAP server name is not valid because a CRL LDAP server with a different name was already
   defined for active profiles. To change the name, deactivate all secure ports and then process the new profile
   with the new CRL LDAP Server name.

602A The CRL LDAP does not have a keyring.
   The CRL LDAP server is used with secure connections, which requires the specification of a key ring. To use
   the CRL LDAP server, process a new profile with a valid key ring.

602B The SSL task initialization failed.
   The Telnet task that supports SSL did not initialize. The PARM1 value is the initialization return code.
   Contact the IBM software support center.

602C An SSL takeover attempt was rejected.
   Previous I/O to the original connection is in progress. The takeover will be aborted and the client
   disconnected.

7001 Invalid character entered on logon panel.
   After translating input to upper case a character that is not valid is found. See PARM1 for the hexadecimal
   value of the character that is not valid.
7002 Load of the default USS table failed.
The default USS table could not be loaded. The most probable cause is that it is no part of the system library is accessible to Telnet. PARM1 might contain the system completion code and PARM2 might contain the reason code. If the load module is accessible to Telnet, contact the IBM software support center.

7003 The default USS table header is an invalid type.
The USS table must be assembled with FORMAT=DYNAMIC using VTAM macros from V4R1 or later. The USS table must have a control block the ID of BD to be valid. If the IBM default USS table is being used, contact the IBM software support center.

7004 Storage for USS/INTERPRET/LUEXIT table failed.
The storage needed to manage or to save the table was not obtained. Increase storage availability. The PARM1 value is the hexadecimal amount of storage requested.

7005 The MVS LOAD of the USS/INTERPRET/LUEXIT failed.
The LOAD of the table or exit failed. The PARM1 value is the reason code of the load failure.

7006 The MVS BLDL of the USS/INTERPRET/LUEXIT table failed.
The specified table or exit was not found. The PARM1 value is the value returned by the MVS BLDL macro in R15. See [z/OS DFSMS Macro Instructions for Data Sets] for information about the MVS BLDL macro. This probably occurred because the table is not in a data set accessible by TCP/IP.

7007 The internal USS table type is invalid.
The table being loaded does not have the correct table identifier of BD or it was not assembled with FORMAT=DYNAMIC using VTAM macros from V4R1 or newer.

7008 The internal INTERPRET table type is invalid.
The table being loaded does not have the correct table identifier of BE. The table is not an INTERPRET table.

7009 No sequence match of input by interpret table.
Input data was passed to the interpret table but did not match any of the sequences in the table. This event is a valid situation and the input data will be processed by the USS table.

700A The returned NQN is in an invalid format.
The interpret table exit routine returned a network qualified name with a format that is not valid. Valid format is name.network where name and network are each a maximum of eight characters.

700B The LU/PRT exit failed the function call.
The LU/PRT exit was invoked with a specific function call. The exit failed the request with a nonzero return code. When the function is ASSIGNLU, the client connection request is ended. The PARM1 value is the return code from the LU exit. The PARM2 value is the specific function call. The PARM3 value is the name of the LU exit. If this error is unexpected, investigate the LU exit to determine the reason for rejecting the requested function.

700C The LU/PRT exit input parameters were changed.
The parameters for an LU or PRT group exit were changed. When the exit is activated, the input parameters are not allowed to be changed. This error was detected during VARY TCPIP,OBDDFILE file processing.

700D The LU/PRT exit has been disabled due to abends.
The LU or PRT exit was disabled. The exit is disabled because it exceeded the maximum number of abends allowed for a user exit. This abend threshold is set at a maximum of three abends in a 10-minute period. Investigate and correct the root cause of the LU/PRT exit abends.

700E Calling LU/PRT exit.
The Debug trace option was selected, causing trace messages to occur. This debug message displays the contents of the parameter list being passed to the LU/PRT exit at invocation time.

700F Return from LU/PRT exit.
The Debug trace option was selected, causing trace messages to occur. This debug message displays the contents of the parameter list upon return from the LU/PRT exit invocation.

7010 LU/PRT exit not allowed with associated printer.
When an associated printer is coded on an LUMAP statement, neither the LU group or PRT group is allowed to be defined as an exit. The LUMAP statement is ignored.

7011 LU name required for LU Exit in MLS environment.
The LU Exit is required to have an LU Name or LU Range defined in the TCPIP Profile to identify a single LU, which will be the Security Standard for the LU Group in a multilevel security environment.
7012 The USS table has a type mismatch.
The USSTCP statement has an SCS or USS3270 table name that has already been added as the other type. Check your profile source and correct the names. The USSTCP can now have USSTCP table1,table2 where table1 is an USS3270 type table, and table2 is an SCS format USS table. The statement is ignored.

7013 A Solicitor screen cannot be sent to a printer.
Telnet attempted to send a solicitor screen to a printer, but a printer cannot accept this screen. A probable cause is that a RESTRICTAPPL is being used, and ALLOWPRINTER was not coded.

7014 LU Exit specified SCS table without 3270 table.
Neither the LU exit nor the USSTCP mapping statement allows an SCS format table to be specified without a valid 3270 format table also being specified. In this case, the LU exit is trying to assign an SCS table without having a 3270 table. Change the exit or create a mapping statement to provide a 3270 format table.

7015 A table specified by the LU Exit is not loaded.
The LU exit returned a USS or Interpret table name that is not valid because the load of the table failed earlier. The connection will continue. If either the 3270 or SCS format table is not valid as a result of a load failure, neither table will be used and either the profile-mapped USS table or the solicitor panel will be used. The PARM2 value specifies the table name that is not loaded.

7016 Incorrect USSMSG length field value.
A USSMSG was to be issued to the client, but the USSMSG in the table was defined with a length of 0.

8001 Available return code.
This return code is not used and is available for future use.

8002 Configuration task setup failed.
The setup of the Telnet configuration task failed. Without the configuration task, Telnet cannot receive any profile statements or operator commands. The PARM1 value is the configuration task return code. Contact the IBM software support center.

8003 Attach of the Configuration task failed.
The MVS macro, ATTACH, failed to attach the Configuration task during Telnet initialization. Without the configuration task, Telnet cannot receive any profile statements or operator commands. The PARM1 value is the ATTACH return code. Contact the IBM software support center.

8004 The Configuration task has ended in error.
The Configuration task ended because of an error condition that caused three abends in a 10-minute period. Without the configuration task, Telnet cannot receive any profile statements or operator commands. Contact the IBM software support center.

8005 Available return code.
This return code is not used and is available for future use.

8006 Incomplete profile update aborted for this one.
An earlier profile process that did not finish because an error is ended without being applied. The new profile request is processed. It is uncommon to end a profile in progress. If the problem persists, contact the IBM software support center.

8007 No IP mask exists for the delete request.
The IP subnet mask entry is being deleted but the IP mask cannot be found. Data corruption is the probable cause. If the problem persists, contact the IBM software support center.

8008 An AbendTrap has already been set.
A VARY AbendTrap command was already issued setting the Abend Trap. Use the Profile display command to see what is set. If you want to change the trap, turn off the current trap by specifying "OFF" as the module name and then set the new trap.

8009 Unknown display request code.
Internal processing created an incorrect display request code. This should not occur. If the problem persists, contact the IBM software support center.

800A Invalid Profile specified on Display command.
The profile number or type specified on the DISPLAY command is invalid. Issue the command with a valid profile number or no profile number.

800B Invalid DEBUG command option.
A DEBUG option other than OFF was specified. OFF is the only valid command option now.
800C Ending profile processing but none in progress.
   Telnet received an "end profile" command from the TCP/IP Configuration task but no profile process was in progress. This should not occur. If the problem persists, call the IBM software support center.

800D No port match for VARY command.
   The port number, range, or type specified does not match any active port. Reissue the command with an active port.

800E No port specified but multiple ports exist.
   The VARY command requires that a port number, range, or type be specified if more than one port is active. Without a port specified, it is unclear whether all ports were meant to be affected.

800F No ports active for VARY command.
   There are no ports active in Telnet now. The command has no affect.

8010 Unknown profile statement SubType encountered.
   Internal processing created an unknown profile statement SubType. The PARM1 value is the invalid subtype. This should not occur. If the problem persists, contact the IBM software support center.

8011 Transform activation request ignored.
   Transform is already active on another port and cannot be activated on this port. The original port must be deactivated before transform can be specified on this port.

8012 Invalid length received for profile statement.
   An internal error caused the statement record to indicate an incorrect length for the profile statement received from the TCP/IP stack. If the problem persists, contact the IBM software support center.

8013 Invalid parameter received in profile statement.
   An internal error caused the statement record to indicate an incorrect parameter for the profile statement received from the TCP/IP stack. If the problem persists, contact the IBM software support center.

8014 LUSESSIONPEND replaces QUEUESESSION.
   LUSESSIONPEND and QUEUESESSION are mutually exclusive. If both are specified at any time in the profile, LUSESSIONPEND is used.

8015 QUEUESESSION ignored, already LUSESSIONPEND.
   LUSESSIONPEND and QUEUESESSION are mutually exclusive. If both are specified at any time in the profile, LUSESSIONPEND is used.

8016 Invalid devicetype specified.
   An invalid device type was specified on the TELNETDEVICE statement. See the TELNETDEVICE statement in z/OS Communications Server: IP Configuration Reference for a list of valid device types.

8017 Invalid 3270E devicetype specified.
   An invalid 3270E device type was specified on the TELNETDEVICE statement. See the TELNETDEVICE statement in z/OS Communications Server: IP Configuration Reference for a list of valid device types.

8018 Codepage setup, including defaults, failed.
   No translation tables from the specified Codepage statement or the defaults were generated. The internal Telnet translation tables will be used.

8019 Unknown profile statement ReqType encountered.
   Internal processing created an unknown profile statement ReqType. The PARM1 value is the invalid ReqType. This should not occur. If the problem persists, contact the IBM software support center.

801A BEGINVTAM block with no port number.
   Multiple BEGINVTAM blocks were specified in the profile. At least one block did specify a port number implying multiple ports. It is unclear which port the no-port BEGINVTAM should be matched with and is therefore ignored.

801B Multiple BEGINVTAM blocks. Last one is used.
   Multiple BEGINVTAM blocks for the same port were found in the profile. The last block is used.

801C Multiple TELNETPARMS blocks. Last one is used.
   Multiple TELNETPARMS blocks for the same port were found in the profile. The last block is used.

801D Multiple PORT blocks. Last one is used.
   Multiple TELNETPARMS blocks for the same port were created from multiple PORT statements. The last block is used.
**EZZ6035I**

**801E BEGINVTAM block with no TELNETPARMS block.**
A BEGINVTAM block was found in the profile but has no matching TELNETPARMS block. A port definition must have both a BEGINVTAM block and a TELNETPARMS block to be successfully started or updated.

**801F TELNETPARMS block with no BEGINVTAM block.**
A TELNETPARMS block was found in the profile but has no matching BEGINVTAM block. A port definition must have both a BEGINVTAM block and a TELNETPARMS block to be successfully started or updated.

**8020 Initialization of the Telnet Port failed.**
Port activation includes attaching a load module that performs all the connection tasks. The attach or initialization of the task failed. The return code is contained in PARM1.

**8021 Maximum number of Telnet Ports exceeded.**
The maximum number of Telnet ports is 255. No more ports can be activated until existing ports are deactivated.

**8022 Port has both secure and basic components.**
The port being quiesced, resumed, or stopped has both secure and basic components. Because the port is both secure and basic, the command will not alter the port. To alter the port, reissue the command for the port without the secure or basic option.

**8023 Placement accepted. Use TELNETPARMS in future.**
The parameter placement in BEGINVTAM is accepted now but will have to be moved to TELNETPARMS in a future release. Move the parameter now to stop receiving the warning message. The parameter statement can now be placed in the TELNETGLOBALS, TELNETPARMS, orParmsGroup.

**8024 Display syntax obsolete. Use OBJ/CLID display.**
The display command is no longer supported in its original format. The use is accepted but is internally translated to one of the OBJect or CLient IDentifier display commands. Use the appropriate OBJect or CLient IDentifier display command to avoid this message.

**8025 The Group must have less than 4294967296 LUs.**
The number of LUs in the group exceeds the Telnet limit of 4294967296. Reduce the number of LUs in the group.

**8026 Usage accepted but obsolete in future release.**
The statement usage is accepted now but will become obsolete in a future release.
- INTERNALCLIENTPARMS - Replace with TELNETPARMS.
- QUEUESESSION - For the DEFAULTAPPLs that QUEUESESSION is affecting, add an ALLOWAPPL statement with the QSESSION option.

**8027 Display syntax obsolete. Use PROF, det display.**
The display command is no longer supported in its original format. The use is accepted but is internally translated to the Profile detail display command. Use that display to avoid this message.

**8028 First character must be equal and not numeric.**
The old style LU range requires that the first character be alphabetic or a national character (@#$) and the low entry first character must match the high entry first character. The first character might be an alphabetic range using the range rules.

**8029 Variable must be all numeric or all alpha.**
When no range rule is supplied, the old style LU range rule of LUBase+LowerRange..LUBase+UpperRange is used. It requires that the variable portion be contiguous, in the rightmost portion of the name, and entirely alphabetic or entirely numeric. If a more complex combination or variable position is required, use an explicit range rule.

**802A First entry is higher than the second entry.**
The first entry must be lower than the second entry to create a valid range. Ensure that the first variable column in the first entry is lower than the first variable column in the second entry. The order for Telnet LU range characters is 0-9, A-Z, @, #, $.

**802B Port stop in progress. Profile update ignored.**
A profile update by the VARY TCPIP,OBEYFILE command or Telnet start was attempted for a port that is in the process of stopping. Reissue the VARY TCPIP,OBEYFILE command after the port has stopped.
EZZ6035I

802C Variant does not match range entries.
The variant is not valid for the LU range entries specified. The range might indicate Fixed when the Start character is different from the End character or the character might not be valid for the variant specified.

802D The variant must be fixed.
The variant must be fixed for the character index. A character is the same in both the Start and End names with a variant other than Fixed with no variable character to the left. PARM1 will contain the RULE used on the LUGROUP. The letter E will appear in the position where the error was detected.

802E IPv6 address invalid in IPv4 environment.
An IPv6 format IP address was specified in the profile. Its use is not allowed in an IPv4 environment. Either change the IP address format or reinitialize the system to support IPv6 addresses.

802F TCPIP Profile Attempted to Change NACUSERID.
A NACUSERID cannot be added, omitted, or altered for an active TN3270 port in subsequent profiles. To add, omit, or alter a NACUSERID, the port must be stopped and then restarted with changes.

8030 NACUSERID profile undefined in security server.
The NACUSERID in the TCPIP profile is not defined by a security server profile.

8031 General security server error for NACUSERID.
An error was reported by the security server while attempting to create an ACEE for this NACUSERID. This error might include undefined NACUSERID profiles.

8032 FORMAT SHORT invalid in an IPv6 environment.
IPv6 addresses are potentially long and require a long print format. FORMAT SHORT is invalid in an IPv6 environment or when an IPv6 address was specified in the profile.

8033 No valid BEGINVTAM/TELNETPARMS blocks.
There are no matching BEGINVTAM/TELNETPARMS blocks to create or update a Telnet port. At least one set of BEGINVTAM/TELNETPARMS block must be present for an update to occur. A TELNETGLOBALS block by itself will update nothing because there is no port update to associate with the TELNETGLOBALS block.

8034 IP Address Range has no unique IP Addresses.
A Range was specified in an IPGROUP or DESTIPGROUP where all the addresses in its range were already accounted for by previous IP addresses and/or Ranges. Subnet Masks and Prefixes do not contribute to this error.

8035 IP Address Range failed bounds test.
A Range was specified that violates one or more of the following range bounds rules:
• Low IP less than or equal to High IP
• IPv4 Addr = xxx.xxx.xxx.nnn
• IPv6 Addr = xxxxxxx:xxxxxxxx:xxxx:x.x.x.x

8036 Group not added. Monitor Group table full.
The monitor group table can hold 255 unique entries. The table is full and the current monitor group will not be added to the table. Either too many groups were specified in the profile or the accumulation of monitor groups across several profiles is over the maximum. A Group is removed from the Monitor Group table when the profile defining the group is non-current and there are no active connections on the entire non-current profile.

8037 Bucket boundary value invalid.
A bucket boundary value is invalid. Bucket boundary values starting at BOUNDARY1 up to BOUNDARY4 cannot decrease in value. The PARM1 value is (in hexadecimal notation) the value in error. The PARM3 value is the parameter in error. The group is ignored. Fix the boundary value so that each value is equal to or greater than the one before it.

8038 Profile dataset failed to open.
The specified data set on the Profile DD statement or on the VARY TCPIP,OBEYFILE command was allocated successfully but did not OPEN successfully. The PARM3 value is the rightmost 22 characters of the data set name. If greater than 22 characters, three dots (...) precede the rightmost 19 characters of the data set name.

8039 Profile dataset synchronous read error occurred.
The specified data set on the Profile DD statement or on the VARY TCPIP,OBEYFILE command was
allocated and OPENed successfully but a read buffer procedure failed. The PARM3 value is the rightmost 22 characters of the data set name. If greater than 22 characters, three dots (...) precede the rightmost 19 characters of the data set name.

803A The statement is obsolete and ignored.
The Telnet statement specified is obsolete and no longer valid. The PARM3 value is the statement that is ignored. Profile processing continues.

803B New block stmt but already in TG,TP,BV,or PG.
A new block statement was encountered while already in another block statement. The PARM2 value is the type of block being processed and the PARM3 value is the new block statement specified in error. Profile processing is ended.

803C End block received but not in that block.
A block ending statement was encountered while in a different statement block. The PARM2 value is the type of block being processed and the PARM3 value is the block ending statement in error. Profile processing is ended.

803D Entire profile process ended. No updates.
This return code is issued whenever a profile is ended because of a previous error severe enough to stop profile processing. No statements are processed. Fix the error indicated in prior debug statements and rerun the profile.

803E Parameter on command is invalid.
A parameter on the Telnet command is invalid. The command is ignored. The PARM2 value is the specific Telnet command and the PARM3 value is the parameter in error.

803F The operator command is invalid.
The Telnet command is invalid. The command is ignored. The PARM3 value is the invalid command.

8040 Parameter is not a number.
The value on the statement in the profile or command is expected to be a number but it is not. The PARM2 value is either the profile statement or the command parameter. The PARM3 value is the value specified that should have been a number.

8041 Parameter is not VTAM style format.
The value on the statement in the profile or command is expected to be a VTAM style name but it is not. The PARM2 value is either the profile statement or the command parameter. The PARM3 value is the value specified that should have conformed to the VTAM style name. See z/OS Communications Server: IP Configuration Reference in the Telnet chapter for information about BEGINVTAM and the general rules for LU naming for valid VTAM style naming convention.

8042 Required parameter missing.
A required parameter on a profile statement or a command is missing. PARM2 is the profile statement or command that is missing the required parameter.

8043 Parameter not used for this statement.
An extraneous parameter was found on a profile statement or command. The parameter is ignored and processing continues. The PARM2 value is the profile statement or command and the PARM3 value is the extra parameter that is ignored.

8044 VTAM style parameter too long.
The VTAM style name is longer than the allowed eight characters. The PARM2 value is the profile statement or command containing the invalid parameter and the PARM3 value is the invalid parameter. For profile processing, an additional message is issued indicating if the statement is usable without the invalid parameter.

8045 Parameter is not Network Qualified Name format.
The profile statement parameter should be a Network Qualified Name. A valid NQN parameter contains two valid VTAM style names connected with a period. The PARM2 value is the profile statement and the PARM3 value is the invalid parameter.

8046 Wildcard invalid for this parameter.
A wildcard format cannot be used on the specified profile statement. The PARM2 value is the profile statement and the PARM3 value is the invalid parameter.
8047 Asterisk invalid for this parameter.
The * wildcard format cannot be used on the specified profile statement. The PARM2 value is the profile
statement and the PARM3 value is the invalid parameter.

8048 Parameter first position cannot be numeric.
The first position of the VTAM style parameter cannot be numeric. The PARM1 value is the first character
specified, the PARM2 value is the profile statement, and the PARM3 value is the invalid parameter.

8049 Parameter longer than allowed.
The parameter specified in the PARM3 value is longer than allowed on the profile statement or command.
The PARM2 value is the profile statement or command.

804A Invalid port range specified.
A Telnet command contains a PORT parameter with an invalid port range specified. The PARM3 value is the
invalid PORT statement.

804B Invalid Client ID TYPE value.
The Client ID type specified on a mapping statement is not valid. See z/OS Communications Server: IP
Configuration Reference in the Telnet chapter for information about BEGINTVATAM and the general rules for
Client IDs for valid Client ID types. The PARM2 value is the mapping statement and the PARM3 value is
the invalid Client ID type and client identifier.

804C DEFAPPL parms but no DEFAPPL.
DEFAPPL parms were found on the LUMAP or PRTMAP statement but no DEFAPPL was specified. The
PARM2 value is the mapping statement and the PARM3 value is the DEFAPPL parameter that is incorrectly
specified. Either add DEFAPPL or remove the DEFAPPL parameter.

804D 20 or more parms is invalid for Telnet commands.
Twenty or more parameters have been specified on the command. No Telnet command has that many
parameters. The command is ignored. the PARM3 value is the command being issued.

804E Capacity limit is invalid.
The capacity limit specified is outside the valid range of 0-100. The PARM2 value is the statement type and
the PARM3 value is the group name and invalid range specified.

804F INCLUDE dataset loop detected.
The data set that is the target of an INCLUDE statement has been recursively included. Either the data set
has an INCLUDE statement that includes itself or it includes a data set that appears earlier in the INCLUDE
sequence. The PARM3 value is the last 22 characters of the data set name. If the data set name is longer than
22 characters, the PARM3 value starts with two periods (..) followed by the last 20 characters of the data set
name.

8050 Groupname too long.
The Object group name is more than eight characters or the Client ID group name is more than 16
characters. The group name must be in the limits described. The PARM2 value is the group type and the
PARM3 value is the invalid groupname.

8051 An LU range failed to be added to Telnet.
An internal error occurred while adding a range to the Telnet tables. The PARM1 value indicates the group
name, the PARM3 value indicates the low and high name of the range that is in error. Contact the IBM
software support center.

8052 Groupname invalid syntax.
The group name has invalid characters in it. The PARM1 value is the invalid character, the PARM2 value is
the statement type, and the PARM3 value is the entire group name. See z/OS Communications Server: IP
Configuration Reference in the Telnet chapter for information about BEGINTVATAM and the general rules for
group name syntax.

8053 Duplicate group name. Last one is used.
One of the following occurred:
• A group name of the same type was specified more than once.
• The same group name was specified in both the LUGROUP and SLUGROUP types.
• The same group name was specified in both the PRTGROUP and SPRTGROUP types.

Use a different group name for one of the groups.
8054 Invalid range rule syntax.
The range rule specified contains an invalid character. The PARM1 value is the invalid character, the
PARM2 value is the statement type, and the PARM3 value is the range in error.

8055 Invalid IP address.
The IP address does not conform to IPv4 or IPv6 format rules. The PARM2 value is the statement type and
the PARM3 value is the IP address in error.

8056 Required value missing on statement/parameter.
A value is required for this statement or parameter. PARM3 is the statement or parameter that is missing the
required value.

8057 Invalid hostname.
The host name that is specified does not conform to the naming rules. Either an invalid character is used or
a dot is misplaced. If an invalid character is found, the PARM2 value is the invalid character. The PARM2
value is the statement type where the invalid host name is specified, and the PARM3 value is the leftmost 22
characters of the host name.

8058 Invalid label length within a hostname.
Each label in a host name must be in the range of 2-63 characters long. The PARM2 value is the statement
type where the invalid host name is specified and the PARM3 value is the leftmost 22 characters of the host
name.

8059 Invalid hyphen placement in hostname.
A label in the host name cannot start or end with a hyphen. The PARM2 value is the statement type where
the invalid host name is specified and the PARM3 value is the leftmost 22 characters of the host name.

805A LU, LUG or USER missing.
The LU, LUG, or USER keyword was specified without an LU name or User ID following. PARM2 is the
statement type containing the keyword.

805B Value outside acceptable range for statement.
The value specified is not in the range described in the [z/OS Communications Server: IP Configuration
Reference] in the Telnet chapter. The PARM2 value is the statement in error and the PARM3 value is the
invalid value specified.

805C Statement is invalid in this statement block.
A valid statement was specified in the wrong statement block. The PARM2 value is an abbreviation of the
current block and the PARM3 value is the statement incorrectly placed in the block.

805D Error during read buffer process. Lost place.
An internal error has occurred while reading the profile. If this occurs, contact the IBM software support
center.

805E Several unused parameters follow.
More than one unused parameter was ignored during statement processing. The PARM3 value is the second
parameter. The first unused parameter was displayed in a previous debug message.

805F Invalid IP subnet.
Subnet specification is not allowed where the IP address was specified.

8060 Dataset name is in use.
The non-partitioned data set is in use and cannot be processed. Free the data set and reissue the VARY
TCPIP,OBEYFILE command. The PARM3 value is the last 22 characters of the data set name. If longer than
22 characters, the PARM3 value starts with .. followed by the last 20 characters of the data set name.

8061 Dynamic allocation of dataset failed.
The probable reason is the data set name was mistyped on the VARY TCPIP,OBEYFILE command. The
PARM1 value is the dynamic allocation return code, the PARM2 value is the reason code, and the PARM3
value is the last 22 characters of the data set name.

8062 Invalid dataset organization values.
The data set organization value is invalid. It must be either sequential or partitioned. If partitioned, a
member must be specified. The PARM3 value is the last 22 characters of the data set name.

8063 Dataset name too long.
The data set name length limits for MVS, SAF, and z/OS UNIX are 44, 237, and 1024 characters, respectively.
Correct the data set name and try the operation again.
Statement is required on Debug Config Trace.
You must specify at least one statement name after Trace. For example, DEBUG CONFIG TRACE,LUMAP,LUGROUP

Module name is required on Debug Module Trace.
You must specify at least one module name after Trace. For example, DEBUG MODULE TRACE,EZBTTSC,EZBTVXRC

Dataset name invalid.
The data set name on the PROFILE DD card does not exist, contains an invalid character or misplaced dot, or it has one of the following characteristics that are invalid for a Telnet profile data set. It is variable block or not fixed or has a record length smaller than 56 or larger than 256. Use a data set that is fixed with record length in the range of 56 - 256.

Abend occurred during profile processing.
The profile process ended abnormally. Contact the IBM software support center.

Duplicate statement or parameter. Last one used.
A duplicate parameter or statement was found. The last instance of the parameter or statement will be used. The specification of a statement antithesis is considered a duplicate entry. For example, MSG07 is considered a duplicate of NOMSG07. The PARM3 value is the statement or parameter being duplicated. The last value specified is the value used by Telnet. Profile processing continues.

Telnet profile attempted to change affinity.
Affinity cannot be changed while Telnet is active. Telnet must be stopped and then restarted with the new TCPIPJOBNAME. PARM1 is the current stack name and PARM2 is the new name specified in the profile.

Maximum number of flow module names reached.
A maximum of 20 module names can be specified on a DEBUG FLOW statement. Reduce the number of names and reissue the VARY TCPIP,OBEYFILE command.

Maximum number of Telnet device entries reached.
A maximum of 21 Telnet device statements can be specified in one Telnet block. There are 21 possible Telnet devices. Find and remove the duplicate entry.

Invalid TelnetParms port.
The TELNETPARMS port is invalid. The TELNETPARMS block will not be processed. An earlier DEBUG message, return code 8040, was probably issued indicating the port error.

Secure parm error stops secure port processing.
A security-related error reported in an earlier DEBUG message will prevent any secure port processing from completing. Telnet will not allow you to create or update a secure port if there are errors found on security-related statements.

Secure TelnetParms block will not be used.
A security-related error was found in the TELNETPARMS block. The entire TELNETPARMS block is ignored. Fix the error and reissue the VARY TCPIP,OBEYFILE command.

The parameter is not part of any statement.
The word found is outside a major Telnet statement block or is found after a valid END statement. PARM2 is the last valid statement processed and the PARM3 value is the invalid word found.

Statement ignored. Prior values retained.
The statement in the PARM3 value was specified with an invalid value. A prior debug message was probably issued showing the error. The statement was either specified earlier in the block, or the default values were taken. The prior values will be retained for processing.

Invalid optional parameter.
An invalid optional parameter was found. A second DEBUG message will indicate the disposition of the statement.

All valid optional parameters are used.
A statement was found to contain at least one invalid optional parameter. All optional valid parameters, before and after the invalid parameters, are processed. The PARM3 value is the statement containing the invalid parameters. A prior DEBUG message describes the invalid parameter.

Remaining optional parameters ignored.
A statement was found to contain an invalid optional parameter. All optional valid parameters up to the
invalid parameter are processed. Optional parameters after the invalid parameter are ignored. The PARM3 value is the statement containing the invalid parameters. A prior DEBUG message describes the invalid parameter.

8075 **Statement in error and is ignored.**
The statement in the PARM3 value has a significant error and will be ignored. Remaining valid statements will be processed.

8076 **Comma or position not valid with this parameter.**
Use of the comma is invalid for this VTAM style name. A comma cannot be at the beginning or end of most values. Typical use of the comma is on the TELNETDEVICE or USSTCP statements. PARM2 is the statement and the PARM3 value is the value in error.

8077 **Divider .. is not valid for this parameter.**
Use of the .. is invalid for this VTAM style name. The .. is only valid for LU name ranges or IP address ranges. The PARM2 value is the statement and the PARM3 value is the value in error.

8078 **LU low/high and range rule must be same size.**
The number of characters was not the same for the low and high LU names or the range on an LU name range value. The PARM2 value is the statement containing the invalid range and the PARM3 value is the invalid range.

8079 **ParmsGroup creation failed.**
The ParmsGroup was not processed. See earlier DEBUG messages to see why the ParmsGroup was not processed.

807A **File process ended before statement end found.**
One of the Telnet statements that requires an END statement is missing the END statement. For example, LUGROUP must have ENDLUGROUP. the PARM3 value is the statement missing the END statement.

807B **The Symbols table failed to load.**
The symbols table was not loaded for Telnet use. The profile process is ended. If the problem persists, contact the IBM software support center.

807C **Invalid character in SAF name.**
A comma, open parenthesis [[, or close parenthesis ]] was incorrectly used in an SAF data set name.

807D **Receive profile data from the dataset.**
The DEBUG PROFILE option was selected, causing trace messages of data to be read in from the profile data set.

807E **Send profile data to Telnet database build.**
The DEBUG PROFILE option was selected, causing trace messages of data structures to be passed to the Telnet database build routine.

807F **Maximum number of profile statements reached.**
A maximum of 20 profile names can be specified on a DEBUG PROFILE statement. Reduce the number of names and reissue the VARY TCP,OBERYFILE command.

8080 **Invalid parameter on profile statement.**
A parameter specified on the profile statement is not valid. The PARM2 value is the first eight characters of the profile statement containing the parameter that is not valid. The PARM3 value is the first twenty two characters of the parameter that is not valid.

8081 **IP range addresses are not the same format.**
When an IP address range is specified, the low and high values must be the same format, IPv4 or IPv6. Formats cannot be mixed. The PARM2 value is the statement name and the PARM3 value is the IP address range in error.

8082 **IP range is invalid.**
The IP range specified is invalid. The most probable cause is trying to specify a range over more than the last octet for IPv4 or more than the last two bytes for IPv6. The PARM2 value is the statement name and the PARM3 value is the IP address range in error.

8083 **The ID is a different type than TYPE= specified.**
The type specified was either an exact IP address or an exact host name. The ID specified is not valid for the TYPE specified. Verify that the ID is correct.
8084 TCPIPJOBNAME is not the active TCPIP stack.
The TCPIPJOBNAME does not match the active TCPIP stack. When running in an INET environment, the TCPIPJOBNAME parameter must match the jobname of the active stack. Correct the TCPIPJOBNAME and restart Telnet.

8085 User not authorized to issue this command.
The User ID attempting to issue the operator command is not authorized in the security product to issue this command.

8086 Invalid CONNTYPE stops port processing.
A CONNTYPE statement that is not valid prevents any secure port processing from completing. To prevent unintentional clear connections, Telnet does not allow you to create or update a port if the CONNTYPE statement is not valid. Correct the CONNTYPE statement and process the profile again.

8087 NOJOIN cannot be used after joining XCF group.
After a Telnet server has joined an XCF group, NOJOIN cannot be specified or used as the default. Telnet must be stopped to leave the group. Continue to specify JOIN. The entire XCFGROUP statement is ignored.

8088 The XCF group name cannot be changed.
After a Telnet server has joined an XCF group, the group name cannot be changed. Telnet must be stopped and restarted with the new name. The entire XCFGROUP statement is ignored.

8089 LUNS parm change invalid unless in QUIESC state.
The LUNS is in a state in which parameter changes are not allowed. CPARM3 specifies the parameter that is being changed. The entire XCFGROUP statement is ignored.

808A LUNS exists but missing in this XCFGROUP.
A LUNS was defined previously but is not defined in this version of the XCFGROUP. The other XCFGROUP definitions are applied and the existing LUNS remains unchanged.

808B Member of XCF group but no XCFGROUP definitions.
The VARY TCPIP,OBEYFILE command was processed without an XCFGROUP definition in TelnetGlobals. The prior XCFGROUP definitions remain in effect.

808C The XCFGROUP is ignored. See earlier messages.
Earlier XCFGROUP warning messages reported problems with the definition, which made the XCFGROUP unusable. If prior XCFGROUP definitions were accepted, they remain unchanged.

808D The Pending profile was removed earlier.
A response from the LUNS for a LUNR pending profile failed because the profile no longer exists. The probable cause is a subsequent VARY TCPIP,OBEYFILE command was issued, which removed the pending profile. If the problem persists, contact the IBM software support center.

808E Pending profile request failed. Port is gone.
A profile update request at the LUNS failed because the LUNS port is gone. A profile update reply at the LUNR failed because the LUNR port is gone.

808F LUNS display request invalid on non-LUNS Telnet.
You attempted to issue a LUNS display on a Telnet that is not a LUNS. Reissue the command on an XCF Telnet with an active LUNS.

8090 Shared LU groups valid only with XCF Telnet.
You attempted to specify shared LU groups on a Classic Telnet or on an XCF Telnet that failed to join the XCF group. Shared groups are not valid on non-XCF Telnet.

8091 Group name cannot be statement name.
The group name specified is a Telnet on a Classic Telnet or on an XCF Telnet that configuration statement name and cannot be used as a group name.

9001 Parms cannot be changed while subagent active.
A VARY TCPIP,OBEYFILE command process attempted to change a subagent parameter while the subagent was active. This event is not allowed. To change a subagent parameter, the subagent must be disabled and then enabled with the new parameter value.

9002 Initialization of the Telnet subagent failed.
The attach or initialization of the Telnet subagent subtask failed. If the problem persists, contact the IBM software support center.
9003 The Telnet Subagent TNSA control block invalid.
The major control block required for the Telnet subagent is not valid. If the problem persists, contact the
IBM software support center.

9004 The TSEB control block could not be found.
The required control block, EZAZTSEB, could not be located. If the problem persists, contact the IBM
software support center.

9005 Setting Affinity to the requested stack failed.
The Telnet subagent could not obtain affinity to the TCP/IP stack name taken from the EZAZTSEB control
block. If the problem persists, contact the IBM software support center.

9006 Unable to open a UDP socket to TCPIP.
A UDP socket is required for the Telnet subagent to communicate with the agent. A socket did not open. If
the problem persists, contact the IBM software support center.

9007 The Telnet Subagent abended.
An abend occurred in the Telnet subagent. If the problem persists, contact the IBM software support center.

9008 The open packet to the agent failed.
The packet required to open the connection to the agent failed. If the problem persists, contact the IBM
software support center.

9009 Parsing the connect or register packet failed.
Parsing of the data packet for connection or registration with the agent failed. If the problem persists,
contact the IBM software support center.

900A No response received from open request to agent.
No response was received after sending an open request to the agent. If the problem persists, contact the
IBM software support center.

900B The DPI open request failed.
The DPI open request failed for one of several reasons. For example, the agent might not be authorized or
the agent identifier might be a duplicate of an already active agent. If the problem persists, contact the IBM
software support center.

900C The required DPI socket could not be obtained.
The DPI socket necessary to communicate with the agent could not be obtained. If the problem persists,
contact the IBM software support center.

900D The registration packet could not be built.
The packet necessary for registration with the agent could not be built. If the problem persists, contact the
IBM software support center.

900E The packet received was invalid.
The packet received from the agent did not have a correct identifier in the header. If the problem persists,
contact the IBM software support center.

900F There is no data for the requested connection.
The Telnet subagent attempted to obtain monitoring data for a connection that either does not exist or is not
being monitored. In this case, the subagent will not report information to the agent for this connection. This
event is an internal use return code. You should not see this return code in external messages.

9010 Affinity is required to start the TN subagent.
The Telnet subagent is enabled to start in Telnet running in its own address space. Affinity was not specified
but is required for the Telnet subagent to know where the agent resides. Stop Telnet, set affinity using the
TCP/IPJOBNNAME parameter, and restart Telnet.

A001 The LUNR hello is the wrong size.
A Hello received by the LUNS is the incorrect size. A packet trace can be used to determine the client. If the
client is a LUNR, contact the IBM software support center.

A002 The LUNR hello is not formatted correctly.
A Hello received by the LUNS does not have the correct format. A packet trace can be used to determine the
client. If the client is a LUNR, contact the IBM software support center.

A003 LUNR hello is from a LUNR unknown to the LUNS.
The LUNS cannot find the LUNR in the XCF group. PARM3 is the system name and the job name of the
LUNR. Verify that the LUNR is in the same XCF group as the LUNS and the correct LUNS server address and port are coded in the XCFGROUP statement. If the problem persists, contact the IBM software support center.

**A004 Tried to send data to a LUNR that is gone.**
The LUNS was unable to send data to a LUNR because the LUNR left the XCF group. PARM3 is the system name and the job name of the LUNR.

**A005 Send failed due to unusable connection state.**
The connection between the LUNR and the LUNS is unusable. PARM3 is the system name and the job name.

**A006 Telnet failed to join the XCF group.**
Telnet was unable to join the XCF group name specified in the XCFGROUP statement. PARM1 contains the return code and PARM2 contains the reason code from IXCJOIN. Correct the error and refresh the Telnet configuration or restart Telnet.

**A007 Telnet internal XCF services stalled.**
One of the Telnet tasks that manages XCF support has stalled. PARM1 contains internal information for IBM. PARM2 indicates how many seconds the task has been hung. Review the Telnet job to ensure that Telnet is receiving enough CPU time. If the problem persists, contact the IBM software support center.

**A008 The XCF User State Update failed.**
Telnet was unable to update the XCF user state field using the IXCSETUS macro. PARM1 contains the return code and Parm 2 contains the reason code. Contact the IBM software support center and provide the messages and Telnet dump

**A009 The LUNS or LUNR is not in a valid state.**
The LUNS or LUNR has been set internally to a stat that is not valid. This condition should not occur. If you see this problem, contact the IBM software support center.

**A00A Telnet is not LUNS capable. Command ignored.**
A LUNS must be defined on this Telnet for the LUNS command to be accepted. Use the XCFGROUP LUNS statement to define a LUNS.

**A00B LUNS accept on listener socket failed.**
The LUNS received an error while trying to accept a connection on the LUNS listening socket. PARM1 contains the return code and Parm 2 contains the reason code. PARM3 indicates that this was an accept failure. Review the return code and reason code and correct the error. If the problem persists, contact the IBM software support center.

**A00C LUNS count ENQ failed during start.**
Telnet tried to obtain an exclusive enqueue using ISGENQ. ISGENQ failed with the return code in PARM1 and the reason code in PARM2. Contact the IBM software support center.

**A00D Telnet not member of XCF group. Command ignored.**
Telnet must be a member of a Telnet XCF group for the display to be accepted. Specify the XCFGROUP statement to become a member of an XCF group.

**A00E The LUNS/LUNR session is gone.**
Telnet is unable to communicate with the LUNS/LUNR. Contact the IBM software support center if the problem persists.

**A00F The LUNS/LUNR connection is gone.**
The connection between the LUNS/LUNR is gone. Telnet will attempt to recover the connection. Contact the IBM software support center if the problem persists.

**A010 Recovery request but LUNS not in recovery.**
The LUNR attempted to send a recovery request but the LUNS is not in recovery. Contact the IBM software support center.

**A011 A request did not create a request record.**
Telnet was unable to make a request record. Contact the IBM software support center.

**A012 LUNS is stopping during hello negotiation.**
The LUNS received a Hello request from a LUNR but the LUNS is stopping. PARM3 contains the system name and the job name of the LUNR connecting to the LUNS. This event is normal if the LUNS is stopping. Otherwise, contact the IBM software support center.
A013 LUNS/LUNR send failed.
A send error occurred while trying to write on the connection between the LUNS and LUNR. PARM1 is the return code. PARM2 is the reason code.

A014 LUNS/LUNR receive failed.
A receive error occurred on the connection between the LUNS and LUNR. PARM1 is the return code. PARM2 is the reason code.

A016 Requests/replies are being purged.
Telnet purged any outstanding request and replies because either the system is leaving the XCF group or the LUNR is unable to establish a connection to the LUNS.

A017 LUNR is told the hello request is invalid.
The LUNR received a response from the LUNS that indicates that the Hello sent by the LUNR was not accepted. If the LUNS is not stopping, contact the IBM software support center.

A018 The LUNR will retry the hello process.
The LUNR received a response from the LUNS, but was unable to complete Hello processing. The LUNR will try to connect to again.

A019 The member is not on the active list.
Telnet received an XCF state update but was unable to find the member as active in the XCF group. This can happen occasionally when an XCF update arrives for a member that was recently removed from the active list.

A01A This member is already on the active list.
Telnet received notification of a new active member but the partner was already active in the XCF group. Contact the IBM software support center.

A01B The XCF group exit parameter list is invalid.
Telnet received an unexpected XCF event. PARM1 is the type of event received. Contact the IBM software support center if the problem persists.

A01C The LUNR session has stopped.
The LUNS/LUNR connection stopped while either the LUNR was connecting to the LUNS or a request was being made. Contact the IBM software support center if the problem persists.

A01D The LUNS lost a start race with another LUNS.
The LUNS was unable to obtain an exclusive enqueue because another LUNS has already started. The LUNS returns to standby state.

A01E This LUNS started late and will go to standby.
The LUNS started but a newer LUNS started. The LUNS goes to standby state.

A01F The LUNS is in the wrong state for the vary cmd.
The LUNS was not in the proper state to accept the vary command. PARM3 is the command issued.

A020 The LUNR connected with incorrect count.
The LUNS received a Hello request from a LUNR, but the LUNR used an old LUNS count. The LUNR will be rejected and will try again with the correct LUNS count. Should that be LUNR?

A021 A dealloc request does not match LUNS record.
The LUNS received a deallocation request for a LU. However, the verification information did not match the information about the LUNS. Parm1 is the LU name being deallocated. Parm3 is the system name and job name of the LUNR. This error can be expected during LUNS takeover. If this message is seen at other times, contact the IBM software support center.

A022 The port no longer exists.
Telnet is unable to process a LUNS/LUNR request because the port was deleted. The request is failed.

A023 The profile no longer exists.
Telnet is unable to process a LUNS/LUNR request because the profile for this request was deleted. The request is failed.

A024 LUNR sent dealloc after recovery - LU not alloc.
Deallos can fail because the dealloc request was built during a rebuild/recover session. When the LUNR sent the LUNS the list of alloc’d LUs, any pending dealloc requests LUs wouldn’t be listed. When the LUNS
goes active, these Deallocs would be sent. They will fail with A024. PARM1 is the LU name. PARM3 is the
system name and job name of the LUNR. In any other scenario, this is an unexpected error - call the IBM
software support center.

A026 The LUNR hello is invalid and should retry.
The LUNS was unable to accept a hello request from a LUNR. The LUNR will try the hello request again.
PARM3 is the system name and jobname of the LUNR. If the problem persists, contact the IBM software
support center.

A027 The LUNS port already in use as a Telnet port.
The XCFGROUP statement configured a LUNS port which is already in use as a Telnet port. A port cannot
be used for both. PARM1 is the port number in hexadecimal.

A028 The Telnet port already in use as a LUNS port.
The TELNETPARMS statement configured a Telnet port that is already in use as a LUNS port. A port cannot
be used for both. Parm1 is the port number in hexadecimal.

A029 Local LU takeover of shared LU is invalid.
An attempt to takeover a LU was failed because the LU is a shared LU allocated from a LUNS. The takeover
request was initiated by a non-shared LU request.

A02A Telnet CPU constraint.
Telnet timer driven events are not occurring on time. The task that schedules events is not getting CPU
cycles. If the reporting module is EZBTXSTA, Telnet has not updated a field monitored by XCF in more than
the amount of time specified on the XCFMONITOR statement. PARM1 is set to 1 if a dump process was the
reason, otherwise PARM1 is 0. PARM2 is the time, in hexadecimal seconds, since the last successful internal
check. If the reporting module is EZBTXUT2, the timer driven task is running often enough to update the
field checked by XCF, but is not running in a timely enough manner to determine the health of other Telnet
tasks. If you see this RCODE occasionally, your system is probably near capacity. If you see this RCODE
repetitively, either the system is constantly at capacity or there is a problem in Telnet. If the system is not at
capacity, contact the IBM software support center.

System action: None.

Operator response: See the specific return code for the operator response. If the return code directs you to contact
the IBM software support center, then take a dump of Telnet. If you can re-create the problem, obtain a CTRACE
with the Telnet option.

System programmer response: See the specific return code for the system programmer response. If the return code
directs you to contact the IBM software support center, then take a dump of Telnet. If you can re-create the problem,
obtain a CTRACE with the Telnet option.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Telnet

Module: EZAZMTNS

Routing code: (2,8),11

Descriptor code: (4,4)

Example: The following Debug message is issued when the DEBUG CONN DETAIL option is requested and the
application name is not known to VTAM. The IP address and port of the client, the TCP/IP connection identifier, LU
name, and Telnet module issuing the message are supplied. The return code in this case is 2011 and the instance of
the return code in this module is 00. In cases where a module issues the return code several times the instance is
helpful to IBM service. A short text explanation follows the return code, which is often enough to solve the problem.
The parameters are specific to each return code.

EZZ6035I jobname DEBUG CONN DETAIL
IP..PORT: 9.37.215.132..4599
CONN: 00000026 LU: TCPM1001 MOD: EZBTVXRQ
RCODE: 2011-00 VTAM macro REQSESS failed.
PARM1: 00000004 PARM2: 00000010 the PARM3 value: 00101200
EZ6038I  jobname COMMAND command name COMPLETE

Explanation: The requested command completed successfully.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

command is one of the following:

INACT
The INACT request is used to deactivate a Telnet LU name so Telnet will not use the name. The LU as managed by Telnet was successfully deactivated.

ACT
The ACT request is used to reactivate a Telnet LU name so Telnet will be able to use the name. The LU as managed by Telnet was successfully activated.

DEBUG
The DEBUG request is used to change the debug status of all active connections. The debug option for all connections was successfully turned off.

ABENDTRAP
The ABENDTRAP request is used to set up an abend if the specified module detects an error. Return code and instance are optional parameters to restrict the trap. The module and optional return code/instance number have been successfully set.

OBEYFILE
The OBEYFILE request is used to update Telnet configuration information. The request was successfully processed.

QUIESCE
The QUIESCE request is used to block any additional connections from being accepted. The ports requested have been found and processing started.

RESUME
The RESUME request is used to unblock a port that is blocked because of an earlier QUIESCE command or quiesced automatically because of an ACCEPT error. The ports requested have been found and processing started.

STOP
The STOP request is used to stop ports. Any active connections are cleaned up. The ports requested have been found and processing started.

The name value is either the LU name that is being activated or deactivated, the debug level requested (Off is currently the only option), or the module name specified on the Abendtrap command, depending on the command.

If the VARY TCPIP,OBEYFILE command is used, the name value is blank.

System action: None.
Operator response: None.
System programmer response: None.
Module: EZAZMTNS

EZ6039I  jobname COMMAND command name FAILED, RCODE=rcode

Explanation: The request did not complete successfully.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

command is one of the following:

INACT
The INACT request is used to deactivate a Telnet LU name so Telnet will not use the name.
**ACT**

The ACT request is used to reactivate a Telnet LU name so Telnet will be able to use the name.

**DEBUG**

The DEBUG request is used to change the debug status of all active connections.

**ABENDTRAP**

The ABENDTRAP request is used to set up an abend if the specified module detects an error. Return code and instance are optional parameters to restrict the trap.

**QUIESCE**

The QUIESCE request is used to block any additional connections from being accepted. The command request will fail if there is no port match or no port was specified when multiple ports are active.

**RESUME**

The RESUME request is used to unblock a port that is blocked because of an earlier QUIESCE command or quiesced automatically because of an ACCEPT error. The command request will fail if there is no port match or no port was specified when multiple ports are active.

**STOP**

The STOP request is used to stop ports. Any active connections are cleaned up. The command request will fail if there is no port match or no port was specified when multiple ports are active.

`name` is either the LU name that is being activated or deactivated, the debug level requested (Off is currently the only option), or the module name specified on the Abendtrap command, depending on the command.

`rcode` is the return code of the failure. The return codes are documented under message EZZ6035I.

**System action:** None.

**Operator response:** For the INACT request, verify that the LU is not already deactivated by using the Telnet INACTLUS display. The LU does not have to already exist in Telnet definitions to be deactivated. It should fail only if it is already deactivated.

For the ACT request, verify that the LU is deactivated by using the Telnet INACTLUS display.

For the DEBUG request, verify that the option is valid. At this time, OFF is the only valid option.

For the ABENDTRAP request, verify that the trap is not already set by using the Telnet PROFILE display.

For the QUIESCE, RESUME, and STOP commands ensure that a port number or range includes an active port. If no port number was specified, ensure that only one port is active.

**System programmer response:** None.

**Module:** EZAZMTNS

---

**EZZ6040I**

`jobname action FAILED FOR PORT pnum, RCODE=rcode`

**Explanation:** A Telnet Server component encountered a severe error.

In the message text:

**jobname**

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the `jobname` value is TNSRV1. If you start the TN3270 server, the `jobname` value is TN3270

**action**

The action the TN3270 server performed.

**pnum**

The port number on which the severe error occurred.

**rcode**

The return code, which identifies the error that was encountered during processing. See message EZZ6035I for a detailed description of the return code.
The TN3270 server stops processing the profile update for the port and does not apply the update to the port. If this profile is the initial profile, the TN3270 server will not listen on the port. If the TN3270 server was previously configured on this port, the port remains active, using the profile that it used prior to the update attempt.

Operator response: Contact the system programmer to diagnose this error.

System programmer response: Use the `rcode` value to correct the problem with the profile. Use the VARY TCPIP,OBEYFILE command to process the corrected profile.

Module: EZAZMTNS

Automation: This message is written to the console. Automation can use this message to detect errors in the TN3270 server configuration.

---

**EZ6041I** 

jobname SNMP SUBAGENT INITIALIZATION COMPLETE

**Explanation:** The SNMP TN3270 subagent has completed initialization and is ready to start processing requests.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the `jobname` value is TNSRV1. If you start the TN3270 server, the `jobname` value is TN3270.

**System action:** The subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

Module: EZBTSdpi.C

Procedure name: main

---

**EZ6042I** 

jobname SNMP SUBAGENT LOST CONNECTION TO AGENT

**Explanation:** This message is issued by the TN3270 Subagent when the existing connection between the subagent and the Agent is broken.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the `jobname` value is TNSRV1. If you start the TN3270 server, the `jobname` value is TN3270.

**System action:** The subagent attempts to reconnect to the SNMP Agent until successful.

**Operator response:** None.

**System programmer response:** Ensure that the SNMP Agent is active. If the SNMP Agent is currently active, the subagent should automatically reconnect to the Agent. If it does not, stop the SNMP Agent and restart it.

Module: EZBTSdpi.C

Procedure name: do_open_and_register

---

**EZ6043I** 

jobname SNMP SUBAGENT RECONNECTED TO AGENT

**Explanation:** This message is issued by the TN3270 Subagent upon successfully reconnecting to the SNMP Agent.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the `jobname` value is TNSRV1. If you start the TN3270 server, the `jobname` value is TN3270.

**System action:** The subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

Module: EZBTSdpi.C

Procedure name: do_open_and_register
EZZ6044I  jobname PROFILE PROCESSING BEGINNING FOR FILE dataset_name

Explanation: The Telnet server began processing Telnet configuration statements from dataset_name.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

dataset_name is the name of the MVS data set.

System action: Telnet server continues.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: EZBTMPRF

EZZ6045I  jobname PROFILE PROCESSING COMPLETE FOR FILE dataset_name

Explanation: The Telnet server completed processing Telnet configuration statements from dataset_name.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

dataset_name is the name of the MVS data set.

System action: Telnet server continues.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: EZBTMPRF

EZZ6046I  jobname PROFILE PROCESSING RESUMING FOR FILE dataset_name

Explanation: The Telnet server resumed processing Telnet configuration statements from dataset_name.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

dataset_name is the name of the MVS data set.

System action: Telnet server continues.

Operator response: None.

System programmer response: None.

Module: EZAZMTNS

Procedure name: EZBTMPRF

EZZ6047I  jobname WAITING FOR tcpip_jobname ON PORT pnum

Explanation: The Telnet server detected that the TCP/IP stack tcpip_jobname is not active. The Telnet server will wait for the stack to start. The Telnet server will listen on port pnum when the stack is started.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

tcip_jobname is the name of the TCP/IP stack the Telnet Server is waiting for. If the tcpip_jobname is TCP/IP, then the Telnet server is waiting for any TCP/IP stack to start.
pnun is the port on which the Telnet server will listen on.

**System action:** Telnet server continues.

**Operator response:** If the TCP/IP stack was not started, start the specified TCP/IP stack. Otherwise, contact the System Programmer.

**System programmer response:** Verify that the TCP/IP stack tcpip_jobname is active and did not end due to an error. Correct any errors, if necessary, and restart the TCP/IP stack. If the Telnet server should be waiting on a different TCP/IP stack, stop the Telnet server, code the TCPIPJOBNAME parameter in TELNETGLOBALS and restart the Telnet server. If the Telnet server does not need stack affinity, remove the TCPIPJOBNAME parameter from TELNETGLOBALS and restart the Telnet server.

**Module:** EZAZMTNS

**Procedure name:** EZBTTMST

---

**EZZ6048I**  
*jobname* type COMMAND FAILED WITH RCODE *rcode*

**Explanation:** A Telnet Vary or Display command failed with the specified rcode.

*jobname* is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the *jobname* value is TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270.

*type* is the command that failed. *type* will be VARY or DISPLAY.

*rcode* is the return code. See message EZZ6035I for more information about *rcode*.

**System action:** The Telnet Server continues.

**Operator response:** Correct the error described by *rcode* and reissue the command. See the z/OS Communications Server: IP System Administrator's Commands for more information about the command syntax.

**System programmer response:** None.

**Module:** EZBTMCMC

**Procedure name:** EZBTMCMC

---

**EZZ6049I**  
*jobname* NON-ZERO OMVS UID IN EFFECT

**Explanation:** The Telnet Server was started with a nonzero OMVS UID. The user ID was not permitted to use the BPX.SUPERUSER resource in the FACILITY class, resulting in an effective UID that is nonzero. In this case, Telnet is not able to increase the MAXFILEPROC value on the Telnet listener socket and will support the number of connections specified by the MAXFILEPROC value instead of the OMVS maximum.

In the message text:

*jobname*  
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the *jobname* value is TNSRV1. If you start the TN3270 server, the *jobname* value is TN3270

**System action:** The Telnet listener socket is limited to MAXFILEPROC concurrent connections.

**Operator response:** Not applicable.

**System programmer response:** Verify that Telnet should be running with a nonzero UID that is not permitted to use the BPX.SUPERUSER resource in the FACILITY class and that the MAXFILEPROC value is large enough so that the number of Telnet connections to a single port is not restricted. If necessary, redefine the user ID with a UID value 0 or permit the user ID to use the BPX.SUPERUSER resource in the FACILITY class or use the RACF ALTUSER command with the FILEPROCMAX option to change the MAXFILEPROC value. See the Steps for defining security for a user ID and associating the user ID with the Telnet procedure name in z/OS Communications Server: IP Configuration Guide

**User response:** Not applicable.
**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: Telnet

**Module:** Not applicable.

**Routing code:** 2,8

**Descriptor code:** 4

**Example:**

```
EZZ6049I TELNET NON-ZERO OMVS UID IN EFFECT
```

**Message Format:**

```
EZ6050I PORT port portstate PROF: profnum CONNS: numconns
Message Format:
----- PORT:    port    port_stat    PROF: CURR CONNS:    0
----- QUAL:    qualification
```

**Explanation:**

`port` is the Port number for the preceding output lines.

`portstate` is one of the following:

- **QUIESCED**
  - The port is in a quiesced state at the time of the display. No new connections can be accepted while quiesced.

- **ACTIVE**
  - The port is in an active state at the time of the display. New connections can be accepted.

`profnum` is the profile number for data just displayed.

`numconns` is the number of connections associated with this profile.

`qualification` indicates that the profile information being displayed is associated with a qualified port. The port qualification might display as an IP address (IPv4 or IPv6), or as a linkname up to 16 characters or the word NONE to indicate that the port is not defined with a qualifier.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAZMTNS

**EZ6052I**

```
displayedlines OF totallines RECORDS DISPLAYED
```

**Explanation:** Specifies the number of data lines displayed and the total lines possible to display for every Telnet display command.

`displayedlines` is the number of data lines displayed.

`totallines` is the total number of data lines possible.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAZMTNS

**Procedure name:** TCP/IP

**EZ6057I**

```
NO QUALIFYING MATCHES
```

**Explanation:** Specifies that no matching data for the display query was found.

**System action:** None.

**Operator response:** None.
**System programmer response:** None.

**Module:** EZAZMTNS

**Procedure name:** TCP/IP

---

**Explanation:** The PROFILE Display command.

Profile and port divider line information follow each profile/port section. See message EZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZ6051I for details. Global settings are displayed after the profile summary data.

**jobname** is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the **jobname** value is TNSRV1. If you start the TN3270 server, the **jobname** value is TN3270.

**persis** represents different persistence-related options in Telnet. Each character position represents a different option. The position might be set to dash (-), indicating that the particular option was not set or it might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

**Position(1)**
- L if LuSessionPend coded.

**Position(2)**
- M if MSG07 coded.

**Position(3)**
- T if TkoSpecLu coded.
- R if TkoSpecLuRecon coded.
- K if TkoSpecLuRecon with KeepOnTmReset coded.
- S if TkoSpecLuRecon with SamePaddr coded.
- C if TkoSpecLuRecon with SameConnType coded.
- M if multiple options are coded TkoSpecLuRecon.

**Position(4)**
- T if TkoGenLu coded.
- R if TkoGenLuRecon coded.
- K if TkoGenLuRecon with KeepOnTmReset coded.
- S if TkoGenLuRecon with SamePaddr coded.
- C if TkoGenLuRecon with SameConnType coded.
- M if multiple options are coded TkoGenLuRecon.

**Position(5)**
- C if CheckClientConn coded.

**Position(6)**
- P if DropAssocPrinter coded.

**Position(7)**
- K if KeepLU coded.

**function** represents different general function options in Telnet. Each character position represents a different option. The position might be set to dash (-), indicating that the particular option was not set; alternatively, the position might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

**Position(1)**
- O if OldSolicitor coded.

**Position(2)**
- P if PasswordPhrase coded.
- D if DisablePasswordPhrase coded.
- * if NoPasswordPhrase coded.

**Position(3)**

---

Chapter 6. EZZ6xxx messages 329
diag represents different diagnostics-related options in Telnet. Each character position represents a different option.
The position might be set to dash (-), indicating that the particular option was not set or it might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

Position(1)
- F if Debug Flow coded.
- T if Debug Trace coded.
- D if Debug Detail coded.
- S if Debug Summary coded
- E if Debug Exception coded.
- V if V TCPIP,T,DEBUG,OFF has been issued to disable to DEBUG setting in the TCPIP profile.

Position(2)
- C if Debug routing is to the console.
- J if Debug routing is to the joblog.
- T if Debug routing is to CTRACE only.

Position(3)
- F if FullDataTrace coded.

security represents different security-related options in Telnet. Each character position represents a different option.
The position might be set to dash (-), indicating that the particular option was not set or it might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

Position(1)
- B if Basic port.
- S if SecurePort coded.
- T if TLSPORT.

Position(2)
- N if ConnType NegtSecure.
- B if ConnType Basic.
- S if ConnType Secure.
- A if ConnType Any.
- 0 if ConnType None coded.

Position(3)
- M if MVS key ring.
- H if z/OS UNIX key ring.
- S if SAF key ring coded.

Position(4)
- L if Cr1 LDAP server coded.

Position(5)
E if Encryption values coded.
D if Default coded.

**Position(6)**
S if Clientauth SSL.
F if Clientauth SAF coded.

**Position(7)**
X if ExpressLogon coded.

**Position(8)**
N if NacUserid coded.

**Position(9)**
2 if SSLv2 coded.

*Timers* represents different timer-related options in Telnet. Each character position represents a different option. The position might be set to dash (-), indicating that the particular option was not set or it might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

**Position(1)**
I if Inactive timer coded.

**Position(2)**
P if ProfileInactive timer coded.

**Position(3)**
K if KeepInactive timer coded.

**Position(4)**
P if PrtInactive timer coded.

**Position(5)**
S if ScanInterval timer coded.

**Position(6)**
T if Timemark timer coded.

**Position(7)**
S if SSLtimeout timer coded.

*Misc* represents different options for SMF, maximum limits, linemode, and transform. To see which parameters are set and to what values, issue a detail display. The position might be set to dash (-), indicating that the particular option was not set or it might be set to asterisk (*), indicating that the particular option was turned off. Otherwise, possible values by position are:

**Position(1)**
S if any SMF records are to be produced.

**Position(2)**
M if any maximum limits are set.
D if all default values are used.

**Position(3)**
L if any linemode options are set.
D if all default values are used.

**Position(4)**
T if any transform options are set.

*Global settings* represent several settings that affect all of Telnet. They are:

**Format**
Indicates the message format for IPv6-affected messages.

**DEBUG**
Indicates that DEBUG PROFILE has been enabled. No information is displayed if DEBUG PROFILE is not specified. Possible values are:

**DEBUG TASK**
The level of task debugging and the output location of the debug messages.

**DEBUG CONFIG**
The level of configuration debugging and the output location of the debug messages.

**DEBUG CONFIG**
The level of configuration trace debugging and the output location of the debug messages.
EZZ6060I

TCPIPJOBNAME
Indicates the TCP/IP stack jobname to which Telnet running in its own address space has affinity. NO
AFFINITY is indicated if TCPIPJOBNAME was not specified. The line is not displayed for Telnet running in
the TCP/IP address space.

Subagent
Indicates whether the Telnet Subagent is Enabled or Disabled. If Enabled, all other TNSACONFIG parameter
values are also displayed.

Keyring
If a key ring was specified, the type and name are displayed. No information is displayed if key ring is not
specified.

CRLLDAPSERVER
If a Certificate Revocation List LDAP Server was specified, the IP address or name and port are displayed.
No information is displayed if CRLLDAPSERVER is not specified.

Abendtrap
If an abend trap was set, the module name, return code, instance and status are displayed. Return code and
instance are optional. If not specified on the abend trap, their values will be all 'FFx.'

modname is the module name for Abendtrap.
rcode is the return code for Abendtrap if specified.
instance is the Instance for Abendtrap if specified.
trap_status is one of the following:

ACTIVE
The abend trap is active.

TRIPPED
The abend trap was tripped. The VARY ABENDTRAP command needs to be issued again to reactivate
the trap.

OFF
The abend trap was turned off. The VARY ABENDTRAP command needs to be issued again to
reactivate the trap.

Explanation:  The LUNS INACTLUS Display command. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

luname is the name of inactive LU.

System action:  None.

Operator response:  None.

System programmer response:  None.

Module:  EZAZMTNS

Procedure name:  TCP/IP

EZZ6064I jobname  CONN DISPLAY

Explanation:  The CONNECTION Summary Display command. Profile and port divider line information follows each profile/port section. See message EZZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details.
**Note:** In an IPv6 environment, or if FORMAT LONG is specified, the IP address will fill the remainder of the first line. The remaining variables will be on a second line under their appropriate headers.

`jobname` is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the `jobname` value TNSRV1. If you start the TN3270 server, the `jobname` value is TN3270.

The `connid` value is the connection ID as it is known to TCPIP.

The `en` value is the encryption type that is being used. If the TLS/SSL is defined in the Telnet profile, then the encryption type is in the following list. If the TLS/SSL is defined in the AT-TLS policy, then the encryption type is defined in the [z/OS Cryptographic Services System SSL Programming](https://www.ibm.com/support/knowledgecenter/SSLTP_1.4.0/com.ibm.zos.v1r4.ezutil.doc/r0001701_.html).

`ipaddr.port` is the client IP address and port number.

`luname` is the LU name that Telnet is using to represent the client to the VTAM appl.

`applid` is the application name with which the client is in session.

`t` is the terminal type of the client and is either:

| T     | The client is a terminal.                        |
| P     | The client is a printer.                         |

`s` is the session state of the connection and is one of the following:

| A     | The connection has an active session with a VTAM appl |
| P     | The connection completed negotiation but not yet established a session with a VTAM appl |
| N     | The client and server are negotiating options to determine the protocol |

`p` is the protocol type of the connection and is one of the following:

| 3     | TN3270 mode                                      |
| E     | TN3270E mode                                     |
| L     | Line mode                                        |
| T     | Transform mode                                   |
| D     | DBCS transform mode                              |
| B     | Binary line mode                                 |
logmode is the logmode of the session.

hostname is displayed only if the telnet profile contains an HNGROUP definition. It is the host name of the client.

Chapter 6. EZZ6xxx messages  335
**Explanation:** The CONNECTION DETAIL Display command.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value is TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

connid is the connection ID as it is known to TCP/IP.

seclabel is the security label assigned to the TCP/IP connection.

ipaddr..port is the client host or destination IP address and port number.

linkname is the linkname, if any, of the connection.

hostname is the host name of client.

time is the time at which the connection was made.

date is the date on which the connection was made.

**SESSION PENDING**

The negotiation process is complete but a session is not established with an appl.

**SESSION ACTIVE**

The negotiation process is complete and a session is active with an appl.

**NEGOTIATE IN PROGRESS**

The negotiation process is not yet complete.

port is the port number for the following output lines.

qualification indicates that the profile this connection is using is associated with a qualified port. The port qualification might display as an IP address (IPv4 or IPv6), or as a linkname up to 16 characters or the word NONE to indicate that the port is not defined with a qualifier.

portstat is the Port status and is either ACTIVE or QUIESCED.

portacc is the port access type. The possible values are BASIC, SECURE, or TTLSSECURE.

connaccess is SECURE, IN PROG, NEGTSEC, or NON-SECURE. If the value is SECURE or NEGTSEC and the encryption type was negotiated, a 2-digit encryption type abbreviation follows. If the portacc value is TTLSSECURE, see [z/OS Cryptographic Services System SSL Programming] for encryption type definitions. If the portacc value is SECURE see [EZZ6064I] for a list of the possible values. If the access involves SSL or TLS, the type and version follow, for example, TLSV1 or SSLV3. If client authentication was requested, the ClientAuth parameter from either AT-TLS policy or the Telnet definition follows the security type.
ttls_rule is the AT-TLS policy rule that matches this connection.

ttls_grp_action is the AT-TLS policy group action that is defined by the ttls_rule value.

ttls_env_action is the AT-TLS policy environment action that is defined by the ttls_rule value.

ttls_conn_action is the AT-TLS policy connection action that is defined by the ttls_rule value.

protocol is the connection protocol.

logmode is the logmode of the session.

devicetype is the device type that the client specified.

options are the connection options negotiated. See EZZ6064I for details.

e_functions are the 3270E Functions negotiated.

B  Bind image to be sent to the client
S  SysReq key function supported
R  Response function supported
S  SCS control codes supported (printer only)
D  Data stream (3270) supported (printer only)
C  Contention Resolution supported
N  SNA Sense supported

ne_functions is the new Environment Function negotiated.

E  Express Logon supported

ruser is the user ID used at the solicitor panel in response to the Telnet request for user ID/password because of Restrictappl being coded.

cuser is the user ID established from client certificate used during SSL handshake negotiation.

cuser is the user ID established from client certificate used during new environment negotiation.

applname is the name of the application in session with the client.

luname is the LU name selected by Telnet to represent the client.

termttype is one of the following:

TERMINAL
  The client is emulating a terminal

PRINTER
  The client is emulating a printer

conntype is one of the following:

GENERIC
  A generic connection was established.

SPECIFIC
  A specific connection was established.

cit is the client Identifier type and is one of the following:
US User ID
HN Hostname
IP IP Address
UG User ID in a USERGROUP
HG Hostname in an HNGROUP
IG IP address in an IPGROUP
DI Destination IP address
LN Linkname
DG Destination IP address in a DESTIPGROUP
LG Linkname in a LINKGROUP
NL Null. No client identifier specified

clid is the client identifier used to map the object.

u is a greater than symbol (>), which identifies the LU group that is being used or the USS table that is being used.

object is the object name that is being mapped.

spec_item is an additional item specifically related to the mapping statement. The map_opts Position(1) describes what the item is.

map_opts contain mapping flags. See the description of the map_opts parameter for details.

nqobject is the Network Qualified Object name that is being mapped.

monitor_data is the response time data collected for this connection. See the information on Connection Monitoring mapping statements in the Telnet section of z/OS Communications Server: IP Configuration Guide for details.

persis, function, diag, secure, timers, and misc are connection parameter flags. See EZZ6080I for details.

System action: None.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Telnet
Module: EZAZMTNS
Routing code: Not specified.
Descriptor code: (5,8,9)

Example: See the Display Telnet connection command in z/OS Communications Server: IP System Administrator’s Commands for an example.
Explanation: The PROFILE Display command.

Profile and port divider line information follows each profile/port section. See message EZZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details. See message EZZ6060I for definitions of the table values. See the z/OS Communications Server: IP Configuration Reference for an explanation of the parameters.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

crisis, function, diag, secure, timers, and misc are connection parameter flags. See EZZ6060I for details.

source is the source of the parameter line. The details of any of these sources can be seen by issuing a DISPLAY OBJECT, ID=source. Possible values are:

*DEFAULT
  Represents the default parameter values set by Telnet.

*TGLOBAL
  Represents the parameters set in TELNETGLOBALS.

*TPARMS
  Represents the parameters set in TELNETPARMS.

TP-profilenum
  Represents the merged results of the DEFAULT, TELNETGLOBALS, and TELNETPARMS parameters. This line is used only on the detailed connection display and matches the profile displays. Parameter details can be seen by issuing a DISPLAY PROF, PROF=profilenum, DETAIL.

PARMSGROUP names
  Represents the parameters set in a PARMSGROUP mapped by PARMSMAP to the client identifier.

<-FINAL
  Represents the merged results of all parms through the PARMSGROUP level, including any PARMSGROUP mapped by the USERID or USERGRP client identifier and any parmsgroup mapped on the LUMAP–PMAP combination.

gp_id is the parameter group identifier used in the summary displays.

actual_parm is the parameter specified showing correct syntax.

System action: None.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Telnet
Module: EZAZMTNS
Routing code: Not specified.
Descriptor code: (5,8,9)
Example: See the Display Telnet PROFILE command in z/OS Communications Server: IP System Administrator’s Commands for an example.

EZZ6081I  jobname CLIENTID DISPLAY
Message Format:
EZZ6081I  jobname CLIENTID DISPLAY
CLIENT ID  CONNS  OBJECT  OBJECT  ITEM
NAME      USING  TYPE   NAME   SPECIFIC  OPTIONS
------------------ ------ --------- -------- ---------- --------
Explanation: This message is displayed in response to the Telnet ClientID display command. It displays a detailed list of client identifier names and their mapped Objects sorted by client identifier, profile, and port. The CLIENTID display can be used to see what client identifiers are defined in the profile and details about the client identifier. The client identifier group details and parameter mapping results can be displayed when the ID= parameter is used in the display command.

Profile and port divider line information follows each profile/port section. See message EZZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details. See message EZZ6060I for definitions of the table values.

Note: In an IPv6 environment, or if FORMAT LONG is specified, the client identifier will fill the remainder of the first line. The remaining variables will be on a second line under their appropriate headers.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270 server, the jobname value is TN3270. If you start the TN3270 server, the jobname value is TN3270.

clid_type is the type of client identifier. Possible client identifier types are:

USERID
   An exact user ID specified on a mapping statement.

HOSTNAME
   An exact host name specified on a mapping statement.

IPADDR
   An exact IP address specified on a mapping statement.

USERGRP
   A user ID group name specified on a mapping statement.

HNGRP
   A host name group name specified on a mapping statement.

IPGRP
   An IP address group name specified on a mapping statement.

DESTIP
   An exact destination IP address specified on a mapping statement.

LINKNAME
   An exact linkname specified on a mapping statement.

DESTIPGRP
   A destination IP address group name specified on a mapping statement.

LINKGRP
   A linkname group name specified on a mapping statement.

NULL
The special case where no client identifier is specified.

clid_type is the type of client identifier.

clid_name is the name of the client identifier.

clid_entries is a list of client identifiers in a group.
clconn is the number of connections using the client identifier mapping statement.

obj_type is the type of Object. Possible Object types are:

ARAPPL
   The Allowappl or Restrictappl application name. If a summary report is requested and DEFAULTAPPL or PRTDEFAULTAPPL mapping statements exist, the last Object entry (DEFAPPL) represents all implicit allowappl objects created to support default appl names that do not explicitly match any coded ALLOWAPPL statement.

DEFAPPL
   The application name specified on the DEFAULTAPPL statement.

PRTAPPL
   The application name specified on the PRTDEFAULTAPPL statement.

LINEAPPL
   The application name specified on the LINEMODEAPPL statement.

MAPAPPL
   The application name specified on the DEFAPPL option of the LUMAP or PRTMAP statement.

USS
   The USS table name specified on the USSTCP statement.

INT
   The interpret table name specified on the INTERPTCP statement.

LU
   The exact LU name specified on the LUMAP statement.

LUGRP
   The LUGROUP name specified on the LUMAP statement.

APPLLUG
   The implicit LUGROUP name created by Telnet for single LUs listed on the ALLOWAPPL or RESTRICTAPPL-USER statement.

PRT
   The exact printer LU name specified on the PRTMAP statement.

PRTGRP
   The PRTGROUP name specified on the PRTMAP statement.

PARMSGRP
   The PARMSGROUP name specified on the PARMSMAP statement.

MONGRP
   The MONITORGROUP name specified on the MONITORMAP statement.

obj_name is the name of the object that is being mapped on the mapping statement.

spec_item is one or more additional optional items that are specific to a mapping statement. The map_opts field defines the spec_item value. The spec_item value can be one of the following:

- When map_opts position(1) is D, the spec_item value is the application name defined by LUMAP/PRTMAP-DEFAPPL.
- When map_opts position(1) is P, the spec_item value is the ParmsGroup name defined by LUMAP/PRTMAP-PMAP.
- When map_opts position(1) is A, the spec_item value is the associated printer name defined on the LUMAP statement.
- When map_opts position(1) is L, the spec_item value is the LuGroup name defined by ALLOWAPPL-LUG.
- When map_opts position(5) is Q, the spec_item value is the timeout defined by ALLOWAPPL/RESTRICTAPPL-QSESSION.

map_opts are additional mapping options on certain mapping statements. Each character position represents a different option. The position might be set to dash (-), indicating that the particular option is not set or does not apply. Possible values by position are:

Position(1)
   D - Item is a default appl on the LU/PRTMAP statement.
   P - Item is a ParmsGroup on the LU/PRTMAP statement. If Object is a USS or Interpret table, the table was loaded due to profile mapping statement.
A - Item is an associated printer on the LUMAP statement.
L - Item is an LU group on an AllowAppl statement.
E - If Object is a USS or Interpret table, the table was loaded as a result of an LU Exit request.
F - If Object is a USS or Interpret table, the table requested by the LU Exit failed to load.

**Position (2)**

C - If Object is an LU/PRTGROUP, indicates Capacity specified.
E - If Object is an LU/PRTGROUP, indicates group is an LU EXIT.
R - If Object or Item is Allow/Restrict, indicates Appl is defined as RestrictAppl.
A - If Object or Item is Allow/Restrict, indicates Appl is defined as AllowAppl.
I - If Object is a DEFAPPL entry of an ARAPPL request, this line indicates the number of connections in
session with default apps that do not match an explicitly provided AllowAppl or RestrictAppl.
P - If Object is a USS,SCS pair, the SCS table was loaded as a result of a profile mapping statement.
E - If Object is a USS,SCS pair, the SCS table was loaded as a result of an LU Exit request.
F - If Object is a USS,SCS pair, the SCS table requested by the LU Exit failed to load.

**Position (3)**

L - Indicates AllowAppl or RestrictAppl has LU or LUG parm specified.

**Position (4)**

L - If position(1) is D then the Appl Object or Item has LogAppl specified. Otherwise, the mapping
statement is an LUMAP statement.
Q - Appl Object or Item has Qinit specified.
D - AllowAppl or Restrictappl has Disconnectable specified.
P - The mapping statement is a PRTMAP statement.

**Position (5)**

F - If Appl Object or Item, indicates FirstOnly specified.
G - If LU/PRTGROUP, indicates Generic mapping of the group.
S - If LU/PRTGROUP, indicates Specific mapping of the group.
Q - AllowAppl or Restrictappl has Qsession specified.

**Position (6)**

D - If Appl Object or Item, indicates DefOnly specified.
K - If LU/PRTGROUP, indicates KeepOpen specified on LU/PRTMAP.
C - Restrictappl has CertAuth specified.

**Position (7)**

A - Restrictappl has AllowPrinter specified.

**Position (8)**

Not used at this time.

da_name is either the DEFAPPL application name, the associated printer name, or the PARMSGROUP name on the
LUMAP statement. Position 4 of the map_opts indicates which name is displayed on the line.

source is the source of the parameter line. The details of any of these sources can be seen by issuing a DISPLAY
OBJECT, ID=source. Possible values are:

*DEFAULT
Represents the default parameter values set by Telnet.

*TGLOBALS
Represents the parameters set in TELNETGLOBALS.

*TPARMS
Represents the parameters set in TELNETPARMS.

TP-profnum
Represents the merged results of the DEFAULT, TELNETGLOBALS, and TELNETPARMS parameters. This
line is used only on the detailed connection display and matches the profile displays. Parameter details can
be seen by issuing a DISPLAY PROF, PROF=profnum, DETAIL.

PARMSGROUP names
Represents the parameters set in a PARMSGROUP mapped by PARMSMAP to the client identifier.

<-FINAL
Represents the merged results of all parms through the PARMSGROUP level, including any PARMSGROUP
mapped by the USERID or USERGRP client identifier and any parmsgroup mapped on the LUMAP–PMAP
combination.
maptype specifies the type of LUMAPping done. The value is either GENERIC or SPECIFIC.

luname is the name of the single LU or LUGROUP on the LUMAP statement that also contains the PMAP option mapping the parmsgroup listed in the next line.

persis, function, diag, secure, timers, and misc are connection parameter flags. See EZZ6060I for details.

System action: None.
Operator response: None.
System programmer response: None.
Module: EZAZMTNS
Procedure name: TCP/IP

EZZ6082I  jobname  CLIENT ID LIST
Message Format:
EZZ6082I  jobname  CLIENT ID LIST
clid_type  clid_name  clid_name  clid_name

Explanation: EZZ6082I displays a list of client identifier names sorted by client identifier, profile, and port. The CLIENTID display can be used to see what Client IDs are defined in the profile and some details about the Client ID. Profile and port divider line information follows each profile/port section. See message EZZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details. See message EZZ6081I for an explanation of the summary parameter fields.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1.

If you start the TN3270 server, the jobname value is TN3270.

clid_type is the type of client identifier. Possible client identifier types are:

USERID
An exact user ID specified on a mapping statement.

HOSTNAME
An exact host name specified on a mapping statement.

IPADDR
An exact IP address specified on a mapping statement.

USERGRP
A user ID group name specified on a mapping statement.

HNGRP
A host name group name specified on a mapping statement.

IPGRP
An IP address group name specified on a mapping statement.

DESTIP
An exact destination IP address specified on a mapping statement.

LINKNAME
An exact linkname specified on a mapping statement.

DESTIPGRP
A destination IP address group name specified on a mapping statement.

LINKGRP
A linkname group name specified on a mapping statement.

NULL
The special case where no client identifier is specified.

clid_name is the exact name of the client identifier.

System action: None.
EZ6083I

Operator response: None.
System programmer response: None.
Module: EZAZMTNS

EZ6083I jobname OBJECT DISPLAY
Message Format:

EZ6083I jobname OBJECT DISPLAY
OBJECT NAME CONNS CLIENT ID CLIENT ID
--- ------ --------- ---------- 
OBJ_TYPE OBJ_NAME CLCONN CL_ID CL_ID_NAME SPEC_ITEM MAP_OPTS
OBJ_ENTRIES

Explanation: This message is displayed in response to the Telnet Object display command. It displays a detailed list of Object names and their client identifiers sorted by Object, profile, and port. The OBJECT display can be used to see what Objects are defined in the profile and some details about the Objects. The Object group details can be displayed when the ID= parameter is used in the display command.

Profile and port divider line information follows each profile/port section. See message EZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist.

If Type=LUGRP,Summary or Type=PRTGRP,Summary is requested, a display of total LUs and in-use LUs by group will be displayed. An LU is considered in-use if it is assigned to a connection, being kept for possible reuse, or deactivated.

In an IPv6 environment, or if FORMAT LONG is specified, the client identifier will fill the remainder of the first line. The remaining variables will be on a second line under their appropriate headers.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

obj_type is the type of Object. Possible Object types are:

ARAPPL
The Allowappl or Restrictappl application name. If a summary report is requested and DEFAULTAPPL or PRTDEFAULTEAPPL mapping statements exist, the last Object entry (DEFAPPL) represents all implicit allowappl objects created to support default appl names that do not explicitly match any coded ALLOWAPPL statement.

DEFAAPPL
The application name specified on the DEFAULTAPPL statement.

PRTAPPL
The application name specified on the PRTDEFAULTAPPL statement.

LINEAPPL
The application name specified on the LINEMODEAPPL statement.

MAPAPPL
The application name specified on the DEFAPPL option of the LUMAP or PRTMAP statement.

USS
The USS table name specified on the USSTCP statement.

INT
The interpret table name specified on the INTERPTCP statement.

LU
The exact LU name specified on the LUMAP statement.

LUGRP
The LUGROUP name specified on the LUMAP statement.

SLUGRP
The SLUGROUP name defined on the specified LUNR.
APPLLUG
The implicit LUGROUP name created by Telnet for single LUs listed on the ALLOWAPPL or
RESTRICTAPPL-USER statement.

PRT
The exact printer LU name specified on the PRTMAP statement.

PRTGRP
The PRTGROUP name specified on the PRTMAP statement.

SPRTGRP
The SPRTGROUP name defined on the specified LUNR.

PARMSGRP
The PARMSGROUP name specified on the PARMSMAP statement.

MONGRP
The MONITORGROUP name specified on the MONITORMAP statement.

 newObj_name
is the exact name of the Object. If Object is LUGROUP or PRTGROUP this line also indicates if the group is
an exit or if a capacity warning level was specified. If the Object is an ALLOWAPPL with the optional LU or LUG
parameter, the Object name is followed by a colon and then the LUGROUP name. If single LUs were listed, Telnet
generates an LUGROUP name to represent the LUs. The format is *LUGnnnn where nnnn is a generated number
beginning with zero and incremented by one for each new group generated.

lu_total
is the total number of LUs in the LU or PRT group. lu_total is not used by other object types.

 newObj_entries
is a list of Objects in a group. For RESTRICTAPPL newObj_types, the newObj_entries represent each User ID and
optional LU or LUG from the RESTRICTAPPL-USER statement. LU entries for LU or PRT groups will have a
preceding character of a hyphen (-), i, or k if assigned, inactive, or kept, respectively. The LU names follow. For
ParmsGroup newObj_types, the newObj_entries are displayed in the same format as the profile detail display with parameters
organized under their appropriate header.

lu_range_total
is the total number of LUs in a range and the number of LUs in use in that range. If an assigned LU is
in more than one range, the in-use count for all ranges will be incremented.

cldconn
is the number of connections using the client identifier mapping statement.

clid_type
is the type of client identifier. Possible client identifier types are:

USERID
An exact user ID specified on a mapping statement.

HOSTNAME
An exact host name specified on a mapping statement.

IPADDR
An exact IP address specified on a mapping statement.

USERGRP
A user ID group name specified on a mapping statement.

HNGRP
A host name group name specified on a mapping statement.

IPGRP
An IP address group name specified on a mapping statement.

DESTIP
An exact destination IP address specified on a mapping statement.

LINKNAME
An exact linkname specified on a mapping statement.

DESTIPGRP
A destination IP address group name specified on a mapping statement.

LINKGRP
A linkname group name specified on a mapping statement.
The special case where no client identifier is specified.

ALLOW
   A special case where the object is an ALLOWAPPL.

RESTRICT
   A special case where the object is a RESTRICTAPPL.

clid_name is the name of the client identifier. If the Object is an ALLOWAPPL or a RESTRICTAPPL, the column is used to indicate if DISCONNECTABLE, QSESSION, or CERTAUTH was specified.

DIS   Indicates that DISCONNECTABLE was coded on ARAPPL type ALLOWAPPL or RESTRICTAPPL.
QS    Indicates that QSESSION was coded on ARAPPL type ALLOWAPPL or RESTRICTAPPL.
CA    Indicates that CERTAUTH was coded on ARAPPL type RESTRICTAPPL.

map_opts contain mapping flags. See the description of the map_opts parameter for details.

spec_item is an item that is specific to a subset of mapping statements. See spec_items for details.

System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  EZAZMTNS

EZZ6084I

jobname OBJECT LIST

Message Format:
EZZ6084I  jobname OBJECT LIST
obj_type
   obj_name  obj_name  obj_name  obj_name  obj_name

Explanation:  EZZ6084I displays a list of Object names sorted by Object type, profile, and port. The OBJECT display can be used to see what Objects are defined in the profile and some details about the Objects.

Profile and port divider line information follows each profile/port section. See message EZZ6050I for details. The last line of this message indicates how many lines of data were displayed and how many total lines exist. See EZZ6052I for details. See message EZZ6081I for an explanation of the summary parameter fields.

jobname is the name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server. If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270.

obj_type is the type of Object. Possible Object types are:

ARAPPL
   The Allowappl or Restrictappl application name.

DEFAPPL
   The application name specified on the DEFAULTAPPL statement.

LINEAPPL
   The application name specified on the LINEMODEAPPL statement.

MAPAPPL
   The application name specified on the LUMAP statement, DEFAPPL parameter.

PRTAPPL
   The application name specified on the PRTDEFAULTAPPL statement.

USS
   The USS table name specified on the USSTCP statement. A preceding character of s indicates that the USS table is an SCS format table.

INT
   The interpret table name specified on the INTERPTCP statement.
The exact LU name specified on the LUMAP statement. A preceding character of a hyphen (-), the letter i, or the letter k indicates that the LU is assigned, inactive, or kept, respectively.

LUGRP
The LUGROUP name specified on the LUMAP statement.

SLUGRP
The SLUGROUP name defined at the specified LUNR.

PRT
The exact printer LU name specified on the PRTMAP statement. A preceding character of a hyphen (-), the letter i, or the letter k indicates that the LU is assigned, inactive, or kept, respectively.

PRTRP
The PRTRP GROUP name specified on the PRTMAP statement.

SPRTGRP
The SPRTGROUP name defined on the specified LUNR.

PARMSGRP
The PARMSGROUP name specified on the PARMSMAP statement.

MONGRP
The MONITORGROUP name specified on the MONITORMAP statement.

$obj_name$ is the exact name of the Object.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAZMTNS

**Procedure name:** TCP/IP

---

**EZZ6085I**

**jobname** LUNS OBJECT DISPLAY

**Explanation:** This message is displayed in response to the Telnet D TCPIP,$jobname$,LUNS,OBJ ect command. The message displays a detailed list of object names sorted by object, profile, port, job name, and system name. The D TCPIP,$jobname$,LUNS,OBJ ect command can be used to determine what shared objects are defined on LUNRs and passed to the LUNS. The object group details can be displayed when the ID= parameter is specified in the display command.

A divider line follows each profile, port, job name, or system name section. The last line of this message indicates how many lines of data were displayed and how many total lines exist.

If Type=SLUGRP,Summary or Type=SPRTGRP,Summary is requested, a display of total LUs and LUs that are in use is displayed, sorted by group. An LU is considered to be in use if it is assigned to a connection, being kept for possible reuse, or is deactivated.

In the message text:

$jobname$
The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270,TNSRV1 server, the $jobname$ value is TNSRV1. If you start the TN3270 server, the $jobname$ value is TN3270

$obj_type$
The type of object. Possible object types are:

**SLUGRP**
The SLUGROUP name defined on the specified LUNR.

**SPRTGRP**
The SPRTGROUP name defined on the specified LUNR.
**EZZ6086I**

obj_name

The exact name of the object. This line also indicates whether a capacity warning level was specified.

lu_total

The total number of LUs in the SLU group or SPRT group.

obj_entries

A list of objects in a group. The obj_entries values are in the format xnnnnnnnn where nnnnnnnn is the LU name and x one of the following:

- A hyphen (-) if the object is assigned.
- The letter i if the object is inactive.
- The letter k if the object is being kept.

lu_range_total

The total number of LUs in a range and the number of LUs in that range that are in use. If an assigned LU is in more than one range, the in-use count for all ranges will be incremented.

ci_conn

The number of connections using LUs that are assigned from that group.

map_opts

The mapping flags. See the description of the [map_opts parameter](#) for details.

**EZZ6086I  jobname LUNS OBJECT LIST**

**Explanation:** This message is displayed in response to the Telnet D TCPIPR jobname,LUNS,OBJECT command. The message displays which objects are defined in the profile and some details about the objects.

A divider line follows each profile, port, job name, and system name section. The last line of this message indicates how many lines of data were displayed and how many total lines exist.

In the message text:

**jobname**

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the **jobname** value TNSRV1. If you start the TN3270 server, the **jobname** value is TN3270
The type of object. Possible object types are:

**SLUGRP**
The SLUGROUP name defined at the specified LUNR.

**SPRTGRP**
The SPRTGROUP name defined at the specified LUNR.

The exact name of the object.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TN3270E Telnet Server

**Module:** Not applicable.

**Routing code:** Not applicable.

**Descriptor code:** Not applicable.

**Automation:** Not applicable.

**Example:**

```
EZZ6086I TELNET LUNS OBJECT LIST
  obj_type
    obj_name obj_name obj_name obj_name obj_name

EZZ6088I  jobname XCF STATS DISPLAY
```

**Explanation:** As a result of a D TCPIP,jobname,XCF,STATS command a table of statistics for the administration connections that are used between the Telnet LU name requestor (LUNR) and the Telnet LU name server (LUNS) telnet jobs in a Telnet XCF GROUP is displayed.

Each connection displayed produces three rows in the table. The first row identifies the LUNR by connection. The second row shows the values for the last complete XCF Monitor interval. The third row shows the weighted average of those values over the last ten completed XCF Monitor intervals. Each 3-digit table value represents either an amount of time or a record count.

Time values can be one of the following:
- A number ending with U to indicate that the value is expressed in microseconds
- A number ending with M to indicate that the value is expressed in rounded milliseconds
- A number ending with S to indicate that the value is expressed in rounded seconds.

Record count values can be one of the following:
- A number only to indicate that the value is an exact count
- A number ending with K to indicate that the value is expressed in rounded thousands
- A number ending with M to indicate that the value is expressed in rounded millions

The table column headers are displayed if the queried telnet job is either an active LUNR or an active LUNS.

If the queried telnet job is an active LUNR, information is displayed for its administration connection to the current LUNS.

If the queried telnet job is an active LUNS, the ====PARTNERS==== separator line is displayed followed by information for the administration connection from each LUNR partner.
The following example shows the format of the EZZ6088I message and its table of statistics:

**EZZ6088I TELNET XCF STATISTICS**

<table>
<thead>

<th>lpndr</th>
<th>lrcvt</th>
<th>lrcvr</th>
<th>lsndt</th>
<th>lsndr</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG: artt</td>
<td>apndr</td>
<td>arcvt</td>
<td>arcvr</td>
<td>asndt</td>
<td>asndr</td>
</tr>
</tbody>
</table>

In the message text:

- **jobname**
  
  The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

  If you start the TN3270.TNSRV1 server, the **jobname** value TNSRV1. If you start the TN3270 server, the **jobname** value is TN3270

- **xm**
  
  The time interval for statistics calculations. The interval is internally set to 60S.

- **nu**
  
  The number of seconds remaining until the next interval completes and the display values are updated.

- **mvsname**
  
  The name of the MVS system on which the Telnet LUNR or LUNS resides.

- **tnname**
  
  The job name of the Telnet LUNR or LUNS.

- **lrtt**
  
  The amount of time the slowest heartbeat record took to complete a round trip in the last interval. The LUNR and the LUNS each send four heartbeat records in each of their respective XCFMONITOR intervals, but no more than one every 15 seconds. The roundtrip time includes the time spent in the Telnet outbound record queue on the sender, in TCP/IP send buffers, in the network, in TCP/IP receive buffers, in the Telnet inbound record queue on the receiver, in the Telnet outbound record queue on the sender, in TCP/IP send buffers, in the network, in TCP/IP receive buffers, and in the Telnet inbound record queue on the sender.

- **lpndr**
  
  The number of records sent to the partner that are still pending a response at the end of the last interval. This number is typically low, but might show brief spikes when shared LU administration work loads are heavy.

- **lrcvt**
  
  The amount of time spent processing records received over the connection during the last interval. This value should vary proportionately with the number of records received. A very high value with a low number of records might indicate that this Telnet is stalled. The value 0 might indicate a network problem.

- **lrcvr**
  
  The number of records received over the connection during the last interval. This value includes responses to heartbeat records so it should usually be at least 4.

- **lsndt**
  
  The amount of time spent processing records sent out over the connection during the last interval. This value includes time spent waiting for the outbound socket to unblock during writes. A very high value might indicate network congestion or a stalled Telnet partner.

- **lsndr**
  
  The number of records sent over the connection during the last interval. This value includes heartbeat records so it should usually be at least 4.

- **artt**
  
  The weighted average of heartbeat round trip times over the last ten intervals.

- **apndr**
  
  The weighted average of pending records over the last ten intervals.
The weighted average of time spent processing records received over the last ten intervals.

The weighted average of records received over the last ten intervals.

The weighted average of time spent processing records sent out over the last ten intervals.

The weighted average of records sent over the last ten intervals.

System action: Telnet processing continues.

Operator response: No action is needed.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: Not applicable.

17 OF 17 RECORDS DISPLAYED

EZZ6089I  jobname  XCF GROUP DISPLAY

Explanation: As a result of a D TCPIP,jobname,XCF,GROUP command, a table of statistics is displayed.

The following example shows the format of the EZZ6089I message and its table of statistics:

LUNS------------------ LUNR--------
MVSNAME TNNAME PDMON CTR RANK STATE STATUS STATE STATUS
--------- -------- ------ --- ------------------- --------------
mvsname tnname pdmon ctr trnk sstate sstat rstate rstat

In the message text:

jobname

The name of the procedure that is used to start the TN3270 server or the job name identifier of the procedure that is used to start the TN3270 server.

If you start the TN3270.TNSRV1 server, the jobname value TNSRV1. If you start the TN3270 server, the jobname value is TN3270
**mvsname**
The name of the MVS system on which the Telnet LUNR or LUNS resides.

**tnname**
The name of the Telnet LUNR or LUNS.

**pdmn**
The flags that can be set to indicate problem detection. Possible values by position are:

- **Position (1)**
  - X if XCFMONITOR detected a problem with a Telnet task or a problem with the administrative connection related to the LUNS or LUNR.

- **Position (2)**
  - C if the CONNECTTIMEOUT time elapsed and the LUNR cannot establish a new connection to the LUNS.

- **Position (3)**
  - R if the RECOVERYTIMEOUT time elapsed and the LUNR cannot establish a new connection to the LUNS.

**ctr**
The LUNS counter value. Telnet increments this value when a new LUNS is activated or when takeovers occur. All members of the same XCF group should have the same LUNS counter value.

**trnk**
The LUNS type and rank that was configured for the LUNS parameter of the XCFGROUP profile statement. This field is blank if the Telnet is a LUNR. The first column contains either a B or a P, depending on whether the LUNS was configured as a backup or primary LUNS. The numerical value that follows this value is the rank of the LUNS as configured in the profile.

**sstate**
The current state of this Telnet LUNS. If this Telnet is a LUNR, this field is blank. The *sstate* value can be one of the following:

- **JOINED**
  - The LUNS has joined the XCF group and is available to be an active LUNS when it is started. A LUNS remains in the JOINED state only when a connection to a TCP/IP stack cannot be made or when this is a backup LUNS and there is no primary LUNS. Otherwise, the LUNS will go to STANDBY or START state.

- **QUIESCE**
  - The LUNS is not available to become the active LUNS if recovery processing were to occur. Issue the VARY TCPIP,tnproc,LUNS,RESUME command to change the LUNS to STANDBY state.

- **STANDBY**
  - The LUNS is available to be an active LUNS when it is started.

- **START**
  - The LUNS is in the process of becoming active. Contention with any other LUNS starting is resolved and a listening socket is created.

- **RECOVER**
  - The LUNS is in the process of recovering connections to LUNRs and gathering.

- **ACTIVE**
  - The LUNS is currently managing shared LUs and allocating LUs to active LUNRs.

- **STOPPED**
  - A LUNS in RECOVER or ACTIVE state has stopped, most likely because another LUNS has taken over. While in STOPPED state, the LUNS cleans up its resources. When it is finished, the LUNS changes to STANDBY state.

- **FAILED**
  - The LUNS has failed as a result of an internal error and is no longer usable.

**sstat**
The flags that can be set to indicate a pending situation for a LUNS. If this Telnet is a LUNR, this field is blank. Each character represents a different situation. Possible *spsnd* values by position are:

- **Position (1)**
  - S if the LUNS is waiting for a socket to become available.
L if the LUNS tried to establish a listener on the socket and failed. The LUNS is changed to QUIESCE state.
C if the LUNS is waiting to connect to a critical LUNR. This flag is accompanied by non-scrollable message EZZ6095I.

Position(2)
R if the LUNS is in recovery and is rebuilding the LUNS database by collecting shared LU information from each LUNR. Generally the sstate value will be RECOVER. The LUNS can be active with this flag set if a LUNR in RECOVER state with no active shared LUs has not finished rebuilding its database with the LUNS. The flag will turn off when the rebuild process is complete for all LUNRs. This flag should be accompanied by non-scrollable message EZZ6094I.

If there are no outstanding connectivity or profile issues, all positions are blank.

rstate
The current state of this Telnet LUNR. The rstate value is one of the following:

**JOINED**
The LUNR has joined the XCF group but is not able to establish a socket with TCPIP.

**STANDBY**
Currently there are no active profiles with shared LU groups defined. However, the LUNR profile contained an XCFGROUP statement, so the LUNR joined the XCF group.

**START**
The LUNR is in the process of connecting to a LUNS.

**ACTIVE**
The LUNR is connected to an active LUNS.

**STOPPED**
A LUNR in RECOVR or ACTIVE state has stopped, most likely because another LUNS has taken over or the last profile with shared LU groups became inactive. While in STOPPED state, the LUNR cleans up its resources. When finished, the LUNR changes to STANDBY state.

**RECOVER**
The LUNR is attempting to rebuild its profile database with a new LUNS.

**FAILED**
The LUNR failed as a result of an internal error and is no longer usable.

rstat
The flags that can be set to indicate a pending situation for a Telnet LUNR. Each character represents a different situation. Possible rpen values by position are:

Position(1)
S if the LUNR is waiting for a socket to become available.
C if the LUNR is waiting for the connection to the LUNS to be established.

Position(2)
P if the LUNR is waiting for acknowledgement from the LUNS that processing of shared LU group objects in the profile is complete. This state is accompanied by non-scrollable message EZZ6092I.

Position(3)
P if the LUNR is in recovery and rebuilding its database with the new LUNS. Generally, the sstate value will be RECOVER. This flag is accompanied by non-scrollable message EZZ6094I.

Position(4)
L if the LUNR has one or more shared LUs allocated.

If there are no outstanding connectivity or profile issues, all positions are blank.

**System action:** Telnet processing continues.

20 OF 20 RECORDS DISPLAYED  
```

---

**EZZ6091I  jobname JOINED XCF GROUP group_name**  

**Explanation:** The Telnet server is reporting that it joined the specified XCF group. Only Telnet servers that contain an XCFGROUP definition in their profile join XCF groups.  

In the message text:

- **jobname**: The job name of the Telnet that joined the XCF group.  
- **group_name**: The name of the XCF group that Telnet joined.  

**System action:** The Telnet server continues.  
**Operator response:** No action is needed.  
**System programmer response:** No action is needed.  
**User response:** Not applicable.  
**Problem determination:** Not applicable.  

**Source:** z/OS Communications Server TCP/IP: TN3270E Telnet Server  
**Module:** EZBTXXCF  
**Routing code:** 2, 8  
**Descriptor code:** 4  
**Automation:** Not applicable.  

**Example:**

```
EZZ6091I  TELNET TNSERV JOINED XCF GROUP EZZTLUNS  
```
**EZZ6092I**  *jobname* LUNR PROFILE PENDING

**Explanation:** This message is issued when the Telnet LU name requester (LUNR) has a profile that is in pending state. The message remains non-scrollable until no profile is in pending state. The profile can remain pending because there is no active Telnet LU name server (LUNS) to connect to or there is no connectivity to an active Telnet LUNS.

In the message text:

- **jobname**
  - The job name of the Telnet server.

**System action:** The LUNR profile remains in PENDING state until one of the following conditions occur:
  - An active Telnet LUNS is detected and accessible.
  - The pending Telnet ports are updated by using a VARY TCPIP,OBEYFILE command that specifies a profile that does not contain any shared LU groups.

See [SLUGROUP] in [z/OS Communications Server: IP Configuration Reference] for information about shared LU groups.

**Operator response:** To determine whether an active LUNS exists, issue a DISPLAY TCPIP,*jobname,XCF,GROUP command that specifies the LUNR job name for the *jobname* value.

If a Telnet LUNS exists but is not in ACTIVE state, start it.

If no Telnet LUNS exists, start a Telnet procedure that includes a LUNS definition.

If a Telnet LUNS exists and it is in ACTIVE state, determine why connectivity cannot be established between the LUNR and LUNS.

See [z/OS Communications Server: IP System Administrator’s Commands] for more information.

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** [z/OS Communications Server TCP/IP: TN3270E Telnet Server]

**Module:** EZBTMCTL

**Routing code:** 2, 8

**Descriptor code:** 2

**Automation:** Not applicable.

**Example:**

```
EZZ6092I TELNET3 LUNR PROFILE PENDING
```

---

**EZZ6093I**  *jobname* task ACTIVE

**Explanation:** The Telnet LU name server (LUNS) or the Telnet LU name requester (LUNR) is reporting that it is active.

In the message text:

- **jobname**
  - The job name of the Telnet server.

- **task**
  - The *task* value can be one of the following:
    - LUNR when the job name is an LU name requester.
    - LUNS when the job name is an LU name server.

**System action:** When a LU Name Server (LUNS) becomes active, any LU Name Requester (LUNR) that belongs to the same XCF subplex as this LUNS can now connect to it. When a LUNR becomes active, it is ready to request LU names for incoming Telnet client connections.

**Operator response:** No action is needed.
**EZ6094I • EZ6095I**

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TN3270E Telnet Server

**Module:** EZBTXXCF

**Routing code:** 2,8

**Descriptor code:** 4

**Automation:** Not applicable.

**Example:**

```
EZ6093I TLUNS1 LUNS ACTIVE
```

---

**EZ6094I  jobname task REBUILD PENDING**

**Explanation:** This message is issued when the indicated Telnet job name is rebuilding, most likely because a Telnet LU name server (LUNS) was deactivated or was started elsewhere. This message remains non-scrollable until the LUNS or LUNR is finished with the rebuild process.

In the message text:

- **jobname**
  The job name of the Telnet server.

- **task**
  One of the following:
  - LUNR when the job name is an LU name requester.
  - LUNS when the job name is an LU name server.

**System action:** When the indicated Telnet task completes its rebuild process, this message is no longer highlighted and scrolls off the screen. A LUNR rebuild is complete when it receives an acknowledgement from the LUNS that the LUNR configuration has been processed. A LUNS rebuild is complete when the LUNS has processed the configuration data from all LUNRs in the XCF group.

**Operator response:** If this message persists, it might be an indication of a problem. Issue the D TCPIP,jobname,XCF,GROUP command and examine the state of the various LUNRs and LUNSs.

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TN3270E Telnet Server

**Module:** EZBTXXCF

**Routing code:** 2,8

**Descriptor code:** 2

**Automation:** Not applicable.

**Example:**

```
EZ6094I TLUNR3 LUNR REBUILD PENDING
```

---

**EZ6095I  jobname LUNS CONN PENDING**

**Explanation:** This message is issued when a new Telnet LU name server (LUNS) is waiting to connect to a previously active Telnet LU Name Requestor (LUNR ) that is using shared LUs or is not aware of the new LUNS. This message remains non-scrollable until the LUNS has a connection with each of the LUNRs that are using shared LU names and all members are aware of the new LUNS.

In the message text:
**EZ6096I  jobname LUNS STOPPED**

**Explanation:** The Telnet LU name server (LUNS) was in RECOVER or ACTIVE state and has been stopped because another LUNS became active or as the result of an error.

In the message text:

```
EZ6096I jobname LUNS STOPPED
```

**System action:** The indicated Telnet LU name server (LUNS) task has stopped. This might indicate a network or server problem.

**Operator response:** Review the messages that were issued before this one to determine the cause of this error. This might have been caused by another LUNS taking over as the active LUNS, in which case there is no error. Otherwise, contact the system programmer.

**System programmer response:** If a problem is suspected, issue the D TCPIP,jobname,XCF,GROUP command and examine the state of the XCF group members.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TN3270E Telnet Server

**Module:** EZBTXXCF

**Routing code:** 2,8

**Descriptor code:** 4

**Automation:** Not applicable.

**Example:**

```
EZ6096I TNSERV LUNS CONN PENDING
```

---

**EZ6097I  jobname task FAILED**

**Explanation:** The Telnet LU name server or Telnet LU name requester has failed as the result of an internal error. The task is no longer usable.

In the message text:
jobname

The job name of the Telnet server.

Task

The task value can be:

LUNR  The job name is an LU name requester.
LUNS  The job name is an LU name server.

System action:  Processing ends on the indicated task.

Operator response:  Contact the system programmer.

System programmer response:  Review the messages that were issued before this one to determine the cause of this error. If there is no apparent reason for the failure, contact IBM software support center.

User response:  Not applicable.

Problem determination:  Not applicable.

Source:  z/OS Communications Server TCP/IP: TN3270E Telnet Server

Module:  EZZTXXCF

Routing code:  2,8

Descriptor code:  2

Automation:  Not applicable.

Example:

EZZ6097I  TELNET2  LUNR  FAILED

EZZ6098I  jobname  LUNR  PURGING  SHARED  CONNECTIONS

Explanation:  The Telnet LU Name Requestor (LUNR) is purging connections using shared LU names because it has not been able to establish connectivity to a Telnet LU Name Server (LUNS) for a configured time interval during LUNS recovery. The interval is defined by the RECOVERYTIMEOUT parameter of the XCFGROUP Telnet configuration statement. When the connections are purged, the LUNS can change to ACTIVE state and begin allocating LU names to other LUNRs because the unconnected LUNR does not own any shared LUs.

In the message text:

jobname

The job name of the Telnet server.

System action:  Telnet processing continues.

Operator response:  Contact the system programmer.

System programmer response:  Determine whether there is a network connectivity problem, and if so, resolve it. To prevent this error from recurring when the LUNR needs more time to establish connectivity to the LUNS after network failures take place, increase the RECOVERYTIMEOUT value or specify 0 for the timer value to disable the function.

User response:  Not applicable.

Problem determination:  See system programmer response.

Source:  z/OS Communications Server TCP/IP: TN3270E Telnet Server

Module:  EZBTXXCF

Routing code:  2,8

Descriptor code:  4

Automation:  Not applicable.

Example:

EZZ6098I  TLUNR1  LUNR  PURGING  SHARED  CONNECTIONS
Explanation: Telnet has internal tasks that manage XCF group communications, the Telnet LU Name Server (LUNS) administrative connection and state, and the Telnet LU Name Requester (LUNR) administrative connections and state. A task might become unresponsive as a result of lock contention or a programming error. A connection might stall because of a network outage or a programming error. The Problem Determination Monitor for this Telnet has detected a problem with one of the internal tasks or an administrative connection.

In the message text:

jobname
The name of this Telnet.

task
The task name. The task value can be XCF, LUNR, or LUNS.

type
The type of problem detected. The type value can be either TASK or I/O.

psys
The system name of the partner when an I/O problem is detected.

pjob
The job name of the partner when an I/O problem is detected.

System action: The operator is alerted by this message of a problem detected by Telnet monitoring.

Operator response: Issue the DISPLAY TCPIP,tnproc,XCF,GROUP command to display a summary of the Telnet XCF group members. If the X flag under the PDMON column persists and the problem is a task problem, stop Telnet to clear the problem. If the problem is I/O, investigate the network to find the reason a connection between the LUNS and LUNR cannot be established.

System programmer response: If a task problem is reported, ensure that maintenance is up to date. If an I/O problem is reported, ensure that the network setup is correct.

User response: Not applicable.

Problem determination: Not applicable.

Routing code: Not applicable.

Descriptor code: 5,8,9

Example: Not applicable.

SNMP agent: Unable to open message catalog snmpdmsg.cat: additional error text

Explanation: The SNMP agent was unable to open the message catalog snmpdmsg.cat in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be 

NLSPATH=/usr/lib/nls/msg/%L/%N.

System action: The agent will use the internal default messages instead of the message from the external message catalog.

Operator response: If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.

System programmer response: If use of the external message catalog is required, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access. See the z/OS XL C/C++ Runtime Library Reference for more information about the catopen() function call. Information regarding the NLSPATH environment variable can be found in the z/OS UNIX System Services Programming Tools. If the default messages are acceptable, no action is necessary.

Module: EZASNA3.C, EZASNWT.C

Procedure name: main

Using catalog catalog file for SNMP agent messages

Explanation: The SNMP agent located its message catalog file.

System action: The agent continues to initialize.

Operator response: None.

System programmer response: None.

Module: EZASNA3.C

Procedure name: main

Sigaction for signal handler failed: specified action: error text (errno/errnojr)

Explanation: The agent issued a sigaction function for the specified action that failed.

erro is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.

errnoj is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

signal handler is one of the following sigaction functions: SIGTTOU, SIGTERM, SIGABEND, SIGPIPE, SIGTTIN.

System action: The agent continues to initialize.

Operator response: None.

System programmer response: Correct the problem indicated by error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

Module: EZASNA3.C
**EZZ6204I**  SIGTERM received for SNMP daemon which is now shutting down.

**Explanation:** The agent received a SIGTERM signal.

**System action:** The agent ends.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASNA3.C

**Procedure name:** pgmstpd

---

**EZZ6205I**  SNMP agent: Could not determine TCPIP jobname using default of 'INET'

**Explanation:** The SNMP agent, osnmpd, could not determine the jobname for the TCP/IP stack that it is to associate itself with. A default value of 'INET' will be used for TCPIPjobname.

**System action:** SNMP agent continues.

**Operator response:** None.

**System programmer response:** In an INET environment, no action is necessary. In a CINET environment, for the SNMP agent to communicate with a particular stack, the TCPIPjobname should be set in the appropriate resolver configuration file or data set. See the [z/OS Communications Server: IP Configuration Guide](http://www.ibm.com) for information about file search order.

An SNMP agent must be associated with a single TCP/IP instance because a portion of the MIB objects supported by a TCP/IP instance are actually implemented in the agent.

**Module:** EZASNA3.C

**Procedure name:** main

---

**EZZ6206I**  Unable to open configuration file: error text

**Explanation:** The agent was unable to open the configuration file. This configuration file can be the community names file or the file for the default MIB variables. See the error text for a more specific reason for the failure. The community names file or the MIB variables file can be in one of several files. The initialization process is searching for a community names or MIB variables file in the prescribed order and reporting on its status.

**System action:** The agent continues searching for the next file name.

**Operator response:** This is an informational message indicating that the particular file in the path was not found.

**System programmer response:** A community names or MIB variables file is required for changing defaults. If the indicted file was not found at all, then the configuration of the agent ends and the agent continues with initialization. If the configuration file name was specified on an environment variable statement in an MVS data set referenced by an STDENV DD statement in the SNMP Agent started procedure, ensure that the data set record format (keyword RECFM) is variable or variable blocked. If the data set record format is fixed block, then MVS fills adds blanks to the end of any records in the data set that do not reach the record length. This means blanks could have been added to the configuration file name. See the [z/OS Communications Server: IP Configuration Guide](http://www.ibm.com) for configuring the community names data set.

**Module:** EZASNC3.C, EZASNASO.C, EZASNA3.C

**Procedure name:** configure_v1_default, configure_community, set_mib_install_defaults

---

**EZZ6207I**  Line number number in the community name file is not in the correct format

**Explanation:** The agent was unable to interpret the statement in the community name file. The statement had fewer than three fields, (community name, IP address, and mask) or was not a comment statement that started with an asterisk (*) or a number sign (#).

**System action:** The agent ignores the current statement and continues reading in the next statement in the file.
Operator response: None.

System programmer response: Determine what is wrong with the statement in the configuration and correct it. If necessary, reIPL the agent. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.13.0/com.ibm.zos.r25.fsc.com.ibm.zos.r25.fsc.mref/ipconfig/r/cmp_macro.html) for more information.

Module: EZASNASO.C

Procedure name: configure_community

<table>
<thead>
<tr>
<th>EZZ6208I</th>
<th>Line number number in the community name file has a community name greater than number characters</th>
</tr>
</thead>
</table>

Explanation: The community name at the specified line number was greater than the indicated number of characters. The statement is ignored and configuration continues.

System action: The agent ignores the current statement and continues reading in the next statement in the file.

Operator response: None.

System programmer response: Determine what is wrong with the statement in the configuration and correct it. In order to pick up the changes, reIPL the agent. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.13.0/com.ibm.zos.r25.fsc.com.ibm.zos.r25.fsc.mref/ipconfig/r/cmp_macro.html) for configuring the community names data set.

Module: EZASNASO.C

Procedure name: configure_community

<table>
<thead>
<tr>
<th>EZZ6209I</th>
<th>Line number number in the community name file has a network address: IP address which is not in the correct format</th>
</tr>
</thead>
</table>

Explanation: The network address at the specified line number is not in dotted notation (xxx.xxx.xxx.xxx). The statement is ignored and configuration continues.

System action: The agent ignores the current statement and continues reading in the next statement in the file.

Operator response: None.

Module: EZASNASO.C

Procedure name: configure_community, configure_COMMUNITY_entry

<table>
<thead>
<tr>
<th>EZZ6210I</th>
<th>Line number number in the community_name file has a network mask or prefix: IP_address that is not in the correct format</th>
</tr>
</thead>
</table>

Explanation: The network mask at the specified line number is not in dotted decimal (xxx.xxx.xxx.xxx) or colon-hexadecimal notation, or the network prefix is not valid. The statement is ignored and configuration continues.

number is the line number in the SNMP agent configuration file.

community_name is the name of the configuration file.

IP_address is the specified IP address or network prefix value.

System action: The SNMP agent ignores the current statement and continues reading in the next statement in the file.

Operator response: None.

System programmer response: To determine what is wrong with the statement in the configuration file, see the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.13.0/com.ibm.zos.r25.fsc.com.ibm.zos.r25.fsc.mref/ipconfig/r/cmp_macro.html) for configuring the community names data set.

Module: EZASNASO.C

Procedure name: configure_community, configure_COMMUNITY_entry
EZZ6211I  Error reading the community names file at line number: number error text: error text
Explanation: The agent was attempting to read the specified line number in the community names file but had an error described by the error text. See the error text for a more specific reason for the failure. The error number is also supplied.
System action: The agent continues initializing.
Operator response: None.
System programmer response: Determine why there was an i/o error and correct it.
Module: EZASNA3.C, EZASNASO.C
Procedure name: set_mib_install_defaults, configure_community

EZZ6212I  Unable to open trap destination file : error text
Explanation: The agent was unable to open the trap destination file. See the error text for a more specific reason for the failure. The trap destination file can be in one of several files. The initialization process is searching for a trap names file in the prescribed order and reporting on its progress attempting to open the files.
System action: The agent continues searching for the next trap destination file.
Operator response: None.
System programmer response: This message can be ignored as long as a trap destination file is eventually found. If no trap destination file is found, then defaults will be used and message EZZ6213I will be issued for this condition.
Module: EZASNASO.C
Procedure name: configure_trap_v1

EZZ6213I  Using SNMP trap defaults
Explanation: The agent was unable to open any trap destination files.
System action: The agent uses the default trap destination settings.
Operator response: None.
System programmer response: The agent continues initializing. See the z/OS Communications Server: IP Configuration Guide for creating a trap destination data set.
Module: EZASNASO.C
Procedure name: configure_trap_v1

EZZ6214I  Using trap destination file for trap destination file
Explanation: The agent found and opened the trap destination file.
System action: None.
Operator response: None.
System programmer response: None.
Module: EZASNASO.C
Procedure name: configure_trap_v1

EZZ6215I  Line number number in the trap destination file is not in the correct format
Explanation: Trap initialization could not process the statement identified by the indicated line number.
System action: The agent ignores the current statement and continues reading in the next statement in the file.
Operator response: None.
System programmer response: Determine what is wrong with the statement in the trap destination file and correct it.
Restart the agent after the statement was corrected. See the \textit{z/OS Communications Server: IP Configuration Reference} on creating a trap destination data set.

\textbf{Module: EZASNASO.C}
\textbf{Procedure name: configure\_trap\_v1}

\textbf{EZ6216I} \hspace{1em} line number \textit{number} in the \textit{trap destination} file failed host\_lookup for ip address: \textit{hostname}

\textbf{Explanation:} The host\_lookup function could not resolve the \textit{hostname} into an IP address for the given \textit{trap destination} at line number \textit{number} in the \textit{trap destination} file.

\textbf{System action:} The agent ignores the current statement and continues reading in the next statement in the file.

\textbf{Operator response:} None.

\textbf{System programmer response:} Determine what is wrong with the statement in the \textit{trap destination} file and correct it.
Restart the SNMP agent.

\textbf{Module: EZASNASO.C}
\textbf{Procedure name: configure\_trap\_v1}

\textbf{EZ6217I} \hspace{1em} Line number \textit{number} in the \textit{trap destination} file protocol is not a supported connection

\textbf{Explanation:} The only trap protocol for trap reporting is \textit{UDP}. At indicated line number in the trap destination file something other than \textit{UDP} was specified.

\textbf{System action:} The agent ignores the current statement and continues reading in the next statement in the file.

\textbf{Operator response:} None.

\textbf{System programmer response:} Determine what is wrong with the statement at line number \textit{number} in the \textit{trap destination} file and correct it.

\textbf{Module: EZASNASO.C}
\textbf{Procedure name: configure\_trap\_v1}

\textbf{EZ6218I} \hspace{1em} Error reading the \textit{trap destination} file at line number: line number - error text: \textit{error text}

\textbf{Explanation:} There was an error reading the \textit{trap destination} file at the line indicated by \textit{line number}. The \textit{error text} will provide more information about the cause of the error.

\textbf{System action:} The agent closes the \textit{trap destination} file current statement and continues initialization.

\textbf{Operator response:} None.

\textbf{System programmer response:} See the error text to determine what is wrong with the \textit{trap destination} file.

\textbf{Module: EZASNASO.C}
\textbf{Procedure name: configure\_trap\_v1}

\textbf{EZ6219I} \hspace{1em} rc=rc (error text) (expect rc (additional error text)) from (SNMP function name)

\textbf{Explanation:} There was an error while the agent attempted to add a target address entry for a notification destination.

\textit{SNMP function name} is the failing SNMP function name.
\textit{error text} and \textit{type} provide more information about the cause of the error.

\textbf{System action:} The agent ignores the problem and continues with initialization.

\textbf{Operator response:} None.

\textbf{System programmer response:} Try to correct the problem with the help of the information in this message.

\textbf{Module: EZASNAC3.C}
\textbf{Procedure name: add\_notification\_destination}
EZZ6220I Unknown notification version

**Explanation:** There was an error while the agent attempted to add a notification destination. The `version` was specified and it is not recognized as valid.

**System action:** The agent ignores the problem and continues with initialization.

**Operator response:** None.

**System programmer response:** Try to correct the problem with the help of the information in this message. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSS7TX_8.5.1/com.ibm.zos/V applicable/zos_ip_config_ref.html) for SNMP agent trap destination configuration.

**Module:** EZASNAC3.C

**Procedure name:** add_notification_destination

---

EZZ6221I Need community name

**Explanation:** When the agent was started a `-c` argument was specified but there was no community name specified.

**System action:** The agent ended.

**Operator response:** None.

**System programmer response:** A community name must be specified if the `-c` argument is specified. The community name follows the `-c` argument. For more information, see the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/SSS7TX_8.5.1/com.ibm.zos/V applicable/zos_ip_config_ref.html)

**Module:** EZASNAC3.C

**Procedure name:** snmp_config_parse_options

---

EZZ6222I Need a z/OS UNIX socket name

**Explanation:** When the agent was started a `-s` argument was specified but there was no z/OS UNIX socket name specified.

**System action:** The agent ended.

**Operator response:** None.

**System programmer response:** A z/OS UNIX socket name must be specified if the `-s` argument is specified. The z/OS UNIX socket name follows the `-s` argument.

**Module:** EZASNAC3.C

**Procedure name:** snmp_config_parse_options

---

EZZ6225I SNMP agent: Initialization complete

**Explanation:** The SNMP agent completed initialization and is ready to receive requests.

**System action:** The agent is functioning.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASNA3.C

**Procedure name:** main

---

EZZ6226I port number is an incorrect port number, using default port

**Explanation:** When the agent was started, a `-p` argument specified a `port number` that was not valid port. The default port value, `default port` is used instead.

**System action:** The agent continues initializing.

**Operator response:** The user can stop the agent and restart it with the intended port number.
System programmer response: None.
Module: EZASNC3.C
Procedure name: snmp_config_parse_options

**EZZ6227I**  
**Added managers for community:** community name rc= rc

**Explanation:** When the agent attempted to add the community name, it found that the name already existed. As a result, it becomes a multiple manager community name.

**System action:** The agent continues initializing.

**Operator response:** None.

**System programmer response:** None.

Module: EZASNC3.C, EZASNOS.C
Procedure name: configure_v1_default, configure_community, configure_COMMUNITY_entry

**EZZ6228I** *(error text) from snmp_local_config_set()*

**Explanation:** The agent was attempting to set the DPI MIB variable, dpiPortForTCP, but was not successful. The *error text* will provide more information about the cause of the error. All subagents that use this connection will be unable to communicate with the agent. This does not affect z/OS UNIX stream subagent connections.

**System action:** The agent continues initializing.

**Operator response:** None.

**System programmer response:** None.

Module: EZASNAAC3.C
Procedure name: set_dpiport

**EZZ6229I**  
**Closing DPI z/OS UNIX socket connection, fd=socket file descriptor**

**Explanation:** The agent closed a DPI z/OS UNIX socket connection to a sub-agent on the file descriptor *socket file descriptor*. This is normally a message that reports agent activity.

**System action:** The agent continues processing.

**Operator response:** None.

**System programmer response:** None.

Module: EZASNAAC3.C
Procedure name: close_dpi

**EZZ6230I**  
**Closing DPI inet socket connection, fd=socket file descriptor, address ip address port port number**

**Explanation:** The agent closed a DPI inet socket connection to a sub-agent on the file descriptor *socket file descriptor*. *ip address* is the IP address and *port number* is the port number. This is normally a message that reports agent activity.

**System action:** The agent continues processing.

**Operator response:** None.

**System programmer response:** None.

Module: EZASNAAC3.C
Procedure name: close_dpi
EZ6231I  (error text) from snmp_delete_subagent()

Explanation:  The agent closed a DPI socket connection and then tried to remove all control blocks related to this sub-agent but had a problem. The rc was returned from the snmp_delete_subagent function. The particular problem is specified by the additional error text error text.

System action:  The agent continues processing.
Operator response:  None.
System programmer response:  None.
Module:  EZASNA3.C
Procedure name:  close_dpi

EZ6232I  The SNMP agent is running as jobname, jobname.

Explanation:  The agent is reporting its jobname.
System action:  The agent continues processing.
Operator response:  None.
System programmer response:  None.
Module:  EZASNA3.C
Procedure name:  main

EZ6233I  Cannot allocate buffers for SNMP and DPI packets; SNMP agent ended.

Explanation:  The agent cannot allocate enough space for buffers.
System action:  The agent ends.
Operator response:  None.
System programmer response:  Determine why there is not enough main memory.
Module:  EZASNA3.C
Procedure name:  main

EZ6234I  gethostname function failed; SNMP agent defaulting to 127.0.0.1

Explanation:  The gethostname function failed. The agent will default to using the loopback address as its local address.
System action:  The agent continues.
Operator response:  None.
System programmer response:  If use of the loopback address is not acceptable, determine which TCP/IP stack the SNMP agent has affinity to. Verify that the TCP/IP stack’s TCPIP.DATA data set has a valid HOSTNAME statement. The TCP/IP stack configuration component uses the z/OS UNIX search order to locate the TCPIP.DATA HOSTNAME statement to determine the stack host name. See [search orders used in the z/OS UNIX environment] in z/OS Communications Server: IP Configuration Guide for a description of this search order. This host name value is the value that is returned on gethostname socket function calls processed by the stack.
Module:  EZASNA3.C
Procedure name:  main

EZ6235I  function_name_and_socket_type_ failure; error_text

Explanation:  function_name_and_socket_type_ failure identifies the function that failed.
error_text provides more information about the cause of the error.
System action:  The agent might end if it involves SNMP socket(161).
Operator response: None.
System programmer response: Determine why the system function failed.
Module: EZASNAAC3.C
Procedure name: main

**EZZ6236I** bind function failed for SNMP inet udp socket; *error_text*

Explanation: The bind function failed to get a socket that would be used for communication between the agent and manager functions.
*error_text* provides more information about the cause of the error.

System action: The agent ends.
Operator response: None.
System programmer response: Determine why the system cannot do a bind.
Module: EZASNAAC3.C
Procedure name: main

**EZZ6237I** failing_socket_function_name for a socket_type; *error_text*

Explanation: The socket function failed for a socket that would be used for communication between the agent and subagents functions.
*error_text* provides more information about the cause of the error.

System action: The agent might end depending on the failing function.
Operator response: None.
System programmer response: Determine why the function failed.
Module: EZASNAAC3.C
Procedure name: main

**EZZ6238I** socket_function_failed_for_z/OS UNIX_DPI_socket; *error_text*

Explanation: The SNMP agent is attempting to set up an AF_UNIX socket for use in communicating with subagents. The AF_UNIX socket is represented by a z/OS UNIX file, whose default path name is /var/dpi_socket. The file name can be specified either on the -s parameter at SNMP agent initialization or by setting the dpiPathNameForUnixStream MIB object value in the OSNMPD.DATA file. This message indicates that one of the function calls used to setup this AF_UNIX socket or its associated z/OS UNIX file failed.

In the message text:

```
socket_function_failed_for_z/OS UNIX_DPI_socket
```

The function call that failed.

*error_text* provides more information about the cause of the error.

A z/OS UNIX DPI socket is used for communication between the agent and subagents functions.

*error_text* provides more information about the cause of the error.

System action: The agent might end depending on the socket function.
Operator response: Restart the SNMP agent with tracing by specifying -d 255 at agent invocation. Use the errnojr shown in the traces for additional help in diagnosing the problem.
System programmer response: Determine why the socket function is failing.
Module: EZASNAAC3.C
Example:
EZZ6238I bind function failed for z/OS UNIX DPI socket ; EDC5111I Permission denied.
Procedure name: main

EZZ6239I  selectex() function timed out on wait forever
Explanation: The selectex socket call made by the SNMP agent timed out. However, the call made by the SNMP agent requested that it wait forever, so the selectex should never have timed out. It might indicate a problem with the SNMP agent, the selectex socket call or the TCP/IP stack.
System action: The SNMP agent tolerates a small, fixed number of errors on the selectex call before ending. If the count of selectex errors is in the limit, the SNMP agent reissues the selectex call. If the error limit was exceeded, the SNMP agent ends.
Operator response: This condition should be reported to your system administrator. Collect traces for the SNMP agent, the C socket layer, and the TCP/IP stack to diagnose the error. Restart the SNMP agent with the traces enabled.
System programmer response: Collect the traces and contact the IBM software support center.
Module: EZASNA3.C
Procedure name: main

EZZ6240I  selectex() function failed return code = rc
Explanation: The selectex socket call made by the SNMP agent failed with the return code shown. This might indicate a problem with the SNMP agent, the selectex socket call, or the TCP/IP stack. For example, if the TCP/IP stack is shut down before the SNMP agent is stopped, this message will be issued.
rc is the return code for the selectex socket call. These return codes are documented in the z/OS XL C/C++ Runtime Library Reference.
System action: The SNMP agent tolerates a small, fixed number of errors on the selectex call before ending. If the count of selectex errors is in the limit, the SNMP agent reissues the selectex call. If the error limit was exceeded, the SNMP agent ends.
Operator response: This condition should be reported to your system administrator.
If this error is not caused by the TCP/IP stack being shut down, then report this condition to your system administrator. Restart the SNMP agent with traces for the SNMP agent, the C socket layer, and the TCP/IP stack enabled to diagnose the error.
System programmer response: Contact the IBM software support center and supply the traces collected.
Module: EZASNA3.C
Procedure name: main

EZZ6241I  receive function failed; error_text
Explanation: The receive function failed. error_text provides more information about the cause of the error.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: main
EZZ6242I  accept function failed for a DPI inet socket; error_text
Explanation: The accept function failed for a DPI inet socket that would be used for communication between the agent and sub-agent functions.
error_text provides more information about the cause of the error.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: main

EZZ6243I  Refused new DPI connection, at maximum connection of maximum_agents
Explanation: The agent refused the connection of a new sub-agent because of a limit on the number of active subagents.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: main

EZZ6244I  Accepted new DPI inet socket connection on fd=file descriptor from inet address port port number
Explanation: The agent accepted a connection to a sub-agent. This event is logged.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: main

EZZ6245I  accept function failed for a DPI z/OS UNIX socket; error_text
Explanation: The accept function failed for a DPI z/OS UNIX socket that would be used for communication between the agent and sub-agent functions.
error_text provides more information about the cause of the error.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: main

EZZ6246I  Accepted new DPI z/OS UNIX socket connection on fd=file descriptor.
Explanation: The agent accepted a connection to a sub-agent over a z/OS UNIX socket connection. This event is logged.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: main

EZ6247I SNMP agent terminating, got number errors on selectex
Explanation: The selectex function failure count reached its limit.
System action: The agent ends.
Operator response: None.
System programmer response: This message is usually issued when the TCP/IP stack, with which the SNMP Agent is associated, ends. If it is issued at this time, then it does not represent an error. If it is issued at other times, then obtain the SNMP Agent traces and review them to determine the cause of the problem. To activate SNMP Agent tracing, invoke the MVS command F agentprocname,TRACE,LEVEL=255. The SNMP Agent uses the syslog daemon to write its traces. The traces are written to the file specified on the daemon facility configuration statement in the syslog daemon configuration file (usually /etc/syslog.conf). See the syslog daemon information in [Z/OS Communications Server: IP Configuration Reference] for more information about the syslog daemon configuration file.
Module: EZASNAA3.C
Procedure name: main

EZ6248I A select function timed out on a DPI connection
Explanation: The receive function failed.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: main

EZ6249I EOF received on DPI fd number
Explanation: The receive function returned an EOF for the indicated file descriptor number while trying to receive from a subagent.
System action: The DPI connection is closed. The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: mustread

EZ6250I receive function failed for a DPI socket; error text
Explanation: The receive function failed for a DPI socket. The error text indicates the specific reason for failure.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: read_tcp_dpi_packet
EZZ6251I  sendto function failed for a DPI socket; error_text. IP address=ipaddr.port_number

Explanation: The sendto function failed for a DPI socket.
error_text provides more information about the cause of the error.

ipaddr is the failing IP address.
port_number is the number of the failing port.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: send_snmp_message

EZZ6252I  On a sendto function only number sent out of total number bytes sent.

Explanation: The sendto function failed to send all the intended bytes on a DPI socket.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: asend_snmp_message

EZZ6253I  send function failed; error_text

Explanation: The send function failed on a DPI socket.
error_text provides more information about the cause of the error.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: send_message_to_snmp_subagent

EZZ6254I  On a send function only number out of number bytes sent

Explanation: The send function failed to send all the intended bytes on a DPI socket.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNAA3.C
Procedure name: send_message_to_snmp_subagent

EZZ6255I  select function failed return code = rc

Explanation: The select socket call made by the SNMP agent failed with the return code shown. This might indicate a problem with the SNMP agent, the select socket call, or the TCP/IP stack.
rc is the return code for the select socket call. These return codes are documented in the z/OS XL C/C++ Runtime Library Reference.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: await_message_from_snmp_subagent

**EZ6256I** gethostbyname function failed for hostname; error text
Explanation: The gethostbyname function failed.
error_text provides more information about the cause of the error.
System action: The agent continues.
Operator response: None.
System programmer response: Determine whether hostname is a valid host name.
Module: EZASNA3.C
Procedure name: snmp_IPaddress LINKAGE lookup_host

**EZ6257I** SIGPIPE received for an SNMP agent which is now shutting down
Explanation: A SIGPIPE signal was received by the agent.
System action: The agent ends.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: sigpipedd

**EZ6258I** SIGABND signal received. SNMP agent daemon terminating with abendcode, rsncode.
Explanation: A SIGABND signal was received by the agent.
abendcode is the hexadecimal MVS Abend code. MVS abend codes are described in the z/OS MVS System Codes.
reasoncode is the reason code associated with this abendcode. They are listed in the description of the abend code in the z/OS MVS System Codes.
System action: The agent ends.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: pgmabndd

**EZ6259I** Tracing is set to trace setting
Explanation: This a response to a modify command that indicates the current trace setting.
System action: The agent continues.
Operator response: None.
System programmer response: None.
Module: EZASNA3.C
Procedure name: mvs_command_handler
**EZZ6260I • EZZ6264I**

**EZZ6260I**  Unrecognized modify request

**Explanation:** This a response to a modify command that could not be serviced because the request was not recognized.

**System action:** The agent continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASNA3.C

**Procedure name:** mvs_command_handler

**EZZ6261I**  Modify request completed

**Explanation:** This a response to a modify command that completed.

**System action:** The agent continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASNA3.C

**Procedure name:** mvs_command_handler

**EZZ6262I**  Unsupported modify command received

**Explanation:** The agent modify command handler does not support the requested modify.

**System action:** The agent continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZASNA3.C

**Procedure name:** mvs_command_handler

**EZZ6263I**  Configuration problem in file *filename* at line *line number* variable name *MIB variable name* not recognized.

**Explanation:** The agent was attempting to configure the MIB variables from the configuration file and did not recognize the MIB variable at the indicated line number.

**System action:** The agent continues initializing.

**Operator response:** None.

**System programmer response:** Check the file and correct the MIB variable at that line number.

**Module:** EZASNA3.C

**Procedure name:** set_mib_install_defaults

**EZZ6264I**  Configuration problem in file *filename* at line *line number* variable name *variable name* the value: *value* not recognized.

**Explanation:** The agent was attempting to configure the variable from the configuration file and did not recognize the variable at the indicated line number.

**System action:** The agent continues initializing.

**Operator response:** None.

**System programmer response:** Check the file and correct the MIB value at that line number.

**Module:** EZASNA3.C
Procedure name: set_mib_install_defaults

Usage: command [options], incorrect option specified. To see a complete list of options, enter command ?

Explanation: This is a list of all supported options.
In the message text, the options are:

- `-a` send packets using physical interface address as source address

- `-c community`
  a community name or password for SNMP requests (default public)

- `-d level` debug level [0..255] default 0 (but 31 is used if -d is specified without a value)

- `-p port` listen for SNMP packets on this port (default 161)

- `?-` display the usage statement

System action: Processing ends.

Operator response: Correct the option or version and reissue the command.

System programmer response: None.

Module: EZASNA3.C

Procedure name: usage

Using file file name for community names configuration

Explanation: The agent is using the file name as its source of community name configuration.

System action: None.

Operator response: None.

System programmer response: The agent configures the community name from entries in this file.

Module: EZASNASO

Procedure name: configure_community

Tracing set to level

Explanation: This message indicates what tracing level was requested. There might be several following lines in the syslog that further state each type of tracing requested.

System action: None.

Operator response: None.

System programmer response: None.

Module: EZASNA3.C

Procedure name: snmp_config_parse_options

Pwtokey usage statement

Explanation: The pwtokey usage statement is displayed when pwtokey is invoked with the -? option.

System action: pwtokey ends after displaying the usage statement.

Operator response: None.

System programmer response: None.

Module: EZASNPWT.C

Procedure name: do_usage

Chapter 6. EZZ6xxx messages 381
EZZ6269I  Display of number byte description:
Explanation: The pwtokey function is writing out a value (either key or SNMP EngineID) as described by the textual description. The value is displayed on the following line.

System action: pwtokey function continues.

Operator response: The output of the pwtokey function is used in configuring the SNMP agent for SNMPv3 security.

System programmer response: None.

Module: EZASNPWTC

Procedure name: dump_bfr

EZZ6272I  SNMP agent: Could not establish affinity with 'jobname' (errno/errnojr)
Explanation: The SNMP agent cannot communicate with the TCP/IP stack jobname. The SNMP agent attempted to use the socket call, setibmopt(), to associate itself with the TCP/IP instance tcpip_name. This TCP/IP name should be the started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) of the TCP/IP instance with which the SNMP agent is to be associated. The setibmopt call failed with the displayed errno and errnojr.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: The SNMP agent ends abnormally.

Operator response: Most likely, the TCP/IP instance's name was not defined correctly to OMVS. Check the SUBFILESYSTYPE NAME for the corresponding TCP/IP instance in the BPXPRMxx member that was used to configure OMVS. Ensure that the TCP/IP started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) matches the SUBFILESYSTYPE NAME. Recycle OMVS or TCP/IP if a change is necessary. If none of the above error conditions exist contact the system programmer.

System programmer response: For the SNMP agent to communicate with a particular stack, the jobname (as determined by the system variable TCPIPjobname) must match "xxxxx" where "xxxxx" is set in the BPXPRMxx member that was used to start OMVS. "xxxxx" is set in the SUBFILESYSTYPE NAME(xxxxx) for ENTRYPOINT(EZBPFINI). In order to establish an affinity with a corresponding TCPIP stack, the SNMP agent uses the setibmopt call. Correct the error indicated by error_code and reason.

Module: EZASNAA3.C

Procedure name: main

EZZ6273I  Value specified for the startup parameter is missing
Explanation: When the agent was started a '-' argument was specified without a value. The default value continues to be in effect.

System action: The agent continues initializing.

Operator response: The user can stop the agent and restart it with the intended value.

System programmer response: None.

Module: EZASNAC3.C

Procedure name: snmp_config_parse_options
SNMP agent: using file file name for configuration

Explanation: This SNMP agent is using file name as its source for user, view, access list, community name, and trap destination definitions.

System action: The SNMP agent continues initialization.

Operator response: None.

System programmer response: None.

Module: EZASNAC3.C

Procedure name: snmp_configure

SNMP agent: using file file name for MIB variable defaults

Explanation: This SNMP agent is using file name as its source for default MIB variable values.

System action: The SNMP agent continues initialization.

Operator response: None.

System programmer response: None.

Module: EZASNA3A.C

Procedure name: set_mib_install_defaults

SNMP agent: unable to open or create boots file file name: error text

Explanation: This SNMP agent is attempting to initialize security settings using file name. If the file does not exist, it will be created. If it cannot be created, this message is issued. See the error text for a more specific reason for the failure.

System action: The SNMP agent will continue to attempt to open all files in the search path for the boots initialization file.

Operator response: None.

System programmer response: A boots initialization file is required when SNMPv3 security is used. This is an informational message indicating which file was attempted in the search order. See the z/OS Communications Server: IP Configuration Guide for configuring the SNMP agent.

Module: EZASNASO.C

Procedure name: configure_engine_boots

SNMP agent: unsuccessful initialization: (no boots file | no engineID | incorrect engineID | incorrect engineBoots). SNMP agent ending.

Explanation: This SNMP agent is attempting to initialize for SNMPv3 security, but one of the following occurred:

• no boots file - no boots file could be opened or created.
• no engineID - an existing boots file was opened, but it did not contain an engineID value.
• incorrect engineID - an existing boots file was opened, but it contained an engineID that was not in the correct format.
• incorrect engineBoots - an existing boots file was opened, but it contained an engineBoots value that was not in the correct format.

System action: The SNMP agent ends.

Operator response: None.

System programmer response: A boots initialization file is required when SNMPv3 security is used. If an existing file is opened, it must contain valid engineID and engineBoots values. Either correct the error and restart the agent or configure the SNMP agent not to use SNMPv3 security. See the z/OS Communications Server: IP Configuration Reference for configuring the SNMP agent.
Module: EZASNASO.C
Procedure name: configure_engine_boots

EZZ6279I SNMP agent: using (new | existing) file file name for boots initialization

Explanation: The file used for SNMP agent boots initialization is displayed with an indication of whether the agent created the file or used an existing file.

System action: The SNMP agent continues boots initialization.

Operator response: None.

System programmer response: To ensure the security of SNMPv3 requests, it is recommended that the same file be used for boots initialization across restarts of the SNMP agent. This message indicates whether a new file was created or an existing file was used.

Module: EZASNASO.C
Procedure name: configure_engine_boots

EZZ6280I SNMP agent: engineBoots value is wrapping

Explanation: The SNMP engineBoots value read from the boots file was greater than or equal to the maximum possible engineBoots value (2,147,483,647). It is incremented each time the agent restarts.

System action: The SNMP agent ends.

Operator response: None.

System programmer response: To ensure the security of SNMPv3 requests, the engineBoots value is incremented on each restart of the agent. When the engineBoots value reaches the maximum, good security practices suggest that all configured user secrets (keys) be regenerated before restarting the SNMP agent. Erase the boots file or change the value of engineBoots in the file to zero. Then restart the SNMP agent.

Module: EZASNASO.C
Procedure name: configure_engine_boots

EZZ6281I SNMP agent: line number number contains an unsupported keyword keyword

Explanation: The SNMP agent configuration file contained an unsupported keyword.

System action: The entry is ignored, and SNMP agent initialization continues with the next line in the file.

Operator response: None.

System programmer response: Correct the entry in the configuration file and restart the SNMP agent. See the z/OS Communications Server: IP Configuration Reference for configuring the SNMP agent.

Module: EZASNASO.C
Procedure name: configure_defined_entries

EZZ6282I SNMP agent: line number number contains an unsupported value value

Explanation: The SNMP agent configuration file contained an unsupported value on the line indicated.

System action: The entry is ignored, and SNMP agent initialization continues with the next line in the file.

Operator response: None.

System programmer response: Correct the entry in the configuration file and restart the SNMP agent. See the z/OS Communications Server: IP Configuration Reference for configuring the SNMP agent.

Module: EZASNASO.C
Procedure name: configure_defined_entries
SNMP agent: line number *number* contains an incorrect number of keywords for a *entry type* entry

**Explanation:** The SNMP agent configuration file requires all keywords to be specified or defaulted with a dash (-). The indicated line contains an incorrect number of keywords for the type of entry.

**System action:** The entry is ignored. The SNMP agent continues initialization.

**Operator response:** None.

**System programmer response:** Correct the entry in the configuration file and restart the SNMP agent. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SS5500_1.10.0/com.ibm.zos.zos.doc/index.html) for configuring the SNMP agent.

**Module:** EZASNASO.C

**Procedure name:** process_DEFAULT_SECURITY_entry, configure_USM_USER_entry, configure_VACM_GROUP_entry, configure_VACM_VIEW_entry, configure_VACM_ACCESS_entry, configure_NOTIFY_entry, configure_TARGET_ADDRESS_entry, configure_TARGET_PARAMETERS_entry, configure_COMMUNITY_entry, configure_NOTIFY_FILTER_PROF_entry, configure_NOTIFY_FILTER_entry

---

SNMP agent: line number *number* contains a keyword value that is too long: *keyword*

**Explanation:** The indicated keyword in the SNMP agent configuration file is too long.

**System action:** The entry is ignored. The SNMP agent continues initialization.

**Operator response:** None.

**System programmer response:** Correct the entry in the configuration file and restart the SNMP agent. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SS5500_1.10.0/com.ibm.zos.zos.doc/index.html) for configuring the SNMP agent.

**Module:** EZASNASO.C

**Procedure name:** process_DEFAULT_SECURITY_entry, configure_USM_USER_entry, configure_VACM_GROUP_entry, configure_VACM_VIEW_entry, configure_VACM_ACCESS_entry, configure_NOTIFY_entry, configure_TARGET_ADDRESS_entry, configure_TARGET_PARAMETERS_entry, configure_COMMUNITY_entry, configure_NOTIFY_FILTER_PROF_entry, configure_NOTIFY_FILTER_entry

---

SNMP agent: line number *number* defaults positional keyword *keyword* but that keyword is required.

**Explanation:** The SNMP agent configuration file contained a dash (-) to default a keyword for which an explicit value must be specified. In some cases, this message will be issued because the value of a keyword makes another keyword required. For example, specifying or defaulting the authProto value to 'HMAC-MD5' makes a key required for authKey.

**System action:** The entry is ignored. The SNMP agent continues initialization.

**Operator response:** None.

**System programmer response:** Correct the entry in the configuration file and restart the SNMP agent. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/knowledgecenter/en/SS5500_1.10.0/com.ibm.zos.zos.doc/index.html) for configuring the SNMP agent.

**Module:** EZASNASO.C

**Procedure name:** process_DEFAULT_SECURITY_entry, configure_USM_USER_entry, configure_VACM_GROUP_entry, configure_VACM_VIEW_entry, configure_VACM_ACCESS_entry, configure_NOTIFY_entry, configure_TARGET_ADDRESS_entry, configure_TARGET_PARAMETERS_entry, configure_COMMUNITY_entry, configure_NOTIFY_FILTER_PROF_entry, configure_NOTIFY_FILTER_entry

---

SNMP agent: line number *number* contains an unsupported value *value*. Default value is used.

**Explanation:** The SNMP agent configuration file contained an unsupported value on the line indicated. The default value was applied and processing of the entry continues.

**System action:** The SNMP agent continues initialization.

**Operator response:** None.
EZZ6287I  SNMP agent: error configuring keyword entry on line number number. SNMP agent ending.

Explanation: An error occurred in trying to create a configuration definition for the specified type of entry on the indicated line of the SNMP agent configuration file. The most likely cause of this error is that there was not sufficient memory to create the entry.

System action: The SNMP agent ends.

Operator response: None.

System programmer response: None.

Module: EZASNASO.C

Procedure name: configure_TARGET_ADDRESS_entry

---

EZZ6289I  SNMP agent: line number number defines a duplicate entry.

Explanation: A duplicate configuration definition for the SNMP agent was found on the specified line number. The SNMP agent continues initialization.

System action: The SNMP agent accepts the definition and continues initialization.

Operator response: None.

System programmer response: None.

Module: EZASNASO.C

Procedure name: configure_USM_USER_entry, configure_VACM_GROUP_entry, configure_VACM_VIEW_entry, configure_VACM_ACCESS_entry, configure_NOTIFY_entry, configure_TARGET_ADDRESS_entry, configure_TARGET_PARAMETERS_entry, configure_NOTIFY_FILTER PROF_entry, configure_NOTIFY FILTER_entry

---

EZZ6290I  setibmsockopt function failed for SNMP INET UDP socket; error text

Explanation: The setibmsockopt function failed for the SNMP INET UDP socket; The error text will provide more information about the cause of the error.

System action: The agent continues, but SOURCEVIPA will not be ignored on the socket used by the agent to receive and respond to requests. As a result, SNMP requests might fail due to IP address verification that would otherwise have been accepted.

Operator response: None.

System programmer response: Determine why the system function failed. Correct the problem and restart the SNMP agent.

Module: EZASNA3.A

Procedure name: main

---

EZZ6292I  SNMP agent: unexpected error adding entry entry at initialization. Return code = code

Explanation: The SNMP agent was attempting to add a configuration entry of the specified type at agent initialization when an unexpected error occurred. The error return code is shown.

System action: The SNMP agent initialization continues.

Operator response: Contact the system programmer.

System programmer response: Attempt to correct the problem and restart the SNMP agent.
Module: EZASNAC3.C
Procedure name: add_notification_destination

EZZ6293I SNMP agent: line number number contains a keyword value that is too short: keyword
Explanation: The indicated keyword in the SNMP agent configuration file is too short.
System action: The entry is ignored. The SNMP agent continues initialization.
Operator response: None.
System programmer response: Correct the entry in the configuration file and restart the SNMP agent. See the z/OS Communications Server: IP Configuration Reference for configuring the SNMP agent.

Module: EZASNASO.C
Procedure name: process_DEFAULT_SECURITY_entry, configure_USM_USER_entry

EZZ6294I SNMP agent: line number number defines a keyword that is not consistent with the other keyword specification.
Explanation: A configuration definition on the specified line number contains keyword values that conflict. Possible cases are:
- A USM_USER configuration definition contains a keyType definition that is not consistent with the engineID specification. For example, if the asterisk is used to specify 'any' for the engineID, the keyType must be non-localized.
- A USM_USER configuration definition contains a storageType definition that is not consistent with the authProto specification. For example, the storageType of readOnly is not allowed when an authProto other than 'none' is specified. keyType must be non-localized.
System action: The SNMP agent ignores the entry and continues initialization.
Operator response: None.
System programmer response: None.

Module: EZASNASO.C
Procedure name: configure_USM_USER_entry

EZZ6295I SNMP agent: Dynamic configuration initialized.
Explanation: Dynamic configuration for the SNMP agent successfully initialized.
System action: The SNMP agent continues initialization.
Operator response: None.
System programmer response: None.

Module: S@DYNINI.C
Procedure name: dynInitialize

EZZ6296I SNMP agent: Error in allocating memory in function
Explanation: The SNMP agent attempted to allocate memory while running in function function. Memory could not be obtained.
System action: If the error occurs during SNMP agent initialization, the SNMP agent will terminate. If the error occurs while the SNMP agent is processing a SET request, the SNMP agent fails the SET request.
Operator response: Contact the system programmer.
System programmer response: Determine why memory was not available. Correct the problem and restart the SNMP agent.
Module: S@DYNINI.C, S@DYNCFY, S@DYNFUP
EZZ6297I  •  EZZ6300I

**Procedure name**: dynInitialize, dynInitializeConfigList, dynUpdateConfig, dynBuildUsmUser, dynBuildVacmGroup, dynBuildVacmAccess, dynBuildNotify dynBuildTargetAddr, dynBuildTargetParm, dynBuildTxtUserRec, dynBuildTxtGroupRec, dynBuildTxtViewRec, dynBuildTxtAccessRec, dynBuildTxtNotifyRec, dynBuildTxtTargetAddrRec, dynBuildTxtTargetParmRec, dynBuildNotifyFilterProf, dynBuildNotifyFilter, dynBuildTxtFilterProfRec, dynBuildTxtFilterRec

---

**EZZ6297I  •  SNMP agent: Error adding entry to dynamic configuration list.**

**Explanation**: The SNMP agent was attempting to add an entry to the dynamic configuration list representing the entries of the SNMPD.CONF configuration file. See previous error messages for the details of the error that occurred.

**System action**: If the error occurs during SNMP agent initialization, the SNMP agent will terminate. If the error occurs while the SNMP agent is processing a SET request, the SNMP agent fails the SET request.

**Operator response**: Contact the system programmer.

**System programmer response**: Depending on the error, either restart the SNMP agent or attempt the SET request again with valid data.

**Module**: S@DYNINILC

**Procedure name**: dynInitializeConfigList

---

**EZZ6298I  •  SNMP agent: Unknown record types in function**

**Explanation**: The SNMP agent dynamic configuration processing encountered an unrecognized record type in function function.

**System action**: Collect SNMP agent traces by restarting the SNMP agent with the -d prarmeter set to 255. Provide the traces and the SNMP agent configuration file, SNMPD.CONF, to the system programmer.

**Operator response**: Contact the IBM software support center with the traces and the SNMPD.CONF file.

**System programmer response**: Contact the IBM software support center for assistance.

**Module**: S@DYNFUP.C, S@DYNCFY.C, S@DYNLST.C, S@DYNFRE.C

**Procedure name**: dynBuildTxtConfigRec, dynVerifyAndBuildRec, dynCmpConfigEntries, dynFreeStr

---

**EZZ6299I  •  Incorrect number of arguments for (pwtokey | pwchange)**

**Explanation**: The pwtokey or pwchange function was invoked with too few or too many arguments

**System action**: pwtokey or pwchange function ends.

**Operator response**: Invoke the command with the correct number of arguments. The -? option can be used to display the usage statement.

**System programmer response**: None.

**Module**: EZASNPWT.C

**Procedure name**: parse_options

---

**EZZ6300I  •  (pwtokey | pwchange) value for option option is not valid.**

**Explanation**: The pwtokey or pwchange function was invoked with a value that was not valid for the specified option or the value was omitted.

**System action**: pwtokey or pwchange function ends.

**Operator response**: Invoke command correctly. The -? option can be used to display the usage statement.

**System programmer response**: None.

**Module**: EZASNPWT.C

**Procedure name**: parse_options
**Chapter 6. EZZ6xxx messages**

---

**EZZ6301I** **Passwords for** *(pwtokey | pwchange)* **must be at least number characters long.**

**Explanation:** The pwtokey or pwchange function was invoked with a password that was too short.

**System action:** pwtokey or pwchange function ends.

**Operator response:** Invoke command correctly. The -? option can be used to display the usage statement.

**System programmer response:** None.

**Module:** EZASNPWT.C, @PWCHNG.C

**Procedure name:** parse_options

---

**EZZ6302I** *(EngineID | Host name or IP address)* **for** *(pwtokey | pwchange)* **is not valid**

**Explanation:** The pwtokey or pwchange function was invoked with an agent identification that was not valid.

**System action:** pwtokey or pwchange function ends.

**Operator response:** Invoke command correctly. The -? option can be used to display the usage statement.

**System programmer response:** None.

**Module:** EZASNPWT.C, @PWCHNG.C

**Procedure name:** parse_options

---

**EZZ6303I** **pwchange usage statement**

**Explanation:** The pwchange usage statement is displayed when pwchange is invoked with the -? option.

**System action:** pwchange ends after displaying the usage statement.

**Operator response:** None.

**System programmer response:** None.

**Module:** @PWCHNG.C

**Procedure name:** do_usage

---

**EZZ6304I** **SNMP agent: Input in function is not valid.**

**Explanation:** The indicated SNMP agent function was invoked with input that is not valid.

**System action:** If the error occurs during SNMP agent initialization, the SNMP agent will terminate. If the error occurs while updates are being written to the SNMPD.CONF file, the SNMP agent will terminate. If the error occurs while the SNMP agent is processing a SET request, the SNMP agent fails the SET request.

**Operator response:** Collect SNMP agent traces. If the error occurs at SNMP agent initialization, collect traces by restarting the SNMP agent with the -d parameter set to 255. If the error occurs as a result of an SNMP SET command, activate traces by using the MVS MODIFY command to set the trace level to 255. Provide the traces and the SNMP agent configuration file, SNMPD.CONF, to the system programmer.

**System programmer response:** Contact the IBM software support center with the traces and the SNMPD.CONF file.

**Module:** @DYNCFY.C, @DYNLST.C

**Procedure name:** dynUpdateConfig, dynAddToConfigList, dynDeleteFromConfigList, dynModifyConfigList, dynCheckString

---

**EZZ6305I** **SNMP agent: String contains non-printable US ASCII characters**

**Explanation:** The SNMP agent dynamic configuration function received an entry that contained non-US ASCII UTF8 characters. Non-US ASCII UTF8 characters are not supported in the SNMP agent's SNMPD.CONF configuration file.

**System action:** If the error occurs during SNMP agent initialization, the SNMP agent will terminate. If the error occurs while the SNMP agent is processing a SET request, the SNMP agent fails the SET request.

**Operator response:** None.
System programmer response: Repeat the configuration step using only US ASCII characters.
Module: S@DYNCFY.C
Procedure name: dynCheckString

SNMP agent: Cannot find entry to delete from the dynamic configuration list.
Explanation: The SNMP agent was invoked to remove a configuration entry from the list representing the SNMPD.CONF entries, but the entry to be deleted was not found.
System action: The SNMP agent fails the SET request.
Operator response: Collect SNMP agent traces. Activate traces by using the MVS MODIFY command to set the trace level to 255. Repeat the failing SNMP SET command. Provide the traces and the SNMP agent configuration file, SNMPD.CONF, to the system programmer.
System programmer response: Contact the IBM software support center with the traces and the SNMPD.CONF file.
Module: S@DYNLST.C
Procedure name: dynDeleteFromConfigList

SNMP agent: Error reopening filename file for writing.
Explanation: The SNMP agent dynamic configuration processing attempted to reopen the SNMPD.CONF configuration file to write updates made by SET requests to the SNMPD.CONF file. However, an error was encountered while opening the file.
System action: The SNMP agent ends.
Operator response: Contact the system programmer.
System programmer response: Determine why the file could not be opened, correct the problem and restart the SNMP agent.
Module: S@DYNFUP.C
Procedure name: dynUpdateConfigFile

SNMP agent: Default entry type entry definition not redefined.
Explanation: The SNMP agent was attempting to set up the default configuration but found that a conflicting entry of the specified type was already defined. The preexisting entry definition is used instead of the default definition.
System action: The SNMP agent continues initialization.
Operator response: None.
System programmer response: Verify that the SNMP agent is configured as required. See the z/OS Communications Server: IP Configuration Reference for information about the default SNMP agent configuration.
Module: EZASNAC3.C
Procedure name: configure_v3_default

Passwords for (pwtokey | pwchange) must be no more than number characters long.
Explanation: The pwtokey or pwchange function was invoked with a password that was too long.
System action: pwtokey or pwchange function ends.
Operator response: Invoke command correctly. The -? option can be used to display the usage statement.
System programmer response: None.
Module: EZASNPWT.C, S@PWCHNG.C
Procedure name: parse_options
EZ6310I  (pwtokey | pwchange) option option is not valid.
Explanation:  The pwtokey or pwchange function was invoked with an option that was not valid.
System action:  pwtokey or pwchange function ends.
Operator response:  Invoke command correctly. The -? option can be used to display the usage statement.
System programmer response:  None.
Module:  EZASNPWT.C, S@PWCHNG.C
Procedure name:  parse_options

EZ6311I  SNMP agent terminating, cannot update configuration file filename.
Explanation:  The SNMP agent was attempting to update the configuration file after a dynamic configuration change, but the file update failed. Possible causes might include insufficient authority to write the file or insufficient space
System action:  The agent ends.
Operator response:  Contact the system programmer.
System programmer response:  See the syslog daemon trace output for more information about why the file update failed. Correct the problem and restart the SNMP agent.
Module:  EZASNA3.C
Procedure name:  main

EZ6312I  SNMP agent: Attempt to update configuration file failed. Agent continues.
Explanation:  The SNMP agent was attempting to update the configuration file with dynamic configuration changes, but the file did not exist.
System action:  The agent continues processing.
Operator response:  Contact the system programmer.
System programmer response:  The agent was initialized with only community based security. Dynamic configuration is supported only when the SNMPD.CONF file exists. Any dynamic configuration changes attempted will be lost when the SNMP agent is restarted. If the ability to make dynamic configuration changes is required, configure the SNMP agent using SNMPV3 security. See the Z/OS Communications Server: IP Configuration Guide for information about SNMP agent configuration.
Module:  S_DYNFUP.C
Procedure name:  main

EZ6313I  interval value is an incorrect interval value, using default interval value
Explanation:  When the agent was started, a -i argument specified a value that was not a valid interval. The value must be between 0 and 10.
System action:  The agent ends.
Operator response:  The user should restart the agent with a valid interval value. For more information, see the Z/OS Communications Server: IP Configuration Reference
System programmer response:  None.
Module:  EZASNAC3.C
Procedure name:  snmp_config_parse_options
EZZ6315I  SNMP agent: line number number contains a keyword value that is incorrect: keyword

Explanation: The indicated keyword value in the SNMP agent configuration file is incorrect. For example, if UTF8 characters are used, the number of characters following the greater than sign (>) might be incorrect.

System action: The entry is ignored. The SNMP agent continues initialization.

Operator response: None.

System programmer response: Correct the entry in the configuration file and restart the SNMP agent. See the z/OS Communications Server: IP Configuration Reference for configuring the SNMP agent.

Module: EZASNASO.C

Procedure name: xlateUTF8String

EZZ6316I  Refused new DPI subagent connection due to authorization failure - SAF RC is safrc security RC is return_code security reason code is reason_code

Explanation: The SNMP agent refused the connection of a new subagent because of a security product authorization failure. If the security product profile EZA.SNMPAGENT.sysname.tcpprocname was defined for this SNMP agent, then the agent will refuse connections from a subagent for one of the following reasons:

- The subagent is not associated with the same TCP/IP stack as the agent. This includes subagents associated with other TCP/IP stacks on the same MVS image or sysplex, or remote subagents.
- The subagent is associated with the same TCP/IP stack as the agent but the agent is unable to obtain the security product user ID associated with the subagent.
- The subagent is associated with the same TCP/IP stack as the agent but the subagent's security product user ID is not authorized to the agent's security product profile.

safrc is the hexadecimal SAF return code.

return_code is the hexadecimal return code from the security product.

reason_code is the hexadecimal reason code from the security product.

System action: The SNMP agent continues.

Operator response: Contact the system programmer.

System programmer response: Locate the specified return_code and reason_code in your installed host security product documentation to determine the cause of the error. If you are using the z/OS Security Server (RACF) as your security product, the return_code and reason_code are documented in the z/OS Security Server RACROUTE Macro Reference in the section about return and reason codes for the RACROUTE REQUEST=AUTH function. Your installed host security product might have issued messages regarding the failure.

For additional diagnostic information, re-create the problem with the SNMP agent traces at level -d 128. Earlier agent trace messages in the syslog daemon trace output might indicate the cause of the authorization failure. See the z/OS Communications Server: IP Configuration Guide for more information about the agent security product profile.

Module: EZASNA3

Procedure name: main

EZZ6317I  Configuration of MIB object MIB_variable_name accepted but will not be allowed in future releases

Explanation: A statement configuring MIB object MIB_variable_name was found in the OSNMPD.DATA file. Configuration of the object is currently accepted but will not be allowed in future releases. The default value is recommended.

MIB_variable_name is the name of the MIB variable.

System action: The SNMP agent accepts the configuration of the MIB object.

Operator response: None.

System programmer response: To prepare for future releases, update the OSNMPD.DATA file to remove the setting for this MIB object.
Module: EZASNAA3.C
Procedure name: set_mib_install_defaults

EZZ6318I SNMP agent will encode 0.0.0.0 in SNMPv1 traps

Explanation: The SNMP agent obtained an IPv6 address during initialization. An IPv6 address cannot be encoded in an SNMPv1 trap. When the agent sends SNMPv1 traps, the IPv4 address 0.0.0.0 will be encoded in the traps.

System action: SNMP agent processing continues. The agent will encode the address 0.0.0.0 in SNMPv1 traps.

Operator response: To force the SNMP agent to obtain an IPv4 address during initialization, restart the agent and specify the -A option. The agent will then put its IPv4 address in outbound SNMPv1 traps.

System programmer response: None.

Module: S_AGV123.C
Procedure name: main

EZZ6319I SNMP agent cannot communicate with managers at IPv6 addresses

Explanation: The SNMP agent tried to open an IPv6-capable socket, but the attempt was unsuccessful because the TCP/IP stack is not running with IPv6 support active. As a result, the agent cannot receive SNMP requests from managers at IPv6 addresses, nor can it send notifications to managers at IPv6 addresses.

System action: SNMP agent processing continues. The agent will still be able to communicate with managers at IPv4 addresses.

Operator response: Contact the system programmer.

System programmer response: If you want the SNMP agent to communicate with managers at IPv6 addresses, ensure that the TCP/IP stack is configured to support IPv6, restart TCP/IP, and restart the SNMP agent. If the problem persists, restart the agent with the -d 255 debug option and contact the IBM software support center with the resulting debug information.

Module: S_AGV123.C
Procedure name: main()

EZZ6320I Incorrect value value specified for the parameter parameter, using default_value

Explanation: When the agent was started, an incorrect value was specified for one of the start parameters. The default value for the parameter was used instead of the specified parameter.

In the message text:

value
  The incorrect value.

parameter
  The parameter for which the incorrect value was specified.

default_value
  The default value that will be used instead of the incorrect value.

System action: The agent initialization continues.

Operator response: See the OSNMPD parameters information in z/OS Communications Server: IP Configuration Reference, then stop and restart the agent with a correct value for the parameter.

System programmer response: No action is needed.

User response: No action is needed.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: SNMP Agent

Module: EZASNAC3.C
EZZ6321I • EZZ6351I

Routing code: *
Descriptor code: *
Automation: Not applicable for automation.

Example:
EZZ6320I Incorrect value 10 specified for the -C parameter, using 1

EZZ6321I agent_job could not find configuration file - using public community name

Explanation: This SNMP agent could not find a configuration file to use as its source for user, view, access list, and community name definitions, and the -c agent start parameter was not specified. The agent first searches for an SNMPD.CONF file. If no SNMPD.CONF file is found, then the agent searches for a PW.SRC file. See the TCP/IP configuration data sets information in z/OS Communications Server: IP Configuration Reference for a description of the search order used to find an SNMPD.CONF and a PW.SRC file. Because the agent could not find a configuration file, and the -c start parameter was not specified, the agent is using community-based security and it has defined a default, well-known community name of public. Any SNMP requests that are received by the agent that use a community name of public will be permitted to access all SNMP management data.

In the message text:

agent_job
The MVS job name of the SNMP agent.

System action: The SNMP agent continues initialization.

Operator response: Contact the system programmer.

System programmer response: If you want to restrict access to SNMP management data, provide either an SNMPD.CONF or PW.SRC configuration file to the SNMP agent. See the SNMP Communications Server: IP Configuration Reference for information about these configuration files.

User response: Not applicable.

Problem determination: See the system programmer response

Source: z/OS Communications Server TCP/IP: SNMP Agent

Module: EZASNAC3

Routing code: 8,10
Descriptor code: 12
Automation: This message is written to the system console and to the syslog daemon. This message is a good candidate for automation. Automation can allow you to be informed when the SNMP agent cannot find a configuration file.

Example:
EZZ6321I OSNMPD COULD NOT FIND CONFIGURATION FILE - USING PUBLIC COMMUNITY NAME

EZZ6351I Abend detected.

Explanation: This message indicates that an internal programming error caused the command to abnormally terminate.

System action: The command ends.

Operator response: Collect debug information using the DEBUG/-d option and forward the results to the system programmer or administrator for resolution. If you invoked the otracert/traceroute command, you can save debug information by redirecting it to a file using the ‘>’ operator.

System programmer response: None.

Module: EZACDTRT

Procedure name: abndhand
EZZ6352I  IPv4-mapped IPv6 address not supported
Explanation:  You specified an IPv4-mapped IPv6 address that is not supported by the command.
System action:  The command ends.
Operator response:  Correct the IP address specification and reissue the command. For information about the command, see the z/OS Communications Server: IP System Administrator's Commands.
System programmer response:  None.
Module:  EZACDTRT
Procedure name:  getHost, getSrcip, getIntf

EZZ6353I  Option option ignored, setsockopt() failed: description (return_code/reason_code)
Explanation:  The command tried to do a setsockopt() for option option but the setsockopt() failed.
option is the option for which the setsockopt() was attempted.
description describes the Return Code.
return_code is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.
reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes.
System action:  The command continues but the option option is ignored.
Operator response:  Contact the system programmer.
System programmer response:  If the reason code was set by the TCP/IP stack, re-create the problem with the DEBUG/-d option specified to obtain a trace. Contact the IBM software support center with the trace output. If the reason code was not set by the TCP/IP stack, contact the product that set the reason code for assistance.
Module:  EZACDTRT
Procedure name:  openSock

EZZ6354I  socket_operation error detected description (return_code/reason_code)
Explanation:  The command was unable to perform the indicated socket operation.
socket_operation is the socket function that failed.
description describes the Return Code.
return_code is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.
reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes.
System action:  The command ends.
Operator response:  Collect debug information using the DEBUG/-d option and forward the results to the system programmer or administrator for resolution. If you invoked the otracert/traceroute command, you can save debug information by redirecting it to a file using the '>' operator.
System programmer response:  None.
Module:  EZACDTRT, EZACDTR6
Procedure name:  openSock, processTracerte, recvPacket, processTracerte6
EZZ6355I  option option ignored for IPv6 destination

Explanation: The indicated option is not supported for IPv6 destinations.

System action: The option is ignored and processing continues.

Operator response: To avoid receiving this message when using IPv6 destinations, specify only those command options that are supported for IPv6. For more information about the command options, see the [z/OS Communications Server: IP System Administrator’s Commands](https://www.ibm.com/support/knowledgecenter/en/SSLVMB_2.2.1/com.ibm.net.sna.doc/COMMIPREF/COMMIPREF.html).

System programmer response: None.

Module: EZACDTRT

Procedure name: trtMain

EZZ6356I Unable to retrieve HOME list for tcpname - description (return_code/reason_code)

Explanation: The command was unable to obtain the HOME list from TCP/IP instance tcpname. If the TCP/IP instance name is TCPIP this might mean that the command is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used. The command tries to obtain the HOME list when the INTF/-i option is specified.

tcpname is the name of the TCP/IP stack from which Traceroute tried to obtain the HOME list.

description describes the meaning of the Return Code.

return_code is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/knowledgecenter/SSLVMB_2.2.1/com.ibm.net.sna.doc/COMMIPREF/COMMIPREF.html).

reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/knowledgecenter/SSLVMB_2.2.1/COMMASSCKVW/ASSCKWASSCKW.html), where the reason codes are listed.

System action: The command ends.

Operator response: Contact the system programmer.

System programmer response: If the reason code was set by the TCP/IP stack, re-create the problem with CTRACE options UDP, PFS, and IOCTL active. Contact the IBM software support center with the CTRACE. If the reason code was not set by the TCP/IP stack, contact the product that set the reason code for assistance.

Module: EZACDTRT

Procedure name: getIfIndex

EZZ6357I Value value for option option is not an integer

Explanation: You specified a non-numeric value when a numeric value was expected.

System action: The command will use the default value for the option and continue processing.

Operator response: Cancel execution and correct option if default is not acceptable. For more information see [z/OS Communications Server: IP System Administrator’s Commands](https://www.ibm.com/support/knowledgecenter/en/SSLVMB_2.2.1/com.ibm.net.sna.doc/COMMIPREF/COMMIPREF.html).

System programmer response: None.

Module: EZACDUTR, EZACDTTR

Procedure name: optArgCh, tokValChk, parsUTR, parsTTR

EZZ6358I The value of option must be between minvalue and maxvalue.

Explanation: You specified an incorrect option value.

System action: The command will use the default value for the option and continue processing.

Operator response: Cancel execution if accepting default is not required.
System programmer response: None.
Module: EZACDTRT, EZACDTTR, EZACDUTR
Procedure name: optArgCh, tokValChk, trtMain

EZZ6359I Incorrect option option value specified
Explanation: You specified an incorrect option value.

option is the command option for which the incorrect value was specified.
System action: The command ends.
Operator response: Specify the command again with a correct value for the indicated option. For the INTF/-i or SRCIP/-s options, the IP address or interface must be of the same address family as the destination.

System programmer response: None.
Module: EZACDTRT
Procedure name: getSrcip, getIfIndex

EZZ6361I Extraneous option 'option'.
Explanation: You specified an extraneous option.
System action: The command ends.
Operator response: Correct the syntax of the incorrect option and reissue the command. For information about the command, see [z/OS Communications Server: IP System Administrator's Commands]

System programmer response: None.
Module: EZACDTTR, EZACDUTR
Procedure name: parsTTR, parsUTR

EZZ6362I Unknown option 'option'.
Explanation: You specified an unknown option.
System action: The command ends.
Operator response: Check the unknown option for misspellings or other problems. Correct the option and reissue the command. For information about the command, see [z/OS Communications Server: IP System Administrator's Commands]

System programmer response: None.
Module: EZACDTTR, EZACDUTR
Procedure name: parsTTR, parsUTR

EZZ6363I Host name too long 'name'.
Explanation: The field interpreted as the host name is too long. Host name must be less than or equal to 255 characters in length.
System action: The command ends.
Operator response: Correct the host name and reissue the otracert command. For information about the command, see [z/OS Communications Server: IP System Administrator's Commands]

System programmer response: None.
Module: EZACDTTR, EZACDUTR
Procedure name: parsTTR, parsUTR
EZZ6364I  Allocation of probe failed - packetSize.

Explanation: This error should not occur and indicates that the command was unable to allocate the probe packet buffer.

System action: The command ends.

Operator response: Try the command again with a smaller packetSize selection. For information about the command, see z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDTRT
Procedure name: trtMain

EZZ6365I  Host name or address not entered

Explanation: A requested host name or IP address was missing.

System action: The command ends.

Operator response: Reissue the command with the host identification included.

System programmer response: None.

Module: EZACDTTR, EZACDUTR
Procedure name: parsTTR, parsUTR

EZZ6367I  Mismatched IP address type values

Explanation: The command found a mismatch in IP address type (that is, IPv4 or IPv6) between some of the IP address values specified. IP address type can be specified with the ADDRTYPE/-A option; or by providing an IP address as the destination host, SRCIP/-s option value, or INTF/-i option value. If a LINK or INTERFACE name was specified for the INTF/-i option value, the command will verify that the LINK or INTERFACE is of the same IP address type as the host or other IP address options specified.

System action: The command ends.

Operator response: Verify that the values specified for destination host, and the ADDRTYPE/-A, SRCIP/-s, or INTF/-i options, are all of the same IP address type, IPv4 or IPv6.

System programmer response: None.

Module: EZACDTRT
Procedure name: getSrcip, getIntf, getIfIndex, getHost

EZZ6370I  Failure detected in closing socket socket (return_code/reason_code).

Explanation: close() error

socket is the socket descriptor of the socket for which close() failed.

return_code is the z/OS UNIX System Services return code. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reason_code is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: The command ends.

Operator response: Collect debug information using the DEBUG/-d option and forward the results to the system programmer or administrator for resolution. If you invoked the otracert/traceroute command, debug information can be saved by redirecting it to a file using the '>' operator.

System programmer response: None.

Module: EZACDTRT
**Procedure name:**  clsSock, getIfIndex

**EZ6371I** Unable to open message catalog 'trtemsg.cat' - description (return_code/reason_code)

**Explanation:**  The command was unable to open the message catalog "trtemsg.cat" in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/%L/%N".

description describes the return code.

`return_code/reason_code` is the z/OS UNIX System Services return code. These return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview/-/doc/6004-1830/EN). `reason_code` is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview/-/doc/6004-1830/EN), where the reason codes are listed.

**System action:**  The command will use the internal default messages instead of the message from the external message catalog.

**Operator response:**  If use of the external message catalog is required, correct the indicated error. If the default messages are acceptable, no action is necessary.

**System programmer response:**  If use of the external message catalog is required, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview/-/doc/6004-1830/EN) for more information about the `catopen()` function call. Information regarding the NLSPATH environment variable can be found in the [z/OS UNIX System Services Programming Tools](https://www.ibm.com/support/docview/-/doc/6004-1830/EN). If the default messages are acceptable, no action is necessary.

**Module:**  EZACDITR, EZACDUTR

**Procedure name:**  main

**EZ6372I** sigaction() failed for signal : reason

**Explanation:**  The command encountered an error attempting to set up the signal handler for the signal specified by `signal`.

`reason` is the error returned by the C run-time library for the failing `sigaction()` call. If the signal handler is not correctly enabled, the command will continue processing, but certain functions controlled by the failing signal will not function properly. Functions controlled by the signals are:

**SIGABND**
- handler controls error reporting and cleanup functions when an abend occurs. If `sigaction` fails for SIGABND and an abend occurs, trace information about the abend will be lost and certain resources might not be properly cleaned up.

**SIGTERM**
- handler controls cleanup of resources during termination.

**SIGPIPE**
- handler allows the command to detect when the connection to the command was terminated.

**SIGINT**
- handler controls cleanup of resources when the user requested that the command stop processing and end.

**System action:**  Processing continues; however, the functions controlled by the failing signal will not function properly.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZACDITR, EZACDUTR

**Procedure name:**  main
EZZ6373I  Unknown host name

Explanation: The host name specified could not be resolved to an IP address. If the Resolver could not resolve the host name to an IP address, message EZZ6366I should have been issued prior to this message. See message EZZ6366I for more information.

System action: The command ends. Verify that host name resolution was configured correctly.

Operator response:
- Correct the syntax of the host name and reissue the command. For information about the command, see z/OS Communications Server: IP System Administrator's Commands.
- Check that the specified host name is valid. If the host name looks correct, contact the system programmer to verify the host address.
- Use the IP address, if it is known.

System programmer response: If message EZZ6366I was issued, follow the recommended actions for that message. Otherwise, re-create the problem with the DEBUG/-d option to obtain a trace. Contact the IBM software support center with the trace output.

Module: EZACDTRT
Procedure name: getHost

EZZ6374I  Execution was interrupted

Explanation: You requested that the command stop processing and end. The TSO TRACERTE command can be interrupted by using the PA1 or ATTN key. The z/OS UNIX otracert/traceroute command can be interrupted by entering the ESC character plus C or c.

System action: The command execution is interrupted. The command ends.

Operator response: None.

System programmer response: None.

Module: EZACDTRT
Procedure name: inhand

EZZ6375I  Found parenthesis but no options

Explanation: You specified a parenthesis without specifying any options.

System action: The command ends.

Operator response: Specify options or remove the parenthesis and reissue the TRACERTE command. For information about the TRACERTE command, see the z/OS Communications Server: IP System Administrator's Commands.

System programmer response: None.

Module: EZACDTRT
Procedure name: parsTTR

EZZ6376I  Execution was canceled

Explanation: None.

System action: The command was stopped by either user or operator action.

Operator response: None.

System programmer response: None.

Module: EZACDTRT
Procedure name: termhand
EZZ6377I  Could not establish affinity with tcpipname (return_code/reason_code)

Explanation: The command attempted to use the setibmopt() socket call to associate itself with the TCP/IP instance tcpipname. The tcpipname in this message will be one of the following:
- The name specified on the TCP/-a option.
- The TCPIPjobname value retrieved from the resolver configuration data set because the INTF/-i option was specified.
- 'INET' if the INTF/-i option was specified without the TCP/-a option and the __iptcpn function was unable to find a default TCP/IP name.

This TCP/IP name should be the started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) of the TCP/IP instance to which the user wants to direct the otracert command. The setibmopt call failed with the displayed return_code and reason_code.

System action: The command ends.

Operator response: The most probable cause of the error is that the TCP/IP instance name was not defined correctly to z/OS UNIX System Services. Check the SUBFILESTYPE NAME for the corresponding TCP/IP instance in the BPXPRMxx member that was used to configure z/OS UNIX System Services. Ensure that the TCP/IP started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) matches the SUBFILESTYPE NAME. The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their names. If none of the above error conditions exist contact the system programmer.

System programmer response: Correct the error indicated by return_code and reason_code.

Module: EZACDTRT
Procedure name: trtMain

EZZ6378I  Executing under INET configuration. The option option is ignored.

Explanation: The command was issued in a z/OS UNIX System Services environment configured for INET. In an INET configuration, there can only be one TCP/IP (for example, AF_INET type) stack connected to z/OS UNIX System Services. In this case, the command continues but ignores the TCP/-a option.

System action: The command continues.

Operator response: None.

System programmer response: None.

Module: EZACDTRT
Procedure name: trtMain

EZZ6379I  'value' specified for option must be length characters or less

Explanation: You specified an incorrect option value.

System action: The command ends.

Operator response: Specify a value less than or equal to requested characters and reissue the otracert command.

System programmer response: None.

Module: EZACDTRT, EZACDTR, EZACDUTR
Procedure name: getInf, parsTTR, parsUTR

EZZ6380I  Unable to open socket_operation socket, tcpipname is not active

Explanation: The command attempted to open a socket for socket_operation processing. The open of the socket failed because the TCP/IP stack tcpipname was not active.

System action: The command ends.

Operator response: Determine why the TCP/IP stack is not active. The tcpipname in this message will be one of the following:
When neither the TCP/-a option nor the INTF/-i option is specified and z/OS UNIX System Services is configured for CINET, the CINET Prerouter selects the TCP/IP stack to which to route the request.

**System programmer response:** None.

**Module:** EZACDTRT

**Procedure name:** openSock

---

**EZZ6381I** Missing value after `option` option.

**Explanation:** You specified `option` without a value.

**System action:** The command ends.

**Operator response:** Specify a value for `option` that is between the accepted minimum and maximum values and reissue the command.

**System programmer response:** None.

**Module:** EZACDTRT, EZACDUTR

**Procedure name:** parsTTR, tokValChk, parsUTR

---

**EZZ6382I** `otracer` is a z/OS UNIX Shell command and must be issued from a z/OS UNIX shell.

**Explanation:** The `otracer` command was not issued from a z/OS UNIX shell.

**System action:** The command ends.

**Operator response:** Reissue the command from a z/OS UNIX Shell. For information about the command, see [z/OS Communications Server: IP System Administrator's Commands](https://www.ibm.com/support/knowledgcenter/en/SSLTBK_21.1.0/com.ibm.zos.r21.isg_ip_v2html/isg_zos_communications_server_ip_system_administrator_s_commands.html)

**System programmer response:** None.

**Module:** EZACDUTR

**Procedure name:** main

---

**EZZ6384I** Could not determine the TCPIPJjobname, using default of 'INET'

**Explanation:** The command invoked the `_iptcpn()` function to retrieve the resolver supplied TCPIPJjobname but no name was returned. A default value of 'INET' will be used for TCPIPJjobname.

**System action:** The command continues.

**Operator response:** None.

**System programmer response:** In an INET environment, no action is necessary. In a CINET environment, for the command to communicate with a particular stack, the TCPIPJjobname should be set in the appropriate resolver configuration file or data set. Make sure that the TCPIPJjobname statement in the appropriate resolver configuration file or data set is correct and resubmit the command. For more information about the search order for locating the resolver configuration file or data set, see [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgcenter/en/SSLTBK_21.1.0/com.ibm.zos.r21.isg_ip_v2html/isg_zos_communications_server_ip_configuration_guide.html). The DISPLAY TCPIP operator command can be used to display all started TCP/IP instances and their jobnames. The TCP/-a command options can be used to explicitly select a TCP/IP instance by specifying its jobname.

**Module:** EZACDTRT

**Procedure name:** trtMain
EZZ6385I  The interface interface was not found in the HOME list for tcpname

Explanation: Either the interface interface was specified on the INTF/-i option but was not defined to the TCP/IP instance named tcpname or the interface is an OSM interface but the user ID did not have RACF authority to use that interface. If the TCP/IP instance name is TCPIP this could mean that the command is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

System action: The command ends.

Operator response: Verify that the value specified for the INTF/-i option is defined to the TCP/IP instance named tcpname. For an OSM interface, verify that the user ID has the RACF authority to use that interface. For more information about OSM interface authorization, see [OSM Access Control in z/OS Communications Server: IP Configuration Guide](#). You can use the Netstat HOME/-h command to verify the interfaces defined to a TCP/IP instance. Reissue the command with a valid value for the INTF/-i option.

System programmer response: None.

Module: EZACDTRT
Procedure name: getIfIndex

EZZ6386I  Interface interface for tcpname can not be specified for the option option.

Explanation: The command was invoked with the INTF/-i option to specify the interface name or IP address on which to send out the probe packets. The interface interface was found in the HOME list of the TCP/IP instance name tcpname, but the interface type cannot be specified for the INTF/-i option.

If the TCP/IP instance name is TCPIP this could mean that the command is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

System action: The command ends.

Operator response: Ensure that the interface specified for the INTF/-i option is not a VIPA interface or a loopback interface and reissue the command.

System programmer response: None.

Module: EZACDTRT
Procedure name: getIfIndex

EZZ6387I  More than one IP address ipaddr found for tcpname.

Explanation: The command was invoked with an IP address specified for the INTF/-i option but there is more than one interface defined to the TCP/IP instance tcpname with IP address ipaddr. If the TCP/IP instance name is TCPIP this could mean that the command is executing in an INET environment and is not aware of the actual name of the TCP/IP instance that is being used.

System action: The command ends.

Operator response: If you have more than one interface with the same IP address, Traceroute cannot determine on which interface you want the outbound packets sent. Reissue the command specifying the interface name on the INTF/-i option to identify the interface to Traceroute.

System programmer response: None.

Module: EZACDTRT
Procedure name: getIfIndex

EZZ6388I  function failed due to error h_errno

Explanation: The function function issued by the command failed with error h_errno. Possible causes of the problem are an error in specifying the configuration file for the Resolver, or that the Resolver address space was not started.

function is the C/C++ Run-Time function that failed.

h_errno is one of the following errors:
HOST_NOT_FOUND
TRY_AGAIN
NO_RECOVERY
NO_DATA

System action: For some function failures, the command ends. For other function failures, the command continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the Resolver address space is started. See the z/OS Communications Server: IP Configuration Guide for information about starting the Resolver address space. If this does not resolve the problem, correct the error indicated by the h_errno value. See the z/OS XL C/C++ Runtime Library Reference for a description of the h_errno for the function that failed.

Module: EZACDTRT
Procedure name: trtMain
Chapter 7. EZZ7xxxx messages

EZZ7000I  Setsockopt failed: description rsn = errnojr

Explanation: TFTP was unable to set the IPV6_RECVPKTINFO option for an established socket.

description describes the error.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: TFTP ends.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the UD and IOCTL options. Obtain the following documentation and contact the IBM software support center:

- The SYSLOG DAEMON logging file
- The requested component trace

Module: TFTPDSCK

Procedure name: prepare_socket_in()

EZZ7001I  Starting.

Explanation: The TFTP daemon is starting.

System action: TFTP continues.

Operator response: None.

System programmer response: None.

Module: TFTP (main)

Procedure name: Store message in system log. Display message on operator console.

EZZ7002E  New daemon fork failed: error message rsn = errnojr

Explanation: Unable to pre-fork a child daemon.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: TFTP is terminated.

Operator response: None.

System programmer response: Verify adequate system resources and try again and/or correct the system error condition.

Module: TFTP (main)

Procedure name: Store message in system log. Display message on operator console.

EZZ7003E  Daemon fork to background failed: error message rsn = errnojr

Explanation: Unable to become a daemon.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.
EZZ7004E  Error allocating memory for incoming datagram request: error message rsn = errnojr

Explanation: Unable to allocate storage needed to satisfy a request from a client.

errorjojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPD is terminated.

Operator response: None.

System programmer response: Verify adequate system resources and try again and/or correct the system error condition.

Module: TFTPD (main)

Procedure name: Store message in system log. Display message on operator console.

---

EZZ7005E  recvfrom - negative length datagram: error message rsn = errnojr

Explanation: The client sent a datagram of negative length. This is a protocol error.

errnojojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPD continues.

Operator response: None.

System programmer response: Verify client adheres to TFTP protocol. If there is no client-side protocol error, contact IBM software support center.

Module: TFTPD (main)

Procedure name: Store message in system log. Display message on operator console.

---

EZZ7006E  recvfrom - no datagram to receive

Explanation: The client sent a datagram of zero length. This is a protocol error.

System action: TFTPD continues.

Operator response: None.

System programmer response: Verify client adheres to TFTP protocol.

Module: TFTPD (main)

Procedure name: Store message in system log. Display message on operator console.

---

EZZ7007E  Could not create a thread: error message

Explanation: The server was unable to create a thread to satisfy a client request. The error is ignored.

System action: TFTPD continues.

Operator response: Try the request again.

System programmer response: Verify adequate system resources and/or correct the system error condition.
Module: TFTPD (main)
Procedure name: Store message in system log.

**EZZ7008W** Ignoring unknown option -option
Explanation: An unsupported command line option was used.
System action: Command line option ignored.
Operator response: None.
System programmer response: Verify command line options used when TFTPD was started.

Module: TFTPDARG
Procedure name: Store message in system log. Display message on operator console.

**EZZ7009E** Could not open cache file: error message rsn = errnojr
Explanation: The file containing the list of files to be cached could not be opened.
errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.
System action: TFTPD is terminated.
Operator response: None.
System programmer response: Verify cache file specified on command line exists and has proper permissions and/or correct the system error condition.

Module: TFTPDARG
Procedure name: Store message in system log. Display message on operator console.

**EZZ7010E** Cache file entries exceed limit.
Explanation: The file containing the list of files to be cached was opened but contained too many file names.
System action: TFTPD is terminated.
Operator response: None.
System programmer response: Verify cache file has no more than 30 file names listed.
Module: TFTPDARG
Procedure name: Store message in system log. Display message on operator console.

**EZZ7011E** Bad conversion mode for cache file entry.
Explanation: One or more entries in the file containing the list of files to be cached has an invalid conversion mode.
System action: TFTPD is terminated.
Operator response: None.
System programmer response: Verify cache file has proper conversion modes. ‘a’ means to preconvert to NETASCII, ‘b’ means do not preconvert.
Module: TFTPDARG
Procedure name: Store message in system log. Display message on operator console.
EZZ7012E  Error allocating memory for filename:  error message  rsn =  errnojr
Explanation:  TFTP is unable to allocate memory for caching files.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action:  TFTP is terminated.
Operator response:  None.
System programmer response:  Verify adequate system resources and/or correct the system error condition.
Module:  TFTPDCCH
Procedure name:  Store message in system log. Display message on operator console.

EZZ7013E  Error accessing file:  file name  description  rsn =  errnojr
Explanation:  Unable to access a requested file for caching.
description describes the error.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action:  TFTP ends.
Operator response:  None.
System programmer response:  Verify file has global read permissions and is located in a permitted directory. Verify no directory backout (../) exists in the path and filename.
Module:  TFTPDCCH
Procedure name:  Store message in system log. Display message on operator console.

EZZ7014E  Could not open file (file name) for caching:  error message  rsn =  errnojr
Explanation:  Unable to open a requested file for caching.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action:  TFTP is terminated.
Operator response:  None.
System programmer response:  Verify file can be opened, correct any system file problems with file and/or correct the system error condition.
Module:  TFTPDCCH
Procedure name:  Store message in system log. Display message on operator console.

EZZ7015E  Error reading file (file name).
Explanation:  Unable to read a requested file for caching.

System action:  TFTP is terminated.
Operator response:  None.
System programmer response:  Verify file can be read, correct any system file problems with file.
Module:  TFTPDCCH
Procedure name:  Store message in system log. Display message on operator console.
EZZ7016E  Error allocating memory for file (file name); error message rsn = errnojr

Explanation: Unable to allocate memory to store a requested file for caching.

ernojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPD is terminated.

Operator response: None.

System programmer response: Verify adequate system resources to store the file and/or correct the system error condition.

Module: TFTPDCCH

Procedure name: Store message in system log. Display message on operator console.

EZZ7017E  Bad cache file entry.

Explanation: The cache file has an improperly formatted entry.

System action: TFTPD is terminated.

Operator response: None.

Module: TFTPDCCH

Procedure name: Store message in system log.

EZZ7018E  No files to be cached found.

Explanation: The cache file was read but did not appear to have any files listed in it.

System action: TFTPD is terminated.

Operator response: None.

Module: TFTPDCCH

Procedure name: Store message in system log. Display message on operator console.

EZZ7019E  Error allocating memory for data buffer; error message rsn = errnojr

Explanation: In attempting to send data to or receive data from the client, TFTPD is unable to allocate memory for a data buffer.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPD ends the request by sending an ERROR packet to the client.

Operator response: None.

System programmer response: Verify adequate system resources and/or correct the system error condition.

Module: TFTPDOPS

Procedure name: Store message in system log.
Send failed for: packet type error message rsn = errnojr

Explanation: TFTPd was unable to send a DATA, ACK, or OACK to the client.

System action: TFTPd sends an ERR to the client.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

Operator response: None.

System programmer response: Correct the system error.

Module: TFTPDOPS, TFTPDOPT

Procedure name: Store message in system log.

recv failed for packet type error message rsn = errnojr

Explanation: TFTPd was unable to receive a DATA, ACK or OACK from the client.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPd sends an ERR to the client.

Operator response: None.

System programmer response: Correct the system error.

Module: TFTPDOPS, TFTPDOPT

Procedure name: Store message in system log.

retransmit failed for packet type error message rsn = errnojr

Explanation: TFTPd was unable to complete a retransmit for a DATA, ACK, or OACK packet type.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPd sends an ERR to the client.

Operator response: None.

System programmer response: Correct the system error.

Module: TFTPDOPS

Procedure name: Store message in system log.

send failed, retry number number, for packet type error message rsn = errnojr

Explanation: TFTPd was unable to retransmit a DATA, ACK, or OACK to the client.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: TFTPd sends an ERR to the client.

Operator response: None.

System programmer response: Correct the system error.

Module: TFTPDOPS

Procedure name: Store message in system log.
EZZ7024E  Could not create socket: error message rsn = errnojr

Explanation:  TFTP was unable to create a socket.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  TFTP is terminated.

Operator response:  None.

System programmer response:  Correct the system error.

Module:  TFTPDSCK

Procedure name:  Store message in system log. Display message on operator console.

EZZ7025E  bind failed: error message rsn = errnojr

Explanation:  TFTP was unable to bind a port.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  TFTP is terminated.

Operator response:  None.

System programmer response:  Correct the system error. Verify TFTP's well-known port (69) is not already in use.

Module:  TFTPDSCK

Procedure name:  Store message in system log. Display message on operator console.

EZZ7026E  connect failed: error message rsn = errnojr

Explanation:  TFTP was unable to set up a socket to send and/or receive from a client.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  The request is terminated.

Operator response:  None.

System programmer response:  Correct the system error.

Module:  TFTPDSCK

Procedure name:  Store message in system log. Display message on operator console.

EZZ7027E  nak - send error: error message rsn = errnojr

Explanation:  TFTP was unable to send a negative acknowledgment to the client.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  The error is ignored.

Operator response:  Try the request again.

System programmer response:  None.

Module:  TFTPUTL

Procedure name:  Store message in system log. Display message on operator console.

**EZZ7031E**  
Exiting Abnormally, Error code: code

**Explanation:**  
TFTPd is exiting because of an internal error condition.

**System action:**  
TFTPd ends.

**Operator response:**  
None.

**System programmer response:**  
Verify adequate resources, restart TFTPd.

**Module:**  
TFTPd (main)

**Procedure name:**  
Store message in system log. Display message on operator console.
EZZ7032E Exiting Abnormally, Signal received: signal code
Explanation: TFTP is exiting because a signal was received.
System action: TFTP ends.
Operator response: None.
System programmer response: Restart TFTP.
Module: TFTP (main)
Procedure name: Store message in system log. Display message on operator console.

EZZ7033E Could not set code page: codepage
Explanation: Codepage is not set.
System action: TFTP is terminated.
Operator response: None.
System programmer response: Verify codepage is available.
Module: TFTPSCP
Procedure name: Store message in system log. Display message on operator console.

EZZ7034E Incorrect Thread Limit, Max Limit: limit
Explanation: An invalid thread limit was specified as a command-line argument.
System action: TFTP is terminated.
Operator response: None.
System programmer response: Restart TFTP with a valid thread limit.
Module: TFTPDA
Procedure name: Store message in system log. Display message on operator console.

EZZ7035E Could not set Thread Limit to limit
Explanation: The system call to set the thread limit for a TFTP daemon failed.
System action: TFTP is terminated.
Operator response: None.
System programmer response: Restart TFTP with a valid thread limit for your system.
Module: TFTP (MVS main)
Procedure name: Store message in system log. Display message on operator console.

EZZ7036E Error opening file stream: error message rsn = errnojr
Explanation: The system call to open a file stream failed.
errorjr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.
System action: The request is terminated.
Operator response: None.
System programmer response: Correct the system error.
Module: TFTPOPS
Procedure name: Store message in system log.
EZZ7037E  •  EZZ7040E

EZZ7037E  Error reading file stream: error message rsn = errnojr
Explanation: The system call to read from a file stream failed.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: The request is terminated.
Operator response: None.
System programmer response: Correct the system error.
Module: TFTPDOPS
Procedure name: Store message in system log.

EZZ7038E  client info: direction ERROR <error code: code, msg: message>
Explanation: Trace record for ERROR packet that is being sent or received. If ERROR received then the request is terminated (client initiated termination).

System action: TFTPD continues; the request terminated.
Operator response: None.
System programmer response: None.
Module: TFTPDOPS, TFTPDOPT, TFTPUTL
Procedure name: Store message in system log.

EZZ7039I  client info: Status Timeout
Explanation: A request involving the client failed due to network timeouts.

System action: The request is terminated.
Operator response: None.
System programmer response: Verify the network performance. If necessary the time-out value might be increased by recycling TFTPD and using the -t option upon restart.
Module: TFTPDOPS, TFTPDOPT
Procedure name: Store message in system log.

EZZ7040E  Error writing file stream: error message rsn = errnojr
Explanation: The system call to write to a file stream failed.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: The request is terminated.
Operator response: None.
System programmer response: Correct the system error.
Module: TFTPDOPS
Procedure name: Store message in system log.
**EZZ7041E**  
*host name: options protocol error*

**Explanation:** A protocol error occurred between the client and server during options negotiation for a request.

**System action:** The request is terminated.

**Operator response:** None.

**System programmer response:** Verify client implements TFTP protocol correctly. If so, contact IBM software support center.

**Module:** TFTPDOPT

**Procedure name:** Store message in system log.

---

**EZZ7042E**  
*Error with archive: directory name*

**Explanation:** A specified archive directory name could not be used.

**System action:** TFTP is terminated.

**Operator response:** None.

**System programmer response:** Verify archive directories specified exist, and are world-readable.

**Module:** TFTPDAEG

**Procedure name:** Store message in system log. Display message on operator console.

---

**EZZ7043E**  
*Number of archives specified exceed limit.*

**Explanation:** More than 20 archive directories were specified.

**System action:** TFTP is terminated.

**Operator response:** None.

**System programmer response:** Restart TFTP, specifying 20 or fewer archive directories.

**Module:** TFTPDAEG

**Procedure name:** Store message in system log. Display message on operator console.

---

**EZZ7044I**  
*client info direction RRQ <file=file name, mode=mode name, recognized options: option list>*

**Explanation:** Trace record for the RRQ packet.

**System action:** TFTP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** TFTPDVLD

**Procedure name:** Store message in system log.

---

**EZZ7045I**  
*client info direction WRQ <file=file name, mode=mode name, recognized options: option list>*

**Explanation:** Trace record for the WRQ packet.

**System action:** TFTP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** TFTPDVLD

**Procedure name:** Store message in system log.
EZZ7046I  client info: Status Transaction completed successfully
Explanation:  Trace record for successful completion of a RRQ or WRQ transaction.
System action:  TFTPD continues.
Operator response:  None.
System programmer response:  None.
Module:  TFTPDREQ
Procedure name:  Store message in system log.

EZZ7047I  client info: direction ACK <block=block> more info
Explanation:  Trace record for ACK packet that is being sent or received.
System action:  TFTPD continues.
Operator response:  None.
System programmer response:  None.
Module:  TFTPDOPS, TFTPDOPT
Procedure name:  Store message in system log.

EZZ7048I  client info: direction DATA <block=block, size bytes> more info
Explanation:  Trace record for DATA packet that is being sent or received.
System action:  TFTPD continues.
Operator response:  None.
System programmer response:  None.
Module:  TFTPDOPS, TFTPDOPT
Procedure name:  Store message in system log.

EZZ7049I  client info: direction OACK <blocksize=block size> more info
Explanation:  Trace record for OACK packet that is being sent.
System action:  TFTPD continues.
Operator response:  None.
System programmer response:  None.
Module:  TFTPUTL
Procedure name:  Store message in system log.

EZZ7050E  Getsockname failed: description rsn = errnoj
Explanation:  TFTPD was unable to get information about an established socket.
description describes the error.

errnoj is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes] where the reason codes are listed.
System action:  TFTPD ends.
Operator response:  Contact the system programmer.
System programmer response:  Correct the system error.
Module:  TFTPDMVS
Procedure name: main()

EZZ7051I Starting
Explanation: The TIMED application is starting.
System action: TIMED continues.
Operator response: None.
System programmer response: None.
Module: TIMED (main)
Procedure name: Store message in syslog. Display message to op console.

EZZ7052E Exiting abnormally, daemon fork to background failed: reason
Explanation: Unable to become a daemon.
System action: TIMED is terminated.
Operator response: None.
System programmer response: Verify adequate system resources and try again and/or correct the system error condition.
Module: TIMED (main)
Procedure name: Store message in syslog. Display message to op console.

EZZ7053E Exiting abnormally, invalid option specified: option
Explanation: An unsupported command line option was used.
System action: TIMED is terminated.
Operator response: Verify command line options used when TIMED was started and try again.
System programmer response: Verify command line options used when TIMED was started.
Module: TIMEDARG
Procedure name: Store message in syslog. Display message to op console.

EZZ7054E Unable to send to client, sendto() error
Explanation: TIMED was unable to send to the client.
System action: TIMED continues.
Operator response: None.
System programmer response: None.
Module: TIMEDPTR
Procedure name: Store message in syslog. Display message to op console.

EZZ7055E Exiting abnormally, recvfrom() error: reason
Explanation: TIMED was unable to receive from the client.
System action: TIMED is terminated.
Operator response: None.
System programmer response: Correct the system error.
Module: TIMEDPTR
Procedure name: Store message in syslog. Display message to op console.
EZZ7056E Exiting abnormally, socket() error: **errno**

Explanation: TIMED was unable to create a socket. One possible cause of this error is that the TCP/IP stack must be started before TIMED.

**errno** is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

System action: TIMED is terminated.

Operator response: None.

System programmer response: Correct the system error.

Module: TIMEDPTR

Procedure name: Store message in syslog. Display message to op console.

---

EZZ7057E Exiting abnormally, bind() error: **reason**

Explanation: TIMED was unable to bind a port.

System action: TIMED is terminated.

Operator response: None.

System programmer response: Correct the system error. Verify TIMED's well-known port (37) is not already in use.

Module: TIMEDPTR

Procedure name: Store message in syslog. Display message to op console.

---

EZZ7058I Exiting

Explanation: TIMED is exiting.

System action: TIMED ends.

Operator response: None.

System programmer response: None.

Module: TIMED (main)

Procedure name: Store message in syslog. Display message to op console.

---

EZZ7059E Exiting Abnormally, Signal received: **signal**

Explanation: TIMED is exiting because a signal was received.

System action: TIMED ends.

Operator response: None.

System programmer response: Restart TIMED.

Module: TIMED (main)

Procedure name: Store message in syslog. Display message to op console.

---

EZZ7060E Request received from **clientaddr**

Explanation: Indicates that a time request was received from a client.

System action: None.

Operator response: None.

System programmer response: None.

Module: TIMEDPTR

Procedure name: Store message in syslog.
EZZ7061I  Time successfully sent to clientaddr
Explanation: Indicates that a time request from a client was satisfied.
System action: None.
Operator response: None.
System programmer response: None.
Module: TIMEDPTR
Procedure name: Store message in syslog.

EZZ7062I  Daemon started
Explanation: Indicates that the TIMED application successfully became a daemon.
System action: None.
Operator response: None.
System programmer response: None.
Module: TIMED (main)
Procedure name: Store message in syslog. Display message to op console.

EZZ7063E  TIMED exiting abnormally, selectex() error: errno
Explanation: TIMED issued a selectex() call that failed with errno errno.
In the message text:

errno

The z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes

System action: TIMED ends.
Operator response: Restart TIMED. If the error persists, contact the system programmer.
System programmer response: Correct the system error. Correct the error indicated by errno.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: TIMED
Module: EZATPTRC
Routing code: 10
Descriptor code: 12
Automation: Not applicable.
Example:
EZZ7063E TIMED exiting abnormally, selectex() error: 157

EZZ7064I  STOP command received. TIMED ends.
Explanation: The STOP command was issued to stop TIMED. TIMED ends.
System action: TIMED ends.
Operator response: None.
System programmer response: None.
User response: Not applicable.
EZZ7080I • EZZ7082E

Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: TIMED
Module: EZATPTRC
Routing code: 10
Descriptor code: 12
Automation: Not applicable.
Example: Not applicable.

EZZ7080I IPv6 address not supported by TCPIP

Explanation: An IPv6 address was specified for the -b option on a TFTPD start command and TCPIP is not enabled for IPv6.
System action: TFTPD ends.
Operator response: Contact the system programmer.
System programmer response: If you are using IPv6, see the z/OS Communications Server: IP Configuration Reference for instructions about how to enable the TCP/IP stack for IPv6. If you do not need IPv6, specify an IPv4 address for the -b start option.
Module: TFTPDSCK
Procedure name: prepare_socket_in

EZZ7081I TFTPD -b start option argument is invalid: value

Explanation: The format of the argument for the -b start option is not dotted decimal (IPv4) or colon-hexadecimal (IPv6.) The argument must be a valid IPv4 or IPv6 address.
value is the invalid argument.
System action: TFTPD ends.
Operator response: Contact the system programmer.
System programmer response: Change the value of the -b start option to a valid IP address and issue the TFTPD start command.
Module: TFTPDSCK
Procedure name: prepare_socket_in

EZZ7082E select failed: description rsn = errnoj

Explanation: A select() issued by TFTPD failed.
description describes the error.
errnoj is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes
System action: TFTPD ends.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the UDP option. Obtain the following documentation and contact the IBM software support center:
• The SYSLOG DAEMON logging file.
• The SYSTCPIP component trace.
Module: TFTPDMVS
Procedure name: main()
EZZ7083E  An IOCTL failed: description rsn = errnojr

Explanation:  An IOCTL issued by TFTP to retrieve stack information failed.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the
reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes.

System action:  TFTP ends.

Operator response:  Contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the UDP
and IOCTL options. Obtain the following documentation and contact the IBM software support center:
• The SYSLOG DAEMON logging file.
• The SYSTCPIP trace.

Module:  TFTPDSCK

Procedure name:  prepare_socket_in()

EZZ7350  (User: User_name) Unable to access HTML file File_name

Explanation:  The HTML file File_name could not be accessed by the IBM Network Station Manager. See the message
below for the specific cause of the error.

System action:  None.

Operator response:  Correct the error and try the request again. If the file does not exist, reinstall the IBM Network
Station Manager licensed program.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response:  None.

Module:  qytcmcgi.c

Procedure name:  None.

EZZ7351  (User: User_name) Required information Variable_name not found or not valid.

Explanation:  Information required by the IBM Network Station Manager was not found in the HTML form data or
was not valid. This might be caused by one of the following:
• Viewing HTML pages from the IBM Network Station Manager without going through the IBM Network Station
Manager main screen.
• Using IBM Network Station Manager CGI programs from non-IBM Network Station Manager HTML pages.
• Editing the IBM Network Station Manager HTML files.
• Not allowing the IBM Network Station Manager to control the flow of operation by using the back up button on
the browser to return to previous screens.

System action:  None.

Operator response:  Do one of the following and try the request again:
• Only use the published URL to access the IBM Network Station Manager functions.
• Do not use IBM Network Station Manager CGI programs from other HTML pages.
• If the HTML files have been edited, reinstall the IBM Network Station Manager licensed program to restore the
HTML files to their correct state.
• Restart the IBM Network Station Manager.
• Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response:  None.

Module:  qytcmcgi.c qytcmssg.c qytcmssc.c

Procedure name:  None.
EZZ7352 • EZZ7354

EZZ7352  (User: User_name) Problem found with HTML file File_name

Explanation: The IBM Network Station Manager cannot process the request due to a problem in HTML file File_name. This might be caused by one of the following:

- Using IBM Network Station Manager CGI programs from non-IBM Network Station Manager HTML pages.
- Editing the IBM Network Station Manager HTML files.

System action: None.

Operator response: Do one of the following and try the request again:

- Do not use IBM Network Station Manager CGI programs from other HTML pages.
- If the HTML files have been edited, reinstall the IBM Network Station Manager licensed program to restore the HTML files to their correct state.
- Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmlc.c qytcmpgc.c qytcmcg.c qytcmtcg.c qytcmtg.c

Procedure name: None.

EZZ7353  (User: User_name) Unable to process data from HTML page.

Explanation: The IBM Network Station Manager was unable to process the data from the HTML page. This might be caused by one of the following:

- Using IBM Network Station Manager CGI programs from non-IBM Network Station Manager HTML pages.
- Editing the IBM Network Station Manager HTML files.
- An error reading data from the HTML page.

System action: None.

Operator response: Do one of the following and try the request again:

- Do not use IBM Network Station Manager CGI programs from other HTML pages.
- If the HTML files have been edited, reinstall the IBM Network Station Manager licensed program to restore the HTML files to their correct state.
- If neither of the above apply, try your request again.
- Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmaic.c qytcmcgc.c qytcmicl.c qytcmpcg.c qytcmsgc.c qytcmscc.c qytcmtc.c

Procedure name: None.

EZZ7354  (User: User_name) Error during authentication for user User_profile_name

Explanation: The user name supplied by the server was null. This can occur if the user was not authenticated before the IBM Network Station Manager program is invoked.

System action: None.

Operator response: Correct the error and try to sign on to the IBM Network Station Manager program again.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmcgl.c

Procedure name: None.
EZZ7355 (User: User_name) Unable to access required file File_name

Explanation: The required file File_name could not be accessed by the IBM Network Station Manager. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again. If the file does not exist, reinstall the IBM Network Station Manager licensed program.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmpgc.c qytcmpsc.c qytcmtcc.c
Procedure name: None.

EZZ7356 (User: User_name) Unable to access system preferences file File_name

Explanation: The system-wide preferences in file File_name could not be accessed by the IBM Network Station Manager. The system-wide preferences for the client application that is being worked with cannot be viewed or changed. They might not be usable by the client application meaning that the system preferences will use their default values as shipped by IBM. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.
If the file was damaged, delete the file and restore a previously saved copy or create it again by selecting new system preferences through the IBM Network Station Manager.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmpgc.c qytcmpsc.c
Procedure name: None.

EZZ7357 (User: User_name) Unable to access user preferences file File_name

Explanation: The user preferences in file File_name could not be accessed by the IBM Network Station Manager. The user preferences for the client application and user that is being worked with cannot be viewed or changed. They might not be usable by the client application meaning that the user preferences will use the system values. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.
If the file was damaged, delete the file and restore a previously saved copy or create it again by selecting new user preferences through the IBM Network Station Manager.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmpgc.c qytcmpsc.c
Procedure name: None.

EZZ7358 (User: User_name) Unable to update system preferences in file File_name

Explanation: The system-wide preferences in file File_name could not be updated by the IBM Network Station Manager. None of the requested changes to the system preferences have been made. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.
EZZ7359 • EZZ7362

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmpsc.c qytcmtcc.c

Procedure name: None.

EZZ7359  (User: User_name) Unable to update user preferences in file File_name

Explanation: The user preferences in file File_name could not be updated by the IBM Network Station Manager. None of the requested changes to the user preferences have been made. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmpsc.c qytcmtcc.c

Procedure name: None.

EZZ7360  (User User_name) Unable to retrieve list of users.

Explanation: The IBM Network Station Manager was unable to retrieve the requested list of users. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again. Otherwise, enter the specific user name directly in the entry field.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmclc.c

Procedure name: None.

EZZ7361  (User: User_name) Unable to convert program data from one Coded Character Set ID to another.

Explanation: The IBM Network Station Manager encountered an error while converting program data from one Coded Character Set to another. See the message below for the specific cause of the error.

System action: None.

Operator response: This error indicates a system problem in the area of multicultural support. Verify that the multicultural support was properly installed.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytmccv.c

Procedure name: None.

EZZ7362  (User: User_name) Unable to access system hardware preferences in file File_name

Explanation: The system-wide IBM Network Station hardware preferences in file File_name could not be accessed by the IBM Network Station Manager. The system-wide preferences in this file cannot be viewed or changed. This file is also accessed by IBM Network Stations and might not be readable by them. IBM Network Stations might still be able to read their default values as shipped by IBM, their workstation-specific preferences, and their user-specific preferences. See the message below for the specific cause of the error.

System action: None.
Operator response: Correct the error and try the request again.

If the file was damaged, delete the file and restore a previously saved copy or create it again by selecting new system hardware preferences through the IBM Network Station Manager.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmtcc.c

Procedure name: None.

---

EZZ7363 (User: User_name) Unable to access workstation or user specific hardware preferences in file
File_name

Explanation: The workstation or user specific IBM Network Station hardware preferences in file File_name could not be accessed by the IBM Network Station Manager. The workstation or user specific hardware preferences in this file cannot be viewed or changed. The file also might not be readable by the IBM Network Station when it loads preferences for itself or its user. The IBM Network Station might still be able to read the default preferences as shipped by IBM and the system-wide preferences. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.

If the file was damaged, delete the file and restore a previously saved copy or create it again by selecting new workstation or user specific hardware preferences through the IBM Network Station Manager.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmtcc.c

Procedure name: None.

---

EZZ7364 (User: User_name) Unable to update workstation preferences in file File_name

Explanation: The workstation preferences in file File_name could not be updated by the IBM Network Station Manager. None of the requested changes to the workstation preferences have been made. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmtcc.c

Procedure name: None.

---

EZZ7368 (User: User_name) Required file File_name contains a statement that is not valid.

Explanation: The required file File_name contains a statement that could not be parsed by the IBM Network Station Manager. The IBM Network Station Manager cannot continue because of the possibility that preference settings will be lost. This file is installed with the IBM Network Station Manager. The IBM Network Station Manager detected a change since installation.

System action: None.

Operator response: Reinstall the IBM Network Station Manager licensed program.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmtcc.c
procedure name: None.

EZZ7369 (User User_name) does not have the proper authority to access user Accessed_User_Name

Explanation: User User_name does not have the proper authority to perform administrative functions through the IBM Network Station Manager.

System action: None.

Operator response: Do one of the following and try the request again.

1. Contact a valid System Administrator and have them set up user User_name as a Systems Administrator.
2. Use a different user profile when signing on to the IBM Network Station Manager that has the required authority.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmcgi.c

Procedure name: None.

EZZ7371 (User: User_name) Unable to access IBM Network Station DNS configuration file File_name

Explanation: The DNS configuration file, File_name, could not be accessed. This file contains statements that configure the domain name servers and host tables on IBM Network Stations. IBM Network Stations might not be able to connect to remote hosts because of this error. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error given in the message below. Then delete the file if it exists. Use the Update host table and DNS configuration button on the Hardware Settings - System Defaults page of the IBM Network Station Manager to create the file again.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmtnr.c qytcmssc.c

Procedure name: None.

EZZ7373 (User: User_name) Unable to access startup file File_name

Explanation: The application startup data in file File_name could not be accessed by the IBM Network Station Manager. The application startup programs, menus, environment variables, or Internet network information cannot be viewed or changed and might not be usable. See the message below for the specific cause of the error.

System action: None.

Operator response: Correct the error and try the request again.

If the file was damaged, delete the file and restore a previously saved copy or create it again by selecting new startup or Internet network information through the IBM Network Station Manager.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmmsg.c qytcmssc.c

Procedure name: None.

EZZ7374 (User: User_name) Unable to access or create system startup file File_name

Explanation: The system startup file File_name could not be accessed or created by the IBM Network Station Manager. In order to save a user startup file, the system startup file must exist. The requested changes to the user startup programs, menus, environment variables, or Internet network information cannot be saved. See the message below for the specific cause of the error.

426 z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)

Operator response:  Correct the error and try the request again.
If the system file was damaged, delete the file and restore a previously saved copy or create it again by selecting new startup or Internet network information through the IBM Network Station Manager.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response:  None.
Module:  qytcmsssc.c
Procedure name:  None.

EZZ7375  (User: User_name) Unable to update startup file File_name
Explanation:  The application startup information in file File_name could not be updated by the IBM Network Station Manager. The requested changes to the startup programs, menus, environment variables, or Internet network information cannot be saved. See the message below for the specific cause of the error.
System action:  None.
Operator response:  Correct the error and try the request again.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response:  None.
Module:  qytcmsssc.c
Procedure name:  None.

EZZ7376  (User: User_name) Corrupted password value found in system preferences file File_name
Explanation:  The IBM Network Station Manager encountered a corrupted password setting in the system-wide preferences file (File_name). The system-wide preferences in this file have been corrupted and are not viewable. The file also might not be readable by IBM Network Stations.
System action:  None.
Operator response:  Data in this file was lost. Delete the file and restore a previously saved copy or create it again by selecting new system hardware preferences through the IBM Network Station Manager.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response:  None.
Module:  qytcmtcg.c
Procedure name:  None.

EZZ7377  (User: User_name) Unable to access required file File_name
Explanation:  The required file File_name could not be accessed by the IBM Network Station Manager.
System action:  None.
Operator response:  If there is a message below, correct the error and try the request again. If there is no message below, the file does not exist. In that case, reinstall the IBM Network Station Manager licensed program.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response:  None.
Module:  qytcmscg.c qytcmsssc.c
Procedure name:  None.
EZZ7381 • EZZ7384

EZZ7381  (User: User_name) Error occurred while determining the national language version.

Explanation: The IBM Network Station Manager was in the process of determining the correct translation to present when the error occurred. This might be caused by one of the following:
• The primary translation of the IBM Network Station Manager licensed program was not installed.
• A secondary translation of the IBM Network Station Manager licensed program was installed without having previously installed the primary translation.
• The primary translation of the IBM Network Station Manager does not match the primary language of the system.

System action: None.

Operator response: Do one of the following and try the request again:
• Reinstall the primary translation of the IBM Network Station Manager licensed program that matches the primary language of the system.
• Reinstall a secondary translation of the IBM Network Station Manager licensed program after installing the primary translation.
• Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmai.c
Procedure name: None.

EZZ7383  (User: User_name) User User does not exist.

Explanation: The user (User) is not an existing user name defined on this system. Only those users that have a valid user name can be configured by the IBM Network Station program.

System action: None.

Operator response: Do one of the following and try the request again:
• System Administrator:
  – Specify an existing user name that is valid.
  – Press the Browse button on the HTML screen to display a list of users that are valid and can be configured for the IBM Network Station program. Select a user from the list.
• Others:
  – Contact the System Administrator. It is possible that the user name that was authenticated is only valid for access via the Server.
• Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmccg.c
Procedure name: None.

EZZ7384  (User: User_name) IBM Network Station Workstation not found.

Explanation: The IBM Network Station name/terminal Workstation could not be resolved.

System action: None.

Operator response: Specify a valid IBM Network Station name. If the name is valid, verify that the domain name server is active.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmccg.c
Procedure name: None.
EZZ7438 (User: User_name) Unexpected condition(s) detected during update Host Table and DNS Configuration: Missing_Info

Explanation: All of the expected information was not available. Information is extracted from the TCPIP.DATA file. See the z/OS Communications Server: IP Configuration Guide for a description of the TCPIP.DATA file search order. See the explanations below for the information that might be missing.

No Domain Name
Host Table not updated with a default domain name because one could not be located. No 'search' or 'domain' statement exists from which the default domain name can be identified. On the 'search' statement, the first domain specified is used as the default domain name and the last 'search' or 'domain' statement detected in the file determines the default domain name.

No Name Servers
Host Table not updated with any name servers because none could be located. No name server statement exists that identifies the name server to be used. One name server statement is needed with a single IP address of the name server.

System hardware settings have been updated with other selections made.

System action: None.
Operater response: If you expect a default Domain Name and/or Name Servers to be updated in the Host Table, correct the error and try the request again.
Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmtcc.c
Procedure name: None.

EZZ7439 (User: User_name) Unable to access Dump file File_name

Explanation: The Dump file File_name could not be accessed by the IBM Network Station Manager. See the message below for the specific cause of the error.

System action: None.
Operator response: Correct the error and try the request again. If the file does not exist, reinstall the IBM Network Station Manager licensed program.
Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmfd.c
Procedure name: None.

EZZ7440 (User User_name) Unable to retrieve list of Dump Files from directory Dump_Directory_Name.

Explanation: The IBM Network Station Manager was unable to retrieve the requested list of dump files from directory Dump_Directory_Name. See the message below (if any) for the specific cause of the error. You might not have read permission to the dump directory or there is no valid dump file.

System action: None.
Operator response: Correct the error and try the request again.
Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.
Module: qytcmclc.c
Procedure name: None.
EZZ7441 • EZZ7443

EZZ7441  (User: User_name) Unexpected error occurred. Dump saved in file Dump_File_Name
Explanation: Unexpected error occurred. The trace of the CGI is saved in file Dump_File_Name
System action: None.
Operator response: Do one of the following and try the request again.
Try submitting the request again.
Restart the IBM Network Station Manager.
Contact your Network Station Administrator with the Dump file name.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response: None.
Module: qycmcut.c
Procedure name: None.

EZZ7442  (User: User_name) User Initiating_User_name initiating conversation is not the current user User_name
Explanation: In processing a series of requests, the IBM Network Station Manager detected a request coming from
user User_name who is not the user that initiated the conversation with the IBM Network Station Manager. All
requests on the current session must originate from user Initiating_User_name.
System action: None.
Operator response: Do one of the following and try the request again.
Try submitting the request again.
Restart the IBM Network Station Manager.
Contact your Network Station Administrator.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response: None.
Module: qycmcgi.c
Procedure name: None.

EZZ7443  (User: User_name) Request received from unexpected IP Address ( Unexpected: Unexpected_IP_Addr,
Expected: Expected_IP_Addr).
Explanation: The IP Address Unexpected_IP_Addr for this request does not match the previous IP Address
Expected_IP_Addr used during this session. In processing a series of requests, the IBM Network Station Manager
detected a request coming from IP address Unexpected_IP_Addr. This is not the IP address that initiated the
conversation with the IBM Network Station Manager. All requests on the current session must originate from IP
address Expected_IP_Addr.
System action: None.
Operator response: Do one of the following and try the request again.
Try submitting the request again.
Restart the IBM Network Station Manager.
Contact your Network Station Administrator.
Message resulted from Process Name / ID: Process_Name / Process_ID
System programmer response: None.
Module: qycmcgi.c
Procedure name: None.
EZZ7444  (User: User_name) IBM Network Station Message Log Initialization Failed with RC: Return_Code.,
            Dump file (Dump_File_Name) created.

Explanation: An unexpected error occurred during initialization for the IBM Network Station Manager message
logging. If possible, a dump file (Dump_File_Name) was created.

System action: None.

Operator response: Try the request again.

If the problem persists, collect the appropriate information and contact your Service Representative.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmccv.c

Procedure name: None.

EZZ7445  (User: User_name) IBM Network Station Manager System Initialization failed with RC: Return_Code.,
            Dump file (Dump_File_Name) created.

Explanation: An unexpected error occurred during system initialization for the IBM Network Station Manager. If
possible, a dump file (Dump_File_Name) was created.

System action: None.

Operator response: Try the request again.

If the problem persists, collect the appropriate information and contact your Service Representative.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

            qytctmgt.c qytctmtst.c

Procedure name: None.

EZZ7446  Description for message Unknown_Message could not be found.

Explanation: The IBM Network Station Manager issued a message for which the message detail could not be found
in the message catalog.

This could be caused by applying a PTF that requires a message catalog update and the catalog was not updated.

System action: None.

Operator response: See your Network Station Administrator.

Ensure that the message catalog was updated with the latest message descriptions. If the error persists, collect the
appropriate documentation and contact your Service Representative.

System programmer response: None.

Module: qytcmccv.c

Procedure name: None.

EZZ7447  Unexpected system error occurred. errno= Errno, Message:_description

Explanation: A system call returned an unexpected error. The error number received is listed above, along with any
text that might be available from the system identifying the error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the
return codes (errnos) information in z/OS UNIX System Services Messages and Codes

description describes the meaning of the errno.

System action: None.
Operator response: Contact your Network Station Administrator.

Ensure that program temporary fixes (PTFs) included with the IBM Network Station Manager licensed program have been applied. Restart the IBM Network Station Manager and then try the request again.

If the error persists, collect the available documentation and contact your Service Representative.

System programmer response: None.

Module: qytcmccv.c qytcmcgi.c

Procedure name: None.

---

EZZ7448 • EZZ7452I

Operator response: Contact your Network Station Administrator.

Ensure that program temporary fixes (PTFs) included with the IBM Network Station Manager licensed program have been applied. Restart the IBM Network Station Manager and then try the request again.

If the error persists, collect the available documentation and contact your Service Representative.

System programmer response: None.

Module: qytcmccv.c qytcmcgi.c

Procedure name: None.

---

EZZ7448 (User: User_name) Unexpected error (Signal_Name) occurred, Dump file (Dump_File_Name) created.

Explanation: An unexpected error occurred while running the IBM Network Station Manager. If possible, a dump file (Dump_File_Name) was created.

See your system documentation for a description of the signal error (Signal_Name) returned.

System action: None.

Operator response: Do one of the following and try the request again.

If the problem persists, collect the appropriate information and contact your Service Representative.

Message resulted from Process Name / ID: Process_Name / Process_ID

System programmer response: None.

Module: qytcmccv.c

Procedure name: None.

---

EZZ7450I FFST text

Explanation: TCP/IP attempted to establish an interface to First Failure Support Technology™ (FFST™) and was unsuccessful. The failure is related to the installation on the operating system.

text is one of the following:

SUBSYSTEM IS NOT INSTALLED
   The FFST Subsystem is not installed on your operating system. TCP/IP can be initialized with out it.

INITIALIZATION MODULE IS NOT FOUND
   The FFST Subsystem is installed but the initialization module cannot be found.

INTERFACE MODULE IS NOT FOUND
   The FFST Subsystem is installed but the interface module could not be found.

TERMINATION MODULE NOT FOUND
   The FFST Subsystem is installed but the termination module cannot be found.

System action: TCP/IP initialization continues, but FFST will not be available to support TCP/IP diagnostics.

Operator response: Save the system log for problem determination. Contact the system programmer to diagnose this error.

System programmer response: Determine the cause of the error, and if FFST support is required. If so, you must restart TCP/IP if FFST support is required for diagnostics.

Module: EZBITINI

Procedure name: None.

---

EZZ7452I FFST initialization failed, RETURN CODE: return code

Explanation: FFST experienced an internal error during initialization with a return code provided. TCP/IP can complete its initialization.

return code is the hexadecimal return code from FFST initialization.
**System action:** TCP/IP initializes.

**Operator response:** Contact the system programmer.

**System programmer response:** Determine the cause of the error, and if FFST support is required. If so, then verify that FFST was installed correctly. You must restart TCP/IP if FFST support is required for diagnostics.

**Module:** EZBITINI

**Procedure name:** None.

---

**EZ7453I CSVDYLPA ADD FOR MODULE modname FAILED, RETURN CODE: return_code REASON CODE: reason_code**

**Explanation:** A CSVDYLPA macro call for the specified load module failed with the specified return code and reason code. TCP/IP cannot complete its initialization.

In the message text:

- **modname**
  - The name of the load module that the CSVDYLPA macro attempted to load.

- **return_code**
  - The return code from the CSVDYLPA macro invocation.

- **reason_code**
  - The reason code from the CSVDYLPA macro invocation.

**System action:** TCP/IP ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Use the return code and reason code provided to determine the cause of the CSVDYLPA macro call failure. See z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN for a description of the CSVDYLPA macro, and the possible return codes and reason codes.

Verify that the load module exists in data set SEZALOAD. Also verify that SEZALOAD is either in the default MVS link list or that it is explicitly specified as a STEPLIB DD card on the started procedure JCL used to start this TCP/IP instance. If no problems are found, collect any available supporting documentation and dumps, and contact the IBM Software Support Center.

**User response:** Not applicable.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP

**Module:** EZBITINI

**Routing code:** 2, 8

**Descriptor code:** 12

**Automation:** This message is issued to the console. You can use automation on this message to detect and respond to module load failures.

**Example:**

```
EZ7453I CSVDYLPA ADD FOR MODULE EZBITCOM FAILED, RETURN CODE: 8 REASON CODE: 00000801
```

---

**EZ7475I ICMP will Ignore Redirects due to Routing Application being Active.**

**Explanation:** The OMPROUTE routing application is active and requires that TCPIP ignore ICMP Redirect packets. The IGNOREREDIRECT option was set dynamically.

**System action:** TCP/IP continues

**Operator response:** None.

**System programmer response:** None.

**Module:** EZBIERTE
**EZ7478I • EZ7503I**

**Procedure name:** EZBIEADR

---

**EZ7478I**  
**ICMPv6 WILL IGNORE REDIRECTS DUE TO ROUTING APPLICATION BEING ACTIVE**

**Explanation:** The OMPROUTE routing application is active and providing routes for IPv6. It requires that TCPIP ignore ICMPv6 Redirect packets. The IPv6 IGNOREREDIRECT option has been set dynamically.

**System action:** TCPIP continues

**Operator response:** None.

**System programmer response:** None.

**Module:** EZBIERT6

**Procedure name:** EZBIEAD6

---

**EZ7500I**  
**reapchild: waitpid loop: pid=child-pid, status=status**

**Explanation:** A SIGCHLD was received but the termination status of the child process cannot be retrieved.

*child-pid* is the return value from waitpid.

*status* is the status returned by waitpid.

**System action:** Processing continues.

**Operator response:** Verify system resources.

**System programmer response:** None.

**Module:** conf

**Procedure name:** reapchild

---

**EZ7501E**  
**low on space (have space-available, host needs space-needed in directory)**

**Explanation:** Sendmail requires more disk space in the queue directory.

*space-available* is the free disk space.

*host* is the host name.

*space-needed* is the required disk space.

*directory* is the queue directory name.

**System action:** Processing continues.

**Operator response:** Verify file system resources. Free up additional disk space.

**System programmer response:** None.

**Module:** conf

**Procedure name:** enoughdiskspace

---

**EZ7503I**  
**queue-id seq-num: log terminated, too many parts**

**Explanation:** Log entry was too long.

*queue-id* is the queue ID of the current mail queue that is being processed.

*seq-num* is the log entry sequence number.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** conf
Procedure name: sm_syslog

EZZ7505I unable to write pid-file
Explanation: Sendmail is unable to write to the pid file.

pid-file is the sendmail pid file name.

System action: Processing continues.

Operator response: Verify file system resources and directory and file permissions.

System programmer response: None.

Module: daemon

Procedure name: getrequests

EZZ7506I problem creating SMTP socket
Explanation: Sendmail failed to bind to and listen on the SMTP server port.

System action: Program ends.

Operator response: Verify that a sendmail server is not already running. Verify system resources.

System programmer response: None.

Module: daemon

Procedure name: opendaemonsocket

EZZ7507I My unqualified host name (host) unknown; sleeping for retry
Explanation: Sendmail failed to retrieve the canonical form of the local host name.

host is the host's short name.

System action: Processing continues.

Operator response: Verify DNS configuration and availability.

System programmer response: None.

Module: daemon

Procedure name: myhostname

EZZ7508I unable to qualify my own domain name (host) -- using short name
Explanation: Sendmail failed to retrieve the canonical form of the local host name.

host is the host's short name.

System action: Processing continues.

Operator response: Verify DNS configuration and availability.

System programmer response: None.

Module: daemon

Procedure name: myhostname

EZZ7510I user uid attempted to action
Explanation: The specified user attempted the specified action.

uid is the uid of the user who attempted the action.

action is the unauthorized action attempted. The action value can be one of the following:

• run daemon
Purge host status

System action: Program ends.
Operator response: Verify that no security breach is being attempted.
System programmer response: None.
Module: main
Procedure name: main

EZZ7511I daemon invoked without full pathname; kill -1 won't work

Explanation: Sendmail was invoked with a relative path name. SIGHUP will not restart the daemon.
System action: Processing continues.
Operator response: Restart using full path name, if appropriate.
System programmer response: None.
Module: main
Procedure name: main

EZZ7512I could not set [ug]id(uid, gid)

Explanation: Sendmail failed to reset the processes uid and gid to the real values, in order to restart.
uid is the uid that could not be set.
gid is the gid that could not be set.
System action: Program ends and automatic restart fails.
Operator response: Verify system resources.
System programmer response: None.
Module: main
Procedure name: sighup

EZZ7513I could not exec sendmail-name

Explanation: Sendmail failed to restart itself.
sendmail-name is the name used to invoke sendmail.
System action: Program ends and automatic restart fails.
Operator response: Verify system resources.
System programmer response: None.
Module: main
Procedure name: sighup

EZZ7514I sendmail starting

Explanation: Sendmail is starting in a daemon mode.
System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: main
Procedure name: main
EZZ7515I  queueup: cannot create filename, uid=uid
Explanation:  Sendmail failed to create queue file for a message.
filename is the name of the queue file that could not be created.
uid is the effective uid of the process.
System action:  Processing continues.
Operator response:  Verify file system resources and queue directory permissions.
System programmer response:  None.
Module:  queue
Procedure name:  queueup

EZZ7516I  queueup: cannot lock filename Arguments: queue file name, error description
Explanation:  Sendmail failed to lock the queue file for a message.
filename is the name of the queue file that could not be locked.
System action:  Processing continues.
Operator response:  Verify system resources.
System programmer response:  None.
Module:  queue
Procedure name:  queueup

EZZ7517I  FAILED to grow WorkList for directory to size
Explanation:  Insufficient memory is available for queue processing.
directory is the queue directory name.
size is the required worklist size.
System action:  Processing continues.
Operator response:  Verify system resources.
System programmer response:  None.
Module:  queue
Procedure name:  grow_wlist

EZZ7519I  filename: WARNING: dangerous write permissions
Explanation:  Configuration file allows group and/or other write access.
filename is the configuration filename.
System action:  Processing continues.
Operator response:  Disallow group and other write access for configuration file.
System programmer response:  None.
Module:  readcf
Procedure name:  readcf
EZZ7522A  sendmail terminating on error, rc = status
Explanation: Sendmail daemon terminated on an error condition.
status is the return code of the process.
System action: Program ends.
Operator response: Restart sendmail daemon.
System programmer response: None.
Module: sysexits
Procedure name: sm_exit

EZZ7523A  sendmail terminating on signal (signo)
Explanation: Sendmail daemon terminated upon receiving the specified signal. signo is the number of the signal caught.
System action: Program ends.
Operator response: Restart sendmail daemon.
System programmer response: None.
Module: sysexits
Procedure name: sm_exit

EZZ7524I  sendmail terminating
Explanation: Sendmail daemon terminated normally.
System action: Program ends.
Operator response: None.
System programmer response: None.
Module: sysexits
Procedure name: sm_exit

Explanation: The mailstats command was invoked with improper command line options. The valid options are:
-C Read the configuration file, cffile, instead of the default sendmail configuration file.
-P Output the information in program-readable mode without clearing statistics.
-f Read the statistics file, stfile, instead of the statistics file specified in the sendmail configuration file.
-o Do not display the name of the mailer in the output.
-p Output the information in program-readable mode and clear statistics.
System action: Program ends.
Operator response: Correct the command syntax and reissue the mailstats command.
System programmer response: None.
Module: mailstat
Procedure name: main
EZZ7528I mailstats: could not open config file filename

Explanation: The sendmail configuration file could not be opened.
filename is the name of the configuration file.

System action: Program ends.
Operator response: Verify configuration file existence and permissions.
System programmer response: None.
Module: mailstats
Procedure name: main

EZZ7529I mailstats: StatusFile filename too long: filename...

Explanation: The sendmail stats file name is too long.
filename is the first 30 characters of the status file name.

System action: Program ends.
Operator response: Save error information for system programmer.
System programmer response: Reduce the length of the status file name specified by the sendmail configuration file.
Module: mailstats
Procedure name: main

EZZ7530I mailstats: Too many mailers defined, limit max.

Explanation: The sendmail configuration file defines too many mailers for mailstats to process.
limit is the maximum number of mailers mailstats can process.

System action: Program ends.
Operator response: Save error information for system programmer.
System programmer response: Reduce the number of mailers defined by the sendmail configuration file.
Module: mailstats
Procedure name: main

EZZ7531I mailstats: no statistics file located

Explanation: The sendmail configuration file does not specify a statistics file.

System action: Program ends.
Operator response: Save error information for system programmer.
System programmer response: Add a StatusFile (S) option to the sendmail configuration file by specifying STATUS_FILE in the mc file.
Module: mailstats
Procedure name: main

EZZ7532I mailstats: could not open statistics file filename

Explanation: The sendmail statistics file could not be opened.
filename is the name of the statistics file.

System action: Program ends.
Operator response: Verify statistics file existence and permissions.
EZZ7533I  •  EZZ7544I

System programmer response:  None.
Module:  mailstats
Procedure name:  main

EZZ7533I  mailstats: unknown statistics file format (file size changed).
Explanation:  This version of mailstats is incompatible with the version of sendmail that created the statistics file.
System action:  Program ends.
Operator response:  Save error information for system programmer.
System programmer response:  Verify that compatible versions of mailstats and sendmail are installed.
Module:  mailstats
Procedure name:  main

EZZ7541I  opendaemonsocket: server SMTP socket wedged: exiting
Explanation:  Sendmail repeatedly failed to bind to and listen on the SMTP server port.
System action:  Program ends.
Operator response:  Verify that a sendmail server is not already running. Verify system resources.
System programmer response:  None.
Module:  daemon
Procedure name:  opendaemonsocket

EZZ7543I  sendall: unlink(filename): permanent
Explanation:  Attempt to unlink the specified queue file failed.
filename is the queue file name.
System action:  Program ends.
Operator response:  Verify system resources.
System programmer response:  None.
Module:  deliver
Procedure name:  dup_queue_file

EZZ7544I  sendall: link(oldfile, newfile): permanent Arguments: existing queue file name, new queue file name
Explanation:  Attempt to link new file name to existing queue file failed.
oldfile is the existing queue file name.
newfile is the new queue file name.
System action:  Program ends.
Operator response:  Verify system resources.
System programmer response:  None.
Module:  deliver
Procedure name:  dup_queue_file
Can't open /dev/null

Explanation: Attempt to open /dev/null failed.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: envelope
Procedure name: openxscript

Can't create transcript stream filename

Explanation: Failed to open a stream for the specified transcript file.
filename is the name of the transcript file.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: envelope
Procedure name: openxscript

fill_fd: when cannot open /dev/null

Explanation: Attempt to open /dev/null failed.
when indicates when the error occurred. It is either "startup" or null ("").
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: main
Procedure name: fill_fd

queueup: cannot create queue temp file filename, uid=uid
Arguments: queue file name, effective uid

Explanation: Attempt to create a queue file failed.
filename is the name of the file that could not be created.
uid is the effective uid of the process.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: queue
Procedure name: queueup

queueup: cannot create data temp file filename, uid=uid

Explanation: Attempt to create a queue data temporary file failed.
filename is the name of the file that could not be created.
uid is the effective uid of the process.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: queue
Procedure name: queueup

EZZ7553I 552 Error writing control file filename
Explanation: Error writing to the specified control file.
filename is the name of the control file.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: queue
Procedure name: queueup

EZZ7554I 452 Error writing control file filename
Explanation: Error writing to specified control file.
filename is the name of the control file.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: queue
Procedure name: queueup

EZZ7556I 554 savemail: cannot save rejected email anywhere
Explanation: sendmail cannot save the rejected mail.
System action: sendmail ends.
Operator response: Contact the system programmer.
System programmer response: Use the messages that precede EZZ7556I to determine why sendmail cannot save mail.
Module: savemail
Procedure name: savemail

EZZ7558I Out of memory!!
Explanation: Insufficient memory available.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: util
Procedure name: xalloc
EZZ7560I Frozen configurations unsupported
Explanation: Sendmail was invoked with the obsolete frozen configuration (-bz) command line option.
System action: Program ends after processing command line options.
Operator response: Restart program without frozen configuration option.
System programmer response: None.
Module: main
Procedure name: main

EZZ7561I Invalid operation mode mode-flag
Explanation: Sendmail was invoked with an invalid mode (-b option) specified.
mode-flag is the single character option flag that followed -b on the command line.
System action: Program ends after processing command line options.
Operator response: Try operation again without invalid option.
System programmer response: None.
Module: main
Procedure name: main

EZZ7562I More than one "from" person
Explanation: Sendmail was invoked with multiple sender addresses (-f or -r options) specified. At most one sender address should be specified.
System action: Program ends after processing command line options.
Operator response: Try operation again with no more than one sender address specified.
System programmer response: None.
Module: main
Procedure name: main

EZZ7563I Bad hop count (hop count)
Explanation: Sendmail was invoked with an invalid hop count (-h option) specified.
hop count is the hop count that was specified on the command line.
System action: Program ends after processing command line options.
Operator response: Try operation again with valid hop count specified.
System programmer response: None.
Module: main
Procedure name: main

EZZ7564I Invalid -N argument
Explanation: Sendmail was invoked with an invalid Delivery Status Notification (-N option) specified.
System action: Program ends after processing command line options.
Operator response: Try operation again with valid Delivery Status Notification option.
System programmer response: None.
Module: main
Procedure name: main

EZZ7565I Duplicate -R flag
Explanation: Sendmail was invoked with multiple Delivery Status Notification return parameter (-R) options specified.
System action: Program ends after processing command line options.
Operator response: Try operation again with at most one Delivery Status Notification return parameter option specified.
System programmer response: None.
Module: main
Procedure name: main

EZZ7566I Invalid -R value
Explanation: Sendmail was invoked with an unknown Delivery Status Notification return parameter (-R) option specified.
System action: Program ends after processing command line options.
Operator response: Try operation again with valid Delivery Status Notification return parameter option specified.
System programmer response: None.
Module: main
Procedure name: main

EZZ7567I Invalid syntax in -V flag
Explanation: Sendmail was invoked with an invalid envelope ID (-V) option specified.
System action: Program ends after processing command line options.
Operator response: Try operation again with valid envelope ID option.
System programmer response: None.
Module: main
Procedure name: main

EZZ7568I Illegal body type body-type
Explanation: Sendmail was invoked with an invalid message body type (-B option) specified.
body-type is the argument specified with the -B command line option
System action: Program ends after processing command line options.
Operator response: Try operation again with valid message body type option.
System programmer response: None.
Module: main
Procedure name: main

EZZ7569I Permission denied
Explanation: The user is not authorized to start sendmail SMTP daemon or to purge host status.
System action: Program ends.
Operator response: Try operation again with root authority.
System programmer response: None.
Module: main
Procedure name: main

EZZ7570I You do not have permission to process the queue
Explanation: The user is not authorized to process the mail queue.
System action: Program ends.
Operator response: Try operation again with root authority.
System programmer response: None.
Module: main
Procedure name: main

EZZ7571I Recipient names must be specified
Explanation: Sendmail was invoked without any recipient addresses.
System action: Program ends.
Operator response: Try operation again with recipients specified.
System programmer response: None.
Module: main
Procedure name: main

EZZ7572I File descriptors missing on startup: descriptors
Explanation: The specified file descriptors were not open at startup. If this occurs, it is probably the result of an incorrect programmatic invocation of sendmail.

*descriptor* is a list of the names of the missing descriptors, which might include
• stdin
• stdout
• stderr
System action: Processing continues.
Operator response: Verify system resources.
System programmer response: Verify correct programmatic invocation of sendmail.
Module: main
Procedure name: main

EZZ7573I cannot open filename
Explanation: Traffic Log file (specified by -X option) could not be opened. This might caused by an incorrect file name or incorrect file and directory access permissions.

*filename* is the Traffic Log file name specified by the -X command line option.
System action: Program ends after processing command line options.
Operator response: Verify file name and permissions.
System programmer response: None.
Module: main
Procedure name: main
**EZZ7574I**  Warning: .cf version level (config-version-level) exceeds sendmail version sendmail-version-level functionality (max-config-version-level)

Explanation: The version number specified in the exceeds that supported by this version of sendmail.

*config-version-level* is the configuration version level specified by the configuration file.

*sendmail-version-level* is the version level of sendmail.

*max-config-version-level* is the maximum configuration level supported by this version of sendmail.

System action: Program ends after processing command line options.

Operator response: Verify that the intended configuration file was specified.

System programmer response: Correct configuration file.

Module: main

Procedure name: main

---

**EZZ7575I**  No local mailer defined

Explanation: Configuration file does not include a local mailer definition.

System action: Program ends after processing command line options.

Operator response: Verify that intended configuration file was specified.

System programmer response: Correct configuration file.

Module: main

Procedure name: main

---

**EZZ7576I**  No prog mailer defined

Explanation: Configuration file does not include a prog mailer definition.

System action: Program ends after processing command line options.

Operator response: Verify that intended configuration file was specified.

System programmer response: Correct configuration file.

Module: main

Procedure name: main

---

**EZZ7577I**  No *file* mailer defined

Explanation: Configuration file does not include a *file* mailer definition.

System action: Program ends after processing command line options.

Operator response: Verify that intended configuration file was specified.

System programmer response: Correct configuration file.

Module: main

Procedure name: main

---

**EZZ7578I**  No *include* mailer defined

Explanation: Configuration file does not include a *include* mailer definition.

System action: Program ends after processing command line options.

Operator response: Verify that intended configuration file was specified.

System programmer response: Correct configuration file.
Module: main
Procedure name: main

EZZ7579I  QueueDirectory (Q) option must be set
Explanation: Configuration file does not specify a QueueDirectory (Q) option.
System action: Program ends after processing command line options.
Operator response: Verify that intended configuration file was specified.
System programmer response: Correct configuration file.
Module: main
Procedure name: main

EZZ7580I  cannot chdir(queue-directory)
Explanation: Could not change to specified queue directory. Either the specified directory does not exist, or it lacks proper permissions.
queue-directory is the queue directory that was specified.
System action: Program ends after processing command line options.
Operator response: Verify directory existence and permissions.
System programmer response: None.
Module: main
Procedure name: main

EZZ7581I  main: cannot stat queue-directory
Explanation: Sendmail failed to retrieve information about the queue directory. Sendmail does not have search access to some directory containing the specified queue directory.
queue-directory is the queue directory that was specified.
System action: Program ends.
Operator response: Verify directory permissions.
System programmer response: None.
Module: main
Procedure name: main

EZZ7582I  daemon: cannot fork
Explanation: Sendmail could not fork a daemon process.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: main
Procedure name: main
EZZ7583I  setuserenv: `putenv(env-setting)` failed
Explanation:  Sendmail failed to set the specified environment variable.

env-setting is the environment variable and value that could not be set.
System action:  Program ends after processing command line options.
Operator response:  Verify system resources.
System programmer response:  None.
Module:  main
Procedure name:  setuserenv

EZZ7585I  cannot open
Explanation:  The specified configuration file does not exist, does not have proper permissions set, or is in a
directory without proper permissions.
System action:  Program ends.
Operator response:  Verify file existence and file and directory permissions.
System programmer response:  None.
Module:  readcf
Procedure name:  readcf

EZZ7586I  cannot fstat
Explanation:  Sendmail does not have search access to some directory containing the specified queue directory.
System action:  Program ends.
Operator response:  Verify directory permissions.
System programmer response:  None.
Module:  readcf
Procedure name:  readcf

EZZ7587I  not a plain file
Explanation:  The specified configuration file is not a plain file
System action:  Program ends.
Operator response:  Verify configuration file specified.
System programmer response:  None.
Module:  readcf
Procedure name:  readcf

EZZ7588I  invalid rewrite line `"rewrite-line" (tab expected)`
Explanation:  A rewrite rule without a required tab was encountered.
rewrite-line is the line from the configuration file that caused the error.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
**Procedure name**: readcf

---

**EZZ7589I** Inappropriate use of symbol on LHS

**Explanation**: The specified symbol was used incorrectly in the left-hand side of a rewrite rule.

*symbol* is the improper symbol found.

**System action**: Program ends after completing configuration processing.

**Operator response**: Save error messages for system programmer.

**System programmer response**: Correct configuration file.

**Module**: readcf

**Procedure name**: readcf

---

**EZZ7590I** R line: null LHS

**Explanation**: A rewrite rule with an empty left-hand side was encountered.

**System action**: Program ends after completing configuration processing.

**Operator response**: Save error messages for system programmer.

**System programmer response**: Correct configuration file.

**Module**: readcf

**Procedure name**: readcf

---

**EZZ7591I** replacement $repl-number out of bounds

**Explanation**: The right-hand side of a rewrite rule contained an out-of-bounds replacement.

*repl-number* is the out-of-bounds replacement number found.

**System action**: Program ends after completing configuration processing.

**Operator response**: Save error messages for system programmer.

**System programmer response**: Correct configuration file.

**Module**: readcf

**Procedure name**: readcf

---

**EZZ7592I** Inappropriate use of symbol on RHS

**Explanation**: The specified symbol was used incorrectly in the right-hand side of a rewrite rule.

*symbold* is the improper symbol found.

**System action**: Program ends after completing configuration processing.

**Operator response**: Save error messages for system programmer.

**System programmer response**: Correct configuration file.

**Module**: readcf

**Procedure name**: readcf

---

**EZZ7593I** R line: null RHS

**Explanation**: A rewrite rule with an empty right-hand side was encountered.

**System action**: Program ends after completing configuration processing.

**Operator response**: Save error messages for system programmer.
EZZ7594I • EZZ7597I

System programmer response: Correct configuration file.
Module: readcf
Procedure name: readcf

EZZ7594I  invalid argument to V line: "version-spec"

Explanation: An invalid version line was encountered.
version-spec is the invalid version specification found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: readcf

EZZ7595I  invalid V line vendor code: "vendor-code"

Explanation: A version line with an invalid vendor code was encountered.
vendor-code is the invalid vendor code found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: readcf

EZZ7596I  unknown control line "line"

Explanation: An invalid control line was encountered.
line is the invalid line found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: readcf

EZZ7597I  I/O read error

Explanation: An error occurred while reading the configuration file.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: readcf
Procedure name: readcf
EZ7598I  too many command-char lines, limit max

Explanation: The configuration file contains too many configuration lines of the specified type.

command-char is the single character command code.

limit is the maximum number of such commands allowed.

System action: Program ends after completing configuration processing.

Operator response: Save error messages for system programmer.

System programmer response: Correct configuration file.

Module: readcf

Procedure name: toomany

EZ7599I  fileclass: cannot open filename

Explanation: The specified file does not exist, does not have proper permissions set, or is in a directory without proper permissions.

filename is the name of the file that could not be opened.

System action: Program ends after completing configuration processing.

Operator response: Verify file existence and file and directory permissions.

System programmer response: None.

Module: readcf

Procedure name: fileclass

EZ7600I  Unable to open bulletin directory 'directory'

Explanation: The bulletin directory could not be opened.

directory is the name of the bulletin directory

System action: Processing continues. (No new bulletins are delivered.)

Operator response: Verify that bulletin directory exists and has proper permissions.

System programmer response: None.

Module: pop_bull

Procedure name: pop_bull

EZ7601I  Unable to open filename

Explanation: The user's .popbull file could not be opened.

filename is the full path name of the user's .popbull file.

System action: Processing continues. (No new bulletins are delivered.)

Operator response: Verify file and directory permissions.

System programmer response: None.

Module: pop_bull

Procedure name: pop_bull
EZZ7602I  •  EZZ7607I

EZZ7602I  •  Unable to open bulletin file filename
Explanation:  The specified bulletin file could not be opened.
filename is the name of the bulletin file.
System action:  Processing continues. (Bulletins including and after the problem bulletin are not delivered.)
Operator response:  Verify file permissions.
System programmer response:  None.
Module:  pop_bull
Procedure name:  CopyOneBull

EZZ7603I  •  Bulletin filename does not start with a valid "From " separator
Explanation:  Bulletin From separator line is malformed.
filename is the name of the bulletin file.
System action:  Processing continues. (Bulletins including and after the malformed bulletin are not delivered.)
Operator response:  Correct From separator line in bulletin file.
System programmer response:  None.
Module:  pop_bull
Procedure name:  CopyOneBull

EZZ7605I  •  Unable to open temporary maildrop 'filename'
Explanation:  The specified temporary mail file could not be created.
filename is the full path name of the file that could not be opened.
System action:  Processing continues, but user is unable to successfully log in.
Operator response:  Verify the permissions for the temporary maildrop directory (/usr/mail/popper).
System programmer response:  None.
Module:  pop_dropcopy
Procedure name:  pop_dropcopy

EZZ7606I  •  Unable to open trace file "filename"
Explanation:  The specified trace file could not be opened.
filename is the name of the trace file.
System action:  Program ends.
Operator response:  Verify trace file directory and permissions.
System programmer response:  None.
Module:  pop_init
Procedure name:  pop_init

EZZ7607I  •  Unable to obtain port and IP address of client
Explanation:  Popper failed to retrieve client address information.
System action:  Program ends.
Operator response:  Verify system resources.
System programmer response:  None.
Module: pop_init
Procedure name: pop_init

EZZ7608I Unable to get canonical name of client
Explanation: Reverse DNS search for client domain name failed.
System action: Processing continues.
Operator response: Verify DNS configuration.
System programmer response: None.
Module: pop_init
Procedure name: pop_init

EZZ7611I Unable to open communication stream for input
Explanation: Popper failed to open input stream.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: pop_init
Procedure name: pop_init

EZZ7612I Unable to open communication stream for output
Explanation: Popper failed to open output stream.
System action: Program ends.
Operator response: Verify system resources.
System programmer response: None.
Module: pop_init
Procedure name: pop_init

EZZ7613I Failed attempted login to username from host host
Explanation: An attempted login from the specified host failed.
username is the name of the local user account.
host is the name of the client host.
System action: Processing continues.
Operator response: Verify that no security breach is being attempted.
System programmer response: None.
Module: pop_pass
Procedure name: pop_pass

EZZ7614I Possible probe of account username from host host
Explanation: The specified host might be checking for the existence of user accounts.
username is the name of the local user account that might have been probed.
host is the name of the client host that might have been probing.
System action: Processing continues.
Operator response: Verify that no security breach is being attempted.
System programmer response: None.
Module: pop_quit
Procedure name: pop_quit

EZZ7615I  Stats: username msg-del bytes-del msg-rem bytes-rem
Explanation: Log of statistics on user maildrop activity.
username is the name of the user for whom statistics are reported.
msg-del is the number of messages deleted from the maildrop.
bytes-del is the number of bytes deleted from the maildrop.
msg-rem is the number of messages remaining in the maildrop.
bytes-rem is the number of bytes remaining in the maildrop.
System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: pop_updt
Procedure name: pop_updt

EZZ7700I  name required for mailer
Explanation: A mailer definition with no mailer name was encountered.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7701I  mailer mailer-name: `=' expected
Explanation: The specified mailer definition is missing an expected equal sign (=).
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7702I  mailer mailer-name: empty path name
Explanation: The specified mailer definition contains an empty path name (P=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7703I**  mailer mailer-name: null end-of-line string
Explanation: The specified mailer definition contains an empty end-of-line string (E=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7704I**  mailer mailer-name: null argument vector
Explanation: The specified mailer definition contains an empty argument (A=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7705I**  mailer mailer-name: null working directory
Explanation: The specified mailer definition contains an empty working directory (D=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7706I**  mailer mailer-name: null charset
Explanation: The specified mailer contains an empty default character set (C=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer
EZZ7707I  mailer mailer-name: null user name
Explanation: The specified mailer contains an user (U=) definition with no user name.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7708I  readcf: mailer U= flag: unknown user username
Explanation: The specified mailer contains an user (U=) definition with an invalid user name.
username is the invalid user name that was found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7709I  mailer mailer-name: null group name
Explanation: The specified mailer contains an user (U=) definition with no group name.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7710I  readcf: mailer U= flag: unknown group group-name
Explanation: The specified mailer contains an user (U=) definition with an invalid group name.
group-name is the invalid group name found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

EZZ7711I  Mmailer-name: A= argument required
Explanation: The specified mailer definition does not contain required argument (A=) definition.
mailer-name is the name of the invalid mailer.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7712I** Mmailer-name: P= argument required

Explanation: The specified mailer definition does not contain required path name (P=) definition.

*mailer-name* is the name of the invalid mailer.

System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7713I** too many mailers defined (limit max)

Explanation: The configuration file contains too many mailer definitions.

*limit* is the maximum number of mailer definitions allowed.

System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: makemailer

**EZZ7714I** readcf: null option name

Explanation: An option line with no option name was encountered.

System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption

**EZZ7715I** readcf: unknown option name option

Explanation: An option line for an unknown option was encountered.

*option* is the unknown option name found.

System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption
EZZ7716I  readcf: ambiguous option name option-found (matches option1 and option2)
Explanation: An option line with an ambiguous option name was encountered.
option-found is the ambiguous option name found.
option1 is the first option name matched.
option2 is the second option name matched.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption

EZZ7717I  Unknown 8-bit mode mode-flag
Explanation: An unknown 8-bit mode specification was encountered.
mode-flag is the unknown single-character 8-bit mode specification found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption

EZZ7718I  Unknown delivery mode mode-flag
Explanation: An unknown delivery mode specification was encountered.
mode-flag is the unknown single-character delivery mode specification found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption

EZZ7719I  readcf: option option unknown group group-name
Explanation: A default group option specifying an unknown group was encountered.
option is the group option flag (g).
group-name is the unknown group name found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: setoption
EZZ7720I  readcf: I option value option_value unrecognized
Explanation:  A sendmail ResolverOptions(I) specifying an unknown value was encountered.
option_value is the unknown option value found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

EZZ7721I  readcf: Op line: option-value unrecognized
Explanation:  A privacy option specifying an unknown value was encountered.
option-value is the unknown option value found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

EZZ7722I  readcf: option u: unknown user username
Explanation:  A default user option specifying an unknown user was encountered.
username is the unknown user name that was found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

EZZ7723I  Invalid queue sort order "option-value"
Explanation:  A queue sorting order option specifying an unknown value was encountered.
option-value is the unknown option value found.
Explanation:  The configuration file contains an invalid option specification.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

EZZ7724I  Invalid NoRecipientAction: option-value
Explanation:  A NoRecipientAction option specifying an unknown value was encountered.
option-value is the unknown option value found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.

Module:  readcf
Procedure name:  setoption

**EZZ7725I  readcf: option DoubleBounceAddress: value required**
Explanation:  A DoubleBounceAddress option specifying no value was encountered.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

**EZZ7726I  readcf: option RunAsUser: unknown user username**
Explanation:  A RunAsUser option specifying an unknown user name was encountered.
_username is the unknown user name that was found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

**EZZ7727I  readcf: option RunAsUser: unknown group group-name**
Explanation:  A RunAsUser option specifying an unknown group name was encountered.
_group-name is the unknown group name found.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  setoption

**EZZ7728I  readcf: config K line: no map name**
Explanation:  A map definition with no map name was encountered.
System action:  Program ends after completing configuration processing.
Operator response:  Save error messages for system programmer.
System programmer response:  Correct configuration file.
Module:  readcf
Procedure name:  makemapentry
EZZ7729I  readcf: config K line, map map-name: no map class

Explanation: A map definition with no map class was encountered.

System action: Program ends after completing configuration processing.

Operator response: Save error messages for system programmer.

System programmer response: Correct configuration file.

Module: readcf

Procedure name: makemapentry

EZZ7730I  readcf: map map-name: class class-name not available

Explanation: A map definition with an unknown map class was encountered.

System action: Program ends after completing configuration processing.

Operator response: Save error messages for system programmer.

System programmer response: Correct configuration file.

Module: readcf

Procedure name: makemapentry

EZZ7731I  invalid ruleset name: "ruleset"

Explanation: The specified rule set name is invalid or not defined.

System action: Program ends after completing configuration processing.

Operator response: Save error messages for system programmer.

System programmer response: Correct configuration file.

Module: readcf

Procedure name: strtorwset

EZZ7732I  bad ruleset ruleset-number (limit max)

Explanation: An invalid rule set number was specified.

System action: Program ends after completing configuration processing.

Operator response: Save error messages for system programmer.

System programmer response: Correct configuration file.

Module: readcf

Procedure name: strtorwset
EZZ7733I  bad ruleset definition "ruleset" (number required after `=')
Explanation: An invalid rule set name definition was encountered.
ruleset is the name of the invalid ruleset definition.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: strtorwset

EZZ7734I  bad ruleset number ruleset-number in "ruleset" (limit max)
Explanation: A rule set name definition specifying an invalid rule set number was encountered.
ruleset-number is the invalid ruleset number found.
ruleset is the name of the invalid ruleset definition.
limit is the maximum ruleset number allowed.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: strtorwset

EZZ7739I  ruleset exceeds the maximum ruleset number max
Explanation: The configuration file defines too many named rule sets.
ruleset is the name of the problem ruleset.
max is the maximum number of named rulesets allowed.
System action: sendmail ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file so that no more than the maximum number of rulesets are used.
Module: readcf
Procedure name: strtorwset

EZZ7735I  ruleset: ruleset changed value (old ruleset-num1, new ruleset-num2)
Explanation: The configuration file contains conflicting rule set name definitions.
ruleset is the name of the invalid ruleset definition.
ruleset-num1 is the first ruleset number associated with the named ruleset.
ruleset-num2 is the second ruleset number associated with the named ruleset.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: strtorwset
EZZ7736I settimeout: invalid queuewarn subtimeout priority
Explanation: A queuewarn timeout option specifying an invalid priority was found.
priority is the unknown priority name found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: settimeout

EZZ7737I settimeout: invalid queuereturn subtimeout priority
Explanation: A queuereturn timeout option specifying an invalid priority was found.
priority is the unknown priority name found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: settimeout

EZZ7738I settimeout: invalid timeout option
Explanation: An invalid timeout option was encountered.
option is the unknown timeout option name found.
System action: Program ends after completing configuration processing.
Operator response: Save error messages for system programmer.
System programmer response: Correct configuration file.
Module: readcf
Procedure name: settimeout

EZZ7800I jobname starting
Explanation: The OMPROUTE application is starting.
In the message text:
jobname
The job name of the OMPROUTE application.
System action: None.
Operator response: None.
System programmer response: None.
Module: OMPROUTE
Example:
EZZ7800I OMPROUTE starting
Procedure name: main
EZZ7801I Deleting stack route to destination, masktype mask/prefix via gateway, link link, metric metric, type routetype, table table

Explanation: OMPROUTE is deleting the specified route from the specified stack route table. This is a route that OMPROUTE discovered using the OSPF or RIP protocol or as the result of a directly connected interface. The route is no longer available.

In the message text:

destination
  The IP address of the route destination.

masktype
  Possible values for masktype are:

  mask
    If the route is an IPv4 route.

  prefixlen
    If the route is an IPv6 route.

mask/prefix
  The destination's subnet mask, if the route is an IPv4 route. If the route is an IPv6 route, this is the destination's prefix length.

gateway
  The IP address of the route's gateway.

link
  The name of the route's outgoing interface.

metric
  The route's metric.

routetype
  A numeric value indicating the type of route. Possible values are:

  1    Direct route

  129  Indirect host route

  130  Indirect subnet route

  132  Indirect network route

  136  Default route

table
  The name of the route table from which the stack route is deleted. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: OMPROUTE continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: ezaormup or eza6rmup

Routing code: 10

Descriptor code: 12

Example:
EZZ7801I Deleting stack route to 9.9.9.0, mask 255.255.255.0 via 0.0.0.0, link OSA1, metric 1, type 1, table EZBMAIN
**EZZ7802I**  *jobname invalid option specified: option*

**Explanation:** An unsupported command-line option was used.

In the message text:

*jobname*

The job name of the OMPROUTE application.

*option*

The invalid option.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** Verify command line options used when OMPROUTE was started and try again.

**Module:** OMPROUTE

**Example:**

EZZ7800I OMPROUTE starting

---

**EZZ7803I**  *jobname, function errno=errnodescription, errno2=errnojr*

**Explanation:** The indicated function failed with the indicated error.

In the message text:

*jobname*

The job name of the OMPROUTE application.

*errno*

The z/OS UNIX System Services return code. These return codes are listed and described in the [return codes](https://www.ibm.com/support/docview.ws/docview/49639) information in z/OS UNIX System Services Messages and Codes.

*description*

Describes the error.

*errnojr*

The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the [reason codes (errnojrs)](https://www.ibm.com/support/docview.ws/docview/49639) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** Correct the system error reported.

**Module:** many

---

**EZZ7804I**  *jobname exiting*

**Explanation:** The OMPROUTE application is exiting normally.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** Restart OMPROUTE if required.

**Module:** OMPROUTE

**Procedure name:** ocleanup
EZZ7805I  jobname exiting abnormally - RC(returncode)

Explanation: The application is exiting abnormally with the specified return code.

In the message text:

jobname
The job name of the OMPROUTE application.

returncode
Possible values for returncode are:

1  Exited due to unrecoverable error.
3  Exited due to receipt of terminating signal.
4  Exited due to invalid startup parameter passed to OMPROUTE.
5  Exited due to failure to add route to TCP/IP stack's route table.
6  Exited due to failure to obtain storage using malloc.
7  Exited due to the TCP/IP stack going down, or the TCP/IP stack is storage constrained, or the TCP/IP stack is otherwise unavailable.
8  Exited while initializing the PSA environment.
9  Exited while initializing the log/trace facility.
10 Exited due to OMPROUTE not being APF authorized.
11 Exited while initializing the IPv4 OSPF and INFORMATIONAL sockets.
12 Exited while configuring the OMPROUTE application.
13 Exited while obtaining the TCP/IP stack's IPv4 route table.
14 Exited while initializing the IPv4 RIP protocol.
15 Exited while initializing the IPv4 OSPF protocol.
16 Exited while dynamically adding an IPv4 OSPF interface.
17 Exited due to failure to delete route from TCP/IP stack's route table.
18 Exited due to failure to change route in TCP/IP stack's route table.
19 Exited while initializing the IPv4 RIP socket.
20 Exited due to failure to update TCP/IP stack's BSD Routing Parameters.
21 Exited due to error establishing thread attributes.
22 Exited while attempting to start subagent thread.
23 Exited because of inability to originate an IPv4 router LSA. For more information about this condition, see the information about dynamic VIPAs and routing protocols in z/OS Communications Server: IP Configuration Guide.
24 Exited due to unrecoverable error in control block reuse code.
25 Exited while initializing the IPv6 RIP socket.
26 Exited while obtaining the TCP/IP stack's IPv6 route table.
27 Exited while initializing the IPv6 RIP protocol.
28 Exited while attempting to start IPv6 thread.
29 Exited while attempting to start Informational Socket thread.
30 Exited while initializing socket for IOCTL calls.
31 Exited while initializing the OMPROUTE heartbeat.
32 Exited while initializing the IPv6 OSPF protocol.
Exited while dynamically adding an IPv6 OSPF interface.
Exited while initializing the IPv6 OSPF sockets.
Exited because of inability to originate an IPv6 OSPF LSA.
Exited because of inability to translate MVS system symbols in the configuration file.
Exited because a duplicate ROUTERID is detected.

System action: OMPROUTE ends.
Operator response: None.
System programmer response: Take necessary corrective action based upon specified return code and any preceding messages indicating the cause of the abnormal exit. Restart OMPROUTE if required.

Module: OMPROUTE

EZZ7806I Changing stack route to destination, masktype mask/prefix via gateway, link link, metric metric, type routetype, table table

Explanation: OMPROUTE is updating information about a route in the specified stack route table. This is a route that OMPROUTE discovered using the OSPF or RIP protocol or as the result of a directly connected interface. The characteristics of the route (for example, metric) have changed.

In the message text:

- destination
  The IP address of the route destination.
- masktype
  Possible values are:
  - mask
    The route is an IPv4 route.
  - prefixlen
    The route is an IPv6 route.
- mask/prefix
  The destination’s subnet mask, if the route is an IPv4 route. If the route is an IPv6 route, this is the destination’s prefix length.
- gateway
  The IP address of the route’s gateway.
- link
  The name of the route’s outgoing interface.
- metric
  The route’s metric.
- routetype
  A numeric value indicating the type of route. Possible values are:
  - 1 Direct route
  - 129 Indirect host route
  - 130 Indirect subnet route
  - 132 Indirect network route
  - 136 Default route
- table
  The name of the route table in which the stack route is changed. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: OMPROUTE continues.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORMUP, EZA6RMUP
Routing code: 10
Descriptor code: 12
Example:
EZZ7806I Changing stack route to 9.9.9.8, mask 255.255.255.252 via 0.0.0.0, link OSA1, metric 110, type 1, table EZBMAIN

Abnormal termination - out of storage
Explanation: OMPROUTE requested storage for a control block or buffer and that request failed.
System action: OMPROUTE ends.
Operator response: None.
System programmer response: Resolve the storage shortage.
Module: OMPROUTE

Could not determine TCPIP jobname, using default of 'INET'
Explanation: The TCPIPjobname parameter was not found in the resolver configuration file so the default
JOBNAME of 'INET' is used. This value is ignored in a single-stack environment.
System action: OMPROUTE continues, using the default JOBNAME of 'INET'.
Operator response: None.
System programmer response: In a CINET environment, ensure that the RESOLVER_CONFIG file that OMPROUTE
points to contains the job name of the TCP/IP stack that you want OMPROUTE to attach to.
Module: EZAORINI

outputstring
Explanation: Used for displaying responses to the DISPLAY command.
System action: None.
Operator response: None.
System programmer response: None.
Module: SPFCFG, EZA6RSXF

Route not deleted from stack routing table - reason, table table
Explanation: A dynamic route was not deleted from the specified stack routing table for the specified reason.
In the message text:
reason
A description of why the route was not deleted from the stack routing table. The only possible value is:
route doesn't exist
The route was not deleted from the stack routing table because the route was not found.
table
The name of the route table from which the route was not deleted. The table value will be either EZBMAIN (for
the main route table) or the name of a policy-based route table.
System action: OMPROUTE continues.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE

**EZZ7811I** Could not establish affinity with TCPIPjobname, **errno=**errnodescription, **errno2=**errnojr

Explanation: An attempt to establish affinity with the specified TCP/IP stack failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: OMPROUTE ends.
Operator response: None.
System programmer response: Correct the system error reported. A possible cause is the TCP/IP stack name being incorrectly specified in the resolver configuration file.
Module: EZAORINI

**EZZ7812I** Could not obtain stack interface flags, ioctl **errno=**errnodescription, **errno2=**errnojr

Explanation: An attempt to obtain the flags for a TCP/IP interface failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action: OMPROUTE ends.
Operator response: None.
System programmer response: Possible internal error. Contact the IBM software support center.
Module: EZAORCFG

**EZZ7813I** Could not obtain stack interface broadcast address, ioctl **errno=**errnodescription, **errno2=**errnojr

Explanation: An attempt to obtain the broadcast address for a TCP/IP interface failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.
_errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: None.

Operator response: None.

System programmer response: Possible internal error. Contact the IBM software support center.

Module: EZAORCFG

---

**EZZ7814I**  
Unable to create socket type *type*, errno=errno, description, errno2=errnojr

Explanation: An attempt to create a socket of the specified type failed with the specified error.

_errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the_errno.

_errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Attempt to correct the system error reported. A possible cause is the TCP/IP stack not being started. If problem persists, there is a possible internal error, contact the IBM software support center.

Module: EZAORINI, EZAORRTI, EZAORYAC, EZA6RINI

---

**EZZ7815I**  
Socket socket bind to port *port*, address *address* failed, errno=errno, description, errno2=errnojr

Explanation: An attempt to bind to the specified port failed with the specified error.

_errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the_errno.

Module: EZAORINI

EZZ7819I Invalid value for keyword coded on type statement

Explanation: The value coded for the specified keyword on the specified configuration statement in the
OMPROUTE configuration file was invalid.
System action: If the keyword does not have a default value, or the keyword is ATTACHES_TO_AREA on the
OSPF_INTERFACE statement, OMPROUTE ends. Otherwise, the default is taken.
Operator response: None.
System programmer response: Correct the value coded for the specified keyword in the OMPROUTE configuration file.
Module: EZAORCFG, EZAORYAC, EZA6RCFG

EZZ7820I Required parameter for keyword not coded on type statement

Explanation: A required keyword for which no default can be taken was not coded on the specified configuration
statement in the OMPROUTE configuration file.
System action: OMPROUTE ends.
Operator response: None.
System programmer response: Add the required keyword to the appropriate configuration statement in the
OMPROUTE configuration file.
Module: EZAORYAC
EZZ7821I Ignoring duplicate type statement for identifier

Explanation: Found a duplicate of the specified configuration statement in the OMPROUTE configuration file. This message will also be seen during RECONFIG processing as OMPROUTE processes interface statements that were previously configured to it.

type is the type of statement or statement parameter for which a duplicate was found.

identifier is additional information to help determine which statements are duplicated.

System action: The duplicate statement is ignored.

Operator response: None.

System programmer response: Remove the duplicate statement from the OMPROUTE configuration file.

Module: EZAORCFG, EZAORYAC, EZA6RCFG

EZZ7822I Could not find configuration file

Explanation: The OMPROUTE configuration file could not be found. The OMPROUTE configuration file used the following search order:

1. The MVS data set or z/OS UNIX file that was specified on the OMPCFG DD statement in the OMPROUTE started procedure
2. The MVS data set or z/OS UNIX file that was specified by the OMPROUTE_FILE environment variable
3. /etc/omproute.conf
4. hlq.ETC.OMPROUTE.CONF

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Check the search order for the existence of the OMPROUTE configuration file. Code the configuration file if one does not exist. For more information, see Steps for configuring OMPROUTE in z/OS Communications Server: IP Configuration Guide.

Module: EZAORYAC

EZZ7825I jobname unrecoverable error (error)

Explanation: OMPROUTE is exiting as a result of the specified unrecoverable error.

In the message text:

jobname
    The job name of the OMPROUTE application.

error
    The error that caused OMPROUTE to exit.

System action: OMPROUTE exits.

Operator response: None.

System programmer response: Possible internal error. Contact the IBM software support center.

Module: LOGTRACE

EZZ7826I Unable to accept connections on socket socket, errno=errnodescription, errno2=errnojr

Explanation: An attempt to accept a connection on the specified socket failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained...
in the introduction to the reason codes (errnojrs) information of the Z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Possible internal error. Contact the IBM software support center.

Module: EZAORINI

| EZZ7827I | Adding stack route to destination, masktype mask/prefix via gateway, link link, metric metric, type routetype, table table |

Explanation: OMPROUTE is adding the specified route to the specified stack route table. This route might have been discovered using OSPF or RIP protocols or might be the result of a directly connected interface.

In the message text:

destination  
The IP address of the route destination.

masktype  
Possible values are:

mask  
The route is an IPv4 route.

prefixlen  
The route is an IPv6 route.

mask/prefix  
The destination's subnet mask, if the route is an IPv4 route. If the route is an IPv6 route, this is the destination's prefix length.

gateway  
The IP address of the route's gateway.

link  
The name of the route's outgoing interface.

metric  
The route's metric.

routetype  
A numeric value indicating the type of route. Possible values are:

1  
Direct route

129  
Indirect host route

130  
Indirect subnet route

132  
Indirect network route

136  
Default route

table  
The name of the route table in which the stack route is added. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: OMPROUTE continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORMUP, EZA6RMUP
EZ7828I

Routing code: 10
Descriptor code: 12
Example:
EZ7827I Adding stack route to 9.9.9.0, mask 255.255.255.252 via 9.9.9.1, link OSA1,
metric 2, type 130, table EZBMAIN

EZ7828I Error adding/deleting/changing version stack route, return code retcode, ioctl errno=errno, description(errnojr), table table

Explanation: An attempt to add, delete, or change a route of the specified IP version in the specified stack route table failed for the specified reason.

In the message text:

version
   The IP version of the route for which the update failed. Possible values are IPv4 or IPv6.

retcode
   The ioctl return code.

errno
   The z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.

description
   Describes the meaning of the errno.

errnojr
   The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

table
   The name of the route table in which there was an error adding, deleting, or changing a stack route. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: Depending on the type and severity of the error, OMPROUTE might terminate or continue processing. For system errors, OMPROUTE ends. If OMPROUTE determines that the error is only for a particular route, it continues processing.

Operator response: Determine whether the error is caused by a bad router or other network error. Correct the failing device.

System programmer response: If OMPROUTE ends, review the error code description to determine the cause of the problem.

User response: Not applicable.

Problem determination: Not applicable.

EZZ7830I error at line line of jobname configuration file processing token

Explanation: The specified error occurred while parsing the specified line in the OMPROUTE configuration file. The error was encountered on or just previous to the specified token.

In the message text:

error
The type of error that occurred while parsing the specified line.

line
The line on which the error occurred.

jobname
The job name of the OMPROUTE application.

token
The token that was being processed by the parser when the error occurred.

System action: OMPROUTE ends.
Operator response: Contact the system programmer.
System programmer response: Correct the error in the OMPROUTE configuration file. See z/OS Communications Server: IP Configuration Reference for more information about how to correctly code statements in the OMPROUTE configuration file. If using symbol translation in the OMPROUTE configuration file in the specified line, ensure that all symbols are defined correctly in the IEASYMxx PARMLIB member. If INCLUDE files were processed as part of the OMPROUTE configuration file, use debug level d1 or higher to print a copy of the expanded configuration file to your OMPROUTE trace to help to identify the correct line number where the syntax error was found.

User response: Not applicable.
Problem determination: See the system programmer response.

Explanation:  This message precedes the display of the OMPROUTE OSPF non-broadcast, multi-access configuration in response to the OSPF,LIST,NBMA display command.
System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  SPFCFG

EZZ7836I  Virtual link configuration
Explanation:  This message precedes the display of the OMPROUTE OSPF virtual links configuration in response to the OSPF,LIST,VLINKS display command.
System action:  None.
Operator response:  None.
System programmer response:  None.
User response:  Not applicable.
Problem determination:  Not applicable.
Source:  z/OS Communication Server TCP/IP other application
Module:  SPFCFG
Routing code:  Not applicable.
Descriptor code:  Not applicable.
Example:  See the configured OSPF virtual links information in z/OS Communications Server: IP System Administrator's Commands for an example of this message.

EZZ7837I  Could not obtain stack interface index, ioctl errno=errno
description=errno2=errnoj
Explanation:  The attempt to obtain the list of interfaces defined to the TCP/IP stack failed with the specified error.
errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes
description describes the meaning of the errno.
errnoj is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.
System action:  OMPROUTE ends.
Operator response:  If the errno=description value is 1122:No buffer space available, then OMPROUTE is being started at a time when the stack's interface list is increasing quickly and significantly. This might be because the stack is taking over large numbers of dynamic VIPAs, or is processing a large profile. If you receive this errno, wait until the local configuration stabilizes and then restart OMPROUTE.
System programmer response:  If this message was not caused by the scenario described in the User response, contact the IBM software support center.
Module:  EZAORCFG, EZA6RCFG
EZZ7838I  Using configuration file: filename

Explanation: The specified configuration file is being used to configure OMPROUTE.
System action: None.
Operator response: None.
System programmer response: None.
Module: EZAORYAC

EZZ7839I  type receive thread ends

Explanation: The specified OMPROUTE thread is terminating. Communications over this thread are terminated.
System action: OMPROUTE ends.
Operator response: None.
System programmer response: Actions determined by preceding messages indicating the cause of the thread termination.
Module: EZAORIRT, EZAORMFY, EZAORORT, EZAORRRT, EZA6RRRT, EZA6RORT

EZZ7840I  sendto() error, errno=errno, description, errno2=errnojr

Explanation: The indicated error occurred while attempting to send a packet of data to an adjacent router.
errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
description describes the meaning of the errno.
errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.
System action: If error is due to TCP/IP stack going down, OMPROUTE ends.
Operator response: None.
System programmer response: This might be a temporary condition caused by the fact that informational socket packets have not yet been processed. If this message appears repeatedly, contact the IBM software support center.
Module: INRIPOUT

EZZ7841I  type receive socket closed unexpectedly

Explanation: A TCPIP socket used for communications by OMPROUTE closed or timed out.
System action: OMPROUTE ends.
Operator response: None.
System programmer response: Investigate possible problems with TCPIP. Restart OMPROUTE.
Module: EZAORIRT

EZZ7842I  type function error, errno=errno, description, errno2=errnojr

Explanation: The indicated function failed with the indicated error. errno is the system error code.
errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
description describes the meaning of the errno.
errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.
System action: If the error is due to the TCP/IP stack going down, OMPROUTE ends. Otherwise, processing continues.

Operator response: None.

System programmer response: Correct the system error reported.

Module: EZAORIRT, EZAORORT, EZAORRRT, EZA6RRRT, EZA6RORT

---

EZZ7843I RIP Configuration

Explanation: This message precedes the display of the OMPROUTE RIP configuration in response to the RIP,LIST,ALL display command.

System action: None.

Operator response: None.

System programmer response: None.

Module: INRPCNFG

---

EZZ7844I RIP Route Acceptance

Explanation: This message precedes the display of the OMPROUTE RIP route acceptance configuration in response to the RIP,LIST,ACCEPTED display command.

System action: None.

Operator response: None.

System programmer response: None.

Module: INRPCNFG

---

EZZ7845I Established affinity with TCPIPjobname

Explanation: OMPROUTE established affinity with the specified TCP/IP stack.

System action: None.

Operator response: None.

System programmer response: None.

Module: EZAORINI

---

EZZ7846I Established affinity with single stack (Common INET is not defined)

Explanation: OMPROUTE always binds itself to a specific stack. This is determined by the TCPIPjobname parameter in the resolver configuration file. The resolver configuration file is found according to the search order described in z/OS Communications Server: IP Configuration Reference.

System action: None.

Operator response: None.

System programmer response: None.

Module: EZAORINI

---

EZZ7847I Routing Table

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator’s Commands.

System action: None.

Operator response: None.

System programmer response: None.

Explanation: An OSPF packet, intended for the specified destination, is being discarded due to the lack of an active interface to the destination.
System action: None.
Operator response: None.
System programmer response: None.
Module: NBMA, EZA6RNBM

---

**EZ7862I** Received type interface name

Explanation: OMPROUTE learned of a status change of the specified type for the specified TCP/IP interface.
System action: OMPROUTE makes any necessary changes to its processing based upon the status change. Also, any necessary changes are made to routes that use this interface.
Operator response: None.
System programmer response: None.
Module: EZAORMII, EZA6RMII

---

482 *z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZ7, SNM)*
EZ7863I  Received type route to destination, table table

Explanation:  There was a status change to the specified route, which was defined using a TCPIP BEGINROUTES or GATEWAY statement, defined to Policy Agent for a policy-based route table, or learned from the IPv6 Router Discovery protocol.

In the message text:

  type
  The type of status change for the route. Possible values are:
    update  The route was updated.
    delete  The route was deleted.

  destination
  The IP address of the destination for which a status change was received.

  table
  The name of the route table in which the status of the route has changed. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action:  OMPROUTE makes any necessary changes to its internal route table based upon the status change.

Operator response:  None.

System programmer response:  None.

User response:  Not applicable.

Problem determination:  Not applicable.

Source:  z/OS Communications Server TCP/IP: OMPROUTE

Module:  EZAORMII, EZA6RMII

Routing code:  10

Descriptor code:  12

Example:
EZ7863I Received update route to 10.0.0.0 , table EZBMAIN

EZ7864I  Deleting all stack routes to destination, type mask/prefix, table table

Explanation:  OMPROUTE is deleting routes from the specified TCP/IP stack route table because none of the routes to the specified destination exist anymore.

In the message text:

  destination
  The IP address of the destination for which stack routes are being deleted.

  type
  Possible values are:
    mask    The destination is an IPv4 destination.
    prefixlen  The destination is an IPv6 destination.

  mask/prefix
  The destination's subnet mask, if the route is an IPv4 route. If the route is an IPv6 route, this is the destination's prefix length.

  table
  The name of the route table from which all routes to the destination are being deleted. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action:  OMPROUTE continues.

Operator response:  None.
EZ7865I • EZ7867I

System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORMUP, EZA6RMUP
Routing code: 10
Descriptor code: 12
Example:
EZ7864I Deleting all stack routes to 10.0.0.0, mask 255.0.0.0, table EZBMAIN

EZ7865I Class mask class_mask being used for interface interface

Explanation: The specified interface was not configured in the OMPROUTE configuration file using an
OSPF_Interface, RIP_Interface, or Interface configuration statement. Therefore, a default mask is being used based
upon the network class.
System action: The default (class) mask is used for the interface. The network that can be accessed with this
interface is computed by ANDing the interface address with this mask. A route to the resulting network (by using
this interface) is added to the TCP/IP stack's route table.
Operator response: None.
System programmer response: If the specified mask is not required for the specified interface, modify the
OMPROUTE configuration file to add an OSPF_Interface, RIP_Interface, or Interface configuration statement for the
interface.
Module: INCONF

EZ7866I jobname MODIFY command accepted

Explanation: A MODIFY command was received by OMPROUTE.
In the message text:
jobname
The job name of the OMPROUTE application.
System action: The MODIFY command is processed.
Operator response: None.
System programmer response: None.
Module: EZAORYAC, SPFCON, EZAORRTI, EZA6RSXF

EZ7867I Invalid type value specified on jobname console command

Explanation: An invalid value of the specified type was entered on a DISPLAY or MODIFY command received by
OMPROUTE.
In the message text:
type
The type of the invalid value.
jobname
The job name of the OMPROUTE application.
System action: The DISPLAY or MODIFY command is ignored.
Operator response: None.
System programmer response: Verify the syntax of the DISPLAY or MODIFY command and reissue.
Module: EZAORYAC, INCON, INRPCON, SPFCON, EZA6RINC, EZA6RIN0, EZA6RSXF

EZZ7868I  Dead Router and DB_Exchange Intervals must be greater than Hello Interval on "type" statement, using defaults

Explanation: A configuration statement of the specified type was encountered in the OMPROUTE configuration file on which either the Dead Router Interval or the DB Exchange Interval is less than or equal to the Hello Interval. This is an invalid configuration.

System action: OMPROUTE continues, using the default values for Dead Router Interval, DB Exchange Interval, and Hello Interval for the interface. The OMPROUTE display command (DISPLAY TCPIP,tcipjobname,OMPROUTE,OSPF,LIST,type or DISPLAY TCPIP,tcipjobname,OMPROUTE,IPV6OSPF,type, where type=INTERFACES or VLINKS) can be used to determine the default values.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file to increase either the Dead Router Interval or the DB Exchange Interval, or decrease the Hello Interval. See the z/OS Communications Server: IP Configuration Reference descriptions of the OSPF configuration statements.

Module: EZAORYAC

EZZ7869I  jobname configuration file must contain OSPF or RIP interface statements

Explanation: OMPROUTE found no OSPF_Interface, RIP_Interface, IPv6_RIP_Interface, or IPv6_OSPF_Interface configuration statements in the OMPROUTE configuration file.

In the message text:

jobname  The job name of the OMPROUTE application.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file, adding the appropriate OSPF_Interface, RIP_Interface, IPv6_RIP_Interface, IPv6_OSPF_Interface, or all four configuration statements.

Module: EZAORCFG

EZZ7870I  OSPF and RIP interface statements for ipad (name) have different values for kwrd

Explanation: OMPROUTE found conflicting keyword values on the configuration interface statements (OSPF_Interface, RIP_Interface, or Interface). The specified IP address and interface name have a different value on the specified keyword. This is an invalid configuration. For example, an OSPF_INTERFACE and RIP_INTERFACE statement for the same actual interface specify different MTU sizes.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file to correct the problem.

Module: EZAORCFG

EZZ7871I  No matching interface statements for ipad (name)

Explanation: No matching OSPF_Interface, RIP_Interface, Interface, IPv6_OSPF_Interface, IPv6_RIP_Interface, or IPv6_Interface statement was found for the specified TCP/IP interface.

System action: OMPROUTE continues. The specified interface will not be used by the OSPF and RIP protocols. Also, if the interface is an IPv4 interface, the class mask will be used in calculating the network route to be added to the route table.

Operator response: None.

System programmer response: If you want OMPROUTE to ignore the specified interface and all other undefined
interfaces, then add the value GLOBAL_OPTIONS ignore_undefined_interfaces=yes to the OMPROUTE configuration file. If you want the specified interface to be used by the OSPF or RIP protocol or both, modify the OMPROUTE configuration file to add an OSPF_Interface, RIP_Interface, IPv6_OSPF_Interface or IPv6_RIP_Interface configuration statement. Otherwise, add an Interface configuration statement (if the interface is an IPv4 interface and the class mask should not be used in calculating the network route to be added to the route table) or an IPv6_Interface configuration statement (if the interface is an IPv6 interface and prefix routes need to be added to the route table for the interface). If you are using a wild card value or an explicit interface definition, see the parsing rules described in method of assigning interface definitions to stack interfaces (wildcard and explicit) in [IP Configuration Guide].

Module: EZAORCFG, EZA6RCFG

EZZ7872I  jobname found another routing application already active

Explanation: OMPROUTE was unable to allocate required TCP/IP resources. These resources are only used by routing applications and in most cases it is the ENQ resource that is inaccessible. Another instance of OMPROUTE or another routing application is running on the TCP/IP stack.

In the message text:

jobname
  The job name of the OMPROUTE application.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Stop the active routing application and restart OMPROUTE.

Tip: Identify which routing application is holding the ENQ resource on MAJOR NAME: SYSZTCPI and MINOR NAME: TCPIP:ROUTEMGR.TCPIP. An RMF™ report can be executed for the lists of jobs currently holding the ENQ resource.

Module: EZAORINI

EZZ7873I  Required parameter parm missing on jobname DISPLAY command

Explanation: The specified required parameter was not provided on a DISPLAY command received by OMPROUTE.

In the message text:

parm
  The parameter that was not specified.

jobname
  The job name of the OMPROUTE application.

System action: The DISPLAY command is ignored.

Operator response: None.

System programmer response: Verify the syntax of the DISPLAY command and reissue.

Module: EZAORYAC

EZZ7874I  Route Expansion

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in [IP System Administrator's Commands].

System action: None.

Operator response: None.

System programmer response: None.

Module: INCON
**EZ7875I** No `version` default route installed for table `table`

**Explanation:** No default route of the specified version was installed in the specified stack route table. If a default route was configured in the OMPROUTE configuration file, this message is probably caused by the outgoing interface for that route being inactive.

In the message text:

- `version`: The IP version for which no default route was installed. Possible values are IPv4 or IPv6.
- `table`: The name of the route table in which no default route was installed. The `table` value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** OMPROUTE continues with no default route installed.

**Operator response:** Contact the system programmer.

**System programmer response:** If you want to have a default route active, modify the OMPROUTE configuration file to include a default route. If a default route is already configured in the OMPROUTE configuration file, activate the next hop interface specified on the default route. See the information about common configuration statements for RIP and OSPF in z/OS Communications Server: IP Configuration Reference for more information about configuring a default route to OMPROUTE.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORRTI, EZA6RRTI

**Routing code:** 10

**Descriptor code:** 12

**Example:**

`EZ7875I` No IPv4 default route installed for table EZBMAIN

---

**EZ7876I** `-- protocol: Packet Sent ------ Type type version`

**Explanation:** A packet, of the specified type and version, was sent by the specified protocol.

**System action:** None.

**EZ7878I** `formatstring`

**Explanation:** Used for displaying formatted packet output.

**System action:** None.

**Operator response:** None.
System programmer response: None.
Module: SPF, EZA6RSPF

**EZZ7879I**  
reason multicast group group on interface interface

Explanation: OMPROUTE is joining or leaving the specified multicast group on the specified interface. These groups are used for RIPv2, OSPF, IPv6 RIP, and IPv6 OSPF protocols.
System action: None.
Operator response: None.
System programmer response: None.
Module: H390MCAS, EZA6RH30

**EZZ7880I** LSA Details

Explanation: This message is produced in response to a DISPLAY TCPIP,,OMPROUTE command. See the [DISPLAY TCPIP,,OMPROUTE command](https://publib.boulder.ibm.com/infocenter/zos/v2r1/ptref/index.jsp?topic=/com.ibm.zos.v2r1.doc/TOCPRT3.html) in *z/OS Communications Server: IP System Administrator's Commands*.
System action: None.
Operator response: None.
System programmer response: None.
Module: SPFCON

**EZZ7881I** field required for point to point link name

Explanation: OMPROUTE found a RIP_Interface configuration statement for the specified interface, which is a point-to-point link configured for RIPv1. The specified keyword is required on this statement and it was not provided.
System action: OMPROUTE ends.
Operator response: None.
System programmer response: Modify the OMPROUTE configuration file, adding the required keyword.
Module: EZAORCFG

**EZZ7882I** Processing static route from stack, destination dest, type mask/prefix, gateway gw, table table

Explanation: The specified route is one of the following:
- Defined using a TCPIP BEGINROUTES or GATEWAY statement.
- Defined to Policy Agent for a policy-based route table.
- Learned from the IPv6 Router Discovery protocol.

In the message text:

dest  
The IP address of the static route destination.

type  
The possible values are:

- mask  
  If the route is an IPv4 route.
- prefix  
  If the route is an IPv6 route.

mask/prefix  
The destination's subnet mask, if the route is an IPv4 route. If the route is an IPv6 route, this is the destination's prefix length.

gw  
The IP address of the route's gateway.
The name of the route table in which the static route is processed. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** OMPROUTE will add the route to its internal route table.

**Operator response:** None.

**System programmer response:** If dynamic XCF is being used, the stack will automatically generate static routes to the XCF partners. If the specified route is one of these routes, no system programmer response is needed. If this route is defined using a TCPIP BEGINROUTES or GATEWAY statement, remove this BEGINROUTES or GATEWAY statement while using OMPROUTE, if possible. This will allow OMPROUTE to dynamically learn and manage the route.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORRTI, EZA6RRTI

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZZ7882I Processing static route from stack, destination 172.16.1.0, mask 255.255.255.0, gateway 0.0.0.0, table EZBMAIN

---

**EZZ7883I**  Processing interface from stack, address *addr*, name *name*, index *index*, flags *flags*

**Explanation:** The specified interface is defined to the TCP/IP stack. OMPROUTE learned of this interface during initialization.

*flags* are the interface capability flags and are a hexadecimal sum of the following values:

- **0X'01'** The interface is up.
- **0X'02'** The interface is broadcast capable.
- **0X'04'** The interface driver is in debug mode.
- **0X'08'** The interface is in loopback only mode.
- **0X'10'** The interface is a Point-to-Point interface.
- **0X'20'** The interface does not support Trailer encapsulation.
- **0X'40'** The interface is running.
- **0X'80'** The interface is ARP incapable.
- **0X'100'** The interface is in promiscuous mode.
- **0X'200'** The interface is receiving all multicast packets.
- **0X'400'** The interface is multicast capable.
- **0X'800'** The interface is point-to-multipoint.
- **0X'1000'** The interface supports Token Ring bridging.
- **0X'2000'** The interface supports extended SAP.
- **0X'4000'** The interface is a VIPA.

For example, an active VIPA interface often appears as 4041 (0x4000 + 0x40 + 0x01).
**Note:** These interface flag values are set by the TCP/IP stack and passed to OMPROUTE.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAORCFG

---

**EZZ7884I RouterID id not a configured OSPF interface**

**Explanation:** OMPROUTE found the RouterID configuration statement in the OMPROUTE configuration file. The specified ID is not a configured OSPF interface.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** In the OMPROUTE configuration file, specify a configured OSPF interface that is not a dynamic VIPA as the router ID, and restart OMPROUTE.

**Module:** SPFCONF

---

**EZZ7885I Route not added to stack routing table - reason, table**

**Explanation:** A dynamic route was not added to the specified stack routing table for the specified reason.

In the message text:

- **reason**
  - The reason that the route was not added to the stack routing table. Possible values are:
    - **static route exists**
      - The static route to the destination already exists and cannot be replaced by a dynamic route.

- **table**
  - The name of the route table to which the stack route was not added. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** OMPROUTE continues.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORMUP, EZA6RMUP

**Routing code:** 10

**Descriptor code:** 12

**Example:**

---

**EZZ7886I Not connected to area specified on jobname DISPLAY command**

**Explanation:** An OMPROUTE DISPLAY command was received that contains the specified area ID. There are no interfaces configured as being attached to this area ID.

In the message text:

- **jobname**
  - The job name of the OMPROUTE application.

**System action:** The DISPLAY command is ignored.

---

490 z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
Operator response: None.
System programmer response: Reenter the DISPLAY command with a corrected area id.
Module: SPFCON, EZA6RSXF

**EZ7887I**  
jobname is not APF authorized

Explanation: An attempt was made to start the OMPROUTE application, but the application is not APF authorized. APF authorization is required to execute OMPROUTE.

In the message text:

jobname
The job name of the OMPROUTE application.

System action: OMPROUTE ends.
Operator response: None.
System programmer response: APF authorize the OMPROUTE application.
Module: OMPROUTE

**EZ7888I**  
one statement ignored, conflicts with previous two statement

Explanation: OMPROUTE found a configuration statement in the OMPROUTE configuration file that conflicts with a previous configuration statement.

System action: OMPROUTE continues, ignoring the specified configuration statement.
Operator response: None.
System programmer response: Modify the OMPROUTE configuration file to resolve the conflict.
Module: EZAORYAC

**EZ7889I**  
msgstring

Explanation: Used for displaying the results of CTRACE initialization. A zero return code and reason code indicates that initialization completed successfully.

System action: None.
Operator response: None.
System programmer response: If CTRACE did not complete successfully, resolve cause of error.
Module: OMPROUTE

**EZ7890I**  
kwd ignored when stmt statement is a wildcard

Explanation: OMPROUTE found the specified wildcard statement in the OMPROUTE configuration file with the specified keyword provided. This keyword is meaningless when the statement is a wildcard.

System action: OMPROUTE continues, ignoring the keyword provided.
Operator response: None.
System programmer response: Modify the OMPROUTE configuration file, removing the superfluous keyword.
Module: EZAORYAC

**EZ7891I**  
Multiple stmt statements for subnet sub have kwd coded as primary

Explanation: OMPROUTE found more than one of the specified configuration statement in the OMPROUTE configuration file for the specified subnet. Each of these statements has the specified keyword coded as "primary".

System action: OMPROUTE continues, ignoring the "primary" setting on all but one of the configuration statements.
Operator response: None.

Chapter 7. EZ7xxxx messages 491
System programmer response: Modify the OMPROUTE configuration file, ensuring that only one of the statements for the specified subnet have the specified keyword coded as 'primary'.

Module: EZAORCFG

Error updating stack BSD RoutingParms, return code retcode, ioctl errno=errno, errno2=errnojr

Explanation: An attempt to update the stack's BSD Routing Parameters failed for the specified reason.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.

eerrnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Possible internal error. Contact the IBM software support center.

Module: EZAORMUP

IP address *.*.*.* not valid on Interface statement, statement ignored

Explanation: OMPROUTE found an Interface configuration statement in the OMPROUTE configuration file with an IP_Address parameter of *.*.*.*. This is not allowed.

System action: OMPROUTE continues, ignoring the specified configuration statement.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file, replacing the full wildcard configuration statement with either explicit statements for each interface or more explicit wildcard statements.

Module: EZAORYAC

Neighbors must be coded for non-broadcast capable stmt name

Explanation: OMPROUTE has found the specified configuration statement in the OMROUTE configuration file. Neighbors must be coded on this statement under the following conditions:

• The statement is RIP_INTERFACE, is defined to send RIP version 1, and the link is not broadcast capable.
• The statement is RIP_INTERFACE, is defined to send RIP version 2, and the link is not multicast capable.
• The statement is OSPF_INTERFACE and Non_Broadcast=YES is coded on the statement.

Without the neighbor information, OMPROUTE cannot communicate routing information over the link.

stmt is the type of definition statement.

name is the link name of the interface.

System action: If the statement is RIP_INTERFACE, OMPROUTE continues and all RIP sending is disabled over this interface. If the statement is OSPF_INTERFACE, OMPROUTE ends.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file, providing neighbor definitions for the neighbors that can be reached over the link.

Module: INRIP, EZAORYAC
EZZ7895I  Processing console command - command
Explanation:  OMPROUTE received the specified DISPLAY or MODIFY command.
System action:  OMPROUTE processes the received command.
Operator response:  None.
System programmer response:  None.
Module:  EZAORMFY

EZZ7896I Could not obtain version stack routing table, ioctl errno=errno2=errnojr, table table
Explanation:  An attempt to obtain the contents of the TCP/IP stack's main routing table, a specific TCP/IP stack
policy-based routing table, or all TCP/IP stack policy-based routing tables of the specified IP version failed with the
specified error.
In the message text:
version
The IP version that was being obtained when the failure occurred. Possible values are IPv4 or IPv6.
errno
The z/OS UNIX System Services return code. These return codes are listed and described in the return codes
information in z/OS UNIX System Services Messages and Codes.
description
Describes the meaning of the errno.
errnojr
The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in
the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and
Codes where the reason codes are listed.
table
The route table or tables that OMPROUTE was unable to obtain. The table value is EZBMAIN (for the main route
table), ALL (for all policy-based route tables), or the name of a policy-based route table.
System action:  OMPROUTE ends.
Operator response:  If the errnodedescription value is 1122:No buffer space available, then OMPROUTE is being
started when the stack's interface list is increasing quickly and significantly. The stack might be taking over large
numbers of dynamic VIPAs, or it might be processing a large profile. If you receive this errno value, wait until the
local configuration stabilizes and then restart OMPROUTE. If the errnodedescription value is not 1122:No buffer space
available, then contact the system programmer.
System programmer response:  This is a possible internal error. Take a dump of TCP/IP and OMPROUTE and
contact the IBM software support center.
User response:  Not applicable.
Problem determination:  Not applicable.
Source:  z/OS Communications Server TCP/IP: OMPROUTE
Module:  EZAORRTI, EZA6RRTI
Routing code:  10
Descriptor code:  12
Example:
EZZ7896I Could not obtain IPv6 stack routing table, ioctl errno=1122, EDC81221
   No buffer space available, errno2=74420324 , table EZBMAIN
EZZ7897I  User is not RACF authorized to start *jobname*

Explanation: The user that attempted to start the OMPROUTE application is not RACF authorized to start it. The user must have RACF authority to the entity MVS.ROUTE.MGR.OMPROUTE.

In the message text:

*jobname*

The job name of the OMPROUTE application.

System action: OMPROUTE ends.

Operator response: None.

System programmer response: Provide RACF authority to the user as described in the z/OS Communications Server: IP Configuration Guide.

Module: EZAORINI

---

EZZ7898I  *jobname* Initialization Complete

Explanation: The OMPROUTE application completed its initialization.

In the message text:

*jobname*

The job name of the OMPROUTE application.

System action: None.

Operator response: None.

System programmer response: None.

Module: OMPROUTE

Procedure name: main

---

EZZ7899I  Temporary file allocation failed processing *jobname* command

Explanation: A temporary file needed to process the OMPROUTE console command could not be allocated.

In the message text:

*jobname*

The job name of the OMPROUTE application.

System action: The command will not be processed.

Operator response: None.

System programmer response: Ensure that space is available in the z/OS UNIX directory defined in the TMPDIR environment variable or in the /tmp directory if TMPDIR is not defined.

Module: EZAORMFY

---

EZZ7900I  Bad length packet, from *source*, type *type*

Explanation: An OSPF packet with an incorrect length was received from the specified source. OMPROUTE determines that a packet has an incorrect length in the following situations:

- The OSPF packet length field value in the OSPF header does not correlate with the IP header length field value in the IP header.
- The number of elements indicated in the OSPF packet does not correlate with the OSPF packet length field value in the OSPF header. An example of this is an OSPF Link State Update packet that specifies an incorrect value for the number of link state advertisements (LSAs) that it contains.

In the message text:

*source*  The IP address of the neighboring OSPF router.
The OSPF packet type. Possible values are:

1  Hello
2  Database description
3  Link state request
4  Link state update
5  Link state acknowledgment

System action: The packet is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPF, EZA6RSPF

Example:
EZZ7900I BAD LENGTH PACKET, FROM 10.2.3.4, TYPE 4

EZZ7901I Bad packet checksum, from source, type type

Explanation: An OSPF packet, identified by its OSPF packet type, was received from the specified source. The checksum value contained in the OSPF packet is incorrect.

System action: The packet is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPF, EZA6RSPF

Example:
EZZ7901I BAD PACKET CHECKSUM, FROM 10.2.3.4, TYPE 4

EZZ7902I Bad OSPF version, from source, type type

Explanation: An OSPF packet of the specified type was received. If the packet is an IPv4 OSPF packet, the version field in the OSPF header is not equal to 2. If the packet is an IPv6 OSPF packet, the version field in the OSPF header is not equal to 3.

System action: The packet is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPF, EZA6RSPF

Example:
EZZ7902I BAD OSPF VERSION, FROM 10.2.3.4, TYPE 4
EZZ7903I • EZZ7905I

2   Database description
3   Link state request
4   Link state update
5   Link state acknowledgment

System action: The packet is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPF, EZA6RSPF

Example:
EZZ7902I BAD OSPF VERSION, FROM 10.2.3.4, TYPE 4

EZZ7903I   No matching SPF-interface for packet from source, type type

Explanation: An OSPF packet of the specified type was received. Either the IP destination specified in the packet is not acceptable, or the parameters in the OSPF header (like area ID) do not match the parameters configured for the receiving interface. This might be an acceptable situation if you have a physical network broken into multiple networks using TCP/IP.

System action: The packet is discarded.

Operator response: None.

System programmer response: None.

Module: SPF, EZA6RSPF

EZZ7904I   Packet authentication failure, from source, type type

Explanation: An OSPF packet of the specified type was received. The packet fails to authenticate.

System action: The packet is discarded.

Operator response: None.

System programmer response: Verify the authentication type and authentication key specified for the appropriate interfaces on this and the source router. The types and keys must match in order for authentication to succeed. If MD5 authentication is being used and OMPROUTE is stopped or recycled, ensure that it stays down for at least 3 times the largest configured dead router interval of the OSPF interfaces that use MD5 authentication, in order to age out the authentication sequence numbers on routers that did not recycle.

Module: SPF

EZZ7905I   No matching OSPF neighbor for packet from source, type type

Explanation: An OSPF packet of the specified type was received. The packet is not a hello packet, and does not match any existing OSPF neighbor. This is an acceptable situation when OMPROUTE is just started and is receiving non-hello packets that the source router has multicasted onto the network prior to receiving a hello packet from the source router.

System action: The packet is discarded.

Operator response: None.

System programmer response: None.

Module: SPF, EZA6RSPF
EZZ7906I  Bad packet type received from source, type type

Explanation:  An OSPF packet was received that specified an incorrect OSPF packet type value.

In the message text:

source  The IP address of the neighboring OSPF router.

type  The OSPF packet type value that is incorrect. Correct values are:

1  Hello
2  Database description
3  Link state request
4  Link state update
5  Link state acknowledgment

System action:  The packet is discarded.

Operator response:  Contact the system programmer.

System programmer response:  Contact the manufacturer of the OSPF application on the source router to report the
problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE
problems in z/OS Communications Server: IP Diagnosis Guide.

Module:  SPF, EZA6RSPF

Example:
EZZ7906I BAD PACKET TYPE RECEIVED FROM 10.2.3.4, TYPE 0

EZZ7907I  Add interface fails for interface_name - exceeded 254 interfaces

Explanation:  OMPROUTE cannot configure an interface because the maximum of 254 configured routing interfaces
was exceeded. This limitation encompasses all interfaces, including real interfaces, VIPAs, and Dynamic VIPAs.

interface_name is the name of the interface that cannot be configured.

System action:  The interface is ignored by OMPROUTE and processing continues. Neither RIP nor OSPF will be
active over the interface. The interface, and any destinations reached through it, will not be advertised into any OSPF
or RIP autonomous systems to which this router is attached.

Operator response:  Contact the system programmer.

System programmer response:  If you want the interface used by RIP or OSPF, define it before the 254 interface limit
is reached.

Module:  EZAORMII

Procedure name:  ezaormii

EZZ7908I  Received packet type type from source

Explanation:  An OSPF packet of the specified type was received from the specified source.

type is the OSPF packet type as described in RFC 2328. See Appendix A, “Related protocol specifications,” on page
931 for directions to get a copy of the RFC.

System action:  None.

Operator response:  None.

System programmer response:  None.

Module:  SPF, EZA6RSPF
**EZZ7909I** • **EZZ7912I**

**EZZ7909I**  
**Sending unicast type** type **dst** destination net net_index interface name**

**Explanation:** A unicast OSPF packet of the specified type was sent out the specified interface to the specified IP destination.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPF, NBMA, EZA6RSPF

---

**EZZ7910I**  
**Sending multicast, type** type, destination destination net net_index interface name**

**Explanation:** A multicast OSPF packet of the specified type sent out the specified interface to the specified destination.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPF, EZA6RSPF

---

**EZZ7911I**  
**Retransmitting packet, type** type, source -> destination**

**Explanation:** A unicast OSPF packet of the specified type is being retransmitted, using the specified source and destination.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPF, EZA6RSPF

---

**EZZ7912I**  
**No FSM match, interface** interface, state state, event event**

**Explanation:** The specified event occurred while an interface was in the specified state. This occurrence is not covered by the interface Finite State Machine. This often occurs because of harmless timing windows. For example, a hello timer pops for a neighbor with whom adjacency was already lost.

**state** is the Interface State Code. The Interface State Codes are described in RFC 2328. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Interface State Codes can be one of the following:

1  Down

1* Suspend. This state is not described in RFC2328. The interface is suspended for one of the following reasons:

- You issued a MODIFY command.
- After the interface exceeded the futile neighbor state loop threshold (DR_Max_adj_Attempt), the interface was unable to establish an adjacency with a neighboring designated router.

See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

2  Backup. This state is not described in RFC 2328. When more than one OSPF interface is defined to the same subnet, only one of the interfaces can be primary, meaning that it will be the interface to carry the OSPF protocol traffic between OMPROUTE and the subnet. All other interfaces to the same subnet will be in this state. Failure of the primary interface will result in automatic switching of OSPF traffic to one of the backup interfaces.

4  Loopback

8  Waiting

---

498  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
event is the Interface Event Code. The Interface Event Codes are described in RFC 2328. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Interface Event Codes can be one of the following:

1. InterfaceUp
2. WaitTimer
3. BackupSeen
4. NeighborChange
5. LoopInd
6. UnloopInd
7. InterfaceDown
8. BackupUp. This state is not described in RFC 2328. Lower-level protocols have indicated that the network interface is operational. This interface is one of multiple OSPF interfaces defined to the same subnet and it is not the primary interface (the interface to carry the OSPF protocol traffic between OMPROUTE and the subnet). The interface will transition to Backup state.
9. InterfaceSuspend. This event is not described in RFC2328. The interface is suspended for one of the following reasons:
   • You issued a MODIFY command.
   • After the interface exceeded the futile neighbor state loop threshold (DR_Max_adj_Attempt), the interface was unable to establish an adjacency with a neighboring designated router.

See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

10. InterfaceActivate. This event is not described in RFC2328. The interface is activated for one of the following reasons:
    • You issued a MODIFY command.
    • The interface can now establish adjacency with a neighboring designated router.

The interface will transition to one of the states other than 1 (Down).

See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

System action:  The event is ignored.

Operator response:  None.

System programmer response:  None

Module:  SPFIFC, EZA6RSFF

EZZ7913I  State change, interface interface, new state state, event event

Explanation:  The specified event occurred on the specified interface, causing its state to transition to the specified new state.

state is the Interface State Code. The Interface State Codes are described in RFC 2328. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Interface State Codes can be one of the following:

1. Down
Suspend. This state is not described in RFC2328. The interface is suspended for one of the following reasons:

- You issued a MODIFY command.
- After the interface exceeded the futile neighbor state loop threshold (DR_Max_adj_Attempt), the interface was unable to establish an adjacency with a neighboring designated router.

See the [network design considerations with z/OS Communications Server](https://www.ibm.com/support/docview.wss?uid=swg21431510) information in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/docview.wss?uid=swg21431510) for more information about futile neighbor state loops.

Backup. This state is not described in RFC 2328. When more than one OSPF interface is defined to the same subnet, only one of the interfaces can be primary, meaning that it will be the interface to carry the OSPF protocol traffic between OMPROUTE and the subnet. All other interfaces to the same subnet will be in this state. Failure of the primary interface will result in automatic switching of OSPF traffic to one of the backup interfaces.

Loopback

DR

`event` is the Interface Event Code. The Interface Event Codes are described in RFC 2328. See [Appendix A, “Related protocol specifications,” on page 931](https://www.ibm.com/support/docview.wss?uid=swg21431510) for directions to get a copy of the RFC. The Interface Event Codes can be one of the following:

- InterfaceUp
- WaitTimer
- BackupSeen
- NeighborChange
- LoopInd
- UnloopInd
- InterfaceDown

BackupUp. This state is not described in RFC 2328. Lower-level protocols have indicated that the network interface is operational. This interface is one of multiple OSPF interfaces defined to the same subnet and it is not the primary interface (the interface to carry the OSPF protocol traffic between OMPROUTE and the subnet). The interface will transition to Backup state.

InterfaceSuspend. This event is not described in RFC2328. The interface is suspended for one of the following reasons:

- You issued a MODIFY command.
- After the interface exceeded the futile neighbor state loop threshold (DR_Max_adj_Attempt), the interface was unable to establish an adjacency with a neighboring designated router.

See the [network design considerations with z/OS Communications Server](https://www.ibm.com/support/docview.wss?uid=swg21431510) information in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/docview.wss?uid=swg21431510) for more information about futile neighbor state loops.

InterfaceActivate. This event is not described in RFC2328. The interface is activated for one of the following reasons:

- You issued a MODIFY command.
- The interface can now establish adjacency with a neighboring designated router.

The interface will transition to one of the other states; however, the interface will not transition to 1 (Down).

See the [network design considerations with z/OS Communications Server](https://www.ibm.com/support/docview.wss?uid=swg21431510) information in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/docview.wss?uid=swg21431510) for more information about futile neighbor state loops.
EZZ7914I  No match for hello received on virtual link, from source

Explanation: A hello packet was received that could only match a virtual link, yet that link is not configured.

System action: The packet is discarded.

Operator response: None.

System programmer response: None.

Module: SPFIFC, EZA6RSFF

EZZ7915I  Network mask mismatch in hello from source over interface - jobname will not form ip_version OSPF adjacency with routerid

Explanation: A hello packet was received from the specified neighbor. The neighbor and OMPROUTE do not use the same network mask for their common network.

In the message text:

source
The neighbor’s interface address on the common IPv4 network.

interface
The name of the interface on which the hello was received.

jobname
The name of the OMPROUTE instance.

ip_version
The IP version. The only possible value is IPv4.

routerid
The neighbor’s OSPF router ID.

System action: The packet is discarded. An OSPF neighbor adjacency is not formed with the neighbor that sent the packet.

Operator response: None.

System programmer response: Correct the configuration on either OMPROUTE or on the neighboring router, ensuring that they both use the same network mask.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFNBR

Routing code: Not applicable.

Descriptor code: Not applicable.

Automation: Not applicable.

Example:
EZZ7915I Network mask mismatch in hello from 9.120.19.5 over OSA1 - OMPROUTE will not form IPv4 OSPF adjacency with 10.13.3.3
Hello interval mismatch in hello from source over interface - jobname will not form ip_version OSPF adjacency with routerid

Explanation: A hello packet was received from the specified neighbor. The neighbor must use the same hello interval on the common network as OMPROUTE uses.

In the message text:

source
The interface IP address of the neighboring OSPF router.

interface
The name of the interface on which the hello was received.

jobname
The name of the OMPROUTE instance.

ip_version
The IP version. Possible values are IPv4 or IPv6.

routerid
The neighbor's OSPF router ID.

System action: The packet is discarded. An OSPF neighbor adjacency is not formed with the neighbor that sent the packet.

Operator response: None.

System programmer response: Correct the configuration on either OMPROUTE or the neighboring router, ensuring that they both use the same hello interval.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFNBR, EZA6RSPB

Routing code: Not applicable.

Descriptor code: Not applicable.

Automation: Not applicable.

Example:
EZZ7916I Hello interval mismatch in hello from 9.120.19.5 over OSA1 - OMPROUTE will not form IPv4 OSPF adjacency with 10.13.3.3

Dead interval mismatch in hello from source over interface - jobname will not form ip_version OSPF adjacency with routerid

Explanation: A hello packet was received from the specified neighbor. The neighbor must use the same dead router interval on the common network as OMPROUTE uses.

In the message text:

source
The interface IP address of the neighboring OSPF router.

interface
The name of the interface on which the hello was received.

jobname
The name of the OMPROUTE instance.

ip_version
The IP version. Possible values are IPv4 or IPv6.

routerid
The neighbor's OSPF router ID.
System action: The packet is discarded. An OSPF neighbor adjacency is not formed with the neighbor that sent the packet.

Operator response: None.

System programmer response: Correct the configuration on either OMPROUTE or the neighboring router, ensuring that they both use the same dead router interval.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFNB, EZA6RSPB

Routing code: Not applicable.

Descriptor code: Not applicable.

Automation: Not applicable.

Example: EZZ7917I Dead interval mismatch in hello from 9.120.19.5 over OSA1 - OMPROUTE will not form IPv4 OSPF adjacency with 10.13.3.3

EZZ7918I  No FSM match, ipversion OSFP, neighbor neighbor, state state, event event

Explanation: The specified event was generated for the specified neighbor, which is currently in the specified state. This was not anticipated by the neighbor Finite State Machine. Also, this message often occurs after OMPROUTE is stopped and restarted in the dead router interval seconds.

ipversion is the IP version that OSPF is running. Possible values for ipversion are:

- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

neighbor is the neighboring OSPF router. If ipversion is IPv4, it is the neighbor's interface address on the common network. If ipversion is IPv6, it is the neighbor's OSPF router ID.

state is the Neighbor State Code. The Neighbor State Codes are described in RFC 2328. See Appendix A, "Related protocol specifications," on page 931 for directions to get a copy of the RFC. The Neighbor State Codes can be one of the following:

- 1  Down
- 2  Attempt
- 4  Init
- 8  2-way
- 16  ExStart
- 32  Exchange
- 64  Loading
- 128 Full

event is the Neighbor Event Code. The Neighbor Event Codes are described in RFC 2328. See Appendix A, "Related protocol specifications," on page 931 for directions to get a copy of the RFC. The Neighbor Event Codes can be one of the following:

- 1  HelloReceived
- 2  Start
- 3  2-WayReceived
- 4  AdjOK
AdjStart. This state is not described in RFC2328. Bidirectional communication was established with the neighbor and this is a neighbor with whom an adjacency should be established.

NoProg. This state is not described in RFC2328. This indicates that adjacency establishment with the neighbor failed to complete in a reasonable time period (Dead_Router_INTERVAL seconds). Adjacency establishment restarts.

MaxAdj. This event is not described in RFC2328. This indicates that OMPROUTE has exceeded the futile neighbor state loop threshold (DR_Max_Adj_Attempt). Even if a redundant parallel interface (primary or backup) exists, OMPROUTE continues to attempt to establish adjacency with the same neighboring designated router over the existing or alternate interface.

See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

**System action:** The event is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Possible internal error. Collect a dump of OMPROUTE and an OMPROUTE debug trace and contact the IBM software support center.

**Module:** SPFNBR, EZA6RSPB

---

**Explanation:** The specified event was generated, causing the specified neighbor to transition to the specified new state.

*ipversion* is the IP version that OSPF is running. Possible values for *ipversion* are:

- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

*neighbor* is the neighboring OSPF router. If *ipversion* is IPv4, it is the neighbor's interface address on the common network. If *ipversion* is IPv6, it is the neighbor's OSPF router ID.

*state* is the Neighbor State Code. The Neighbor State Codes are described in RFC 2328. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Neighbor State Codes can be one of the following:

1. Down
2. Attempt
4. Init
8. 2-way
16. ExStart
32. Exchange
64. Loading
event is the Neighbor Event Code. The Neighbor Event Codes are described in RFC 2328. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Neighbor Event Codes can be one of the following:

1. HelloReceived
2. Start
3. 2-WayReceived
4. AdjOK?
5. NegotiationDone
6. ExchangeDone
7. SeqNumberMismatch
8. BadLSReq
9. LoadingDone
10. 1-way
11. KillNbr
12. InactivityTimer
13. LLDown
14. AdjStart. This event is not described in RFC2328. Bidirectional communication was established with the neighbor and this is a neighbor with whom an adjacency should be established.
15. NoProg. This event is not described in RFC2328. This is an indication that adjacency establishment with the neighbor failed to complete in a reasonable time period (Dead_Router_Interval seconds). Adjacency establishment restarts.
16. MaxAdj. This event is not described in RFC2328. This indicates that OMPROUTE has exceeded the futile neighbor state loop threshold (DR_Max_Adj_Attempt). Even if a redundant parallel interface (primary or backup) exists, OMPROUTE continues to attempt to establish adjacency with the same neighboring designated router over the existing or alternate interface. See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

System action: None.
Operator response: None.
System programmer response: None.
Module: SPFBR, EZA6RSPB

EZZ920I  Outstanding Database Description packet not avail for ipversion OSPF neighbor neighbor

Explanation: An attempt was made to retransmit a Database Description packet to the specified neighbor, but the packet could not be found.

ipversion is the IP version that OSPF is running. Possible values for ipversion are:
- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

neighbor is the neighboring OSPF router. If ipversion is IPv4, it is the neighbor's interface address on the common network. If ipversion is IPv6, it is the neighbor's OSPF router ID.

System action: Retransmission is aborted.
Operator response: Contact the system programmer.
System programmer response: Possible internal error. Collect a dump of OMPROUTE and an OMPROUTE debug trace and contact the IBM software support center.

Module: DBXCHG, EZA6RDBX

EZZ7921I OSPF Adjacency Failure, neighbor neighbor, old state state, new state state, event event

Explanation: The specified event was generated, causing the specified OSPF adjacency to transition to the specified new state.

state is the Neighbor State Code. The Neighbor State Codes are described in RFC 1583. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Neighbor State Codes can be one of the following:

1  Down
2  Attempt
4  Init
8  2-way
16  ExStart
32  Exchange
64  Loading
128 Full

event is the Neighbor Event Code. The Neighbor Event Codes are described in RFC 1583. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC. The Neighbor Event Codes can be one of the following:

7  SeqNumberMismatch
8  BadLSReq
10  1-way
11  KillNbr
12  InactivityTimer
13  LLDown
15  NoProg. This event is not described in RFC1583. This is an indication that adjacency establishment with the neighbor failed to complete in a reasonable time period (Dead_Router_INTERVAL seconds). Adjacency establishment restarts.
16  MaxAdj. This event is not described in RFC2328. This indicates that OMPROUTE has exceeded the futile neighbor state loop threshold (DR_Max_Adj_Attempt). Even if a redundant parallel interface (primary or backup) exists, OMPROUTE continues to attempt to establish adjacency with the same neighboring designated router over the existing or alternate interface.

See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

System action: None.

Operator response: If connectivity problems occur investigate source of adjacency establishment failure.

System programmer response: None.

Module: SPFNBR

Procedure name: nbr_fsm()
EZZ7922I  Bad length Link state advertisement received from *neighbor*

**Explanation:** A Link State Update packet was received from the specified neighbor. OMPROUTE determined that the link state advertisements (LSAs) contained in the packet had one of the following problems:

- The sum of the length values specified in the headers of the LSAs contained in the packet exceeds the length value specified in the OSPF header of the packet.
- An LSA header length field value is smaller than the length of the LSA header.
- The number of elements in an LSA does not correlate with the LSA header length field value. An example of this is a Router LSA that specifies an incorrect value for the number of links that it contains.

In the message text:

*neighbor*

The IP address of the neighboring OSPF router.

**System action:** The LSA is discarded.

**Operator response:** Contact the system programmer.

**System programmer response:** Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see [diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide](#).

**Module:** SPF

**Example:**

EZZ7922I BAD LENGTH LINK STATE ADVERTISEMENT RECEIVED FROM 10.2.3.4

---

EZZ7923I  from *neighbor*, LS advertisement checksum fails: LS type *type* id *id* destination org source

**Explanation:** A link state advertisement was received from the specified neighbor. The advertisement is identified by its LS type, ID, and originator. The checksum value contained in the advertisement is incorrect.

In the message text:

*neighbor*

The IP address of the neighboring OSPF router.

*type*

The link state advertisement type.

Possible values in an IPv4 link state advertisement (LSA) are:

- 1    Router-LSA
- 2    Network-LSA
- 3    Summary-LSA (IP network)
- 4    Summary-LSA (ASBR)
- 5    AS-external-LSA

Possible values in an IPv6 LSA are:

- 2001  Router-LSA
- 2002  Network-LSA
- 2003  Inter-Area-Prefix-LSA
- 2004  Inter-Area-Router-LSA
- 4005  AS-External-LSA
- 0008  Link-LSA
- 2009  Intra-Area-Prefix-LSA
The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.

The router ID of the originator of the advertisement.

System action: The LSA is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPFLOOD, EZA6RSPL

Example: EZZ7923I FROM 10.2.3.4, LS ADVERTISEMENT CHECKSUM FAILS: LS TYPE 1 ID 5 ORG 10.2.3.1

EZZ7924I from neighbor, bad LS type, advertisement typ type id destination org source

Explanation: A link state advertisement was received from the specified neighbor. The advertisement is identified by its LS type, ID, and originator. The advertisement's LS type is incorrect.

In the message text:

neighbor
The IP address of the neighboring OSPF router.

type
The link state advertisement type.

Possible values in an IPv4 link state advertisement (LSA) are:

1 Router-LSA
2 Network-LSA
3 Summary-LSA (IP network)
4 Summary-LSA (ASBR)
5 AS-external-LSA

Possible values in an IPv6 LSA are:

2001 Router-LSA
2002 Network-LSA
2003 Inter-Area-Prefix-LSA
2004 Inter-Area-Router-LSA
4005 AS-External-LSA
0008 Link-LSA
2009 Intra-Area-Prefix-LSA

destination
The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.

source
The router ID of the originator of the advertisement.

System action: The LSA is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.
**Module:** SPF, EZA6RSPF

**Example:**

EZZ7924I FROM 10.2.3.4, BAD LS TYPE, ADVERTISEMENT: TYP 99 ID 5 ORG 10.2.3.1

---

**EZZ7925I** from neighbor, AS external link adv. on Virtual Link typ id destination org source

**Explanation:** An autonomous system (AS) external link state advertisement was received over a virtual link from the specified neighbor. AS external link advertisements should not be sent over virtual links.

In the message text:

- **neighbor**: The IP address of the neighboring OSPF router.
- **type**: The link state advertisement type.
  - The only possible value in an IPv4 link state advertisement (LSA) is:
    - 5 AS-external-LSA
  - The only possible value in an IPv6 LSA is:
    - 4005 AS-External-LSA
- **destination**: The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.
- **source**: The router ID of the originator of the advertisement.

**System action:** The LSA is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see [diagnosing OMPROUTE problems](#) in z/OS Communications Server: IP Diagnosis Guide.

**Module:** SPFLOOD, EZA6RSPL

**Example:**

EZZ7925I FROM 10.2.3.4, AS EXTERNAL LINK ADV. ON VIRTUAL LINK: TYP 5 ID 5 ORG 10.2.3.1

---

**EZZ7926I** from neighbor, old LS advertisement typ id destination org source

**Explanation:** A link state advertisement was received from the specified neighbor. The advertisement is older than the current database copy.

**System action:** The advertisement is ignored.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFLOOD, EZA6RSPL

**Example:**

EZZ7925I FROM 10.2.3.4, AS EXTERNAL LINK ADV. ON VIRTUAL LINK: TYP 5 ID 5 ORG 10.2.3.1

---

**EZZ7927I** from neighbor, self update typ id destination org source

**Explanation:** A link state advertisement (LSA) was received. The advertisement was originated by the router itself, yet is newer than the database copy. This indicates that it originated before the router was last started. This causes the router to either advance the LS sequence number and originate a new instance of the advertisement, or delete the advertisement, if it is a summary LSA and the attached area does not want to import summary LSAs anymore.

**System action:** None.

**Operator response:** None.
**EZZ7928I • EZZ7931I**

System programmer response: None.
Module: SPFLOOD, EZA6RSPL

---

**EZZ7928I** from neighbor, new LS advertisement typ type id destination org source

Explanation: A link state advertisement was received from the specified neighbor. The advertisement is newer than the current database copy.

System action: The advertisement is flooded out all other interfaces, and installed in the routing database.

Operator response: None.
System programmer response: None.
Module: SPFLOOD, EZA6RSPL

---

**EZZ7929I** from neighbor, Old acknowledgment for advertisement typ type id destination org source

Explanation: An unexpected link state acknowledgment was received from the specified neighbor. The acknowledgment, however, is for a previous instance of the link state advertisement.

System action: The acknowledgment is ignored.

Operator response: None.
System programmer response: None.
Module: SPFACK, EZA6RSPC

---

**EZZ7930I** Bad acknowledgment from neighbor: for advertisement typ type id destination org source

Explanation: An unexpected link state acknowledgment was received from the specified neighbor. The acknowledgment, however, is for the current instance of the link state advertisement.

System action: The acknowledgment is ignored.

Operator response: None.
System programmer response: None.
Module: SPFACK, EZA6RSPC

---

**EZZ7931I** ipversion OSPF LS update retransmission to neighbor neighbor

Explanation: A Link State Update packet containing retransmitted link state advertisements was unicast to the specified neighbor. This probably indicates packet loss during the flooding procedure.

ipversion is the IP version that OSPF is running. Possible values for ipversion are:

- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

neighbor is the neighboring OSPF router. If ipversion is IPv4, it is the neighbor's interface address on the common network. If ipversion is IPv6, it is the neighbor's OSPF router ID.

System action: None.
Operator response: None.
System programmer response: None.
Module: SPFACK, EZA6RSPC
**EZZ7932I  ipversion OSPF LS acknowledgment sent directly to neighbor neighbor**

**Explanation:** A Link State Acknowledgment packet was sent directly to the specified neighbor. This is in response to duplicate link state advertisements received from the neighbor. This probably indicates packet loss during the flooding procedure.

*ipversion* is the IP version that OSPF is running. Possible values for *ipversion* are:

* IPv6 — OSPF for IPv6
* IPv4 — OSPF for IPv4

*neighbor* is the neighboring OSPF router. If *ipversion* is IPv4, it is the neighbor's interface address on the common network. If *ipversion* is IPv6, it is the neighbor's OSPF router ID.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFLOOD, EZA6RSPL

---

**EZZ7933I  Flushing advertisement: typ type id destination org source**

**Explanation:** The specified link state advertisement contained in the link state database was not refreshed for 2 hours. The advertisement is deleted from the database. This probably indicates that the originator of the advertisement is unreachable.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFPARSE, SPFTIMER, EZA6RSFT

---

**EZZ7934I  Originating LS advertisement: typ type id destination org source**

**Explanation:** The specified link state advertisement is being (re)originated by the router. This can be due to topological change, or the necessity to refresh.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFORIG, EZA6RSFR

---

**EZZ7935I  New jobname route to destination desttype destination, type routertype cost cost, table table**

**Explanation:** The OSPF route table build process detected a new best route to the specified destination, the new route has the specified cost.

In the message text:

*jobname* 
The job name of the OMPROUTE application.

*desttype* 
The type of destination described by the new OMPROUTE route. Possible values are:

* BR  The destination is an area border router.
* RTR  The destination is a router.
* ASBR The destination is an AS boundary router.
* Net  The destination is a normal route.
* Fadd The destination is a forwarding address (for external routes).
destination
   The specified destination.

routetype
   The type of route to the destination. Possible values are:
   DIR     A directly connected network, subnet, or host.
   SPF     The route is an OSPF intra-area route.
   SPIA    The route is an OSPF interarea route.

cost
   The route metric.

table
   The name of the route table in which the new OMPROUTE route was added. The table value is either EZBMAIN
   (for the main route table) or the name of a policy-based route table.

System action: The new route is placed in the specified OMPROUTE internal route table, replacing any existing
route to the same destination. The new route is also added to the specified TCP/IP stack route table.

Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: SPFRTTBL, EZA6RSRT
Routing code: 10
Descriptor code: 12
Example: EZZ7935I New OMPROUTE route to destination Net 10.0.0.0, type Dir cost 1 , table EZBMAIN

EZZ7936I Unicast hello sent to IP destination neighbor

Explanation: An OSPF hello was sent to the specified IP destination. The hello packet was sent using unicast.

System action: None.
Operator response: None.
System programmer response: None.
Module: NBMA, EZA6RNBM

EZZ7937I The ipversion OSPF routing protocol is disposition

Explanation: This message is displayed on router startup and when a re-read of the OMPROUTE configuration file
results in the OSPF protocol being enabled. This message indicates the operational status of the OSPF protocol.

ipversion is the IP version that OSPF is running. Possible values for ipversion are:
- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

disposition is enabled or disabled.

System action: None.
Operator response: None.
System programmer response: None.
Module: EZAORYAC, SPFCONFCH, SPFCONF, EZA6RSPN, EZA6RSPX
**EZZ7938I** SPF Interface *interface (name)* is not an IP interface, interface not installed

**Explanation:** This message is displayed on router startup when an OSPF interface address is configured, yet this address was not configured to the TCP/IP stack.

**System action:** The OSPF interface is not installed. OMPROUTE retains the definition for later use if an interface matching the definition is installed. If the definition is a dynamic VIPA wildcard, it will be used to configure dynamic VIPA interfaces that fall in its wildcard range.

**Operator response:** None.

**System programmer response:** If this message is received because of a configuration error, modify the OMPROUTE configuration file or the TCP/IP stack configuration, ensuring that the specified interface is configured in both.

**Module:** SPFCONF

---

**EZZ7939I** Duplicate LS acknowledgment received from *ipversion neighbor neighbor*

**Explanation:** Unexpected link state acknowledgment was received from the specified neighbor. This probably indicates packet loss during the flooding procedure.

*ipversion* is the IP version that OSPF is running. Possible values for *ipversion* are:
- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

*neighbor* is the neighboring OSPF router. If *ipversion* is IPv4, it is the neighbor’s interface address on the common network. If *ipversion* is IPv6, it is the neighbor’s OSPF router ID.

**System action:** The link state acknowledgment is ignored.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFACK, EZA6RSPC

---

**EZZ7940I** from *neighbor*, bad age field, advertisement typ *type id destination org source*

**Explanation:** The specified link state advertisement (LSA) was received from the specified neighbor. The advertisement’s LS age field is incorrect.

In the message text:

*neighbor*

The IP address of the neighboring OSPF router.

*type*

The link state advertisement type.

Possible values in an IPv4 LSA are:
- 1 Router-LSA
- 2 Network-LSA
- 3 Summary-LSA (IP network)
- 4 Summary-LSA (ASBR)
- 5 AS-external-LSA

Possible values in an IPv6 LSA are:
- 2001 Router-LSA
- 2002 Network-LSA
- 2003 Inter-Area-Prefix-LSA
- 2004 Inter-Area-Router-LSA
- 4005 AS-External-LSA
0008 Link-LSA
2009 Intra-Area-Prefix-LSA

destination
The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.

source
The router ID of the originator of the advertisement.

System action: The LSA is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPFLOOD, EZA6RSPL

Example:
EZZ7940I FROM 10.2.3.4, BAD AGE FIELD, ADVERTISEMENT: TYP 5 ID 5 ORG 10.2.3.1

EZZ7941I Transit area area not configured, ipversion virtual link ignored

Explanation: A virtual link was configured to have a certain transit area, yet that area was not configured.
area is the dotted-decimal area number of the transit area required by the virtual link.
ipversion is the IP version that OSPF is running. Possible values for ipversion are:
• IPv6 — OSPF for IPv6
• IPv4 — OSPF for IPv4

System action: The virtual link is ignored.

Operator response: Contact the system programmer.

System programmer response: Modify the OMPROUTE configuration file to correct the transit area configured for the virtual link, if incorrect, or to configure the area.

Module: SPFCONF, EZA6RSPN

EZZ7942I Backbone area is not configured, all ipversion virtual links discarded

Explanation: OMPROUTE found virtual links configured in the OMPROUTE configuration file, but the backbone area is not configured. Virtual links cannot be used unless a backbone area is configured.
ipversion is the IP version that OSPF is running. Possible values for ipversion are:
• IPv6 — OSPF for IPv6
• IPv4 — OSPF for IPv4

System action: If ipversion is IPv4, all Virtual_Link configuration statements are ignored. If ipversion is IPv6, all IPv6_Virtual_Link configuration statements are ignored.

Operator response: Contact the system programmer.

System programmer response: Modify the OMPROUTE configuration statement to configure the backbone area for the IP version specified by ipversion.

Module: SPFCONF, EZA6RSPN

EZZ7943I Destination desttype destination now unreachable, table table

Explanation: The specified destination in the specified route table was found to be unreachable during the OSPF route table build process.

In the message text:
**desttype**
The type of the destination that is now unreachable. Possible values are:

- **BR**  The destination is an area border router.
- **RTR**  The destination is a router.
- **ASBR** The destination is an AS boundary router.
- **Net**  The destination is a normal route.
- **Fadd** The destination is a forwarding address (for external routes).

**destination**
The IP address of the destination that is now unreachable.

**table**
The name of the route table that contains the specified unreachable address. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** The route to the specified destination is removed from OMPROUTE's internal route table and from the TCP/IP stack's route table.

**Operator response:** None.
**System programmer response:** None.
**User response:** Not applicable.
**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** SPFRTTBL, EZA6RSRT

**Routing code:** 10

**Descriptor code:** 12

**Example:**
EZZ7943I Destination BR 10.95.46.34 now unreachable, table EZBMAIN

---

**EZZ7944I** Limit of 16 statement definitions exceeded

**Explanation:** More than 16 NEXT_HOP and NAME pairs were found on the specified configuration statement. The maximum number that can be defined is 16.

**Statement** is either DEFAULT_ROUTE or IPV6_DEFAULT_ROUTE.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** Fix the specified configuration statement so that it has 16 or fewer NEXT_HOP and NAME pairs

**Module:** EZAORYAC

**Procedure name:** ezaoryac

---

**EZZ7945I** from neighbor, received unexpected MaxAge typ type id destination org source

**Explanation:** The specified link state advertisement was received from the specified neighbor. Its age is MaxAge and there is no current instance of the advertisement in the router's database.

**System action:** The advertisement is acknowledged and then discarded without flooding.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFLOOD, EZA6RSPL
EZZ7946I • EZZ7947I

EZZ7946I  error in advertisement: typ type id destination org source

Explanation: A link state advertisement (LSA) that contained an error was received. OMPROUTE detected one of the following problems in the LSA:

- The LSA type in the LSA is unknown.
- The autonomous system (AS) external LSA contained a zero forwarding address in the address prefix.
- The AS external LSA contained an incorrect value in the address prefix such that a route to the originator of the LSA or to the AS boundary router could not be created.

In the message text:

**type**  The link state advertisement type.

Possible values in an IPv4 LSA are:

1  Router-LSA
2  Network-LSA
3  Summary-LSA (IP network)
4  Summary-LSA (ASBR)
5  AS-external-LSA

Possible values in an IPv6 LSA are:

2001  Router-LSA
2002  Network-LSA
2003  Inter-Area-Prefix-LSA
2004  Inter-Area-Router-LSA
4005  AS-External-LSA
0008  Link-LSA
2009  Intra-Area-Prefix-LSA

**destination**  The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the **type** value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.

**source**  The router ID of the originator of the advertisement.

System action: The LSA is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: SPFLOOD, SPFPARSE, EZA6RSPL, EZA6RSPP

Example:

EZZ7946I ERROR IN ADVERTISEMENT: TYP 4 ID 5 ORG 10.2.3.1

EZZ7947I  Stub area mismatch in hello from source over interface - jobname will not form ip_version OSPF adjacency with routerid

Explanation: A hello packet was received from the specified neighbor. The neighbor must match with OMPROUTE concerning the attached area's ability to process AS external link advertisements.

In the message text:
**source**
- The interface IP address of the neighboring OSPF router.

**interface**
- The name of the interface on which the hello was received.

**jobname**
- The name of the OMPROUTE instance.

**ip_version**
- The IP version. Possible values are IPv4 or IPv6.

**routerid**
- The neighbor’s OSPF router ID.

**System action:** The hello packet is ignored. An OSPF neighbor adjacency will not be formed with the neighbor that sent the packet.

**Operator response:** None.

**System programmer response:** Correct the configuration on either OMPROUTE or the neighboring router, ensuring that they both use the same stub area value for the attached network.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** SPFNB, EZAR6SPP

**Routing code:** Not applicable.

**Descriptor code:** Not applicable.

**Automation:** Not applicable.

**Example:**

EZZ7947I Stub area mismatch in hello from 9.120.19.5 over OSA1 - OMPROUTE will not form IPv4 OSPF adjacency with 10.13.3.3

```
EZZ7948I FROM neighbor, TYPE type LSA in STUB AREA, ADV: TYP type ID destination ORG source
```

**Explanation:** An autonomous system (AS) external link state advertisement (LSA) was received from the specified neighbor over an interface attached to a stub area. AS external advertisements should not be flooded through a stub area and are therefore ignored.

In the message text:

**neighbor**
- The IP address of the neighboring OSPF router.

**type**
- The link state advertisement type.
  - The only possible value in an IPv4 LSA is:
    - 5 AS-external-LSA
  - The only possible value in an IPv6 LSA is:
    - 4005 AS-External-LSA

**destination**
- The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2328 for IPv4 OSPF and RFC 2740 for IPv6 OSPF.

**source**
- The router ID of the originator of the advertisement.

**System action:** The LSA is ignored.

**Operator response:** Contact the system programmer.
System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see [diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide](#).

Module: SPFLOOD, EZA6RSPL

Example:

EZZ7948I FROM 10.2.3.4, TYPE 5 LSA IN STUB AREA, ADV: TYP 5 ID 5 ORG 10.2.3.1

**EZZ7949I** Dijkstra calculation performed, on *number* *ipversion* area(s), table *table*

Explanation: As a result of a topology change, the specified route table was recalculated, starting with the Dijkstra calculation.

In the message text:

- **number**: The number of attached OSPF areas affected by the route table calculation.
- **ipversion**: The version of IP that OSPF is running. Possible values are:
  - IPv6: OSPF for IPv6
  - IPv4: OSPF for IPv4
- **table**: The name of the route table that was recalculated. The *table* value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: None.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFRTTBL, EZA6RSRT

Routing code: 10

Descriptor code: 12

Example:

EZZ7949I Dijkstra calculation performed, on 2 IPv4 area(s), table EZBMAIN

---

**EZZ7950I** Network LSA with old Advertising Router: *(type,destination,source)*

Explanation: A network links advertisement having one of our addresses as Link State ID, but whose Advertising Router is not our Router ID, was received. These advertisements are flushed, as they are assumed to be out-of-date.

System action: The advertisement is flushed.

Operator response: None.

System programmer response: None.

Module: SPFLOOD

---

**EZZ7951I** Reparsing Network LSA: LS_ID

Explanation: A network link is being reparsed, owing to the fact that there are multiple network-LSAs in the network with the same Link State ID. This indicates that a router changed OSPF Router IDs, and originated the same router-LSA before and after the change. This is a normal, but rare, event.

System action: None.
Operator response: None.
System programmer response: None.
Module: SPFPARSE

EZZ7952I FROM sender, AS SCOPE LSA IN STUB AREA: TYP type ID id ORG org

Explanation: OMPROUTE received a link state advertisement (LSA) with autonomous system (AS) scope over an interface attached to an IPv6 stub area. Advertisements with AS scope are not allowed in stub areas. This might indicate a configuration problem on the originating router.

In the message text:
sender The router ID of the neighboring OSPF router.
type The link state advertisement type.
Possible values are:
2001 Router-LSA
2002 Network-LSA
2003 Inter-Area-Prefix-LSA
2004 Inter-Area-Router-LSA
4005 AS-External-LSA
0008 Link-LSA
2009 Intra-Area-Prefix-LSA
id The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2740.
org The router ID of the originator of the advertisement.
System action: The LSA is ignored.
Operator response: Contact the system programmer.
System programmer response: Verify that OMPROUTE and the sending router agree on whether or not the attached area is a stub area. See the z/OS Communications Server: IP Configuration Reference for more information about defining areas. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.
Module: EZA6RSPL
Procedure name: spf_rupd6
Example:
EZZ7952I FROM 10.2.3.4, AS SCOPE LSA IN STUB AREA: TYP 4005 ID 5 ORG 10.2.3.1

EZZ7953I FROM sender, RESERVED SCOPE LSA: TYP type ID id ORG org

Explanation: A link state advertisement (LSA) was received with an incorrect scope value. The scope value is indicated in the first three bits of the link state type. This probably indicates a code error on the sending router.

In the message text:
sender The router ID of the neighboring router.
type The link state advertisement type.
Possible values are:
2001 Router-LSA
2002 Network-LSA
id     The link state ID value. This value identifies the portion of the internet environment that is being described by the LSA. The contents of this field depend on the type value. For more information on this value, see RFC 2740.

org    The router ID of the originator of the advertisement.

System action: The LSA is ignored.

Operator response: Contact the system programmer.

System programmer response: Contact the vendor of the sending router. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: EZA6RSPL

Procedure name: spf_rupd6

Example:
EZZ7953I FROM 10.2.3.4, RESERVED SCOPE LSA: TYP 7000 ID 5 ORG 10.2.3.1

EZZ7954I IPV6 OSPF ADJACENCY FAILURE, NEIGHBOR neighbor, OLD STATE ostate, NEW STATE nstate, EVENT event

Explanation: The specified event was generated, causing the specified OSPF adjacency to transition to the specified new state.

ostate and nstate are Neighbor State Codes. The Neighbor State Codes are described in RFC 1583. See Appendix A, “Related protocol specifications,” on page 931 for information about accessing RFCs. The Neighbor State Codes can be one of the following:

1     Down
2     Attempt
4     Init
8     2-way
16    ExStart
32    Exchange
64    Loading
128   Full

event is the Neighbor Event Code. The Neighbor Event Codes are described in RFC 1583. See Appendix A, “Related protocol specifications,” on page 931 for information about accessing RFCs. The Neighbor Event Codes can be one of the following:

7     SeqNumberMismatch
8     BadLSReq
10    1-way
11    KillNbr
12    InactivityTimer
13    LLDown
EZZ7955I  BAD LENGTH IPV6 LINK STATE ADVERTISEMENT RECEIVED FROM neighbor

Explanation: A Link State Update packet was received from the specified neighbor. OMPROUTE detected one of the following problems in the link state advertisements (LSAs) contained in the packet:

- The sum of the length values specified in the headers of the LSAs contained in the packet exceeds the length value specified in the OSPF header of the packet.
- An LSA header length field value is smaller than the length of the LSA header.
- The number of entries in an LSA does not correlate with the LSA header length field value. For example, an incorrect number of prefix values in a Link LSA or Intra-Area Prefix LSA.
- The address prefix in an LSA that contains address prefixes does not correlate with the address prefix length field value.

In the message text:

neighbor    The router ID of the neighboring router.

System action: The LSA is discarded.

Operator response: Contact the system programmer.

System programmer response: Contact the manufacturer of the OSPF application on the source router to report the problem. For additional information, including instructions on gathering documentation, see diagnosing OMPROUTE problems in z/OS Communications Server: IP Diagnosis Guide.

Module: EZA6RSPE, EZA6RSPL

Procedure name: spf_rupd6

Example:
EZZ7955I BAD LENGTH IPV6 LINK STATE ADVERTISEMENT FROM 10.2.3.4

EZZ7956I  OSPF area area not configured, interface interface not installed

Explanation: This message is displayed on router startup when an OSPF interface is configured, but the attached area configured for the interface is not a configured area.

System action: OMPROUTE continues, but the specified interface will not be used as an OSPF interface.

Operator response: None.

System programmer response: Modify the OMPROUTE configuration file to correct the Attaches_To_Area parameter on the specified OSPF_Interface or IPv6_OSPF_Interface statement, if incorrect, or to configure the area.

Module: SPFCONF, EZAORYAC, EZA6RSPN
**EZZ7957I • EZZ7960I**

**EZZ7957I IPv6 OSPF Interface name is not an IP interface, interface not installed**

**Explanation:** This message is displayed during OMPROUTE startup when an IPv6 OSPF interface is configured to OMPROUTE, and this interface was not installed on the TCP/IP stack.

**System action:** The IPv6 OSPF interface is not installed.

**Operator response:** Contact the system programmer.

**System programmer response:** Modify the OMPROUTE configuration file or the TCP/IP stack configuration, ensuring that the specified interface is configured in both.

**Module:** EZA6RSPN

**Procedure name:** spfconf6

**EZZ7958I IPv6 OSPF Interfaces**

**Explanation:** This message is produced in response to a DISPLAY TCPIP, OMPROUTE command. See the DISPLAY TCPIP, OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZA6RSXF

**Procedure name:** spfc_ifc6

**EZZ7959I IPv6 OSPF Interface Details**

**Explanation:** This message is produced in response to a DISPLAY TCPIP, OMPROUTE command. See the DISPLAY TCPIP, OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZA6RSXF

**Procedure name:** spfc_difc6

**EZZ7960I IPV6 OSPF INTERFACES name1 AND name2 DISCOVERED ON SAME LINK WITH DIFFERENT INSTANCE ID VALUES**

**Explanation:** OMPROUTE determined that the two IPv6 OSPF interfaces identified by name1 and name2 are attached to the same link. This might have been determined due to the interfaces being configured to OMPROUTE with a common prefix parameter or due to OSPF protocol packets sent by one interface being received by the other interface. In addition, the two interfaces are using different instance ID values, either explicitly configured using the INSTANCE parameter of the IPV6_OSPF_INTERFACE statement or inherited from the INSTANCE parameter of the IPV6_OSPF statement. OMPROUTE supports multiple instances, but does not keep separate link state databases by instance.

name1 and name2 are the names of the two interfaces.

**System action:** Both interfaces will participate in the IPv6 OSPF protocol. Each interface will communicate only with those routers on the link that are using the same instance ID value as that interface is using. However, because OMPROUTE does not keep separate link state databases by instances, OMPROUTE will include the link state information learned over one interface in the set of information sent over the other interface, thus mixing together the two sets of link state information.

**Operator response:** Contact the system programmer

**System programmer response:** If you do not intend to have these two interfaces use different instance ID values or you do not want OMPROUTE to mix the two sets of link state information, modify the OMPROUTE configuration.
file to configure common instance ID values for the two interfaces using the INSTANCE parameter of the
IPV6_OSPF_INTERFACE statement. If you modify OMPROUTE configuration as a result of the message, stop and
restart OMPROUTE for the changes to take effect.

**Module:** EZA6RCFG, EZA6RSPF

---

**EZZ7961I** Demand circuit support active for ipversion area area

**Explanation:** This message is displayed when there are no more DC bit clear LSAs in any of the area’s link state
databases and it is valid to set the DoNotAge bit.

*ipversion* is the IP version that OSPF is running. Possible values for *ipversion* are:

- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFUTIL, EZA6RSTL

---

**EZZ7962I** Demand circuit support not active for ipversion area area

**Explanation:** This message is displayed when an LSA with the DC bit clear is added to one of the area’s link state
databases and any LSAs with the DoNotAge bit set are purged.

*ipversion* is the IP version that OSPF is running. Possible values for *ipversion* are:

- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFUTIL, EZA6RSTL

---

**EZZ7963I** Unchanged advertisement: typ type id destination org source suppressed for demand interfaces

**Explanation:** This message is displayed when an LSA is not flooded over one or more circuits configured as
demand circuits because there is no change in the content of the LSA from a previous version.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFLOOD, EZA6RSPL

---

**EZZ7964I** Hello’s on interface interface to neighbor neighbor are being suppressed.

**Explanation:** This message is displayed when hello suppression becomes active for the specified interface and
neighbor.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFNBRI, DBXCHG, EZA6RDBX, EZA6RSPB
EZZ7965I  Cbit clear indicate LSA received in ipversion area area from source

Explanation:  This message is displayed when a special type 4 indicate LSA is received in a non stub area to indicate the presence of routers outside the area that do not support DoNotAge processing.

_ipversion_ is the IP version that OSPF is running. Possible values for _ipversion_ are:
- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

_area_ is the dotted-decimal area number.

_source_ is the dotted-decimal router ID of the router that originated the LSA.

System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  SPFPARSE, EZA6RSPP

---

EZZ7966I  Cbit clear indicate LSA originated in ipversion area area

Explanation:  This message is displayed when the local router originates a special type 4 indicate LSA to indicate the presence of routers outside the area that do not support DoNotAge processing.

_ipversion_ is the IP version that OSPF is running. Possible values for _ipversion_ are:
- IPv6 — OSPF for IPv6
- IPv4 — OSPF for IPv4

_area_ is the dotted-decimal area number.

System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  SPFORIG, EZA6RSFR

---

EZZ7967I  advertisement discarded, overflows buffer: LS type type id destination org source

Explanation:  A link state advertisement (LSA) was discarded because it would be too large to fit in the router's data area. A router LSA became excessively large due to a large number of interfaces configured in a single area.

System action:  None.
Operator response:  None.
System programmer response:  Reconfigure the network to reduce the size of the largest link state advertisement or reconfigure the router to increase the size of the router data area to hold the LSA. The size of the router data area to hold LSAs is equal to the largest MTU size defined on an OSPF_INTERFACE configuration statement. The size of the data area can be enlarged by increasing the MTU on an OSPF_INTERFACE statement (for example, on the statement for a VIPA interface).
Module:  SPFLOOD, SPFORIG, EZA6RSFR, EZA6RSPL

---

EZZ7968I  Hello interval missed on interface interface

Explanation:  This message indicates that at least one interface missed hello intervals and the Dead Router Interval is approaching. A routing daemon for a complex network topology has many time-sensitive tasks. On busy systems, if these tasks exceed a certain time period (Dead Router Interval), adjacent routers will determine that OMPROUTE became inactive and drop routes.

_interface_ is the name of the OSPF interface that missed at least two hello intervals.

System action:  OMPROUTE continues.
Operator response: Verify that the interface is active on the network.

System programmer response: OMPROUTE might not be configured with the proper dispatching priority to process the dynamic routing protocol traffic for the network. If adjacent routers drop routes learned from OMPROUTE, then the dispatching priority of OMPROUTE must be increased or the Dead Router Interval lengthened.

Module: SPFTIMER, EZA6RSFT
Procedure name: spf_htim, spf_htim6

EZZ7969I IPV6 AS BOUNDARY ROUTING FORWARDING ADDRESS CANNOT BE LINKLOCAL OR MULTICAST

Explanation: The DEFAULT_FORWARDING_ADDRESS parameter of the IPV6_AS_BOUNDARY_ROUTING configuration statement was coded with a link-local or multicast address. This is not permitted. Forwarding addresses must be unicast and global in scope.

System action: The value is ignored and OMPROUTE continues with no DEFAULT_FORWARDING_ADDRESS.

Operator response: Contact the system programmer.

System programmer response: Ensure that the DEFAULT_FORWARDING_ADDRESS parameter of the IPV6_AS_BOUNDARY_ROUTING configuration statement is either not coded or is coded with a unicast and global-scope IPv6 address.

Module: EZAORYAC
Procedure name: ezaoryac

EZZ7970I IPv6 OSPF Information

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

System action: None.
Operator response: None.
System programmer response: None.

Module: EZA6RSXF
Procedure name: spfc_list6

EZZ7971I IPv6 Virtual Link Details

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

System action: None.
Operator response: None.
System programmer response: None.

Module: EZA6RSXF
Procedure name: spfc_vlink6

EZZ7972I IPv6 OSPF Virtual Links

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

System action: None.
Operator response: None.
System programmer response: None.
**EZZ7973I • EZZ7975I**

**Module:** EZA6RSXF  
**Procedure name:** spfc_vlink6

---

**EZZ7973I IPv6 OSPF Areas**

**Explanation:** This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

---

**EZZ7974I Could not open /dev/null for writing.**

**Explanation:** OMPROUTE opens /dev/null for writing to avoid the display of duplicate OMPROUTE error messages on the system console. The attempt to open /dev/null for writing failed.

**System action:** OMPROUTE ends.

**Operator response:** None.

**System programmer response:** Ensure that /dev is in a write-enabled z/OS UNIX and ensure that the file permissions for /dev/null allow for writing by OMPROUTE.

---

**EZZ7975I jobname ignoring undefined interface interface**

**Explanation:** An interface is defined to the TCP/IP stack that is not defined to OMPROUTE, and the GLOBAL_OPTIONS IGNORE_UNDEFINED_INTERFACES parameter is configured to YES. This interface is ignored by OMPROUTE.

**Results:**

- OMPROUTE does not update BSDROUTINGPARMS values for this interface in the stack.
- Neither the interface home address nor the interface subnet is advertised using RIP or OSPF.
- OMPROUTE does not add a direct route to the interface subnet to the TCP/IP route table.
- Static routes that use this interface are not accepted from TCP/IP, and are not advertised by OMPROUTE.

In the message text:

`jobname`  
The name of the OMPROUTE instance.

`interface`  
An IPv4 or IPv6 interface name.

**System action:** OMPROUTE continues. OMPROUTE ignores this interface.

**Operator response:** Contact the system programmer.

**System programmer response:** If you intended for this interface to be ignored by OMPROUTE, no action is required. If you intended for this interface to be used by OMPROUTE, ensure that the interface is defined in the OMPROUTE configuration file, and check the OMPROUTE interface definitions for misspellings of interface names or other errors that might prevent OMPROUTE from recognizing a definition for this interface.

**User response:** Not applicable

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORCFG,EZA6RCFG,EZA6RSPN,SPFCONF
Routing code: 10
Descriptor code: 12
Example:
EZZ7975I OMPROUT1 ignoring undefined interface QDIO432L

EZZ7976I IPv6 configuration statements ignored, IPv6 disabled on stack

Explanation: One or more IPv6 interfaces are configured in the OMPROUTE configuration file, using either the IPV6_INTERFACE, IPV6_RIP_INTERFACE or IPV6_OSPF_INTERFACE statement. These interface statements are being ignored because IPv6 is disabled on the TCP/IP stack.

System action: The IPv6 configuration statements are ignored.

Operator response: Contact the system programmer

System programmer response: If you want IPv6 dynamic routing, enable IPv6 on the TCP/IP stack. If you do not want IPv6 dynamic routing, you can remove the IPv6 configuration statements from the OMPROUTE configuration file.

Module: EZAORYAC
Procedure name: ezaoriti

EZZ7977I Processing IPv6 interface from stack, address ipaddr, name name, index index, flags flags, flags2 flags2

Explanation: The specified interface address is defined to the TCP/IP stack. OMPROUTE has learned of this interface during initialization.

ipaddr is an IP address on the interface that is being processed.
name is the interface's name.
index is the interface's stack index value.
flags are the interface capability flags and are a hexadecimal sum of the following values:

0X'0001'
   The interface is up.

0X'0002'
   The interface is broadcast capable.

0X'0004'
   The interface driver is in debug mode.

0X'0008'
   The interface is in loopback only mode.

0X'0010'
   The interface is a point-to-point interface.

0X'0020'
   The interface does not support trailer encapsulation.

0X'0040'
   The interface is running.

0X'0080'
   The interface is ARP incapable.

0X'0100'
   The interface is in promiscuous mode.

0X'0200'
   The interface is receiving all multicast packets.
The interface is multicast capable.

The interface is point-to-multipoint.

The interface supports Token Ring bridging.

The interface supports extended SAP.

The interface is a Virtual IP Address (VIPA).

flags2 are additional interface capability flags and are a hexadecimal sum of the following values:

0X'02' This is a link-local address.

0X'04' This interface is a dynamic VIPA.

These interface flag values are set by the TCP/IP stack and passed to OMPROUTE.

System action: None.

Operator response: None.

System programmer response: None.

Module: EZA6RCFG

Procedure name: ifinit6

EZZ7978I sendmsg() error, errno=errno, description, errno2=errnojr

Explanation: The indicated error occurred while attempting to send a packet of data to an adjacent router.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

description describes the meaning of the errno.

errojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: If the error is due to the TCP/IP stack going down, OMPROUTE ends.

Operator response: None.

System programmer response: This might be a temporary condition because informational socket packets have not yet been processed. If this message appears repeatedly, take a dump of TCP/IP and OMPROUTE and contact the IBM software support center.

Module: EZA6RIXR

Procedure name: inet_output6

EZZ7979I IPv6 Routing Table

**System programmer response:** None.

**Module:** INRIP

---

**EZZ8004I**  
response received from host source  
**Explanation:** A RIP route table update was received. Note that it might take more than one response packet to transmit the entire route table, especially if the route table is large.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** INRIP, EZA6RINR
**EZZ8005I** • **EZZ8009I**

---

**EZZ8005I**  bad command code command received from host source  

Explanation: A RIP message was received with an unrecognized command code. This is probably caused by an error or out of date software in the source host.  

System action: The received RIP packet is ignored.  

Operator response: None.  

System programmer response: Contact the manufacturer of the source host and report the problem.  

Module: INRIP, EZA6RINR

---

**EZZ8006I**  response received from off network host source  

Explanation: A RIP routing update response was received from a machine that was not directly attached to the network the response came in on. Because normal RIP software is generally written to send data only to connected nets, this is probably indicative of a hostile event.  

System action: The packet is discarded.  

Operator response: None.  

System programmer response: Examine audit trails and other information to determine the original source host.  

Module: INRIPIN

---

**EZZ8007I**  Global RIP filters must be type NOSEND or NORECEIVE  

Explanation: Only filter types of NOSEND or NORECEIVE are valid for a global RIP filter.  

System action: OMPROUTE ends.  

Operator response: None.  

System programmer response: Correct the value coded for the specified keyword in the OMPROUTE configuration file.  

Module: EZAORYAC

---

**EZZ8008I**  dynamic route to destination from source disallowed  

Explanation: A dynamic route was received but is being ignored as it does not match the types of routes configured to be accepted on the interface.  

System action: Received dynamic route is ignored.  

Operator response: None.  

System programmer response: If you want the route to be accepted, either modify the types of routes to be accepted on the interface or add an ACCEPT_RIP_ROUTE/IPV6_ACCEPT_RIP_ROUTE statement to the configuration to explicitly allow the route.  

Module: INRIPIN, EZA6RIRP

---

**EZZ8009I**  network destination now unreachable via router router, deleted, table table  

Explanation: An incoming RIP update, from the router that was previously listed as the next hop to the destination network, announced that the destination is unreachable (at metric ‘infinity’). The RIP route to that destination is being deleted.  

In the message text:  

destination  

   The IP address of the destination that is now unreachable.  

router  

   The IP address of the router through which the destination is now unreachable.
**EZ8010I** update route to net destination at metric metric hops via router router, table table

**Explanation:** A new (better) route to the given destination was learned using RIP and was installed.

In the message text:

- **destination**: The IP address of the route destination for which there is an update.
- **metric**: The route's metric.
- **router**: The IP address of the router through which the destination is reached.
- **table**: The name of the route table in which the new route was installed. The `table` value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** The new route is placed in OMPROUTE's internal route table, replacing any existing route to the same destination. The new route is also added to the TCP/IP stack's route table.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

EZ8010I network 172.16.0.0 now unreachable via router 192.168.92.3, deleted, table EZBMAIN
**EZ8012I • EZ8016I**

System programmer response: None.
Module: INRIPOUT, EZA6RIXR

---

**EZ8012I**  Sending broadcast response to address destination in count packets with number routes

Explanation: The router is sending a normal RIP broadcast update (triggered either by a timer or a change in the route table) to the specified address.

System action: None.
Operator response: None.
System programmer response: None.
Module: INRIPOUT

---

**EZ8013I**  Sending response to address destination in count packets with number routes

Explanation: The router is sending a RIP update (triggered by a request from another host) to the specified address.

System action: None.
Operator response: None.
System programmer response: None.
Module: INRIPOUT

---

**EZ8014I**  Blackhole RIP filters must be type NOSEND or NORECEIVE

Explanation: Only filter types of NOSEND or NORECEIVE are valid when * is coded as the destination network.

System action: OMPROUTE ends.
Operator response: None.
System programmer response: Correct the value coded for the specified keyword in the OMPROUTE configuration file.
Module: EZAORYAC

---

**EZ8015I**  Sending packet to destination

Explanation: A RIP packet (either a route table update, or when an interface first comes up, a request) was sent to the specified destination.

System action: None.
Operator response: None.
System programmer response: None.
Module: INRIPOUT, EZA6RIXR

---

**EZ8016I**  Global RIP Filters

Explanation: This message precedes the display of the global RIP filters in response to the DISPLAY TCPIP,proc,OMPROUTE,RIP,FILTERS command.

System action: None.
Operator response: None.
System programmer response: None.
Module: INRPCON
EZZ8017I  network route to destination timed out, table table

Explanation: There is a route (in the specified route table to the specified destination) that uses a router that has not been heard from for 180 seconds. The route is marked unreachable.

In the message text:

destination
   The IP address of the destination that is marked unreachable.

table
   The name of the route table in which the route is marked unreachable. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: The route is marked unreachable in OMPROUTE's internal route table and is deleted from the TCP/IP stack's route table.

Operator response: None.

System programmer response: None.

User response: None.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: INRIPTIM, EZA6RIPT

Routing code: 10

Descriptor code: 12

Example:

EZZ8017I network route to 162.44.112.192 timed out, table EZBMAIN

EZZ8018I  network route to destination deleted, table table

Explanation: There is a route (in the specified route table to the specified destination) that uses a router that has not been heard from for 300 seconds. The route was previously marked unreachable, and is now being deleted.

In the message text:

destination
   The IP address of the destination that is being deleted.

table
   The name of the route table from which the route is being deleted. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: The route is deleted from OMPROUTE's internal route table.

Operator response: None.

System programmer response: None.

User response: None.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: INRIPTIM, EZA6RIPT

Routing code: 10

Descriptor code: 12

Example:

EZZ8018I network route to 10.1.0.0 deleted, table EZBMAIN
EZZ8019I  Mismatch version version received from host source

Explanation: The version field in the received RIP header did not match the configured version on the receiving interface.

System action: The received RIP packet is ignored.

Operator response: None.

System programmer response: Modify the configuration on either the source or local router, ensuring that the RIP version configured for the appropriate interfaces match.

Module: INRIP

EZZ8020I  Authentication error received from host source

Explanation: A RIP packet from the specified host was rejected due to an authentication error caused by either invalid authentication info or authentication not being enabled. This is probably caused by a misconfiguration.

System action: None.

Operator response: None.

System programmer response: Modify the configuration on either the source or local router, ensuring that the authentication configurations are consistent.

Module: INRIP

EZZ8021I  sending version response to address destination from source in count packets with number routes

Explanation: The router is sending a normal update of the specified RIP version (triggered either by a timer or a change in the route table) to the specified address.

version is the version of RIP in use. Values are RIP2 or IPv6RIP.

destination is the IP address of the RIP packet's destination.

source is the source address of the packet that is being sent. If it is an IPv4 RIP packet, this will be the sending interface's home address. If it is an IPv6 RIP packet, this will be the sending interface's link-local address.

count is the number of RIP packets used to send the response.

number is the total number of RIP routes in the response.

System action: None.

Operator response: None.

System programmer response: INRIPOUT, EZA6RIXR

Module: rip_snd_tbl, rip_snd_tbl6

EZZ8022I  Destination dst filtered on dir RIP broadcast (name)

Explanation: A destination on an inbound or outbound RIP broadcast was filtered due to a FILTER statement.

System action: None.

Operator response: None.

System programmer response: None.

Module: INRIPIN, INRIPOUT, EZA6RIRP, EZA6RIXR

EZZ8023I  The RIP routing protocol is disposition

Explanation: Displayed on router startup and when a re-read of the OMPROUTE configuration file results in the RIP protocol being enabled. Indicates operational status of the RIP protocol.

System action: None.
RIP message received on non RIP interface source from destination is ignored.

Explanation: A RIP routing message was received on an interface that is not configured as a RIP interface or is configured as a RIP interface that will not receive RIP packets.

System action: The packet is discarded.

Operator response: None.

System programmer response: None.

Module: OMPROUTE, EZAORYAC

RIP send to destination fails

Explanation: An attempt to send a RIP packet to the indicated destination failed. This might be a temporary condition, however if the message is issued repeatedly this condition requires attention.

System action: None.

Operator response: None.

System programmer response: Other OMPROUTE messages will give the errno explanation for this failure.

Module: EZAORRRT, EZA6RRRT

RIP packet from router router-name ignored

Explanation: OMPROUTE was configured to ignore RIP packets from router-name.

System action: OMPROUTE continues.

Operator response: If you want to use RIP packets from the specified router, update the OMPROUTE profile to accept RIP packets from this router.

System programmer response: None.

Module: INRIP, EZA6RINR

Procedure name: rip_in, rip_in6

EZZ8031I  IPv6 RIP Route Acceptance

Explanation: This message is produced in response to a DISPLAY TCPIP,,OMPROUTE command. See the DISPLAY TCPIP,,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.
System action: None.
Operator response: None.
System programmer response: None.
Module: EZA6RIPC
Procedure name: lstipad6

EZZ8032I  Received IPv6 RIP message contains incorrect prefix length length

Explanation: An IPv6 RIP message was received that contains a route entry with the specified incorrect prefix length. The correct range is 0-128.

length is the received incorrect prefix length.
System action: The incorrect route entry is ignored. Processing continues with the next entry in the message.
Operator response: None.
System programmer response: Contact the administrator of the IPv6 RIP application on the source router to report the problem.
Module: EZA6RIRP, EZA6RIXR
Procedure name: rip_update6, rip_snd_partial6
EZZ8033I Received IPv6 RIP message contains incorrect next hop address addr

Explanation: An IPv6 RIP message was received that contains a next hop entry with the specified incorrect next hop address. Correct next hop addresses are link-local.

addr is the incorrect address that was received.

System action: The originator of the message is considered to be the next hop for all routes that follow the incorrect next hop entry until the end of the message or until another next hop entry is encountered in the message.

Operator response: None.

System programmer response: Contact the administrator of the IPv6 RIP application on the source router to report the problem.

Module: EZA6RIRP
Procedure name: rip_update6

EZZ8034I Received IPv6 RIP message contains incorrect prefix pref

Explanation: An IPv6 RIP message was received that contains a route entry with the specified incorrect prefix. This prefix is incorrect because it is either multicast or link-local.

pref is the incorrect prefix that was received.

System action: The incorrect route entry is ignored. Processing continues with the next entry in the message.

Operator response: None.

System programmer response: Contact the administrator of the IPv6 RIP application on the source router to report the problem.

Module: EZA6RIRP
Procedure name: rip_update6

EZZ8035I Received IPv6 RIP message contains incorrect metric value

Explanation: An IPv6 RIP message was received that contains a route entry with the specified incorrect metric. Correct metrics are in the range 1-16.

value is the incorrect metric that was received.

System action: The incorrect route entry is ignored. Processing continues with the next entry in the message.

Operator response: None.

System programmer response: Contact the administrator of the IPv6 RIP application on the source router to report the problem.

Module: EZA6RIRP
Procedure name: rip_update6

EZZ8036I The IPV6 RIP routing protocol is disposition

Explanation: This message is displayed on router startup and when a re-read of the OMPROUTE configuration file results in the IPv6 RIP protocol being enabled. It indicates the operational status of the IPv6 RIP protocol.

disposition is the status of the IPv6 RIP protocol. Values are enabled or disabled.

System action: None.

Operator response: None.

System programmer response: None.
Module: OMPROUTE, EZAORYAC
Procedure name: main, ezaoryac
**EZZ8050I • EZZ8052I**

**EZZ8050I**  Updating BSD RouteParms for link *linkname*, MTU *mtuval*, metric *metricval*, subnet *subnetval*,
destination *destval*

**Explanation:** OMPROUTE is updating the stack’s BSD Routing Parameters for the specified link so that it will agree
with the data that is being used by OMPROUTE.

**System action:** None.
**Operator response:** None.
**System programmer response:** None.
**Module:** EZAORMUP

---

**EZZ8051I**  Error deleting all dynamic *version* stack routes, return code *retcode*, ioctl errno=errno, description=
errno2=errnojr, table *table*

**Explanation:** An attempt to delete all dynamic routes from the stack’s main route table, or a specific TCP/IP stack
policy-based route table, all stack route tables of the specified version failed for the specified reason.

In the message text:

**version**
The IP version whose routes OMPROUTE attempted to delete. Possible values are IPv4 or IPv6.

**errno**
The z/OS UNIX System Services return code. These return codes are listed and described in the return codes
information in z/OS UNIX System Services Messages and Codes.

**description**
Describes the meaning of the errno.

**errnojr**
The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in
the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes
where the reason codes are listed.

**table**
The stack route table or tables in which there was an error deleting all dynamic routes. The *table* value is
EZBMAIN (for the main route table), ALL (for all route tables), or the name of a policy-based route table

**System action:** OMPROUTE ends.
**Operator response:** Review the error code description to determine the cause of the problem and the appropriate
response.
**System programmer response:** None.
**User response:** None.
**Problem determination:** None.
**Source:** z/OS Communications Server TCP/IP: OMPROUTE
**Module:** EZAORRTI, EZA6RRTI
**Routing code:** 10
**Descriptor code:** 12
**Example:**
EZZ8051I Error deleting all dynamic IPv4 stack routes, return code -1, ioctl errno=1122: EDC8122I No buffer space available, errno2=74420324 , table SECHIGH

---

**EZZ8052I**  *jobname* send to *ipaddr* blocked by *blocker* when using *intfname*

**Explanation:** OMPROUTE cannot send to the IP address indicated using the specified interface because of
restrictions imposed by security policies implemented on the TCP/IP stack.

If the specified IP address is a multicast address, this message is written to the console. The inability to send to any
of its OSPF multicast addresses disables OSPF. The inability to send to any RIP version 2 or IPv6 RIP multicast addresses disables that version of RIP or IPv6 RIP. Otherwise, only the interface or IP address that is being blocked is affected, and this message is a debug message that is seen only if OMPROUTE debug messages are enabled.

In the message text:

jobname
The job name of the OMPROUTE application.

ipaddr
The IP address to which OMPROUTE is unable to send using intfname.

intfname
The name of the interface that OMPROUTE is unable to use to send to ipaddr.

blocker
The type of security policy that is blocking OMPROUTE. Possible values are:

NETACCESS
OMPROUTE is blocked as a result of restrictions coded on NETACCESS statements in the TCP/IP profile.

TCPIP
OMPROUTE is blocked as a result of other security policies, including, but not limited to, IP security and Policy Agent.

System action: OMPROUTE continues.

Operator response: Contact the system programmer.

System programmer response: Restricting routing daemons using security policies is not recommended and might affect network connectivity. If you do not want these restrictions, ensure that security products are configured so that the OMPROUTE user ID has full network access. If you want OMPROUTE to be restricted from OSPF multicast addresses, consider not running OMPROUTE or running it with OSPF disabled because OSPF will be ineffective without access to its multicast addresses. If you want OMPROUTE to be restricted from RIP version 2 multicast addresses, consider not running OMPROUTE or running it with RIP version 1 only. If you want OMPROUTE to be restricted from IPv6 RIP multicast addresses, consider not running OMPROUTE or running it with IPv6 RIP disabled.

Module: INRIPOUT, EZA6RIXR

Example:
EZZ8052I OMPROUT1 send to 9.67.101.5 blocked by TCPIP when using OSA1

Procedure name: inet_output, inet_output6

EZZ8054I Add failed for net network; bad network number, table table

Explanation: This message is generated when a network cannot be added to the route table because of a bad network number.

In the message text:
EZZ8055I • EZZ8056I

**network**

The IP address of the destination in the route for which the add failed.

**table**

The name of the route table to which the route was not added. The `table` value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** OMPROUTE continues.

**Operator response:** None.

**System programmer response:** If the network is valid, there is a possible internal error. Contact the IBM software support center.

**User response:** None.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** INRTE

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZZ8055I Add failed for net 137.91.251.25; bad network number, table EZBMAIN

---

**EZZ8055I • Re-adding static route to net network , table table**

**Explanation:** This message is generated when a static route to a network is brought back into use.

In the message text:

**network**

The IP address of the destination.

**table**

The name of the route table to which the static route is being added. The `table` value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

**System action:** OMPROUTE continues.

**Operator response:** None.

**Module:** INCONF

---
EZZ8067I Network net_index interface name is inactive

Explanation: This message is generated when an inactive network interface is encountered during initialization, no direct routes will be created on this network.

System action: None.
Operator response: None.
System programmer response: None.
Module: OMPROUTE

EZZ8068I IPv6 INTERFACE DEFINITION FOR interface IS REDUNDANT AND WILL NOT BE USED

Explanation: OMPROUTE found an IPV6_INTERFACE definition in the OMPROUTE configuration file that can never be used because it is superseded by one or more wildcard IPV6_OSPF_INTERFACE, or IPV6_RIP_INTERFACE definitions, or both. When matching stack interfaces to OMPROUTE interface definitions, the IPV6_OSPF_INTERFACE and IPV6_RIP_INTERFACE definitions are searched before the IPV6_INTERFACE definitions. If an IPV6_OSPF_INTERFACE or an IPV6_RIP_INTERFACE definition is found for the interface, IPV6_INTERFACE definitions are not considered, even if they are explicit, or are more specific wildcards than the IPV6_RIP_INTERFACE or IPV6_OSPF_INTERFACE definitions that were found. See the z/OS Communications Server: IP Configuration Guide for more information.

interface is the name of the interface defined to OMPROUTE

System action: OMPROUTE deletes the redundant IPv6_INTERFACE definition and processing continues.
Operator response: Contact the system programmer
System programmer response: Review the OMPROUTE method for selecting interface definitions for stack interfaces and ensure that your definitions are correct and will lead to the intended result. See the z/OS Communications Server: IP Configuration Guide for more information.
Module: EZA6RCFG
Procedure name: redundantGenericFound

EZZ8069I IPv6 INTERFACE DEFINITION FOR interface IS REDUNDANT BUT WAS ALREADY USED

Explanation: Processing a RECONFIG command caused a new IPV6_RIP_INTERFACE or IPV6_OSPF_INTERFACE wildcard definition, or both to be added, which would make an existing IPV6_INTERFACE definition redundant. However in this case the IPV6_INTERFACE definition had already been used to configure an installed stack interface before the RECONFIG command was issued, so it cannot be ignored or deleted.

Usually, when matching stack interfaces to OMPROUTE interface definitions, the IPV6_OSPF_INTERFACE and IPV6_RIP_INTERFACE definitions are searched before the IPV6_INTERFACE definitions. If an IPV6_OSPF_INTERFACE or an IPV6_RIP_INTERFACE definition is found for the interface, IPV6_INTERFACE definitions are not considered, even if they are explicit, or are more specific wildcards than the IPV6_RIP_INTERFACE or IPV6_OSPF_INTERFACE definitions that were found. See the z/OS Communications Server: IP Configuration Guide for more information.

interface is the name of the interface defined to OMPROUTE.

System action: Processing continues. The redundant IPv6_Interface is not deleted because it was already used to configure an installed stack interface.
Operator response: Contact the system programmer.
System programmer response: Ensure that you understand how wildcard interfaces are parsed. See the z/OS Communications Server: IP Configuration Guide for more information about defining IPV6 interfaces, if the IPv6 OSPF or IPv6 RIP protocol is used. If you use the RECONFIG command to add interface definitions to OMPROUTE, add the interface definition to OMPROUTE before the interface is installed to the stack. OMPROUTE does not use new definitions added using RECONFIG to configure stack interfaces that are already installed.
Module: EZA6RCFG
Procedure name: redundantGenericFound
EZZ8070I • EZZ8071I

EZZ8070I  jobname Unable to retrieve messages from path_and_file
Explanation: OMPROUTE successfully opened its catalog file but was unable to retrieve messages from the file.

Note: This message is displayed in uppercase on the console.
In the message text:

jobname
The job name of the OMPROUTE instance.

path_and_file
The file name including the path that contains the message catalog.

System action: OMPROUTE uses the internal default messages instead of the messages from the external message catalog.

System programmer response: The inability to retrieve messages might be caused by an z/OS UNIX file system error. If you cannot correct the problem, contact the IBM software support center.

User response: If you want to use the external message catalog, contact the system programmer to correct the error.

Module: OMPROUTE
Procedure name: main

EZZ8071I  jobname Message catalog path_and_file out of date, catalog cattime, expected modtime
Explanation: OMPROUTE determined that the message catalog omprdmsg.cat is out of date. The time stamp found in the message catalog is for a different time than that needed by the OMPROUTE load module.

Note: This message is displayed in uppercase on the console.
In the message text:

jobname
The job name of the OMPROUTE instance.

path_and_file
The file name including the path that contains the message catalog. If the message catalog cannot be found, the path_and_file value is the default message catalog omprdmsg.cat.

cattime
The timestamp found on the message catalog. If the message catalog is not found or cannot be opened, the cattime value is UNKNOWN.

modtime
The timestamp that was expected on the message catalog.

System action: OMPROUTE uses the internal default messages instead of the messages from the external message catalog.

Operator response: If you want to use the external message catalog, contact the system programmer to correct the error.

System programmer response: An out-of-date message catalog can be caused by any of the following conditions:
• The wrong z/OS UNIX file system was mounted.
• The NLSPATH environment variable pointed to an old catalog.
• The service update for the new catalog failed.
If you cannot correct the problem, contact the IBM software support center.

User response: Not applicable.

Problem determination: Not applicable.

Module: OMPROUTE

Example: None.
**EZ8072I**  Received *type* logical connection over *name*, destination *dest*

**Explanation:**  OMPROUTE learned of a status change of the specified type for the logical connection to the specified destination over the specified TCP/IP interface.

**System action:**  OMPROUTE makes any necessary changes to its processing based upon the status change. Also, any necessary changes are made to routes that use this logical connection.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZAORMII

**EZ8073I**  Dynamically added *intf_name* to *jobname* configuration

**Explanation:**  A new OSPF_Interface, RIP_Interface, Interface, IPv6_OSPF_Interface, IPv6_RIP_Interface, or IPv6_Interface statement was successfully read from the OMPROUTE configuration file as a result of issuing F proc,RECONFIG command.

In the message text:

*intf_name*  
The name of the interface that was dynamically added.

*jobname*  
The job name of the OMPROUTE application.

**System action:**  None.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZAORYAC

**EZ8074I**  *jobname* processing error

**Explanation:**  OMPROUTE experienced a processing error.

In the message text:

*jobname*  
The job name of the OMPROUTE application.

**System action:**  OMPROUTE ends. This message is followed by an EZZ805I message that provides the processing return code.

**Operator response:**  Contact the system programmer.

**System programmer response:**  Rectify the problem indicated by the return code given on the EZZ7805I message that follows this one.

**Module:**  OMPROUTE

**EZ8075I**  Retrying queued stack route updates

**Explanation:**  Stack route update attempts that earlier failed and were queued for retry are now being retried. Retries that fail will not be retried again.

**System action:**  OMPROUTE continues.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZAORMUP, EZA6RMUP
EZZ8076I  Stack route update retries complete

Explanation: All stack route updates that were waiting to be retried have been attempted.

System action: OMPROUTE continues.

Operator response: None.

System programmer response: None.

Module: EZAORMUP, EZA6RMUP

EZZ8077I  Ignoring replaceable static route to dest, type mask/prefix using gateway - reason , table table

Explanation: TCP/IP informed OMPROUTE of the specified new replaceable static route in the specified route table. OMPROUTE did not accept the route from TCP/IP for the specified reason.

In the message text:

dest
    The destination of the route that was ignored.

type
    Possible values are:
    subnet mask
        The route is an IPv4 route.
    prefixlen
        The route is an IPv6 route.

mask/prefix
    The subnet mask of the destination of the route that was ignored if the route is an IPv4 route, or the prefix length if the route is an IPv6 route.

gateway
    The gateway used by the replaceable static route to reach the destination.

reason
    The reason OMPROUTE ignored the replaceable static route. The only value for reason is:
    dynamic routes already active
        OMPROUTE is already aware of dynamic routes to the destination, and dynamic routes are preferable to replaceable static routes.

table
    The name of the route table in which the replaceable static route was located. The table value is either EZBMAIN (for the main route table) or the name of a policy-based route table.

System action: Processing continues; the existing routes to the destination specified by the dest value are not modified.

Operator response: If you intended the static route to override dynamic routes, contact the system programmer.

System programmer response: If you intended the static route to override dynamic routes, do not define the static route as replaceable.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORMII, EZA6RMII

Routing code: 10

Descriptor code: 12

Example:
EZZ8077I Ignoring replaceable static route to 9.9.9.0,
    Subnet mask 255.255.255.0 using 9.9.9.1 - dynamic routes already active, table EZBMAIN
EZ8100I  

jobname subagent Starting

**Explanation:** The OMPROUTE subagent is starting to initialize.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**System action:** The OMPROUTE subagent is attempting to connect to the SNMP agent.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAORDPI

---

**EZ8101I**  

jobname subagent Initialization Complete

**Explanation:** The OMPROUTE subagent completed initialization and is ready to start processing.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**System action:** The OMPROUTE subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAORDPI

---

**EZ8102I**  

jobname subagent Internal Error code

**Explanation:** An internal error occurred.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**code**

Possible values are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>mkDPIopen failed</td>
</tr>
<tr>
<td>02</td>
<td>pDPIpacket failed</td>
</tr>
<tr>
<td>03</td>
<td>No DPI response to DPI OPEN packet</td>
</tr>
<tr>
<td>04</td>
<td>SNMP agent rejected the DPI OPEN request</td>
</tr>
<tr>
<td>05</td>
<td>OMPROUTE subagent not authorized to agent</td>
</tr>
<tr>
<td>06</td>
<td>DPIget_fd_for_handle failed</td>
</tr>
<tr>
<td>07</td>
<td>mkDPIregister failed</td>
</tr>
<tr>
<td>08</td>
<td>mkDPIresponse failed</td>
</tr>
<tr>
<td>09</td>
<td>Severe processing error</td>
</tr>
<tr>
<td>10</td>
<td>mkDPIset failed</td>
</tr>
</tbody>
</table>

**System action:** The OMPROUTE subagent is disconnected from the SNMP agent.

**Operator response:** Re-create the problem with the SNMP agent -d trace option and OMPROUTE -s 1 trace option and make sure that Syslog Daemon (syslogd) is running. Contact the TCP/IP administrator.

**System programmer response:** Error information will be written to the syslogd output file. Contact your IBM
software support center with the trace information from the SYSLOGD.

**Module**: EZAORDPI

### EZZ8103I  
**jobname** subagent Shutdown Complete

**Explanation**: OMPROUTE subagent disconnected from the SNMP agent.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**System action**: The OMPROUTE subagent is disconnected from the SNMP agent.

**Operator response**: Restart OMPROUTE subagent.

**System programmer response**: None.

**Module**: EZAORDPI

### EZZ8104I  
**jobname** subagent: duplicate subagent identifier error

**Explanation**: The SNMP agent rejected the DPI OPEN request from the OMPROUTE subagent because another subagent was already connected to the SNMP agent using the same subagent identifier.

In the message text:

*jobname*

The job name of the OMPROUTE application.

**System action**: The OMPROUTE subagent is disconnected from the SNMP agent.

**Operator response**: Ensure that no user DPI programs are using this 1.3.6.1.4.1.2.11.7.3 subagent identifier.

**System programmer response**: None.

**Module**: EZAORDPI

### EZZ8105I  
**jobname** subagent: waiting for group **MIB_Object**

**Explanation**: The OMPROUTE subagent attempted to register the specified MIB object. One of the following could have occurred:

- Another DPI subagent had already registered the requested MIB object with a higher priority.
- The OMPROUTE subagent had successfully registered the specified MIB object, but the SNMP agent received a later registration from another subagent that requested a higher priority than the priority with which the OMPROUTE subagent was currently registered.

In the message text:

*jobname*

The job name of the OMPROUTE application.

*MIB_Object*

The MIB object that OMPROUTE attempted to register.

**System action**: The OMPROUTE subagent will continue processing for the other MIB objects supported by the OMPROUTE subagent. If the MIB object becomes available at a later time the OMPROUTE subagent will begin processing for that MIB object.

**Operator response**: If it is acceptable that a DPI subagent program other than the OMPROUTE subagent provide the processing for the MIB variables in the specified MIB object, then no action is necessary. Otherwise, the other DPI subagent must be ended in order for the OMPROUTE subagent to provide the processing for the variables in the specified MIB object.

**System programmer response**: None.

**Module**: EZAORDPI
**EZZ8106I**  jobname subagent: group MIB_Object unregistered by Manager

**Explanation:** The OMPROUTE subagent received a notification that the MIB object MIB_Object was unregistered. This action was initiated by a request from an SNMP manager.

In the message text:

*Jobname*
The job name of the OMPROUTE application.

*MIB_Object*
The MIB object that was not registered by the manager.

**System action:** The OMPROUTE subagent will continue processing for the other MIB object supported by the OMPROUTE subagent. The variables under the MIB object unregistered by the SNMP Manager will no longer be available.

**Operator response:** If it is acceptable that the specified MIB object is no longer available, then no action is necessary. To regain the unregistered MIB object, the OMPROUTE subagent must be closed by an SNMP Manager. Do this by setting the saStatus for the OMPROUTE subagent to not valid (2). This will cause the OMPROUTE subagent to disconnect from the SNMP agent, then reconnect and reregister all of its supported MIB objects, including any that were previously unregistered by an SNMP Manager request.

**System programmer response:** None.

**Module:** EZAORDPI

---

**EZZ8107I**  jobname subagent: Connection to SNMP agent Dropped

**Explanation:** The OMPROUTE subagent was connected to the SNMP agent, but the connection was broken.

In the message text:

*Jobname*
The job name of the OMPROUTE application.

**System action:** The OMPROUTE subagent will try to reconnect to the SNMP agent until reconnected.

**Operator response:** If the SNMP agent job is not active, restart the SNMP agent. If the SNMP agent is currently active, the OMPROUTE subagent should automatically reconnect to the agent. If this does not occur, then stop the SNMP agent and restart it.

**System programmer response:** None.

**Module:** EZAORDPI

---

**EZZ8108I**  jobname subagent: reconnected to SNMP agent

**Explanation:** The OMPROUTE subagent reconnected to the SNMP agent after detecting that the prior connection had been broken.

In the message text:

*Jobname*
The job name of the OMPROUTE application.

**System action:** The OMPROUTE subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZAORDPI

---

**EZZ8109I**  jobname subagent: Connecting to loopback address to SNMP agent

**Explanation:** The OMPROUTE subagent was unable to resolve the local host address and is using the loopback address to connect to the SNMP agent instead of the host address.

In the message text:
jobname

The job name of the OMPROUTE application.

System action: The OMPROUTE subagent will try to connect to the agent using the loopback address.

Operator response: Contact the System Programmer.

System programmer response: The following should be considered:

- Ensure that default home internet address is valid in the PROFILE.TCPIP data set.
- If the loopback address is used to connect to the SNMP agent, and a password other than the SNMP agent's -c default password is used by the OMPROUTE subagent when connecting, then the password used by the OMPROUTE subagent must be defined for the loopback address 127.0.0.1 in the SNMP agent's configuration data file.
- If possible, correct the indicated error. If necessary, contact your IBM software support center with the trace output.

Module: EZAORDPI

EZZ8110I Unable to start jobname subagent

Explanation: A MODIFY ROUTESA command was entered to enable the OMPROUTE subagent, but the subagent was unable to be started.

In the message text:

jobname

The job name of the OMPROUTE application.

System action: OMPROUTE processing continues without the OMPROUTE subagent.

Operator response: Re-create the problem with the OMPROUTE -d3 trace option. Contact the TCP/IP administrator.

System programmer response: Error information will be written to the debug output destination file. This defaults to stdout, but can be written to a file by using the OMPROUTE_DEBUG_FILE environment variable before starting OMPROUTE. Contact your IBM software support center with the resulting debug information.

Module: EZAORRTI

EZZ8111I jobname subagent is already disposition

Explanation: A MODIFY ROUTESA command was entered to enable or disable the OMPROUTE subagent, but the subagent was already enabled or disabled.

In the message text:

jobname

The job name of the OMPROUTE application.

System action: The OMPROUTE subagent remains enabled or disabled.

Operator response: None.

System programmer response: None.

Module: EZAORRTI

EZZ8120I Non-matching Instance ID, from ipaddr, type packettype

Explanation: An IPv6 OSPF packet was received whose instance identifier does not match the receiving interface's instance identifier. This message is only issued once for each source IP address. Messages for subsequent packets from the same source are only issued to the OMPROUTE debug trace.

ipaddr is the source IP address of the packet.

packettype is the type of OSPF packet. Values are:

1 Hello
2 Database description
3 Link state request
4 Link state update
5 Link state acknowledgment

System action: The packet is ignored. Processing continues.
Operator response: Contact the system programmer.
System programmer response: If multiple instances of IPv6 OSPF are running on the attached link, this might not be an error if the packet was for an instance other than the one for which the receiving interface was coded.
Verify that the instance ID for the receiving IPv6_OSPF_INTERFACE is correct.
See the [IPv6_OSPF_INTERFACE statement](z/OS Communications Server: IP Configuration Reference) for more information about coding the instance ID.

Module: EZA6RSPF
Procedure name: inspf6

EZZ8121I IPV6 OSPF INTERFACES interface1 AND interface2 DETECTED ON SAME LINK, backup_interface SET AS BACKUP

Explanation: OMPROUTE determined that two interfaces connect to the same multiaccess link. The IPv6_OSPF_INTERFACE statement for neither interface indicates that it is the primary interface for the link. OMPROUTE selected one interface as the primary interface and set the other interface as a backup interface.
interface1 and interface2 are the names of the two interfaces.
backup_interface is the name of the interface that OMPROUTE set as a backup interface for the multiaccess link.

System action: OMPROUTE continues. The interface selected as primary will carry the IPv6 OSPF protocol traffic for the link. Failure of the primary interface results in automatic switching of IPv6 OSPF protocol traffic to one of the backup interfaces.
Operator response: Contact the system programmer.
System programmer response: Configure one of the interfaces that connect to the multiaccess link as the primary interface for the link. For more information about how to code a primary interface, see the PARALLEL_OSPF parameter on the [IPv6_OSPF_INTERFACE statement](z/OS Communications Server: IP Configuration Reference).
User response: Not applicable.

Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZA6RSPF
Routing code: 10
Descriptor code: 12
Automation: Not applicable.
Example:
EZZ8121I IPV6 OSPF INTERFACES OSAQDIO16 AND OSAQDIO26 DETECTED ON SAME LINK, OSAQDIO26 SET AS BACKUP

EZZ8122I IPV6 OSPF INTERFACE DEFINITIONS WILL BE IGNORED BECAUSE NO IPV6/IPV4 ROUTER ID HAS BEEN DEFINED

Explanation: No IPv6 OSPF router ID was coded. In this case OMPROUTE will set the IPv6 OSPF router ID to be equal to the IPv4 OSPF router ID; however no IPv4 OSPF router ID was coded either. Therefore, OMPROUTE has no default to use for this value and will not load IPv6 OSPF.

System action: All IPv6_OSPF_Interface definitions will be ignored.
Operator response: Contact the system programmer.
System programmer response: Ensure that a valid IPv6 OSPF router ID is coded.
See IPv6_OSPF in z/OS Communications Server: IP Configuration Reference for more information about coding the IPv6 OSPF router ID.

Module: EZAORYAC
Procedure name: ezaoriti

EZZ8123I IPv6_OSPF_INTERFACE statements for interface1 and interface2 have PARALLEL_OSPF coded as primary

Explanation: interface1 and interface2 have been determined to connect to the same multiaccess link, and both are coded as primary. Only one interface can be primary on a multiaccess link.

Tip: OMPROUTE considers two multiaccess IPv6 interfaces to be on the same link if they have any prefixes in common.

interface1 and interface2 are the names of the interfaces with the conflicting definitions.

System action: OMPROUTE selects one interface to be primary and the other interface is made a backup.

See the PARALLEL_OSPF parameter on the IPv6_OSPF_INTERFACE statement in the z/OS Communications Server: IP Configuration Reference for more information.

Operator response: Contact the system programmer.

System programmer response: Ensure that only one interface on a link is coded as primary.

Module: EZA6RCFG, EZA6RSPF
Procedure name: chkMulti6, insp6, spfnetup6

EZZ8124I IPv6 OSPF Statistics

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See the DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands.

**Operator response:** None.

**System programmer response:** None.

**Module:** SPFCON

**Procedure name:** spfc_dnbr

---

**EZ8131I** Parameter keyword configured differently on IPv6 OSPF and IPv6 RIP statements for interface name

**Explanation:** OMPROUTE found conflicting keyword values on interface statements (IPv6_OSPF_INTERFACE and IPv6_RIP_INTERFACE) for the same interface. The specified interface name has conflicting values for the specified keyword. This is an invalid configuration, for example, an IPv6_OSPF_INTERFACE and IPv6_RIP_INTERFACE statement for the same interface specify different values for the RT_GAIN keyword.
kwrd is the keyword that has conflicting values.
name is the interface that has the statement with conflicting values.

**System action:** If the message is issued during OMPROUTE initialization, OMPROUTE ends.
If the message is issued during an OMPROUTE reconfiguration, all statements involved in the conflict and occurring in the new configuration are ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** Modify the OMPROUTE configuration file to correct the problem.

**Module:** EZA6RCFG

**Procedure name:** compare_and_complain()

---

### EZZ8132I jobname FOR stackname HAS ALL DYNAMIC ROUTING PROTOCOLS DISABLED

**Explanation:** OMPROUTE completed parsing its configuration file, and all dynamic routing protocols are disabled because none of them are fully configured. OMPROUTE requires at least one dynamic routing protocol to be fully configured. This error might occur because no valid RIP_INTERFACE, OSPF_INTERFACE, IPV6_RIP_INTERFACE or IPV6_OSPF_INTERFACE statements were configured to OMPROUTE. This error might also occur because a routing protocol was not completely configured, for example, failure to configure a router ID for IPv6 OSPF.

In the message text:

jobname
The job name of the OMPROUTE application.

stackname
The job name of the TCP/IP stack to which OMPROUTE has affinity.

**System action:** OMPROUTE continues, waiting for a RECONFIG or stack notification to start a routing protocol.

**Operator response:** Contact the system programmer.

**System programmer response:** If OMPROUTE is to be used for dynamic routing, ensure that at least one of the supported dynamic routing protocols is completely configured. The minimum configuration requirements for each protocol are:
- IPv4 RIP requires at least one RIP_INTERFACE statement.
- IPv4 OSPF requires at least one OSPF_INTERFACE statement.
- IPv6 RIP requires at least one IPV6_RIP_INTERFACE statement.
- IPv6 OSPF requires at least one IPV6_OSPF_INTERFACE statement and a valid router ID for IPv6 OSPF.

**Tip:** A routing protocol can also be inactive if none of the interfaces defined for use with the protocol are installed and active in the stack. Update the stack to add or activate the interfaces so omproute can start the protocol.

**Module:** EZAORCFG

**Procedure name:** cfg_isAnyProtocolReady

---

### EZZ8133I type statement ignored, name already defined to stack

**Explanation:** During OMPROUTE RECONFIG processing, an interface configuration statement was encountered for an interface that was already defined to the TCP/IP stack. When new interface configuration statements are added to the OMPROUTE configuration using RECONFIG, the RECONFIG must be performed before those interfaces are defined to the TCP/IP stack.

type is the type of interface configuration statement that is being ignored.
name is the name of the interface specified on the statement that is being ignored.

**System action:** OMPROUTE continues and the specified statement is ignored.

**Operator response:** None.

**System programmer response:** To add the specified interface to the OMPROUTE configuration, stop and restart OMPROUTE using a configuration file that has been updated to include the new statement.
Module: EZAORYAC
Procedure name: ezaoryac

EZZ8134I OSPF ROUTERID ipaddr IS A DYNAMIC VIPA. THIS IS NOT A RECOMMENDED CONFIGURATION FOR jobname

Explanation: The router ID specified by the ipaddr value, which was either configured or chosen by OMPROUTE, is a dynamic VIPA (DVIPA). Using a DVIPA as a router ID is acceptable, if necessary, but it is not the most efficient method. If the DVIPA is moved to another TCPIP stack, multiple instances of OMPROUTE might use the same router ID, which can cause routing problems.

In the message text:

ipaddr
The IP address selected as the router ID.

jobname
The OMPROUTE job name.

System action: OMPROUTE continues using the DVIPA as its router ID.

Operator response: None.

System programmer response: To avoid this message, modify the OMPROUTE configuration file by providing a configured OSPF interface that is not a dynamic VIPA as the router ID, and restart OMPROUTE. Consider using a static VIPA IP address as the router ID.

User response: Not applicable.

Problem determination: Not applicable.

Module: SPFCONF, SPFCFGCH
Example: None.

EZZ8135I DUE TO SUBNET MASK mask FROM type STATEMENT, IP ADDRESS ipaddr IS THE SUBNET BROADCAST ADDRESS

Explanation: An interface home address cannot be the same as its subnet broadcast address. The OMPROUTE configuration statement that matched the specified IP address included a subnet mask that violated this rule. The subnet broadcast address is obtained by logically ORing the IP address with the bit complement of the subnet mask. For example, the IP address 9.67.104.212 and the subnet mask 255.255.255.0 result in a subnet broadcast address of 9.67.104.255. In this example, the IP address 9.67.104.212 is not the same as subnet broadcast address 9.67.104.255, so the IP address can be used; however, the IP address 9.67.104.255 cannot be used because it is the same as the subnet broadcast address.

In the message text:

ipaddr
The IP address.

mask
The subnet mask value obtained from a statement in the OMPROUTE configuration file. The value was obtained from a statement of the type indicated by the type value. The statement was used for this interface because it explicitly specified the IP address or because it was specified with a wildcard value and the interface matched the wildcard value.

type
The type of OMPROUTE configuration statement from which the subnet mask was obtained. The value of type is either OSPF_Interface, RIP_Interface or Interface.

System action: OMPROUTE continues.

Operator response: None.

System programmer response: Change the value of the IP address in TCPIP, or in the OMPROUTE configuration file, or both, to be an address that is not the broadcast address for the subnet. Change the interface IP address value or subnet mask value so that the IP address is no longer the subnet broadcast address. You can change the IP address.
by modifying the TCPIP PROFILE configuration file, or the OMPROUTE configuration file. The subnet mask can be changed in the OMPROUTE configuration file.

User response: Not applicable.

Problem determination: Not applicable.

Module: EZAORCFG, EZAORYAC

Example: None.

EZZ8136I NO PHYSICAL INTERFACES ARE ATTACHED TO AREA area - OSPF MIGHT NOT FUNCTION PROPERLY

Explanation: The area specified by the area value contains only VIPA interfaces. The area might be disjointed and OSPF might behave unpredictably. If the area specified by the area value is the backbone area (0.0.0.0), then the backbone area is disjointed and OSPF will not calculate routes correctly. If the area specified by the area value is a non-backbone area and there are no physical interfaces to the backbone on the same stack, the VIPA area will not be properly connected to the backbone. The backbone area must be reachable from every area using either a physical interface or an OSPF virtual link.

In the message text:

area

The identifier of the OSPF area in dotted decimal format.

System action: OMPROUTE continues using the area as defined.

Operator response: Notify the system programmer.

System programmer response: To avoid this message, modify the OMPROUTE configuration file so that VIPAs are not isolated in their own area. See the OMPROUTE configuration file in z/OS Communications Server: IP Configuration Reference for more information.

Putting all the VIPAs in an area that is different from the area where all the stack's physical interfaces are located is not the most efficient configuration because all VIPAs will be inter-area resources to all other OSPF areas. In this case, an OSPF virtual link is required to connect that area to the backbone area (0.0.0.0). See steps for configuring OSPF and RIP (IPv4 and IPv6) in z/OS Communications Server: IP Configuration Guide for more information.

User response: Not applicable.

Problem determination: Not applicable.

16 NETS DELETED, 0 NETS INACTIVE

EZZ8138I  jobname discarded a packet that was received on backup ipversion OSPF interface interface

Explanation: This message is produced when an inbound unicast IPv4 or IPv6 packet is received on a backup parallel OSPF Interface. It is required that inbound unicast OSPF packets are received on the primary OSPF interface.

Receiving OSPF packets on a backup OSPF interface can result in the following conditions:
- New OSPF adjacencies cannot form, which prevents OMPROUTE from learning new routes from its neighbors.
- Existing OSPF adjacencies fail with an EZZ7921I message for IPv4 adjacencies, or an EZZ7954I message for IPv6 adjacencies. This causes OMPROUTE to lose any existing routes previously learned from its neighbors.

This scenario might occur if OMPROUTE is running with parallel OSPF interfaces in the same subnet as another OMPROUTE that is the designated router or backup designated router and shares an OSA card in QDIO mode with that other OMPROUTE. If one OMPROUTE has the shared OSA card as the primary OSPF interface and the other OMPROUTE has the shared OSA card as the backup OSPF interface, this message is issued and the OSPF adjacency is not formed.

In the message text:

jobname  The name of the OMPROUTE instance.

ipversion  The IP version (IPv4 or IPv6).

interface  The name of the interface on which the packet was received.

System action: OMPROUTE continues but the inbound packet is discarded.

Operator response: Contact the system programmer.

System programmer response: If the problem is because an OSA card is being shared, change the Router_Priority value to 0 on the OSPF_Interface statement in the OMPROUTE configuration for both systems. This prevents
OMPROUTE from becoming the designated router or backup designated router. If OMPROUTE must be capable of acting as the designated router or backup designated router, code the Parallel_OSPF option on the OSPF_Interface statements to the same value, either Primary or Backup, in the OMPROUTE configuration for both systems.

If the problem persists after taking this corrective action, collect an IP packet trace and an OMPROUTE debug trace and contact the IBM software support center.

**User response:** Not applicable.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** SPF,EZA6RSPF

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZZ8138I OMPROUT1 discarded a packet that was received on backup IPV6 interface QDIO6201

---

**EZZ8140I** jobname is unable to translate MVS system symbols as a result of a symbol translation error return code rc

**Explanation:** OMPROUTE is unable to translate MVS system symbols in the OMPROUTE configuration file.

In the message text:

*jobname* The name of the OMPROUTE instance

*rc* The return code returned by the ASASYMBM symbol translation service. These return codes are documented in z/OS MVS Programming: Assembler Services Reference ABE-HSP

**System action:** If this message is issued during reconfiguration processing, OMPROUTE continues, but symbol translation does not occur. Otherwise, OMPROUTE ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Determine the cause of the failure of ASASYMBM to translate symbols as described in z/OS MVS Programming: Assembler Services Reference ABE-HSP

**User response:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORYAC

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZZ8140I OMPROUT1 is unable to translate MVS system symbols as a result of a symbol translation error return code 8

---

**EZZ8141I** Could not obtain version stack dynamic routing parameters, ioctl errno= errno : description , errno2= errnojr

**Explanation:** OMPROUTE attempted to obtain the dynamic routing parameters configured for policy-based routing from the TCP/IP stack. This attempt failed with the specified error.

In the message text:

*version* The IP version of the dynamic routing parameters that were being obtained when the failure occurred. Possible values are IPv4 or IPv6.
errno
The z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

description
Describes the meaning of the errno.

errnojr
The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: OMPROUTE continues. If the stack is configured for policy-based routing and dynamic routing parameters are configured for any of the policy-based route tables, OMPROUTE will not provide dynamic routing for those policy-based route tables.

Operator response: Save the system log for problem determination and contact the system programmer.

System programmer response: Take a dump of TCP/IP and OMPROUTE and contact the IBM software support Center.

User response: Not applicable.

Problem determination: None

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORRTI

Routing code: 10

Descriptor code: 12

Example:
EZZ8141I Could not obtain IPv4 stack dynamic routing parameters, ioctl errno= 1122 :
   EDC8122I No buffer space available , errno2= 74420324

EZZ8142I Dynamic routing parameter created for table tblname , interface ifname , gateway gwaddr

Explanation: The specified dynamic routing parameter was created for the specified policy-based route table.

In the message text:

 tblname
 The name of the policy-based route table for which the dynamic routing parameter was created.

 ifname
 The name of the interface in the dynamic routing parameter that was created.

 gwaddr
 The address of the next-hop gateway in the dynamic routing parameter that was created.

System action: OMPROUTE continues. The new dynamic routing parameter is used by OMPROUTE to control the dynamic routes that are added to the policy-based route table.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORRTI, EZA6RRTI

Routing code: 10

Descriptor code: 12

Example:
**EZ8143I • EZ8144I**

EZ8142I Dynamic routing parameter created for table SECHIGH, interface OSA1, gateway 10.10.10.1

**EZ8143I**  Dynamic routing parameter deleted for table tablename, interface ifname, gateway gwaddr

**Explanation:** The specified dynamic routing parameter was deleted for the specified policy-based route table.

In the message text:

*tablename*

The name of the policy-based route table for which the dynamic routing parameter was deleted.

*ifname*

The name of the interface in the dynamic routing parameter that was deleted.

*gwaddr*

The address of the next-hop gateway in the dynamic routing parameter that was deleted.

**System action:** OMPROUTE continues. The dynamic routing parameter is no longer used by OMPROUTE to control the dynamic routes that are added to the policy-based route table.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORMII, EZA6RMII

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZ8143I Dynamic routing parameter deleted for table SECHIGH, interface OSA1, gateway 10.10.10.1

---

**EZ8144I**  Policy-based route table tablename created for ipversion

**Explanation:** A policy-based route table was created in the OMPROUTE database for the specified IP version.

In the message text:

*tablename*

The name of the policy-based route table that was created.

*ipversion*

The IP version for which the policy-based route table was created.

**System action:** OMPROUTE continues. OMPROUTE will provide dynamic routing support for the policy-based route table according to the dynamic routing parameters that are created for the table. The creation of dynamic routing parameters is reported using message EZ8142I.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORRTI, EZA6RRTI

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZ8144I Policy-based route table SECHIGH created for IPv4
EZZ8145I  Policy-based route table tblname deleted for ipversion

Explanation:  A policy-based route table was deleted from the OMPROUTE database for the specified IP version.

In the message text:

`tblname`
   The name of the policy-based route table that was deleted.

`ipversion`
   The IP version for which the policy-based route table was deleted.

System action:  OMPROUTE continues. OMPROUTE no longer provides dynamic routing support for the policy-based route table for the specified IP version.

Operator response:  None.

System programmer response:  None.

User response:  Not applicable.

Problem determination:  Not applicable.

Source:  z/OS Communications Server TCP/IP: OMPROUTE

Module:  EZAORMII, EZA6RMII

Routing code:  10

Descriptor code:  12

Example:
EZZ8145I Policy-based route table SECHIGH deleted for IPv4

EZZ8146I  Received delete all dynamic routing parameters notification for ipversion

Explanation:  OMPROUTE received notification from the TCP/IP stack that all dynamic routing parameters defined for all policy-based route tables for the specified IP version have been deleted.

In the message text:

`ipversion`
   The IP version for which a notification was received that all dynamic routing parameters have been deleted.

System action:  OMPROUTE continues. OMPROUTE no longer provides dynamic routing support for any policy-based route tables for the specified IP version. This will change if OMPROUTE receives a notification from the TCP/IP stack that dynamic routing parameters have been added for a policy-based route table for the specified IP version.

Operator response:  None.

System programmer response:  None.

User response:  Not applicable.

Problem determination:  Not applicable.

Source:  z/OS Communications Server TCP/IP: OMPROUTE

Module:  EZAORMII, EZA6RMII

Routing code:  10

Descriptor code:  12

Example:
EZZ8146I Received delete all dynamic routing parameters notification for IPv4
**EZ8147I • EZ8148I**

**EZ8147I**  Received *type* dynamic routing parameters notification for table *tblname* for *ipversion*

**Explanation:** OMPROUTE received notification from the TCP/IP stack that the status of the dynamic routing parameters defined for the specified policy-based route table and for the specified IP version changed.

In the message text:

*type*

The type of status change that occurred for the dynamic routing parameters. Possible values are:

- **addorupdate**
  
The dynamic routing parameters for the policy-based route table were added or updated.

- **delete**
  
The dynamic routing parameters for the policy-based route table were deleted.

*tblname*

The name of the policy-based route table for which the dynamic routing parameter status change occurred.

*ipversion*

The IP version for which the dynamic routing parameter status change occurred.

**System action:** OMPROUTE continues.

- If the dynamic routing parameters were deleted, OMPROUTE no longer provides dynamic routing support for the specified policy-based route table and IP version.
- If the dynamic routing parameters were added or updated, OMPROUTE uses the new dynamic routing parameters to provide dynamic routing support for the specified policy-based route table and IP version.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORMII, EZA6RMII

**Routing code:** 10

**Descriptor code:** 12

**Example:**

EZ8147I Received delete dynamic routing parameters notification for table SECHIGH for IPv4

---

**EZ8148I**  Static route ignored, interface *ifname* not defined to stack for *ipversion*

**Explanation:** OMPROUTE received a static route from the TCP/IP stack. The static route uses an interface that is not defined to the stack for the specified IP version.

In the message text:

*ifname*

The name of the interface that is used in the static route and that is not defined to the stack for the specified IP version.

*ipversion*

The IP version for which the static route is defined and for which the interface is not defined.

**System action:** OMPROUTE continues. The static route that was received is ignored by OMPROUTE and does not appear in the display of the OMPROUTE route table. If the interface is later defined to the TCP/IP stack, the stack resends the static route to OMPROUTE, if the static route is still defined.

**Operator response:** If the specified interface should be defined to the TCP/IP stack, contact the system programmer.

**System programmer response:**

- If the specified interface is defined to the TCP/IP stack, verify that the spelling of the interface name is correct on both the interface definition and the static route definition in the TCP/IP profile. Also, verify that the interface is defined for the IP version that is specified in the message.
If the specified interface is not defined to the TCP/IP stack and you want it to be defined, modify the TCP/IP profile to include the definition of the interface. When you have made the necessary changes to the TCP/IP profile, use the VARY TCPIP,OBEYFILE command to install the updated profile.

If no problems are detected with the definition of the interface or the static route, take a dump of TCP/IP and OMPROUTE and contact the IBM software support Center.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORRTI, EZA6RRTI

Routing code: 10

Descriptor code: 12

Example:

EZZ8149I Static route ignored, interface OSA1 not defined to stack for IPv4

---

**EZZ8149I** Static route ignored, table tblname unknown for ipversion

**Explanation:** OMPROUTE has received a static route from the TCP/IP stack. The static route is from a policy-based route table that is not in the OMPROUTE database for the specified IP version.

In the message text:

- **tblname**
  - The name of the policy-based route table that is not in the OMPROUTE database for the specified IP version.

- **ipversion**
  - The IP version for which the policy-based route table is not in the OMPROUTE database.

**System action:** OMPROUTE continues. The received static route is ignored by OMPROUTE.

**Operator response:** OMPROUTE does not provide dynamic routing for a policy-based route table for an IP version if the route table has no dynamic routing parameters defined for that IP version. The route table is not reported to OMPROUTE for the IP version and will not be in the OMPROUTE database. OMPROUTE does not require knowledge of static routes in the route table for that IP version.

If OMPROUTE should not be providing dynamic routing for the specified policy-based route table and IP version, this message is expected. If OMPROUTE should be providing dynamic routing for the specified policy-based route table and IP version, contact the system programmer.

**System programmer response:** If OMPROUTE should be providing dynamic routing for the specified policy-based route table and IP version, use the `pasearch -T` command to display the dynamic routing parameters configured for the route table. See the [pasearch command](https://publib.boulder.ibm.com/infocenter/comserver/v8r1/topic/com.ibm.zos.v2r1.tcpipt.intrd/admin/pasearch.htm) display policies information in [z/OS Communications Server: IP System Administrator's Commands](https://publib.boulder.ibm.com/infocenter/comserver/v8r1/topic/com.ibm.zos.v2r1.tcpipt.intrd/admin/ipadm administered commands.htm) for more information about using the command. If problems are detected with the definition of the policy-based route table, modify the policy definition. The updated policy will be installed the next time the Policy Agent reads the Routing configuration file.

If no problems are detected with the definition of the policy-based route table, take a dump of TCP/IP and OMPROUTE and contact the IBM software support Center.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORMII, EZA6RMII

Routing code: 10

Descriptor code: 12

Example:

EZZ8149I Static route ignored, table SECLOW unknown for IPv6
There are no version policy-based route tables to display

Explanation: You entered an OMPROUTE RTTABLE or RT6TABLE display command with either the operand PRTABLE=ALL or the operand PRTABLE=tablename. This command requests the display of IPv4 or IPv6 policy-based route tables that are known by OMPROUTE. This message is displayed when no policy-based route tables can be displayed by OMPROUTE in response to the command.

In the message text:

version
The IP version for which no policy-based route tables are displayed.

System action: OMPROUTE processing continues.

Operator response: Policy-based route tables are known by OMPROUTE for an IP version only when they are configured with dynamic routing parameters for that IP version. To make policy-based route tables known by OMPROUTE for the specified IP version, contact the system programmer.

System programmer response: Use the Netstat ROUTe/-r command with the PR modifier to display the policy-based route tables that are known by the TCP/IP stack. See the Netstat ROUTe/-r report information in z/OS Communications Server: IP System Administrator's Commands for information about using the Netstat ROUTe/-r command. Use the pasearch -T command to display configuration details for the policy-based route tables defined to Policy Agent. See the pasearch command display policies information in z/OS Communications Server: IP System Administrator's Commands for information about using the command.

If you discover problems in the configuration of your policy-based route tables, make the appropriate changes to the RouteTable statements in the Policy Agent configuration file. For information about configuring a policy-based route table and configuring a dynamic routing parameter for a policy-based route table, see the RouteTable statement information in z/OS Communications Server: IP Configuration Reference.

If no configuration problems are discovered, contact IBM software support center.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: INCON, EZA6RINC

Routing code: 10

Descriptor code: 12

Example:
EZZ8150I There are no IPv4 policy-based route tables to display

OSPF authentication has been disabled on identifier

Explanation: The OMPROUTE configuration file contains an OSPF_INTERFACE statement or an AREA statement that defines an authentication type, but the authentication key was not specified on the OSPF_INTERFACE statement that defines the interface that has the matching identifier. OSPF authentication has been disabled on the interface that has the matching identifier.

In the message text:

identifier
An identifying characteristic of the interface. For OSPF_INTERFACE statements with an explicit IP address, the identifier value is the IP address of the interface. For OSPF_INTERFACE statements with a wildcard, the identifier value is the wildcard IP address. For VIRTUAL_LINK statements, the identifier value is the generated virtual link name.

System action: OSPF authentication on the specified address is disabled. OMPROUTE processing continues.

Operator response: Contact the system programmer.

System programmer response: Correct the OMPROUTE configuration file by specifying an authentication key. If the interface is a VIPA or if you do not want authentication, code Authentication_Type=NONE on the interface.

User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: SPFCONF, EZAORYAC
Routing code: 10
Descriptor code: 12
Example:
EZZ8151I OSPF authentication has been disabled on 192.168.1.1

EZZ8152I NSSA is unsupported in hello from source over interface - jobname will not form ip_version OSPF adjacency with routerid

Explanation: A hello packet was received from the specified neighbor that is configured in a not-so-stubby area (NSSA). OMPROUTE does not support NSSA for IPv4 or IPv6 OSPF.

In the message text:
source
The interface IP address of the neighboring OSPF router.
interface
The name of the interface on which the hello was received.
jobname
The name of the OMPROUTE instance.
ip_version
The IP version. Possible values are IPv4 or IPv6.
routerid
The neighbor's OSPF router ID.

System action: OMPROUTE continues and the hello packet is discarded. An OSPF neighbor adjacency is not formed with the neighbor that sent the packet.
Operator response: Contact the system programmer.
System programmer response: Modify the configuration on the neighboring source router, ensuring that OMPROUTE and the source router use the same stub area value for the attached network.
User response: Not applicable.
Problem determination: See system programmer response.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: SPFNBR, EZA6RSPB
Routing code: 10
Descriptor code: 12
Automation: Not applicable.
Example:
EZZ81521 NSSA is unsupported in hello from 1.1.1.1 over OSA1 - OMPROUTE1 will not form IPv4 OSPF adjacency with 10.3.3.3

EZZ8153I jobname is unable to open INCLUDE file incl_file found in file_name on line lineno

Explanation: The OMPROUTE instance could not open the specified file that was found on the INCLUDE statement in the specified OMPROUTE configuration file.

In the message text:
jobname
The name of the OMPROUTE instance.
incl_file
   The name of the file to be included with the INCLUDE statement.

file_name
   The name of the OMPROUTE configuration file, or the file that was specified by a nested INCLUDE statement.

lineno
   The line number on which the INCLUDE statement was found.

System action: The INCLUDE statement is not processed. OMPROUTE continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the file exists. If the file is an MVS data set, ensure that it has the record format Variable Blocked and not Fixed Block. Ensure that the syntax of the file name is correct. See the [INCLUDE configuration statement] in [z/OS Communications Server: IP Configuration Reference] for more information. After you correct the INCLUDE statement, restart OMPROUTE.
User response: Not applicable.
Problem determination: See the system programmer response.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORYAC
Routing code: 10
Descriptor code: 12
Automation: Not applicable.

Example:
EZZ8153I OMPROUTX is unable to open INCLUDE file USER1.OMP AREA found in TST.OMPROUTE.CONF on line 9

EZZ8154I The syntax of the INCLUDE statement is not valid for jobname in config_file_name on line lineno

Explanation: An INCLUDE statement that did not specify a file name was found in the configuration file specified by the config_file_name value.

In the message text:

jobname
   The name of the OMPROUTE instance.

config_file_name
   The name of the OMPROUTE configuration file, or the file that was specified by a nested INCLUDE statement.

lineno
   The line number on which the INCLUDE statement was found.

System action: The INCLUDE statement is ignored. OMPROUTE continues.
Operator response: Contact the system programmer.
System programmer response: Correct the INCLUDE statement. See the [INCLUDE configuration statement] in [z/OS Communications Server: IP Configuration Reference] for more information. After you correct the INCLUDE statement, restart OMPROUTE.
User response: Not applicable.
Problem determination: See the system programmer response.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORYAC
Routing code: 10
Descriptor code: 12
Automation: Not applicable.
Example:
EZZ8154I The syntax of the INCLUDE statement is not valid for OMPROUT1 in TST.OMPROUTE.CONF on line 12

EZZ8155I The number of nested INCLUDES exceeds the maximum for jobname in file_name on line lineno

Explanation: The maximum limit of nested INCLUDE statements has been reached. The INCLUDE statement that is found on the specified line in the OMPROUTE file will not be processed.

In the message text:

jobname
   The name of the OMPROUTE instance.

file_name
   The file that was included from the last valid nested INCLUDE statement.

lineno
   The line number on which the INCLUDE statement that exceeded the limit was found.

System action: The specified INCLUDE statement value is ignored. OMPROUTE continues.

Operator response: Contact the system programmer.

System programmer response: Change the configuration file or nested INCLUDE files to allow the necessary INCLUDE files to be processed. After you correct the INCLUDE statement, restart OMPROUTE.

User response: Not applicable.

Problem determination: See system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORYAC

EZZ8156I jobname is unable to translate MVS system symbols or process INCLUDE statements as a result of error errno: errno description errno2: errnojr

Explanation: OMPROUTE is unable to translate MVS System Symbols or to process INCLUDE statements in the OMPROUTE configuration file because an internal file open failed.

In the message text:

jobname
   The name of the OMPROUTE instance.

errno
   The z/OS UNIX System Services return code. These return codes are listed and described in the errno information in z/OS UNIX System Services Messages and Codes

description
   Describes the meaning of the errno.

errnojr
   The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the errnojr information in z/OS UNIX System Services Messages and Codes where the reason codes are listed.

System action: OMPROUTE ends.

Operator response: Contact the system programmer.

System programmer response: Review the errno and errnojr descriptions returned and correct the error. If the error
EZZ8157I

cannot be corrected, gather the information specified in problem determination section and contact IBM software support center.

User response: Not applicable.

Problem determination: Use an OMPROUTE trace level of -d3 to gather more information about the failure to translate symbols or the failure to process INCLUDE statements.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORYAC

Routing code: 10

Descriptor code: 12

Automation: Not applicable.

Example:
EZZ8156I OMPROUT1 is unable to translate MVS system symbols or process INCLUDE statements as a result of error errno: 61 EDC5061I An error occurred when attempting to define a file to the system errno2: 12140272

EZZ8157I jobname ipversion OSPF detected futile neighbor state loop with neighbor neighbor on interface interface after threshold_value adjacency attempts

Explanation: This event was generated for the neighboring designated router (specified by the neighbor value), which exceeded the loop threshold for the number of adjacency attempts allowed before reaching full adjacency. This event might be caused by a problem with remote networking hardware. If OMPROUTE finds a redundant parallel interface (primary or backup) that can reach the same neighbor in the LAN, OMPROUTE changes the interface state to SUSPEND and issues message EZZ8158I to indicate that OMPROUTE will attempt to establish an adjacency over the redundant interface. If OMPROUTE does not find a redundant parallel interface, OMPROUTE continues to attempt to establish an adjacency to that neighbor over the same interface. See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about futile neighbor state loops.

In the message text:

jobname
The name of the OMPROUTE application.

ipversion
The IP version that OSPF is running. Possible values for ipversion are:
- IPv6 OSPF for IPv6
- IPv4 OSPF for IPv4

neighbor
neighbor is one of the following:
- The interface address of the neighboring OSPF router, if the ipversion value is IPv4.
- The router ID of the neighboring OSPF router, if the ipversion value is IPv6.

interface
The name of the local interface over which OMPROUTE failed to form an adjacency with the specified neighbor.

threshold_value
The neighbor state loop threshold value for the number of adjacency attempts with a specified neighbor.

System action: OMPROUTE continues and tries to establish an adjacency with the neighbor over the same interface or over a redundant parallel interface (primary or backup), if one is available.

Operator response: Contact the system programmer

System programmer response: If connectivity problems persist, investigate the reason that the adjacency could not be established. Inspect the remote networking hardware components, such as routers, switches, or cabling, that might contribute to the problem.

User response: Not applicable.
Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFNBR, EZA6RSPB

Routing code: 10

Descriptor code: 12

Automation: This message goes to the console or syslog.

Example: For IPv4:

EZZ8157I OMPROUTE IPv4 OSPF detected futile neighbor state loop with neighbor 10.1.1.2 on interface OSAGBE1 after 10 adjacency attempts

For IPv6:

EZZ8157I OMPROUTE IPv6 OSPF detected futile neighbor state loop with neighbor 10.1.1.5 on interface OSAGBE1 after 10 adjacency attempts

EZZ8158I  

jobname ipversion OSPF could not establish adjacency on interface interface1 - trying to establish adjacency on interface interface2

Explanation: This message was issued because OMPROUTE could not establish an adjacency with a neighbor on the interface specified by the interface1 value. The neighbor is identified in message EZZ8157I. OMPROUTE found a redundant parallel interface (interface2) that can reach the same neighbor on the LAN and OMPROUTE is attempting to establish an adjacency with the neighbor. OMPROUTE will change interface1 to SUSPEND state and interface1 will remain in that state until the interface is recycled or is dynamically activated to allow an adjacency to be established.

In the message text:

jobname
The name of the OMPROUTE application.

ipversion
The IP version that OSPF is running. Possible values for ipversion are:

IPv6 OSPF for IPv6
IPv4 OSPF for IPv4

interface1
The name of the local interface over which OMPROUTE failed to establish an adjacency.

interface2
The name of the redundant parallel interface over which OMPROUTE will now attempt to establish an adjacency.

System action: OMPROUTE continues and will attempt to establish an adjacency with the neighbor over the redundant parallel interface.

Operator response: Contact the system programmer.

System programmer response: If connectivity problems persist, investigate the reason that the adjacency could not be established. Inspect the remote networking hardware components, such as routers, switches, or cabling, that might contribute to the problem.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFCON, EZA6RSXF
Routing code: 10
Descriptor code: 12
Automation: This message goes to console or syslog.

Example:
- Command: F OMPROUTE,OSPF,INTERFACE,NAME=OSAGE1,SUSPEND
  EZZ8159I OMPROUTE MODIFY SUSPEND command for IPv4 OSPF interface OSAGE1 is successful
- Command: F OMPROUTE,IPv6OSPF,INTERFACE,ID=2,SUSPEND
  EZZ8159I OMPROUTE MODIFY SUSPEND command for IPv6 OSPF interface ID=2 is successful

**EZZ8160I** jobname MODIFY ACTIVATE command for ipversion OSPF interface interface is successful

Explanation: A MODIFY console command to activate the specified OSPF interface in the OMPROUTE application was successful.

In the message text:

jobname
The name of the OMPROUTE application.

ipversion
The IP version that OSPF is running. Possible values for ipversion are:

- IPv6 OSPF for IPv6
- IPv4 OSPF for IPv4
interface
The interface value can be one of the following.
  • The interface name if the ipversion value is IPv4 or IPv6.
  • The interface ID if the ipversion value is IPv6. The interface ID is displayed in the form ID=x, where x is the interface ID number.

System action: OMPROUTE continues.
Operator response: None.
System programmer response: None.
User response: None.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: PFCON, EZA6RSXF
Routing code: 10
Descriptor code: 12
Automation: This message goes to console or syslog.
Example:
  • Command: F OMPROUTE,OSPF,INTERFACE,NAME=OSAGE1,ACTIVATE
    EZZ8160I OMPROUTE MODIFY ACTIVATE command for IPv4 OSPF interface OSAGE1 is successful
  • Command: F OMPROUTE,IPV6OSPF,INTERFACE,ID=2,ACTIVATE
    EZZ8160I OMPROUTE MODIFY ACTIVATE command for IPv6 OSPF interface ID=2 is successful

EZZ8161I jobname MODIFY SUSPEND command for ipversion OSPF interface interface failed: error_text

Explanation: A MODIFY console command to suspend the specified OSPF interface in the OMPROUTE application failed for the specified reason.
In the message text:
  jobname  The name of the OMPROUTE application.
  ipversion  The IP version that OSPF is running. Possible values for ipversion are:
    IPv6 OSPF for IPv6
    IPv4 OSPF for IPv4
  interface  The interface value can be one of the following.
    • The interface name if the ipversion value is IPv4 or IPv6.
    • The interface ID if the ipversion value is IPv6. The interface ID is displayed in the form ID=x, where x is the interface ID number.
  error_text  The error_text value can be one of the following.
    interface is VIPA  The specified OSPF interface is a static or dynamic VIPA that is not allowed to be dynamically suspended.
    interface has been deleted  The specified OSPF interface has been deleted according to the TCP/IP profile configuration. A recent VARY TCPIP,OBEYFILE command might have been issued to remove the corresponding interface from the TCP/IP profile configuration.
This condition might occur if the `ipversion` value is IPv6 and a recent `VARY TCPIP,OBEYFILE` command was issued to add the interface to the TCP/IP profile configuration, but the interface was not active.

**interface is already suspended**
The specified OSPF interface might have been suspended previously by the detection of a futile neighbor state loop or by a recent MODIFY command.

**interface is not active**
The specified OSPF interface is not active in the TCP/IP stack. The corresponding interface might not be defined in the TCP/IP profile configuration, a device or link outage might have occurred, or a recent VARY TCPIP command might have been issued to stop the device or interface.

**System action:** OMPROUTE continues.

**Operator response:** None.

**System programmer response:** Apply change based on the error text when appropriate:

**interface is VIPA**
Specify an OSPF interface that is not a static VIPA or a dynamic VIPA.

**interface has been deleted**
Specify an OSPF interface that is defined in the corresponding OMPROUTE and TCP/IP profile configurations. If the `ipversion` value is IPv6 and a recent VARY TCPIP,OBEYFILE command was issued to add the interface to the TCP/IP profile configuration when the interface was not active, use the VARY TCPIP,START command to start the interface so that it can be suspended.

**interface is already suspended**
Specify an OSPF interface that is in an active state [any state other than 1 (Down) and 1* (Suspend)].

**interface is not active**
Specify an OSPF interface that is defined and active in the TCP/IP stack. The OSPF interface must be in an active state [any state other than 1 (Down) or 1* (Suspend)] before it can be suspended.

**User response:** None.

**Problem determination:** See the system programmer response

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

- EZZ8161I OMPROUTE MODIFY SUSPEND command for IPv4 OSPF interface OSAGE1 failed: interface has been deleted
- Command: F OMPROUTE,IPV6OSPF,INTERFACE,ID=2,SUSPEND
- EZZ8161I OMPROUTE MODIFY SUSPEND command for IPv6 OSPF interface ID=2 failed: interface is already suspended

---

**EZZ8162I**

`jobname MODIFY ACTIVATE command for ipversion OSPF interface interface failed: error_text`

**Explanation:** A MODIFY console command to activate the specified OSPF interface in the OMPROUTE application has failed for the specified reason.

In the message text:

- **jobname**
  - The name of the OMPROUTE application.

- **ipversion**
  - The IP version that OSPF is running. Possible values for `ipversion` are:

  - **IPv6**
    - OSPF for IPv6
**IPv4** OSPF for IPv4

**interface**
The *interface* value can be one of the following.
- The interface name if the *ipversion* value is IPv4 or IPv6.
- The interface ID if the *ipversion* value is IPv6. The interface ID is displayed in the form ID=x, where x is the interface ID number.

**error_text**
The *error_text* value can be one of the following.
- **interface is VIPA**
  The specified OSPF interface is a static or dynamic VIPA that is not allowed to be dynamically suspended.
- **interface has been deleted**
  The specified OSPF interface has been deleted according to the TCP/IP profile configuration. A recent VARY TCPIP,OBEYFILE command might have been issued to remove the corresponding interface from the TCP/IP profile configuration.
  This condition might occur if the *ipversion* value is IPv6 and a recent VARY TCPIP,OBEYFILE command was issued to add the interface to the TCP/IP profile configuration, but the interface was not active.
- **interface is already active**
  The specified OSPF interface is not in a suspended state. The interface is currently active, was recently recycled, or was previously activated by a MODIFY command.
- **interface is not active**
  The specified OSPF interface is not active in the TCP/IP stack. The corresponding interface might not be defined in the TCP/IP profile configuration, a device or link outage might have occurred, or a recent VARY TCPIP command might have been issued to stop the device or interface.

**System action:** OMPROUTE continues.

**Operator response:** None.

**System programmer response:** Apply change based on the error text when appropriate:
- **interface is VIPA**
  Specify an OSPF interface that is not a static VIPA or a dynamic VIPA.
- **interface has been deleted**
  Specify an OSPF interface that is defined in the corresponding OMPROUTE and TCP/IP profile configurations. If the *ipversion* value is IPv6 and a recent VARY TCPIP,OBEYFILE command was issued to add the interface to the TCP/IP profile configuration when the interface was not active, use the VARY TCPIP,START command to start the interface so that it can be suspended.
- **interface is already active**
  Specify an OSPF interface that is in a suspended state [a state marked as 1* (Suspend)].
- **interface is not active**
  Specify an OSPF interface that is defined and active in the TCP/IP stack. The OSPF interface must be in a suspended state [a state marked as 1* (Suspend)] before it can be activated.

**User response:** None.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** SPFCON, EZA6RSXF

**Descriptor code:** 12

**Automation:** This message goes to console or syslog.

**Example:**
- Command: F OMPROUTE,OSPF,INTERFACE,NAME=OSAGE1,ACTIVATE
EZZ8162I: OMPROUTE MODIFY ACTIVATE command for IPv4 OSPF interface OSAGE1 failed: interface has been deleted

- Command: F OMPROUTE,IPV6OSP,F,INTERFACE,IF=2,ACTIVATE
EZZ8162I OMPROUTE MODIFY ACTIVATE command for IPv6 OSPF interface ID=2 failed: interface is already active

**EZZ8163I**

stack_name MTU value stack_val for interface differs from omproute_procname MTU value omproute_val

**Explanation:** The TCP/IP stack informed OMPROUTE that the specified interface is defined to the stack. The MTU value defined to the stack for the interface is not the same MTU value that is being used by OMPROUTE for the interface.

In the message text:
- stack_name
  - The name of the TCP/IP stack.
- stack_val
  - The MTU value that is defined to the stack for the interface.
- interface
  - The name of the interface.
- omproute_procname
  - The name of the OMPROUTE instance.
- omproute_val
  - The MTU value that is being used by OMPROUTE for the interface.

**System action:** OMPROUTE continues. All routes that are using the specified interface that are added to the stack route table by OMPROUTE will have the MTU value set to the value that is being used by OMPROUTE.

**Operator response:** Contact the system programmer.

**System programmer response:** Take one of the following actions so that the stack and OMPROUTE will use the same MTU value for the interface:

- If OMPROUTE is using the correct MTU value for the interface:
  1. Use the VARY TCPIP,STOP command to stop the interface.
  2. Issue the VARY TCPIP,OBEYFILE command with a profile that contains an INTERFACE DELETE statement for the interface, followed by an INTERFACE DEFINE statement for the interface that includes the correct MTU value.
  3. Use the VARY TCPIP,START command to start the interface.
  4. (Optional) To make the change to the MTU value permanent in the TCP/IP profile, modify the INTERFACE statement that defines the interface in the TCP/IP profile to specify the value that is being used by OMPROUTE.

  See [IPAQENET OSA-Express QDIO interfaces](z/OS Communications Server: IP Configuration Reference) for information about the INTERFACE statement in the TCP/IP profile.

- If the stack is using the correct MTU value for the interface:
  - Modify any OSPF_INTERFACE, RIP_INTERFACE, and INTERFACE statements that define the interface in the OMPROUTE configuration file to specify the value being used by the stack.
  - If the interface is configured to OMPROUTE using a wildcard configuration statement, you might need to explicitly configure this interface with a separate configuration statement.
  - If this interface is not configured to OMPROUTE and you do not want to add it to the OMPROUTE configuration, modify the OMPROUTE configuration file to include a GLOBAL_OPTIONS statement that specifies IGNORE_UNDEFINED_INTERFACES=YES. See [OMPROUTE configuration file](z/OS) for information about the GLOBAL_OPTIONS statement.

See [VARY TCPIP,START or VARY TCPIP,STOP](z/OS Communications Server: IP System Administrator's Commands) for information about the VARY TCPIP,STOP and VARY TCPIP,START commands. See [VARY TCPIP,OBEYFILE](z/OS Communications Server: IP System Administrator's Commands) for information about the VARY TCPIP,OBEYFILE command.
Communications Server: IP Configuration Reference for information about the OSPF_INTERFACE, RIP_INTERFACE, INTERFACE, and GLOBAL_OPTIONS statements in the OMPROUTE configuration file.

– After you have made the appropriate changes to the OMPROUTE configuration file, restart OMPROUTE.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORCFG, EZAORMII

Routing code: 10

Descriptor code: 12

Automation: This message is displayed on the system console. You can use automation to issue an alert when the stack and OMPROUTE are using different MTU values for an interface.

Example:
EZZ8163I TCPCS1 MTU value 8992 for OSA1 differs from OMPROUT1 MTU value 5000

EZZ8164I stack_name subnet mask value stack_val for interface differs from omproute_procname subnet mask value omproute_val

Explanations: OMPROUTE has been informed by the TCP/IP stack that the specified interface is defined to the stack. The subnet mask value defined to the stack for the interface is not the same subnet mask value that is being used by OMPROUTE for the interface.

In the message text:
stack_name
The name of the TCP/IP stack.

stack_val
The subnet mask value that is defined to the stack for the interface.

interface
The name of the interface.

omproute_procname
The name of the OMPROUTE instance.

omproute_val
The subnet mask value that is being used by OMPROUTE for the interface.

System action: OMPROUTE continues. The direct route that is added to the stack route table by OMPROUTE, which is for the subnet that is directly accessible over the interface, will use the subnet mask value that is being used by OMPROUTE. If the interface is configured to OMPROUTE as an OSPF interface, OMPROUTE might incorrectly process the interface as if it is on the same LAN as another OSPF interface, when they are not actually on the same LAN. The result of this incorrect processing is that OMPROUTE puts one of the interfaces in backup state and will not communicate the OSPF protocol over it.

Operator response: Contact the system programmer.

System programmer response: Take one of the following actions so that the stack and OMPROUTE will use the same subnet mask value for the interface:

• If OMPROUTE is using the correct subnet mask value for the interface:
  1. Use the VARY TCPIP,STOP command to stop the interface.
  2. Issue the VARY TCPIP,OBEYFILE command with a profile that contains an INTERFACE DELETE statement for the interface, followed by an INTERFACE DEFINE statement for the interface that includes the correct subnet mask value.
  3. Use the VARY TCPIP,START command to start the interface.
  4. (Optional) To make the change to the subnet mask value permanent in the TCP/IP profile, modify the INTERFACE statement that defines the interface in the TCP/IP profile to specify the value that is being used by OMPROUTE.
To make the change in the subnet mask value permanent in the TCP/IP profile, modify the INTERFACE statement that defines the interface in the TCP/IP profile to specify the value being used by OMPROUTE. See IPAQENET OSA-Express QDIO interfaces in z/OS Communications Server: IP Configuration Reference for information about the INTERFACE statement in the TCP/IP profile.

See VARY TCPIP,START or VARY TCPIP,STOP in z/OS Communications Server: IP System Administrator’s Commands for information about the VARY TCPIP,STOP and VARY TCPIP,START commands. See VARY TCPIP,OBEYFILE in z/OS Communications Server: IP System Administrator’s Commands for information about the VARY TCPIP,OBEYFILE command.

- If the stack is using the correct subnet mask value for the interface:
  - Modify any OSPF_INTERFACE, RIP_INTERFACE, and INTERFACE statements that define the interface in the OMPROUTE configuration file to specify the value being used by the stack.
  - If the interface is configured to OMPROUTE using a wildcard configuration statement, you might need to explicitly configure this interface with a separate configuration statement.
  - If this interface is not configured to OMPROUTE and you do not want to add it to the OMPROUTE configuration, modify the OMPROUTE configuration file to include a GLOBAL_OPTIONS statement that specifies IGNORE_UNDEFINED_INTERFACES=YES. See OMPROUTE configuration file in z/OS Communications Server: IP Configuration Reference for information about the OSPF_INTERFACE, RIP_INTERFACE, INTERFACE, and GLOBAL_OPTIONS statements in the OMPROUTE configuration file.
  - After you have made the appropriate changes to the OMPROUTE configuration file, restart OMPROUTE.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORCFG, EZAORMII

Routing code: 10

Descriptor code: 12

Automation: This message is displayed on the system console. You can use automation to issue an alert when the stack and OMPROUTE are using different subnet mask values for an interface.

Example:

EZZ8164I TCPCS1 subnet mask value 255.255.255.0 for OSA1 differs from OMPROUT1 subnet mask value 255.255.0.0

EZZ8165I DUPLICATE ip_version OSPF ROUTER ID router_number DETECTED

Explanation: OMPROUTE detected another OSPF router in the OSPF autonomous system that is using the same router ID as OMPROUTE. The router ID must be a unique 32-bit number for each router in the autonomous system. Duplicate router IDs can prevent adjacencies from forming between routers that are directly connected. Duplicate router IDs can also cause increased CPU usage for other OSPF routers and intermittent routing failures. Packets might be lost, which causes performance problems, or hosts might become unreachable.

In the message text:

ip_version
  The version of IP that OSPF is running.

router_number
  The OSPF router ID for the IP version, in dotted decimal format.

System action: If OMPROUTE was started within the last dead router interval, OMPROUTE ends. If OMPROUTE has been running for longer than the dead router interval, OMPROUTE continues.

Operator response: Contact the system programmer.

System programmer response: If the router_number value is not correct for OMPROUTE, verify that the correct OMPROUTE configuration file was used when OMPROUTE was started. Ensure that the correct router ID is configured. If the router ID is not configured in the OMPROUTE configuration file, code an IPv6_OSPF statement for IPv6 or an OSPF statement for IPv4 to configure the router ID.
See the steps for configuring OSPF and RIP (IPv4 and IPv6) in [z/OS Communications Server: IP Configuration Guide](#) for more information about coding a router ID for OMPROUTE.

If the OMPROUTE configuration file uses the INCLUDE statement, use debug level 1 to see the complete configuration file used by OMPROUTE.

If the `router_number` value is correct for OMPROUTE, you must identify the duplicate router in the network. Use the `D TCPIP,,OMPROUTE,OSPF,NBR` or `D TCPIP,,OMPROUTE,IPV6OSPF,NBR` command to identify the designated router. Determine which router is advertising a duplicate router ID.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** SPF, SPFLOOD, EZA6RSPF, EZA6RSPL

**Routing code:** 10

**Descriptor code:** 12

**Automation:** This message is issued to the system console. The system programmer can use automation to be notified to investigate the router ID configuration.

**Example:**

```
EZZ8165I DUPLICATE IPV4 OSPF ROUTER ID 10.2.3.4 DETECTED
```

**EZZ8166I** Received *type* storage shortage notification for *ip_version*

**Explanation:** OMPROUTE has received a notification from the TCP/IP stack about a change in the status of a storage shortage condition.

In the message text:

- **type**
  - The status change that occurred. Possible values are:
    - `begin`
      - The stack has entered a storage shortage.
    - `end`
      - The stack has exited a storage shortage.

- **ip_version**
  - The version of IP for which the notification was received.

**System action:** OMPROUTE processing continues.

**Operator response:** No action is needed.

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: OMPROUTE

**Module:** EZAORMII, EZA6RMII

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable for automation.

**Example:**

```
EZZ8166I Received begin storage shortage notification for IPv4
```

---

Chapter 8. EZZ8xxx messages 581
EZZ8167I  OSPF dead router checking is resumed for ip_version

Explanation: OSPF dead router checking was suspended as a result of a storage shortage in the TCP/IP stack. OSPF dead router checking has resumed.

In the message text:

ip_version
   The version of IP for which OSPF dead router checking has resumed.

System action: OMPROUTE processing continues.
Operator response: No action is needed.
System programmer response: No action is needed.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: EZAORMII, EZA6RMII
Routing code: 10
Descriptor code: 12
Automation: Not applicable for automation.
Example: EZZ8167I OSPF dead router checking is resumed for IPv4

EZZ8168I  OSPF dead router checking is suspended for ip_version

Explanation: OSPF dead router checking is suspended for the specified IP version as a result of a storage shortage in the TCP/IP stack.

In the message text:

ip_version
   The version of IP for which OSPF dead router checking is suspended.

System action: OMPROUTE processing continues.
Operator response: No action is needed.
System programmer response: Check the system console for a message that reports the storage shortage. See the documentation for that message for information about the actions that you should take.
User response: Not applicable.
Problem determination: Not applicable.

Module: EZAORMII, EZA6RMII

Routing code: 10

Descriptor code: 12

Automation: Not applicable for automation.

Example:

EZZ8169I RIP route aging is resumed for IPv4

EZZ8170I  RIP route aging is suspended for ip_version

Explanation: RIP route aging is suspended for the specified IP version as a result of a storage shortage in the TCP/IP stack.

In the message text:

ip_version
   The version of IP for which RIP route aging is suspended.

System action: OMPROUTE processing continues.

Operator response: No action is needed.

System programmer response: Check the system console for a message reporting the storage shortage. See the documentation for that message for information about the actions that you should take.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORMII, EZA6RMII

Routing code: 10

Descriptor code: 12

Automation: Not applicable for automation.

Example:

EZZ8168I RIP route aging is suspended for IPv6
**EZ8171I**

**EZ8171I  jobname ipversion OSPF is using type router ID routerid from source**

**Explanation:** The specified router ID is being used by the OMPROUTE application as a 32-bit unique identifier within an OSPF autonomous system.

In the message text:

**jobname**
- The name of the OMPROUTE application.

**ipversion**
- The IP version that OSPF is running. Possible values for ipversion are:
  - **IPv6**
    - OSPF for IPv6.
  - **IPv4**
    - OSPF for IPv4.

**type**
- The configuration type. Possible values for type are:
  - **assigned**
    - A router ID is not specified on an OMPROUTE configuration statement. The specified router ID is assigned by OMPROUTE as the default.
  - **configured**
    - The specified router ID is configured on an OMPROUTE configuration statement.

**routerid**
- The assigned or configured router ID.

**source**
- The source of the router ID. Possible values for source are:
  - **ROUTERID statement**
    - The router ID was obtained from a ROUTERID statement in the OMPROUTE configuration file.
  - **OSPF statement**
    - The router ID was obtained from an OSPF statement in the OMPROUTE configuration file.
  - **IPV6_OSPF statement**
    - The router ID was obtained from an IPV6_OSPF statement in the OMPROUTE configuration file.
  - **interface_name interface**
    - Because a router ID is not specified on an OMPROUTE configuration statement, the router ID was set by OMPROUTE using the IP address assigned to an IPv4 interface.

For more information about assigned and configured router IDs, see [steps for configuring OSPF and RIP (IPv4 and IPv6)](https://www.ibm.com/support/knowledgecenter/S5XM77_1.3.0/com.ibm.zos.v1r3.messages.doc/ezz8171i_omproute_extensions.html) in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/S5XM77_1.3.0/com.ibm.zos.v1r3.messages.doc/ezz8171i_omproute_extensions.html).

**System action:** OMPROUTE continues.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** If the router ID that is displayed is incorrect, check the configuration statements and parameters in the OMPROUTE configuration file.

- If multiple IPv4 statements (ROUTERID and OSPF) are coded in any combination, the router ID specified (either in a statement keyword or in a RouterID parameter) on the last IPv4 statement is selected.
- If multiple IPv6 statements (IPV6_OSPF) are coded, the router ID specified in the RouterID parameter on the last IPv6 statement is selected.
If IPv4 and IPv6 OSPF are both active, but the router ID on the IPv6_OSPF statement is not specified, the default or configured router ID that is being used for IPv4 is assigned to IPv6.

See z/OS Communications Server: IP Configuration Reference for information about the ROUTERID, OSPF, and IPv6_OSPF statements in the OMPROUTE configuration file.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: SPFCON, EZA6RSXF

Routing code: 10

Descriptor code: 12

Automation: This message goes to console or syslog.

Example:

EZZ8171I OMPROUTE IPV4 OSPF is using configured router ID 9.1.1.1 from ROUTERID statement
EZZ8171I OMPROUTE IPV4 OSPF is using configured router ID 9.1.1.1 from OSPF statement
EZZ8171I OMPROUTE IPV4 OSPF is using assigned router ID 9.1.1.1 from ETH1 interface
EZZ8171I OMPROUTE IPV6 OSPF is using assigned router ID 10.1.1.1 from ETH1 interface
EZZ8171I OMPROUTE IPV4 OSPF is using configured router ID 9.1.1.1 from OSPF statement
EZZ8171I OMPROUTE IPV6 OSPF is using configured router ID 67.67.67.67 from IPv6_OSPF statement

EZZ8172I jobname IGNORING ENVIRONMENT VARIABLE OMPROUTE_OPTIONS WHICH WILL BE RETIRED IN A FUTURE RELEASE

Explanation: The environment variable OMPROUTE_OPTIONS is ignored by OMPROUTE because it will be retired in a future release. The options provided by the GLOBAL_OPTIONS statement in the OMPROUTE configuration file are used instead.

In the message text:

jobname
The name of the OMPROUTE instance.

System action: OMPROUTE continues.

Operator response: Contact the system programmer.

System programmer response: Remove the OMPROUTE_OPTIONS environment variable from OMPROUTE.

Use the GLOBAL_OPTIONS statement in the OMPROUTE configuration file to specify an equivalent value for the OMPROUTE_OPTIONS environment variable. See GLOBAL_OPTIONS statement in z/OS Communications Server: IP Configuration Reference for more information.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: OMPROUTE

Routing code: 10

Descriptor code: 12

Automation: This message goes to the console or syslog. Not applicable for automation.

Example:

EZZ8172I OMPROUT1 IGNORING ENVIRONMENT VARIABLE OMPROUTE_OPTIONS WHICH WILL BE RETIRED IN A FUTURE RELEASE

EZZ8173I GLOBAL OPTIONS

Explanation: This message is produced in response to a DISPLAY TCPIP,OMPROUTE command. See DISPLAY TCPIP,OMPROUTE command in z/OS Communications Server: IP System Administrator's Commands for more information.

System action: None.
**EZZ8174I**

Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: OMPROUTE
Module: SPFCFG
Routing code: 10
Descriptor code: 12
Automation: This message goes to the console or syslog. Not applicable for automation.
Example:
```
EZZ8173I GLOBAL OPTIONS
   IGNORE_UNDEFINED_INTERFACES: YES
   OPTIMIZE_OSPF_HELLO_PROCESSING: YES
```

```
EZZ8174I Error action stack route to destination . masktype mask/prefix . gateway gateway . interface interface .
   table table
```
Explanation: An attempt to update the specified stack route table failed.

Note: This message is displayed in uppercase on the console.

In the message text:

**action**
Possible values are:
- **adding** The error occurred while attempting to add the route to the stack route table.
- **deleting** The error occurred while attempting to delete the route in the stack route table.
- **changing** The error occurred while attempting to change the route in the stack route table.

**destination**
The IP address of the route destination.

**masktype**
Possible values are:
- **mask** The route is an IPv4 route.
- **prefixlen** The route is an IPv6 route.

**mask/prefix**
If the route is an IPv4 route, this is the destination's subnet mask. If the route is an IPv6 route, this is the destination's prefix length.

**gateway**
The IP address of the route's gateway.

**interface**
The name of the route's outgoing interface.

**table**
The name of the TCP/IP stack route table in which there was an error adding, deleting, or changing a route.
The table value is either EZBMAIN for the main route table or the name of a policy-based route table.

System action: In some cases, OMPROUTE will try the operation again later. For system errors, OMPROUTE will issue an additional message with specific error information and end.

Operator response: Determine whether the error is caused by a bad router or other network error. If so, correct the failing device. If OMPROUTE ends, contact the system programmer.

System programmer response: If OMPROUTE ends, use this message with any other error messages to determine the cause of the problem.
User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: OMPROUTE

Module: EZAORMUP, EZA6RMUP

Routing code: 10

Descriptor code: 12

Automation: This console message might be issued in cases where OMPROUTE exits abnormally. Automation to notify the operator should be considered so that further investigation can take place.

Example:
EZZ8174I ERROR ADDING STACK ROUTE TO DEST 197.11.104.2, MASK 255.255.240.0, GATEWAY 16.2.16.232, INTERFACE 04ETHL1, TABLE EZBMAIN
EZZ8174I ERROR CHANGING STACK ROUTE TO DEST 2001:0DB8::104:2, PREFIXLEN 64, GATEWAY FE80::4, INTERFACE V6O4ETHL1, TABLE PRTAB1

EZZ8230I NSLAPM2 STARTING ON tcpName

Explanation: The Network SLAPM2 subagent is starting.
tcpName is the procedure name used to start TCP/IP stack.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: NSLAPM2

Procedure name: main

EZZ8231I NSLAPM2 CONNECTED TO POLICY AGENT ON tcpName

Explanation: The Network SLAPM2 subagent connected to the Policy Agent.
tcpName is the procedure name used to start TCP/IP stack.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: NSLAPM2, NSLAPTBL

Procedure name: doPAPIConnect, buildPolicyStatsTable

EZZ8232I NSLAPM2 CONNECTED TO SNMP AGENT ON tcpName

Explanation: The Network SLAPM2 subagent established a connection with the SNMP Agent.
tcpName is the procedure name used to start TCP/IP stack.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: NSLAPM2

Procedure name: doSNMPConnect
**EZZ8233I** - NSLAPM2 Initialization Complete on tcpName

**Explanation:** The Network SLAPM2 subagent has completed initialization and is ready to start processing requests.

tcpName is the procedure name used to start TCP/IP stack.

**System action:** The Network SLAPM2 subagent waits for requests.

**Operator response:** None.

**System programmer response:** None.

**Module:** NSLAPM2

**Procedure name:** main

---

**EZZ8234I** - NSLAPM2 Unable to Connect to Policy Agent on tcpName

**Explanation:** The Network SLAPM2 subagent was not able to connect to the Policy Agent.

tcpName is the procedure name used to start TCP/IP stack.

**System action:** The Network SLAPM2 subagent periodically attempts to connect to the Policy Agent.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that Policy Agent is started correctly or re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. Re-create the problem with the nslapm2 -d 1 option for trace. If the problem persists, contact the IBM software support center with traces.

**Module:** NSLAPM2

**Procedure name:** doPAPIConnect

---

**EZZ8235I** - NSLAPM2 Error code FROM Policy Agent on tcpName

**Explanation:** The Network SLAPM2 subagent received the following Policy Agent API return code.

code is the return code. The following is a list of the return codes and their meaning:

- **8** Policy Agent's function was not ready.
- **11** Policy Agent on the PolicyPerformanceCollection statement does not have a DataCollection parameter with a value of Rule.
- **16** The Network SLAPM2 subagent could not allocate storage to execute the request.
- **17** Policy Agent could not allocate storage to execute the request.
- **18** Policy Agent encountered an internal error and cannot execute the request.
- **19** The Network SLAPM2 subagent encountered an internal error and cannot continue executing the request.
- **20** The Network SLAPM2 subagent is not registered to Policy Agent.
- **21** The Network SLAPM2 subagent is not executing with the correct security level.
- **22** The Network SLAPM2 subagent is executing with an incorrect level of PAPI.DLL.
- **30-33** The Network SLAPM2 subagent lost its connection to Policy Agent.
- **34** The Network SLAPM2 had a read from Policy Agent time out.
- **35-49** The Network SLAPM2 subagent lost its connection to Policy Agent.
- **51** The tcpName was not configured to Policy Agent.
- **52** The tcpName was greater than eight characters.
- **54** The tcpName is not available.

tcpName is the procedure name used to start TCP/IP stack. This TCP/IP name is passed to Policy Agent to retrieve performance information.
System action: For code 8, 11, 17 and 34 the Network SLAPM2 tries to reconnect to Policy Agent 3 times. If reconnect to Policy Agent is unsuccessful, the Network SLAPM2 subagent stops. For all other codes, the Network SLAPM2 subagent stops.

Operator response: For code 52, the TCP/IP Procedure Name was greater than 8 characters. Restart the subagent with a valid tcpName on the -p option. Contact your system programmer, if required. For all other codes, contact the system programmer.

System programmer response: Take the necessary corrective action based on the error code. If required, restart Network SLAPM2 subagent. If required, restart Policy Agent. The following is a list of the codes and their actions:

8   Configure PolicyPerformance Collection statement with DataCollection parameter set to Rule in Policy Agent.
16  Increase the region size for the Network SLAPM2 subagent.
17  Increase the region size for Policy Agent or re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file.
18, 20 Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file.
19  Re-create the problem with the Network SLAPM2 subagent -d 255 trace option.
21  Either set up the user of Network SLAPM2 subagent with the correct security level or re-create the problem with -d 255 trace option.
22  Policy Agent libraries (papi.dll) must be accessible to Network SLAPM2 subagent. The LIBPATH environment variable can be set to indicate where papi.dll is found (/usr/lpp/tcpip/lib).
30-49 Validate that Policy Agent is executing. Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file.
51  The tcpName was not configured to Policy Agent. See the \textit{z/OS Communications Server: IP Configuration Reference} for information about how to configure the TcpImage statement for Policy Agent.
54  The tcpName is not available. Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file.

Module: NSLAPM2, NSLAPTBL

Procedure name: buildPolicyInfo, buildPolicyStatsTable, buildScalarInfo, doPAPIConnect, main

\textbf{EZZ8236I}  
NSLAPM2 UNABLE TO CONNECT TO SNMP AGENT ON tcpName

\textbf{Explanation:} The Network SLAPM2 subagent initialization was not successful. See syslogd for additional messages that might further describe the particular reason.

tcpName is the procedure name used to start TCP/IP stack.

\textbf{System action:} The Network SLAPM2 subagent will try to connect to the SNMP Agent periodically.

\textbf{Operator response:} Contact the system programmer.

\textbf{System programmer response:} If the SNMP Agent is not active, restart the SNMP Agent. If the SNMP Agent is currently active, the Network SLAPM2 subagent should automatically reconnect to the agent. If it does not, stop the SNMP Agent and restart it.

\textbf{Module:} NSLAPM2

\textbf{Procedure name:} doSNMPConnect

\textbf{EZZ8237I}  
NSLAPM2 ERROR code FROM SNMP AGENT ON tcpName

\textbf{Explanation:} The Network SLAPM2 subagent was connected to the SNMP Agent, but the connection was broken. code is the return code. The following is a list of the return codes and their meaning:

01   The mkDPICopen command failed.
There was a failure parsing DPI open packet.
There was no DPI response to DPI open.
The SNMP agent rejected the Open request.
The subagent is not authorized to SNMP Agent.
The DPIget_fd_for_handle command failed.
There was a failure during mkDPIregister.
There was a failure parsing DPI register packet.
There was a severe error processing packet.
The SNMP Agent rejected the DPI open request from the subagent because another subagent has already connected to the Agent using the same subagent identifier.
The subagent cannot register this MIB tree or this MIB tree has been unregistered. This action was initiated by a request from an SNMP Manager.
The subagent has received a close packet from the SNMP Agent.
There was a failure sending packet to SNMP Agent.
The SNMP Agent socket is closed.
There was no DPI response to DPI register.
The SNMP agent rejected the Register request.
There was an error receiving a packet from SNMP Agent.
There was an error processing packets from SNMP Agent.

tcpName is the procedure name used to start TCP/IP stack.

**System action:** The Network SLAPM2 subagent stops.

**Operator response:** The following is a list of the codes and their required actions:

- **05** Verify that the community name specified for the subagent matches one supported by the SNMP Agent.
- **10** The Network SLAPM2 subagent uses 1.3.6.1.4.1.2.11.7.5 as the subagent identifier. Ensure that no user DPI programs are using this subagent identifier and that no Network SLAPM2 subagent instance has already been started.
- **11** The 1.3.6.1.4.1.2.5.30.1 MIB tree is no longer available. If it is acceptable that the specified MIB tree is not available, then no action is necessary. Otherwise, contact the system programmer with the MIB tree that is no longer available. Restart the Network SLAPM2 subagent when the MIB tree becomes available.

**For all other error codes**
Re-create the problem with the Network SLAPM2 subagent -d 255 trace option. Error information will be written to the Syslog Daemon (syslogd) output file by default.

**Note:** Use of the -o startup option sends all debug information to stdout.
Contact the system programmer with the syslogd output or stdout. See the information on SNMP Agent Distributed Protocol Interface Version 2.0 in the [z/OS Communications Server: IP Programmer's Guide and Reference](https://www.ibm.com/support/knowledgecenter/en/SSLVMB_2.1.0/com.ibm.zos.v2r1.mqapipg/zos_com_ip_programmers_guide.html) for SNMP Agent error descriptions. Take the necessary corrective action based on the error code. Restart Network SLAPM2 subagent request if necessary.

**System programmer response:** If the SNMP Agent job is not active, restart the SNMP Agent. Restart the Network SLAPM2 subagent. If the Network SLAPM2 subagent does not reconnect, then stop the SNMP Agent and restart it. If the problem persists, contact IBM software support center with traces.

**Module:** NSLAPM2

**Procedure name:** doSNMPConnect, readSNMPData
EZZ8238I  NSLAPM2 MODIFY ACCEPTED

Explanation:  A MODIFY command was accepted by the Network SLAPM2 subagent.

System action:  Processing continues.

Operator response:  None.

System programmer response:  None.

Module:  NPLATFM

Procedure name:  systemCommandHandler

EZZ8239I  NSLAPM2 DEBUG LEVEL debugLevel CACHE TIME cacheTime SAMPLING INTERVAL samplingInterval

Explanation:  This is the response to a Network SLAPM2 subagent MODIFY proname,QUERY command.

debugLevel is the debug level specified with the -d startup option, or with the MODIFY proname DEBUG,LEVEL command.

cacheTime is the subagent cache time in seconds specified with the -t startup option, or with the MODIFY proname CACHETIME,LEVEL command.

samplingInterval is the value configured in Policy Agent on the PolicyPerformanceCollection statement. If the samplingInterval value is larger than cacheTime, then samplingInterval will be the value used for refreshing the Network SLAPM2 subagent tables.

System action:  Processing continues.

Operator response:  See the z/OS Communications Server: IP Configuration Reference for the description of each of the displayed level values.

System programmer response:  None.

Module:  NPLATFM

Procedure name:  systemCommandHandler

EZZ8240I  NSLAPM2 MODIFY COMMAND HAS SYNTAX ERROR

Explanation:  The Network SLAPM2 subagent is unable to process a MODIFY command. One possibility is that an incorrect parameter was specified on the command.

System action:  The Network SLAPM2 subagent command is ignored.

Operator response:  Verify the syntax of the MODIFY command and reissue the command. See the z/OS Communications Server: IP Configuration Reference for the syntax of the Network SLAPM2 subagent MODIFY command.

System programmer response:  None.

Module:  NPLATFM

Procedure name:  systemCommandHandler

EZZ8241I  NSLAPM2 MODIFY COMMAND HAS INCORRECT VALUE value FOR PARAMETER parm

Explanation:  The Network SLAPM2 subagent is unable to process a MODIFY command. An incorrect value was specified on the command.

value is the incorrect value for the parameter parm.

parm is the parameter that has the incorrect value.

System action:  The Network SLAPM2 subagent MODIFY command is ignored.

Operator response:  Verify that the parameter values for the MODIFY command are correct and reissue the command. See the z/OS Communications Server: IP Configuration Reference for the syntax of the Network SLAPM2 subagent MODIFY command.
System programmer response: None.
Module: NPLATFM
Procedure name: systemCommandHandler

**EZZ8242I**  NSLAPM2 ABNORMAL SHUTDOWN code ON tcpName

Explanation: The Network SLAPM2 subagent is exiting abnormally.

*code* is return code. The following is a return code and its meaning:

**01** The Network SLAPM2 subagent was unable to allocate storage.

*tcpName* is the procedure name used to start TCP/IP stack.

System action: The Network SLAPM2 subagent stops.

Operator response: The following action is required for the errors:

**01** Contact the system programmer.

System programmer response: For code **01**, increase the region size for the Network SLAPM2 subagent. Correct the problem indicated by error code in the log. Restart Network SLAPM2 subagent.

Module: NSLAPtbl
Procedure name: buildPolicyStatsTable, copyPolicyStats

**EZZ8243I**  NSLAPM2 SHUTDOWN IN PROGRESS ON tcpName

Explanation: The Network SLAPM2 subagent is about to exit.

*tcpName* is the procedure name used to start TCP/IP stack.

System action: The Network SLAPM2 subagent begins to shut down.

Operator response: None.

System programmer response: None.

Module: NSLAPM2
Procedure name: terminator

**EZZ8244I**  NSLAPM2 SHUTDOWN COMPLETE ON tcpName

Explanation: The Network SLAPM2 subagent is exiting.

*tcpName* is the procedure name used to start TCP/IP stack.

System action: The Network SLAPM2 subagent ends.

Operator response: None.

System programmer response: None.

Module: NSLAPM2
Procedure name: terminator

**EZZ8245I**  NSLAPM2 gethostid failed - using IPv4 loopback address to connect to SNMP agent

Explanation: The Network SLAPM2 subagent was unable to resolve the local host address and is using the IPv4 Loopback address to connect to the SNMP agent instead of to the host address.

The Network SLAPM2 subagent uses the gethostid() socket function to retrieve the local host address. The IP address returned by this function is the primary interface address of the TCP/IP stack associated with the subagent. If the returned IP address is loopback, or the gethostid() function failed, then the subagent uses loopback to connect to the SNMP agent and issues this message.

System action: The Network SLAPM2 subagent tries to connect to the agent using the loopback address.
Operator response: Contact the TCP/IP administrator.

System programmer response: If the Network SLAPM2 subagent should not use loopback to connect to the agent, ensure that there is a non-loopback IP address defined as the primary interface to the TCP/IP stack associated with the subagent. The primary interface is either the first LINK in the HOME list, or the LINK specified on a PRIMARYINTERFACE profile statement. You can use the TSO NETSTAT HOME or z/OS UNIX Netstat -h commands to determine which LINK is the primary interface for a stack.

If the loopback address is used to connect to the agent, and a password other than the SNMP agent -c default password is used by the subagent when connecting, then the password used by the subagent must be defined for the loopback address 127.0.0.1 in the SNMP agent PW.SRC or SNMPD.CONF file.

If a non-loopback IP address is defined as the primary interface, re-create the problem with the Network SLAPM2 subagent -d trace option. The trace messages indicate the error that the subagent received when it attempted to retrieve the primary interface IP address.

Module: NPLATFM

Procedure name: getNHostAddr

EZZ8246I NSLAPM2 Unable to open message catalog pagtsmsg.cat - description

Explanation: The Network SLAPM2 subagent attempted to open the subagent message catalog pagtsmsg.cat in the message catalog directory, but was unable to open the catalog due to the indicated description. The subagent message catalog should have been installed in (or have a symbolic link provided in) the /usr/lib/nls/msg/C message catalog directory.

description describes the error.

System action: The Network SLAPM2 subagent will use the internal default messages instead of the external message catalog.

Operator response: Contact the system programmer.

System programmer response: If you want to use the external message catalog, correct the indicated error. If the default messages are acceptable, no action is necessary.

Module: NSLAPM2

Procedure name: main

EZZ8247I NSLAPM2 Could not determine TCPIP jobname - using default of INET

Explanation: The Network SLAPM2 subagent could not determine the jobname for the TCP/IP stack with which it is to associate. A default value of INET will be used for TCPIPjobname.

System action: The Network SLAPM2 subagent continues processing.

Operator response: None.

System programmer response: In a z/OS UNIX System Services INET environment, no action is necessary. In a z/OS UNIX System Services Common INET environment, the TCPIPjobname should be set in the appropriate resolver configuration file or data set, for the Network SLAPM2 subagent to communicate with a particular stack. The search order used to locate the resolver configuration data set or file is described in the z/OS Communications Server: IP Configuration Reference.

A Network SLAPM2 subagent must be associated with a single TCP/IP instance because it retrieves information from a single TCP/IP instance to implement its MIB objects.

Module: NPLATFM

Procedure name: getTcpName

EZZ8252I UNABLE TO OPEN MESSAGE CATALOG "SPXMSG.CAT" : error

Explanation: The DISPLAY TCPIP,SYSPLEX command was unable to open the command message catalog "spxmsg.cat" in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/%L/%N".
EZZ8253I  DISPLAY SYSPLEX TERMINATED DUE TO UNEXPECTED ERROR

Explanation:  An unexpected event caused the command to terminate.

System action:  The Display Sysplex command ends.

Operator response:  None.

System programmer response:  See previously displayed error messages, related to this command, for an explanation of the error. If there are no previous error messages, reissue the command specifying the DEBUG option. This will cause trace messages to be written to the TCP/IP SYSPRINT data set. Save the trace messages and contact IBM software support center.

Module:  EZACDSPX

Procedure name:  cdDsp

EZZ8254I  ioctl FAILED WITH ERROR : error (errno/errnojr).

Explanation:  The Display Sysplex or Vary Sysplex command issued the SIOCGIBMOPT ioctl for the ioctl subtype. The ioctl call failed with the specified error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errno) information in z/OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information in z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  The Display Sysplex or Vary Sysplex command ends.

Operator response:  Correct the indicated error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

System programmer response:  Correct the indicated error. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the socket errors.

Module:  EZACDSPX

Procedure name:  procVIPA

EZZ8255I  DISPLAY SYSPLEX USING NAME NODENAME FOR MVS SYSTEM NAME

Explanation:  The command was unable to retrieve the MVS system name using the uname() function.

System action:  The Display Sysplex command continues using a value of NODENAME for the MVS system name, but some information might be missing from the report.

Operator response:  None.

System programmer response:  Reissue the command specifying the DEBUG option. This will cause trace messages...
to be written to the TCP/IP SYSPRINT data set. Save the trace messages and contact IBM software support center.

**System programmer response:** None.

**Module:** EZACDSPX

**Procedure name:** cdDsp

---

**EZZ8256I**  
**ioct1 FAILED WITH ERROR :**  
**error ( errno|errnoj) **

**Explanation:** The VARY TCPIP,DROP command issued an ioctl call with the indicated I/O control command. The ioctl call failed with the specified error.

In the message text:

- `ioctl` The failing I/O control command.
- `error` The error message associated with the z/OS UNIX System Services error.
- `errno` The z/OS UNIX System Services return code. These return codes are listed and described in the [return codes (errno) information](https://www.ibm.com/support/knowledgecenter/en/SLSCGF_1.10.0/com.ibm.zos.v1r12.jes.doc/qag lhsreturncodes.html) in z/OS UNIX System Services Messages and Codes.
- `errnoj` The hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained in the introduction to the [reason codes (errnoj) information](https://www.ibm.com/support/knowledgecenter/en/SLSCGF_1.10.0/com.ibm.zos.v1r12.jes.doc/qaglhserrnojrs.html) of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

**System action:** TCP/IP continues. The DROP command fails.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the indicated error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/knowledgecenter/en/SLSCGF_1.10.0/com.ibm.zos.v1r12.jes.doc/qag lhszcxxref.html) for more information of the socket errors.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP

**Module:** EZACDSPX

**Routing code:** 10

**Descriptor code:** 12

**Automation:** Not applicable.

**Example:**

```
EZZ8256I SIOCDROP FAILED WITH ERROR : EDC8109I PROTOCOL NOT AVAILABLE. ( 1109/74050209 )
```

---

**EZZ8260I**  
**SYSPLEX versionRelease**

**Explanation:** This message displays the current version and release for the command. The message is followed by the output for the requested command report.

**System action:** The Display Sysplex command continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZACDSPX

**Procedure name:** procVIPA, contVIPA

---

Chapter 8. EZZ8xxxx messages  595
EZZ8268I  VARY SYSPLEX TERMINATED DUE TO UNEXPECTED ERROR

Explanation: A vary sysplex command terminated due to an unexpected error.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: If message EZZ8254I was displayed prior to this message, use the *errno* and *errnojr* from that message to determine the cause of the failure. If no message EZZ8254I is displayed, TCP/IP could not allocate storage for an IOCTL request. If so, issue DISPLAY TCPIP,,STOR command to determine current storage usage and limits. Save the system log and request a dump for problem determination. See the z/OS Communications Server: IP Diagnosis Guide for more information.

Module: EZACDSPX

Procedure name: procVIP, contVIP

---

EZZ8269I tcpstackname mvsname IS NOT A MEMBER OF A SYSPLEX GROUP

Explanation: The stack is not currently a member of a sysplex group. Prior messages explain why the stack is in this state. See the z/OS Communications Server: IP Configuration Guide for more information about Sysplex problem detection and recovery.

tcpstackname is the name of the TCP/IP stack.
mvsname is the name of the MVS system.

System action: TCP/IP continues.

Operator response: Look at the prior messages to determine the appropriate action.

System programmer response: None.

Module: EZACDSPX

Procedure name: cdDsp

---

EZZ8270I SYSPLEX GROUP FOR stackname AT mvsname IS groupname

Explanation: This message is displayed in response to the DISPLAY TCPIP,,SYSPLEX,GROUP command. It identifies the sysplex group that TCP/IP has joined.

In the message text:

stackname
The job name of the TCP/IP stack.

mvsname
The name of the MVS system that the stack is running on.

grouppname
The name of the sysplex group that this stack has joined.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Module: EZACDSPX

Example: None.
**EZZ8301I**  
**VIPA ip_addr TAKEN OVER FROM tcp_jobname ON mvsname**

**Explanation:** The VIPA appeared in a VIPADYNAMIC VIPABACKUP list for the stack issuing the message, and the VIPA was deleted (VIPADYNAMIC VIPADELETE or IOCTL DELETE) from the stack where it was active or the other stack terminated. The stack issuing the message was first in the backup list and now defined and activated the VIPA.

`ip_addr` is the IP address of the dynamic VIPA.
`tcp_jobname` is the name of the job associated with the procedure that was used to start TCP/IP.
`mvsname` is the name of the MVS system where the TCP/IP job is.

**System action:** TCP/IP continues.

---

**EZZ8302I**  
**VIPA ip_addr TAKEN FROM tcp_jobname ON mvsname**

**Explanation:** The stack issuing this message activated a dynamic VIPA that was active on another stack. The other stack deactivated the DVIPA.

`ip_addr` is the IP address of the dynamic VIPA.
`tcp_jobname` is the name of the job associated with the procedure that was used to start TCP/IP.
`mvsname` is the name of the MVS system where the TCP/IP job is.

**System action:** TCP/IP continues.

---

**EZZ8303I**  
**VIPA ip_addr GIVEN TO tcp_jobname ON mvsname**

**Explanation:** The TCP/IP issuing the message had the dynamic VIPA in active state. Another TCP/IP configured the same DVIPA and this stack deactivated the DVIPA so the other stack can activate it.

`ip_addr` is the IP address of the dynamic VIPA.
`tcp_jobname` is the name of the job associated with the procedure that was used to start TCP/IP.
`mvsname` is the name of the MVS system where the TCP/IP job is.

**System action:** TCP/IP continues.

---

**EZZ8304I**  
**VIPA ip_addr SURRENDERED TO tcp_jobname ON mvsname**

**Explanation:** The TCP/IP that issued this message detected that its definition for the specified dynamic VIPA (IPaddr) conflicts with the same dynamic VIPA defined on the specified TCP/IP (TCPJobnm), and deleted its dynamic VIPA. If the deleted dynamic VIPA was active, connections might have been broken. The TCP/IP to which the dynamic VIPA was surrendered continues to have the dynamic VIPA defined and active. The conflict that caused the TCP/IP to delete a dynamic VIPA might have occurred from any of the following situations:

- Two TCP/IPs activate the same dynamic VIPA nearly simultaneously.
- One TCP/IP defines a dynamic VIPA as VIPABACKUP at nearly the same time that another TCP/IP activates the same dynamic VIPA using the SIOCSVIPA IOCTL or a BIND. The VIPABACKUP dynamic VIPA is deleted.
- An SIOCSVIPA IOCTL is used to define a dynamic VIPA that another TCP/IP had previously activated using the SIOCSVIPA IOCTL or a BIND. The dynamic VIPA that was previously activated using the SIOCSVIPA IOCTL or a BIND is deleted on that TCP/IP.

`ip_addr` is the IP address of the dynamic VIPA.
`tcp_jobname` is the name of the job associated with the procedure that was used to start TCP/IP.
`mvsname` is the name of the MVS system where the TCP/IP job is.

**System action:** TCP/IP continues.

**Operator response:** Restart the reconfigured application or change profile definitions and issue the VARY TCPIP,,OBEYFILE command to the appropriate TCP/IPs.

**System programmer response:** Resolve the dynamic VIPA conflict among the TCP/IPs.
EZZ8305I  VIPA  ip_addr  REJECTED - ACTIVE AT  tcp_jobname  ON  mvsname

Explanation: Failure indication that a VIPA with IP address  ip_addr  in a VIPADYNAMIC VIPADEFINE or VIPADYNAMIC VIPABACKUP list could not be configured because the VIPA was already activated with IOCTL or BIND on the TCP/IP identified by TCPJOBNAME, running on the MVS image named MVSNAME. The IP address was not activated for Automated Takeover (VIPDEFINE).

 ip_addr  is the IP address of the dynamic VIPA.

tcp_jobname  is the name of the job associated with the TCP/IP procedure that has the VIPA active.

 mvsname  is the name of the MVS system where the TCP/IP job is.

System action: TCP/IP continues.

Operator response: Either remove IPaddress in a VIPADEFINE list, or delete the dynamic VIPA from the other TCP/IP identified in this message. Then try the command again.

System programmer response: Determine which TCP/IP stack should really be supporting the designated dynamic VIPA.

EZZ8306I  VIPA  ip_addr  CANNOT BE DELETED

Explanation: The specified IPaddress is one of the following:

• not currently defined to this stack
• a physical IP address
• a VIPA defined statically (not in VIPADYNAMIC VIPADEFINE or VIPADYNAMIC VIPABACKUP lists, and not activated using IOCTL or BIND-specific in a defined VIPARANGE)

Only Dynamic VIPAs defined using VIPADEFINE or VIPABACKUP or using IOCTL or BIND() in a defined VIPARANGE might be deleted with VIPADELETE.

 ip_addr  is the IP address of the dynamic VIPA.

System action: TCP/IP continues.

Operator response: If the IPaddress was incorrectly specified, correct the error and try the command or activation again.

EZZ8307I  ip_addr  IS ALREADY DEFINED

Explanation: The IP address  ip_addr  specified in a VIPADYNAMIC VIPADEFINE or VIPADYNAMIC VIPABACKUP list is already defined in a HOME list or IPCONFIG DYNAMICXCF on this stack. The address is ignored (rejected from the VIPADEFINE list in which it was defined), but other addresses in the VIPADEFINE or VIPABACKUP list are processed.

 ip_addr  is the IP address of the dynamic VIPA.

System action: TCP/IP continues.

Operator response: If the IPaddress was incorrectly specified, correct the error and try the command or activation again.

EZZ8308I  ip_addr  NOT DEFINED - OWNED BY  tcp_jobname  ON  mvsname

Explanation: The IP address  ip_addr  is defined in a HOME list entry or IPCONFIG DYNAMICXCF entry in another stack designated by tcpjobname and mvsname. The VIPA is deleted from the VIPADYNAMIC VIPADEFINE or VIPADYNAMIC VIPABACKUP list in which it was defined, but other VIPAs in the VIPADEFINE or VIPABACKUP list are processed.

 ip_addr  is the IP address.

tcp_jobname  is the name of the job associated with the TCPIP procedure that owns the IP address.

 mvsname  is the name of the MVS system where the TCP/IP job is.

System action: TCP/IP continues.
Operator response: Either correct this stack's profile so as not to contain IP address in a VIPADYNAMIC list, or delete the IP address from the designated other stack, and then try the command or activation again.

System programmer response: Determine which TCP/IP stack should really be supporting the designated dynamic VIPA.

---

**EZz8309I** TOO MANY VIPAS - `ip_addr` REJECTED

**Explanation:** There are already 1024 active and backup dynamic/moveable VIPAs on this stack defined in a combination of VIPADYNAMIC VIPADEFINE and VIPADYNAMIC VIPABACKUP lists, and requested in defined nets in VIPADYNAMIC VIPARANGE (by SIOCSVIPA IOCTL or BIND). The IP address is deleted from the VIPADEFINE or VIPABACKUP list in which it appeared, but other VIPAs in the list are processed as normal.

`ip_addr` is the IP address of the dynamic VIPA.

**System action:** TCP/IP continues.

**Operator response:** Correct the appropriate definitions and try the command or activation again.

**System programmer response:** Reduce the number of defined or backup Dynamic VIPAs for this stack.

---

**EZz8310I** VIPARANGE `ip_addr` REJECTED - TOO MANY VIPARANGES

**Explanation:** There can be a maximum of 256 unique VIPARANGE definitions (as defined by both Network Prefix and Address Mask) active on a stack at any time.

`ip_addr` is the IP address used to define a VIPARANGE.

**System action:** TCP/IP continues.

**Operator response:** Correct the appropriate definitions and try the command or activation again.

**System programmer response:** Remove existing VIPARANGE definitions, or consolidate several existing ones into larger subnets, networks, or supernets.

---

**EZz8311I** VIPARANGE `addr_mask` `ip_addr` CANNOT BE DELETED

**Explanation:** The VIPARANGE specified with address mask `addr_mask` and IP address `ip_addr` is not defined on the receiving TCP/IP, and thus cannot be deleted.

`addr_mask` is the address mask used to define a VIPARANGE.

`ip_addr` is the IP address used to define a VIPARANGE.

**System action:** TCP/IP continues.

**Operator response:** Display the current list of defined VIPARANGES, if necessary. Correct the addrmask or the ipaddr or both, and try the command or activation again.

---

**EZz8312I** VIPA `ip_addr` might NOT BE CHANGED WITH `vipadynamic`

**Explanation:** The dynamic VIPA IP address is already defined on the current stack. The current status of the DVIPA is active or the DVIPA has been deactivated. It cannot be changed by VIPADEFINE or VIPABACKUP directly.

`ip_addr` is the IP address used by the dynamic VIPA.

`vipadynamic` is the VIPADYNAMIC statement being processed and is either VIPADEFINE or VIPABACKUP.

**System action:** TCP/IP continues.

**Operator response:** If the IP address was incorrectly specified, correct the error and try the command or activation again. If the IP address is correct and you want to change how the dynamic VIPA is defined, you must use a VIPADELETE before the VIPADEFINE/VIPABACKUP.

**Guideline:** VIPADELETE will break any connections that might exist.
**EZZ8313I**  CANNOT ACTIVATE ip_addr - name IN USE

**Explanation:** An attempt was made to define and activate a dynamic VIPA (using VIPADEFINE, takeover while defined as VIPABACKUP, VIPARANGE IOCTL, or VIPARANGE BIND) and the constructed device or link name name is already defined on this TCP/IP. If name starts with VIPD, then the attempt was to create a DEVICE. If the name starts with VIPL, then a LINK name was being built. In either case, activation of dynamic VIPA IPaddr failed.

**NOTE:** If name starts with VIPD, then both VIPDxxxxxx and VIPLxxxxxx (where ‘xxxxxx’ is the hexadecimal representation of IPaddr) must not already be defined. If the check for VIPDxxxxxxx finds it already defined, no additional check is made for VIPLxxxxxxx at that time.

ip_addr is the IP address of the dynamic VIPA.

name is the generated device or link name for the dynamic VIPA.

**System action:** TCP/IP continues.

**Operator response:** Correct the appropriate definitions and try the command or activation again.

**System programmer response:** Ensure none of the static definitions contain a link name of VIPLxxxxxxx or a device name of VIPDxxxxxxx.

---

**EZZ8314I** DVIPA action for ipaddress failed with ERRNO=errno ERRNO2=errnojr

**Explanation:** The MODDVIPA utility failed to create or delete a dynamic VIPA.

**action** is the utility function and socket call that failed. ipaddress is the dynamic VIPA address or TCPIP stack name that is not valid.

errno is the Sockets return code. These return codes are listed and described in the [return codes (errnos) information](z/OS Communications Server: IP and SNA Codes) in z/OS Communications Server: IP and SNA Codes.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the [reason codes (errnojrs) information](z/OS UNIX System Services Messages and Codes) of the z/OS UNIX System Services Messages and Codes.

**System action:** TCP/IP continues. The utility ends.

**Operator response:** If the IP address or TCPIP stack name was incorrectly specified, correct the error and run the utility again, otherwise contact the system programmer.

**System programmer response:** See the [z/OS UNIX System Services Messages and Codes](z/OS Communications Server: IP and SNA Codes) for more information about the errnojr. See the [z/OS Communications Server: IP and SNA Codes](z/OS Communications Server: IP and SNA Codes) for the specific reason for failure reported by errno.

**Module:** EZBXFDVP

**Procedure name:** main

---

**EZZ8315I** VIPADISTRIBUTE WITH THE PORT KEYWORD REJECTED FOR DVIPA ip_addr

**Explanation:** The PORT keyword was specified on a VIPADISTRIBUTE statement for a dynamic VIPA (DVIPA) that already had a VIPADISTRIBUTE statement specified without a PORT keyword, indicating dynamic ports. A VIPADISTRIBUTE DELETE must first be issued to change from dynamic ports to statically defined ports.

ip_addr is the IP address specified on the rejected VIPADISTRIBUTE statement without the PORT keyword.

**System action:** Processing continues. The VIPADISTRIBUTE statement is rejected.

**Operator response:** Contact the system programmer.

**System programmer response:** To disable dynamic ports, delete all previous VIPADISTRIBUTE statements for the DVIPA IP address. Then reissue the VIPADISTRIBUTE with the PORT keyword.

**Module:** EZBXFDYN

**Procedure name:** ValidateVDIST
### EZZ8316I  VIPADISTIBUTE WITHOUT THE PORT KEYWORD REJECTED FOR DVIPA ip_addr

**Explanation:** The PORT keyword was not specified on a VIPADISTIBUTE statement, indicating dynamic ports for a dynamic VIPA (DVIPA) that already had a VIPADISTIBUTE statement specified with a PORT keyword. A VIPADISTIBUTE DELETE must first be issued to change to dynamic ports.

- `ip_addr` is the IP address specified on the VIPADISTIBUTE statement containing the rejected PORT keyword.

**System action:** Processing continues. The VIPADISTIBUTE statement is rejected.

**Operator response:** Contact the system programmer.

**System programmer response:** To enable dynamic ports, delete all previous VIPADISTIBUTE statements for the DVIPA IP address. Then reissue the VIPADISTIBUTE for this DVIPA without the PORT keyword.

**Module:** EZBXFDYN

**Procedure name:** ValidateVDIST

---

### EZZ8317I  TARGET DVIPA dvipa WITH ZONE SECLABEL zone_seclabel NOT PERMITTED ON tcpjobname WITH stack_seclabel

**Explanation:** There is a configuration conflict between TCP/IP and the security server. A distributing stack has notified `tcpjobname` that it is a distribution target for `dvipa`. This IP address has a security label that is incompatible with the security label of `tcpjobname`.

- `dvipa` is the distributed dynamic VIPA.
- `zone_seclabel` is the security label assigned to the zone resource profile.
- `tcpjobname` is the job name of target TCP/IP stack.
- `stack_seclabel` is the security label of the user ID under which `tcpjobname` is running.

**System action:** The target request is rejected. The distributing TCP/IP is notified and will display message EZZ8318I. Processing continues.

**Operator response:** Save the system log for problem determination. Notify the network and security administrators.

**System programmer response:** For all multilevel security target stacks, `dvipa` must be in a NetAccess security zone and `zone_seclabel` must be defined and active on the system (`mvsname`). For multilevel security restricted stacks, `zone_seclabel` must not be SYSMULTI and must be equivalent to `stack_seclabel`. Complete the following steps to correct the error.

1. Check that `dvipa` is configured into the correct NetAccess security zone (`zonename`) in all distributor and target TCP/IP Profiles.
2. Check that the security server resource profile for EZB.NETACCESS.mvsname.tcpjobname.zonename exists and has the correct security label assigned.
3. Check that `tcpjobname` is running under the intended user ID and with the correct security label.
4. Check that `tcpjobname` is intended to be a distribution target for `dvipa`.
5. **Check that the security label `zone_seclabel` is defined and active on `mvsname`.** See [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com) for more information about configuring TCP/IP in a multilevel security environment.

**Module:** EZBXFUDV PLX

**Procedure name:** EZBXFDPT

---

### EZZ8318I  VIPADISTIBUTE FOR dvipa REFUSED BY tcpjobname ON mvsname

**Explanation:** `tcpjobname` on system `mvsname` has notified this TCP/IP that it refuses to be a distribution target for any ports on `dvipa`.

- `dvipa` is the distributed dynamic VIPA.
- `tcpjobname` is the job name of target TCP/IP stack.
- `mvsname` is the name of the system on which the target is running.

**System action:** `tcpjobname` on `mvsname` is removed as a target for `dvipa`. Processing continues.
Operator response: Save the system log for problem determination. Notify the network and security administrators.

System programmer response: For all multilevel security target stacks, dvipa must be in a NetAccess security zone and its security label must be defined and active on mvsname. For multilevel security restricted stacks, the zone security label must not be SYSMULTI and must be equivalent to the stack security label. Complete the following steps to correct the error.

1. Check that dvipa is configured into the correct NetAccess security zone (zonename) in all distributor and target TCP/IP Profiles.
2. Check that the security server resource profile for EZB.NETACCESS.mvsname.tcpjobname.zonename exists and has the correct security label assigned.
3. Check that tcpjobname is running under the intended user ID and with the correct security label.
4. Check that the security label zone_seclabel is defined and active on mvsname. See the z/OS Communications Server: IP Configuration Guide for more information about configuring TCP/IP in a multilevel security environment.

Module: EZBXFMSI PLX
Procedure name: Process_VIPADist

EZ8319I DVIPA dvipa WITH ZONE SECLABEL zone_seclabel NOT PERMITTED ON tcpjobname WITH stack_seclabel

Explanation: There is a configuration conflict between TCP/IP and the security server. tcpjobname is processing a VIPADEFINE or VIPABACKUP statement for dvipa. This IP address has a security label that is incompatible with the security label of tcpjobname.

dvipa is the dynamic VIPA.
zone_seclabel is the security label assigned to the zone resource profile.
tcpjobname is the job name of target TCP/IP stack.
stack_seclabel is the security label of the user ID under which tcpjobname is running.

System action: The VIPADEFINE or VIPABACKUP statement is rejected. Processing continues.

Operator response: Save the system log for problem determination. Notify the network and security administrators.

System programmer response: For all multilevel security stacks, dvipa must be in a NetAccess security zone and zone_seclabel must be defined and active on the system (mvsname). For multilevel security restricted stacks, zone_seclabel must not be SYSMULTI and must be equivalent to stack_seclabel.

1. Check that dvipa is configured into the correct NetAccess security zone (zonename) in tcpjobname TCP/IP Profile.
2. Check that the security server resource profile for EZB.NETACCESS.mvsname.tcpjobname.zonename exists and has the correct security label assigned.
3. Check that tcpjobname is running under the intended user ID and with the correct security label.
4. Check that the security label zone_seclabel is defined and active on mvsname. See the z/OS Communications Server: IP Configuration Guide for more information about configuring TCP/IP in a multilevel security environment.

Module: EDBXFDYN PLX, EDBX6DYN PLX
Procedure name: ValidateVDEF and ValidateVBkUp

EZ8320I Usage: host [-d] [-h1-?] host

Explanation: This message shows the syntax for the host command. It is displayed when incorrect parameters were specified or when the -h or -? options were specified.

host This is the DNS host name or numeric address string for the host to query.

-d This option specifies that debugging messages should be displayed. This might be useful for problem diagnosis.

-h or -? These options request that this message be displayed.
EZZ8321I hostname has addresses address-list

Explanation: address-list is a list of IP addresses associated with the specified host or (none) if no IP addresses were found but the host name was valid.

System action: The command continues.
Operator response: None.
System programmer response: None.

EZZ8322I aliases: alias-list

Explanation: alias-list is a list of aliases for the specified host. This message will be displayed only if one or more aliases were found.

System action: The command continues.
Operator response: None.
System programmer response: None.

EZZ8330I Usage: hostname [-s] [-c|-g|-r] [-p stackname] [-d] [-h|-?]

Explanation: This message shows the syntax for the hostname, domainname, and dnsdomainname commands. It is displayed when incorrect parameters were specified or when the -h or -? options were specified.

-s This option, only valid for the hostname command, specifies that host name should omit the DNS domain name and print only the host-specific portion.
-c This option, the default, specifies that the host name should be retrieved from the resolver configuration file.
-g This option specifies that the host name should be retrieved using the gethostname() system call.
-r This option specifies that the host name should be retrieved from the DNS server, with the query based on the results of the gethostname() system call.
-p stackname Use the specified AF_INET stack.
-d This option specifies that debugging messages should be displayed. This might be useful for problem diagnosis.
-h or -? These options request that this message be displayed.

System action: The command ends.
Operator response: Run the command again with the correct parameters.
System programmer response: None.

EZZ8331I The DNS domain name could not be determined.

Explanation: The DNS domain name could not be determined using the specified mechanism. This message is printed by the domainname and dnsdomainname commands when the DNS domain name could not be found.

If the -c option was specified (the default mechanism), this could be due to the DOMAINORIGIN keyword not being specified in the client configuration file (TCPIP.DATA).

If the -g option was specified, this could be due to gethostname() returning only the host part of the fully-qualified DNS name.

System action: The command ends.
EZZ8340I • EZZ8344I

Operator response: Run the command again using a different mechanism (-c, -d, or -g option) for retrieving this information.

System programmer response: Ensure that the DOMAINORIGIN keyword is specified in the client configuration file (TCPIPDATA).

EZZ8340I This function requires the TCP/IP base feature of z/OS

Explanation: The function or command that issued this message is disabled because the TCP/IP base feature of z/OS is not enabled.

System action: The command ends.

Operator response: Contact the system programmer.

System programmer response: The IFAPRDxx parmlib member specifies whether or not the TCP/IP base feature is enabled. Correct the IFAPRDxx parmlib member if it is in error.

If TCP/IP_BASE is not part of your system there is no action to take and this function or command cannot be used.

EZZ8341I Error return-code reason-code was returned from libcall: explanation

Explanation: The specified library or system call (libcall) failed. explanation describes the nature of the error. return-code is the return code (errno) in hexadecimal format from the library or system call. reason-code is the reason code in hexadecimal format.

System action: Processing continues.

Operator response: See z/OS UNIX System Services Messages and Codes for more information about return-code and reason-code.

System programmer response: None.

EZZ8342I operation: reason

Explanation: The specified DNS name resolution operation failed for the specified reason.

System action: Processing continues.

Operator response: Ensure that the host name or IP address is correct. Contact the system programmer if the parameters are correct but DNS name resolution fails.

System programmer response: Ensure that the DNS server and host name and address tables are configured correctly.

EZZ8343I This command is not supported in this environment.

Explanation: A command was used in an unsupported environment. For example, a command that is supported only in the z/OS UNIX shell was used in the TSO environment.

System action: Processing continues.

Operator response: Use this command in a supported environment. For example, if the command is supported only in the z/OS UNIX shell, switch to that environment and use the command from that environment.

System programmer response: None.

EZZ8344I This command must be APF-authorized

Explanation: A command was used that requires APF authorization to function correctly, but the command was not running APF-authorized.

System action: Processing continues.

Operator response: Contact the system programmer to ensure that the program was installed correctly.

System programmer response: Ensure that the program was installed correctly. If the program executable resides in
the z/OS UNIX file system, ensure that the APF-authorized attribute is on. If the program resides in a load module, ensure that the library that contains it is APF authorized.

**EZZ8345I** Message catalog *filename* could not be opened - Default messages will be used

**Explanation:** The message catalog file could not be opened. See message EZZ8341I for the error codes. The command will use the default message strings instead of the message strings in the message catalog file.

*filename* is the name of the message catalog.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** Ensure that the message catalog was installed properly.

**EZZ8346I** jobname CONDITION HANDLER SETUP FAILED WITH MESSAGE NUMBER *msg_num*

**Explanation:** The application, specified by the *jobname* value, will be unable to establish a condition handler. The application will be unable to request SVC dumps for abend conditions.

**Note:** This message is displayed in uppercase on the console. In the message text:

*jobname*  
The job name of the application that is attempting to establish the condition handler.

*msg_num*  
The message number that is returned by CEEHDLR.

**System action:** The application continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Save the application log and contact the IBM software support center.

**User response:** Not applicable.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP

**Module:** Not applicable.

**Routing code:** 2, 11

**Descriptor code:** 12

**Automation:** Not applicable.

**Example:**

EZZ8346I PAGENT condition handler setup failed with message number 0256

**EZZ8392I** Unable to open message catalog *trapfwd.cat* - *additional_error_text*

**Explanation:** The Trap Forwarder daemon was unable to open the message catalog *trapfwd.cat* in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be NLSPATH=/usr/lib/nls/msg/%L/%N.

**System action:** The Trap Forwarder daemon will use the internal default messages instead of the messages from the external message catalog.

**Operator response:** If you want to use the external message catalog, contact the system programmer. If the default messages are acceptable, no action is necessary.

**System programmer response:** If you want to use the external message catalog, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access. See the z/OS XL C/C++ Runtime Library Reference for more information about the catopen() function call. Information regarding the NLSPATH environment variable can be found in the z/OS UNIX System Services Programming Tools. If the default messages are acceptable, no action is necessary.
Module: TFWINIT.C
Procedure name: tfwInitLogging

EZZ8393I Using catalog catalog_file for TRAPFWD messages
Explanation: The Trap Forwarder daemon located its message catalog file. catalog_file is the name of the catalog file.
System action: The Trap Forwarder daemon continues to initialize.
Operator response: None.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwInitLogging

EZZ8394I No value specified for the startup parameter
Explanation: When the Trap Forwarder daemon was started, a parameter was specified without a value.
startup is a command line parameter.
System action: The Trap Forwarder daemon ends.
Operator response: Correct the error and restart the Trap Forwarder daemon with the correct parameter value.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwParseCmdLineArgs

EZZ8395I parameter value is out of range
Explanation: While processing the start options for the Trap Forwarder daemon, a parameter was encountered that required a numeric value in a specified range. The value specified was outside the allowable range of values for the parameter being processed.
parameter is a command line parameter.
System action: The Trap Forwarder daemon ends.
Operator response: Correct the value specified for the parameter in error and restart the Trap Forwarder daemon.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwParseCmdLineArgs

EZZ8396I parameter value is not numeric
Explanation: While processing the start options for the Trap Forwarder daemon, a parameter was encountered that required a numeric value. The value specified was not numeric.
parameter is a command line parameter.
System action: The Trap Forwarder daemon ends.
Operator response: Correct the value specified for the parameter in error and restart the Trap Forwarder daemon.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwParseCmdLineArgs
EZZ8397I Unable to open configuration_file - error_text

Explanation: The Trap Forwarder daemon was unable to open the configuration_file.

configuration_file is the name of the configuration file.

erro_text is the error message string, containing a more specific reason for the failure.

System action: The Trap Forwarder daemon ends.

Operator response: Correct the error and restart the Trap Forwarder daemon.

System programmer response: None.

Module: TFWINIT.C

Procedure name: tfwReadConfigFile

---

EZZ8398I Line number linenumber in the configuration_file file has an IP address address which is not in the correct format - entry ignored

Explanation: The Trap Forwarder daemon was unable to interpret the IP address correctly.

linenumber is the number of the line in the configuration file.

configuration_file is the name of the configuration file.

address is the IP address.

System action: The Trap Forwarder daemon ignores the current statement and continues reading the next statement in the configuration file.

Operator response: Contact the system programmer.

System programmer response: Correct the error and restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the z/OS Communications Server: IP Configuration Reference.

Module: TFWINIT.C

Procedure name: tfwReadConfigFile

---

EZZ8399I gethostbyname function failed for address - entry ignored

Explanation: The gethostbyname function failed for the indicated IP address.

address is the IP address.

System action: The Trap Forwarder daemon ignores the current statement and continues reading the configuration file.

Operator response: Contact the system programmer.

System programmer response: Correct the error and restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the z/OS Communications Server: IP Configuration Guide.

Module: TFWINIT.C

Procedure name: tfwReadConfigFile

---

EZZ8400I Line number linenumber in the configuration_file file has an incorrect port number port_number - entry ignored

Explanation: The port number at the specified line number is not valid.

linenumber is the number of the line in the configuration file.

configuration_file is the name of the configuration file.

port_number is the port number specified in the configuration file.
System action: The line is ignored and the Trap Forwarder daemon continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the IP address in the configuration file and restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the "z/OS Communications Server: IP Configuration Reference".

Module: TFWINIT.C
Procedure name: tfwReadConfigFile

---

**EZZ8401I** Line number linenumber in the configuration_file file has an incorrect option option - entry ignored

Explanation: The option at the specified line number is not valid.

*linenumber* is the number of the line in the configuration file.

*configuration_file* is the name of the configuration file.

*option* is the option specified in the configuration file.

System action: The line is ignored and the Trap Forwarder daemon continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the option in the configuration file and restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the "z/OS Communications Server: IP Configuration Reference".

Module: TFWINIT.C
Procedure name: tfwReadConfigFile

---

**EZZ8402I** Line number linenumber in the configuration_file file contains an incorrect number of keywords - entry ignored

Explanation: The indicated line contains an incorrect number of keywords.

*linenumber* is the number of the line in the configuration file.

*configuration_file* is the name of the configuration file.

System action: The line is ignored and the Trap Forwarder daemon continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the entry in the configuration file and restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the "z/OS Communications Server: IP Configuration Reference".

Module: TFWINIT.C
Procedure name: tfwReadConfigFile

---

**EZZ8403I** Maximum number of destinations exceeded on line linenumber in the configuration_file file - entry ignored

Explanation: The maximum number of destinations to which trap datagrams can be forwarded was exceeded.

*linenumber* is the number of the line in the configuration file.

*configuration_file* is the name of the configuration file.

System action: The line is ignored and the Trap Forwarder daemon continues processing.

Operator response: Contact the system programmer.

System programmer response: Correct the configuration file. The maximum number could have been reached for either of the following reasons:

* The destinations where the trap originating information has to be appended.
• The destinations where the trap datagrams are forwarded without the originating information.

For information about configuring the Trap Forwarder daemon, see the [z/OS Communications Server: IP Configuration Reference](#).

**Module:** TFWINIT.C

**Procedure name:** tfwReadConfigFile

---

**EZZ8404I** TRAPFWD: COULD NOT DETERMINE TCPIPJOBNAME - DEFAULTING TO INET

**Explanation:** The Trap Forwarder daemon could not determine the jobname for the TCP/IP stack. The default value of 'INET' is used.

**System action:** Trap Forwarder daemon continues initializing.

**Operator response:** None.

**System programmer response:** In an INET environment, no action is necessary. In a CINET environment, for the Trap Forwarder daemon to communicate with a particular stack, the TCPIPJobname should be set in the appropriate resolver configuration file or data set. See the [z/OS Communications Server: IP Configuration Guide](#) for the search order to locate the resolver configuration data set or file. The Trap Forwarder daemon must be associated with a single TCPIP instance.

**Module:** TFWINIT.C

**Procedure name:** tfwEstablishAffinity

---

**EZZ8405I** TRAPFWD: COULD NOT ESTABLISH AFFINITY WITH 'jobname' (error_code/reason)

**Explanation:** The Trap Forwarder daemon attempted to use the socket call, setibmopt(), to associate itself with the TCP/IP instance jobname. This TCP/IP name should be the started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) of the TCP/IP instance with which the Trap Forwarder daemon is to be associated. The setibmopt call failed with the displayed error_code and reason.

jobname is the jobname of the Trap Forwarder daemon.

error_code is the error number.

reason is the reason code.

**System action:** The Trap Forwarder daemon ends abnormally.

**Operator response:** Most likely, the TCP/IP instance's name was not defined correctly to OMVS. Check the SUBFILESYSTYPE NAME for the corresponding TCP/IP instance in the BPXPRMxx member that was used to configure OMVS. Ensure that the TCP/IP started procedure name (or identifier if the 'S member.identifier' format of the MVS Start command was used) matches the SUBFILESYSTYPE NAME. Recycle OMVS or TCP/IP if a change is necessary. If none of the above error conditions exist contact the system programmer.

**System programmer response:** For the Trap Forwarder daemon to communicate with a particular stack, the jobname (as determined by the system variable TCPIPJobname) must match "xxxxx" where "xxxxx" is set in the BPXPRMxx member used to start OMVS. "xxxxx" is set in the SUBFILESYSTYPE NAME(xxxxx) for ENTRYPOINT(EZBPFINI). In order to establish an affinity with a corresponding TCP/IP stack, the Trap Forwarder daemon uses the setibmopt call. Correct the error indicated by error_code and reason. For more information about error_code and reason, see [z/OS UNIX System Services Messages and Codes](#).

**Module:** TFWINIT.C

**Procedure name:** tfwEstablishAffinity

---

**EZZ8406I** Sigaction for signal failed - error_text (error_code/reason)

**Explanation:** The Trap Forwarder daemon issued a sigaction function that failed. The error_text will provide more information about the cause of the error.

signal is the name of the signal.

error_text is the error message string.
EZZ8407I  •  EZZ8411I

System action:  Trap Forwarder daemon continues initializing.
Operator response:  None.
System programmer response:  Correct the problem indicated by error_text. See the z/OS XL C/C++ Runtime Library Reference for further explanation of the sigaction function errors.
Module:  TFWINIT.C
Procedure name:  tfwInitSignalHandlers

EZZ8407I  Unable to allocate memory
Explanation:  The Trap Forwarder daemon attempted to allocate memory to receive trap datagrams. Memory could not be obtained.
System action:  The Trap Forwarder daemon initialization ends.
Operator response:  Contact the system programmer.
System programmer response:  Determine why memory was not available. Correct the problem and restart the Trap Forwarder daemon.
Module:  TFWINIT.C
Procedure name:  tfwInitialize

EZZ8409I  TRAPFWD: INITIALIZATION COMPLETE
Explanation:  The Trap Forwarder daemon completed initialization and is ready to receive and forward trap datagrams.
System action:  The Trap Forwarder daemon is functioning.
Operator response:  None.
System programmer response:  None.
Module:  TFWINIT.C
Procedure name:  tfwInitialize

EZZ8410I  Maximum size of trap datagram exceeded - trap datagram discarded
Explanation:  The Trap Forwarder daemon received a trap datagram that has a size greater than the size specified during startup. The trap datagram is discarded.
System action:  The Trap Forwarder daemon continues to listen for trap datagrams.
Operator response:  Contact the system programmer.
System programmer response:  If a trap datagram of a larger size needs to be forwarded, use the -l startup option to configure the Trap Forwarder daemon. For information about configuring the Trap Forwarder daemon, see the z/OS Communications Server: IP Configuration Guide.
Module:  TFWINIT.C
Procedure name:  tfwInitialize

EZZ8411I  function function failed - error code: error_code reason: reason
Explanation:  The system function failed. error_code and reason will provide more information about the cause of the error.
function is the system function that failed.
error_code is the error number.
reason is the reason code.
System action:  The Trap Forwarder daemon ends.
Operator response: Contact the system programmer.

System programmer response: Determine why the system function failed. For more information about error_code and reason, see z/OS XL C/C++ Runtime Library Reference.

Module: TFWINIT.C, TFWMAIN.C

Procedure name: tfwProcessIncomingTrapPkt, tfwCreateSockets

---

EZZ8412I TRAPFWD: TRACING IS SET TO setting

Explanation: This is a response to a modify command that indicates the current trace setting. setting is the debug level.

System action: The Trap Forwarder daemon continues.

Operator response: None.

System programmer response: None.

Module: TFWMAIN.C

Procedure name: tfwProcessMVSCommand

---

EZZ8413I TRAPFWD: UNRECOGNIZED MODIFY REQUEST

Explanation: This is a response to a modify command that could not be serviced because the request was not recognized.

System action: The Trap Forwarder daemon continues.

Operator response: Correct the error and issue the modify command again.

System programmer response: None.

Module: TFWMAIN.C

Procedure name: tfwProcessMVSCommand

---

EZZ8414I TRAPFWD: MODIFY REQUEST COMPLETED

Explanation: This is a response to a modify command that completed.

System action: The Trap Forwarder daemon continues.

Operator response: None.

System programmer response: None.

Module: TFWMAIN.C

Procedure name: tfwProcessMVSCommand

---

EZZ8416I TRAPFWD: CONFIGURATION REFRESH FAILED

Explanation: The Trap Forwarder daemon tried to refresh the configuration by reading the configuration file again but failed.

System action: The Trap Forwarder daemon continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the configuration file exists and is readable.

Module: TFWMAIN.C

Procedure name: tfwProcessMVSCommand
EZ8417I  signal RECEIVED - TRAPFWD DAEMON IS SHUTTING DOWN
Explanation: The Trap Forwarder daemon received a signal and is shutting down.
signal is the name of the signal.
System action: The Trap Forwarder daemon ends.
Operator response: None.
System programmer response: None.
Module: TFWINIT.C
Procedure name: sigPipeHandler, sigAbndHandler, sigTermHandler

EZ8418I Usage: command<-d debug level><-p port number> <-l max packet len>
Explanation: Shows allowed syntax for calling trapfwd.
command is the command name.
System action: The trapfwd daemon ends after displaying usage information.
Operator response: None.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwDisplayUsage

EZ8419I Unsupported parameter: parameter
Explanation: An unsupported parameter was specified while starting the Trap Forwarder daemon.
parameter is a command line parameter.
System action: The Trap Forwarder daemon ends.
Operator response: Correct the error and restart the Trap Forwarder daemon.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwParseCmdLineArgs

EZ8420I The Trap Forwarder daemon is running as jobname
Explanation: The Trap Forwarder daemon is reporting its jobname.
jobname is the jobname of the Trap Forwarder daemon
System action: The Trap Forwarder daemon continues processing.
Operator response: None.
System programmer response: None.
Module: TFWINIT.C
Procedure name: tfwInitialize

EZ8421I Trap Forwarder daemon cannot receive traps from IPv6 agents
Explanation: The Trap Forwarder daemon tried to open an IPv6-capable socket for receiving traps, but the attempt was unsuccessful because the TCP/IP stack is not running with IPv6 support active. Therefore the daemon cannot receive traps from SNMP agents at IPv6 addresses.
System action: Processing continues. The Trap Forwarder daemon will try to open an IPv4-only socket for receiving traps.
Operator response: Contact the system programmer.

System programmer response: If the TCP/IP stack is not running with IPv6 support active, configure the stack to support IPv6, restart TCP/IP and the Trap Forwarder daemon. If the problem persists, restart the Trap Forwarder daemon with the -d 3 debug option and contact the IBM software support center with the resulting debug information.

Module: TFWINIT.C

Procedure name: tfwCreateSockets

EZZ8422I Trap Forwarder daemon cannot forward traps to IPv6 listeners

Explanation: The Trap Forwarder daemon tried to open an IPv6-capable socket for forwarding traps, but the attempt was unsuccessful because the TCP/IP stack is not running with IPv6 support active. Therefore the daemon cannot forward traps to listeners at IPv6 addresses.

System action: Processing continues. The Trap Forwarder daemon will try to open an IPv4-only socket for forwarding traps.

Operator response: Contact the system programmer.

System programmer response: If the TCP/IP stack is not running with IPv6 support active, configure the stack to support IPv6, restart TCP/IP and the Trap Forwarder daemon. If the problem persists, restart the Trap Forwarder daemon with the -d 3 debug option and contact the IBM software support center with the resulting debug information.

Module: TFWINIT.C

Procedure name: tfwCreateSockets

EZZ8423I getaddrinfo failed for address - entry ignored

Explanation: The getaddrinfo function failed for the indicated host name or IP address specified on the current statement in the Trap Forwarder configuration file. If a host name was specified, getaddrinfo was unable to resolve it to an IP address. If an IP address was specified, it is not valid. The statement will be ignored.

address is the host name or IP address specified.

System action: The Trap Forwarder daemon ignores the current statement and continues reading the next statement in the configuration file.

Operator response: Contact the system programmer.

System programmer response: Ensure that the host name or IP address specified in the Trap Forwarder configuration file is correct. Then restart the Trap Forwarder daemon or issue a refresh command to refresh the configuration. For information about configuring the Trap Forwarder daemon, see the z/OS Communications Server IP Configuration Guide

Module: TFWINIT.C

Procedure name: tfwReadConfigFile

EZZ8431I PAGENT STARTING

Explanation: The Policy Agent application is starting.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: PAGENT

Procedure name: main
EZZ8432I   PAGENT INITIALIZATION COMPLETE
Explanation:  The Policy Agent completed initialization and is ready to start processing.
System action:  Processing continues.
Operator response:  None.
System programmer response:  None.
Module:  PAGENT
Procedure name:  main

EZZ8433I   PAGENT SHUTDOWN COMPLETE
Explanation:  The Policy Agent application is exiting normally.
System action:  Policy Agent ends.
Operator response:  Restart Policy Agent if required.
System programmer response:  None.
Module:  PAGENT
Module:  PAGENT
Procedure name:  main
Procedure name:  terminator

EZZ8434I   PAGENT EXITING ABNORMALLY
Explanation:  The Policy Agent is exiting abnormally.
System action:  Policy Agent ends.
Operator response:  Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.
System programmer response:  Take the necessary corrective action based on log information indicating the cause of the abnormal exit. Restart Policy Agent if required.
Module:  PAGENT
Procedure name:  main

EZZ8435I   pasearch Command: Environment Error code
Explanation:  The pasearch command is exiting abnormally due to an environment error. The error is described by code.
CODE   Meaning
16   Could not allocate storage to execute pasearch command.
17   Policy Agent could not allocate storage to execute pasearch command.
18   Policy Agent encountered an internal error and cannot execute the pasearch request.
19   pasearch encountered an internal error and cannot continue executing the pasearch request.
20   pasearch is not registered to Policy Agent.
21   pasearch is not executing with the correct security level.
22   pasearch is executing with incorrect level of PAPI.DLL.
System action:  The pasearch command ends.
Operator response:  The actions required for the following errors are:
CODE   Action
614   z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
Increase the region size for pasearch or limit the search information returned from pasearch.

Increase the region size for Policy Agent or re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

Re-create the problem with the pasearch -d trace option.

Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

Either set up the user of pasearch to be executed with correct security level or re-create the problem with pasearch -d trace option.

The Policy Agent API libraries (papi.dll) must be accessible to pasearch. The LIBPATH environment variable can be set to indicate where papi.dll is found (/usr/lib).

**System programmer response:** Take the necessary corrective action based on the error code. Restart Policy Agent or reissue pasearch if required.

**Module:** PASEARCH

**Procedure name:** palIssueMessage

---

**EZ8436I**  
pasearch Command: Connection Error *code*

**Explanation:** The pasearch command encountered a connection error with the Policy Agent. The error is described by *code*.

<table>
<thead>
<tr>
<th>CODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>Connect to Policy Agent failed.</td>
</tr>
<tr>
<td>31</td>

</tr>
</tbody>
</table>

Chapter 8. EZ8xxxx messages  615
EZZ8438I

53 The PolicyFilterName or PolicyScopeName was greater than 47 characters.

**System action:** The pasearch command ends.

**Operator response:** Correct the input parameter based on the error code or re-create the problem with the pasearch -d trace option and with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

**System programmer response:** Take the necessary corrective action based on log information indicating the cause of the abnormal exit. Reissue pasearch if required.

**Module:** PASEARCH

**Procedure name:** pIssueMessage

---

EZZ8438I PAGENT POLICY DEFINITIONS CONTAIN ERRORS FOR *image* : *type*

**Explanation:** The specified policies, which are defined in a configuration file or on an LDAP server, contain errors, or cannot be accessed, for the specified TCP/IP stack or remote policy client. The error might be caused by any of the following conditions:

- The policy definitions contain one or more syntax or semantic errors.
- The configuration file configured for the specified policy type does not exist or cannot be read.
- The Policy Agent that is acting as a policy client does not have permission to access the specified policy type on the Policy Agent that is acting as a policy server.
- The import requestor does not have permission to access the policy type on the Policy Agent.

*image* is the name of the TCP/IP stack, remote policy client, or import requestor for which the policy errors were detected. When the *image* value specifies an import requestor, this message is written only to the Policy Agent log file.

*type* indicates the policy type for which errors were detected. The *type* value is one of the following:

- **IDS** Intrusion Detection Services policies
- **IPSEC** IP Filtering, KeyExchange and LocalDynVpn policies
- **LDAP** Policies configured in LDAP
- **QOS** Quality of Service policies
- **ROUTING** Policy-based routing policies
- **TTLS** Application Transparent Transport Layer Security (AT-TLS) policies

**System action:** The results depend on *type* as follows:

- **IDS** Only the policy (for example rule or action) that contained the error was discarded.
- **IPSEC** The previous IPSec policies will remain in effect and all of the new configured IPSec policies were discarded.
- **LDAP** Only the policy (for example rule or action) that contained the error was discarded.
- **QOS** Only the policy (for example rule or action) that contained the error was discarded.
- **ROUTING** The previous routing policies remain in effect and all of the newly configured routing policies are discarded.
- **TTLS** The previous AT-TLS policies will remain in effect and all of the new configured AT-TLS policies were discarded.

**Operator response:** Contact the system programmer. If the system programmer indicates that more information is required in the appropriate Policy Agent log file, restart the Policy Agent with a minimum ofLogLevel 127 configured in the configuration file, or with the -d 1 start option.

**System programmer response:** Examine the log files to determine the cause of the policy definition errors. When this message occurs on a policy client, examine the log files on the policy server because policy parsing is performed on the policy server. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 configured in the configuration file or start the appropriate Policy Agent with the -d 1 start option.
Correct the Policy Agent policy definition errors identified in the log and restart Policy Agent with the corrected policy definitions.

**Module:** PLFMISC

**Procedure name:** plfm_disciplineMsg

---

**EZ8439I**  PAGENT READFROMDIRECTORY STATEMENT CONTAINS ERRORS

**Explanation:** The Policy Agent ReadFromDirectory statement in the configuration file contains errors.

**System action:** The ReadFromDirectory statement is not applied and Policy Agent does not attempt to connect to the LDAP server.

**Operator response:** Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

**System programmer response:** Correct the Policy Agent configuration file errors identified in the log and restart Policy Agent with the corrected configuration file.

**Module:** pinitimg.c

**Procedure name:** processingStmt_UseLDAPRules

---

**EZ8440I**  PAGENT CANNOT CONNECT TO LDAP SERVER FOR TcpImage

**Explanation:** The Policy Agent could not connect to the LDAP server for TcpImage. This might indicate a problem with the LDAP server, or might indicate that the associated TCP/IP stack was recycled.

If the LDAP server had successfully connected, then the original policies will not be deleted from the TCP/IP stack. If no policies are changed when the LDAP server reconnects, then no new message will be displayed.

**System action:** Policy Agent retries connecting to the LDAP server, using a sliding retry interval that starts at 1 minute and increases up to 30 minutes at 5 minute intervals. As long as the connection attempt is unsuccessful, Policy Agent cannot read LDAP policies.

**Operator response:** If the problem persists, verify that the LDAP server is running and that the correct connection parameters have been specified on the ReadFromDirectory configuration statement. If the connect attempt still fails, re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. If you are using SYSLOGD, ensure that the Syslog Daemon (syslogd) is running.

**System programmer response:** Correct the Policy Agent configuration file or the LDAP server problem and restart either Policy Agent or the LDAP server.

**Module:** LDAPCLNT

**Procedure name:** ReadLdapRules

---

**EZ8441I**  PAGENT MODIFY COMMAND UNSUCCESSFUL - SYNTAX ERROR

**Explanation:** The Policy Agent application is unable to process a MODIFY command. An incorrect parameter was specified on the command.

**System action:** The Policy Agent MODIFY command is ignored.

**Operator response:** Verify the syntax of the MODIFY command and reissue the command. See the z/OS Communications Server: IP System Administrator's Commands for the syntax of the Policy Agent MODIFY command.

**System programmer response:** None.

**Module:** PZOSINIT

**Procedure name:** pzos_command_handler
EZZ8442I  PAGENT MODIFY COMMAND UNSUCCESSFUL - INCORRECT VALUE

Explanation: The Policy Agent application is unable to process a MODIFY command. An incorrect value was specified on the command.

System action: The Policy Agent MODIFY command is ignored.

Operator response: Verify the correct parameter values for the MODIFY command and reissue the command. See the [z/OS Communications Server: IP System Administrator's Commands] for the syntax of the Policy Agent MODIFY command.

System programmer response: None.

Module: PZOSINIT

Procedure name: pzos_command_handler

EZZ8443I  PAGENT MODIFY COMMAND ACCEPTED

Explanation: A MODIFY command was accepted by the Policy Agent.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: PZOSINIT

Procedure name: pzos_command_handler

EZZ8444I  PAGENT LOG LEVEL loglevel DEBUG LEVEL debuglevel TRACE LEVEL tracelevel

Explanation: This is the response to a Policy Agent MODIFY procname,QUERY command.

loglevel is the value specified with the LogLevel configuration statement or with the MODIFY LOGLEVEL,LEVEL command.

ddebuglevel is the debug level specified with the -d startup option, or with the MODIFY DEBUG,LEVEL command.

tracelevel is the trace level specified with the -t startup option, or with the MODIFY TRACE,LEVEL command.

System action: Processing continues.

Operator response: See the [z/OS Communications Server: IP Configuration Reference] for the description of each of the displayed level values.

System programmer response: None.

Module: PZOSINIT

Procedure name: pzos_command_handler

EZZ8445I  PAGENT SHUTDOWN IN PROGRESS

Explanation: The Policy Agent application is about to exit normally.

System action: Policy Agent begins to shut down.

Operator response: None.

System programmer response: None.

Module: PAGENT

Procedure name: terminator
EZZ8446I  TCP CONNECTION FROM PAGENT ON tcp_procname TO PAGENT ON remote_ip_address: remote_port IS NO LONGER ACTIVE

Explanation: The Policy Agent running on the distributing stack lost its TCP connection with the Policy Agent running on the target stack.

tcp_procname is the TCP/IP jobname of the distributing stack.
remote_ip_address is the IP address of the Policy Agent running on the target stack.
remote_port is the port number used by the Policy Agent running on the target stack.

System action: The Policy Agent will not be able to obtain the QoS fractions using service level granularity from the target stack. If the target stack is removed from the distributing stack target list, no action will be taken. Otherwise, the Policy Agent running on the distributing stack will try to establish a connection with the Policy Agent running on the target stack.

Operator response: None.

System programmer response: If the target stack was supposed to be removed from the distributor stack target list, then no further action is necessary. If the target stack was removed from the distributor stack list in error, then look at the system log to determine the problem. If the target stack is still in the distributor stack list, then take the necessary corrective action, based on the information in the Policy Agent log, indicating the cause of the TCP connection failure.

Module: PQOSCOLL

Procedure name: pqos_refresh_target_cache, pqos_cleanup_target_cache, pqos_get_info_from_listeners

---

EZZ8447I  THROUGHPUT QOS MAXIMUM REACHED FOR SOME SERVICE LEVELS

Explanation: The Throughput QoS maximum was reached for some service levels. This message will be issued again only if the QoS level goes back to normal and then reaches the maximum again.

System action: None.

Operator response: The log for Policy Agent will indicate which service levels have reached the maximum if the debug level includes debug level 8.

System programmer response: Take the necessary corrective action to ensure that the expected connection and traffic distribution is occurring.

Module: PQOSCACH

Procedure name: pqos_refresh_perf_cache

---

EZZ8448I  PAGENT DOES NOT HAVE QOSLISTENER AND QOSCOLLECTOR PORTS DEFINED

Explanation: Policy Agent needs the pagentQosListener and pagentQosCollector ports defined to collect QoS statistics with service level granularity. The /etc/services file must contain the definitions for the pagentQosListener and pagentQosCollector ports.

System action: Processing continues, but QoS statistics with service level granularity will not be used.

Operator response: If QoS statistics with service level granularity is not required, no action needs to be taken. If QoS statistics with service level granularity is required, contact the system programmer.

System programmer response: Modify /etc/services in each node in the sysplex to have a common pagentQosListener port and pagentQosCollector port. See the Z/OS Communications Server: IP Configuration Guide for more information.

Module: PQOSMON

Procedure name: policy_perf_monitor
EZZ8449I PAGENT RUNNING ON tcp_procname CONNECTED TO PAGENT RUNNING ON remote_ip_address:remote_port

Explanation: The Policy Agent running on a distributing stack established a connection with the Policy Agent running on the target stack to collect QoS statistics with service level granularity.

tcp_procname is the TCP/IP jobname of the distributing stack.
remote_ip_address is the IP address of the Policy Agent running on the target stack.
remote_port is the port number used by the Policy Agent running on the target stack.

System action: None.
Operator response: None.
System programmer response: None.
Module: PQOSCOLL
Procedure name: pqos_connect_to_listener

EZZ8450I PAGENT RUNNING ON tcp_procname DECLINED TO ACCEPT A CONNECTION FROM PAGENT RUNNING ON remote_ip_address:remote_port

Explanation: The Policy Agent running on the target stack, tcp_procname, rejected a connection request because the request was not received from a recognized distributing stack.

tcp_procname is the TCP/IP jobname of the target stack.
remote_ip_address is the IP address of the Policy Agent running on the distributing stack.
remote_port is the port number used by the Policy Agent running on the distributing stack.

System action: Processing continues
Operator response: Contact the system programmer.
System programmer response: If the remote IP address/port is not part of the sysplex, then this might be a security breach. If it is part of the sysplex, then verify that the migration tasks for the load distribution function have all been completed. If so, then re-create problem with Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. Ensure that the Syslog Daemon (syslogd) is running.
Module: PQOSLISN
Procedure name: qosListener

EZZ8451I PAGENT RUNNING ON tcp_procname CANNOT ESTABLISH CONNECTION WITH PAGENT RUNNING ON remote_ip_address:remote_port

Explanation: The Policy Agent running on the distributing stack was not able to establish a TCP connection to Policy Agent running on a target stack to collect QoS Service Level statistics. Although the Policy Agent on the distributing stack will continue to retry connection establishment periodically, this message will not be issued again for this target.

tcp_procname is the TCP/IP jobname of the distributing stack.
remote_ip_address is the IP address of the Policy Agent running on the target stack.
remote_port is the port number used by the Policy Agent running on the target stack.

System action: Policy Agent running on the distributing stack will not be able to collect QoS statistics using service level granularity from the target node. Aggregate QoS statistics will be used for distribution of work to this target.
Operator response: If QoS statistics with service level granularity is not required from this target, no action needs to be taken. If QoS statistics with service level granularity is required, contact the system programmer.
System programmer response: The Policy Agent log indicates the reason for the connection failure. Take necessary corrective action based on the information indicating the cause of the TCP connection failure.
Module: PQOSCOLL.C
Procedure name: pqos_connect_to_listener

EZZ8452I  PAGENT READY FOR REMOTE CLIENT CONNECTIONS ON POLICY SERVER

Explanation: The Policy Agent that is acting as a policy server is ready to provide services for remote policy clients. This message is issued when the ClientConnection configuration statement is specified in the Policy Agent main configuration file. It is also issued after the condition reported with message EZZ8788I has been corrected. See EZZ8788I for more information about that message.

System action: Processing continues.

Operator response: None.

System programmer response: None.

User response: Not applicable.

Problem determination: Not applicable.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

Module: paapi.c

Routing code: 10

Descriptor code: 12

Example: Not applicable.

EZZ8453I  jobtype STORAGE

Explanation: TCP/IP issues this message as part of a group of messages in response to a DISPLAY TCPIP,procname,STOR command. This is the first message in the group. A complete description of the message group follows:

EZZ8453I  jobtype STORAGE

EZZ8454I  jobname STORAGE CURRENT MAXIMUM LIMIT

EZD2018I  location

EZZ8455I  storagetype current maximum limit

EZD2024I  type current maximum

EZZ8459I  DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY

This message identifies the type of information shown in the message group.

jobtype is the type of job. Possible values are:

TCP/IP
The job is a TCP/IP job.

TELNET
The job is a TN3270 job.

EZZ8454I
This message is a header message for EZZ8455I.

jobname is the job name associated with the procedure used to start the job.

EZD2018I
This message identifies the storage location for the storage described in the subsequent message EZZ8455I.

location is the location of the storage. Possible values are:

31-BIT
The storage is 31-bit storage located below the 2 GB bar.
**EZZ8453I**

64-BIT
The storage is 64-bit storage located above the 2 GB bar.

**EZZ8455I**

This message contains storage totals.

storageType is the storage type. Possible values are:

ECsA
The amount of extended common storage area in use.

PRIVATE
The amount of pooled private storage in use.

ECsA MODULES
The amount of common storage in use for load modules loaded by dynamic LPA.

HVCOMMON
The amount of 64-bit common storage in use.

HVPRIVATE
The amount of 64-bit private storage in use.

TRACE HVCOMMON
The amount of 64 bit common storage that was obtained for tracing.

TRACE HVPRIVATE
The amount of 64 bit common storage that was obtained for tracing.

SMC-R FIXEDMEMORY
The amount of 64-bit private fixed storage in use for Shared Memory Communications - Remote Direct Memory Access (SMC-R). An instance of message EZZ8455I specifying SMC-R FIXEDMEMORY is only included in the message group if SMC-R is or was previously enabled for this TCP/IP stack by specifying the SMCR parameter on the GLOBALCONFIG profile statement.

current is the amount of storage currently allocated. The value ends with either K to indicate 1024 bytes or M to indicate 1048576 bytes. The current value for SMC-R FIXEDMEMORY is the sum of the SMC-R SEND MEMORY and SMC-R RECV MEMORY current values in message EZD2024I.

maximum is the maximum amount of storage ever allocated since the job was started. The value ends with either K to indicate 1024 bytes or M to indicate 1048576 bytes. The maximum value for SMC-R FIXEDMEMORY is the maximum amount of storage ever allocated for SMC-R send and receive buffers combined, but can be less than the sum of the maximum values in message EZD2024I for SMC-R SEND MEMORY and SMC-R RECV MEMORY.

limit is the storage limit that the job allows.
- When jobType on EZZ8453I is TELNET, the storage does not have a limit.
- When storageType is SMC-R FIXEDMEMORY, limit is defined using the SMCR FIXEDMemory keyword value on the GLOBALCONFIG profile statement. The FIXEDMemory value represents the limit for all SMC-R storage, regardless of whether it is used for send or receive buffers.
- Otherwise, limit is defined on the GLOBALCONFIG profile statement for TCP/IP.

The value ends with either K to indicate 1024 bytes or M to indicate 1048576 bytes, is NOLIMIT if the storage does not have a limit, or is N/A for SMC-R FIXEDMEMORY when the SMC-R function was previously enabled on this TCP/IP stack but is not currently enabled. See z/OS Communications Server: IP Configuration Reference for more information.

**EZD2024I**

- This message contains storage totals. This message is only included in the message group if SMC-R is or was previously enabled for this TCP/IP stack by specifying the SMCR parameter on the GLOBALCONFIG profile statement.
- Type is the storage type. Possible values are:
SMC-R RECV MEMORY

The amount of 64-bit private storage allocated as SMC-R receive buffers for all SMC-R link groups associated with this TCP stack.

SMC-R SEND MEMORY

The amount of 64-bit private storage allocated for SMC-R send buffers by this TCP/IP stack.

- current is the amount of storage currently allocated. The value ends with either K to indicate 1024 bytes or M to indicate 1048576 bytes.
- maximum is the maximum amount of storage ever allocated since the job was started. The value ends with either K to indicate 1024 bytes or M to indicate 1048576 bytes.

EZZ8459I

This message is displayed when the DISPLAY TCPIP,procname,STOR command completed.

System action: The job continues.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: None.
Module: EZACDDSU
Routing code: 0
Descriptor code: 5, 8, 9
Automation: Not applicable.
Example:

EZZ8459I DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY

EZZ8454I  jobname STORAGE CURRENT MAXIMUM LIMIT

Explanation: This message is issued as part of a message group. See message EZZ8453I for a complete description of the message group.

EZZ8455I  storagetype current maximum limit

Explanation: This message is issued as part of a message group. See message EZZ8453I for a complete description of the message group.

System action: See message EZZ8453I.
Operator response: See message EZZ8453I.
System programmer response: See message EZZ8453I.
User response: See message EZZ8453I.
Problem determination: See message EZZ8453I.
Module: See message EZZ8453I.
Routing code: See message EZZ8453I.
Descriptor code: See message EZZ8453I.
Automation: See message EZZ8453I.
Example: See message EZZ8453I.

**EZZ8456I** TCPIP MODULE STORAGE

Explanation: TCP/IP issues this message in response to a DISPLAY TCPIP,procname,STOR,MODULE=modid command. A complete description of the display follows:

EZZ8456I TCPIP MODULE STORAGE

mod_ID LOADED AT address IN LOAD MODULE loadmod_ID

offset modprg1 modprg2 modprg3 modprg4 *translate

In the message text:

mod_ID
  The name of the specified module.

address
  The address of the specified module.

loadmod_ID
  The load module that contains the specified module.

offset
  The current display offset.

modprg1
  Four bytes of the specified module.

modprg2
  Four bytes of the specified module.

modprg3
  Four bytes of the specified module.

modprg4
  Four bytes of the specified module.

translate
  The module line translated to EBCDIC.

System action: TCP/IP continues.

Operator response: None.

System programmer response: None.

Programmer response: None.

Example:

11.56.08 DISPLAY TCPIP,,STOR,MODULE=ezBTIINI
11.56.08 EZZ8456I TCPIP MODULE STORAGE 390

EZZ8459I DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY

**EZZ8457I**

**Explanation:** This message is displayed in response to the DISPLAY TCPIP,procname,STOR,MODULE=modid command in a display that begins with EZZ8456I. See the description of **EZZ8456I** for a complete description of the display.
EZZ8458I  offset modprg1 modprg2 modprg3 modprg4 *translate

Explanation: This message is displayed in response to the DISPLAY TCPIP,procname,STOR,MODULE=modid command in a display that begins with EZZ8456I. See the description of [EZZ8456I] for a complete description of the display.

EZZ8459I  DISPLAY TCPIP STOR COMPLETED SUCCESSFULLY

Explanation: This message is displayed when the DISPLAY TCPIP,procname,STOR,MODULE=modid command completed.

System action: TCP/IP continues.
Operator response: None.
System programmer response: None.
Programmer response: None.

EZZ8460I  modid AND ITS STORAGE CANNOT BE DISPLAYED

Explanation: This message is displayed in response to the DISPLAY TCPIP,procname,STOR,MODULE=modid command when an undisplayable module was specified.

modid is the name of the specified module.

System action: TCP/IP continues.
Operator response: Re-enter the DISPLAY TCPIP,procname,STOR,MODULE=modid command with a displayable module name.
System programmer response: None.
Programmer response: None.

EZZ8461I  ip_addr IS NOT A ROUTABLE DYNAMIC VIPA

Explanation: This message is additional information for message EZZ8469I. A VIPADISTRIBUTE DEFINE statement is in a profile data set, but the specified DVIPA address is not configured on this stack as a VIPADEFINE or VIPABACKUP dynamic VIPA or the DVIPA address has been deactivated.

ip_addr is the IP address of the Dynamic VIPA.

System action: TCP/IP continues. The VIPADISTRIBUTE statement is rejected.
System programmer response: If you intend to distribute the specified IP address, ensure that it was configured with a VIPADEfine or VIPABACKUP statement before the VIPADISTRIBUTE statement is processed.

EZZ8462I  ip_addr port_num IS BEING DISTRIBUTED TO ALL STACKS

Explanation: This message is additional information for message EZZ8470I or EZZ8471I. Incoming connections to the specified IP address-port pair are currently being distributed among all stacks in the sysplex group. This message further explains why a VIPADISTRIBUTE DEFINE statement was ignored, or a VIPADISTRIBUTE DELETE statement was rejected. If the specified IP address and port were in a VIPADISTRIBUTE DEFINE statement with a specified DESTIP address, the VIPADISTRIBUTE DEFINE statement is ignored because the specified DESTIP address is already eligible for incoming connections to this IP address and port. If the specified IP address and port were in a VIPADISTRIBUTE DELETE statement with a specified DESTIP address, the VIPADISTRIBUTE DELETE statement is rejected because this IP address-port pair is currently configured for distribution to all stacks and exclusion of one stack is not supported.

ip_addr is the IP address of the Dynamic VIPA.
port_num is the distributed port.

System programmer response:
If the specified IP address or port is not correct, resubmit the VIPADISTRIBUTE statement with the correct IP address and port.

If the statement was VIPADISTRIBUTE DEFINE, no additional action is necessary.

If the statement was VIPADISTRIBUTE DELETE to exclude distribution to a particular stack submit:
1. VIPADISTRIBUTE DELETE statement specifying DESTIP ALL
2. VIPADISTRIBUTE DEFINE statements for each stack that is to be a target of this VIPADISTRIBUTE

**EZZ8463I ip_addr port_num destip NOT FOUND**

**Explanation:** This message is additional information for message EZZ8472I. A VIPADISTRIBUTE DELETE statement appears in a profile data set, but the specified DVIPA address, port, and DESTIP are not currently configured for distribution by this stack or the DVIPA address has been deactivated.

*ip_addr* is the IP address of the Dynamic VIPA.

*port_num* is the distributed port.

*destip* is the DXCF IP address of the destination stack.

**System action:** TCP/IP continues. The VIPADISTRIBUTE DELETE statement is ignored.

**System programmer response:** If the specified IP address, port, or DESTIP is not correct, submit a corrected VIPADISTRIBUTE statement.

**EZZ8464I VIPADIST DELETE ip address port REJECTED - VIPADIST ALL**

**Explanation:** A VIPADISTRIBUTE DELETE statement appears in a profile data set specifying an ipaddress, port, and specific destination XCF address to be excluded from distribution. However, the specified ipaddress and port is currently configured for distribution to all stacks and exclusion of one stack is not supported. The VIPADISTRIBUTE DELETE statement is ignored.

*ip address* is the IP address of the Dynamic VIPA.

*port* is the distributed port.

**System action:** TCP/IP continues.

**System programmer response:** If the specified ipaddress, port, and/or DESTIP ipaddress is not correct, resubmit a corrected VIPADISTRIBUTE statement. If the specified ipaddress, port, and DESTIP are correct and you intend to exclude the stack with that DESTIP ipaddress from distribution, you must submit a VIPADISTRIBUTE DELETE statement specifying DESTIP ALL along with individual VIPADISTRIBUTE DEFINE statements for each stack that is to be the target of this dynamic VIPA distribution.

**EZZ8465I ip_addr IS A DESTINATION FOR A VIPADISTRIBUTE**

**Explanation:** This message is additional information for message EZZ8306I. A VIPADELETE statement appears in a profile data set specifying an IP address that currently exists as a destination dynamic VIPA on this stack. Destination dynamic VIPAs cannot be deleted using the VIPADELETE configuration statement.

*ip_addr* is the IP address of the Dynamic VIPA.

**System action:** TCP/IP continues. The VIPADELETE statement is rejected.

**System programmer response:** If the specified IP address is not correct, submit a corrected VIPADELETE statement. To remove the specified IP address from this stack submit a VIPADISTRIBUTE DELETE statement on the stack that is distributing this dynamic VIPA. The DESTIP address on the VIPADISTRIBUTE DELETE statement must either specify this stack's Dynamic XCF IP address or the keyword 'ALL' to end distribution to all stacks for the specified IP address and port.

**EZZ8466I VIPADISTRIBUTE REJECTED - DYNAMIC XCF IS NOT ENABLED**

**Explanation:** A VIPADISTRIBUTE statement appears in a profile data set, but Dynamic XCF is not enabled on this stack.

**System action:** TCP/IP continues. The VIPADISTRIBUTE statement is ignored.
**System programmer response:** Enable Dynamic XCF with the IPCONFIG DYNAMICXCF configuration statement. Either correct and resubmit the original profile or submit a VARY TCPIP,OBEYFILE command.

---

**EZZ8467I**  
**VIPADISTRIBUTE WOULD EXCEED MAXIMUM DESTIPS**

**Explanation:** This message is additional information for message EZZ8469I. A VIPADISTRIBUTE DEFINE statement appears in a profile data set, but the specified IP address and port are currently configured for distribution to the maximum number of destination IP addresses.

**System action:** TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

**System programmer response:** Use one of the following commands to see the DESTIPs configured on this stack:

- display tcpip,tcpip_procname,netstat,vipadcfg
- onetstat -F
- netstat vipadcfg

Submit a VIPADISTRIBUTE DELETE statement followed by a VIPADISTRIBUTE DEFINE statement to remove an existing DESTIP and configure the new DESTIP.

---

**EZZ8468I**  
**VIPADISTRIBUTE WOULD EXCEED MAXIMUM PORTS**

**Explanation:** This message is additional information for message EZZ8469I. A VIPADISTRIBUTE DEFINE statement appears in a profile data set, but the specified IP address is currently configured for distribution to the maximum number of ports.

**System action:** TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

**System programmer response:** Use one of the following commands to see the ports configured on this stack:

- display tcpip,tcpip_procname,netstat,vipadcfg
- onetstat -F
- netstat vipadcfg

Submit a VIPADISTRIBUTE DELETE statement followed by a VIPADISTRIBUTE DEFINE statement to remove an existing port and configure the new port.

---

**EZZ8469I**  
**VIPADISTRIBUTE ip_addr port_num destip REJECTED**

**Explanation:** A VIPADISTRIBUTE DEFINE statement appears in a profile data set, but the specified IP address and port cannot be distributed to the specified DESTIP address. An additional message is issued to describe the reason. 

*ip_addr* is the IP address of the Dynamic VIPA.

*port_num* is the distributed port.

*destip* is the DXCF IP address of the destination stack.

**System action:** TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

**System programmer response:** See the additional message.

---

**EZZ8470I**  
**VIPADISTRIBUTE ip_addr port_num destip IGNORED**

**Explanation:** A VIPADISTRIBUTE DEFINE statement appears in a profile data set, but the specified IP address and port are already distributed to the specified DESTIP. An additional message is issued to describe the reason.

*ip_addr* is the IP address of the Dynamic VIPA.

*port_num* is the distributed port.

*destip* is the DXCF IP address of the destination stack.

**System action:** TCP/IP continues. The VIPADISTRIBUTE statement is ignored.

**System programmer response:** See the additional message.
EZZ8471I • EZZ8475I

EZZ8471I  VIPADIST DEL ip_addr port_num destip REJECTED

Explanation: A VIPADISTRIBUTE DELETE statement appears in a profile data set, but distribution of the specified IP address and port to the specified DESTIP address could not be deleted. An additional message is issued to describe the reason.

ip_addr is the IP address of the Dynamic VIPA.
port_num is the distributed port.
destip is the DXCF IP address of the destination stack.

System action: TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

System programmer response: See the additional message.

EZZ8472I  VIPADIST DEL ip_addr port_num destip IGNORED

Explanation: A VIPADISTRIBUTE DELETE statement appears in a profile data set, but the specified IP address and port are not currently being distributed to the specified DESTIP address. An additional message is issued to describe the reason.

ip_addr is the IP address of the Dynamic VIPA.
port_num is the distributed port.
destip is the DXCF IP address of the destination stack.

System action: TCP/IP continues. The VIPADISTRIBUTE statement is ignored.

System programmer response: See the additional message.

EZZ8473I  ip_addr IS NOT A DYNAMIC VIPA

Explanation: This message is additional information for message EZZ8306I. A VIPADELETE statement appears in a profile data set, but the specified IP address is not configured as a dynamic VIPA on this stack.

ip_addr is the IP address of the Dynamic VIPA.

System action: TCP/IP continues. The VIPADELETE statement is rejected.

System programmer response: Specify a dynamic VIPA address.

EZZ8474I  ip_addr IS A DISTRIBUTING VIPA

Explanation: This message is additional information for message EZZ8306I and EZZ9666I. A VIPADELETE statement appears in a profile data set, but the specified dynamic VIPA address is currently configured as distributing to one or more stacks in the sysplex group.

ip_addr is the IP address of the Dynamic VIPA.

System action: TCP/IP continues. The VIPADELETE is rejected.

System programmer response: To delete this dynamic VIPA, you must first issue one or more VIPADISTRIBUTE DELETE statements to end all distributions for this dynamic VIPA. Use one of the following commands to see the distributions configured for this dynamic VIPA:
• display tcpip,tcpip_procname,netstat,vipadcfg
• onetstat -F
• netstat vipadcfg

Then issue the VIPADELETE statement.

EZZ8475I  SYSPLEX DISTRIBUTOR SERVICE MANAGER FUNCTION NOT AVAILABLE

Explanation: The sysplex distributor was not able to open and bind to the UDP port specified on the SMPORT parameter on the VIPASMPARMS statement in the TCPIP profile. This probably means that this port is already reserved or that another application is already bound to this port.
**System action:** The sysplex distributor will not perform the Service Manager function for the Cisco Multi-Node Load Balancer (MNLB).

**Operator response:** Contact the system programmer.

**System programmer response:** Update the TCPIP profile to specify a different port on the SMPORT parameter on the VIPASMPARMS statement.

**Module:** TCPIP

**Procedure name:** EZBXFCIN

---

**EZZ8476I** NO VIPASMPARMS STATEMENT FOR VIPA *ip_address*

**Explanation:** The sysplex distributor cannot perform the Service Manager function for the indicated VIPA because there is no VIPASMPARMS statement in the TCPIP profile.

*ip_address* is a VIPA specified on a VIPADISTRIBUTE statement.

**System action:** The sysplex distributor accepts the VIPADISTRIBUTE statement but will not perform the Service Manager function without a VIPASMPARMS statement.

**Operator response:** Contact the system programmer.

**System programmer response:** Update the TCPIP profile to specify a VIPASMPARMS statement in the VIPADYNAMIC block.

**Module:** TCPIP

**Procedure name:** EZBXFDYN

---

**EZZ8477I** INCONSISTENT VIPASMPARMS DEFINED BY *tcp_jobname* ON *mvsname*

**Explanation:** The VIPASMPARMS statement in the TCPIP profile on this stack is inconsistent with the VIPASMPARMS statement in the TCPIP profile for another TCP/IP stack in the sysplex.

*tcp_jobname* is the jobname of the other TCP/IP stack.

*mvsname* is the name of the system on which the other TCP/IP stack is running.

**System action:** The sysplex distributor on this stack will use the parameters defined on the VIPASMPARMS statement in the TCPIP profile. However, this inconsistent definition across the stacks probably means that the sysplex distributor will not provide the intended workload distribution in the sysplex for Dynamic VIPAs with the SERVICEMGR parameter.

**Operator response:** Contact the system programmer.

**System programmer response:** Review the VIPASMPARMS statements in the respective TCPIP profiles and, if necessary, update these definitions.

**Module:** TCPIP

**Procedure name:** EZBXFMSI

---

**EZZ8495I** TRMD STARTED

**Explanation:** trmd was started.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZATRMD

**Procedure name:** main
EZZ8496I  trmd internal error:indicator
Explanation: An unexpected internal error occurred. The value of indicator can be one of the following:
76  An error occurred while opening a socket. Ensure that the stack is running and was initialized correctly.
77  An error occurred while forking.
78  trmd could not allocate enough storage. Increase your region size.
79  An error occurred while setting up a signal handler.
System action: Application ends.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8498I  TRMD STACK UNAVAILABLE:stackname
Explanation: trmd was unable to establish affinity to a TCP/IP stack.
System action: Application ended.
Operator response: None.
System programmer response: Ensure that the stack was initialized correctly.
Module: EZATRMD
Procedure name: main

EZZ8500I  TRMD INITIALIZATION COMPLETE
Explanation: trmd initialized successfully.
System action: Application continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8501I  TRMD ENDED
Explanation: trmd is ending.
System action: Application ended.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8502I  TRMD ARGUMENT INVALID
Explanation: An invalid argument was specified.
System action: Application ends.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8503I TRMD ALREADY RUNNING ON: stackname
Explanation: A copy of trmd is already running. Only one copy of trmd might be running per TCP/IP image at a time.
System action: Application ends.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8504I No value specified for the option option
Explanation: The trmdstat command was invoked with an option without a value.
option is a command line option.
System action: The trmdstat command ends.
Operator response: Correct the error and reissue the trmdstat command with the correct option value.
System programmer response: None.
Module: TSTATINI.C
Procedure name: tstatParseCmdLineArgs

EZZ8505I Value specified for option option is out of range
Explanation: While processing the command line options for the trmdstat command, an option was encountered that required a numeric value in a specified range. The value specified was outside the allowable range of values for the option being processed.
option is a command line option.
System action: The trmdstat command ends.
Operator response: Correct the value specified for the option in error and reissue the trmdstat command.
System programmer response: None.
Module: TSTATINI.C
Procedure name: tstatParseCmdLineArgs

EZZ8506I Value specified for the option option is not numeric
Explanation: While processing the command line options for the trmdstat command, an option was encountered that required a numeric value. The value specified was not numeric.
option is a command line option.
System action: The trmdstat command ends.
Operator response: Correct the value specified for the option in error and reissue the trmdstat command.
System programmer response: None.
EZZ8507I  IP address address specified for the filter option is not in the correct format

Explanation: The trmdstat command was unable to interpret the IP address correctly.

address is the IP address.

filter is the command filter with which the IP address was specified.

System action: The trmdstat command ends.

Operator response: Correct the value specified for the IP address and reissue the trmdstat command.

System programmer response: None.

Module: TSTATINI.C

Example:
EZZ8507I IP address 5c09 specified for the -h option is not in the correct format

Procedure name: tstatParseCmdLineArgs

EZZ8508I  Unable to open input_file - error_text

Explanation: The trmdstat command was unable to open the input_file specified in the command line.

input_file is the name of the input file.

error_text is the error message string, containing a specific reason for the failure.

System action: The trmdstat command ends.

Operator response: Correct the error and reissue the trmdstat command.

System programmer response: None.

Module: TSTATMN.C

Procedure name: main

EZZ8509I  Unable to allocate memory in function

Explanation: The trmdstat command attempted to allocate memory in function function. Memory could not be obtained.

function is the name of the function that cannot allocate memory.

System action: The trmdstat command ends.

Operator response: Contact the system programmer.

System programmer response: Determine why memory was not available. Correct the problem and reissue the trmdstat command.

Procedure name: tstatUpdateConnList, tstatUpdateDetInfo, tstatUpdateConnHostInfo, tstatUpdateATTACKList, tstatUpdateATTACKDetailsInfo, tstatUpdateATTACKSummaryInfo, tstatUpdateFLOODList, tstatUpdateFLOODDetailsInfo, tstatUpdateFLOODSummaryInfo, tstatUpdateINTFLOODList, tstatUpdateINTFLOODDetailsInfo, tstatUpdateINTFLOODSummaryInfo, tstatUpdateSUPPRESSList, tstatUpdateSUPPRESSDetailsInfo, tstatUpdateSUPPRESSSummaryInfo, tstatUpdateSCANDetailsInfo, tstatUpdateSCANList, tstatUpdateSCANDetailsInfo, tstatUpdateSCANSummaryInfo, tstatUpdateTCPList, tstatUpdateTCPDetailsInfo, tstatUpdateTCPSummaryInfo, tstatUpdateTCPeSummaryInfo, tstatUpdateUDPList, tstatUpdateUDPDetai

EZZ8510I  Unable to open message catalog catalog_name - error_text

Explanation: The trmdstat command was unable to open the message catalog trmdstat.cat in the message catalog directory. The default location for the message catalog is set by the NLSPATH environment variable to be NLSPATH=/usr/lib/nls/msg/%L/%N.

catalog_name is the name of the message catalog.
**System action:** The trmdstat command will use the internal default messages instead of the messages from the external message catalog.

**Operator response:** If you want to use the external message catalog, contact the system programmer. If the default messages are acceptable, no action is necessary.

**System programmer response:** If you want to use the external message catalog, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/knowledgecenter/STGQZG_8.2.0/cxxref_cxxref.html) for more information about the catopen() function call. See the [z/OS UNIX System Services Programming Tools](https://www.ibm.com/support/knowledgecenter/STGQZG_8.2.0/uxstools/uxstools/home.html) for more information about the NLSPATH environment variables. If the default messages are acceptable, no action is necessary.

**Module:** TSTATINIC

**Procedure name:** tstatInitialize

---

Usage: trmdstat <Options> log_file_name

**Explanation:** The following is the complete text of the message:

Usage: trmdstat <Options> log_file_name

**Report type options:**
- `-A` - Displays the ATTACK report
- `-C` - Displays the CONNECTION report
- `-F` - Displays the FLOOD report
- `-I` - Displays the IDS summary report
- `-N` - Displays the SCAN report
- `-T` - Displays the TCP TR report
- `-U` - Displays the UDP TR report
- `default` - Displays the TCP TR summary report

**Report content options:**
- `-D` - For `-A`, `-C`, `-F`, `-N`, `-T` or `-U`, displays the details information
- `-E` - For `-T`, displays the extended summary information
- `-S` - For `-A`, `-F`, `-T`, or `-U`, displays statistics information

**Stack name option:**
- `-j stack name` - The name of the TCP/IP stack for which records are to be included

**IP Address and port range options:**
- `-h ip_address` - For `-A`, `-C`, `-F`, `-N` or `-U`, displays information for ip_address
- `-k ip_address` - For `-T` and `-S`, displays information for the peak ip_address
- `-s ip_address` - For `-A` or `-T` (without `-S`), displays information for the source ip_address
- `-t ip_address` - For `-A` or `-T`, displays information for the destination ip_address
- `-p port_range` - For `-C` `-T` or `-U`, for `-A` or `-F` (without `-S`), Port range to be included

**Time range options:** (mmddhhmmss)
- `-i initial_time` - Time of the first record to be included
- `-f final_time` - Time of the final record to be included

**Additional filter options:**
- `-c correlator` - Select records with this correlator
  - Not valid with `-S` or `-I`.
- `-n interface` - For `-F`, select records by interface name

**Debug option:**
- `-d debug_level` - Specifies the debug level

**System action:** TRMDSTAT was invoked requesting help or with a specification error.

**System action:** TRMDSTAT processing ends.
EZZ8540I  •  EZZ8544I

Operator response: Restart TRMDSTAT.
System programmer response: None.
Module: TSTATINI
Procedure name: tstatDisplayUsage

EZZ8540I  SUPERUSER AUTHORITY REQUIRED
Explanation: TRMD was invoked from a user ID that was not a superuser.
System action: TRMD processing ends.
Operator response: Restart TRMD from a superuser.
System programmer response: None.
Module: EZATRMD
Procedure name: main

EZZ8541I  TRMD MESSAGE CATALOG COULD NOT BE OPENED - DEFAULT MESSAGES WILL BE USED
Explanation: The trmdm.cat message catalog file could not be opened. TRMD will use the default message strings instead of the message strings in the message catalog file.
System action: Processing continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the message catalog was installed properly and the NLSPATH is correct.
Module: EZATRMD
Procedure name: issue_message

EZZ8543I  TRMD UNSUPPORTED OPERATOR COMMAND
Explanation: A unrecognized operator command was issued for TRMD. TRMD supports the stop and cancel commands.
System action: The command is ignored. TRMD continues.
Operator response: Issue a supported TRMD command.
System programmer response: Not applicable.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Intrusion Detection Services
Module: ezatrzos.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8544I  TRMD IPSEC LOGGING COULD NOT ACTIVATE
Explanation: TRMD could not obtain storage for the IPSec log buffer. At least 2 megabytes of private storage is needed to process the IPSec log records.
System action: TRMD continues to run but TRMD will not write IPSec log records.
Operator response: Contact the system programmer.
System programmer response: If IPSec logging is required, ensure that the region size specified on the TRMD job or exec statement allows at least 2 megabytes of virtual storage. Stop and restart TRMD.
User response: Not applicable.
Problem determination: See the system programmer response.
Source: z/OS Communications Server TCP/IP: Intrusion Detection Services
Module: ezatrzos.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8545I TRMD IPSEC LOGGING ACTIVATED

Explanation: TRMD processing detected that IPSec is active on the TCP/IP stack and TRMD will write IPSec log records and IDS log records.
System action: TRMD processing continues and TRMD will write IPSec and IDS log records.
Operator response: Not applicable.
System programmer response: Not applicable.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Intrusion Detection Services
Module: ezatrzos.c
Routing code: Not applicable.
Descriptor code: Not applicable.
Example: Not applicable.

Usage: trmd option
Message Format:
Usage: trmd option
Options are:
-d Level Specifies the debug level
Valid debug levels are 1,2,3
-? Displays Usage

Explanation: This message shows the syntax for the trmd command. Parameters are optional. This message is displayed when -? option is specified or if an invalid option was entered.
System action: TRMD ends.
Operator response: If an invalid option was specified, reissue the trmd command with a correct value.
System programmer response: None.
Module: EZATRMD
Procedure name: issue_message

EZZ8600I DCAS UNABLE TO OPEN MESSAGE CATALOG dcasm.cat ERRNO errno

Explanation: The Digital Certificate Access Server was unable to open the dcasm.cat message catalog. The default location for the message catalog is set by the NLSPATH environment variable to be "NLSPATH=/usr/lib/nls/msg/%L/%N".

 errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes
System action: Initialization continues.
Operator response: None.
EZZ8601I  •  EZZ8605I

System programmer response: If you want to use the external message catalog, correct the indicated error. If the
default messages are acceptable, no action is necessary.

Module: dcasmain
Procedure name: main

EZZ8601I  DCAS IS STARTING
Explanation: The Digital Certificate Access Server is initializing.
System action: Initialization continues.
Operator response: None.
System programmer response: None.
Module: dcasmain
Procedure name: main

EZZ8602I  DCAS ENDED
System action: None.
Operator response: None.
System programmer response: None.
Module: dcasmain
Procedure name: termprocess

EZZ8603I  DCAS INVALID CLIENTAUTH VALUE
Explanation: The CLIENTAUTH keyword value specified in the DCAS configuration file is incorrect.
System action: DCAS ends.
Operator response: None.
System programmer response: Correct the CLIENTAUTH value and restart DCAS.
Module: dcasconf
Procedure name: process_passtick_config

EZZ8604I  DCAS IS ATTEMPTING TO END ALL THREADS
Explanation: This indicates that the DCAS ending process is starting.
System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: dcasmain
Procedure name: termthreads

EZZ8605I  DCAS INITIAL VALIDATIONS FAILED: errtype
Explanation: When trying to start DCAS, some validation conditions were not met.
errtype can be one of the following:

not a superuser
DCAS must run with superuser authority.
DCAS must run as an authorized application.

User is not authorized to start DCAS.

System action: DCAS ends.
Operator response: None.
System programmer response: Review the following:

- Change DCAS to run with superuser authority.
- Change DCAS to run from an APF authorized library.

Use RACF to define the user ID under which DCAS is started to the MVS.SERVMGR.DCAS profile in the OPERCMDS class. Do the following RACF commands:

- Rdefine OPERCMDS MVS.SERVMGR.DCAS UACC(NONE)
- Permit MVS.SERVMGR.DCAS CLASS(OPERCMDS) ACCESS(CONTROL) ID(user ID)

Module: dcasinit
Procedure name: validations

---

**EZZ8606I**  DCAS INITIALIZATIONS FAILED: errtype ERRNO errno

**Explanation:** When trying to start DCAS, a main thread initialization failed.

**errtype** can be one of the following:

- **Thread Attribute**
  Failed creating a thread attribute.

- **Thread Key**
  Failed creating a thread key.

**errno** is the decimal z/OS UNIX System Services return code set by the Language Environment C Run-Time service that DCAS invoked. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes. The Language Environment Run-Time function invocation that failed is one of the following:

- **Thread Attribute, Thread Key**
  pthread_attr_init()
- **Thread Key**
  pthread_key_create()

System action: DCAS is not started.
Operator response: None.
System programmer response: Make sure that DCAS is started with the POSIX(ON) runtime option. DCAS uses the Language Environment C/C++ Run-Time library services. Verify that a problem does not exist with the Language Environment Run-Time Library. The z/OS XL C/C++ Runtime Library Reference describes the function calls and the errno's returned.

Module: dcasmain dcasinit
Procedure name: initprocess daemonicize

---

**EZZ8607I**  DCAS threaddesc THREAD service FAILED ERRNO errno

**Explanation:** The Language Environment C/C++ Run-Time service that failed is one of the following:

**threaddesc**
Type of thread where failure occurred can be one of the following:
EZZ8608I

**MAIN** DCAS main thread.
**PORT** DCAS port thread.
**STOP** DCAS stop thread.

**CNxxxxxx** DCAS client thread where xxxxxx is a number concatenated to CN to identify the client thread uniquely.

*service* The runtime service that was performed failed and can be one of the following:

- **SETINTRTYPE** Thread invocation of pthread_setintrtype() returned an error
- **GETSPECIFIC** Thread invocation of pthread_getspecific() returned an error
- **SETSPECIFIC** Thread invocation of pthread_setspecific() returned an error
- **CREATE** Thread invocation of pthread_create() returned an error

**errno** *errno* is the decimal z/OS UNIX System Services return code set by the Language Environment C Run-Time service that DCAS invoked. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes. The Language Environment Run-Time function invocation that failed is one of the following:

**System action:** The thread where the failure occurred will terminate. If the *threaddesc* is MAIN, PORT, or STOP, DCAS ends. If the *threaddesc* is CNxxxxxx, the client thread ends.

**Operator response:** None.

**System programmer response:** Make sure that DCAS is started with the POSIX(ON) runtime option. DCAS uses the Language Environment C/C++ Run-Time library services. Verify that a problem does not exist with the Language Environment Run-Time Library. The z/OS XL C/C++ Runtime Library Reference describes the function calls and the *errno*’s returned.

**Module:**

**Procedure name:** main

---

**EZZ8608I** DCAS *threaddesc* THREAD FAILED OBTAINING STORAGE LENGTH *storlen* FOR *storagedesc*

**Explanation:** DCAS was unable to obtain storage.

*threaddesc* indicates the type of thread that had the failure and can be one of the following:

- **MAIN** DCAS main thread.
- **PORT** DCAS port thread.
- **CNxxxxxx** DCAS client thread where xxxxxx is a number concatenated to CN to identify the client thread uniquely.

*storlen* is the length of storage in decimal that the thread tried to obtain.

*storagedesc* is the representation of storage that the thread was trying to obtain. These are internal data structures that might be useful for problem determination. *storagedesc* can be one of the following:

- DCAS_Main
- Configuration Parm
- Keyring Filename
- Password Filename
- SafKeyring Filename
- Port
- Thread Data

---

638  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
System action: Thread will fail. For threaddesc of MAIN, PORT, or STOP, DCAS will end.

Operator response: None.

System programmer response: Increase the region size for the started program. If the problem persists, turn on debugging and capture a debug trace. See the z/OS Communications Server: IP Diagnosis Guide for information about diagnosing problems with DCAS to determine how to turn on debugging.

Module: dcasmain dcasconf dcasaccp dcasconn dcasclie

Procedure name: Initprocess; process_config_keyword,initport; acceptcon; connt_alloc,connblk_alloc;ClientThread

EZZ8609I  DCAS SIGNAL FUNCTION sigfunc FAILED FOR signal ERRNO errno

Explanation: DCAS performed a signal function using the Language Environment C Run-Time services, and the signal function returned an error.

sigfunc is the signal function that failed can be one of the following:

sigaddset()
   Add a signal to a signal set.

sigwait()
   Wait on a set of signals.

sigaction()
   Perform an action when signal occurs.

signal is the signal that failed. For sigfunc of sigwait(), this is NA (not applicable). These are DCAS Unix System Services signals. They are described in the z/OS XL C/C++ Programming Guide.

errno is the decimal z/OS UNIX System Services return code set by the Language Environment C Run-Time service that DCAS invoked. These return codes are listed and described in the return codes (ernos) information in z/OS UNIX System Services Messages and Codes.

System action: For sigfunc of sigwait(), DCAS will end; otherwise, DCAS will terminate the thread and cause DCAS to end if the thread was the listening port thread.

Operator response: None.

System programmer response: Make sure that DCAS is started with the POSIX(ON) runtime option. DCAS uses the Language Environment C/C++ Run-Time library services. Verify that a problem does not exist with the Language Environment Run-Time Library. The z/OS XL C/C++ Runtime Library Reference describes the function calls and the errno’s returned.

Module: dcasmain dcasaccp dcasclie

Procedure name: main,main_signals;accp_signals;clie_signals

EZZ8610I  DCAS OPEN FOR FILE filename FAILED ERRNO: errno

Explanation: Open for the file failed.

filename is the name of the file that failed to open.

errno is the decimal z/OS UNIX System Services return code set by the Language Environment C Run-Time service that DCAS invoked. These return codes are listed and described in the return codes (ernos) information in z/OS UNIX System Services Messages and Codes.

System action: DCAS ends.

Operator response: None.

System programmer response: Verify that the file, as specified, exists; z/OS UNIX file names are case sensitive. Correct the problem and restart DCAS.
Module:  processopts Demonize
Procedure name:  dcasmain dcasinit

EZZ8611I  DCAS failed to establish affinity to tcpipname  ERROR  errno/errnojr

Explanation:  DCAS tried to establish affinity to a TCP/IP stack name specified in the DCAS configuration. The name used is the name specified with the TCP/IP keyword in the DCAS configuration file. If DEFAULT was specified, then the TCP/IP jobname from the TCPIP.DATA file is used.

tcpipname  is the name used to establish affinity to.

errno  is the decimal z/OS UNIX System Services return code returned by the setibmopt(). These return codes are listed and described in the  return codes (errnos) information  of the z/OS UNIX System Services Messages and Codes.

errnojr  is the hexadecimal z/OS UNIX System Services reason code returned by the setibmopt(). The format of the 4-byte reason code is explained in the introduction to the  reason codes (errnojrs) information  of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  DCAS ends.
Operator response:  None.
System programmer response:  Name specified is not configured to be a valid socket PFS. Make sure that it is a valid TCP/IP jobname.

Module:
Procedure name:

EZZ8612I  DCAS sockfunc Call FAILED  errno/errnojr  FOR PORT portno

Explanation:  One of the initial socket calls to activate the port failed.

sockfunc  is the socket call that failed.

errno  is the hexadecimal z/OS UNIX System Services return code returned by the sockfunc. These return codes are listed and described in the  return codes (errnos) information  of the z/OS UNIX System Services Messages and Codes.

errnojr  is the hexadecimal z/OS UNIX System Services reason code returned by the sockfunc. The format of the 4-byte reason code is explained in the introduction to the  reason codes (errnojrs) information  of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

System action:  DCAS ends.
Operator response:  None.
System programmer response:  The  errno/errnojr  give the reason for the sockfunc failure.

Module:  dcassock
Procedure name:  Initsock

EZZ8613I  DCAS SSL INITIALIZATION FAILED RC:rcode  ERRNO:  errno

Explanation:  DCAS attempt to initialize Secure Socket Layer (SSL) functions failed.

rcode  is the return code from gsk_initialize() and can be one of the following:

2  No certificate
4  Password for key ring file is incorrect
8  The key ring file is incorrect
102 The sec_types value was incorrect
103 The V2_session timeout value was incorrect
104 The V3_session timeout value was incorrect
-10 GSK_IO_ERROR
**errno** is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes information in z/OS UNIX System Services Messages and Codes. The **errno** is returned only if the return code is GSK_IO_ERROR. The translated **errno** is one of the following:

**EINVAL**
- Parameter is not valid or null on gsk_initialize()

**EFAULT**
- Invalid address on gsk_initialize()

**EUNKNOWN**
- Unknown error occurred

**System action:** DCAS ended.

**Operator response:** None.

**System programmer response:** Determine the reason for the failure from the return code and **errno**. Correct the problem and restart the DCAS. The failure is most likely due to a problem with the KEYRING or STASHFILE file or the SAFKEYRING value that was specified in the DCAS configuration.

**Module:** dcasgsk

**Procedure name:** gskinit

---

**EZZ8614I** DCAS SSL OBTAIN CIPHER FAILED RC:rcode ERRNO: errno

**Explanation:** Attempt to obtain cipher information from SSL failed.

**rcode** is the return code from the gsk_get_cipher_info()

-10 Indicates GSK_IO_ERROR for SSL.

**errno** is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

**System action:** DCAS ends.

**Operator response:** None.

**System programmer response:** Determine the reason for the failure from the return code and **errno**. Correct the problem and restart the DCAS.

**Module:** dcasgsk

**Procedure name:** gskinit

---

**EZZ8615I** DCAS NOTIFIED THAT PORT portnum HAS ENDED

**Explanation:** DCAS port thread notified the main thread that the listening port and its connections have ended.

**portnum** is the listening port number.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** Other messages might be present if the port ended due to an error with DCAS. This message is also issued in response to a stop type command. See the z/OS Communications Server: IP Diagnosis Guide for information about diagnosing problems with DCAS if an error occurred.

**Module:** dcasmain

**Procedure name:** termthreads
EZZ8616I  DCAS SECURITY SERVER IS UNAVAILABLE SAFRC: src RACFRRC rrc RACFRSN rrsn

Explanation: Security server (RACF) is not available. The return codes provided indicate the reason for the failure. The following are the codes returned by SAF and RACF in response to a RACROUTE STAT macro issued by DCAS:

src is the SAF return code.
rrc is the RACF return code.
rrsn is the RACF reason code.

System action: DCAS ends.

Operator response: None.

System programmer response: RACF (or other SAF compliant security server that provides the same function) must be active. Return codes from RACROUTE STAT macro are defined in the Z/OS Security Server RACROUTE Macro Reference.

Module: dcasinit
Procedure name: Racfchecks

EZZ8617I  DCAS cmdtype COMMAND RECEIVED

Explanation: Operator command issued to DCAS.

cmdtype can be one of the following:

STOP DCAS ends.

MODIFY Debugging toggle.

UNSUPPORTED DCAS does not support this command.

System action: For a STOP command, DCAS ends. For a MODIFY command DCAS will toggle debug level 3 to the logfile originally specified at startup or if none specified, then it will log to syslogd. For an UNSUPPORTED command, DCAS ignores the command.

Operator response: None.

System programmer response: None.

Module: dcasstop
Procedure name: monitorstop

EZZ8618I  DCAS LISTENING ON porttype PORT portnum

Explanation: DCAS port is active and accepting connections.

porttype is the type of port and can be:

SECURE Connection on this port uses SSL for secure communication

portnum is the port number of the listening port

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: dcasaccp
Procedure name: acceptcon

642  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
EZZ8619I  DCAS PORT THREAD IS ENDING FOR PORT portnum
Explanation: DCAS listening port is ending.
portnum is the port number of the listening port.
System action: DCAS ends.
Operator response: None.
System programmer response: Stop DCAS and restart. Other messages might be present if the port is ending due to an error. See the z/OS Communications Server: IP Diagnosis Guide for information about diagnosing DCAS. The message also appears when the port ends normally.
Module: dcasaccp
Procedure name: acceptcon

EZZ8620I  DCAS security server SERVAUTH class is status
Explanation: status is the status of the RACF SERVAUTH class and can be one of the following:
active  SERVAUTH class is active.
inactive  SERVAUTH class is inactive.
undefined  SERVAUTH class is undefined.
System action: DCAS continues.
Operator response: None.
System programmer response: If DCAS is configured with CLIENTAUTH LOCAL2 and extended client authentication using the SERVAUTH class is required, then the SERVAUTH must be active. Using the RACF RDEFINE command, define the SERVAUTH CLASS.
Module: dcasinit
Procedure name: Racfchecks

EZZ8621I  DCAS SECURITY SERVER STATUS NOT DETERMINED
Explanation: DCAS checked the status of the security server (RACF). The return code from the security server indicated that the status of RACF could not be determined.
System action: DCAS continues.
Operator response: None.
System programmer response: RACF router was not loaded; the request, resource, subsystem combination could not be found in the RACF ROUTER table. Successful RACF exit processing could not take place. Verify RACF installation and setup.
Module: dcasinit
Procedure name: Racfchecks

EZZ8622I  DCAS CONFIGURATION PROCESSED UNKNOWN KEYWORD keyword
Explanation: DCAS configuration file processor found an unknown keyword.
keyword is the unknown keyword processed.
System action: DCAS continues.
Operator response: None.
System programmer response: Correct the keyword in the configuration file. Stop and restart DCAS.
Module: dcasconf
Procedure name: process_keyword

EZZ8623I  DCAS CONFIGURATION FILE KEYWORD keyword DOES NOT HAVE A VALUE
Explanation: DCAS configuration file processing found a valid keyword that does not have a value.

keyword is the keyword processed.
System action: DCAS continues.
Operator response: None.
System programmer response: Update the keyword indicated in the DCAS configuration file and restart DCAS.
Module: dcasconf
Procedure name: process_keyword

EZZ8624I  DCAS PROCESSING CONFIGURATION FILE filename
Explanation: DCAS is processing the configuration file.

filename is the filename processed.
System action: DCAS continues.
Operator response: None.
System programmer response: None.
Module: dcasmain
Procedure name: main

EZZ8625I  DCAS CONFIGURATION FILE PROCESSING IS COMPLETE
Explanation: Configuration file was processed.
System action: DCAS continues.
Operator response: None.
System programmer response: None.
Module: dcasmain
Procedure name: main

EZZ8626I  DCAS PORT portnum SIGNAL ACTION signal OCCURRED
Explanation: Signal action occurred on the port thread.

portnum is the port number associated with the listening port thread.
signal is the signal that occurred and can be one of the following:

SIGABND
   Abend.
SIGILL
   Invalid object module.
SIGPIPE
   Write on pipe with no one to read.
SIGSEGV
   Segmentation violation.
SIGTERM
   Termination signal received.
UNKNOWN

Signal received that was unexpected.

System action: For SIGABND, SIGSEGV, or SIGILL the port will attempt to recover. For SIGTERM or SIGPIPE the port will terminate. A CEEDUMP might have been taken.

Operator response: None.

System programmer response: Save CEEDUMP for diagnosis if one was taken. See z/OS Unix system signals that are described in the z/OS XL C/C++ Programming Guide

Module: dcasaccp

Procedure name: acceptcon

EZZ8627I  DCAS clientid SIGNAL ACTION signal OCCURRED
Explaination: Client thread received a signal.

signal is the signal that occurred and can be one of the following:

SIGABND
    Abend.

SIGILL
    Invalid object module.

SIGSEGV
    Segmentation violation.

SIGPIPE
    Write on pipe with no one to read.

SIGTERM
    Termination signal received.

UNKNOWN
    Signal received that was unexpected.

System action: Client thread ends. A CEEDUMP might have been taken.

Operator response: None.

System programmer response: Save CEEDUMP for diagnosis if one was taken. See z/OS Unix system signals that are described in the z/OS XL C/C++ Programming Guide

Module: dcasclie

Procedure name: clie_sighand

EZZ8628I  DCAS DEBUG REQUESTED BUT NO LOGFILE WAS DEFINED
Explaination: Did not specify a logfile.

System action: DCAS continues without debugging.

Operator response: None.

System programmer response: See the z/OS Communications Server: IP Configuration Guide to see how to specify a log file. Stop and restart DCAS with logging.

Module: dcasmain

Procedure name: main

EZZ8629I  DCAS SAFKEYRING AND KEYRING ARE MUTUALLY EXCLUSIVE - SAFKEYRING USED
Explaination: In the DCAS configuration file SAFKEYRING and KEYRING keywords were specified. They are mutually exclusive. SAFKEYRING value is used.

System action: DCAS continues and SAFKEYRING value is used.
EZZ8630I  DCAS CLIENTAUTH DEFAULTED TO LOCAL2
Explanation:  CLIENTAUTH keyword was not specified in the configuration file. It defaults to CLIENTAUTH LOCAL2.
System action:  DCAS continues.
Operator response:  None.
System programmer response:  See the z/OS Communications Server: IP Configuration Reference for information about configuring the DCAS and specifying the CLIENTAUTH keyword.
Module:  dcasconf
Procedure name:  process_passtick_config

EZZ8631I  DCAS NO CONFIGURATION FILE
Explanation:  A DCAS configuration file was not specified and no default configuration file was found.
System action:  DCAS ends.
Operator response:  None.
System programmer response:  Start the DCAS with a valid configuration file. See the z/OS Communications Server: IP Configuration Reference for information about specifying a DCAS configuration file.
Module:  dcasmain
Procedure name:  main

EZZ8632I  DCAS IPV6 ADDRESS NOT SUPPORTED BY TCPIP STACK
Explanation:  An IPv6 address was specified for the IPADDR keyword in DCAS.CONF and the TCPIP stack is not IPv6-enabled.
System action:  DCAS ends.
Operator response:  Contact system programmer.
System programmer response:  If IPv6 is being used, see the z/OS Communications Server: IP Configuration Reference for instructions on IPv6-enabling the TCP/IP stack. If IPv6 is not needed, specify an IPv4 address for the IPADDR keyword in DCAS.CONF.
Module:  dcasconf
Procedure name:  process_passtick_config()

EZZ8633E  DCAS HOST NAME hostname COULD NOT BE RESOLVED ERROR: errno errojr
Explanation:  When processing the IPADDR keyword in dcas.conf, a host name that could not be resolved to an IP address was specified.
hostname is the name specified on the IPADDR keyword.
errno is the decimal z/OS UNIX System Services return code returned by the getaddrinfo() function. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.
errojr is the hexadecimal z/OS UNIX System Services reason code returned by the getaddrinfo() function. The
format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: DCAS ends.

Operator response: Contact the system programmer.

System programmer response: Change the name specified on the IPADDR keyword in dcas.conf to a name that can be resolved to an IP address.

Module: dcasconf

Procedure name: process_passtick_config()

---

EZZ8634E  DCAS PORT VALUE port IS OUT OF RANGE

Explanation: When processing the PORT keyword in dcas.conf, a value outside of the valid range was detected. The valid range for the PORT keyword value is 1 - 65535.

port is the port number that is out of range.

System action: DCAS ends.

Operator response: Change the value specified on the PORT keyword in dcas.conf to a value in the range of 1 - 65535. Restart DCAS.

System programmer response: None.

Module: dcasconf

Procedure name: process_passtick_config()

---

EZZ8635E  DCAS PORT VALUE port IS NOT NUMERIC

Explanation: While processing the PORT keyword for dcas.conf, a non-numeric value was encountered. A numeric value is required.

port is the port number that is non-numeric.

System action: DCAS ends.

Operator response: Correct the value specified for the PORT keyword and restart DCAS.

System programmer response: None.

Module: dcasconf

Procedure name: process_passtick_config()

---

EZZ8638I  TRMD UDP constrained entry

logged:timestamp,dipaddr=dipaddr,dport=dport,qsize=qsize,correlator=correlator,probeid=probeid,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for UDP did not specify TypeActions Limit. The inbound queue exceeds 90% of the policy defined queue size.

timestamp is the date and time the inbound queue for a UDP port became constrained.

dipaddr is the destination IP address that triggered the storage constraint.

dport is the destination port specified in the policy.

qsize is the queue size specified in the policy.

correlator is the IDS trace correlator.

probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues
EZZ8639I • EZZ8640I

Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZZ8639I  TRMD UDP constrained
     entry:timestamp, dipaddr=dipaddr, dport=dport, qsize=qsize, correlator=correlator, probeid=probeid, sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for UDP specified TypeActions Limit. The inbound queue exceeds 90% of the policy defined queue size. No more datagrams will be accepted until this condition is alleviated.

timestamp is the date and time the inbound queue for a UDP port became constrained.
dipaddr is the destination IP address that triggered the storage constraint.
dport is the destination port specified in the policy.
qsize is the queue size specified in the policy.
correlator is the IDS trace correlator.
probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZZ8640I  TRMD UDP constrained exit
     logged:timestamp, dipaddr=dipaddr, dport=dport, qsize=qsize, correlator=correlator, datagrams=datagrams, duration=duration, probeid=probeid, sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for UDP did not specify TypeActions Limit. The inbound queue was reduced below 80% of the policy defined queue size.

timestamp is the date and time the inbound queue for a UDP port exited constraint.
dipaddr is the destination IP address that triggered the storage constraint.
dport is the destination port specified in the policy.
qsize is the queue size specified in the policy.
correlator is the Intrusion Detection Services (IDS) trace correlator.
datagrams is the number of datagrams that would have been discarded during the constraint period.
duration is the number of seconds the inbound queue was constrained.
probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Explanation: The Intrusion Detection Services (IDS) policy for UDP specified TypeActions Limit. The inbound queue was reduced below 80% of the policy defined queue size.

timestamp is the date and time the inbound queue for a UDP port exited constraint.
dipaddr is the destination IP address that triggered the storage constraint.
dport is the destination port specified in the policy.
qsize is the queue size specified in the policy.
correlator is the IDS trace correlator.
datagrams is the number of datagrams that were discarded during the constraint period.
duration is the number of seconds the queue was constrained.
probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: EZATRMD

Procedure name: WriteLogEntries

Explanation: The Intrusion Detection Services (IDS) UDP statistics have been gathered.

timestamp is the date and time the UDP statistics were gathered.
dipaddr is the destination IP address.
dport is the bound port specified in the policy.
qsize is the queue size specified in the policy.
dagsrecv is the number of datagrams received. If action is NOLIMIT then this includes the number of datagrams that would have been discarded as shown in dagsdisc. If action is LIMIT then this does not include the number of datagrams that were discarded as shown in dagsdisc.
dagsdisc is the number of datagrams discarded (if action is LIMIT) or the number of datagrams that would have been discarded (if action is NOLIMIT.)
bytsrecv is the number of bytes received. If action is NOLIMIT then this includes the number of bytes that would have been discarded as shown in bytsdisc. If action is LIMIT then this does not include the number of bytes that were discarded as shown in bytsdisc.
bytsdisc is the number of bytes discarded (if action is LIMIT) or the number of bytes that would have been discarded (if action is NOLIMIT.)
bytes_peak is the largest number of bytes queued during the statistics interval. This field is set only if a receive was processed during the statistics interval.
dg_peak is the largest number of datagrams queued during the statistics interval. This field is set only if a receive was processed during the statistics interval. Datagrams from a Pascal API are not included in the count.

**EZ8643I • EZ8644I**

*duration* is the number of seconds UDP inbound queue was constrained.

*constraints* is the number of times the constrained state was entered.

*action* is the policy TypeActions indicator. LIMIT indicates TypeActions LIMIT was specified in the policy; NOLIMIT indicates TypeActions LIMIT was not specified in the policy.

*sensorhostname* is the fully qualified host name of the IDS sensor.

**System action:**  Processing continues.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZATRMD

**Procedure name:**  WriteStatEntries

---

### EZ8643I

**TRMD SCAN threshold exceeded:**

timestamp=sipaddr,scantype,pthreshold=pinterval,vs=vs,
ps=ps,norm=norm,correlator=correlator,probeid=probeid,sensorhostname=sensorhostname

**Explanation:**  A possible fast or slow scan was detected from a source IP address.

*timestamp* is the date and time the scan event was detected.

*sipaddr* is the source IP address that triggered the scan detection.

*scantype* is the type of scan experienced. F indicates a fast scan; S indicates a slow scan.

*pthreshold* is the fast or slow scan threshold specified in the policy.

*pinterval* is the scan interval specified in the policy.

*vs* is the number of very suspicious events encountered before reaching the threshold. See the [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/S4GTYD_2.1.0/com.ibm.zos.msk1/V2R10/SecIP/zos_config_g.htm) for a description of very suspicious events.

*ps* is the number of possibly suspicious events encountered before reaching the threshold. See the [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/S4GTYD_2.1.0/com.ibm.zos.msk1/V2R10/SecIP/zos_config_g.htm) for a description of possibly suspicious events.

*norm* is the number of normal events encountered before reaching the threshold. See the [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/S4GTYD_2.1.0/com.ibm.zos.msk1/V2R10/SecIP/zos_config_g.htm) for a description of normal events.

*correlator* is the Intrusion Detection Services (IDS) trace correlator.

*probeid* is the unique identifier of the probe detection point. See the [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/support/knowledgecenter/S4GTYD_2.1.0/com.ibm.zos.msk1/V2R10/SecIP/zos_codes.htm) for a description of the Intrusion Detection Services probe IDs.

*sensorhostname* is the fully qualified host name of the IDS sensor.

**System action:**  Processing continues.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  EZATRMD

**Procedure name:**  WriteLogEntries

---

### EZ8644I

**TRMD SCAN detail:**

date time=sipaddr,correlator,vs=vs,
ps=ps,norm=norm,correlator=correlator,probeid=probeid,sensorhostname=sensorhostname,

event_list=proto1,dest1,portortype1,susp1; proto2,dest2,portortype2,susp2; proto3,dest3,portortype3,susp3;
proto4,dest4,portortype4,susp4

**Explanation:**  The Intrusion Detection Services (IDS) policy for scan specifies that low-level details are to be logged to the syslog daemon. A possible fast or slow scan was reported. Included in the message is the summary information for up to four events that contributed to the scan detection. If more than four events contributed to the scan detection, additional EZ8644I messages will be issued until all events are included.

In the message text:
**date**
The date when the scan event was detected.

**time**
The time when the scan event was detected.

**sipaddr**
The source IP address that triggered the scan detection.

**correlator**
The IDS trace correlator.

**event_count**
The number of events included in the event list.

**probeid**
The unique identifier of the probe detection point. See [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com) for a description of the Intrusion Detection Services probe IDs.

**sensorhostname**
The fully qualified host name of the IDS sensor.

**proto1, proto2, proto3, and proto4**
The protocol numbers associated with the events that contributed to the scan. If the `event_count` value is less than 4, the `proto2, proto3, and proto4` parameters might not be displayed.

**dest1, dest2, dest3, and dest4**
The destination IP addresses associated with the events that contributed to the scan. If the `event_count` value is less than 4, the `dest2, dest3, and dest4` parameters might not be displayed.

**portortype1, portortype2, portortype3, and portortype4**
The destination ports associated with the events that contributed to the scan if the protocol is UDP or TCP. If the protocol is ICMP or ICMPv6, each of these values is one of the following values:

- **0** Event was a normal ICMP request or a normal ICMPv6 Echo request.
- **3** Event was an ICMP request or an ICMPv6 Echo request that was rejected by QOS policy.
- **17** Event was an ICMP request sent to a broadcast or multicast address.
- **18** Event was an ICMP Info request.
- **19** Event was an ICMP Subnet mask request.
- **20** Event was an ICMP request with the Record Route option.
- **21** Event was an ICMP request with the Record Timestamp option.
- **48** Event was an ICMPv6 Echo request sent to a multicast address.
- **49** Event was an ICMPv6 Echo request with a Routing header.

If the `event_count` value is less than 4, the `portortype2, portortype3, and portortype4` parameters might not be displayed.

**susp1, susp2, susp3, and susp4**
The suspicion levels associated with the events that contributed to the scan. Possible suspicion levels are:

- **V** Very suspicious.
- **P** Possibly suspicious.
- **N** Normal.

If the `event_count` value is less than 4, the `susp2, susp3, and susp4` parameters might not be displayed.

The events related to the scan might span several log records.

**System action:** Processing continues.

**Operator response:** None.
EZZ8645I • EZZ8646I

System programmer response: None.

Module: EZATRMD

Example: The following example shows that four events contributed to the scan:

The following example shows that three events contributed to the scan:

The following example shows that seven events contributed to the scan. The events related to the scan span two messages:

Procedure name: WriteLogEntries

EZZ8645I TRMD SCAN detection
delayed: timestamp, correlator=correlator, probeid=probeid, sensorhostname=sensorhostname

Explanation: Scan interval processing took more than an interval to complete. Scan detection logging might be delayed.

timestamp is the date and time the scan event was detected.
correlator is the Intrusion Detection Services (IDS) trace correlator.

probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: Scan processing is not able to complete its evaluation of the source ip addresses it is tracking in its normal internal interval (30 or 60 seconds). This might indicate that a large number of source ip addresses are being monitored. If the policy is using High scan sensitivity, the installation might want to consider lowering the scan sensitivity level for high usage ports.

Module: EZATRMD

Procedure name: WriteLogEntries

EZZ8646I TRMD SCAN storage
constrained: timestamp, correlator=correlator, probeid=probeid, sensorhostname=sensorhostname

Explanation: Private storage could not be obtained to track either a source IP address or a scan event. Scan tracking might be incomplete.

timestamp is the date and time the scan event was detected.
correlator is the Intrusion Detection Services (IDS) trace correlator.

probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.
System action: Processing continues.
Operator response: None.
System programmer response: Determine the cause of the storage shortage. See the z/OS Communications Server: IP Diagnosis Guide for information about storage shortages.
Module: WriteLogEntries
Procedure name: EZATRMD

EZZ8647I TRMD SCAN storage constraint
exited:timestamp,correlator=correlator,probeid=probeid,sensorhostname=sensorhostname

Explanation: Scan private storage allocation failures no longer occurring. Normal Scan tracking resumed.

timestamp is the date and time the scan event was detected.
correlator is the Intrusion Detection Services (IDS) trace correlator.
probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZZ8648I TRMD ATTACK packet was discarded: date
timestamp,sipaddr=sipaddr,dipaddr=dipaddr,sport=sport,dport=dport,type=type,proto=proto,option=option,
fragsize=fragsize,correlator=correlator,probeid=probeid,sensorhostname=sensorhostname,restrictval=restrictval

Explanation: An attack event of the indicated type was detected while a packet was being processed. The packet was discarded because Intrusion Detection Services (IDS) policy for the attack type specified that packets must be discarded.

In the message text:
date
The date when the attack event was detected.
time
The time when the attack event was detected.
sipaddr
The source IP address in the packet.
dipaddr
The destination IP address in the packet.
sport
The source port in the packet. A value of zero indicates that the packet did not contain a source port value or that the source port was not known at the point that the attack was detected.
dport
The destination port in the packet. A value of zero indicates that the packet did not contain a destination port value or that the destination port was not known at the point that the attack was detected.
type
The attack event type. It will have one of the following values:

Malformed
Malformed packet
OutboundRaw
Outbound RAW restriction

IPFragment
Inbound fragment

ICMP
ICMP redirect

IPOPT
IP option restriction

IPPROTO
IP protocol restriction

PerpEcho
UDP perpetual echo

OutboundRaw6
IPv6 outbound RAW restriction

IPv6NextHeader
IPv6 next header restriction

IPv6HopOptions
IPv6 hop-by-hop option restriction

IPv6DestOptions
IPv6 destination option restriction

DataHiding
Data hiding

EELDLCCheck
EE packet received on wrong port

EEPPortCheck
EE source port incorrect

EEMalformed
EE malformed packet

These correspond to the AttackType values specified in IDS policy. See the z/OS Communications Server: IP Configuration Guide for a description of the attack types.

proto
The IP protocol type.
- For an IPv4 packet, this is the IP protocol value from the IP header.
- For an IPv6 packet, this is the upper layer protocol value (such as TCP or UDP). A value of zero indicates that the protocol value was not known at the point that the attack was detected. The IPv6 header does not contain a protocol field. To obtain the protocol value for an IPv6 packet, any extension headers must be processed. For some attack types, such as Malformed, the extension headers might not have been processed yet when the attack is detected. In that case, the value is 0.

Tip: If this value is 0 and you have IDS event trace enabled in your policy, you can use the correlator value from this message to find the corresponding trace entry. The IDS trace formatter will format the packet, including the protocol header and any extension headers.

option
The IP option that was detected in the packet and was restricted by the IDS policy. option is only applicable when the type is IPOPT. For other attack types, the value is 0.

fragoff
The offset, from the beginning of the original datagram, to where the data in this fragment differs from the data received in previous fragments. fragoff is only applicable when type is IPFragment and probeid is either 04030002 or 04030011. Otherwise, the value is 0.

correlator
The IDS trace correlator for the attack event.
**probeid**

The unique identifier of the probe detection point. See [intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes](https://www.ibm.com) for a description of the IDS probe IDs.

**sensorhostname**

The fully qualified host name of the IDS sensor.

**restrictval**

The value that was detected in the packet and was restricted by the IDS policy. *restrictval* is only applicable when *type* is `OutboundRaw`, `IPPROTO`, `IPPROT0`, `OutboundRaw6`, `IPv6NextHeader`, `IPv6HopOptions`, or `IPv6DestOptions`. For other attack types, the value is 0.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZATRMD

**Example:**

```plaintext
EZZ8648I TRMD ATTACK packet was discarded:07/16/2010
20:19:43.52,sipaddr=9.67.120.4,dipaddr=9.67.120.3,sport=0,dport=0,
type=IPPROTO,proto=89,option=0,fragsize=0,correlator=2905,
probeid=04060001,sensorhostname=MVS123.tcp.company.com,restrictval=89
```

**Procedure name:** WriteLogEntries

---

**EZZ8649I**

TRMD ATTACK packet would have been discarded:

```plaintext
date, time, sipaddr=sipaddr, dipaddr=dipaddr, sport=sport, dport=dport, type=type,
proto=proto, option=option, fragsize=fragoff, correlator=correlator, probeid=probeid,
sensorhostname=sensorhostname, restrictval=restrictval
```

**Explanation:** An attack event of the indicated type was detected while a packet was being processed. The packet was not discarded because Intrusion Detection Services (IDS) policy for the attack type specified that packets must not be discarded.

*date* is the date when the attack event was detected.

*time* is the time when the attack event was detected.

*sipaddr* is the source IP address in the packet.

*dipaddr* is the destination IP address in the packet.

*sport* is the source port in the packet. A value of zero indicates that the packet did not contain a source port value or that the source port was not known at the point that the attack was detected.

*dport* is the destination port in the packet. A value of zero indicates that the packet did not contain a destination port value or that the destination port was not known at the point that the attack was detected.

*type* is the attack event type. It will have one of the following values:

- **Malformed**
  - Malformed packet

- **OutboundRaw**
  - Outbound RAW restriction

- **IPFragment**
  - Inbound fragment

- **ICMP**
  - ICMP redirect

- **IPPROTO**
  - IP protocol restriction

- **IPPROT0**
  - IP option restriction

- **PerpEcho**
  - UDP perpetual echo
OutboundRaw6
   IPv6 outbound RAW restriction

IPv6NextHeader
   IPv6 next header restriction

IPv6HopOptions
   IPv6 hop-by-hop option restriction

IPv6DestOptions
   IPv6 destination option restriction

DataHiding
   Data hiding

EELDLCCheck
   EE packet received on wrong port

EEPortCheck
   EE source port incorrect

EEMalformed
   EE malformed packet

These correspond to the AttackType values specified in IDS policy. See the z/OS Communications Server: IP Configuration Guide for a description of the attack types.

proto is the IP protocol type.
   • For an IPv4 packet, this is the IP protocol value from the IP header.
   • For an IPv6 packet, this is the upper layer protocol value (such as TCP or UDP). A value of zero indicates that the protocol value was not known at the point that the attack was detected. The IPv6 header does not contain a protocol field. To obtain the protocol value for an IPv6 packet, any extension headers must be processed. For some attack types, such as Malformed, the extension headers might not have been processed yet when the attack is detected. In that case, the value is 0.
   Tip: If this value is 0 and you have IDS event trace enabled in your policy, you can use the correlator value to find the corresponding trace entry. The IDS trace formatter will format the packet, including the protocol header and any extension headers.

option is the IP option that was detected in the packet and was restricted by the IDS policy. option is only applicable when the type is IPOPT. For other attack types, the value is 0.

fragoff is the offset, from the beginning of the original datagram, to where the data in this fragment differs from the data received in previous fragments. fragoff is only applicable when type is IPFragment and probeid is either 04030002 or 04030011. Otherwise, the value is 0.

correlator is the IDS trace correlator for the attack event.

probeid is the unique identifier of the probe detection point. See the z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

restrictval is the value that was detected in the packet and was restricted by the IDS policy. restrictval is only applicable when type is OutboundRaw, IPOPT, IPPROTO, OutboundRaw6, IPv6NextHeader, IPv6HopOptions, or IPv6DestOptions. For other attack types, the value is 0.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Example:
EZZ8650I TRMD ATTACK SYN flood

**Explanation:** SYN flood start implies the server is under SYN flood attack.

- *timestamp* is the date and time the SYN flood attack started.
- *dipaddr* is the bound IP address of the SYN flood target.
- *dport* is the bound port of the SYN flood target.
- *proto* is the IP protocol type.
- *correlator* is the Intrusion Detection Services (IDS) trace correlator. You can use the correlator to find the corresponding EZZ8651I Syn Flood End message.
- *probeid* is the unique identifier of the probe detection point. See [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/support/docview.ws耻 motivo?docid=ibmmanuals:sg24-8204_51467) for a description of the Intrusion Detection Services probe IDs.
- *sensorhostname* is the fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZATRMD

**Procedure name:** WriteLogEntries

---

EZZ8651I TRMD ATTACK SYN flood

**Explanation:** SYN flood end indicates the SYN flood attack ended.

- *timestamp* is the date and time the SYN flood attack ended.
- *dipaddr* is the bound IP address of the SYN flood target.
- *dport* is the bound port of the SYN flood target.
- *proto* is the IP protocol type.
- *correlator* is the Intrusion Detection System (IDS) trace correlator. You can use the correlator to find the corresponding EZZ8651I Syn Flood Start message.
- *duration* is the number of seconds of the SYN flood attack.
- *synrecvd* is the number of handshakes started during SYN flood.
- *firstack* is the number of handshakes completed during SYN flood.
- *syndiscard* is the number of SYNs randomly discarded during SYN flood.
- *syntimeout* is the number of SYNs timing out during SYN flood.
- *probeid* is the unique identifier of the probe detection point. See [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/support/docview.ws耻 motivo?docid=ibmmanuals:sg24-8204_51467) for a description of the Intrusion Detection Services probe IDs.
- *sensorhostname* is the fully qualified host name of the IDS sensor.

**System action:** Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

__EZZ8652I__  TRMD ATTACK accept queue expanded:

- timestamp
dipaddr=dipaddr
dport=dport
proto=proto
correlator=correlator
probeid=probeid
sensorhostname=sensorhostname

Explanation: The Accept queue (the queue of incomplete connections for a port) was expanded.

- timestamp is the date and time the accept queue was expanded.
- dipaddr is the bound IP address for which the accept queue became full.
- dport is the bound port for which the accept queue became full.
- proto is the IP protocol type.
- correlator is the Intrusion Detection Services (IDS) trace correlator.
- probeid is the unique identifier of the probe detection point. See [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/support/knowledgecenter/SSFKQJ_7.1.0/com.ibm.zos.v2r1.fm.web.doc/a0045603.html) for a description of the Intrusion Detection Services probe IDs.
- sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

__EZZ8653I__  TRMD ATTACK statistics:

date
time
type=type
attacks=attacks
action=action
sensorhostname=sensorhostname

Explanation: Intrusion Detection Services (IDS) ATTACK statistics have been gathered.

In the message text:
- date The date when statistics were gathered.
- time The time when statistics were gathered.
- type The attack event type. Possible values are:
  - Malformed
  - OutboundRaw
  - IPFragment
  - ICMP
  - IPOPT
  - IPPROTO
  - Flood
  - PerpEcho
  - OutboundRaw6
  - IPv6NextHeader
  - IPv6HopOptions
  - IPv6DestOptions
- TCPQueueSize
- GlobalTCPStall
- DataHiding
- EELDLCCheck
- EEPortCheck
- EEMalformed
- EEXIDFlood

These correspond to the AttackType values specified in IDS policy. See the [z/OS Communications Server: IP Configuration Guide](#) for a description of the attack types.

<table>
<thead>
<tr>
<th>attacks</th>
<th>The number of attacks of type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>The Intrusion Detection Services (IDS) policy action for the attack type. Possible values are discard, nodiscard, resetconn, or noresetconn.</td>
</tr>
</tbody>
</table>

**Result:** For an IDS rule that was configured using LDAP, the value discard indicates that TypeActions LIMIT was specified in the policy. The value nodiscard indicates that TypeActions LIMIT was not specified in the policy.

| sensorhostname | The fully qualified host name of the IDS sensor. |

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZATRMD

**Example:**

EZZ8653I TRMD ATTACK statistics:07/16/2010 20:20:07.93,type=TCPQueueSize,attacks=5,action=noresetconn, sensorhostname=HOST1.COMPANYA.COM

**Procedure name:** WriteStatEntries

---

**EZZ8654I**  
TRMD ATTACK Interface flood start:

date, time, ifcname, dipaddr, correlator, discardcnt, discardp, lastsip, probeid, sensorhostname

**Explanation:** An interface flood condition for the specified interface has been detected by Intrusion Detection Services (IDS).

In the message text:

- **date**  
The date when the interface flood started.

- **time**  
The time when the interface flood started.

- **ifcname**  
The name of the interface experiencing the interface flood condition.

- **dipaddr**  
An IP address assigned to the interface.

- **correlator**  
The Intrusion Detection Services (IDS) trace correlator.

- **discardcnt**  
The number of packets received on the interface that were discarded or not processed and triggered the interface flood detection.
**EZ8655I**

**discardp**
The percentage of the total packets received on the interface that were discarded and triggered the interface flood detection.

**lastsip**
The source IP address, if available, from the packet being discarded when the flood condition was detected.

**probeid**
The unique identifier of the probe that indicated the interface flood start. See [z/OS Communications Server: IP and SNA Codes](https://www.ibm.com/docs/en/zos/2.4.0?topic=security-ze) for a description of the Intrusion Detection Services probe IDs.

**sensorhostname**
The fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** A possible interface flood condition exists for the specified interface. An IDS Trace of the next 100 discarded inbound packets on the interface will be written if tracing was requested by the IDS ATTACK FLOOD policy. Reviewing the IDS Trace data might help determine the cause of the interface flood. If the flood continues for more than five minutes, an EZ8656I message with additional summary data will be written to syslogd every five minutes until the interface flood condition ends. Reviewing this data might also help to determine the cause of the flood.

**Module:** EZATRMD

**Example:**

```
EZ8654I TRMD ATTACK Interface flood start:07/16/2010 20:19:43.52,ifcname=OSA123,dipaddr=9.67.120.3,correlator=57,discardcnt=372,discardp=23,lastsip=9.67.120.73,probeid=04070010,sensorhostname=MVS123.tcp.company.com
```

**Procedure name:** WriteLogEntries

**EZ8655I**

TRMD ATTACK Interface flood end: date

```
time,ifcname=ifcname,dipaddr=dipaddr,correlator=correlator,duration=duration,discardcnt=discardcnt,discardp=discardp,mfproto=mfproto,mfprotop=mfprotop,mfcat=mfcat,mfcatp=mfcatp,mfsrcmac=mfsrcmac,mfsrcmacp=mfsrcmacp,smmfproto=smmfproto,smmfprotop=smmfprotop,smmfcat=smmfcat,smmfcatp=smmfcatp,lastsip=lastsip,sipcnt=sipcnt,probeid=probeid,sensorhostname=sensorhostname
```

**Explanation:** The interface flood for the specified interface has ended. The data covers the period from the start of the flood and only includes packets received on the specified interface.

In the message text:

**date**
The date when the interface flood ended.

**time**
The time when the interface flood ended.

**ifcname**
The name of the interface experiencing the interface flood condition.

**dipaddr**
An IP address assigned to the interface at the start of the interface flood.

**correlator**
The Intrusion Detection Services (IDS) trace correlator.

**duration**
The number of seconds since the start of the interface flood was detected.

**discardcnt**
The number of packets received on the interface that were discarded or not processed since the interface flood was detected.
**discardp**
- The percentage of the total packets received on the interface that were discarded since the interface flood was detected.

**mfproto**
- The protocol seen most frequently in the IP header of the discarded packets since the start of the interface flood. The protocol value is the protocol number, or zero if the protocol value is unknown.

**mfprotop**
- The percentage of times this protocol was seen in the packets discarded for the interface during the interface flood condition.

**mfcat**
- The category of discards seen most frequently since the start of the interface flood. Possible values are:
  - **Storage**
    - Storage could not be obtained to process the packet. Storage shortages can indicate a problem in the system other than an inbound packet flood.
  - **Checksum**
    - Packet had checksum error.
  - **Malform**
    - Malformed packet.
  - **Dest**
    - Destination not found. For example, the port is not active or is reserved, the matching socket is not available, or there are no listeners for the RAW protocol.
  - **Firewall**
    - Packet rejected by IP security.
  - **MedHdr**
    - Bad media header.
  - **Forward**
    - Packet is not for this TCP/IP stack but could not be forwarded. For example, forwarding is prevented because the header is bad or the IPCONFIG NODATAGRAMFWD option is specified.
  - **QOSPol**
    - Packet dropped due to QoS policy.
  - **IDSPol**
    - Packet dropped due to IDS policy.
  - **Access**
    - Packet dropped due to NetAccess, multilevel security, or OSM access checks.
  - **ATTLS**
    - Packet dropped due to AT-TLS policy.
  - **OtherPol**
    - Packet dropped due to other configuration policy.
  - **Queue**
    - Queue limit (other than those specified by IDS) prevented queueing the packet for processing. Possible queues include the syn queue, the reassembly queue, and the UDP or RAW receive queues.
  - **OtherSyn**
    - Syn problems other than syn queue full.
  - **State**
    - State mismatch.
  - **UnpackErr**
    - Packet dropped due to unpacking problems.
  - **Misc**
    - Miscellaneous reasons not listed above. For example, the TCP packet was outside of the TCP window, or duplicate fragments were found during packet reassembly.
**EZ8655I**

`mfcatp`  
The percentage of times this category was seen in the packets discarded for the interface during the interface flood condition.

`mfsrcmac`  
Reported for LCS and some QDIO devices. It is not applicable for other device types. For packets discarded since the interface flood was detected, this is the source MAC seen most frequently in the discarded packets. For device types that do not provide the source MAC address, N/A will be in this field and the following fields that relate to the source MAC will show zeros.

`mfsrcmacp`  
The percentage of times this source MAC address was seen in the packets discarded for the interface during the interface flood condition.

`smmfproto`  
Provided if the most frequent source MAC address (`mfsrcmac`) is available. This is the protocol seen most frequently in the IP header of the discarded packets for that source MAC address during the interface flood condition. The protocol value is the protocol number, or zero if the protocol value is unknown.

`smmfprotop`  
Provided if the most frequent source MAC address (`mfsrcmac`) is available. This is the percentage of times the protocol reported in `smmfproto` was seen in the packets discarded for that source MAC address during the interface flood condition.

`smmfcat`  
Provided if the most frequent source MAC address (`mfsrcmac`) is available. This is the category of discards seen most frequently for that source MAC address during the interface flood condition. See the `mfcat` field for the list of possible categories.

`smmfcatp`  
Provided if the most frequent source MAC address (`mfsrcmac`) is available. This is the percentage of times the category reported in `smmfcat` was seen in the packets discarded for that source MAC address during the interface flood condition.

`lastsip`  
The source IP address of the last packet discarded on this interface during the interface flood condition.

`sipcnt`  
The consecutive number of discarded packets for the interface that have the same source IP address as the last discarded packet. If the previously discarded packet's source IP address is not the same as the last discarded packet's source IP address, the count will be 1.

`probeid`  
The unique identifier of the probe that indicated the interface flood end. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

`sensornhostname`  
The fully qualified host name of the IDS sensor.

**System action:**  Processing continues.

**Operator response:**  None.

**System programmer response:**  The system programmer might want to analyze the data provided in this message to determine the cause of the interface flood condition. If the condition was not a true interface flood, the system programmer should consider changing the IDS ATTACK FLOOD policy actions to higher values to prevent future false detections.

**Module:**  EZATRMD

**Example:**
```
EZ8655I TRMD ATTACK Interface flood end:07/16/2010 20:19:43.52,ifcname=OSA123,dipaddr=9.67.120.3,
correlator=57,duration=25,discardcnt=102,discardp=29,mfproto=6,mfprotop=82,mfcat=Malform,mfcatp=82,
mfsrcmac=40000C750800,mfsrcmacp=82,smmfproto=6,smmfprotop=100,smmfcat=Malform,smmfcatp=100,
lastsip=9.67.120.73,sipcnt=57,probeid=04070014,sensornhostname=MVS123.tcp.company.com
```

**Procedure name:**  WriteLogEntries
TRMD ATTACK Interface flood continues:

**Explanation:** If an interface flood continues more than 5 minutes, an intermediate log record is written at 5 minute intervals until the interface flood ends. The data covers the period from the start of the flood and only includes packets received on the specified interface. Its purpose is to provide interim information that might be helpful in determining the source of the interface flood while the flood is occurring and help determine if the characteristics of the interface flood are changing over time.

In the message text:

- **date**
  The date when the log record was written.

- **time**
  The time when the log record was written.

- **ifcname**
  The name of the interface experiencing the interface flood condition.

- **dipaddr**
  An IP address assigned to the interface at the start of the interface flood.

- **correlator**
  The Intrusion Detection Services (IDS) trace correlator.

- **duration**
  The number of seconds since the start of the interface flood was detected.

- **discardcnt**
  The number of packets received on the interface that were discarded or not processed since the interface flood was detected.

- **discardp**
  The percentage of the total packets received on the interface that were discarded since the interface flood was detected.

- **mfproto**
  The protocol seen most frequently in the IP header of the discarded packets since the start of the interface flood. The protocol value is the protocol number, or zero if the protocol value is unknown.

- **mfprotop**
  The percentage of times this protocol was seen in the packets discarded for the interface during the interface flood condition.

- **mfcat**
  The category of discards seen most frequently since the start of the interface flood. Possible values are:

  **Storage**
  Storage could not be obtained to process the packet. Storage shortages can indicate a problem in the system other than an inbound packet flood.

  **Checksum**
  Packet had checksum error.

  **Malform**
  Malformed packet.

  **Dest**
  Destination not found. For example, the port is not active or is reserved, the matching socket is not available, or there are no listeners for the RAW protocol.

  **Firewall**
  Packet rejected by IP security.
**MedHdr**
Bad media header.

**Forward**
Packet is not for this TCP/IP stack but could not be forwarded. For example, forwarding is prevented because the header is bad or IPCONFIG NODATAGRAMFWD is specified.

**QOSPol**
Packet dropped due to QoS policy.

**IDSPol**
Packet dropped due to IDS policy.

**Access**
Packet dropped due to NetAccess, multilevel security, or OSM access checks.

**ATTLS**
Packet dropped due to AT-TLS policy.

**OtherPol**
Packet dropped due to other configuration policy.

**Queue**
Queue limit (other than those specified by IDS) prevented queueing the packet for processing. Possible queues include the syn queue, the reassembly queue, and the UDP or RAW receive queues.

**OtherSyn**
Syn problems other than syn queue full.

**State**
State mismatch.

**UnpackErr**
Packet dropped due to unpacking problems.

**Misc**
Miscellaneous reasons not listed above. For example, the TCP packet was outside of the TCP window, or duplicate fragments were found during packet reassembly.

**mfcatp**
The percentage of times this category was seen in the packets discarded for the interface during the interface flood condition.

**mfsrsrcmac**
Reported for LCS and some QDIO devices. It is not applicable for other device types. For packets discarded since the interface flood was detected, this is the source MAC seen most frequently in the discarded packets. For device types that do not provide the source MAC address, N/A will be in this field and the following fields that relate to the source MAC will show zeros.

**mfsrsrcmacp**
The percentage of times this source MAC address was seen in the packets discarded for the interface during the interface flood condition.

**smmfproto**
Provided if the most frequent source MAC address (*mfsrsrcmac*) is available. This is the protocol seen most frequently in the IP header of the discarded packets for that source MAC address during the interface flood condition. The protocol value is the protocol number, or zero if the protocol value is unknown.

**smmfprotop**
Provided if the most frequent source MAC address (*mfsrsrcmac*) is available. This is the percentage of times the protocol reported in *smmfproto* was seen in the packets discarded for that source MAC address during the interface flood condition.

**smmfcat**
Provided if the most frequent source MAC address (*mfsrsrcmac*) is available. This is the category of discards seen most frequently for that source MAC address during the interface flood condition. See the *mfcat* field for the list of possible categories.
smmfcat
Provided if the most frequent source MAC address (mfsrcmac) is available. This is the percentage of times the
category reported in smmfcat was seen in the packets discarded for that source MAC address during the interface
flood condition.

lastsip
The source IP address of the last packet discarded on this interface during the interface flood condition.
sipcnt
The consecutive number of discarded packets for the interface that have the same source IP address as the last
discarded packet. If the previously discarded packet's source IP address is not the same as the last discarded
packet's source IP address, the count will be 1.

probeid
The unique identifier of the probe that indicated the interface flood end. See z/OS Communications Server: IP
and SNA Codes for a description of the Intrusion Detection Services probe IDs.
sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: The system programmer might want to analyze the data provided in this message to
determine the cause of the interface flood condition. If the condition was not a true interface flood, the system
programmer should consider changing the IDS ATTACK FLOOD policy actions to higher values to prevent future
false detections.

Module: EZATRMD

Example:
EZZ8656I TRMD ATTACK Interface flood continues:07/16/2010 20:19:43.52,ifcname=OSA123,dipaddr=9.67.120.3
,correlator=57,duration=75,discardcnt=102,discardp=29,mfproto=6,mfprotot=82,mfcat=Malform,mfcatp=82,
mfsrcmac=40000C750800,mfsrcmacp=82,smmfproto=6,smmfprotot=100,smmfcat=Malform,smmfcatp=100,
lastsip=9.67.120.73,sipcnt=57,probeid=04070011,sensorhostname=MVS123.tcp.company.com

Procedure name: WriteLogEntries

EZZ8657I TRMD ATTACK Interface flood statistics

Explanation: Intrusion Detection Services (IDS) interface flood statistics have been gathered. This message is issued
only when statistics are requested in the policy action for the flood attack type. If exception statistics are requested,
this message is written for a statistics interval only if an interface flood started during the statistics interval or
continued into the statistics interval.

In the message text:
date
The date when the statistics were gathered.
time
The time when the statistics were gathered.
ifcname
The name of the interface.
dipaddr
An IP address assigned to the interface.
discardcnt
The number of packets received on the interface during the statistics interval that were discarded or not
processed.
discardp
The percentage of the total packets received on the interface during the statistics interval that were discarded.
The number of interface flood conditions during the statistics interval.

The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: The system programmer can use this data to help determine the values to be used for the flood percentage value and the minimum discard value in the policy for the flood attack type.

Module: EZATRMD

Example: EZZ8657I TRMD ATTACK Interface flood statistics:07/16/2010 20:19:43.52,ifcname=OSA123,dipaddr=9.67.120.3,discardcnt=521,discardp=18,fl dct=1,sensorhostname=MVS123.tcp.company.com

System action: Processing continues.

Operator response: None.

System programmer response: When the problem causing the storage constraint is resolved, the Interface Flood detection support can be activated by removing the IDS ATTACK FLOOD policy and then adding the IDS ATTACK FLOOD policy again or by stopping and restarting the interface.

Module: EZATRMD

Explanation: Storage needed by IDS interface flood processing to collect informational data related to the interface flood condition could not be obtained. Collection of informational data for the interface that requires additional storage is temporarily suspended and will resume at the start of the next one-minute interval.

timestamp is the date and time the problem occurred.

ifcname is the interface (or link) name for which storage could not be obtained.

dipaddr is an IP address assigned to the interface.

correlator is the Intrusion Detection Services (IDS) trace correlator.

probeid is the unique identifier of the probe that detected the storage constrained condition. See Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: When the problem causing the storage constraint is resolved, the Interface Flood detection support can be activated by removing the IDS ATTACK FLOOD policy and then adding the IDS ATTACK FLOOD policy again or by stopping and restarting the interface.

Module: EZATRMD

Procedure name: WriteStatEntries

Explanation: Storage needed by IDS interface flood processing to collect informational data related to the interface flood condition could not be obtained. Collection of informational data for the interface that requires additional storage is temporarily suspended and will resume at the start of the next one-minute interval.

timestamp is the date and time the problem occurred.

ifcname is the interface (or link) name for which storage could not be obtained.

dipaddr is an IP address assigned to the interface.

correlator is the Intrusion Detection Services (IDS) trace correlator.

probeid is the unique identifier of the probe that detected the storage constrained condition. See Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: When the problem causing the storage constraint is resolved, the Interface Flood detection support can be activated by removing the IDS ATTACK FLOOD policy and then adding the IDS ATTACK FLOOD policy again or by stopping and restarting the interface.

Module: EZATRMD

Procedure name: WriteLogEntries

Explanation: Storage needed by IDS interface flood processing to collect informational data related to the interface flood condition could not be obtained. Collection of informational data for the interface that requires additional storage is temporarily suspended and will resume at the start of the next one-minute interval.

timestamp is the date and time the problem occurred.

ifcname is the interface (or link) name for which storage could not be obtained.

dipaddr is an IP address assigned to the interface.

correlator is the Intrusion Detection Services (IDS) trace correlator.

probeid is the unique identifier of the probe that detected the storage constrained condition. See Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: Be aware that the data provided by the EZZ8655I and EZZ8656I messages might be incomplete.

Module: EZATRMD

Procedure name: WriteLogEntries

EZZ8660I TRMD TCP connection log records suppressed:

Explanation: To prevent syslog flooding, Intrusion Detection Services (IDS) logging was suppressed for log messages EZZ9324I (TCP connection refused) and EZZ9319I (TCP connection would have been refused). Traffic regulation (TR) support for TCP limits the number of EZZ9324I (TCP connection refused), EZZ9319I (TCP connection would have been refused) and EZZ9318I (QOS exception) log records written in a 5-minute interval. For a listening port, a maximum of 100 of these log records will be written in a 5-minute interval. Across all ports monitored by TCP TR, a maximum of 1000 of these log records will be written in a 5-minute interval.

time is the date and time of the first log record suppressed for the port in the 5 minute interval.

lhost is the IP address of the local host.

port is the listening port for which log suppression occurred.

count is the number of EZZ9324I and EZZ9319I log messages suppressed during the 5 minute interval.

scope is either:

Port The log records were suppressed because 100 log records had already been written for the listening port in the 5-minute interval.

TR The log records were suppressed because the total number of TCP TR log records written during the 5-minute interval exceeded 1000 log records.

probeid is the unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: TCP/IP processing continues. TCP TR logging resumes.

Operator response: None.

System programmer response: Examine relevant syslog messages to determine the source of the log entries and take appropriate action: adjust the active policy to be less restrictive or investigate the logged connections refused.

Module: EZATRMD

Procedure name: WriteLogEntries

EZZ8661I TRMD TCP QOS exception log records suppressed:

Explanation: To prevent syslog flooding, Intrusion Detection Services (IDS) logging was suppressed for log message EZZ9318I (QOS exception). Traffic regulation (TR) support for TCP limits the number of EZZ9324I (TCP connection refused), EZZ9319I (TCP connection would have been refused) and EZZ9318I (QOS exception) log records written in a 5-minute interval. For a listening port, a maximum of 100 of these log records will be written in a 5-minute interval. Across all ports monitored by TCP TR, a maximum of 1000 of these log records will be written in a 5-minute interval.
**EZ8662I**

time is the date and time of the first log record suppressed for the port in the 5 minute interval.
lhost is the IP address of the local host.
port is the listening port for which log suppression occurred.
count is the number of EZZ9318I log messages suppressed during the 5 minute interval.
scope is either:

- **Port** The log records were suppressed because 100 log records had already been written for the listening port in the 5-minute interval.
- **TR** The log records were suppressed because the total number of TCP TR log records written during the 5-minute interval exceeded 1000 log records.

probeid is the unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

**System action:** TCP/IP processing continues. TCP TR logging resumes.

**Operator response:** None.

**System programmer response:** Examine relevant syslog messages to determine the source of the log entries and take appropriate action: adjust the active policy to be less restrictive or investigate the logged QOS exceptions.

**Module:** EZATRMD

**Procedure name:** WriteLogEntries

---

**EZ8662I** TRMD TCP receive queue constrained entry logged: date time, connid=connid, jobname=jobname, lipaddr=lipaddr, lport=lport, ripaddr=ripaddr, rport=rport, correlator=correlator, probeid=probeid, sensorhostname=sensorhostname, trigger=trigger, dataage=dataage, bytesqueued=bytesqueued, queuesize=queuesize

**Explanation:** The TCP receive queue for the specified connection is constrained because excessive or old data is accumulating on the queue.

In the message text:

date
The date when the queue became constrained.
time
The time when the queue became constrained.
connid
The ID of the connection that is associated with the queue that is constrained.
jobname
The job name of the connection that is associated with the queue that is constrained.
lipaddr
The local IP address of the connection that is associated with the queue that is constrained.
lport
The local port of the connection that is associated with the queue that is constrained.
ripaddr
The remote IP address of the connection that is associated with the queue that is constrained.
rport
The remote port of the connection that is associated with the queue that is constrained.
correlator
The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8663I is issued, with the same correlator value, when the queue exits the constrained state.
probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

trigger
The condition that triggered the queue to become constrained. This field is one of the following values:

DataAge
The constraint was triggered because data remained on the receive queue for at least 60 seconds.

BytesQueued
The constraint was triggered because a given amount of data remained on the receive queue for at least 30 seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

dataage
The age in seconds of the oldest data on the receive queue when the queue became constrained.

bytesqueued
The number of bytes queued on the receive queue when the queue became constrained.

queuesize
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
- VS - very short
- S - short
- L - long
- VL - very long

System action: Processing continues

Operator response: Issue the Netstat ALL/-A command to display detailed information about the specified connection, including the receive buffer size, the size of the data queued on the receive queue, and the date and time of the oldest data on the receive queue. See the Netstat ALL/-A report in z/OS Communications Server: IP System Administrator's Commands for information about the Netstat ALL/-A command.

Determine why the local application is not receiving the data that is being sent by the remote application, or is not receiving the data at a sufficient rate to avoid the accumulation of excessive or old data on the receive queue. Take appropriate steps to cause the local application to read the accumulated data. If necessary, close the connection to free the storage that is being held on the queue.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: See the operator response.

Automation: This message is written to syslog. This message is a good candidate for automation. Automation can alert you to when the TCP receive queue for a connection enters a constrained state. Message EZZ8663I is issued, with the same correlator value, when the queue exits the constrained state.

Example:
EZZ8662I TRMD TCP receive queue constrained entry logged: 09/09/2008 17:11:28.55, connid= 00000125 , jobname= USER15 , laddr= 4.4.4.4 , lport= 1165 , raddr= 7.7.7.7 , rport= 5000 , correlator= 137 , probeid= 01000001 , sensorhostname= HOST1.COMPANYA.COM , trigger= DataAge , dataage= 60 , bytesqueued= 576 , queuesize= S
EZZ8663I  TRMD TCP receive queue constrained exit logged: date time, connid= connid , jobname= jobname , lipaddr= lipaddr , lport= lport , ripaddr= ripaddr , rport= rport , correlator= correlator , duration= duration , probeid= probeid , sensorhostname= sensorhostname , dataage= dataage , bytesqueued= bytesqueued , queue size= queue size

Explanation: The TCP receive queue for the specified connection is no longer constrained.

In the message text:

date
The date when the queue became unconstrained.

time
The time when the queue became unconstrained.

connid
The ID of the connection that is associated with the queue that is unconstrained.

jobname
The job name of the connection that is associated with the queue that is unconstrained.

lipaddr
The local IP address of the connection that is associated with the queue that is unconstrained.

lport
The local port of the connection that is associated with the queue that is unconstrained.

ripaddr
The remote IP address of the connection that is associated with the queue that is unconstrained.

rport
The remote port of the connection that is associated with the queue that is unconstrained.

correlator
The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8662I is issued, with the same correlator value, when the queue enters the constrained state.

duration
The number of seconds that the queue was constrained.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

dataage
The age in seconds of the oldest data on the receive queue when the queue became unconstrained.

bytesqueued
The number of bytes queued on the receive queue when the queue became unconstrained.

queue size
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:

• VS - very short
• S - short
• L - long
• VL - very long

System action: Processing continues

Operator response: No action is needed.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: Not applicable.
EZZ8664I

Routing code: *

Descriptor code: *

Automation: Not applicable for automation

Example:
EZZ8663I TRMD TCP receive queue constrained exit logged: 09/09/2008 17:11:33.55 , connid= 00000125 , jobname= USER15 , lipaddr= 4.4.4.4 , lport= 1165 , ripaddr= 7.7.7.7 , rport= 5000 , correlator= 137 , duration= 5 , probeid= 01000002 , sensorhostname= HOST1.COMPANYA.COM , dataage= 5 , bytesqueued= 256 , queuesize= S

EZZ8664I TRMD TCP send queue constrained entry logged: date time , connid= connid , jobname= jobname , lipaddr= lipaddr , lport= lport , ripaddr= ripaddr , rport= rport , correlator= correlator , probeid= probeid , sensorhostname= sensorhostname , trigger= trigger , dataage= dataage , bytesqueued= bytesqueued , queuesize= queuesize

Explanation: The TCP send queue for the specified connection is constrained because excessive or old data is accumulating on the queue.

In the message text:

date
  The date when the queue became constrained.

time
  The time when the queue became constrained.

connid
  The ID of the connection that is associated with the queue that is constrained.

jobname
  The job name of the connection that is associated with the queue that is constrained.

lipaddr
  The local IP address of the connection that is associated with the queue that is constrained.

lport
  The local port of the connection that is associated with the queue that is constrained.

ripaddr
  The remote IP address of the connection that is associated with the queue that is constrained.

rport
  The remote port of the connection that is associated with the queue that is constrained.

correlator
  The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8665I is issued, with the same correlator value, when the queue exits the constrained state.

probeid
  The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
  The fully qualified host name of the IDS sensor.

trigger
  The condition that triggered the queue to become constrained. This field is one of the following values:

  DataAge
    The constraint was triggered because data remained on the send queue for at least 60 seconds.
BytesQueued
The constraint was triggered because a given amount of data remained on the send queue for at least 30
seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

DataAge
The age in seconds of the oldest data on the send queue when the queue became constrained.

BytesQueued
The number of bytes queued on the send queue when the queue became constrained.

QueueSize
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
  • VS - very short
  • S - short
  • L - long
  • VL - very long

System action:  Processing continues

Operator response:  Issue the Netstat ALL/-A command to display detailed information about the specified
connection, including the send buffer size, the size of the data queued on the send queue, and the date and time of
the oldest data on the send queue. See the Netstat ALL/-A report in z/OS Communications Server: IP System
Administrator's Commands for information about the Netstat ALL/-A command.

Determine why the remote application is not receiving the data being sent by the local application, or is not receiving
the data at a sufficient rate to avoid the accumulation of excessive or old data on the send queue. Take appropriate
steps to cause the remote application to read the accumulated data. If necessary, close the connection in order to free
the storage that is being held on the queue.

System programmer response:  No action is needed.

User response:  Not applicable.

Problem determination:  See the operator response.

Descriptor code:  *

Automation:  This message is written to syslog. This message is a good candidate for automation. Automation can
alert you to when the TCP send queue for a connection exits a constrained state. Message EZZ8665I is issued, with
the same correlator value, when the queue exits the constrained state.

Example:
EZZ8664I TRMD TCP send queue constrained entry logged: 09/09/2008 17:11:28.55 , connid= 00000125 ,
jobname= USER15 , lipaddr= 4.4.4.4 , lport= 1165 , ripaddr= 7.7.7.7 , rport= 5000 ,
correlator= 141 , probeid= 01000003 , sensorhostname= HOST1.COMPANYA.COM ,
trigger= DataAge , dataage= 60 , bytesqueued= 576 , queuesize= S

EZZ8665I TRMD TCP send queue constrained exit logged: date time , connid= connid , jobname= jobname ,
lipaddr= lipaddr , lport= lport , ripaddr= ripaddr , rport= rport , correlator= correlator , duration= duration ,
probeid= probeid , sensorhostname= sensorhostname , dataage= dataage , bytesqueued= bytesqueued , queuesize= queuesize

Explanation:  The TCP send queue for the specified connection is no longer constrained.

In the message text:

Date
The date when the queue became unconstrained.

Time
The time when the queue became unconstrained.
**connid**
The ID of the connection that is associated with the queue that is unconstrained.

**jobname**
The job name of the connection that is associated with the queue that is unconstrained.

**lipaddr**
The local IP address of the connection that is associated with the queue that is unconstrained.

**lport**
The local port of the connection that is associated with the queue that is unconstrained.

**ripaddr**
The remote IP address of the connection that is associated with the queue that is unconstrained.

**rport**
The remote port of the connection that is associated with the queue that is unconstrained.

**correlator**
The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8664I is issued, with the same correlator value, when the queue exits the constrained state.

**probeid**
The unique identifier of the probe detection point. See the [Intrusion detection services probeids](z/OS Communications Server: IP and SNA Codes) for a description of the IDS probe IDs.

**sensorhostname**
The fully qualified host name of the IDS sensor.

**dataage**
The age in seconds of the oldest data on the send queue when the queue became constrained.

**bytesqueued**
The number of bytes queued on the send queue when the queue became unconstrained.

**queuesize**
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
- VS - very short
- S - short
- L - long
- VL - very long

**System action:** Processing continues

**Operator response:** No action is needed.

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TRMD

**Module:** EZATRMD

**Routing code:** *

**Descriptor code:** *

**Automation:** Not applicable for automation.

**Example:**
EZZ8665I TRMD TCP send queue constrained exit logged: 09/09/2008 17:11:33.55 , connid= 00000125 , jobname= USER15 , lipaddr= 4.4.4.4 , lport= 1165 , ripaddr= 7.7.7.7 , rport= 5000 , correlator= 141 , duration= 5 , probeid= 01000004 , sensorhostname= HOST1.COMPANYA.COM , dataage= 5 , bytesqueued= 256 , queuesize= 5
EZZ8666I TRMD TCP out-of-order queue constrained entry logged: date time connid= connid jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport trigger= trigger dataage= dataage bytesqueued= bytesqueued queuesize= queuesize correlator= correlator probeid= probeid sensorhostname= sensorhostname

Explanation: The TCP out-of-order queue for the specified connection is constrained because excessive or old data is accumulating on the queue.

In the message text:

date
The date when the queue became constrained.

time
The time when the queue became constrained.

connid
The ID of the connection that is associated with the queue that is constrained.

jobname
The job name of the connection that is associated with the queue that is constrained.

lipaddr
The local IP address of the connection that is associated with the queue that is constrained.

lport
The local port of the connection that is associated with the queue that is constrained.

ripaddr
The remote IP address of the connection that is associated with the queue that is constrained.

rport
The remote port of the connection that is associated with the queue that is constrained.

trigger
The condition that triggered the queue to become constrained. This field is one of the following values:

DataAge
The constraint was triggered because data remained on the out-of-order queue for at least 60 seconds.

BytesQueued
The constraint was triggered because a given amount of data remained on the out-of-order queue for at least 30 seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

dataage
The age in seconds of the oldest data on the out-of-order queue when the queue became constrained.

bytesqueued
The number of bytes queued on the out-of-order queue when the queue became constrained.

queuesize
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:

• VS - very short
• S - short
• L - long
• VL - very long

correlator
The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8667I is issued, with the same correlator value, when the queue exits the constrained state.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.
System action:  Processing continues.

Operator response:  Determine why the local application had excessive or old data on the out-of-order queue.
Excessive or old data on the out-of-order queue might be the result of a remote application sending partial data either as an attack or because of a problem with the remote application. Excessive or old data might also be the result of a network problem that prevented data that was sent by the remote application from reaching its destination.

System programmer response:  No action is needed.

User response:  Not applicable.

Problem determination:  See the operator response.

**correlator**
The correlator for a constrained queue condition. The correlator can be used to locate the entry and exit log messages for an event that was caused by a constrained TCP queue. Message EZZ8668I is issued, with the same correlator value, when the queue enters the constrained state.

**duration**
The number of seconds that the queue was constrained.

**probeid**
The unique identifier of the probe detection point. See the [intrusion detection services probeids](https://publib.boulder.ibm.com/infocenter/tivihelp/v1r2/topic/com.ibm.zos.r2.2/messages/ip/ip.tbl) in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

**sensorhostname**
The fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** No action is needed.

**System programmer response:** No action is needed.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: TRMD

**Module:** EZATRMD

**Routing code:** *

**Descriptor code:** *

**Automation:** Not applicable for automation.

**Example:**
EZZ8667I TRMD TCP out-of-order queue constrained exit logged: 06/09/2010 17:11:33.55 connid= 00000125 jobname= USER15 lipaddr= 4.4.4.4 lport= 1165 ripaddr= 7.7.7.7 rport= 5000 dataage= 5 bytesqueued= 256 queuesize= S correlator= 137 duration= 5 probeid= 040A0008 sensorhostname= HOST1.COMPANYA.COM

---

EZZ8668I TRMD TCP connection reset due to constrained receive queue detected: date time connid= connid jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport trigger= trigger dataage= dataage bytesqueued= bytesqueued queuesize= queuesize correlator= correlator probeid= probeid sensorhostname= sensorhostname

**Explanation:** The specified TCP connection was reset because the receive queue for the connection was constrained and Intrusion Detection Services (IDS) policy for the TCP queue size attack type specified that connections with constrained queues should be reset. The receive queue was constrained because excessive or old data had accumulated on the queue.

In the message text:

**date**
The date when the connection was reset.

**time**
The time when the connection was reset.

**connid**
The ID of the connection that was reset.

**jobname**
The job name of the connection that was reset.
lipaddr
   The local IP address of the connection that was reset.

lport
   The local port of the connection that was reset.

ripaddr
   The remote IP address of the connection that was reset.

rport
   The remote port of the connection that was reset.

trigger
   The condition that triggered the queue to become constrained. This field is one of the following values:

   DataAge
      The constraint was triggered because data remained on the receive queue for at least 60 seconds.

   BytesQueued
      The constraint was triggered because a given amount of data remained on the receive queue for at least 30 seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

dataage
   The age in seconds of the oldest data on the receive queue when the connection was reset.

bytesqueued
   The number of bytes queued on the receive queue when the connection was reset.

queuesize
   The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
      • VS - very short
      • S - short
      • L - long
      • VL - very long

correlator
   The correlator for a constrained queue condition.

probeid
   The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

censorhostname
   The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: Determine why the local application was not receiving the data that was being sent by the remote application, or was not receiving the data at a sufficient rate to avoid the accumulation of excessive or old data on the receive queue.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: See the operator response.

Automation: This message is written to syslogd. This message is a good candidate for automation. Automation can alert you when a TCP connection is reset because the TCP receive queue for the connection entered a constrained state.

Example:
EZZ8669I

EZZ8668I TRMD TCP connection reset due to constrained receive queue detected: 09/09/2008 17:11:28.55
connid= 00000125 jobname= USER15 lipaddr= 4.4.4.4 lport= 1165 ripaddr= 7.7.7.7 rport= 5000
trigger= DataAge dataage= 60 bytesqueued= 576 queuesize= 5 correlator= 137 probeid= 040A0003
sensorhostname= HOST1.COMPANYA.COM

EZZ8669I TRMD TCP connection reset due to constrained send queue detected:

date time connid= connid
  jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport trigger= trigger dataage=
  dataage bytesqueued= bytesqueued queuesize= queuesize correlator= correlator probeid= probeid
  sensorhostname= sensorhostname

Explanation: The specified TCP connection was reset because the send queue for the connection was constrained
and intrusion detection services (IDS) policy for the TCP queue size attack type specified that connections with
constrained queues should be reset. The send queue was constrained because excessive or old data had accumulated
on the queue.

In the message text:

date
  The date when the connection was reset.

time
  The time when the connection was reset.

connid
  The ID of the connection that was reset.

jobname
  The job name of the connection that was reset.

lipaddr
  The local IP address of the connection that was reset.

lport
  The local port of the connection that was reset.

ripaddr
  The remote IP address of the connection that was reset.

rport
  The remote port of the connection that was reset.

trigger
  The condition that triggered the queue to become constrained. This field is one of the following values:

  DataAge
    The constraint was triggered because data remained on the send queue for at least 60 seconds.

  BytesQueued
    The constraint was triggered because a given amount of data remained on the send queue for at least 30
    seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

dataage
  The age in seconds of the oldest data on the send queue when the connection was reset.

bytesqueued
  The number of bytes queued on the send queue when the connection was reset.

queuesize
  The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
    • VS - very short
    • S - short
    • L - long
    • VL - very long

correlator
  The correlator for a constrained queue condition.
**probeid**

The unique identifier of the probe detection point. See the [intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes](https://www.ibm.com) for a description of the IDS probe IDs.

---

**sensorhostname**

The fully qualified host name of the IDS sensor.

---

**System action:** Processing continues.

**Operator response:** Determine why the remote application was not receiving the data being sent by the local application, or was not receiving the data at a sufficient rate to avoid the accumulation of excessive or old data on the send queue.

sensorhostname= HOST1.COMPANYA.COM
```

---

**EZZ8670I**

TRMD TCP connection reset due to constrained out-of-order queue detected: date time connid= connid jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport trigger= trigger dataage= dataage bytesqueued= bytesqueued queuesize= queuesize correlator= correlator probeid= probeid sensorhostname= sensorhostname

**Explanation:** The specified TCP connection was reset because the out-of-order queue for the connection was constrained and Intrusion Detection Services (IDS) policy for the TCP queue size attack type specified that connections with constrained queues should be reset. The out-of-order queue was constrained because excessive or old data had accumulated on the queue.

In the message text:

**date**

The date when the connection was reset.

**time**

The time when the connection was reset.

**connid**

The ID of the connection that was reset.

**jobname**

The job name of the connection that was reset.

**lipaddr**

The local IP address of the connection that was reset.

**lport**

The local port of the connection that was reset.

**ripaddr**

The remote IP address of the connection that was reset.

**rport**

The remote port of the connection that was reset.
trigger
The condition that triggered the queue to become constrained. This field is one of the following values:

DataAge
The constraint was triggered because data remained on the out-of-order queue for at least 60 seconds.

BytesQueued
The constraint was triggered because a given amount of data remained on the out-of-order queue for at least 30 seconds. This amount is configured in IDS policy using one of four abstract queue sizes.

dataage
The age in seconds of the oldest data on the out-of-order queue when the connection was reset.

bytesqueued
The number of bytes queued on the out-of-order queue when the connection was reset.

queuesize
The configured abstract queue length for the TCP Queue Size IDS attack type. Possible values are:
- VS - very short
- S - short
- L - long
- VL - very long

correlator
The correlator for a constrained queue condition.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: Determine why the local application had excessive or old data on the out-of-order queue. Excessive or old data on the out-of-order queue might be the result of a remote application sending partial data either as an attack or because of a problem with the remote application. Excessive or old data might also be the result of a network problem that prevented data that was sent by the remote application from reaching its destination.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: See the operator response.

Routing code: *

Descriptor code: *

Automation: This message is written to syslogd. This message is a good candidate for automation. Automation can alert you when a TCP connection is reset because the TCP out-of-order queue for the connection entered a constrained state.

Example:
EZZ8670I TRMD TCP connection reset due to constrained out-of-order queue detected: 09/09/2008 17:11:28.55 commid= 00000125 jobname= USER15 1ipaddr= 4.4.4.4 1port= 1165 ripaddr= 7.7.7.7 rport= 5000 trigger= DataAge dataage= 60 bytesqueued= 576 queuesize= S correlator= 137 probeid= 040A0009 sensorhostname= HOST1.COMPANYA.COM
Explanation: A global TCP stall condition has been detected by Intrusion Detection Services (IDS). The global TCP stall condition is detected for a TCP/IP stack when at least 50% of active TCP connections are stalled and at least 1000 TCP connections are active.

In the message text:

date
The date when the global TCP stall condition was detected.

time
The time when the global TCP stall condition was detected.

totalconn
The total number of active TCP connections when the global TCP stall condition was detected.

stalledpct
The percentage of active TCP connections that were stalled at the time the global TCP stall condition was detected.

A TCP connection is considered stalled if one or more of the following conditions are true:
- The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
- The TCP send queue is full and data is not being retransmitted.

smallwindowpct
The percentage of active TCP connections that are stalled because the TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the smallwindowpct value and the writeblockpct value.

writeblockpct
The percentage of active TCP connections that are stalled because the TCP send queue is full and data is not being retransmitted. If data is being retransmitted, there might be a network outage. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the smallwindowpct value and the writeblockpct value.

action
The action specified in the policy for the Global TCP Stall attack type. The action parameter can be one of the following values:

resetconn
All stalled TCP connections will be reset. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8673I will be generated for each stalled connection that is reset.

noresetconn
Stalled TCP connections will not be reset. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8674I will be generated for each stalled connection.

correlator
The correlator for a global TCP stall condition. Message EZZ8672I is issued, with the same correlator value, when the global TCP stall condition is exited. The global TCP stall condition is exited when the number of stalled connections drops to 25% of active TCP connections or the number of stalled connections drops to 450 or fewer. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8673I or EZZ8674I is issued, with the same correlator value, for each stalled connection.

probeid
The unique identifier of the probe detection point. See the Intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.
System action: Processing continues.

If the value displayed for action is resetconn, all stalled TCP connections will be reset. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8673I will be generated for each stalled connection that is reset.

If the value displayed for action is noresetconn, stalled TCP connections will not be reset. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8674I will be generated for each stalled connection.

Operator response: Use the values in this message to determine whether the global TCP stall condition was caused by connections whose TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU, or by connections whose TCP send queues are full and data is not being retransmitted, or by a combination of both types of contributing factors.

If you requested detailed syslogd messages for the Global TCP Stall attack type, either message EZZ8673I or message EZZ8674I was generated for each stalled connection that contributed to the detection of the global TCP stall condition. See those messages for information about the connections that contributed to the global TCP stall.

If you did not request detailed syslogd messages for the Global TCP Stall attack type and the value displayed for action is noresetconn, the connections contributing to the attack were not reset. Use the Netstat ALL/-A command to display connection information. The connections that are stalled are indicated by the value Yes in the SendStalled report field.

If you are experiencing a network outage, the global TCP stall might not be an indication of an attack; otherwise, the global TCP stall might have been caused by an attack or by a problem with a remote application.

Analyze the data for the connections that contributed to the global TCP stall. If the remote IP address is the same for many of the connections, determine whether there is a problem with the application at that remote IP address or whether that remote IP address is being used to launch an attack.

If the value displayed for action is noresetconn, use the Netstat IDS/-k command to monitor the number of TCP connections that are stalled and the percentage of active TCP connections that are stalled.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: See the operator response.

Source: z/OS Communications Server TCP/IP: TRMD

Module: EZATRMD

Routing code: *

Descriptor code: *

Automation: This message is written to syslogd. Automation on this message will provide you with an indication of when a global TCP stall attack is detected.

Example:

EZZ8672I TRMD Global TCP Stall exited: date time totalconn= totalconn stalledpct= stalledpct smallwinpct= smallwindowpct writeblkpct= writeblockpct duration= duration action= action correlator= correlator probeid= probeid sensorhostname= sensorhostname

Explanation: A global TCP stall condition has exited. The global TCP stall condition is entered for a TCP/IP stack when at least 50% of active TCP connections are stalled and at least 1000 TCP connections are active. The global TCP stall condition is exited for a TCP/IP stack when less than 25% of active TCP connections are stalled or the number of stalled connections drops to 450 or fewer.

In the message text:

date

The date when the global TCP stall condition was exited.
time
The time when the global TCP stall condition was exited.

totalconn
The total number of active TCP connections when the global TCP stall condition was exited.

stalledpct
The percentage of active TCP connections that were stalled at the time the global TCP stall condition was exited.
A TCP connection is considered stalled if one or more of the following conditions are true:
• The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
• The TCP send queue is full and data is not being retransmitted.

smallwindowpct
The percentage of active TCP connections that are stalled because the TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the smallwindowpct value and the writeblockpct value.

writeblockpct
The percentage of active TCP connections that are stalled because the TCP send queue is full and data is not being retransmitted. If data is being retransmitted, there might be a network outage. A TCP connection can be stalled due to multiple conditions. For example, a TCP connection might be included in both the smallwindowpct value and the writeblockpct value.

duration
The duration, in seconds, that the global TCP stall condition was in effect.

action
The action specified in the policy for the Global TCP Stall attack type. The action parameter can be one of the following values:

resetconn
All stalled TCP connections were reset when the global TCP stall condition was detected. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8673I was generated for each stalled connection that was reset.

noretconn
Stalled TCP connections were not reset when the global TCP stall condition was detected. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8674I was generated for each stalled connection.

correlator
The correlator for a global TCP stall condition. Message EZZ8673I was issued, with the same correlator value, when the global TCP stall condition was detected. If you requested detailed syslogd messages for the Global TCP Stall attack type, message EZZ8673I or EZZ8674I was issued, with the same correlator value, for each stalled connection.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: No action is needed.
System programmer response: No action is needed.
User response: Not applicable.
Problem determination: See the operator response.
Source: z/OS Communications Server TCP/IP: TRMD
Module: EZATRMD
Routing code: *
Descriptor code: *

Automation: This message is written to syslogd. Automation on this message will provide you with an indication of when a global TCP stall attack condition is exited.

Example:
smallwinpct= 25 writeblkpct= 10 duration= 312 action= resetconn correlator= 151 probeid= 040B0002
sensorhostname= HOST1.COMPANYA.COM

EZZ8673I TRMD TCP connection reset because Global TCP Stall attack detected: date time connid= connid
jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport sendqdata= sendqdata
windowsize= windowsize correlator= correlator probeid= probeid sensorhostname= sensorhostname

Explanation: A global TCP stall condition was detected and the specified connection was stalled. The connection was reset because Intrusion Detection Services (IDS) policy for the Global TCP Stall attack type specified that stalled connections should be reset.

A global TCP stall condition is detected for a TCP/IP stack when at least 50% of active TCP connections are stalled and at least 1000 TCP connections are active.

A TCP connection is considered stalled if one or more of the following conditions are true:
• The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
• The TCP send queue is full and data is not being retransmitted.

In the message text:
date
   The date when the connection was reset.
time
   The time when the connection was reset.
connid
   The ID of the connection that was reset.
jobname
   The job name of the connection that was reset.
lipaddr
   The local IP address of the connection that was reset.
lport
   The local port of the connection that was reset.
ripaddr
   The remote IP address of the connection that was reset.
rport
   The remote port of the connection that was reset.
sendqdata
   The amount of data queued to the TCP send queue.
windowsize
   The size of the TCP window. The TCP send window size is set based on values provided by the TCP peer.
correlator
   The correlator for a global TCP stall condition. Message EZZ8672I is issued, with the same correlator value, when the global TCP stall condition is detected. Message EZZ8673I is issued, with the same correlator value, when the global TCP stall condition is exited. Additional EZZ8673I messages are issued, with the same correlator value, for other connections that are reset as a result of the global TCP stall condition.
probeid

The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname

The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: The connection was determined to be stalled for one or both of the following reasons:

- The TCP send queue for the connection was full and data was not being retransmitted. Use the sendqdata value in this message to determine the amount of data that was queued to the TCP send queue at the time that the connection was reset.
- A window advertisement was received from the peer with a window size that is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. Use the windowsize value in this message to determine the last window size received from the peer at the time that the connection was reset.

If you are experiencing a network outage, the global TCP stall that caused this message might not be an indication of an attack; otherwise, the global TCP stall might have been caused by an attack or by a problem with a remote application.

Analyze the data in this message and the EZZ8673I messages issued for other connections that contributed to the global TCP stall. If the remote IP address is the same for many of the connections, determine whether there is a problem with the application at that remote IP address or whether that remote IP address is being used to launch an attack.

System programmer response: No action is needed.

User response: Not applicable.

Problem determination: See the operator response.

Module: EZATRMD

Routing code: *

Descriptor code: *

Automation: This message is written to syslogd. Automation on this message will provide you with information about the TCP connections that contribute to the detection of a Global TCP Stall attack.

Example:

EZZ8673I TRMD TCP connection reset because Global TCP Stall attack detected: 06/09/2010 17:11:28.55
connid= 00000125 jobname= USER15 lipaddr= 4.4.4.4 lport= 1165 ripaddr= 7.7.7.7 rport= 5000
sendqdata= 500 windowsize= 0 correlator= 137 probeid= 040B0001 sensorhostname= HOST1.COMPANYA.COM

EZZ8674I TRMD TCP connection would have been reset because Global TCP Stall attack detected: date time
connid= connid jobname= jobname lipaddr= lipaddr lport= lport ripaddr= ripaddr rport= rport
sendqdata= sendqdata windowsize= windowsize correlator= correlator probeid= probeid sensorhostname=
sensorhostname

Explanation: A global TCP stall condition was detected and the specified connection was stalled. The connection was not reset because Intrusion Detection Services (IDS) policy for the Global TCP Stall attack type specified that stalled connections should not be reset.

A global TCP stall condition is detected for a TCP/IP stack when at least 50% of active TCP connections are stalled and at least 1000 TCP connections are active. At the time the condition was detected, if a policy action of reset connections had been configured, all stalled TCP connections would have been reset.

A TCP connection is considered stalled if one or more of the following conditions are true:

- The TCP send window size is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. The TCP send window size is set based on values provided by the TCP peer. The default MTU for IPv4 is 576. The default MTU for IPv6 is 1280.
The TCP send queue is full and data is not being retransmitted.

In the message text:

- **date**
  - The date when the condition was detected.

- **time**
  - The time when the condition was detected.

- **connid**
  - The ID of the connection.

- **jobname**
  - The job name of the connection.

- **lipaddr**
  - The local IP address of the connection.

- **lport**
  - The local port of the connection.

- **ripaddr**
  - The remote IP address of the connection.

- **rport**
  - The remote port of the connection.

- **sendqdata**
  - The amount of data queued to the TCP send queue.

- **windowsize**
  - The size of the TCP window. The TCP send window size is set based on values provided by the TCP peer.

- **correlator**
  - The correlator for a global TCP stall condition. Message EZZ8671I is issued, with the same correlator value, when the global TCP stall condition is detected. Message EZZ8672I is issued, with the same correlator value, when the global TCP stall condition is exited. Additional EZZ8674I messages are issued, with the same correlator value, for other connections that were stalled at the time that the global TCP stall condition was detected.

- **probeid**
  - The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

- **sensorhostname**
  - The fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** The connection was determined to be stalled for one or both of the following reasons:

- The TCP send queue for the connection was full and data was not being retransmitted. Use the **sendqdata** value in this message to determine the amount of data that was queued to the TCP send queue at the time that the global TCP stall condition was detected.

- A window advertisement was received from the peer with a window size that is less than 256 or is less than the smaller of the largest send window that has been seen for the connection and the default MTU. Use the **windowsize** value in this message to determine the last window size received from the peer at the time that the global TCP stall condition was detected.

If you are experiencing a network outage, the global TCP stall that caused this message might not be an indication of an attack; otherwise, the global TCP stall might have been caused by an attack or by a problem with a remote application.

Analyze the data in this message and the EZZ8674I messages issued for other connections that contributed to the global TCP stall. If the remote IP address is the same for many of the connections, determine if there is a problem with the application at that remote IP address or if that remote IP address is being used to launch an attack.

**System programmer response:** No action is needed.
User response: Not applicable.

Problem determination: See the operator response.

Automation: This message is written to syslogd. Automation on this message will provide you with information about the TCP connections that contribute to the detection of a Global TCP Stall attack.

Example:
EZZ8674I TRMD TCP connection would have been reset because Global TCP Stall attack detected: 06/09/2010 17:11:28.55 connid= 00000125 jobname= USER15 lipaddr= 4.4.4.4 lport= 1165 ripaddr= 7.7.7.7 rport= 5000 sendqdata= 500 windowsize= 0 correlator= 137 probeid= 040B0001 sensorhostname= HOST1.COMPANYA.COM

EZZ8675I TRMD ATTACK EE XID timeout: date time
dipaddr
dport
sipaddr
sport
correlator
probeid
sensorhostname

Explanation: An XID for an EE connection has timed out. This Enterprise Extender endpoint, with the specified destination IP address, received an XID to activate a new connection and responded with an XID reply. The Enterprise Extender endpoint, with the specified source IP address, did not send the next XID to continue activation of the connection. The XID reply was re-sent three times before detecting the timeout.

In the message text:

date
The date when the XID timed out.

time
The time that the XID timed out.

dipaddr
The destination VIPA address of the XID packet.

dport
The destination port for the XID packet.

sipaddr
The source IP address of the XID packet.

sport
The source port of the XID packet.

correlator
The correlator for an EE XID timeout condition.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDS probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: Monitor the console for additional EZZ8675I messages. If no further messages are seen, this event is not an attack. If additional EZZ8675I or EZZ8677I messages are issued to the console, check the source IP address as it can be an EE XID flood attack.

User response: Not applicable.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: TRMD
Module: EZATRMD
Routing code: 2, 8
Descriptor code: 8, 9
Automation: Not applicable.
Example:
EZZ8675I TRMD ATTACK EE XID timeout: 10/19/2010 01:43:37.20 dipaddr= 9.42.105.53 dport= 12000 sipaddr= 9.42.105.50 sport= 12000 correlator= 49 probeid= 04130001 sensorhostname= HOST1.COMPANYA.COM
Procedure name: WriteLogEntries

EZZ8676I TRMD ATTACK EE XID timeout flood statistics: date time dipaddr= dipaddr timeoutcnt= timeoutcnt peakxids= peakxids floodcount= floodcount sensorhostname= sensorhostname

Explanation: Intrusion Detection Services (IDS) ATTACK statistics have been gathered for the XID flood policy. All the values, except peakxids, represent the number of received XIDs that timed out in the statistics interval. The value for the statistics interval is defined in the action associated with the IDS EE XID attack rule.

In the message text:

date
The date when the statistics were collected.
time
The time when the statistics were collected.
dipaddr
The destination IP address of the EE connection.
timeoutcnt
The total number of XID timeouts during this statistics interval.
peakxids
The highest number of XID timeouts in any one minute interval during this statistics interval.
floodcount
The number of times an EE XID flood started during this statistics interval.
sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: None.
Source: z/OS Communications Server TCP/IP: TRMD

Module: EZATRMD
Routing code: 2, 8
Descriptor code: 8, 9
Automation: None.
Example:
EZZ8676I TRMD ATTACK EE XID timeout Flood statistics:10/19/2010 01:53:00.97 dipaddr=9.42.105.53 timeoutcnt= 105 peakxids= 4 floodcount= 1 sensorhostname=HOST1.COMPANYA.COM
Procedure name: WriteLogEntries
TRMD ATTACK EE XID timeout flood start: date time dipaddr= dipaddr timeoutthreshold= timeoutthreshold lastsip= lastsip sipcnt= sipcnt correlator= correlator probeid= probeid sensorhostname= sensorhostname

Explanation: An EE XID flood attack was detected by Intrusion Detection Services (IDS). This occurs when the number of EE XID timeouts, documented by message EZZ8675I, received in a one minute interval is equal to the EEXIDtimeout value. The EEXIDtimeout value is set in the action for the EE_XID_FLOOD IDS policy. If not set, the value is 100 for an active EE_XID_FLOOD IDS policy.

In the message text:

date
The date when the EE XID flood attack started.

time
The time when the EE XID flood attack started.

dipaddr
The destination IP address of the XID that starts the EE XID flood attack.

timeoutthreshold
The numbers of XIDs that timed out prior to entering the EE XID flood attack.

lastsip
The source IP address of the XID that started the EE XID flood attack.

sipcnt
The consecutive number of XIDs that timed out that have the same source IP address as the last timed out XID. If the previously timed out XID packet's source IP address is not the same as the last timed out XID packet's source IP address, the count will be 1.

correlator
The correlator for an EE XID timeout flood start condition.

probeid
The unique identifier of the probe detection point. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the IDs probe IDs.

sensorhostname
The fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: A possible XID flood attack exists for the specified destination IP address. The lastsip and sipcnt provide information pertaining to the source of the XIDs. If the last source IP address (lastsip) is a valid partner EE endpoint and sipcnt is greater than one, check for problems at the source. If the sipcnt is one, check the syslogd for EZZ8675I messages that identify previous timeouts to this destination IP address. If the source IP address is valid, test the EE connectivity between the two EE endpoints by issuing the DISPLAY NET,EEDIAG,TEST=YES command. See z/OS Communications Server: SNA Operation for details.

User response: Not applicable.

Problem determination: None.

TRMD ATTACK EE XID timeout flood start: 11/04/2010 01:54:12.32 dipaddr= 9.42.105.53 timeoutthreshold= 2 lastsip= 9.42.105.50 sipcnt= 10 correlator= 23 probeid= 04130002 sensorhostname= HOST1.COMPANYA.COM

Procedure name: WriteLogEntries
**Explanation:** The EE XID flood attack has ended. This message is issued when Intrusion Detection Services detects that the host is no longer experiencing an EE XID Flood attack.

In the message text:

- **date**
  The date when the XID flood attack ended.

- **time**
  The time when the XID flood attack ended.

- **dipaddr**
  The destination IP address of the inbound XIDs.

- **duration**
  The number of seconds of the EE XID flood attack.

- **timedoutcnt**
  The number of XIDs that timed out during the EE XID flood attack.

- **lastsip**
  The source IP address of the last XID that timed out during the EE XID flood attack.

- **sipcnt**
  The consecutive number of XIDs that timed out that have the same source IP address as the last timed out XID.
  If the previously timed out XID packet's source IP address is not the same as the last timed out XID packet's source IP address, the count will be 1.

- **correlator**
  The correlator for an EE XID timeout flood end condition.

- **probeid**
  The unique identifier of the probe detection point. See the [intrusion detection services probeids](z/OS Communications Server: IP and SNA Codes) for a description of the IDs probe IDs.

- **sensorhostname**
  The fully qualified host name of the IDS sensor.

Automation:  Not recommended.

Example:  Not applicable.

EZZ8761I  IDS EVENT DETECTED

Explanation:  This is the first message of a message group. A complete description of the message group follows:

EZZ8761I  IDS EVENT DETECTED
EZZ8730I  STACK stack_name
EZZ8762I  IDS EVENT_TYPE event_type
EZZ8763I  CORRELATOR correlator - PROBEID probe_id
[EZZ8770I  INTERFACE intf_name]
[EZZ8764I  SOURCE IP ADDRESS source - PORT port]
[EZZ8765I  DESTINATION IP ADDRESS dest - PORT port]
EZZ8766I  IDS RULE rule_name
EZZ8767I  IDS ACTION action_name

EZZ8761I

The policy-based intrusion detection system (IDS) detected an event that specified that the console operator was to be alerted. The occurrence of this message can indicate that the TCP/IP stack or a particular application is under stress. The stress might be caused by a peak in workload or might be caused by malicious activity such as packet flooding, port scanning or malformed packets.

EZZ8730I

This message provides the name of the TCP/IP stack that detected the specified event.

stack_name is the name of the TCP/IP stack.

EZZ8762I

This message provides the event type of the IDS event.

event_type can be one of the following:
   TCP TOTAL CONNECTION LIMIT REACHED
   TCP SOURCE IP CONNECTION LIMIT REACHED
   TCP PORT CONSTRAINED
   TCP PORT UNCONSTRAINED
   UDP PORT QUEUE CONSTRAINED
   UDP PORT QUEUE UNCONSTRAINED
EZZ8761I

FAST SCAN DETECTED
SLOW SCAN DETECTED
SCAN INTERVAL OVERRUN
SCAN STORAGE CONSTRAINED
SCAN STORAGE UNCONSTRAINED
SUSPICIOUS PACKET RECEIVED
SYN FLOOD STARTED
SYN FLOOD ENDED
INTERFACE FLOOD START
INTERFACE FLOOD END
INTERFACE FLOOD DETECTION DISABLED
ACCEPT QUEUE EXPANDED
TCP QUEUE CONSTRAINED
TCP QUEUE UNCONSTRAINED
TCP CONN RESET - QUEUE CONSTRAINED
GLOBAL TCP STALL ENTERED
GLOBAL TCP STALL EXITED
EE XID FLOOD STARTED
EE XID FLOOD ENDED

EZZ8763I

This message provides the IDS trace correlator and probe ID for the IDS event.

correlator is the IDS trace correlator associated with the event.

probe_id is the probe ID associated with the event. See the intrusion detection services probeids in z/OS Communications Server: IP and SNA Codes for a description of the probe IDs.

EZZ8764I

This message provides the source IP address and source port from the IP packet associated with the IDS event. This message is issued only when the source IP address is relevant to the event.

source is the source IP address of the packet associated with the event.

port is the source IP port associated with the packet. The source port is only relevant for TCP or UDP protocols and will be zero for any other protocol. port will be zero if the source IP port is not known at the time of the attack. port will always be zero if event_type in message EZZ8762I is FAST SCAN DETECTED or SLOW SCAN DETECTED.

EZZ8765I

This message provides the destination IP address and destination port from the IP packet associated with the IDS event. This message is issued only when the destination IP address is relevant to the event.

dest is the destination IP address of the packet associated with the event.

port is the destination IP port associated with the packet. The destination port is only relevant for TCP or UDP protocols and will be zero for any other protocol. port will be zero if the destination port is not known at the point that an attack event is detected.

EZZ8770I

This message provides the interface or link name associated with the IDS event. This message is issued only when the interface name is relevant to the event.
intf_name is the interface or link name associated with the event.

EZZ8766I

This message provides the IDS policy rule name that is associated with the other messages in the group.

rule_name is the short name of the IDS rule that is associated with the messages in this group.

Results:
- When the event_type value in message EZZ8762I is TCP PORT UNCONSTRAINED, the rule_name value is N/A if the application is no longer listening on the port.
- If the rule_name value contains characters that cannot be printed to the MVS console, such as the ~ character, a blank is substituted for the unprintable character.

EZZ8767I

This message provides the IDS policy action name that is associated with the other messages in the group.

action_name is the short name of the IDS action that is associated with the messages in this group.

Results:
- When the event_type value in message EZZ8762I is TCP PORT UNCONSTRAINED, the action_name value is N/A if the application is no longer listening on the port.
- If the action_name value contains characters that cannot be printed to the MVS console, such as the ~ character, a blank is substituted for the unprintable character.

System action: Processing Continues.

Operator response: Save the system console log, IDS syslog file, and IDS packet trace for the person responsible for IDS policy definition. IDS policy definition determines if IDS events are written to syslog, the IDS packet trace, both or neither.

System programmer response: You can use the trmdstat OE shell command to analyze the IDS syslog file. You can use the IPCS trace formatters to format the IDS packet trace if one was collected for this event. If IDS policy is not maintained by the system programmer, then provide the log and trace information to the person responsible for IDS policy. You can use the IDS action name and IDS rule name to locate the IDS policy that is responsible for the messages.

If message EZZ8762I has an event_type of SCAN INTERVAL OVERRUN, scan processing is not able to complete an evaluation of the source ip addresses it is tracking in its normal internal interval (30 or 60 seconds). This might indicate that a large number of source ip addresses are being monitored. If the policy is using High scan sensitivity, consider lowering the scan sensitivity level for high usage ports. If message EZZ8762I has an event_type of SCAN STORAGE CONSTRAINED, determine the cause of the storage shortage. See the z/OS Communications Server: IP Diagnosis Guide for information about storage shortages.

Problem determination: See the system programmer response.

Module: EZBIDIDM

Descriptor code: 8, 9

Example:
EZZ8761I IDS EVENT DETECTED 243
EZZ8730I STACK TCPCS3
EZZ8762I EVENT TYPE: UDP PORT QUEUE CONSTRAINED
EZZ8763I CORRELATOR: 3 - PROBEID 02000001
EZZ8765I DESTINATION IP ADDRESS 3.3.3.3 - PORT 300
EZZ8766I IDS RULE All_Well-Known_UDP
EZZ8767I IDS ACTION All_Well-Known_UDP

Procedure name: EZBIDLOG
EZZ8762I  IDS EVENT TYPE  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8763I  CORRELATOR  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8764I  SOURCE IP ADDRESS  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8765I  DESTINATION IP ADDRESS  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8766I  IDS RULE  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8767I  IDS ACTION  

**Explanation:** This message is issued as part of a message group. See message EZZ8761I for a complete description of the message group.

EZZ8768I  IDS SCAN STORAGE EXCEEDED  

**Explanation:** IDS scan-detection can consume large amounts of storage if HIGH was specified as the scan sensitivity for high usage ports or if the port is undergoing a flooding attack. If the storage used to track the source IP addresses exceeds 1 MB of storage, scan processing will inform the installation. This information can be used with message EZZA364I to determine if scan detection is the cause of a storage constraint.

- **nbrmeg** is the number of megabytes of storage exceeded. The message is issued at 1 MB, 2 MB and power of 2 MB increments (for example, 1 MB, 2 MB, 4 MB, 8 MB, and so forth).

- **nbrsip** is the number of source IP addresses currently being tracked by scan detection.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** If the system is storage constrained and it appears that the scan detection is contributing to this problem, consider changing the scan policy. If the installation set the scan sensitivity to HIGH on high usage ports, consider reducing the sensitivity level or removing the port from scan detection until the storage constraint is resolved.

**Module:** EZBIDSCN

**Procedure name:** EZBIDSCT

EZZ8769I  ICMP WILL IGNORE REDIRECTS DUE TO INTRUSION DETECTION POLICY  

**Explanation:** Intrusion Detection Services (IDS) policy is active and the ICMP_REDIRECT attack policy specifies that ICMP redirect packets are to be discarded. All future ICMP Redirects will be ignored.

**System action:** TCPIP continues.

**Operator response:** None.

**System programmer response:** None.

EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR image : type

Explanation: The Policy Agent that is acting as a policy server or a policy client completed processing the local configuration files and installing any active policies of the specified type for the specified image. This message is displayed when policies of the type specified have been processed for the specified image from Policy Agent configuration files during the following conditions:

- The Policy Agent initialization
- The MODIFY procname,REFRESH command or MODIFY procname,UPDATE command was issued
- A SIGHUP signal
- Policy changes were found when reading configuration files
- The TCP/IP stack started

This message is also displayed when policies of the type that were requested have been processed for an import requestor. These import policies are processed only one time and can be retrieved by the import requestor.

image is the name of the TCP/IP stack for which the policies will be in effect. When the image value specifies an import requestor, this message is written only to the Policy Agent log file.

type indicates which policy type will be in effect for image. type can be one of the following:

IDS Intrusion Detection Services policies
IPSEC IP Filtering, KeyExchange and LocalDynVpn policies
NONE No policies were updated or contained errors
QOS Quality of Service policies
ROUTING Policy-based routing policies
TTLS Application Transparent Transport Layer Security (AT-TLS) policies

System action: Processing continues.
Operator response: None.
System programmer response: None.

Module: PLFMMISC
Procedure name: plfm_disciplineMsg

EZZ8772I PAGENT LDAP POLICY PROCESSING COMPLETE FOR tcpImage : type

Explanation: The Policy Agent completed querying the LDAP server and installing any active type policies for tcpImage. This message is displayed when type policies have been processed for tcpImage from LDAP during the following conditions:

- Policy Agent initialization
- MODIFY procname,REFRESH command and MODIFY procname,UPDATE command
- SIGHUP signal
Policy changes found during LDAP server refresh interval processing
TCP/IP stack started

tcpImage is the name of the TCP/IP stack for which the type policies will be in effect.
type indicates which policy type will be in effect for tcpImage. type can be one of the following:
- QOS  Quality of Service policies
- IDS  Intrusion Detection Services policies
- NONE No policies were updated or contained errors

System action:  Processing continues.
Operator response:  None.
System programmer response:  None.
Module:  PLFMMISC
Procedure name:  plfm_disciplineMsg

---

EZZ8773I  PAGENT POLICIES PURGED FOR tcpImage type

Explanation:  The Policy Agent purged all type policies for tcpImage. This message is displayed if the PURGE option was coded on TcpImage statement or on a specific policy type configuration statement, in the following cases:
- During Policy Agent shutdown
- If a tcpImage statement was deleted from the Policy Agent configuration file for type policies

See [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.zhtml?c=300113&dlc=300113&id=1620469) for information about the policy agent configuration file and the TcpImage or PEPInstance statements.

tcpImage is the name of the TCP/IP stack for which the type policies were purged.
type indicates which policy type was purged from tcpImage. type can be one of the following:
- QOS  Quality of Service policies
- IDS  Intrusion Detection Services policies
- TTLS  Application Transparent Transport Layer Security (AT-TLS) policies

Result:  This message is issued for type QOS even if Quality of Service (QOS) policies are not defined for tcpImage.

System action:  None.
Operator response:  None.
System programmer response:  None.
Module:  PLFMMISC
Procedure name:  plfm_disciplineMsg

---

EZZ8774I  PAGENT POLICIES NOT PURGED FOR tcpImage type

Explanation:  The type policies for tcpImage were not purged when the Policy Agent shut down. This message is displayed if the NOPURGE option was coded on TcpImage statement or on a specific policy type configuration statement in the following cases:
- During Policy Agent shutdown
- If a TcpImage statement was deleted from the Policy Agent configuration file for type policies

See [Policy Agent and policy applications in z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.zhtml?c=300113&dlc=300113&id=1620469) for information about the policy agent configuration file and the TcpImage or PEPInstance statements.
tcpImage is the name of the TCP/IP stack for which the type policies were not purged.

type indicates which policy type was not purged from tcpImage. type can be one of the following:

IDS       Intrusion Detection Services policies
QOS       Quality of Service policies
ROUTING   Policy-based routing policies
TTLS      Application Transparent Transport Layer Security (AT-TLS) policies

Result: This message is issued for type QOS even if Quality of Service (QOS) policies are not defined for tcpImage.

System action:  None.
Operator response: None.
System programmer response: None.
Module:  PLFMMISC
Procedure name:  plfm_disciplineMsg

EZZ8775I   PAGENT ON TcpName CONNECTION NO LONGER ACTIVE TO ipaddress..port

Explanation:  The Policy Agent running on the sysplex distributing stack lost its TCP connection with the Policy Agent running on the sysplex target stack.

TcpName is the name of the sysplex distributing stack.

ipaddress is the IP address of the Policy Agent running on the sysplex target stack.

port is the port number used by the Policy Agent running on the sysplex target stack.

System action:  The Policy Agent will not be able to obtain the QoS fractions using service level granularity from the sysplex target stack. If the sysplex target stack is removed from the sysplex configuration, no further action will be taken. Otherwise, the Policy Agent running on the sysplex distributing stack will continue to attempt to establish a connection with the Policy Agent running on the sysplex target stack.

Operator response:  If the sysplex target stack was correctly removed from the configuration, no action needs to be taken. Otherwise, contact the system programmer.

System programmer response:  If the sysplex target stack was removed from the configuration in error, then check the Policy Agent log to determine the problem. If the sysplex target stack is still in the configuration, then re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. Take the necessary corrective action based on the information in the Policy Agent log indicating the cause of the TCP connection failure.

Module:  PQOSCOLL
Procedure name:  pqos_refresh_target_cache, pqos_cleanup_target_cache, pqos_get_info_from_listeners

EZZ8776I   PAGENT ON TcpName CONNECTED TO ipaddress..port

Explanation:  The Policy Agent running on a sysplex distributing stack established a connection with the Policy Agent running on the sysplex target stack to collect QoS statistics with service level granularity.

TcpName is the name of the sysplex distributing stack.

ipaddress is the IP address of the Policy Agent running on the sysplex target stack.

port is the port number used by the Policy Agent running on the sysplex target stack.

System action:  Processing continues.
Operator response:  None.
System programmer response:  None.
Module:  PQOSCOLL
Procedure name: pqos_connect_to_listener

EZZ8777I   PAGENT ON TcpName DECLINED CONNECTION FROM ipaddress..port

Explanation: The Policy Agent running on a sysplex target stack rejected a connection request because the request was not received from a recognized sysplex distributing stack.

TcpName is the name of the sysplex target stack.

ipaddress is the IP address of the remote system that was declined.

port is the port number used by the remote system that was declined.

System action: Processing continues.

Operator response: Contact the system programmer.

System programmer response: If the remote IP address/port is not part of the sysplex, then this might be an attempt to breach security. Investigate why the remote system is trying to connect to the Policy Agent. If it is part of the sysplex, then verify that the migration tasks for the load distribution function have all been completed. If so, then re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. Use the information in the Policy Agent log to diagnose the problem.

Module: PQOSLISN

Procedure name: qosListener

EZZ8778I   PAGENT ON TcpName CANNOT CONTACT ipaddress..port

Explanation: The Policy Agent running on the sysplex distributing stack was not able to establish a TCP connection to the Policy Agent running on a sysplex target stack to collect QoS service level statistics. Although the Policy Agent on the sysplex distributing stack will periodically continue to retry connection establishment, this message will not be issued again for this sysplex target unless the policy configuration is refreshed.

TcpName is the name of the sysplex distributing stack.

ipaddress is the IP address of the Policy Agent running on the sysplex target stack.

port is the port number used by the Policy Agent running on the sysplex target stack.

System action: Policy Agent running on the sysplex distributing stack will not be able to collect QoS statistics using service level granularity from the sysplex target stack. Aggregate QoS statistics will be used for distribution of work to this sysplex target.

Operator response: If QoS statistics with service level granularity is not required from this sysplex target, no action needs to be taken. If QoS statistics with service level granularity is required, contact the system programmer.

System programmer response: Re-create the problem with the Policy Agent -d trace option or a LogLevel 511 statement in the Policy Agent configuration file. Take the necessary corrective action based on the information indicating the cause of the TCP connection failure.

Module: PQOSCOLL

Procedure name: pqos_connect_to_listener

EZZ8779I   PAGENT TCPIMAGE/PEPINSTANCE STATEMENTS CONTAIN ERRORS

Explanation: A TCPIMAGE or PEPINSTANCE statement in the Policy Agent main configuration file contains errors.

System action: No policy entries are installed in the TCP/IP stacks named by the associated TCPIMAGE or PEPINSTANCE statements that contain errors.

Operator response: If Policy Agent was run with a LogLevel of at least 127 or started with -d 1 start option at the time of the error, then examine the log file to obtain the policy definition errors. Otherwise, re-create with at least a LogLevel of 127 or start Policy Agent with -d 1 start option to see the policy definition errors.

System programmer response: Correct the Policy Agent policy definition errors identified in the log and restart Policy Agent.

Module: PINIT
Procedure name: pinit_init_tcpimages

EZ8780I  PAGENT CANNOT CONNECT TO POLICY SERVER FOR tcpImage : serverType AT host

Explanation: The connection between the Policy Agent that is acting as a policy client and the Policy Agent that is acting as a policy server was not successful because there were connectivity problems, security problems, or other policy server problems.

On the policy client, the ServerConnection statement can be configured with connection and security information for a primary and optional backup policy server. On the policy client for each TCP/IP stack, a PolicyServer statement can be configured with processing and security information for the policy server. On the policy server, the ClientConnection statement contains the listening port for this connection.

In the message text:

**tcpImage**
- The name of the TCP/IP stack for which the connection to the policy server was not established.

**serverType**
- The type of policy server for which a connection was not established. Possible values are:
  - PRIMARY
    - Primary policy server
  - BACKUP
    - Backup policy server

**host**
- The host name or the IP address for which the connection to the policy server was not established.

System action: The policy client continues. The policy client uses the configured connection-wait parameter and connection-retry parameter on the ServerConnection statement to automatically retry the primary and backup connections until a connection is made. Until the connection attempt is successful, the policy client cannot retrieve the configured remote policies.

Operator response: Contact the system programmer. If the system programmer indicates that more information is required in the policy server or policy client log file, restart the appropriate Policy Agent with a minimum of LogLevel 127 configured in the configuration file, and with the -d 128 start option.

System programmer response: Examine the log files to determine the errors that prevented a connection between the policy client and the policy server. See the information about configuring the policy agent in [z/OS Communications Server: IP Configuration Guide](https://www.ibm.com/support/knowledgecenter/SSWVV5_2) for information about setting up the correct configuration. If any configuration errors were corrected, restart the Policy Agent on the system where the changes were made. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 and start the policy server or policy client with the -d 128 start option.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

Module: pclient.c and piniting.c

Routing code: 10

Descriptor code: 12

Example: Not applicable.

EZ8781I  PAGENT CONNECTED TO POLICY SERVER FOR tcpImage : serverType AT host

Explanation: The connection between the Policy Agent that is acting as a policy client and the Policy Agent that is acting as a policy server was successful.

In the message text:

**tcpImage**
- The name of the TCP/IP stack for which the connection to the policy server was established.
serverType
   The type of policy server for which a connection was established. Possible values are:
      PRIMARY
         Primary policy server
      BACKUP
         Backup policy server

host
   The host name or the IP address for which the connection to the policy server was established.

System action: Processing continues.
Operator response: None.
System programmer response: None.
User response: Not applicable.
Problem determination: Not applicable.
Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)
Module: pclient.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8782I   PAGENT CONNECTION NO LONGER ACTIVE TO POLICY SERVER FOR tcpImage : serverType AT host

Explanation: The connection between the Policy Agent that is acting as a policy client and the Policy Agent that is acting as a policy server is no longer active. This is expected if a change was made to the configuration that caused the connection to end. For example, the PolicyServer configuration statement on the policy client might have been removed.

On the policy client, the ServerConnection statement can be configured with connection and security information for a primary and optional backup policy server. On the policy client for each TCP/IP stack, a PolicyServer statement can be configured with processing and security information for the policy server. On the policy server, the ClientConnection statement contains the listening port for this connection.

In the message text:

tcpImage
   The name of the TCP/IP stack that lost the connection to the policy server.

serverType
   The type of policy server that lost a connection. Possible values are:
      PRIMARY
         Primary policy server
      BACKUP
         Backup policy server

host
   The host name or the IP address for which the connection to the policy server was lost.

System action: The policy client continues. If a configuration change caused the connection to end, the existing remote policies are removed from the policy client's corresponding TCP/IP stack. But if the connection ended unexpectedly, the existing remote policies remain installed in the policy client's corresponding TCP/IP stack. The policy client uses the configured connection-wait parameter and connection-retry parameter on the ServerConnection statement to automatically retry the primary and backup connections until it connects to a server. Until the connection attempt is successful, the policy client cannot retrieve new remote policies.

Operator response: If a configuration change did not cause the connection to end, contact the system programmer. If the system programmer indicates that more information is required in the policy server or policy client log file,
restart the appropriate Policy Agent with a minimum of LogLevel 127 configured in the configuration file, and with the -d 128 start option.

**System programmer response:** Examine the log files to determine the errors that prevented a connection between the policy client and the policy server. See the information about configuring the policy agent in [z/OS Communications Server: IP Configuration Guide](https://publib.boulder.ibm.com/infocenter/tivihelp/v2r1/topic/com.ibm.zos.r1.2/zhbip.htm) for information about setting up the correct configuration. If configuration changes were made, restart the Policy Agent on the system where the changes were made. If more information is needed to diagnose the errors, re-create the error with a minimum of LogLevel 127 and start the policy server or policy client with the -d 128 start option.

**User response:** Not applicable.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

**Module:** pclient.c

**Routing code:** 10

**Descriptor code:** 12

**Example:** Not applicable.

---

**EZZ8783I**  PAGENT POLICY SERVER REACHED MAXIMUM NUMBER OF CONNECTED POLICY CLIENTS

: maxValue

**Explanation:** The Policy Agent reached its maximum allowed number of connected policy clients and of clients using the ServicesConnection statement.

In the message text:

maxValue

The maximum number of connected policy clients.

**System action:** The policy server continues, but no new policy clients are allowed to connect and retrieve policies from the policy server until one or more existing policy clients disconnect from the policy server.

**Operator response:** Contact the system programmer.

**System programmer response:** Evaluate your configuration to ensure that no more than the maximum number of policy clients attempt to connect to the policy server. Examine the Policy Agent log files on the policy server to determine the identity of the clients that are failing to connect. Issue the command to determine the identities of policy clients that are already connected.

**User response:** Not applicable.

**Problem determination:** See the system programmer response.

**Source:** z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

**Module:** paapi.c

**Routing code:** 10

**Descriptor code:** 12

**Example:** Not applicable.

---

**EZZ8784I**  PAGENT CLIENTCONNECTION STATEMENT CONTAINS ERRORS ON POLICY SERVER

**Explanation:** A ClientConnection statement in the main configuration file contains errors on the Policy Agent that is acting as a policy server.

**System action:** The policy server continues but does not listen for remote client connections using this ClientConnection statement.

**Operator response:** Contact the system programmer. If the system programmer indicates that more information is required in the policy server log file, restart the policy server with a minimum of LogLevel 127 configured in the configuration file, or with the -d 1 start option.
System programmer response: Examine the log file to determine the cause of the problem. Correct the policy server configuration errors identified in the log and restart the policy server. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 or start the policy server with the -d 1 start option to see the configuration errors.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)
Module: pinit.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8785I PAGENT DYNAMICCONFIGPOLICYLOAD STATEMENTS CONTAIN ERRORS ON POLICY SERVER

Explanation: One or more DynamicConfigPolicyLoad statements in the main configuration file contain errors on the Policy Agent that is acting as a policy server. This statement allows the dynamic load of policies for remote policy clients. When a policy client requests that the policy server dynamically load policies, the set of DynamicConfigPolicyLoad statements is searched to determine the best match to the policy client name. Because one or more DynamicConfigPolicyLoad statements contain errors, it is possible that an unintended statement will be matched for the policy client.

System action: The policy server continues but might not install the correct policies for policy clients.

Operator response: Contact the system programmer. If the system programmer indicates more information is required in the policy server log file, restart the policy server with a minimum of LogLevel 127 configured in the configuration file, or with the -d 1 start option.

System programmer response: Examine the log file to determine the cause of the problem. Correct the policy server configuration errors identified in the log and restart the policy server. If you need more information to diagnose the errors, re-create the error with a minimum of LogLevel 127 or start the policy server with the -d 1 start option to see the configuration errors.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)
Module: pinit.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8786I PAGENT POLICYSERVER STATEMENT CONTAINS ERRORS ON POLICY CLIENT FOR tcpImage

Explanation: A PolicyServer statement configured in an image configuration file contains errors. The PolicyServer statement is used by the Policy Agent that is acting as a policy client for each corresponding TCP/IP stack. This statement contains the connection and security information used to connect to the Policy Agent that is acting as a policy server.

In the message text:

tcpImage

The name of the TCP/IP stack for which the configuration file contains the PolicyServer statement with errors.

System action: The policy client continues but does not try to connect to the policy server to retrieve remote policies for the corresponding TCP/IP stack.

Operator response: Contact the system programmer. If the system programmer indicates more information is
required in the policy client log file, restart the policy client with a minimum of LogLevel 127 configured in the
configuration file, or with the -d 1 start option.

**System programmer response**: Examine the log file to determine the cause of the problem. Correct the policy client
configuration errors identified in the log and restart the policy client. If you need more information to diagnose the
errors, re-create the error with a minimum of LogLevel 127 or start the policy client with the -d 1 start option to see
the configuration errors.

**User response**: Not applicable.

**Problem determination**: See the system programmer response.

**Source**: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

**Module**: pinitimg.c

**Routing code**: 10

**Descriptor code**: 12

**Example**: Not applicable.

---

**EZZ8787I**  PAGENT SERVERCONNECTION STATEMENT CONTAINS ERRORS ON POLICY CLIENT

**Explanation**: A ServerConnection statement in the Policy Agent main configuration file contains errors. This
configuration statement is used when the Policy Agent is acting as a policy client to specify connection parameters to
a Policy Agent that is acting as a policy server.

**System action**: The policy client continues but does not try to connect to the policy server for any TCP/IP stack
serviced by this Policy Agent.

**Operator response**: Contact the system programmer. If the system programmer indicates more information is
required in the policy client log file, restart the policy client with a minimum ofLogLevel 127 configured in the
configuration file, or with the -d 1 start option.

**System programmer response**: Examine the log file to determine the cause of the problem. Correct the policy client
configuration errors identified in the log and restart the policy client. If you need more information to diagnose the
errors, re-create the error with a minimum of LogLevel 127 or start the policy client with the -d 1 start option to see
the configuration errors.

**User response**: Not applicable.

**Problem determination**: See the system programmer response.

**Source**: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)

**Module**: pinit.c

**Routing code**: 10

**Descriptor code**: 12

**Example**: Not applicable.

---

**EZZ8788I**  PAGENT UNABLE TO SERVICE REMOTE CLIENT CONNECTIONS ON POLICY SERVER

**Explanation**: The Policy Agent that is acting as a policy server is unable to provide services for remote policy
clients. This situation has occurred because the information configured on the ClientConnection configuration
statement is incorrect, or because of an internal error.

**System action**: The policy server continues but does not respond to new policy client connections or to requests on
existing policy client connections.

**Operator response**: Contact the system programmer. If the system programmer indicates more information is
required in the policy server log file, restart the policy server with a minimum of LogLevel 127 configured in the
configuration file, and with the -d 128 start option.

**System programmer response**: Examine the log file to determine the cause of the problem. If the problem was
the result of a socket or bind failure, there might be an incorrect port specified on the ClientConnection configuration
statement. Verify that the port is valid and correct the statement if necessary. Otherwise, re-create the error with a
minimum of LogLevel 127 and start the policy server with the -d 128 start option to see the configuration errors. See the information about gathering diagnostic information in z/OS Communications Server: IP Diagnosis Guide for information about the documentation that should be obtained before contacting IBM Service.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)
Module: paapi.c pprofile.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8789I  PAGENT SERVERCONNECTION AND CLIENTCONNECTION STATEMENTS CANNOT BE CONFIGURED TOGETHER

Explanation: Both the ServerConnection statement and the ClientConnection statement are configured in the Policy Agent main configuration file. A Policy Agent can act as a policy server or a policy client, but not both.

System action: The Policy Agent continues but ignores both the ServerConnection and the ClientConnection statements.

Operator response: Contact the system programmer. Restart the Policy Agent when the system programmer has corrected the configuration error.

System programmer response: Determine whether the Policy Agent should be acting in the role of policy server or policy client. Correct the Policy Agent configuration file to remove the statement that is not needed and restart the Policy Agent.

User response: Not applicable.

Problem determination: See the system programmer response.

Source: z/OS Communications Server TCP/IP: Policy Agent (PAGENT)
Module: pinit.c
Routing code: 10
Descriptor code: 12
Example: Not applicable.

EZZ8790I  PAGENT REMOTE POLICY PROCESSING COMPLETE FOR image : type

Explanation: The Policy Agent that is acting as a policy server or a policy client completed processing the remote configuration files that are defined on the Policy Agent that is acting as a policy server. On the policy client, this processing includes installing any active policies of the specified type for the specified TCP/IP stack or remote policy client. This message is displayed when the specified policies have been processed for the specified TCP/IP stack or remote policy client from Policy Agent configuration files during the following conditions, if the specified policies are being retrieved from the policy server:

- Policy Agent initialization
- A MODIFY procname,REFRESH command and MODIFY procname,UPDATE command were issued, if any policy changes were made on the policy server
- SIGHUP signal, if any policy changes were made on the policy server
- Policy changes were found when reading configuration files on the policy server
- A TCP/IP stack started

In the message text:

image  
The name of the TCP/IP stack or remote policy client for which the type policies will be in effect.
Result: When the image value is the remote policy client name, then this message is written only to the Policy Agent log file on the policy server.

**type**
Indicates which policy type will be in effect for the image. Possible values are:
- **IDS** Intrusion Detection Services policies
- **IPSEC** IP Filtering, KeyExchange, and LocalDynVpn policies
- **NONE** No policies were updated or contained errors
- **QOS** Quality of Service policies
- **ROUTING** Policy-based routing policies
- **TTLS** Application Transparent Transport Layer Security (AT-TLS) policies

**System action:** Processing continues.

---

**EZZ8824I**

cache cleaner could not create iterator: description

**Explanation:** There was not enough memory to initialize the named server cache cleaning process. The cache cleaning process will be set to an idle state and will be rescheduled.

description describes the error.

**System action:** The named server continues. If a problem occurs with the cache cleaner where another cache cleaner is still running then the named server will end with an assertion failure.

**Operator response:** Notify the system programmer.

**System programmer response:** Increase TSO address space or region size and restart the named server. If the named server does end with an assertion failure then re-create this problem with a SYSTCPIP component trace active specifying the TC,UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use `rndc dumpdb` to dump the named servers cache to a file. See the z/OS Communications Server: IP System Administrator’s Commands on the use of the `rndc` utility.
- Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space.

**Module:** DNSCACHE

**Procedure name:** begin_cleaning
EZZ8825I master zones do not have an allow-notify field

Explanation: The allow-notify option is present in a master zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.

System action: The named server ends.

Operator response: Remove the allow-notify option from any master zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_set_allownotify

---

EZZ8826I stub zones do not have an allow-notify field

Explanation: The allow-notify option is present in a stub zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.

System action: The named server ends.

Operator response: Remove the allow-notify option from any stub zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_set_allownotify

---

EZZ8827I cache cleaner did not finish in one cleaning-interval

Explanation: The cache cleaner did not complete cleaning in the cleaning-interval. A cache cleaner is still active. The cleaning-interval is set in the options section of the named server configuration file.

System action: The named server continues.

Operator response: If the cleaning-interval is set to a small value, increase it to allow more time for cache cleaning.

System programmer response: None.

Module: DNSCACHE

Procedure name: cleaning_timer_action

---

EZZ8829I client @client_IP: description

Explanation: An error occurred in a request from client_IP with an incorrect peer address.

client_IP is the incorrect IP address of the client in question where the error described by description occurred.

description describes the error that occurred.

System action: The named server continues.

Operator response: Review the error message being reported for the client IP address. This message can occur for various error conditions from the named server client process. Set the debug level to 10 to produce debug messages from client processing.

System programmer response: None.

Module: CLIENT

Procedure name: ns_client_logv

---

EZZ8830I Out of memory

Explanation: The named server was not able to allocate space for an access control list table.

System action: The named server ends.

Operator response: Contact the system programmer.
**System programmer response:** Increase TSO address space or region size and restart the **named** server.

**Module:** CONFACL

**Procedure name:** dns_c_acltable_new

---

**EZ8831I** Failed to delete ACL element

**Explanation:** The **named** server is trying to delete access control lists from its internal access control list table and determined that there was an internal error detected while attempting to delete an access control list from its IP match list.

**System action:** The **named** server ends.

**Operator response:** This message should never be issued.

**System programmer response:** None.

**Module:** CONFACL

**Procedure name:** dns_c_acltable_clear

---

**EZ8832I** Not enough memory

**Explanation:** The **named** server was not able to allocate space for an access control list table.

**System action:** The **named** server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Increase TSO address space or region size and restart the **named** server.

**Module:** CONFACL

**Procedure name:** dns_c_acl_new

---

**EZ8833I** Not enough memory

**Explanation:** The **named** server was not able to allocate space for an access control list table.

**System action:** The **named** server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Increase TSO address space or region size and restart the **named** server.

**Module:** CONFACL

**Procedure name:** dns_c_acl_new

---

**EZ8834I** empty control statement

**Explanation:** The control statement in the **named** server configuration file is empty.

**Module:** CONFCTL

**Procedure name:** dns_c_ctrllist_validate

---

**EZ8835I** type unix control channels are not implemented

**Explanation:** The control statement in the **named** server configuration file has a z/OS UNIX control channel. The z/OS UNIX control channel type from BIND 8 is not implemented in this version of the **named** server.

**System action:** The **named** server continues.

**Operator response:** Remove the z/OS UNIX control channel from the controls statement.
System programmer response: None.
Module: CONFCTL
Procedure name: dns_c_ctrl_validate

**EZZ8836I**  type inet control channel has no keys clause; control channel will be disabled
Explanation: The control statement in the named server configuration file has no keys clause.
System action: The named server continues with no control channel configured.
Operator response: Add a keys clause containing one or more valid keys.
System programmer response: None.
Module: CONFCTL
Procedure name: dns_c_ctrl_validate

**EZZ8837I**  type inet control channel has no keys; control channel will be disabled
Explanation: The control statement in the named server configuration file has no key in the keys clause.
System action: The named server continues running with no control channel configured.
Operator response: Add valid keys to the keys clause of the control statement in the named server configuration file.
System programmer response: None.
Module: CONFCTL
Procedure name: dns_c_ctrl_validate

**EZZ8838I**  option named-xfer is obsolete
Explanation: The option named-xfer is specified in the named server configuration file but is considered obsolete and is ignored.
System action: The named server continues.
Operator response: Remove this option from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

**EZZ8839I**  hint zones do not have an allow-notify field
Explanation: The allow-notify option is present in a hint zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.
System action: The named server ends.
Operator response: Remove the allow-notify option from any hint zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_set_allownotify

**EZZ8840I**  forward zones do not have an allow-notify field
Explanation: The allow-notify option is present in a forward zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.
System action: The named server ends.
Operator response: Remove the allow-notify option from any forward zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_set_allownotify

---

**EZZ8841I** option memstatistics-file is not implemented

Explanation: The option memstatistics-file is specified in the named server configuration file but is not implemented and is ignored.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Check the named server configuration file for the memstatistics-file option and remove it.

System programmer response: None.

Module: CONFCTX

Procedure name: dns_c_checkconfig

---

**EZZ8842I** the default for the auth-nxdomain option is now no

Explanation: The option auth-nxdomain was not found in the named server configuration file. The default setting changed from yes to no.

System action: The named server will interpret option auth-nxdomain as having the value of no. Configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: If you need to specify auth-nxdomain as yes add it to your named server configuration file. See the [Z/OS Communications Server: IP Configuration Reference] for the auth-nxdomain option necessary the meet your installations requirement.

System programmer response: None.

Module: CONFCTX

Procedure name: dns_c_checkconfig

---

**EZZ8843I** option deallocate-on-exit is obsolete

Explanation: The option deallocate-on-exit is obsolete and is ignored by the named server. named server always performs memory leak checking.

System action: The named server will ignore this option. The configuration parser continues parsing the remainder of the named server configuration file.

Operator response: Remove option deallocate-on-exit from the named server configuration file.

System programmer response: None.

Module: CONFCTX

Procedure name: dns_c_checkconfig

---

**EZZ8844I** master zones do not have an allow-notify field

Explanation: The allow-notify option is present in a master zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.

System action: The named server ends.

Operator response: Remove the allow-notify option from any master zones.

System programmer response: None.

Module: CONZONE
Procedure name: dns_c_zone_getallownotify

EZZ8845I  option fake-iquery is obsolete
Explanation: The option fake-iquery is obsolete and is ignored by the named server. This option was used in Bind 8 to enable simulating the obsolete DNS query type IQUERY. named server does not perform IQUERY simulation.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option fake-iquery from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8846I  option fetch-glue is obsolete
Explanation: The option fetch-glue is obsolete and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option fetch-glue from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8847I  option has-old-clients is obsolete
Explanation: The option has-old-clients is obsolete and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option has-old-clients from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8848I  option host-statistics is not implemented
Explanation: The option host-statistics is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option host-statistics from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8849I  option multiple-cnames is obsolete
Explanation: The option multiple-cnames is obsolete and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option multiple-cnames from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8850I option rfc2308-type1 is not implemented
Explanation: The option rfc2308-type1 is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option rfc2308-type1 from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8851I option use-id-pool is obsolete
Explanation: The option use-id-pool is obsolete and is ignored by the named server. Named server always allocates query IDs from a pool.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option use-id-pool from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8852I option treat-cr-as-space is obsolete
Explanation: The option treat-cr-as-space is obsolete and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option treat-cr-as-space from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

EZZ8853I option check-names is not implemented
Explanation: The option check-names is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option check-names from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig
EZZ8854I  option use-ixfr is obsolete
Explanation:  The option use-ixfr is obsolete and is ignored by the named server.
System action:  The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response:  Remove option use-ixfr from the named server configuration file.
System programmer response:  None.
Module:  CONFCCTX
Procedure name:  dns_c_checkconfig

EZZ8855I  option max-cache-size is not implemented
Explanation:  The option max-cache-size is not implemented and is ignored by the named server.
System action:  The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response:  Remove option max-cache-size from the named server configuration file.
System programmer response:  None.
Module:  CONFCCTX
Procedure name:  dns_c_checkconfig

EZZ8856I  option min-roots is obsolete
Explanation:  The option min-roots is obsolete and is ignored by the named server.
System action:  The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response:  Remove option min-roots from the named server configuration file.
System programmer response:  None.
Module:  CONFCCTX
Procedure name:  dns_c_checkconfig

EZZ8857I  option serial-queries is obsolete
Explanation:  The option serial-queries is obsolete and is ignored by the named server.
System action:  The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response:  Remove option serial-queries from the named server configuration file.
System programmer response:  None.
Module:  CONFCCTX
Procedure name:  dns_c_checkconfig

EZZ8858I  option maintain-ixfr-base is obsolete
Explanation:  The option maintain-ixfr-base is obsolete and is ignored by the named server. It was used in BIND 8 to determine whether a transaction log was kept for Incremental Zone Transfer. named server maintains a transaction log whenever possible. If you need to disable outgoing incremental zone transfers, use provide-ixfr no.
System action:  The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response:  Remove option maintain-ixfr-base from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

---

**EZZ859I** option max-ixfr-log-size is obsolete

Explanation: The option max-ixfr-log-size is obsolete and is ignored by the named server.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option max-ixfr-log-size from the named server configuration file.

System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_checkconfig

---

**EZZ861I** host portion of network address address is not zero

Explanation: The named server attempted to create an address match list but it found that the host portion of the network address being added to the address match list was not zero.

address is the network address specified.

System action: The named server ends.

Operator response: Verify that the network address being checked is a valid address.

System programmer response: None.
Module: CONFIP
Procedure name: dns_c_imatchpattern_new

---

**EZZ862I** view max-cache-size is not implemented

Explanation: The option max-cache-size, specified in the named configuration file under a view statement is obsolete and is ignored by the named server.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option max-cache-size from the named server configuration file.

System programmer response: None.
Module: CONFVIEW
Procedure name: dns_c_viewtable_checkviews

---

**EZZ863I** view check-names is obsolete

Explanation: The option check-names, specified in the named configuration file under a view statement is obsolete and is ignored by the named server.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option check-names from the named server configuration file.

System programmer response: None.
Module: CONFVIEW
Procedure name: dns_c_viewtable_checkviews
EZZ8864I  stub zones do not have an allow-notify field
Explanation: The allow-notify option is present in a stub zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.
System action: The named server ends.
Operator response: Remove the allow-notify option from any stub zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallownotify

EZZ8865I  option statistics-interval is not implemented
Explanation: The option statistics-interval is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option statistics-interval from the named server configuration file.
System programmer response: None.
Module: CONFCtx
Procedure name: dns_c_checkconfig

EZZ8866I  option topology is deprecated
Explanation: The option topology is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option topology from the named server configuration file.
System programmer response: None.
Module: CONFCtx
Procedure name: dns_c_checkconfig

EZZ8867I  hint zones do not have an allow-notify field
Explanation: The allow-notify option is present in a hint zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.
System action: The named server ends.
Operator response: Remove the allow-notify option from any hint zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallownotify

EZZ8868I  option rrset-order is not implemented
Explanation: The option rrset-order is not implemented and is ignored by the named server.
System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.
Operator response: Remove option rrset-order from the named server configuration file.
System programmer response: None.
Module: CONFCtx
Procedure name: dns_c_checkconfig

EZZ8869I  forward zones do not have an allow-notify field
Explanation: The allow-notify option is present in a forward zone in the named server configuration file. The option allow-notify is only allowed in secondary zones.
System action: The named server ends.
Operator response: Remove the allow-notify option from any forward zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallownotify

EZZ8870I  bad transport value: transport_type
Explanation: The option check-names is obsolete and is ignored by the named server.
transport_type is the check-names setting from the options statement of the named server configuration file.
System action: The named server continues.
Operator response: Remove option check-names from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_ctx_setchecknames

EZZ8871I  bad transport value: transport_type
Explanation: The option check-names is obsolete and is ignored by the named server.
transport_type is the check-names setting from the options statement of the named server configuration file.
System action: The named server continues.
Operator response: Remove option check-names from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_ctx_getchecknames

EZZ8872I  bad transport value: transport_type
Explanation: The option check-names is obsolete and is ignored by the named server.
transport_type is the check_names setting from the options statement of the named server configuration file.
System action: The named server continues.
Operator response: Remove option check-names from the named server configuration file.
System programmer response: None.
Module: CONFCTX
Procedure name: dns_c_ctx_unsetchecknames

EZZ8873I  dns_ipmatch_none element type
Explanation: The named server found no match for an address match list element type of none when deleting an element from the address match list table. The valid options for an address match list element are localhost, localnets, pattern, indirect, key, an access control list or any.
System action: The named server might end.
EZZ8874I  •  EZZ8877I

Operator response:  Try again with a valid address match list element.
System programmer response:  None.
Module:  CONFIP
Procedure name:  dns_c_ipmatchelement_delete

EZZ8874I  ipmatch none element type
Explanation:  The named server found no match for an element type when copying an element from an address match list. The valid options for an address match list element are: localhost, localnets, pattern, indirect, key, an access control list or any.
System action:  The named server will delete the element from its address match list or it will not be appended to its address match list.
Operator response:  Try again with a valid address match list element.
System programmer response:  None.
Module:  CONFIP
Procedure name:  dns_c_ipmatchelement_copy

EZZ8875I  dns_ipmatch_none element type
Explanation:  The named server found no match for an element type when printing an element from an address match list. The valid options for an address match list element are: localhost, localnets, pattern, indirect, key, an access control list or any.
System action:  The named server will not print the address match list.
Operator response:  Try again with a valid address match list element.
System programmer response:  None.
Module:  CONFIP
Procedure name:  dns_c_ipmatchelement_print

EZZ8876I  This type of channel doesn't have a path field
Explanation:  The configuration file parser found a definition of a logging channel with an unnecessary file path option. The path option is only allowed for a logging channel definition containing a file option.
System action:  The named server continues parsing the named server configuration file.
Operator response:  Remove the logging channel file path option from the named server configuration file.
System programmer response:  None.
Module:  CONFLOG
Procedure name:  dns_c_logchan_setpath

EZZ8877I  This type of channel doesn't have a version field
Explanation:  The configuration file parser found a definition of a logging channel with an unnecessary version option. The versions option is only allowed for a logging channel definition containing a file option.
System action:  The named server continues parsing the named server configuration file.
Operator response:  Remove the logging channel versions option from the named server configuration file.
System programmer response:  None.
Module:  CONFLOG
Procedure name:  dns_c_logchan_setversions
EZZ8878I  This type of channel doesn't have a size field
Explanation: The configuration file parser found a definition of a logging channel with an unnecessary size option specified. The size option is only allowed for a logging channel definition containing a file option.
System action: The named server continues parsing the named server configuration file.
Operator response: Remove the logging channel file size option from the named server configuration file.
System programmer response: None.
Module: CONFLOG
Procedure name: dns_c_logchan_setsize

EZZ8879I  This type of channel doesn't have a facility field
Explanation: The configuration file parser found a logging channel definition with an unnecessary facility option specified.
System action: The named server continues parsing the named server configuration file.
Operator response: Remove the logging channel facility option from the named server configuration file.
System programmer response: None.
Module: CONFLOG
Procedure name: dns_c_logchan_setfacility

EZZ8880I  Not a legal facility for a syslog channel: facility
Explanation: The configuration parser found a logging channel definition with a syslog option that specified an incorrect syslog_facility. Ensure that the syslog facility specified for the logging channel syslog is a valid syslog facility. If a channel goes to syslog, you can specify the facility to be any of the following:
• kern
• user
• mail
• daemon
• auth
• syslog
• lpr
• news
• uucp
• cron
• authpriv
• ftp
• local0
• local1
• local2
• local3
• local4
• local5
• local6
• local7
The default is daemon.

facility is the facility specified on the logging channel syslog option.
System action: The named server continues parsing the named server configuration file.
Operator response: Correct the problem by specifying a valid syslog facility.
System programmer response: None.
Module: CONFLOG
Procedure name: dns_c_facility2string

EZZ8883I dns_c_parse_namedconf: error creating lexer
Explanation: There is not enough storage to startup the rndc utility.
System action: rndc ends.
Operator response: Contact the system programmer.
System programmer response: Increase TSO address space or region size and restart rndc.
Module: CONFNDC
Procedure name: parser_setup

EZZ8884I dns_c_parse_namedconf: error opening file filename
Explanation: The rndc utility is not able to open the rndc configuration file and lock it for read only. named server might need more memory to allow the rndc utility to process the rndc configuration file.
filename is the rndc configuration file that rndc is trying to open.
System action: rndc ends.
Operator response: Ensure that the file being opened is a valid file.
System programmer response: Increase TSO address space or region size and restart rndc.
Module: CONFNDC
Procedure name: parser_setup

EZZ8885I dns_c_parse_namedconf: Error creating symtab
Explanation: There is not enough memory to create the rndc internal symbol table.
System action: rndc ends.
Operator response: Contact the system programmer.
System programmer response: Increase TSO address space or region size and restart rndc.
Module: CONFNDC
Procedure name: parser_setup

EZZ8886I dns_c_parse_namedconf: Error installing keyword
Explanation: The keyword might already exist in symbol table or there might not be enough memory to install the keyword in the internal symbol table.
System action: rndc configuration file parsing ends.
Operator response: Review the rndc configuration file to determine if the keyword is already in use, else contact the system programmer.
System programmer response: Increase TSO address space or region size and restart rndc.
Module: CONFNDC
Procedure name: parser_setup
**EZ8887I** file_name line_number error_text near token

Explanation: The *rdc* configuration file parser found a problem in the *rdc* configuration file used to start the *rdc* utility.

file_name is the file name of the *rdc* configuration file.
line_number is the line number in the configuration file.
error_text is the error the parsing routine found.
token is the last token the parser accepted.

System action: *rdc* configuration file parsing continues.
Operator response: Correct *rdc* configuration file.
System programmer response: None.
Module: CONFNDC
Procedure name: parser_complain

---

**EZ8888I** file_name line_number error_text

Explanation: The *rdc* configuration file parser found a problem in the *rdc* configuration file used to start the *rdc* utility.

file_name is the file name of the *rdc* configuration file.
line_number is the line number in the configuration file.
error_text is the error the parsing routine found.

System action: *rdc* configuration file parsing continues.
Operator response: Correct the *rdc* configuration file.
System programmer response: None.
Module: CONFNDC
Procedure name: parser_complain

---

**EZ8889I** Out of memory

Explanation: There is not enough memory to process view command in the *named* server configuration file.

System action: The *named* server ends.
Operator response: Contact the system programmer.
System programmer response: Increase TSO address space or region size and try *rdc* again.
Module: CONFVIEW
Procedure name: dns_c_viewtable_new

---

**EZ8890I** zone zone_name: check-names is not implemented

Explanation: The option check-names is obsolete and is ignored by the *named* server.

zone_name is the name of the zone with the check-names option specified in the *named* server configuration file.

System action: The *named* server will ignore this option. The configuration parser will continue parsing the remainder of the *named* server configuration file.
Operator response: Remove option check-names from the *named* server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_validate
EZZ8891I  view fetch-glue is obsolete

Explanation: The option fetch-glue, specified in the named server configuration file under a view statement, is obsolete and is ignored.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option fetch-glue from the named server configuration file.

System programmer response: None.

Module: CONFVIEW

Procedure name: dns_c_viewtable_checkviews

EZZ8894I  view rfc2308-type1 is not implemented

Explanation: The option rfc2308-type1, specified in the named configuration file under a view statement, is not implemented and is ignored.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named configuration file.

Operator response: Remove option rfc2308-type1 from the named server configuration file.

System programmer response: None.

Module: CONFVIEW

Procedure name: dns_c_viewtable_checkviews

EZZ8895I  zone zone_name: pubkey is deprecated

Explanation: The option pubkey, specified in the named configuration file under a zone statement, is not implemented and is ignored. In BIND 8, this option was intended for specifying a public zone key for verification of signatures in DNSSEC signed zones when they are loaded from disk. named does not verify signatures on loading and ignores this option.

zone_name is the name of the zone with the pubkey option specified.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option pubkey from the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_validate

EZZ8897I  zone zone_name: maintain-ixfr-base is obsolete

Explanation: The option maintain-ixfr-base, specified in the named configuration file under a zone statement, is not implemented and is ignored.

zone_name is the name of the zone with the maintain-ixfr-base option specified.

System action: The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

Operator response: Remove option maintain-ixfr-base from the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_validate
**EZZ8898I**  
*zone zone_name: ixfr-base is obsolete*

**Explanation:** The option ixfr-base, specified in the named configuration file under a zone statement, is not implemented and is ignored.

*zone_name* is the name of the zone with the ixfr-base option specified

**System action:** The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

**Operator response:** Remove option ixfr-base from the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_validate

---

**EZZ8898I**  
*view min-roots is obsolete*

**Explanation:** The option min-roots, specified in the named configuration file under a view statement, is obsolete and is ignored.

**System action:** The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

**Operator response:** Remove option min-roots from the named server configuration file.

**System programmer response:** None.

**Module:** CONFVIEW

**Procedure name:** dns_c_viewtable_checkviews

---

**EZZ8899I**  
*view rrset-order is not implemented*

**Explanation:** The option rrset-order, specified in the named configuration file under a view statement, is not implemented and is ignored.

**System action:** The named server will ignore this option. The configuration parser will continue parsing the remainder of the named server configuration file.

**Operator response:** Remove option rrset-order from the named server configuration file.

**System programmer response:** None.

**Module:** CONFVIEW

**Procedure name:** dns_c_viewtable_checkviews

---

**EZZ8900I**  
*Insufficient memory*

**Explanation:** The named server ran out of system memory while processing a new view.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Increase TSO address space or region size and restart the named server.

**Module:** CONFVIEW

**Procedure name:** dns_c_view_new

---

**EZZ8901I**  
*bad transport value: transport_type*

**Explanation:** The option check-names is obsolete and is ignored by the named server.

*transport_type* is the check-names setting from the view statement of the named server configuration file.

**System action:** The named server ends.
~EZZ8902I~ ~EZZ8905I~

**Operator response:** Remove option check-names from the **named** server configuration file.

**System programmer response:** None.

**Module:** CONFVIEW

**Procedure name:** dns_c_view_setchecknames

---

**EZZ8905I** ~zone zone_name: allow-update is ignored when update-policy is also used~

**Explanation:** The allow-update option and the update-policy option cannot be defined together under a zone statement.

*zone_name* is the name of the zone found in error.

**System action:** The **named** server continues.

**Operator response:** Review the conflict between the allow-update option and the update-policy option for the affected zone in the **named** server configuration file and choose which one should remain active.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_validate
EZ8906I zone zone_name: missing masters entry

Explanation: The masters option is missing under a secondary zone statement in the named server configuration file. It is required to enable the secondary zone zone_name to notify master zones for updates.

zone_name is the name of the zone found in error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Add the masters option under the affected secondary zone statement.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_validate

EZ8907I zone zone_name: masters value is empty

Explanation: The masters option under a secondary zone statement in named server configuration file has no value.

zone_name is the name of the zone found in error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Specify at least one IP address of a master server on the masters option under the affected secondary zone.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_validate

EZ8908I hint zones do not have a pubkey field

Explanation: The option pubkey, specified in the named configuration file, is incorrect under a hint zone statement. The pubkey option is only allowed under master, secondary or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the pubkey option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getpubkeylist

EZ8909I forward zones do not have a pubkey field

Explanation: The option pubkey, specified in the named configuration file, is incorrect under a forward zone statement. The pubkey option is only allowed under master, secondary or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the pubkey option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getpubkeylist
EZZ8910I  forward zones do not have a file field

Explanation: The file option, specified in the named configuration file, is incorrect under a forward zone statement. The file option is only allowed under master, secondary, stub or hint zones.

System action: The named server ends.

Operator response: Remove the file option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setfile

EZZ8911I  forward zones do not have a file field

Explanation: The file option, specified in the named configuration file, is incorrect under a forward zone statement. The file option is only allowed under master, secondary, stub or hint zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the file option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getfile

EZZ8912I  hint zones do not have an allow-update-forwarding field

Explanation: The allow-update-forwarding option, specified in the named configuration file, is incorrect under a hint zone statement. The allow-update-forwarding option is only allowed under master, secondary, stub or hint zones.

System action: The named server ends.

Operator response: Remove the allow-update-forwarding option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setallowupdateforwarding

EZZ8913I  forward zones do not have an allow-update-forwarding field

Explanation: The allow-update-forwarding option, specified in the named configuration file, is incorrect under a forward zone statement. The allow-update-forwarding option is only allowed under master, secondary, stub or hint zones.

System action: The named server ends.

Operator response: Remove the allow-update-forwarding option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setallowupdateforwarding

EZZ8914I  hint zones do not have an allow-update-forwarding field

Explanation: The allow-update-forwarding option, specified in the named configuration file, is incorrect under a hint zone statement. The allow-update-forwarding option is only allowed under master, secondary, stub or hint zones.
System action: The named server ends.
Operator response: Remove the allow-update-forwarding option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallowupdateforwarding

EZZ8915I forward zones do not have an allow-update-forwarding field
Explanation: The allow-update-forwarding option, specified in the named configuration file, is incorrect under a forward zone statement. The allow-update-forwarding option is only allowed under master, secondary, stub or hint zones.
System action: The named server ends.
Operator response: Remove the allow-update-forwarding option from the forward zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallowupdateforwarding

EZZ8916I slave zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a secondary zone statement. The ssauth option is only allowed under master zones. This option is ignored.
System action: The named server continues.
Operator response: Remove the ssuauth option from the secondary zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setssuauth

EZZ8917I stub zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a stub zone statement. The ssauth option is only allowed under master zones. This option is ignored.
System action: The named server continues.
Operator response: Remove the ssuauth option from the stub zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setssuauth

EZZ8918I hint zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a hint zone statement. The ssauth option is only allowed under master zones. This option is ignored.
System action: The named server continues.
Operator response: Remove the ssuauth option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
EZZ8919I • EZZ8922I

Procedure name: dns_c_zone_setssuauth

EZZ8919I forward zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a forward zone statement. The ssauth option is only allowed under master zones. This option is ignored.
System action: The named server continues.
Operator response: Remove the ssuauth option from the forward zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setssuauth

EZZ8920I slave zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a secondary zone statement. The ssauth option is only allowed under master zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the ssuauth option from the secondary zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getssuauth

EZZ8921I stub zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a stub zone statement. The ssauth option is only allowed under master zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the ssuauth option from the stub zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getssuauth

EZZ8922I hint zones do not have an ssuauth field
Explanation: The option ssuauth, specified in the named configuration file, is incorrect under a hint zone statement. The ssauth option is only allowed under master zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the ssuauth option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getssuauth
EZZ8923I  forward zones do not have an ssuauth field
Explaination: The option ssuauth, specified in the named configuration file, is incorrect under a forward zone statement. The ssuauth option is only allowed under master zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the ssuauth option from the forward zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getssuauth

EZZ8924I  hint zones do not have an allow-query field
Explaination: The option allow-query, specified in the named configuration file, is incorrect under a hint zone statement. The allow-query option is only allowed under master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the allow-query option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowquery

EZZ8925I  forward zones do not have an allow-query field
Explaination: The option allow-query, specified in the named configuration file, is incorrect under a forward zone statement. The allow-query option is only allowed under master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the allow-query option from the forward zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowquery

EZZ8926I  hint zones do not have an allow-query field
Explaination: The option allow-query, specified in the named configuration file, is incorrect under a hint zone statement. The allow-query option is only allowed under master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the allow-query option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowquery
EZZ8927I  forward zones do not have an allow-query field

Explanation: The option allow-query, specified in the named configuration file, is incorrect under a forward zone statement. The allow-query option is only allowed under master, secondary, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the allow-query option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getallowquery

EZZ8928I  hint zones do not have an allow-transfer field

Explanation: The option allow-transfer, specified in the named configuration file, is incorrect under a hint zone statement. The allow-transfer option is only allowed under master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the allow-transfer option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_setallowtransfer

EZZ8929I  forward zones do not have an allow-transfer field

Explanation: The option allow-transfer, specified in the named configuration file, is incorrect under a forward zone statement. The allow-transfer option is only allowed under master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the allow-transfer option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_setallowtransfer

EZZ8930I  hint zones do not have an allow-transfer field

Explanation: The option allow-transfer, specified in the named configuration file, is incorrect under a hint zone statement. The allow-transfer option is only allowed under master, secondary, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the allow-transfer option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getallowtransfer
EZZ8931I  forward zones do not have an allow-transfer field

Explanation: The option allow-transfer, specified in the named configuration file, is incorrect under a forward zone statement. The allow-transfer option is only allowed under master, secondary, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the allow-transfer option from the forward zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getallowtransfer

EZZ8932I  hint zones do not have a dialup field

Explanation: The option dialup, specified in the named configuration file, is incorrect under a hint zone statement. The dialup option is only allowed under master, secondary and stub zones.

System action: The named server ends.

Operator response: Remove the dialup option from the hint zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setdialup

EZZ8933I  forward zones do not have a dialup field

Explanation: The option dialup, specified in the named configuration file, is incorrect under a forward zone statement. The dialup option is only allowed under master, secondary and stub zones.

System action: The named server ends.

Operator response: Remove the dialup option from the forward zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setdialup

EZZ8934I  hint zones do not have a dialup field

Explanation: The option dialup, specified in the named configuration file, is incorrect under a hint zone statement. The dialup option is only allowed under master, secondary and stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the dialup option from the hint zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getdialup

EZZ8935I  forward zones do not have a dialup field

Explanation: The option dialup, specified in the named configuration file, is incorrect under a forward zone statement. The dialup option is only allowed under master, secondary and stub zones. This option is ignored.

System action: The named server continues.
### EZZ8936I - EZZ8939I

**Operator response:** Remove the dialup option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getdialup

---

**EZZ8936I**  
stub zones do not have a notify field

**Explanation:** The option notify, specified in the named configuration file, is incorrect under a stub zone statement. The notify option is only allowed under master and secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify option from the stub zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotify

---

**EZZ8937I**  
hint zones do not have a notify field

**Explanation:** The option notify, specified in the named configuration file, is incorrect under a hint zone statement. The notify option is only allowed under master and secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify option from the hint zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotify

---

**EZZ8938I**  
forward zones do not have a notify field

**Explanation:** The option notify, specified in the named configuration file, is incorrect under a forward zone statement. The notify option is only allowed under master and secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotify

---

**EZZ8939I**  
stub zones do not have a notify field

**Explanation:** The option notify, specified in the named configuration file, is incorrect under a stub zone statement. The notify option is only allowed under master and secondary zones.

**System action:** The named server continues.

**Operator response:** Remove the notify option from the stub zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getnotify
EZZ8940I hint zones do not have a notify field

Explanation: The notify option is present in a hint zone in the named server configuration file. The notify option is only allowed in master zones or secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the notify option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotify

EZZ8941I forward zones do not have a notify field

Explanation: The notify option is present in a forward zone in the named server configuration file. The notify option is only allowed in master zones or secondary zones.

System action: The named server continues. This option is ignored.

Operator response: Remove the notify option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotify

EZZ8942I stub zones do not have a also_notify field

Explanation: The also-notify option is present in a stub zone in the named server configuration file. The also-notify option is only allowed in master zones or secondary zones.

System action: The named server ends.

Operator response: Remove the also-notify option from the stub zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setalsonotify

EZZ8943I hint zones do not have a also_notify field

Explanation: The also-notify option is present in a hint zone in the named server configuration file. The also-notify option is only allowed in master zones or secondary zones.

System action: The named server ends.

Operator response: Remove the also-notify option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setalsonotify

EZZ8944I forward zones do not have a also_notify field

Explanation: The also-notify option is present in a forward zone in the named server configuration file. The also-notify option is only allowed in zones of type master or secondary zones.

System action: The named server ends.
EZZ8945I  •  EZZ8948I

Operator response: Remove the also-notify option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setalsonotify

EZZ8945I  stub zones do not have a also_notify field

Explanation: The also-notify option is present in a stub zone in the named server configuration file. The also-notify option is only allowed in master zones or secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the also-notify option from the stub zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getalsonotify

EZZ8946I  hint zones do not have a also_notify field

Explanation: The also-notify option is present in a hint zone in the named server configuration file. The also-notify option is only allowed in master zones or secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the also-notify option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getalsonotify

EZZ8947I  forward zones do not have a also_notify field

Explanation: The also-notify option is present in a forward zone in the named server configuration file. The also-notify option is only allowed in zones of type master or secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the also-notify option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getalsonotify

EZZ8948I  stub zones do not have a maintain-ixfr-base field

Explanation: The maintain-ixfr-base option is present in a stub zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones.

System action: The named server ends.

Operator response: Remove the maintain-ixfr-base option from the stub zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_setmaintixfrbase

**EZZ8949I** hint zones do not have a maintain-ixfr-base field

**Explanation:** The maintain-ixfr-base option is present in a hint zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the maintain-ixfr-base option from the hint zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setmaintixfrbase

**EZZ8950I** forward zones do not have a maintain-ixfr-base field

**Explanation:** The maintain-ixfr-base option is present in a forward zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the maintain-ixfr-base option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setmaintixfrbase

**EZZ8951I** stub zones do not have a maintain-ixfr-base field

**Explanation:** The maintain-ixfr-base option is present in a stub zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones. This option is ignored.

**System action:** The named server continues.

**Operator response:** Remove the maintain-ixfr-base option from the stub zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setmaintixfrbase

**EZZ8952I** hint zones do not have a maintain-ixfr-base field

**Explanation:** The maintain-ixfr-base option is present in a hint zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones. This option is ignored.

**System action:** The named server continues.

**Operator response:** Remove the maintain-ixfr-base option from the hint zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setmaintixfrbase
EZZ8953I  forward zones do not have a maintain-ixfr-base field
Explanation:  The maintain-ixfr-base option is present in a forward zone in the named server configuration file. The maintain-ixfr-base option is only allowed in master zones or secondary zones. This option is ignored.
System action:  The named server continues.
Operator response:  Remove the maintain-ixfr-base option from the forward zone statement in the named server configuration file.
System programmer response:  None.

EZZ8967I  forward zones do not have a pubkey field
Explanation: The pubkey option is specified in a forward zone in the named server configuration file. The pubkey option is only allowed in master zones, secondary zones, or stub zones.
System action: The named server ends.
Operator response: Remove the pubkey option from the forward zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_addpubkey

EZZ8968I  master zones do not have a masters port field
Explanation: The masters port option is specified in a master zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones.
System action: The named server ends.
Operator response: Remove the master port option from the master zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setmasterport

EZZ8969I  hint zones do not have a masters port field
Explanation: The masters port option is specified in a hint zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones.
System action: The named server ends.
Operator response: Remove the master port option from the hint zone statement in the named server configuration file.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setmasterport

EZZ8970I  forward zones do not have a masters port field
Explanation: The masters port option is specified in a forward zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones.
System action: The named server ends.
**Operator response:** Remove the master port option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setmasterport

---

**Explanation:** The masters port option is specified in a forward zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones. This option is ignored.

**System action:** The named server continues.

**Operator response:** Remove the master port option from the master zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getmasterport

---

**Explanation:** The masters port option is specified in a hint zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones. This option is ignored.

**System action:** The named server continues.

**Operator response:** Remove the master-port option from the hint zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getmasterport

---

**Explanation:** The masters port option is specified in a forward zone in the named server configuration file. The masters port option is only allowed in secondary zones, or stub zones. This option is ignored.

**System action:** The named server continues.

**Operator response:** Remove the master port option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getmasterport

---

**Explanation:** The masters IP addresses option is specified in a master zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

**System action:** The named server ends.

**Operator response:** Remove the masters IP address option from the master zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE
Procedure name: dns_c_zone_setmasterips

EZZ8975I hint zones do not have a masters IP addresses field

Explanation: The masters IP addresses option is specified in a hint zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

System action: The named server ends.

Operator response: Remove the masters IP address option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setmasterips

EZZ8976I forward zones do not have a masters IP addresses field

Explanation: The masters IP addresses option is specified in a forward zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

System action: The named server ends.

Operator response: Remove the masters IP address option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setmasterips

EZZ8977I master zones do not have a masters IP addresses field

Explanation: The masters IP addresses option is specified in a master zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the masters IP address option from the master zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setmasterips

EZZ8978I hint zones do not have a masters IP addresses field

Explanation: The masters IP addresses option is specified in a hint zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the masters IP address option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getmasterips
### EZZ8979I  forward zones do not have a masters IP addresses field

**Explanation:** The masters IP addresses option is specified in a forward zone in the named server configuration file. The masters IP addresses option is only allowed in secondary zones, or stub zones.

**System action:** If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

**Operator response:** Remove the masters IP address option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_getmasterips

### EZZ8980I  forward zones do not have a zone-statistics field

**Explanation:** The statistics option is specified in a forward zone in the named server configuration file. The zone-statistics option is only allowed in master zones, secondary zones, or stub zones.

**System action:** The named server ends.

**Operator response:** Remove the statistics option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setstatistics

### EZZ8981I  hint zones do not have a transfer-source field

**Explanation:** The transfer-source option is specified in a hint zone in the named server configuration file. The transfer-source option is only allowed in master zones, secondary zones, or stub zones.

**System action:** The named server ends.

**Operator response:** Remove the transfer-source option from the hint zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_settransfersource

### EZZ8982I  forward zones do not have a transfer-source field

**Explanation:** The transfer-source option is specified in a forward zone in the named server configuration file. The transfer-source option is only allowed in master zones, secondary zones, or stub zones.

**System action:** The named server ends.

**Operator response:** Remove the transfer-source option from the forward zone statement in the named server configuration file.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_settransfersource
EZZ8983I hint zones do not have a zone-statistics field

Explanation: The zone-statistics option is specified in a hint zone in the named server configuration file. The zone-statistics option is only allowed in master zones, secondary zones, or stub zones.

System action: The named server ends.

Operator response: Remove the statistics option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setstatistics

EZZ8984I hint zones do not have a transfer-source field

Explanation: The transfer-source option is specified in a hint zone in the named server configuration file. The transfer-source option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the transfer-source option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_gettransfersource

EZZ8985I forward zones do not have a transfer-source field

Explanation: The transfer-source option is specified in a forward zone in the named server configuration file. The transfer-source option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the transfer-source option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_gettransfersource

EZZ8986I forward zones do not have a zone-statistics field

Explanation: The zone-statistics option is specified in a forward zone in the named server configuration file. The zone-statistics option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the statistics option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getstatistics

EZZ8987I hint zones do not have a transfer-source-v6 field

Explanation: The transfer-source-v6 option is specified in a hint zone in the named server configuration file. The transfer-source-v6 option is only allowed in master zones, secondary zones, or stub zones.

System action: The named server ends.
Operator response: Remove the transfer-source-v6 option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_settransfersourcev6

EZZ8988I forward zones do not have a transfer-source-v6 field

Explanation: The transfer-source-v6 option is specified in a forward zone in the named server configuration file. The transfer-source-v6 option is only allowed in master zones, secondary zones, or stub zones.

System action: The named server ends.

Operator response: Remove the transfer-source-v6 option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_settransfersourcev6

EZZ8989I hint zones do not have a zone-statistics field

Explanation: The zone-statistics option is specified in a hint zone in the named server configuration file. The zone-statistics option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the statistics option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getstatistics

EZZ8990I hint zones do not have a transfer-source-v6 field

Explanation: The option transfer-source-v6, specified in the named configuration file, is incorrect under a hint zone statement. The transfer-source-v6 option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the transfer-source-v6 option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_gettransfersourcev6

EZZ8991I forward zones do not have a transfer-source-v6 field

Explanation: The option transfer-source-v6, specified in the named configuration file, is incorrect under a forward zone statement. The transfer-source-v6 option is only allowed in master zones, secondary zones, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the transfer-source-v6 option from the forward zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE

Procedure name: dns_c_zone_gettransfersourcev6

EZZ8992I master zones do not have a max-transfer-time-in field

Explanation: The option max-transfer-time-in, specified in the named configuration file, is incorrect under a master zone statement. The max-transfer-time-in option is only allowed in secondary zones, or stub zones.

System action: The named server ends.

Operator response: Remove the max-transfer-time-in option from the master zone statement in the named server configuration file.

System programmer response: None.

EZZ9027I  stub zones do not have a max-ixfr-log-size field
Explanation:  The option max-ixfr-log-size, specified in the named configuration file, is incorrect under a stub zone statement. The max-ixfr-log-size option is only allowed in master zones or secondary zones. This option is ignored.
System action:  The named server continues.
Operator response:  Remove the max-ixfr-log-size option from the stub zone statement in the named server configuration file.
System programmer response:  None.
Module:  CONFZONE
Procedure name:  dns_c_zone_setmaxixfrlog

EZZ9028I  hint zones do not have a max-ixfr-log-size field
Explanation:  The option max-ixfr-log-size, specified in the named configuration file, is incorrect under a hint zone statement. The max-ixfr-log-size option is only allowed in master zones or secondary zones. This option is ignored.
System action:  The named server continues.
Operator response:  Remove the max-ixfr-log-size option from the hint zone statement in the named server configuration file.
System programmer response:  None.
Module:  CONFZONE
Procedure name:  dns_c_zone_getmaxixfrlog
EZZ9029I  forward zones do not have a max-ixfr-log-size field

Explanation: The option max-ixfr-log-size, specified in the named configuration file, is incorrect under a forward zone statement. The max-ixfr-log-size option is only allowed in master zones or secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the max-ixfr-log-size option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getmaxixfrlog

---

EZZ9030I  hint zones do not have a forward field

Explanation: The option forward, specified in the named configuration file, is incorrect under a hint zone statement. The forward option is only allowed in master, secondary, stub or forward zones.

System action: The named server ends.

Operator response: Remove the forward option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setforward

---

EZZ9031I  hint zones do not have a forward field

Explanation: The option forward, specified in the named configuration file, is incorrect under a hint zone statement. The forward option is only allowed in master, secondary, stub or forward zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the forward option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getforward

---

EZZ9032I  hint zones do not have a forwarders field

Explanation: The option forwarders, specified in the named configuration file, is incorrect under a hint zone statement. The forwarders option is only allowed in master, secondary, stub or forward zones.

System action: The named server ends.

Operator response: Remove the forwarders option from the hint zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setforwarders

---

EZZ9033I  hint zones do not have a forwarders field

Explanation: The option forwarders, specified in the named configuration file, is incorrect under a hint zone statement. The forwarders option is only allowed in master, secondary, stub or forward zones. This option is ignored.

System action: The named server continues.
Operator response: Remove the forwarders option from the hint zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getforwarders

---

EZZ9034I hint zones do not have an allow-update field

Explanation: The option allow-update, specified in the named configuration file, is incorrect under a hint zone statement. The allow-update option is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the allow-update option from the hint zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowupd

---

EZZ9035I forward zones do not have an allow-update field

Explanation: The option allow-update, specified in the named configuration file, is incorrect under a forward zone statement. The allow-update option is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the allow-update option from the forward zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowupd

---

EZZ9036I hint zones do not have an allow-update field

Explanation: The option allow-update, specified in the named configuration file, is incorrect under a hint zone statement. The allow-update option is only allowed in master, secondary, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the allow-update option from the hint zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setallowupd

---

EZZ9037I forward zones do not have an allow-update field

Explanation: The option allow-update, specified in the named configuration file, is incorrect under a forward zone statement. The allow-update option is only allowed in master, secondary, or stub zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the allow-update option from the forward zone statement in the named server configuration file.

System programmer response: None.
Module: CONFZONE
Procedure name:  dns_c_zone_getallowupd

EZZ9038I  hint zones do not have an allow-update field

Explanation:  The option allow-update, specified in the named configuration file, is incorrect under a hint zone statement. The allow-update option is only allowed in master, secondary, or stub zones. This option is ignored.

System action:  The named server continues.

Operator response:  Remove the allow-update option from the hint zone statement in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_unsetallowupd

EZZ9039I  forward zones do not have an allow-update field

Explanation:  The option allow-update, specified in the named configuration file, is incorrect under a forward zone statement. The allow-update option is only allowed in master, secondary, or stub zones. This option is ignored.

System action:  The named server continues.

Operator response:  Remove the allow-update option from the forward zone statement in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_unsetallowupd

EZZ9040I  dispatch  thread_id:  error_text

Explanation:  The named server detected an error on a code thread being dispatched for execution. The named server will report the error and return to determine next action.

thread_id is the hexadecimal address of the thread in error.

error_text describes the error.

System action:  The named server might end.

Operator response:  Set the debug message level no higher than 92 in the named configuration file to determine if there are any other dispatching errors. If you are unable to fix the error then contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 92. Obtain the following documentation and contact the IBM software support center:

• The named server configuration file.
• The SYSLOG DAEMON logging file.
• All configured named logs.
• Use rncd dumpdb to dump the named servers cache to a file. See the z/OS Communications Server: IP System Administrator’s Commands on the use of the rncd utility.
• The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
• Dump the named server address space if the server continues running after this message was issued. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping address spaces.

Module:  DISPATCH

Procedure name:  dispatch_log
**EZZ9055I dialup option dialup_option cannot be used with master zones**

**Explanation:** The valid dialup options for master zones are **no**, **yes** and **notify**.

*dialup_option* is the dialup option specified in the named configuration file under a zone statement.

**System action:** The named server ends.

**Operator response:** Remove the dialup option in the master zone or change the option to **no**, **yes** or **notify** as required by your configuration requirements. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support manuals) for information about the Bind 9 DNS dialup option.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setdialup

---

**EZZ9056I dialup option dialup_option cannot be used with stub zones**

**Explanation:** The valid dialup options for stub zones are **passive** and **notifypassive**.

*dialup_option* is the dialup option specified in the named configuration file under a zone statement.

**System action:** The named server ends.

**Operator response:** Remove the dialup option in the stub zone or change the option to **passive** or **notifypassive** as required by your configuration requirements. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support manuals) for information about the Bind 9 DNS dialup option.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setdialup

---

**EZZ9057I stub zones do not have a notify-source field**

**Explanation:** The Ensure that the there-source option is present in a stub zone in the named server configuration file. The option notify-source is only allowed in secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify-source option from any stub zones.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotifysource

---

**EZZ9059I file_name seek: description**

**Explanation:** The named server failed to complete a seek on the journal. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

*file_name* is the journal file name.

*description* describes the error.

**System action:** The named server continues running without processing the journal file.

**Operator response:** Delete the corrupt journal file and restart the named server to create a new journal file.

**System programmer response:** None.

**Module:** JOURNAL

**Procedure name:** journal_seek
EZZ9060I  file_name: read: description

Explanation: An error other than end-of-file occurred while reading a journal record from the file_name journal. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.
description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_read

---

EZZ9061I  file_name: write: description

Explanation: The named server failed to write a journal record to the file_name journal. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.
description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_write

---

EZZ9062I  file_name: flush: description

Explanation: The named server failed to flush the journal write buffer during journal file synchronization. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.
description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_fsync

---

EZZ9063I  file_name: fsync: description

Explanation: The named server failed to write the journal data from the file buffer to the storage device. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.
description describes the error.

System action: The named server continues running without processing the journal file.
Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_fsync

EZZ9064I  file_name: create: description

Explanation: The named server failed to create the journal file. The error described by description will explain the errno from the fopen(). The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_file_create

EZZ9065I  file_name: write: description

Explanation: The named server failed to write to the journal file. The journal file name will match the zone being journaled. The error described by description will explain the errno from the fwrite(). The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_file_create

EZZ9066I  file_name: close: description

Explanation: The named server failed to close the journal file. The journal file name will match the zone being journaled. The error described by description will explain the errno from the fclose(). The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: journal_file_create
EZZ9067I  journal file file_name does not exist, creating it

Explanation: The named server did not find a journal file associated with a zone for the dynamic update or incremental file transfer, IXFR. When the named server does not find a journal file in such a case, it creates one automatically with the file name zone_file_name.jnl where zone_file_name is the name of the zone being journaled.

file_name is the journal file name.

System action: The named server creates the journal file.

Operator response: None.

System programmer response: None.

Module: JOURNAL

Procedure name: dns_journal_open

EZZ9068I  file_name: open: description

Explanation: The journal file being opened exists but the named server could not open it. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

description describes the error.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: dns_journal_open

EZZ9069I  file_name: journal format not recognized

Explanation: The named server determined the journal file contains an incorrect header. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL

Procedure name: dns_journal_open

EZZ9070I  file_name: journal unexpectedly empty

Explanation: The named server is reading a journal file but found it empty. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

System action: The named server continues running without processing the journal file.

Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response: None.

Module: JOURNAL
Procedure name:  dns_journal_open

EZZ9071I  file_name: journal file corrupt: expected serial journal_serial_no, got transaction_serial_no

Explanation:  There was an internal inconsistency between the journal serial number and the transaction serial number. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.
journal_serial_no is the serial number for a valid journal transaction.
transaction_serial_no is the serial number for the journal transaction header being processed.

System action:  The named server continues running without processing the journal file.

Operator response:  Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response:  None.

Module:  JOURNAL

Procedure name:  journal_next

EZZ9072I  file_name: offset too large

Explanation:  The named server failed to process a journal header because it was too large for the space available and would cause a wrap condition. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

System action:  The named server continues running without processing the journal file.

Operator response:  Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response:  None.

Module:  JOURNAL

Procedure name:  journal_next

EZZ9073I  malformed transaction: number SOAs

Explanation:  The basic journal transaction consistancy check failed. There were more than two SOAs (start of authority) resource records involved in the changes being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

number is the number of SOA resource records found.

System action:  The named server continues running without processing the journal file.

Operator response:  Ensure that there is only one SOA record defined to the zone being journaled.

System programmer response:  None.

Module:  JOURNAL

Procedure name:  dns_journal_commit

EZZ9074I  malformed transaction: serial number would decrease

Explanation:  The named server rejected a transaction that did not properly increment the zone serial number. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

System action:  The named server continues without processing the journal file.

Operator response:  Delete the corrupt journal file and restart the named server to create a new journal file.

System programmer response:  None.

Module:  JOURNAL
**Procedure name:** dns_journal_commit

**EZ9075I** malformed transaction: file_name last serial journal_serial != transaction first serial trans_serial

**Explanation:** The named server rejected a transaction whose zone serial number was incorrectly incremented. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

journal_serial is journal header ending serial number.

trans_serial is the transaction serial number.

**System action:** The named server continues running without processing the journal file.

**Operator response:** Delete the corrupt journal file and restart the named server to create a new journal file.

**System programmer response:** None.

**Module:** JOURNAL

**Procedure name:** dns_journal_commit

**EZ9076I** file_name: journal file corrupt: missing initial SOA

**Explanation:** The journal file does not contain an initial start of authority (SOA) resource record. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

**System action:** The named server continues running without processing the journal file.

**Operator response:** Delete the corrupt journal file and restart the named server to create a new journal file.

**System programmer response:** None.

**Module:** JOURNAL

**Procedure name:** roll_forward

**EZ9077I** journal open failure

**Explanation:** The named server failed to open a journal to print its contents possibly because of insufficient memory. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

**System action:** The named server continues running without processing the journal file.

**Operator response:** Ensure that the named server has the authority to open the journal.

**System programmer response:** Increase the TSO address space or region size and restart the named server.

**Module:** JOURNAL

**Procedure name:** dns_journal_print

**EZ9078I** file_name: journal file corrupt: missing initial SOA

**Explanation:** The journal file does not contain an initial start of authority (SOA) resource record. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.

file_name is the journal file name.

**System action:** The named server continues.

**Operator response:** Delete the corrupt journal file and restart the named server to create a new journal file.

**System programmer response:** None.

**Module:** JOURNAL

**Procedure name:** dns_journal_print
Procedure name: dns_journal_print

EZ9079I  file_name: cannot print: journal file corrupt
Explanation: The named server failed to print the journal file because it is corrupt. The journal file name will match the zone being journaled.
file_name is the journal file name.
System action: Journal is not printed.
Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.
System programmer response: None.
Module: JOURNAL
Procedure name: dns_journal_print

EZ9080I  journal corrupt: empty transaction
Explanation: The journal file had a transaction with an empty header. The journal file might be corrupt.
System action: The named server continues running without processing the journal file.
Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.
System programmer response: None.
Module: JOURNAL
Procedure name: read_one_rr

EZ9081I  file_name: journal file corrupt: expected serial journal_serial, got trans_serial
Explanation: The named server is advancing to the next journal entry but found a journal entry that contained a zone start of authority (SOA) serial field is not the same. Whenever a zone is dynamically updated and the update is stored in the zones journal file, the journal entry includes a copy of the zones SOA serial field before and after the update. The journal file name will match the zone being journaled.
file_name is the journal file name.
journal_serial is the current zones SOA serial field.
trans_serial is the zone SOA serial field of the journal transaction read.
System action: The named server continues running without processing the journal file.
Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.
System programmer response: None.
Module: JOURNAL
Procedure name: read_one_rr

EZ9082I  file_name: journal corrupt: impossible RR size (RR_size bytes)
Explanation: The journal had a resource record (RR) size of less than 11 or greater than 65,535 bytes. The journal file might be corrupt. The journal file name will match the zone being journaled. The incremental file transfer (IXFR) might fail or an authoritative master file might be incomplete.
file_name is the journal file name.
RR_size is the size of the incorrect resource record.
System action: The named server continues running without processing the journal file.
Operator response: Delete the corrupt journal file and restart the named server to create a new journal file.
System programmer response: None.
**EZZ9086I • EZZ9097I**

**Module:** JOURNAL

**Procedure name:** read_one_rr

---

**EZZ9086I file log channel has no file name**

**Explanation:** A file log channel defined in the named server configuration file has no file name assigned to it. The log files path might not be correctly assigned to the logging channel because of insufficient memory.

**System action:** The named server continues.

**Operator response:** The named server should have caught this error when processing the named configuration file as this error is caught by the configuration parser. Contact the system programmer to increase memory.

**System programmer response:** Increase the TSO address space or region size and restart the named server.

---

**Module:** LOGCONF

**Procedure name:** channel_fromconf

---

**EZZ9087I hint zones do not have a notify-source field**

**Explanation:** The notify-source option is present in a hint zone in the named server configuration file. The option notify-source is only allowed in secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify-source option from any hint zones.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotifysource

---

**EZZ9088I forward zones do not have a notify-source field**

**Explanation:** The notify-source option is present in a forward zone in the named server configuration file. The option notify-source is only allowed in secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify-source option from any forward zones.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotifysource

---

**EZZ9097I dumping master file: tempfile_name: open: description**

**Explanation:** The named server failed to create or open a unique file.

`tempfile_name` is the name of the unique temporary file being created and opened.

`description` describes the error.

**System action:** The named server stops the dump procedure and continues.

**Operator response:** Ensure that there is adequate space to create the temporary file.

**System programmer response:** None.

**Module:** MASTERDU

**Procedure name:** dns_master_dump
dumping master file: tempfile_name: description

Explanation: There was an error dumping an entire zone database into a temporary master file possibly because of insufficient memory. The named server deletes the temporary dump file.

tempfile_name is the name of the unique temporary file being used to contain the entire zone database being dumped.

description describes the error.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: This problem might be resolved by increasing the TSO address space or region size and restarting the named server. Otherwise, re-create this problem with a SYSTCPIP component trace active specifying the TC,UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use \texttt{rndc dumpdb} to dump the named servers cache to a file. See the \texttt{z/OS Communications Server: IP System Administrator’s Commands} on the use of the \texttt{rndc} utility.
- Dump the named server address space. See the \texttt{z/OS Communications Server: IP Diagnosis Guide} for instructions on dumping an address space.

Module: MASTERDU

Procedure name: dns_master_dump

dumping master file: tempfile_name: close: description

Explanation: The named server could not close the temporary dump output file.

tempfile_name is the name of the unique temporary file being closed.

description describes the error.

System action: The named server deletes the temporary dump file and continues.

Operator response: Ensure that there is adequate space on the output device to contain the entire zone database being dumped.

System programmer response: None.

Module: MASTERDU

Procedure name: dns_master_dump

dumping node to file: file_name: open: description

Explanation: The named server could not open the dump output file.

file_name is the name of the file being opened as output.

description describes the error.

System action: The named server does not complete the dump of a node to a master file.

Operator response: Review the file that the named server is attempting to open to make sure it exists and that the named server has write access to it.

System programmer response: None.

Module: MASTERDU

Procedure name: dns_master_dumpnode
dumping master file: rename: file_name description

Explanation: The named server could not rename the temporary dump file to the specified dump file. The named server does not delete the dump file. 

file_name is the name the unique temporary file is being renamed.

description describes the error.

System action: The named server continues.

Operator response: Review the error description and fix the problem. Rename the file name manually if required.

System programmer response: None.

Module: MASTERDU

Procedure name: dns_master_dump

stub zones do not have a notify-source field

Explanation: The notify-source option is present in a stub zone in the named server configuration file. The option notify-source is only allowed in secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the notify-source option from any stub zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotifysource

hint zones do not have a notify-source field

Explanation: The notify-source option is present in a hint zone in the named server configuration file. The option notify-source is only allowed in secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the notify-source option from any hint zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotifysource

unimplemented channel command omapi_region

Explanation: The named server could not process the rndc reload zones or reload configuration because of an unimplemented function. The valid rndc commands are as follows:

- reload
- reload zone
- refresh zone
- stats
- querylog
- dumpdb
- stop
- halt

The named server informs rndc that the channel command is not implemented.

omapi_region is the object manager name.

System action: The named server continues.
Operator response: Contact the user that issued the `rndc` command to inform him of the valid `rndc` commands.

System programmer response: None.

Module: OMAPI

Procedure name: control_setvalue

---

**EZ9105I**  unknown channel command `omapi_region`

Explanation: The named server determined that the `rndc` channel command is incorrect. The valid `rndc` commands are as follows:

- `reload`
- `reload zone`
- `refresh zone`
- `stats`
- `querylog`
- `dumpdb`
- `stop`
- `halt`

`omapi_region` is the object manager name.

System action: The named server continues.

Operator response: Contact the user that issued the `rndc` command to inform him of the valid `rndc` commands.

System programmer response: None.

Module: OMAPI

Procedure name: control_setvalue

---

**EZ9109I**  couldn't register key `key_id` for use with command channel `socket_addr`; description

Explanation: There was a problem registering the `key_id` because of insufficient memory or the key being registered already exists. The control facility will be unavailable for use with the key `key_id`.

`key_id` is the name of the key being registered.

`socket_addr` is the socket IP address for the object manager being configured.

`description` describes the error.

System action: The named server continues.

Operator response: Ensure that the key being registered is unique for the object manager being authorized. Contact the system programmer to increase memory.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: OMAPCONF

Procedure name: register_keys

---

**EZ9113I**  no key statements for use by control channels

Explanation: The named server found no key list information. The control facility will be unavailable for use on the address `socket_addr`.

System action: The named server continues.

Operator response: Ensure that the named server configuration file contains a controls option with the keys option specified with a valid key list.

System programmer response: None.

Module: OMAPCONF
EZZ9121I • EZZ9154I

Procedure name: ns_omapi_configure

EZZ9121I forward zones do not have a notify-source field

Explanation: The option notify-source is specified on a forward zone statement in the named server configuration file. The option notify-source is only allowed for secondary zones. This option is ignored.

System action: The named server continues.

Operator response: Remove the notify-source option from the forward zone statement in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotifysource

EZZ9124I stub zones do not have a notify-source-v6 field

Explanation: The option notify-source-v6 is specified on a stub zone statement in the named server configuration file. The option notify-source-v6 is only allowed for secondary zones.

System action: The named server ends.

Operator response: Remove the notify-source-v6 option from any stub zones.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setnotifysourcev6

EZZ9127I when using view statements, all zones must be in views

Explanation: The named server found a zone specified in the named server configuration file that was not in the scope of a view.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Ensure that all zones belong to views.

System programmer response: None.

Module: SERVER

Procedure name: load_configuration

EZZ9154I validating dns_name region_used: error_text

Explanation: The validator encountered an error described by error_text.

dns_name is the DNS name.
region_used is the name of the buffer region.
error_text describes the error.

System action: The named server continues.

Operator response: Set the debug level to at least 3 to generate more dispatcher debug messages. Correct the error being reported.

System programmer response: None.

Module: VALIDATO

Procedure name: validator_logv
**EZ9155I** validator @validator_pointer: error_text

**Explanation:** The validator encountered an error described by error_text.

validator_pointer is the address of the validator.

text describes the error.

**System action:** The named server continues.

**Operator response:** Set the debug level to at least 3 to generate more dispatcher debug messages. Correct the error being reported.

**System programmer response:** None.

**Module:** VALIDATO

**Procedure name:** validator_logv

---

**EZ9156I** transfer of zone_name from master_zone: msg_text

**Explanation:** This message is used to log the incoming zone transfer messages during the zone transfer in process.

zone_name is the zone name being transferred.

master_zone is the master zone being transferred from.

msg_text describes the error.

**System action:** The named server continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error for the zone being transferred. Set the debug level to 3 but no higher than seven to produce zone transfer debug messages.

**Module:** XFRIN

**Procedure name:** xfrin_logv

---

**EZ9158I** hint zones do not have a notify-source-v6 field

**Explanation:** The notify-source-v6 option is specified in a hint zone in the named server configuration file. The option notify-source-v6 is only allowed in secondary zones.

**System action:** The named server ends.

**Operator response:** Remove the notify-source-v6 option from any hint zones.

**System programmer response:** None.

**Module:** CONFZONE

**Procedure name:** dns_c_zone_setnotifysourcev6

---

**EZ9159I** IBM message catalog msgcat_name open failed description

**Explanation:** The named server failed to open its message catalog. Default internal English messages will be used.

msgcat_name is the name of the message catalog that failed to open.

description describes the error.

**System action:** The named server continues.

**Operator response:** Ensure that a valid message catalog file named ns9.cat exists in the path specified by the NLSPATH z/OS UNIX shell environment variable.

**System programmer response:** None.

**Module:** B9MSGCAT

**Procedure name:**
EZ9161I  IBM message catalog msgcat_name closed
Explanation: The named server closed its message catalog as part of its shut down process.

*msgcat_name* is the name of the message catalog.

System action: The named server continues to shut down.
Operator response: None.
System programmer response: None.
Module: B9MSGCAT
Procedure name:

EZ9173I  not started with Superuser authority. Exiting named, BIND v9
Explanation: The named server must be started by a user with the Superuser privilege.

System action: The named server ends.
Operator response: Obtain Superuser status for the user ID being used to start the named server from the RACF administrator. See the [z/OS Communications Server: IP Configuration Reference](https://www.ibm.com/support/docview.wss?uid=ssg15701124) for information about superuser status.
System programmer response: None.
Module: NDMAIN
Procedure name: check_user_authorization

EZ9174I  function: zone zone_name: error_message
Explanation: The named server uses this message to log zone processing errors.

*function* is the name of the function reporting the error.
*zzone_name* is the name of the zone being processed.
*error_message* describes the error.

System action: The named server continues.
Operator response: Correct the error described in the *error_message*.
System programmer response: None.
Module: ZONE
Procedure name: zone_log

EZ9175I  source_file: line_number: file does not end with newline
Explanation: An unexpected end-of-file condition caused the named server to end the parsing of the master file.

*source_file* is the name of the master file being processed.
*line_number* is the line number in the master file being processed.

System action: The named server continues.
Operator response: Ensure that the master file data being processed is not a partial file.
System programmer response: None.
Module: MASTER
Procedure name: WARNUNEXPECTEDEOF
DNS Master Load: source_file line_number: unexpected end of type

Explanation: An unexpected end-of-line or end-of-file condition caused the named server to end the parsing of the master file.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

type is the token type being processed.

System action: The named server continues.

Operator response: Review the master file data being processed for possible unrequired characters or partial files.

System programmer response: None.

Module: MASTER

Procedure name: gettoken

DNS Master Load: source_file line_number: $TTL ttl_value > MAXTTL, setting $TTL to 0

Explanation: The named server is processing a time-to-live (TTL) value and found the value to be greater than 2147483647 seconds. The named server will set the TTL value to zero and continue to process the master file.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

ttl_value is the line number in the master file.

System action: The named server continues.

Operator response: Review the record being processed in the master file and correct its TTL value.

System programmer response: None.

Module: MASTER

Procedure name: load

DNS Master Load: source_file line_number: $INCLUDE might not be used with $DATE

Explanation: The named server was loading data from a master file and encountered a $INCLUDE directive after previously processing a $DATE directive. $INCLUDE should not be used after $DATE is used in the same file. The zone containing the error will not load.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

System action: The named server continues.

Operator response: Remove the $DATE directive from source_file at line line_number.

System programmer response: None.

Module: MASTER

Procedure name: load

DNS Master Load: source_file line_number: unknown $ directive directive

Explanation: The named server was processing master file records and found a directive that is in error. Master file processing ends. The valid directives are as follows:

- $ORIGIN
- $INCLUDE
- $TTL
- $GENERATE
source_file is the name of the master file being processed.

line_number is the line number in the master file.

directive is the directive being processed that is in error.

System action: The named server continues.

Operator response: Remove the unknown directive from the master file.

System programmer response: None.

Module: MASTER

Procedure name: load

---

EZ9180I  dns_master_load: source_file: line_number: No current owner name

Explanation: The named server is processing a master file and found an error condition that indicates that the owner name in this master file is not found. The owner name is usually the domain name where the resource record is found. Master file processing ends.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

System action: The named server continues.

Operator response: Correct the owner name for the directive in error.

System programmer response: None.

Module: MASTER

Procedure name: load

---

EZ9181I  dns_master_load: source_file: line_number: TTL ttl_value > MAXTTL, setting TTL to 0

Explanation: The named server is processing a time-to-live (TTL) value and found the value to be greater than 2147483647 seconds. The named server will set this TTL value to zero and continues processing the master file.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

ttl_value value found for the TTL being processed.

System action: The named server continues.

Operator response: Correct the TTL value specified.

System programmer response: None.

Module: MASTER

Procedure name: load

---

EZ9182I  dns_master_load: source_file: line_number: no TTL specified

Explanation: The named server is processing the master file class record time-to-live (TTL) and determined that the TTL referenced does not exist nor is there a default TTL established. Master file processing ends.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

System action: The named server continues.

Operator response: Specify a TTL value.

System programmer response: None.
Module: MASTER
Procedure name: load

EZZ9183I dns_master_load: source_file|line_number: using RFC 1035 TTL semantics

Explanation: The default time-to-live (TTL) value was not specified by a $TTL directive. The name server will use the last explicitly stated value for the TTL. See Appendix A, “Related protocol specifications,” on page 931 for directions to get a copy of the RFC.

source_file is the name of the master file being processed.
line_number is the line number in the master file.

System action: The named server continues.
Operator response: None.
System programmer response: None.

Module: MASTER
Procedure name: load

EZZ9184I dns_master_load: source_file|line_number: unknown RR type token

Explanation: The named server found a master file option that is determined to be not implemented or is incorrect. This could be a typing error. Master file processing ends.

source_file is the name of the master file being processed.
line_number is the line number in the master file.
token is token in the master file that is incorrect.

System action: The named server continues.
Operator response: Ensure that the option specified is correct.
System programmer response: None.
Module: MASTER
Procedure name: load

EZZ9185I dns_master_load: source_file|line_number: class class_specified != zone class zone_class

Explanation: The named server determined that the class specified in the master file record does not match the class of the zone.

source_file is the name of the master file being processed.
line_number is the line number in the master file.
class_specified is the class specified.
zone_class is the zone class.

System action: The named server continues.
Operator response: Ensure that the class specified in the master file matches its zones class.
System programmer response: None.
Module: MASTER
Procedure name: load
EZZ9186I  dns_master_load: source_file:line_number: TTL set to prior TTL (ttl)

Explaination: The named server is setting the first time-to-live (TTL) resource data value to that which was specified in a prior TTL resource data value.

source_file is the name of the master file being processed.

line_number is the line number in master file.

ttl is the TTL whose value used.

System action: The named server continues.

Operator response: None.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9187I  dns_master_load: error_text

Explaination: The named server failed to load the master file being processed because of insufficient memory.

erro_text describes the error.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: MASTER

Procedure name: load

EZZ9188I  dns_master_load: source_file:line_number: ignoring out-of-zone data (name)

Explaination: The named server found records that belong to another zone. This record is ignored and the master file processing continues.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

name is the DNS name of the resource record in error.

System action: The named server continues.

Operator response: Ensure that the record in error is associated with the correct zone.

System programmer response: None.

Module: MASTER

Procedure name: generate

EZZ9189I  source_file:line_number: file does not end with newline

Explaination: The named server is converting resource data from text into uncompressed wire form and found an end-of-file condition with the resource data being converted. The resource data might be incomplete.

source_file is the name of the master file containing the resource data being processed.

line_number is the line number in the master file.

System action: The named server continues.

Operator response: Ensure that there are not end-of-file characters in the resource data specified.

System programmer response: None.

Module: RDATA

772  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
Procedure name: fromtext_warneof

EZZ9190I  dns_rdata_fromtext: source_fileline_number: near eol: error_text
Explanation: The named server is converting resource data from text into uncompressed wire form and found an end-of-line condition with the resource data being converted. The resource data might be incomplete.
source_file is the name of the master file containing the resource data being processed.
line_number is the line number in the master file.
error_text describes the error.
System action: The named server continues.
Operator response: Ensure that there are no end-of-line characters in the resource data specified.
System programmer response: None.
Module: RDATA
Procedure name: fromtext_error

EZZ9191I  dns_rdata_fromtext: source_fileline_number: near eof: error_text
Explanation: The named server is converting resource data from text into uncompressed wire form and found an end-of-file condition with the resource data being converted. The resource data might be incomplete.
source_file is the name of the master file containing the resource data being processed.
line_number is the line number in the master file.
error_text describes the error.
System action: The named server continues.
Operator response: Ensure that there are no end-of-file characters in the resource data specified.
System programmer response: None.
Module: RDATA
Procedure name: fromtext_error

EZZ9192I  dns_rdata_fromtext: source_fileline_number: near number: error_text
Explanation: The named server is converting resource data from text into uncompressed wire form and found an error condition where a number is incorrect.
source_file is the name of the master file containing the resource data being processed.
line_number is the line number in the master file.
number is the token being processed that appears to be a number.
error_text describes the error.
System action: The named server continues.
Operator response: Ensure that there are no numeric characters in the resource data specified.
System programmer response: None.
Module: RDATA
Procedure name: fromtext_error
**EZZ9193I • EZZ9196I**

**EZZ9193I  dns_rdata_fromtext: source_file:line_number: near string: error_text**

**Explanation:** The named server is converting resource data from text into uncompressed wire form and found an error condition where a string or a quoted string is incorrect.

- **source_file** is the name of the master file containing the resource data being processed.
- **line_number** is the line number in the master file.
- **string** is the token being processed that appears to be a string or a quoted string.
- **error_text** describes the error.

**System action:** The named server continues.

**Operator response:** Ensure that there are no character strings or quoted character strings in the resource data specified.

**System programmer response:** None.

**Module:** RDATA

**Procedure name:** fromtext_error

---

**EZZ9194I  dns_rdata_fromtext: source_file:line_number: error_text**

**Explanation:** The named server failed to convert resource data from text into uncompressed wire form.

- **source_file** is the name of the master file containing the resource data being processed.
- **line_number** is the line number in the master file.
- **error_text** describes the error.

**System action:** The named server continues.

**Operator response:** Correct the specified resource data.

**System programmer response:** None.

**Module:** RDATA

**Procedure name:** fromtext_error

---

**EZZ9195I  dns_rdata_fromtext: source_file:line_number: error_text**

**Explanation:** The named server found an unexpected null token while converting resource data from text into uncompressed wire form.

- **source_file** is the name of the master file containing the resource data being processed.
- **line_number** is the line number in the master file.
- **error_text** describes the error.

**System action:** The named server continues.

**Operator response:** Correct the specified resource data.

**System programmer response:** None.

**Module:** RDATA

**Procedure name:** fromtext_error

---

**EZZ9196I  options configuration failed: error_text**

**Explanation:** The directory name specified by the directory option on the options statement in the named server configuration file is incorrect. The named server is parsing the named server configuration file and is unable to change directory to the directory specified in the directory option.

- **error_text** describes the error.

---

774  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
EZZ9197I  Failed to create zone list
Explanation: The named server failed to create the zone list being parsed from the named server configuration file because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: yyparse

EZZ9198I  error creating new zone
Explanation: The named server failed to create the new zone being parsed from the named server configuration file because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: yyparse

EZZ9199I  error adding new zone to list
Explanation: The named server failed to add the newly created zone to the zone list because of insufficient memory while processing the zone element.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: yyparse

EZZ9200I  zone configuration for zone_name failed: error_text
Explanation: The named server completed parsing the named server configuration file zone statements but detected an error condition while either configuring or reconfiguring a zone.
zone_name is the name of the zone being configured.
error_text describes the error.
System action: If the error_text value is already exists, only the first occurrence of zone_name will be loaded and the name server continues. For all other possible error_text values, the name server ends.
Operator response: Correct the error described by the error_text and any prior error messages written to the SYSLOG DAEMON logging file.
System programmer response: None.
Module: CONFPARS
Procedure name: yyparse

EZZ9201I Failed to create trusted key list
Explanation: The named server failed to process the trusted-keys variable in the named server configuration file because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.

Module: CONFPARS
Procedure name: yyparse

EZZ9202I Failed to set trusted keys
Explanation: The named server failed to set the new trusted key in the trusted key list because it would duplicate an existing entry.
System action: The named server ends.
Operator response: Ensure that the trusted keys in the named server configuration file are unique.
System programmer response: None.

Module: CONFPARS
Procedure name: yyparse

EZZ9203I No trusted key list defined!
Explanation: The named server could not find a trusted key in a trusted key list because the list did not exist in the current configuration or view.
System action: The named server ends.
Operator response: Ensure the trusted-keys statement in the named server configuration file is correct.
System programmer response: None.

Module: CONFPARS
Procedure name: yyparse

EZZ9204I Failed to create trusted key
Explanation: The named server failed to create a new trusted key because of insufficient storage.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.

Module: CONFPARS
Procedure name: yyparse

EZZ9205I Failed to append trusted key
Explanation: The named server failed to append a trusted key because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: yyparse

EZZ9206I dns_parse_namedconf: error creating mem context
Explanation: The named server failed to process the named server configuration file because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: dns_c_parse_namedconf

EZZ9208I dns_parse_namedconf: error creating config context
Explanation: The named server was not able to create the configuration context because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: dns_c_parse_namedconf

EZZ9209I dns_parse_namedconf: error creating lexer
Explanation: The named server was unable to create the lexer process to parse the named configuration file because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: CONFPARS
Procedure name: dns_c_parse_namedconf

EZZ9210I file_name: open: error_text
Explanation: The named server failed to open the named server configuration file specified.
_file_name_ is the name of named server configuration file.
_error_text_ describes the error.
System action: The named server ends.
Operator response: Ensure that the named server file exists. Otherwise, contact system programmer to increase storage.
System programmer response: Increase the TSO address space or region size to resolve problems with insufficient memory.
Module: CONFPARS
Procedure name: dns_c_parse_namedconf
EZZ9211I  EZZ9214I

EZZ9211I  file_name line_number; message near token

Explanation: The named server found semantic errors while parsing the named server configuration file.

file_name is the name of the named server configuration file.

line_number is the line number in the named server configuration file. It does not include comment lines.

message describes the error.

token is the token in error.

System action: The named server might end depending on the severity of the error.

Operator response: Correct the named configuration file statement in error. See the z/OS Communications Server: IP Configuration Reference for the proper syntax for the statements in the named server configuration file.

System programmer response: None.

Module: CONFPARS

Procedure name: parser_complain

EZZ9212I  file_name line_number; message

Explanation: The named server found semantic errors while parsing the named server configuration file. This message will explain the failure found in the named server configuration file.

file_name is the name of the named server configuration file.

line_number is the line number in the named server configuration file. It does not include comment lines.

message describes the error.

System action: The named server might end depending on the severity of the error.

Operator response: Correct the named configuration file statement in error. See the z/OS Communications Server: IP Configuration Reference for the proper syntax for the statements in the named server configuration file.

System programmer response: None.

Module: CONFPARS

Procedure name: parser_complain

EZZ9213I  TCP/IP might not be active. named server, BIND v9 ending

Explanation: The named server cannot continue because TCP/IP Services is not active.

System action: A Language Environment CEE dump was taken and the named server ends.

Operator response: Contact the system programmer.

System programmer response: Ensure that TCP/IP Services is active and restart the named server.

Module: RESOLVER

Procedure name: dns_resolver_create

EZZ9214I  IBM message catalog problem. Using default messages

Explanation: The named server failed to retrieve a message from its message catalog. The message catalog, ns9.cat, might be corrupt. The file might have been transfered in ASCII but must be binary mode. The file is a binary and must be file transfered as BINARY.

System action: The named server will use its default English messages.

Operator response: Ensure that the message catalog, ns9.cat, has the correct file format and is the version distributed with BIND v9 DNS.

System programmer response: None.

Module: B9MSGCAT
Procedure name: ibm_msgcat_init

EZZ9221I Unable to write to file, logging halted

Explanation: The named server failed to write log messages to a configured log because of insufficient disk space.

System action: The named server continues.

Operator response: Ensure that there is enough space for the logging files defined in the named configuration file. Either alter the space definition in the named configuration file or contact the system programmer for more space. After the space problem is corrected, stop and restart the named server or reload the named server to resume logging.

System programmer response: Ensure that there is no problem with either the DASD or the z/OS UNIX file system the log files reside on. Otherwise, allocate more disk space for the named server log files.

Module: ISCLOG

Procedure name: isc_log_doit

EZZ9222I forward zones do not have a notify-source-v6 field

Explanation: The option notify-source-v6, specified in the named configuration file, is incorrect in a forward zone. The option notify-source-v6 is only allowed in secondary zones.

System action: The named server ends.

Operator response: Remove the notify-source-v6 option from any forward zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setnotifysourcev6

EZZ9223I stub zones do not have a notify-source-v6 field

Explanation: The option notify-source-v6, specified in the named configuration file, is incorrect in a stub zone. The option notify-source-v6 is only allowed in secondary zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the notify-source-v6 option from any stub zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotifysourcev6

EZZ9224I hint zones do not have a notify-source-v6 field

Explanation: The option notify-source-v6, specified in the named configuration file, is incorrect in a hint zone. The option notify-source-v6 is only allowed in secondary zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the notify-source-v6 option from any hint zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getnotifysourcev6
EZZ9225I  forward zones do not have a notify-source-v6 field

Explanation:  The option notify-source-v6, specified in the named configuration file, is incorrect in a forward zone. The option notify-source-v6 is only allowed in secondary zones.

System action:  If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response:  Remove the notify-source-v6 option from any forward zones in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_getnotifysourcev6

EZZ9226I  hint zones do not have a min-retry-time field

Explanation:  The option min-retry-time, specified in the named configuration file, is incorrect in a hint zone. The option min-retry-time is only allowed in master, secondary, or stub zones.

System action:  The named server ends.

Operator response:  Remove the min-retry-time option from any hint zones in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_setminretrytime

EZZ9227I  forward zones do not have a min-retry-time field

Explanation:  The option min-retry-time, specified in the named configuration file, is incorrect in a forward zone. The option min-retry-time is only allowed in master, secondary, or stub zones.

System action:  The named server ends.

Operator response:  Remove the min-retry-time option from any forward zones in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_setminretrytime

EZZ9228I  hint zones do not have a min-retry-time field

Explanation:  The option min-retry-time, specified in the named configuration file, is incorrect in a hint zone. The option min-retry-time is only allowed in master, secondary, or stub zones.

System action:  If the named is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response:  Remove the min-retry-time option from any hint zones in the named server configuration file.

System programmer response:  None.

Module:  CONFZONE

Procedure name:  dns_c_zone_setminretrytime

EZZ9229I  forward zones do not have a min-retry-time field

Explanation:  The option min-retry-time, specified in the named configuration file, is incorrect in a forward zone. The option min-retry-time is only allowed in master, secondary, or stub zones.
System action: If the named is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the min-retry-time option from any forward zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getminretrytime

---

**EZ9230I** hint zones do not have a max-retry-time field

Explanation: The option max-retry-time, specified in the named configuration file, is incorrect in a hint zone. The option max-retry-time is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the max-retry-time option from any hint zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setmaxretrytime

---

**EZ9231I** forward zones do not have a max-retry-time field

Explanation: The option max-retry-time, specified in the named configuration file, is incorrect in a forward zone. The option max-retry-time is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the max-retry-time option from any forward zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_setmaxretrytime

---

**EZ9232I** hint zones do not have a max-retry-time field

Explanation: The option max-retry-time, specified in the named configuration file, is incorrect in a hint zone. The option max-retry-time is only allowed in master, secondary, or stub zones. This option is ignored.

System action: If the named is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the max-retry-time option from any hint zones in the named server configuration file.

System programmer response: None.

Module: CONFZONE

Procedure name: dns_c_zone_getmaxretrytime

---

**EZ9233I** error message would overflow

Explanation: The named server failed to generate an error message during the named server configuration file processing because the message is too big.

System action: A Language Environment CEE dump was taken and the named server ends.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Obtain the following documentation and contact the IBM software support center:
The named server configuration file.
The SYSLOG DAEMON logging file.
All configured named logs.
The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
The Language Environment dump produced when re-creating this error.

Module: CONFPARS
Procedure name: parser_complain

EZZ9235I  isc_mutex_init failed in new_adbfind()
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: ADB
Procedure name: new_adbfind

EZZ9236I  handle_signal() signal setup: description
Explanation: The named server received a signal that it could not handle.
signal is a z/OS UNIX System Services signal. The valid signals handled by the named server are as follows:
• SIGHUP
• SIGINT
• SIGPIPE
• SIGTERM

description describes the error.
System action: The named server continues.
Operator response: Ensure that the correct signal was passed issued to the named server.
System programmer response: None.
Module: APP
Procedure name: handle_signal

EZZ9238I  isc_app_start() sigsetops: description
Explanation: The named server failed to set up a signal set and mask because an incorrect was specified. The named server handles the following signals:
• SIGHUP
• SIGINT
• SIGTERM

description describes the error.
System action: A Language Environment CEE dump was taken and the named server ends.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCP/IP component trace active specifying the TC,
UDP and IOCTL options and set the debug level on the named server configuration file to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/docs/en/zos-communications-server) for instructions on setting and producing a component trace.
- The Language Environment dump produced when re-creating this error.

**Module:** APP

**Procedure name:** isc_app_start

---

**EZZ9239I isc_app_start() pthread_sigmask:** description

**Explanation:** The named server failed to set the blocked signals for a thread because the signals in the mask are incorrect.

*description* describes the error.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/docs/en/zos-communications-server) for instructions on setting and producing a component trace.

**Module:** APP

**Procedure name:** isc_app_start

---

**EZZ9240I isc_app_run() sigsetops:** description

**Explanation:** The named server failed to set up the signal set and masks because of an incorrect signal to block was specified. The named server blocks the following signals:

- SIGHUP
- SIGINT
- SIGIOERR
- SIGTERM

*description* describes the error.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/docs/en/zos-communications-server) for instructions on setting and producing a component trace.

**Module:** APP
Procedure name: isc_app_run

EZZ9243I  isc_app_shutdown() kill: description
Explanation: The named server failed to shutdown because a thread could not be ended.
description describes the error.
System action: The named server does not end and is unuseable.
Operator response: Contact the system programmer.
System programmer response: Issue the z/OS UNIX kill -9 command to end the named server. Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
- The dump of the named address space.
Module: APP

Procedure name: isc_app_shutdown

EZZ9245I  isc_app_reload() kill: description
Explanation: The named server failed to reload because a thread could not be ended.
description describes the error.
System action: A Language Environment CEE dump was taken and the named server ends.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
- The dump of the named address space taken when the problem was re-created.
Module: APP

Procedure name: isc_app_reload

EZZ9246I  unknown auth algorithm algorithm_returned
Explanation: The named object manager returned an unknown algorithm while attempting to make a key. The only algorithm allowed by the object manager is hmac-md5. The object manager will not be able to register this key.
algorithm_returned is the algorithm name returned.
System action: The named server continues.
Operator response: Ensure that the algorithm associated with the security key is specified as hmac-md5. See the
z/OS Communications Server: IP Configuration Reference for more information about specifying algorithms for keys.

System programmer response: None.

Module: AUTH

Procedure name: auth_makekey

EZZ9247I isc_mutex_init failed

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: DISPATCH

Procedure name: qid_allocate

EZZ9248I isc_mutex_init() failed: error_text

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

error_text describes the error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: DNSCACHE

Procedure name: dns_cache_create

EZZ9249I isc_task_create() failed: error_text

Explanation: The named server failed to create the cache cleaner task because of insufficient memory or the named server is shutting down.

error_text describes the error.

System action: The named server continues.

Operator response: If the error is insufficient memory, then contact the system programmer to increase memory.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: DNSCACHE

Procedure name: cache_cleaner_init

EZZ9250I cache cleaner: isc_task_onshutdown() failed: error_text

Explanation: The named server failed because of insufficient memory.

error_text describes the error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: If the error is insufficient storage, then contact the system programmer to increase memory.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: DNSCACHE

Procedure name: cache_cleaner_init

EZZ9251I isc_timer_create() failed: error_text

Explanation: The named server failed to create a cache cleaner task timer because of insufficient memory or the named server is not able to obtain the time of day.

error_text describes the error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Ensure that the z/Series host is able to return the correct time. Use the z/OS UNIX date command to ensure that the CPUs date is correct. See the z/OS UNIX System Services Command Reference for more information about the date command. If the error is insufficient memory, then contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: DNSCACHE

Procedure name: cache_cleaner_init

EZZ9252I cache cleaner: dns_dbiterator_first() failed: error_text

Explanation: The named server cache cleaner failed to clean the cache. The information reflected by the cache will become stale and you will experience erroneous results.

error_text describes the error.

System action: The named server continues.

Operator response: Shut down and restart the named server to rebuild the cache.

System programmer response: None.

Module: DNSCACHE

Procedure name: begin_cleaning

EZZ9253I cache cleaner: dns_dbiterator_current() failed: error_text

Explanation: The named server failed to perform incremental cache cleaning. The named server will stop cleaning the cache and set the cache cleaner to an idle state. The information reflected by the cache will become stale and you will experience erroneous results.

error_text describes the error.

System action: The named server continues.

Operator response: Shut down and restart the named server to rebuild the cache.

System programmer response: None.

Module: DNSCACHE

Procedure name: incremental_cleaning_action

EZZ9254I cache cleaner: dns_db_expirenode() failed: error_text

Explanation: The named server cache cleaner failed to determine which nodes in the cache are expired while performing intermediate cache cleaning. The information reflected by the cache will become stale and you will experience erroneous results. The named server cache cleaner continues.

error_text describes the error.
<table>
<thead>
<tr>
<th>Module: DNSCACHE</th>
<th>Procedure name: incremental_cleaning_action</th>
<th>System action: The named server continues.</th>
<th>Operator response: Shut down and restart the named server to rebuild the cache.</th>
<th>System programmer response: None.</th>
</tr>
</thead>
</table>

### EZZ9255I: cache cleaner: dns_dbiter_next() failed: error_text

**Explanation:** The named server cache cleaner failed to determine the next database node to clean while performing intermediate cache cleaning. The information reflected by the cache will become stale and you will experience erroneous results.

*error_text* describes the error.

**System action:** The named server continues.

**Operator response:** Shut down and restart the named server to rebuild the cache.

**System programmer response:** None.

### EZZ9256I: cache cleaner: dns_dbiter_pause() failed: error_text

**Explanation:** The named server failed to perform intermediate cache cleaning. The information reflected by the cache will become stale and you will experience erroneous results.

*error_text* describes the error.

**System action:** The named server continues.

**Operator response:** Shut down and restart the named server to rebuild the cache.

**System programmer response:** None.

### EZZ9257I: cache cleaner: dns_db_expirenode() failed: error_text

**Explanation:** The named server failed to perform intermediate cache cleaning. The information reflected by the cache will become stale and you will experience erroneous results. The named server cache cleaner continues.

*error_text* describes the error.

**System action:** The named server continues.

**Operator response:** Shut down and restart the named server to rebuild the cache.

**System programmer response:** None.

### EZZ9259I: pthread_cond_timedwait() returned error_text

**Explanation:** A named server thread failed a time out.

*error_text* describes the error.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC,
UDP and IOCTL options and set the debug level on the named server configuration file to 99. Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
- The dump of the named address space.

Module: CONDITIO
Procedure name: isc_condition_waituntil

EZZ9260I unknown type in omapi_connection_putdata: data_type
Explanation: The named object manager detected an internal error.

data_type is the data type.

System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use rndc dumpdb to dump the named servers cache to a file.
- The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
- The dump of the named address space.

Module: CONNECTI
Procedure name: omapi_connection_putdata

EZZ9261I Unexpected path to connection_destroy - the connection object was dereferenced without a previous disconnect
Explanation: The named object manager connection being destroyed was not previously disconnected. The named object manager will disconnect the connection being destroyed.

System action: The named server will continue.
Operator response: None.
System programmer response: None.
Module: CONNECTI
Procedure name: connection_destroy

EZZ9262I unknown type in omapi_data_create: data_type
Explanation: The named object manager detected an internal error.

data_type is the data type.

System action: The named server continues.
Operator response: Contact the system programmer.
**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Dump the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
- The dump of the named address space.

**EZZ9263I isc_mutex_init() failed: error_text**

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

*error_text* describes the error.

**System action:** If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

**Module:** MASTER

**Procedure name:** loadctx_create

---

**EZZ9264I isc_mutex_init() failed: error_text**

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

*error_text* describes the error.

**System action:** The named server continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

**Module:** TSIG

**Procedure name:** dns_tsigkey_createfromkey

---

**EZZ9265I isc_mutex_init failed**

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

**System action:** The named server continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

**Module:** DISPATCH
Procedure name:  dispatch_allocate

EZZ9266I  isc_result_register() failed: error_code

Explanation:  The named server failed to build the result table because of insufficient memory.

error_code describes the error and will be a 1 for insufficient memory.

System action:  The named server continues.

Operator response:  Contact the system programmer.

System programmer response:  Increase the TSO address space or region size and restart the named server.

Module:  DST_RESU

Procedure name:  initialize_action

EZZ9267I  fcntl(file_descriptor, F_SETFL, flags): description

Explanation:  The named server detected an internal error.

file_descriptor is the file descriptor for the /dev/random device.

flags is the O_NONBLOCK flag being set for the file descriptor.

description describes the error.

System action:  A Language Environment CEE dump was taken and the named server ends when the named server fails to create a socket manager. Otherwise, the named server continues.

Operator response:  If the named server ends, then contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named server configuration file to 99. Obtain the following documentation and contact the IBM software support center:

• The named server configuration file.
• The SYSLOG DAEMON logging file.
• All configured named logs.
• Use rndc dumpdb to dump the named servers cache to a file.
• The component trace requested. See the z/OS Communications Server: IP Diagnosis Guide for instructions on setting and producing a component trace.
• The Language Environment dump produced by this error.

Module:  ENTROPY

Procedure name:  make_nonblock

EZZ9268I  making interface scan socket: description, errno2=errnojr

Explanation:  The named server detected an internal error.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojr) information of the z/OS UNIX System Services Messages and Codes.

System action:  The named server continues.

Operator response:  Contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the IOCTL option and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

• The named server configuration file.
• The SYSLOG DAEMON logging file.
• All configured named logs.
The component trace requested.

Dump the named address space if the named server did not end. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space.

**Module:** INTRFCEI  
**Procedure name:** isc_interfaceiter_create

---

**EZ9269I**  
**file**: fatal error:  
**Explanation:** The named server uses this message to report its unrecoverable errors.  
**file** is the file name.  
**line** is the line number in the file.  
**System action:** A Language Environment CEE dump was taken and the named server ends.  
**Operator response:** Review the previous error messages written to the SYSLOG DAEMON logging file or the named logging files and fix them. If you are not able to resolve this problem, then contact the system programmer.  
**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:  
- The named server configuration file.  
- The SYSLOG DAEMON logging file.  
- All configured named logs.  
- The component trace requested.

**EZ9276I**  
**named, BIND v9 ending**  
**Explanation:** BIND v9 does not have superuser authority.  
**System action:** The named server ends.  
**Operator response:** Ensure that the named server user ID has superuser capabilities.  
**System programmer response:** None.

**Module:** NDMAIN  
**Procedure name:** check_user_authorization

---

**EZ9277I**  
**unknown datatype in omapi_data_dereference: type**  
**Explanation:** The named server detected an internal error.  
**type** is the incorrect data.  
**System action:** A Language Environment CEE dump was taken and the named server ends.  
**Operator response:** Inform the user of the rndc client that the rndc client being used might not be downward compatible with the named server software. Temporarily disable this client through the controls address match list in the named server configuration file, or completely disable rndc by removing the controls statement from the named server configuration file. Any changes to the named server configuration file must be followed by an rndc reload or SIGHUP signal to re-read the named server configuration file.  
**System programmer response:** None.

**Module:** OMAPDATA  
**Procedure name:** omapi_data_dereference
EZZ9278I  Unexpected state state

Explanation:  The named server could not determine the state of the token being processed by lex. This error can occur while parsing the following files:
• the named server configuration file
• the rndc configuration file
• a master file
• resource data
The token being processed is not one of the following:
• carriage return / line feed
• string
• number
• comment
• end-of-line
• end-of-file
• double quote

state is the state of the lexer.

System action:  A Language Environment CEE dump was taken and the named server ends.

Operator response:  Contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The named server configuration file.
• The SYSLOG DAEMON logging file.
• All configured named logs.
• The component trace requested.
• Use rndc dumpdb to dump the named servers cache to a file.
• The Language Environment dump produced when re-creating this error.

Module:  LEX

Procedure name:  isc_lex_gettoken

EZZ9279I  Unexpected state state

Explanation:  The named server failed to convert a DNS name from text format into uncompressed wire format. The DNS name being converted is incorrect.

state is the state of the data being converted.

System action:  A Language Environment CEE dump was taken and the named server ends.

Operator response:  Ensure that all DNS names are valid names and are properly typed in the named server configuration file. If you are not able to resolve this problem, then contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The named server configuration file.
• The SYSLOG DAEMON logging file.
• All configured named logs.
• The component trace requested.
• Use rndc dumpdb to dump the named servers cache to a file.
• The Language Environment dump produced when re-creating this error.
Module: DNSNAME
Procedure name: dns_name_fromtext

EZZ9280I Unexpected label type label_type
Explanation: The named server failed to convert a DNS name from uncompressed wire format to text format. The DNS name in uncompressed wire format has an incorrect label.
label_type is the master file internal record format.
System action: A Language Environment CEE dump was taken and the named server ends.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use rndc dumpdb to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

Module: DNSNAME
Procedure name: dns_name_totext

EZZ9281I Unexpected label type label_type
Explanation: The named server failed to convert a DNS name to lower case characters.
label_type is the master file internal record format.
System action: A Language Environment CEE dump was taken and the named server ends.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use rndc dumpdb to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

Module: DNSNAME
Procedure name: dns_name_downcase

EZZ9282I Unknown state state
Explanation: The named server failed to convert a DNS name from wire format to text.
state is the state of the data in error.
System action: A Language Environment CEE dump was taken and the named server ends.
Operator response: Ensure that all DNS names are valid names and are properly keyed entered in the named server configuration file. If you are not able to resolve this problem, then contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC,
UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use `rndc dumpdb` to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

**Module:** DNSNAME  
**Procedure name:** dns_name_fromwire

---

**EZZ9284I unknown address family:family**

**Explanation:** The named server failed to process a socket address because of an unknown protocol family.  
*family* is the protocol family in error.

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Ensure that all socket addresses defined are of the Internet protocol family. If you are not able to resolve this problem, then contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use `rndc dumpdb` to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

**Module:** SOCKADDR  
**Procedure name:** isc_sockaddr_pf

---

**EZZ9285I unknown address family:family**

**Explanation:** The named server failed to set the port for a socket address because of an unknown socket address protocol family.  
*family* is the protocol family in error.

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Ensure that all socket addresses defined are of the Internet protocol family. If you are not able to resolve this problem, then contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use `rndc dumpdb` to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

**Module:** SOCKADDR
**Procedure name:** isc_sockaddr_setport

**EZ9286I  unknown address family: family**

**Explanation:** The named server failed to get a port for a socket address because of an unknown socket address protocol family.

*family* is the protocol family in error.

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Ensure that all socket addresses defined are of the Internet protocol family. If you are not able to resolve this problem, then contact the system programmer.

**System programmer response:** Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use `rndc dumpdb` to dump the named servers cache to a file.
- Setup a component trace for the SYSTCPIP component. See the [z/OS Communications Server: IP Diagnosis Guide](https://www.ibm.com/support/docview.wss?uid=swg21387902) for instructions on setting and producing a component trace.
- The Language Environment dump produced when re-creating this error.

**Module:** SOCKADDR

**Procedure name:** isc_sockaddr_getport

**EZ9287I write() failed during watcher poke: description, errno2=errnojr**

**Explanation:** The named server failed to process a poke because of a problem writing to a file descriptor.

*description* describes the error.

*errnojr* is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview.wss?uid=swg21387902).

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use `rndc dumpdb` to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

**Module:** ISCSOCKT

**Procedure name:** select_poke

**EZ9288I read() failed during watcher poke: description, errno2=errnojr**

**Explanation:** The named server failed to read an internal file descriptor.

*description* describes the error.

*errnojr* is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview.wss?uid=swg21387902).

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Contact the system programmer.

**Module:** ISCSOCKT
Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use rrdc dumpdb to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

Module: ISCSOCKT

Procedure name: select_readmsg

---

**EZZ9289I**

**select() failed: description, errno2=errnojr**

**Explanation:** The named server watcher failed. The socket manager failed to use a file descriptor.

*description* describes the error.

*errnojr* is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the [reason codes (errnojrs) information](z/OS UNIX System Services Messages and Codes) of the z/OS UNIX System Services Messages and Codes.

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use rrdc dumpdb to dump the named servers cache to a file.
- The Language Environment dump produced when re-creating this error.

Module: ISCSOCKT

Procedure name: watcher

---

**EZZ9290I**

**RUNTIME_CHECK(expression) failed**

**Explanation:** The named server failed because of a runtime check condition.

*expression* is the reason named server received a runtime check.

**System action:** A Language Environment CEE dump was taken and the named server ends.

**Operator response:** Review the failure returned in this message and any prior messages to resolve the problem. If you are not able to resolve the problem then contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Use rrdc dumpdb to dump the named servers cache to a file.
The Language Environment dump produced when re-creating this error.

Module: ISCERROR
Procedure name: isc_error_runtimecheck

EZZ9291I  RESOLVER INITIALIZATION COMPLETE
Explanation: The Resolver address space initialized and is ready to accept MODIFY and STOP commands, and Resolver services are available to applications.
System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZBREINI
Procedure name: EZBREINI

EZZ9292I  RESOLVER ENDING
Explanation: A STOP command was entered. The Resolver address space is ending normally.
System action: Resolver services are no longer available to applications.
Operator response: The Resolver address space can be restarted to make Resolver services available to applications.
System programmer response: None.
Module: EZBREINI
Procedure name: EZBREINI

EZZ9293I  cmdname COMMAND PROCESSED
Explanation: The Resolver address space accepted and processed the MODIFY RESOLVER,cmdname command.
cmdname will be one of the following:
DISPLAY
   Display the current settings for the GLOBALTCPIPDATA file and the DEFAULTTCPIPDATA file.
FLUSH  Delete the information in the system-wide resolver cache.
REFRESH
   Notify the Resolver that changes to the Resolver setup file, to the GLOBALTCPIPDATA file, or to the DEFAULTTCPIPDATA have been made. Subsequent requests for Resolver services from applications will be processed using those changes.
System action: The Resolver address space waits for another MODIFY or STOP command.
Operator response: None.
System programmer response: None.
Module: EZBREINI, EZBRECFG
Procedure name: EZBREINI, EZBRECFG

EZZ9294I  INCORRECT type SYNTAX
Explanation: The MODIFY RESOLVER command entered did not have correct syntax.
type will be one of the following:
COMMAND
   The syntax of the command is not correct.
FILENAME
   The syntax for the filename specified as the setup file is not correct.
**EZZ9295I • EZZ9296I**

**System action:** The MODIFY RESOLVER command is ignored.

**Operator response:** Correct the MODIFY RESOLVER command and reenter it. See the "z/OS Communications Server: IP System Administrator's Commands" for more information about Resolver commands.

**System programmer response:** None.

**Module:** EZBREINI, EZBRECFG

**Procedure name:** EZBREINI, EZBRECFG

---

**EZZ9295I  INCORRECT STATEMENT SYNTAX ON LINE lineno**

**Explanation:** The resolver issues this message when it detected an error while it was processing the resolver setup file. The error was caused by one of the following conditions:

- A statement in the resolver setup file is valid, but does not use the correct syntax.
- A statement in the resolver setup file is not a valid resolver setup statement.

In the message text:

*lineno*

The line number in the resolver setup file of the statement that contains the error

**System action:** The incorrect setup file statement is rejected.

- If this message is generated during the initialization of the resolver address space, the resolver continues processing the resolver setup file.
- If this message is generated during the processing of a MODIFY RESOLVER,REFRESH,SETUP=setup_file command, the MODIFY command fails.

**Operator response:** Contact the system programmer.

**System programmer response:** If this message is generated during the initialization of the resolver address space, take one of the following actions:

- If the syntax error did not affect the resolver configuration settings, you can ignore this message. Optionally, you can correct the setup statement on the line number specified by the *lineno* value to avoid future warning messages.
- If the syntax error did affect the resolver configuration settings, correct the setup file statement. After you correct the statement, instruct the operator to issue a MODIFY RESOLVER,REFRESH,SETUP=setup_file command to correct the resolver configuration.

If this message is generated during the processing of a MODIFY RESOLVER,REFRESH command, correct the setup file statement. After you correct the statement, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=setup_file command again.

See "z/OS Communications Server: IP Configuration Reference" for more information about resolver setup file statements.

**Problem determination:** None.

**Source:** z/OS Communications Server TCP/IP: System Resolver

**Module:** EZBRECFG

**Routing code:** 2, 8

**Descriptor code:** 5

**Automation:** This message is displayed at the operator console and is suitable for automation. You can use it to detect resolver initialization problems that impact your system.

---

**EZZ9296I  UNABLE TO ACCESS FILE filename - RC rc**

**Explanation:** The resolver issues this message when it is unable to access an MVS data set or a z/OS UNIX file during the initialization of the resolver address space or while processing a MODIFY RESOLVER,REFRESH,SETUP command.

In the message text:
**filename**

The name of the data set or file that the resolver was unable to access.

- If this message was generated during initialization of the resolver address space, *filename* is the resolver setup file.
- If this message was generated while processing a MODIFY RESOLVER,REFRESH,SETUP command, *filename* can be either the resolver setup file specified on the SETUP operand, or a data set or file specified on a resolver setup statement.

**rc** The return code and is one of the following values:

<table>
<thead>
<tr>
<th>Return code (hexadecimal)</th>
<th>Meaning</th>
<th>Corrective action for the file specified by the <em>filename</em> value</th>
</tr>
</thead>
<tbody>
<tr>
<td>00080004</td>
<td>File or data set not allocated.</td>
<td>Ensure that <em>filename</em> exists.</td>
</tr>
</tbody>
</table>
| 00080008                  | Open failed. | • Ensure that the specified MVS data set, PDS member, or z/OS UNIX file exists and is accessible to the resolver.  
  • Examine the JES message log (JESMSGLG). If the JESMSGLG contains the message OMVS SEGMENT NOT DEFINED define an OMVS segment for the resolver address space. |
| 0008000C                  | Record format of MVS data set is not supported. | Ensure that the *filename* value is an MVS data set that has a record format F or FB, or is a member specified in the PDS data set. |
| 00080010                  | Data set in use. | Ensure that the specified MVS data set is not allocated by another job. |
| 00080024                  | Insufficient storage to allocate and open file. | Increase the region size for the resolver. |

**System action:**

- If this message was generated during the initialization of the resolver address space, processing continues. The resolver initializes with the default configuration settings.
- If this message was generated while a MODIFY RESOLVER,REFRESH,SETUP command was processing, the MODIFY command is ignored.

**Operator response:** Contact the system programmer.

**System programmer response:** See the table in the explanation section for the corrective actions to take.

- If this message was generated during the initialization of the resolver address space and the resolver setup file has been corrected, instruct the operator to issue a MODIFY RESOLVER,REFRESH,SETUP command to correct the resolver configuration.
- If this message was generated while a MODIFY RESOLVER,REFRESH,SETUP command was processing and the file specified by the *filename* value has been corrected, instruct the operator to issue the MODIFY command again.

**Problem determination:** None.

**Source:** z/OS Communications Server TCP/IP: System Resolver
Module: EZBRECFG
Routing code: 2, 8
Descriptor code: 5

Automation: This message is displayed at the operator console and is suitable for automation. You can use it to detect resolver initialization problems that impact your system.

EZZ9297E UNABLE TO ACCESS FILE filename - RC rc

Explanation: The resolver issues this message when it is unable to access an MVS data set or a z/OS UNIX file in the following situations:
- When it is processing resolver setup file statements during the initialization of the resolver address space.
- When it is processing a resolver API call.

In the message text:

filename
   The name of the data set or file that the resolver was unable to access

rc   The return code and is one of the following values:

<table>
<thead>
<tr>
<th>Return code (hexadecimal)</th>
<th>Meaning</th>
<th>Corrective action for the file specified by the filename value</th>
</tr>
</thead>
<tbody>
<tr>
<td>00080008</td>
<td>Open failed.</td>
<td>Ensure that the specified MVS data set, PDS member, or the z/OS UNIX file exists and is accessible to the resolver.</td>
</tr>
<tr>
<td>00080010</td>
<td>Data set in use.</td>
<td>Ensure that the specified MVS data set is not allocated by another job.</td>
</tr>
<tr>
<td>0008000C</td>
<td>Record format of MVS data set is not supported.</td>
<td>Ensure that the filename value is an MVS data set that has a record format F or FB, or is a member specified in the PDS data set.</td>
</tr>
<tr>
<td>00080024</td>
<td>Insufficient storage to allocate and open file.</td>
<td>Increase the region size for the resolver.</td>
</tr>
<tr>
<td>xx0xxxx</td>
<td>Dynamic allocation failed.</td>
<td>See z/OS MVS Programming: Authorized Assembler Services Guide and perform the corrective actions listed in the DYNALLOC error reason code table for SVC99 error code xxxx.</td>
</tr>
</tbody>
</table>

System action: If this message was generated during resolver startup, the initialization of the resolver address space continues.

If this message was generated while a resolver API invocation was processing, the resolver continues. If the file specified by the filename value represents a TCPIP.DATA file, the resolver assigns default values for all configuration statements that can appear in the file.

Operator response: Contact the system programmer.

System programmer response: See the table in the explanation section for the corrective actions you take. After the corrective actions are complete, instruct the operator to issue a MODIFY RESOLVER,REFRESH,SETUP=setup_file command.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: System Resolver

Module: EZBRECFG
Routing code: 2, 8
Descriptor code: 2

Automation: This message is displayed at the operator console and is suitable for automation. You can use it to detect resolver initialization problems that impact your system.

**EZZ9298I resolversetupstatement - setupstatementvalue**

Explanation: This message is one of a group of messages issued in response to a MODIFY RESOLVER,DISPLAY command or a MODIFY RESOLVER,REFRESH command.

The **setupstatementvalue** value depends on the **resolversetupstatement** value, as shown in the following table:

<table>
<thead>
<tr>
<th>If the resolversetupstatement value is...</th>
<th>then the setupstatementvalue value is:</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULTTCPIPDATA</td>
<td>The name of the MVS data set or the z/OS UNIX file that is currently in use as the default TCPIP.DATA file.</td>
</tr>
<tr>
<td>GLOBALTCPIPDATA</td>
<td>The name of the MVS data set or the z/OS UNIX file that is currently in use as the global TCPIP.DATA file.</td>
</tr>
<tr>
<td>DEFAULTIPNODES</td>
<td>The name of the MVS data set or the z/OS UNIX file that is currently in use as the default IPNODES file.</td>
</tr>
<tr>
<td>GLOBALIPNODES</td>
<td>The name of the MVS data set or the z/OS UNIX file that is currently in use as the global IPNODES file.</td>
</tr>
<tr>
<td>CACHE</td>
<td>The maximum amount of storage that the resolver can use to cache response information from the name server.</td>
</tr>
<tr>
<td>MAXTTL</td>
<td>The maximum time to live (TTL) setting, in seconds, that the resolver can use when creating cache entries that represent response information from the name server.</td>
</tr>
<tr>
<td>UNRESPONSIVE THRESHOLD</td>
<td>The maximum percentage of resolver queries to which a name server can fail to respond and still be considered responsive.</td>
</tr>
</tbody>
</table>

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**System action:** The resolver address space ends.

**Operator response:** Contact the system programmer.

**System programmer response:** See the table in the explanation section for the corrective actions you need to take. After the corrective actions are complete, instruct the operator to restart the resolver address space.

**Problem determination:** None.

**Source:** Z/OS Communications Server TCP/IP: System Resolver

**Module:** EZBREINI

**Routing code:** 2, 8

**Descriptor code:** 2
Automation: This message is displayed at the operator console and is suitable for automation. You can use it to detect resolver initialization problems that impact your system.

EZZ9301E  RESOLVER ENDED ABNORMALLY
Explanation: An unrecoverable error occurred in the Resolver address space.
System action: An SVC dump of the Resolver address space is created and the Resolver address space ends.
Operator response: Restart the Resolver address space.
System programmer response: Save the SVC dump and contact the IBM software support center.
Module: EZBREINI
Procedure name: EZBREINI

EZZ9302I  UNABLE TO ACCESS TRACE FILE filename RC rc
Explanation: The resolver trace output file could not be opened for writing.
filename is specified by way of the SYSTCPT DD card or the RESOLVER_TRACE environment variable.
rc is the return code and will be one of the following:

<table>
<thead>
<tr>
<th>Return code (hexadecimal)</th>
<th>Meaning</th>
<th>Corrective action for filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>00080008</td>
<td>OPEN failed</td>
<td>Ensure that the specified MVS data set or z/OS UNIX file exists and is accessible to the user or job.</td>

<tr>
<td>0010xxxx</td>
<td>Dynamic allocation failed</td>
<td>See the z/OS MVS Programming Authorized Assembler Services Guide and perform the corrective actions listed in the DYNALLOC error reason code table for SVC99 error code xxxx.</td>
</tr>
</tbody>
</table>

System action: The user or job continues. No resolver traces are written.
Operator response: See corrective actions listed above.
System programmer response: None.
Module: EZBRERIN
Procedure name: EZBRERIN

EZZ9303I  RESOLVER INITIALIZATION FAILED - RESOLVER ALREADY ACTIVE
Explanation: The Resolver was already started. Only one resolver address space might be active.
System action: This RESOLVER fails to initialize. The currently active resolver continues to operate.
Operator response: Either stop the currently active resolver or issue the MODIFY RESOLVER,REFRESH command to specify and activate a different setup file. See the z/OS Communications Server: IP System Administrator’s Commands for more information about resolver commands.
System programmer response: None.
Module: EZBREINI
Procedure name: EZBREINI

EZZ9304I resolversetupstatement

Explanation: This message is one of a group of messages issued in response to a MODIFY RESOLVER,DISPLAY command or a MODIFY RESOLVER,REFRESH command.

resolversetupstatement is one of the following:

CACHE
Indicates that system-wide resolver caching is active.

COMMONSEARCH
Indicates that the search order for the local host file will be the same for either an IPv6 or an IPv4 name query.

NOCACHE
Indicates that system-wide resolver caching is not active.

NOCOMMONSEARCH
Indicates that the search order for the local host file will be different for an IPv6 or an IPv4 name query.

AUTOQUIESCE
Indicates that the resolver stops sending DNS queries resulting from application or TCPIP resolver API calls to a name server while the name server is considered to be unresponsive.

See the z/OS Communications Server: IP Configuration Guide for more information about resolver search order, resolver caching, and resolver handling of unresponsive name servers.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: EZBREINI, EZBRECFG

Example: In this example, all the default resolver setup values are displayed:

F RESOLVER,DISPLAY
EZZ9298I DEFAULTTCPIPDATA - None
EZZ9298I GLOBALTCPIPDATA - None
EZZ9298I DEFAULTIPNODES - None
EZZ9298I GLOBALIPNODES - None
EZZ9304I NOCOMMONSEARCH
EZZ9304I CACHE
EZZ9298I CACHESIZE - 200M
EZZ92981 MAXTTL - 2147483647
EZZ9298I UNRESPONSIVETHRESHOLD - 25
EZZ9293I DISPLAY COMMAND PROCESSED

In this example, the AUTOQUIESCE operand on the UNRESPONSIVETHRESHOLD resolver setup statement has been coded:

F RESOLVER,DISPLAY
EZZ9298I DEFAULTTCPIPDATA - None
EZZ9298I GLOBALTCPIPDATA - /etc/resolv.conf
EZZ9298I DEFAULTIPNODES - None
EZZ9298I GLOBALIPNODES - None
EZZ9304I NOCOMMONSEARCH
EZZ9304I CACHE

     STATUS: ACTIVE    FAILURE RATE:  0%
EZZ9305I NAME SERVER 10.2.2.2

Chapter 9. EZZ9xxx messages  805
EZZ9305I • EZZ9306I

**EZZ9305I**

- **count** CACHE ENTRIES DELETED

**Explanation:** This message is issued in response to a MODIFY RESOLVER,FLUSH command, or in response to a MODIFY RESOLVER,REFRESH,SETUP=resolver_setupfile_filename command when resolver caching is in effect and the NOCACHE resolver setup statement is specified in the resolver setup file.

In the message text:

- **count**

  The number of resolver cache entries that were deleted.

**System action:** Processing continues. If this message is issued in response to a MODIFY RESOLVER,FLUSH command, resolver caching remains active. If this message is issued in response to a MODIFY RESOLVER,REFRESH command, resolver caching is no longer active.

**Operator response:** None.

**System programmer response:** None.

**User response:** Not applicable.

**Problem determination:** Not applicable.

**Source:** z/OS Communications Server TCP/IP: System Resolver

**Module:** EZBREINI, EZBRECFG

**Routing code:** Not applicable.

**Descriptor code:** Not applicable.

**Automation:** There is little value in automating on this message because the number of cache entries will always be variable.

**Example:**

EZZ9305I 200 CACHE ENTRIES DELETED

---

**EZZ9306I** CACHE SIZE VALUE CANNOT BE REDUCED DYNAMICALLY

**Explanation:** A MODIFY RESOLVER,REFRESH,SETUP=setup_filename command was issued, and the value specified for the CACHESIZE parameter or the default value that is used when the CACHESIZE parameter is not specified in the setup file, is smaller than the current setting. The CACHESIZE setting can only be increased dynamically.

**System action:** The value for the CACHESIZE parameter is left unchanged, and the MODIFY RESOLVER,REFRESH,SETUP command fails.

**Operator response:** Contact the system operator.

**System programmer response:** Use the NETSTAT RESCache/-q SUMMARY command or the MODIFY RESOLVER,DISPLAY command to determine the value of the CACHESIZE parameter for the resolver cache. Specify a value for the CACHESIZE parameter in the file specified by the setup_filename value so that the CACHESIZE value is equal to or larger than the current value. Re-issue the MODIFY RESOLVER,REFRESH,SETUP command.

Alternatively, issue a MODIFY RESOLVER,REFRESH,SETUP=setup_filename command, where the NOCACHE parameter is specified in the setup file. Then, issue a second MODIFY RESOLVER,REFRESH,SETUP=setup_filename command, where the CACHE parameter is specified (or the default value is used) in the setup file, and the CACHESIZE parameter with the required value is also specified.

Alternatively, issue the STOP RESOLVER command to stop the resolver, and then restart the resolver with the smaller value for the CACHESIZE parameter.

**User response:** Not applicable.
Problem determination: Not applicable.

Routing code: Not applicable.
Descriptor code: Not applicable.
Example:
EZZ93061 CACHESIZE VALUE CANNOT BE REDUCED DYNAMICALLY

**EZZ9307E** RESOLVER CACHE STORAGE IS DEPLETED

Explanation: The resolver is using 98% of the maximum amount of storage that can be used to cache resource record information, as defined by the CACHESIZE resolver setup statement.

System action: No additional resource records will be cached until storage use drops below 90% of the maximum amount. Storage use can drop as the result of either the expiration and deletion of resource records or user intervention.

Operator response: To increase the resolver cache size, contact the system programmer. Alternatively, issue the **MODIFY RESOLVER,FLUSH,ALL** command to delete all resource records from the cache.

System programmer response: Use the **NETSTAT RESCache/-q SUMMARY** command or the **MODIFY RESOLVER,DISPLAY** command to determine the value of the CACHESIZE parameter for the resolver cache. Increase the value for CACHESIZE in the file specified by the setup-filename parameter. Issue the **MODIFY RESOLVER,REFRESH,SETUP** command.

User response: Not applicable.
Problem determination: Not applicable.

Routing code: 2,8
Descriptor code: 2
Example:
EZZ9307E RESOLVER CACHE STORAGE IS DEPLETED

**EZZ9308E** UNRESPONSIVE NAME SERVER DETECTED AT IP ADDRESS ipaddress

Explanation: This message is issued when the resolver detects that the specified name server failed to respond to a percentage of resolver queries. The percentage of failed resolver queries is in excess of the threshold that is specified by using the UNRESPONSIVETHRESHOLD resolver setup statement.

In the message text:

ipaddress

The IPv4 or IPv6 network address of the name server that is considered unresponsive.

System action: Processing continues. The resolver continues to send queries to the name server while the name server is specified in the TCPIP.DATA data sets used by the installation.

The message remains on the operator console until one of the following events occurs:

- During a future monitor checkpoint, the percentage of resolver queries to which the name server has failed to respond drops below the UNRESPONSIVETHRESHOLD percentage.
- You change the UNRESPONSIVETHRESHOLD value to zero by using the **MODIFY RESOLVER,REFRESH,SETUP=setup_file_name** command. Changing the value of the UNRESPONSIVETHRESHOLD parameter to zero disables the monitoring function, so no additional EZZ9308E messages will be generated until the function is re-enabled.
- The resolver is stopped.

Operator response: Contact the system programmer.
System programmer response: Determine if the name server is unresponsive due to a network condition, a configuration error, or a temporary condition that might resolve itself later.

- If a network condition is preventing resolver requests or name server responses from reaching the correct destination, correct the network condition. When requests can successfully reach the name server and are being responded to, the resolver will detect the change in responsiveness at the next monitor interval and will clear the message from the operator console.

- If a configuration error is causing the name server to be unresponsive, use resolver diagnostic tools such as MODIFY RESOLVER,DISPLAY or Trace Resolver output to determine which TCPIP.DATA data sets are used in the failing resolver queries and investigate the following possibilities:
  - If the UNRESPONSIVETHRESHOLD value specifies a lower percentage of errors than your network can tolerate during typical operations, increase the threshold percentage in the resolver setup file. For example, if the threshold percentage is 25%, but your network can tolerate 40%, increase the threshold to 40%-45%.
  - If the IP address is no longer valid as a destination name server, remove the IP address from the list of name servers that were coded by using the NSINTERADDR or NAMESERVER configuration statements.
  - If the RESOLVERTIMEOUT value is coded so small that the response is unable to return from the name server within the specified time value, increase the timeout setting to a value that permits a larger percentage of responses to arrive within the timeout window.

When the configuration error is corrected, do one of the following to cause the resolver to use the updated configuration information:

- If you modified the setting of the UNRESPONSIVETHRESHOLD parameter, have the operator issue the MODIFY RESOLVER, REFRESH, SETUP=setup_file_name command.
- If you modified the RESOLVERTIMEOUT parameter, or if you removed an IP address from the list of name servers that were coded with the NSINTERADDR or NAMESERVER configuration statements, have the operator issue the MODIFY RESOLVER, REFRESH command.

- If you eliminated a network condition and a configuration error as the reason for the message, then the resolver might be generating the message for a temporary condition that might resolve itself. For example, the name server might be having maintenance applied, or the name server might have a very high percentage of failures because there were few queries sent to the name server during the monitoring interval, so even a short network interruption would severely impact the calculations. If this situation repeats itself, an overly aggressive UNRESPONSIVETHRESHOLD value might be contributing to the situation. Consider increasing the setting for the UNRESPONSIVETHRESHOLD parameter in the resolver setup file, and then have the operator issue the MODIFY RESOLVER, REFRESH, SETUP=setup_file_name command to make the resolver less sensitive to name server response failures.

User response: Not applicable.

Problem determination: Not applicable.

<tr>
<td>TOTAL NUMBER OF QUERIES SENT totalsent</td>
<td></td>
</tr>
<tr>
<td>TOTAL NUMBER OF FAILURES totalfail</td>
<td></td>
</tr>
<tr>
<td>PERCENTAGE percent%</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: This is a multi-line message that is issued to report statistical information about an unresponsive name server, or about a name server that was previously unresponsive but is now considered to be responsive. The statistics represent data that is specific to the name server. The data was accumulated by the resolver during the most recent monitoring interval.

In the message text:

ipaddress
The IPv4 or IPv6 network address of the name server.

totalsent
The count of resolver queries that were directed to the name server during the most recent monitoring interval.

totalfail
The count of instances when the name server did not respond to resolver queries that were directed to the name server during the most recent monitoring interval.

percent
The percentage of resolver queries to which the name server did not respond during the most recent monitoring interval.

System action: Processing continues. The resolver resets the statistics to zero before starting the next monitor interval.
Operator response: Contact the system programmer.
System programmer response: If the statistics were reported when a name server became responsive again, compare the percent value to the unresponsiveness threshold value.
• If the failure rate is close to the threshold, but your network is operating at a satisfactory level, increase the UNRESPONSIVETHRESHOLD setting to eliminate unnecessary notifications that the name server is unresponsive at this threshold level.
• If the totalsent value is zero, then the name server might be responsive only because no requests were sent to the name server during the most recent monitoring interval. There might still be issues with the name server, so monitor for any new EZZ9308E messages that indicate that this name server is unresponsive again.
If the statistics that were reported are for an unresponsive name server and they are similar to previous interval statistics for this name server, or if they represent an improvement in the responsiveness of the name server, continue monitoring the statistics.

If the statistics that were reported are for an unresponsive name server and they are significantly worse than previous intervals, determine the reason for the change.

- If the name server is unresponsive due to a network condition that prevents a larger percentage of resolver requests or name server responses from reaching the correct destination, correct the network condition. When requests can successfully reach the name server and are being responded to, the resolver will detect the change in responsiveness at the next monitor interval and will clear the message from the operator console. The resolver will also issue message EZZ9309I to indicate that the server is now responsive.

- If you eliminated a network condition as the reason for the message, determine if the name server is unresponsive due to a configuration error. Use resolver diagnostic tools such as MODIFY RESOLVER,DISPLAY or Trace Resolver output to determine which TCPIP.DATA data sets are being used in the failing resolver queries. Investigate the following are possibilities:
  - If the UNRESPONSIVETHRESHOLD value specifies a lower percentage of errors than your network can tolerate during typical operations, increase the threshold percentage in the resolver setup file. For example, if the threshold percentage is 25%, but your network can tolerate 40%-45%
  - If the IP address is no longer valid as a destination name server, remove the IP address from the list of name servers that were coded by using the NSINTERADDR or NAMESERVER configuration statements.
  - If the RESOLVERTIMEOUT value is so small that the response is unable to return from the name server within the specified time value, increase the RESOLVERTIMEOUT setting to a value that permits a larger percentage of responses to arrive within the timeout window.

When the configuration error is corrected, have the operator do one of the following to cause the resolver to use the updated configuration information:

- If you modified the setting of UNRESPONSIVETHRESHOLD, the operator should issue the MODIFY RESOLVER,REFRESH,SETUP=setup_file_name command.
- If you modified RESOLVERTIMEOUT, or you removed an IP address from the list of name servers that were coded by using NSINTERADDR or NAMESERVER statement, the operator should issue the MODIFY RESOLVER,REFRESH command.

- If you eliminated network conditions or configuration errors as the reason for the message, then the resolver might be generating the message for a temporary condition that might resolve itself. For example, the name server might be having maintenance applied, or the name server might have a very high percentage of failures because there were few queries sent to the name server during the monitoring interval, so even a short network interruption would severely impact the calculations. If this situation repeats itself, an UNRESPONSIVETHRESHOLD value that specifies a lower percentage of errors than your network can tolerate during typical operations might be contributing to the situation. Consider increasing the setting for UNRESPONSIVETHRESHOLD in the resolver setup file, and then have the operator issue the MODIFY RESOLVER,REFRESH,SETUP=setup_file_name command to make the resolver less sensitive to name server response failures.

User response: Not applicable.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: System Resolver

Module: Routing code: 2,8

Descriptor code: 12

Automation: This message is a good candidate for automation if you are using automation to monitor message EZZ9308E to collect statistics on name server responsiveness.

Example:

EZZ9310I NAME SERVER 10.45.23.200
TOTAL NUMBER OF QUERIES SENT 6574
TOTAL NUMBER OF FAILURES 2957
PERCENTAGE 45%
STOPPED USING NAME SERVER AT IP ADDRESS ipaddress

Explanation: This message is issued when the resolver stops forwarding domain name server (DNS) queries that were generated by an application to the specified unresponsive name server. A name server is considered to be unresponsive when it fails to respond to resolver queries at a rate that exceeds the unresponsive threshold percentage of the installation. Specify the threshold percentage by using the UNRESPONSIVETHRESHOLD resolver setup statement. The failure rate is compared to the unresponsive threshold percentage at 30-second intervals.

ipaddress is the IPv4 or IPv6 network address of the name server that is considered unresponsive.

System action: Processing continues. The resolver continues to send DNS queries that were generated by an application to responsive name servers that are specified in the global TCPIP.DATA data set. The resolver polls the unresponsive name server periodically to determine when the name server is again responsive to DNS queries. The message remains on the operator console until one of the following events occurs:

- During a future monitor checkpoint, the percentage of resolver polling queries to which the name server has failed to respond drops below the UNRESPONSIVETHRESHOLD percentage.
- Operator intervention disables the resolver's autonomic quiescing of unresponsive name server function.
- The resolver is stopped.

Operator response: Contact the system programmer.

System programmer response: Determine whether the name server is unresponsive as a result of a network condition, a configuration error, or a temporary condition that might resolve itself later.

- If a network condition prevents resolver requests or name server responses from reaching the correct destination, correct the network condition. When the resolver polling queries are successfully responded to, the resolver will clear the message from the operator console.
- If a configuration error causes the name server to be unresponsive, use resolver diagnostic tools such as MODIFY RESOLVER,DISPLAY or Trace Resolver output to determine which of the following conditions causes the error:
  - If the UNRESPONSIVETHRESHOLD value specifies a lower percentage of errors than what your network can tolerate during typical operations, increase the threshold percentage in the resolver setup file. For example, if the threshold percentage is 25%, but your network can tolerate 40%, increase the threshold to a value in the range of 40% - 45%.
  - If the IP address is no longer valid as a name server, remove the IP address from the list of name servers to be used by the resolver. The list of name servers is defined using the NSINTERADDR or NAMESERVER configuration statements in the global TCPIP.DATA file.
  - If the RESOLVERTIMEOUT value is too low for responses to consistently return from the name server within the specified time value, increase the timeout setting to a value that permits a larger percentage of responses to arrive within the timeout interval.

After you have corrected the configuration error, take one of the following actions to cause the resolver to use the updated configuration information:

- If you modified the setting of the UNRESPONSIVETHRESHOLD parameter, instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=setup_file_name command.
- If you modified the RESOLVERTIMEOUT parameter, or if you removed an IP address from the list of name servers, instruct the operator to issue the MODIFY RESOLVER,REFRESH command.

- If you eliminate a network condition and a configuration error as the reason for the message, the resolver might be generating the message for a temporary condition that might resolve itself. For example, the name server might be having maintenance applied, or the name server might have a very high percentage of failures because few queries were sent to the name server during the monitoring interval; even a short network interruption would severely impact the calculations. If this situation repeats itself, an overly aggressive UNRESPONSIVETHRESHOLD value might be contributing to the situation. Consider increasing the setting value for the UNRESPONSIVETHRESHOLD parameter in the resolver setup file and instruct the operator to issue the MODIFY RESOLVER,REFRESH,SETUP=setup_file_name command to make the resolver less sensitive to name server response failures.

Automation: Candidate for automation if the automation is used for messages EZ9311E and EZ9313I. This message indicates that the name server at *ipaddress* is now responsive.

Example:
EZ9312I RESUMED USING NAME SERVER AT IP ADDRESS 10.45.23.200

**EZ9313I** NAME SERVER ipaddress

Message Format:

- TOTAL NUMBER OF QUERIES SENT *total_sent*
- TOTAL NUMBER OF FAILURES *total_fail*
- TOTAL NUMBER OF RESOLVER POLLS SENT *total_polls_sent*
- TOTAL NUMBER OF POLL FAILURES *total_polls_fail*
- PERCENTAGE percent%

Explanation: This is a multi-line message that is issued by the resolver to report statistical information about an unresponsive name server. The statistics are based on data that was accumulated by the resolver during the most recent monitoring interval. The data is specific to the specified name server.

In the message text:

*ipaddress*

The IPv4 or IPv6 network address of the name server that is considered to be unresponsive.

*total_sent*

The number of queries that were directed to the unresponsive name server during the most recent monitoring interval. This value includes domain name server (DNS) queries that were generated by an application and resolver polling queries (*total_polls_sent*).

*total_fail*

The number of queries that were directed to the name server during the most recent monitoring interval for which a response was not received. This value includes failures to respond to DNS queries that were generated by an application and to resolver polling queries (*total_polls_fail*).
total_polls_sent
The number of resolver polling DNS queries that were directed to the unresponsive name server during the most recent monitoring interval.

total_polls_fail
The number of times that the name server did not respond to resolver polling DNS queries that were directed to that name server during the most recent monitoring interval.

percent
The percentage of total DNS queries (total_sent) to which the name server did not respond during the most recent monitoring interval.

System action: Processing continues. The resolver resets the statistics to 0 before starting the next monitor interval.

Operator response: None.

System programmer response: The resolver issues message EZZ9313I at the same time that message EZZ9311E is issued. See message EZZ9311E for the appropriate system programmer response.

EZZ9316I TRMD TCP
statistics=timestamp, port=port, host=host, lhost=lhost, peak=peak, hostpeak=hostpeak, requests=requests, terminations=terminations, current=current, suggested_limit=suggested_limit, suggested_percentage=suggested_percentage, duration=duration, warnings=warnings, qos_exceptions=qos_exceptions, action=action, sensorhostname=sensorhostname

Explanation: Traffic Regulation statistics have been gathered.

*timestamp* is the time the statistics were recorded.

*port* is the port from which these statistics were collected.

*host* is the IP address that requested a connection and held the maximum number of concurrent connections for a single host during the collection interval.

*lhost* is the IP address of the local host that held the maximum number of concurrent connections for a single host during the collection interval.

*peak* is the maximum number of concurrent connections to this port held during the collection interval.

*hostpeak* is the largest number of connections held by host at any time during the collection interval.

*requests* is the number of connections requested during the collection interval.

*terminations* is the number of connections that were disconnected during the collection interval.

*current* is the number of connections currently active on this port.

*suggested_limit* is a suggested value for TotalConnections based on the traffic during this collection interval. If TypeActions Limit is specified and connections are refused during the interval, the value will be 0.

*suggested_percentage* is a suggested value for Percentage based on the traffic during this collection interval. If TypeActions Limit is specified and connections are refused during the interval, the value will be 0.

*duration* is the amount of time spent in a constrained state. A constrained state occurs when the number of available connections dropped to 10% of TotalConnections value. A constrained state ends when the number of available connections increases to 12% of TotalConnections.

*warnings* is the number of connections that would have been refused if TypeActions Limit had been specified.

*qos_exceptions* is the number of connections that would have been refused by Intrusion Detection Services (IDS) policy, but allowed by QoS policy if TypeActions Limit had been specified.

*action* is the policy TypeAction indicator. LIMIT indicates TypeActions LIMIT was specified in the policy; NOLIMIT indicates TypeActions LIMIT was not specified in the policy.

*sensorhostname* is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

Explanation: The Intrusion Detection Services (IDS) policy for TCP specified TypeActions Limit. A connection that did not meet current IDS policy specification was allowed by QoS policy.
timestamp is the date and time at which the QoS exception was made.
lhost is the IP address of the local host.
port is the port on which the QoS exception occurred.
host is the host for which the QoS exception was made.
available is the number of connections out of the total pool that were still available.
total is the number of connections specified by the TotalConnections policy keyword.
percent is the percentage specified by the Percentage policy keyword.
correlator is the IDS trace correlator.
probeid is the unique identifier of the probe detection point.
host_current is the number of connections that the host held at the time of the QoS exception.
qos_limit is the number of connections allowed by the excepting QoS policy.
sensorhostname is the fully qualified host name of the IDS sensor.

System action:  Processing continues.

EZZ9320I  TRMD TCP constrained entry
logged:timestamp,lhost=host,port=port,host=host,available=available,total=total,percent=percent,
correlator=correlator,probeid=probeid,threshold=threshold,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for TCP did not specify TypeActions Limit. The available connections for this port fell to 10% of the value specified in the TotalConnections policy specification.

*timestamp* is the date and time at which the constrained condition was entered.

*lhost* is the IP address of the local host.

*port* is the port that entered constrained state.

*host* is the IP address of the host causing the constraint.

*available* is the number of connections available out of the total pool.

*total* is the number of connections specified by the TotalConnections policy keyword.

*percent* is the percentage specified by the Percentage policy keyword.

*correlator* is the IDS trace correlator.

*probeid* is the unique identifier of the probe detection point.

*threshold* is the constrained state is entered when available is less than or equal to threshold.

*sensorhostname* is the fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**EZZ9321I** TRMD TCP constrained entry:

\[\text{timestamp}, lhost=\text{lhost}, port=\text{port}, host=\text{host}, available=\text{available}, total=\text{total}, percent=\text{percent}, correlator=\text{correlator}, probeid=\text{probeid}, threshold=\text{threshold}, sensorhostname=\text{sensorhostname}\]

**Explanation:** The Intrusion Detection Services (IDS) policy for TCP specified TypeActions Limit. The available connections for this port fell to 10% of the value specified in the TotalConnections policy specification.

- `timestamp` is the date and time at which the constrained condition was entered.
- `lhost` is the IP address of the local host.
- `port` is the port that entered constrained state.
- `host` is the IP address of the host causing the constraint.
- `available` is the number of connections available out of the total pool.
- `total` is the number of connections specified by the TotalConnections policy keyword.
- `percent` is the percentage specified by the Percentage policy keyword.
- `correlator` is the IDS trace correlator.
- `probeid` is the unique identifier of the probe detection point.
- `threshold` indicates that the constrained state is entered when `available` is less than or equal to `threshold`.
- `sensorhostname` is the fully qualified host name of the IDS sensor.

**EZZ9322I** TRMD TCP constrained exit

\[\text{logged}:\text{timestamp}, \text{lhost}=\text{lhost}, \text{port}=\text{port}, \text{host}=\text{host}, \text{available}=\text{available}, \text{total}=\text{total}, \text{percent}=\text{percent}, \text{correlator}=\text{correlator}, \text{probeid}=\text{probeid}, \text{duration}=\text{duration}, \text{sensorhostname}=\text{sensorhostname}\]

**Explanation:** The Intrusion Detection Services (IDS) policy for TCP did not specify TypeActions Limit. The number of available connections for this port exceeded 12% of the value specified in the TotalConnections policy specification.

- `timestamp` is the date and time at which the constrained condition ended.
- `lhost` is the IP address of the local host.
- `port` is the port that is no longer constrained.
- `host` is the IP address of the host causing the constraint.
- `available` is the number of connections available out of the total pool.
- `total` is the number of connections specified by the TotalConnections policy keyword.
- `percent` is the percentage specified by the Percentage policy keyword.
- `correlator` is the IDS trace correlator.
- `probeid` is the unique identifier of the probe detection point.
- `threshold` indicates that the constrained state is exited when `available` is greater than `threshold`.
- `duration` is the number of seconds the port was constrained.
- `sensorhostname` is the fully qualified host name of the IDS sensor.

**System action:** Processing continues.

**Operator response:** None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZZ9323I TRMD TCP constrained
    exit:timestamp,lhost=local_host,host=host,available=available,total=total,percent=percent,
    correlator=correlator,probeid=probeid,threshold=threshold,duration=duration,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for TCP specified TypeActions Limit. The number of available connections for this port exceeded 12% of the value specified in the TotalConnections policy specification.

timestamp is the date and time at which the constrained condition ended.
lhost is the IP address of the local host.
port is the port that is no longer constrained.
host is the IP address of the host causing the constraint.
available is the number of connections available out of the total pool.
total is the number of connections specified by the TotalConnections policy keyword.
percent is the percentage specified by the Percentage policy keyword.
correlator is the IDS trace correlator.
probeid is the unique identifier of the probe detection point.
threshold indicates that the constrained state is exited when available is greater than threshold.
duration is the number of seconds the port was constrained.
sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZZ9324I TRMD TCP connection refused:
    refused:timestamp,lhost=local_host,host=host,available=available,total=total,percent=percent,
    correlator=correlator,probeid=probeid,host_current=host_current,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Services (IDS) policy for TCP specified TypeActions Limit. A connection that did not meet current Traffic Regulation policy specification was refused.

timestamp is the date and time at which the connection was refused.
lhost is the IP address of the local host.
port is the port to which the refused connection was destined.
host is the IP address of the host that was refused.
available is the number of connections available out of the total pool.
total is the number of connections specified by the TotalConnections policy keyword.
percent is the percentage specified by the Percentage policy keyword.
correlator is the IDS trace correlator.
probeid is the unique identifier of the probe detection point.
host_current is the number of connections that host held when the connection was refused.
sensorhostname is the fully qualified host name of the IDS sensor.
System action: Processing continues.
Operator response: None.
System programmer response: None.
Module: EZATRMD
Procedure name: WriteLogEntries

EZ9325I  TRMD Log records
missing:timestamp,logtype=logtype,logmissing=logmissing,probeid=probeid,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Service (IDS) event recording capacity was exceeded and log entries for an intrusion type specified in an active policy have been lost.

timestamp is the date and time at which the log entries were lost.

logtype is the intrusion type for which log entries have been lost. logtype will be one of the following:
- ATTACK
- TCPTR
- UDPTR
- SCAN
- SCANDT

logmissing is the number of log entries missing.

probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.
System programmer response: Examine relevant syslog messages to determine the source of the log entries and either adjust the active policy to be less restrictive or investigate the logged intrusions.

Module: EZATRMD
Procedure name: WriteLogEntries

EZ9326I  TRMD Statistics records
missing:timestamp,stattype=stattype,statmissing=statmissing,probeid=probeid,sensorhostname=sensorhostname

Explanation: The Intrusion Detection Service (IDS) event recording capacity was exceeded and statistics entries for an intrusion type specified in an active policy have been lost.

timestamp is the date and time at which the statistics entries were lost.

stattype is the intrusion type for which statistics entries have been lost. stattype will be one of the following:
- ATTACK
- TCPTR
- UDPTR

statmissing is the number of statistics entries missing.

probeid is the unique identifier of the probe detection point. See z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.
Operator response: None.

System programmer response: Examine relevant syslog messages to determine the source of the statistics entries and either adjust the active policy to be less restrictive or investigate the intrusions resulting in statistics logging.

Module: EZATRMD

Procedure name: WriteStatEntries

EZZ9327I TRMD Attack log records suppressed:
date time,attack
type=attacktype,count=count,probeid=probeid,sensorhostname=sensorhostname

Explanation: Intrusion Detection Services (IDS) event recording was suppressed for an attack type specified in the active policy. IDS suppresses logging of attack events of a particular attack type after 100 events have been logged in a 5-minute interval. This is done to prevent syslog flooding. Logging resumes after the 5-minute interval ends.

date is the date of the beginning of the 5-minute interval in which log records were suppressed.

time is the time of the beginning of the 5-minute interval in which log records were suppressed.

attacktype is the attack event type. attacktype will be one of the following:

- Malformed
  Malformed packet

- OutboundRaw
  Outbound RAW restriction

- IPFragment
  Inbound fragment

- ICMP
  ICMP redirect

- IPOPT
  IP option restriction

- IPPROTO
  IP protocol restriction

- Flood
  Flood event

- PerpEcho
  UDP perpetual echo

- DataHiding
  Data hiding

- TCPQueueSize
  TCP queue size event

- GlobalTCPStall
  Global TCP stall event

- OutboundRaw6
  IPv6 outbound RAW restriction

- IPv6NextHeader
  IPv6 next header restriction

- IPv6HopOptions
  IPv6 hop-by-hop option restriction

- IPv6DestOptions
  IPv6 destination option restriction

- EELDLDCheck
  EE packet received on wrong port
EEMalformed
  EE malformed packet

EEPortCheck
  EE source port incorrect

EEXIDFlood
  EE XID flood detection

These correspond to the AttackType values specified in IDS policy. See the Z/OS Communications Server: IP Configuration Guide for a description of attack event types.

count is the number of log entries suppressed.

probeid is the unique identifier of the probe detection point. See Z/OS Communications Server: IP and SNA Codes for a description of the Intrusion Detection Services probe IDs.

sensorhostname is the fully qualified host name of the IDS sensor.

System action: Processing continues.

Operator response: None.

System programmer response: Examine relevant syslog messages to determine the source of the log entries and take appropriate action: adjust the active policy to be less restrictive or investigate the logged intrusions.

Module: EZATRMD

Example:
EZZ9327I TRMD Attack log records suppressed:07/16/2010 20:19:43.52,attack
type=IPFragment,count=57,probeid=0403FFF0,sensorhostname=MVS123.tcp.company.com

Procedure name: WriteLogEntries

---

EZZ9331I get interface configuration: description, errno=errnojr

Explanation: The named server failed to get the configuration of a recently created IPv4 interface manager socket. description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the Z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Ensure that the IPv4 interface the named is requesting configuration data for is a valid IPv4 interface.

System programmer response: None.

Module: INTRFCEI

Procedure name: isc_interfaceiter_create

---

EZZ9332I get interface configuration: maximum buffer size exceeded

Explanation: The named server received more IPv4 interface configuration data than it can accommodate. The data received on the IPv4 interface configuration exceeded 1 megabyte in size.

System action: The named server continues.

Operator response: Ensure that the IPv4 interface the named is requesting configuration data for is a valid IPv4 interface.

System programmer response: None.

Module: INTRFCEI

Procedure name: isc_interfaceiter_create
EZZ9333I  interface_iterator_name: getting interface flags: description, errno2=errnojr

Explanation: The named server failed to get the network interface flags because of an ioctl error. There is a problem with TCP/IP Services or z/OS. This interface will be ignored.

interface_iterator_name is the interface iterator name.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the IOCTL option and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Dump the named address space if the named server did not end. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space.
- Dump the TCP/IP Stack. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping the TCP/IP stack.

Module: INTRFCEI

Procedure name: internal_current

EZZ9334I  interface_iterator_name: getting destination address: description, errno2=errnojr

Explanation: The named server failed to get the destination address in a point to point interface because of an ioctl error. There is a problem with TCP/IP Services or z/OS. This interface will be ignored.

interface_iterator_name is the interface iterator name.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the IOCTL option and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Dump the named address space if the named server did not end. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space.
- Dump the TCP/IP Stack. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping the TCP/IP stack.

Module: INTRFCEI

Procedure name: internal_current
EZZ9335I  interface_iterator_name: getting netmask: description, errno2=errnojr

Explanation: The named server failed to get the network interface network mask because of an ioctl error. There is a problem with TCP/IP Services or z/OS. This interface will be ignored.

interface_iterator_name is the interface iterator name.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the IOCTL option and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- The component trace requested.
- Dump the named address space if the named server did not end. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space.
- Dump the TCP/IP Stack. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping the TCP/IP stack.

Module: INTRFCEI

Procedure name: internal_current

EZZ9342I  missing SOA

Explanation: The named server dynamic update failed to process a resource record (RR) because it could not find a node in the start of authority (SOA) data. The SOA serial number was not updated. The dynamic update action will fail.

System action: The named server continues.

Operator response: Ensure that the zone being updated contains a valid SOA resource record.

System programmer response: None.

Module: JOURNAL

Procedure name: dns_db_createiotauple

EZZ9343I  isc_mutex_init() failed: error_text

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

error_text describes the error.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ZONE

Procedure name: dns_zonemgr_create
EZZ9344I  isc_mutex_init() failed: error_text
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: DNSSDB
Procedure name: createnode

EZZ9345I  isc_mutex_init() failed: error_text
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
error_text describes the error.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: KEYTABLE
Procedure name: dns_keytable_create

EZZ9346I  isc_rwlock_init() failed: error_text
Explanation: The named server failed to place a read/write lock.
error_text describes the error.
System action: If the named is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: KEYTABLE
Procedure name: dns_keytable_create

EZZ9352I  isc_lex_gettoken() failed: error_text
Explanation: The named server failed to load a master file because the master file resource record token being processed was not one of the following:
• end-of-line
• end-of-file
• multiple line condition
• escape character
The master file being processed will not be loaded.
error_text describes the error.

System action: The named server continues.

Operator response: Ensure that the master file being loaded contains valid resource records.

System programmer response: None.

Module: MASTER

Procedure name: gettoken

EZZ9353I  dns_master_load: source_filesource_line_number: $DATE outside epoch

Explanation: The date specified on the $DATE master file record is incorrect. The master file will not be loaded.

source_file is the source being processed by lex.

source_line_number is the line number in the source file.

System action: The named server continues.

Operator response: Ensure that the date specified on the $DATE master file resource record is correct.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9354I  dns_master_load: source_filesource_line_number: $DATE in future, using current date

Explanation: The date specified on the $DATE master file record is incorrect. The current date will be used instead. The master file will be loaded.

source_file is the source being processed by lex.

source_line_number is the line number in the source file.

System action: The named server continues.

Operator response: Ensure that the date specified on the $DATE master file resource record is correct.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9355I  source_filesource_line_number: isc_lex_gettoken() returned unexpected token type (token_type)

Explanation: The named server failed to process the master file being loaded because it found tokens other than the following:

• end-of-file
• end-of-line
• strings

The master file will not be loaded.

source_file is the source being processed by lex.

source_line_number is the line number lex is processing.

token_type is the token type found in error.

System action: The named server continues.

Operator response: Correct the resource record in error.

System programmer response: None.
EZZ9356I  isc_lex_gettoken() returned unexpected token type

Explanation: The named server failed to process a time-to-live (TTL) resource record in the master file being loaded. The TTL value was not a string. The master file is not loaded.

System action: The named server continues.

Operator response: Ensure that the TTL specified is correct. See the z/OS Communications Server: IP Configuration Reference for more information about specifying a TTL value.

System programmer response: None.

Module: MASTER
Procedure name: load

EZZ9357I  isc_lex_gettoken() returned unexpected token type

Explanation: The named server failed to process a time-to-live (TTL) resource record in the master file being loaded. The TTL value was not a string. The master file is not loaded.

System action: The named server continues.

Operator response: Ensure that the TTL specified is correct. See the z/OS Communications Server: IP Configuration Reference for more information about specifying a TTL value.

System programmer response: None.

Module: MASTER
Procedure name: load

EZZ9358I  isc_mutex_init() failed: error_text

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

error_text describes the error.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: DNSSDB
Procedure name: dns_sdb_create

EZZ9359I  isc_rwlock_init() failed: error_text

Explanation: The named server failed to create a forward table because of a problem creating a read/write lock.

error_text describes the error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: FORWARD
Procedure name:  dns_fwdtable_create

EZZ9360I     could not set master file style

Explanation:   The named server failed to convert the resource data set or question section because of a problem with the master file style. The data being processed might be too long or there might be insufficient buffer space to convert the data from column format.

System action:  The named server continues.

Operator response:  Ensure that the master file data being processed is correct. If you are unable to resolve this problem, then contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module:  MASTERDU

Procedure name:  dns_rdataset_totext

EZZ9361I     master file write failed:  error_text

Explanation:   The named server failed to write the domain resource data to a master file. error_text describes the error.

System action:  The named server continues.

Operator response:  Ensure that the named server has the authority to write to a master file. Use the error response to determine why the named server could not write the buffer to the master file.

System programmer response:

Module:  MASTERDU

Procedure name:  dump_rdataset

EZZ9362I     could not set master file style

Explanation:   The named server failed to convert the resource data set or question section because of a problem with the master file style. The data being processed might be too long or there might be insufficient buffer space to convert the data from column format.

System action:  The named server continues.

Operator response:  Ensure that the master file data being processed is correct. If you are unable to resolve this problem, then contact the system programmer.

System programmer response:  Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module:  MASTERDU

Procedure name:  dns_master_dumptostream
EZZ9363I  isc_mutex_init() failed

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ISCMEM

Procedure name: isc_mem_createx

---

EZZ9364I  socket() failed: errno_text, errno2=errnojr

Explanation: The named server failed to create a socket.

eerrno_text describes the error.

eerrnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Use the error response to determine why the named server could not create a socket. If you are not able to resolve the problem, then contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: NET

Procedure name: try_proto

---

EZZ9365I  unknown state in omapi_protocol_signal_handler: protocol_state

Explanation: The named server object manager failed to process a protocol signal because of an incorrect protocol state. The named object manager wakes up after a number of bytes were processed to check for signals.

protocol_state is the state of the signal handler. Valid protocol states are as follows:

- intro wait
- header wait
- name length wait
- name wait
- value length wait
- value wait
- signature wait

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The **named** server configuration file
• The SYSLOG DAEMON logging file
• All configured **named** logs
• The component trace requested

**Module**: OMAPPROT

**EZZ9372I isc_time_nowplusinterval: error_text**

**Explanation:** The named server failed to compute the resolver fetch expiration time.

*error_text* describes the error.

**System action:** The named server continues.

**Operator response:** Use the z/OS UNIX date command to ensure that the CPU time is correct. See the [z/OS UNIX System Services Command Reference](https://www.ibm.com/support/knowledgecenter/SSSHQN_2.1.0/com.ibm.zos.v2r1.0.shshrf.shshrf.pdf) for more information about the date command.

**System programmer response:** None.

**Module:** RESOLVER

**Procedure name:** fctx_create
EZZ9373I isc_timer_create: error_text

Explanation: The named server failed to create the resolver fetch inactivity timer.

error_text describes the error.

System action: The named server continues.

Operator response: Use the z/OS UNIX date command to ensure that the CPU's date is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.

System programmer response: None.

Module: RESOLVER
Procedure name: fctx_create

EZZ9374I isc_result_register() failed: error_code

Explanation: The named server failed to register an internal results table used to report function results in textual format because of insufficient memory.

error_code describes the error and will be a 1 for insufficient memory.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: DNSRESUL
Procedure name: initialize_action

EZZ9375I register_table() failed: error_code

Explanation: The named server failed to register an internal results table used to report function results in textual format because of insufficient memory.

error_code describes the error and will be a 1 for insufficient memory.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: ISCRESUL
Procedure name: initialize_action

EZZ9377I isc_mutex_init() failed: error_text

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

error_text describes the error.

System action: The named server might end depending on the severity of the problem.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking.
Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: RWLOCK
Procedure name: print_lock
EZZ9378I isc_condition_init(readable) failed: error_text

Explanation: The named server failed to initialize the thread condition variable because of insufficient memory. The read/write lock conditional variable is not set.

error_text describes the error.

System action: The named server might end depending on the severity of the problem.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: RWLOCK
Procedure name: print_lock

EZZ9379I isc_condition_init(writeable) failed: error_text

Explanation: The named server failed to initialize the thread condition variable because of insufficient memory. The read/write lock conditional variable is not set.

error_text describes the error.

System action: The named server might end depending on the severity of the problem.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: RWLOCK
Procedure name: print_lock

EZZ9380I unknown address family: socket_address_family

Explanation: The named found an incorrect socket address family for the socket address being hashed. The valid socket address families are AF_INET or AF_INET6 addresses. The hash value will not be provided for the socket address.

socket_address_family is the socket address family found in error.

System action: The named server continues.

Operator response: Ensure that all socket addresses are AF_INET or AF_INET6 addresses.

System programmer response: None.

Module: SOCKADDR
Procedure name: isc_sockaddr_hash

EZZ9381I fcntl(file_descriptor, F_SETFL, flag_set): error_text, errno2=errnojr

Explanation: The named server failed to change a socket to a non-blocking status.

file_descriptor is the file Descriptor the fcntl() is using.
flag_set is the set of flags that fcntl() is using.
error_text describes the error.

errojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes

System action: If the named server was creating a socket manager, it ends. Otherwise, it continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
The named server configuration file
The SYSLOG DAEMON logging file
All configured named logs
The component trace requested

Module: ISCSOCKT
Procedure name: make_nonblock

EZZ9382I  internal_send: address: error_text

Explanation: The named server failed to send a message to a socket. 
address is the ip address that is failing an internal send.
error_text describes the error.

System action: The named server continues
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested

Module: ISCSOCKT
Procedure name: doio_send

EZZ9383I  internal_send: send() returned 0

Explanation: The named server sent zero bytes of data to the client. This is not an error.

System action: The named server continues.
Operator response: None.
System programmer response: None.

Module: ISCSOCKT
Procedure name: doio_send

EZZ9384I  isc_mutex_init() failed

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ISCSOCKT
Procedure name: allocate_socket
EZZ9385I  socket() failed: error_text, errno2=errnojr
Explanation: The named server failed to create a socket.
error_text describes the error.
errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Re-create this problem with a SYSTCP/IP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested
Module: ISCSOCKT
Procedure name: isc_socket_create

EZZ9390I  internal_accept: accept() failed: error_text, errno2=errnojr
Explanation: The named server accept() failed.
error_text describes the error.
errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojs) information of the z/OS UNIX System Services Messages and Codes.
System action: The named server continues.
Operator response: If a TCP/IP stack was started while the name server was running, or if a TCP/IP stack ended while the name server was running, this message is expected. Otherwise, contact the system programmer.
System programmer response: Re-create this problem with a SYSTCP/IP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
• The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested
Module: ISCSOCKT
Procedure name: internal_accept

EZZ9392I  isc_mutex_init() failed
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: ISCSOCKT
Procedure name: isc_socketmgr_create
EZZ9393I  isc_condition_init() failed

Explanation: An error condition occurred while setting the shutdown_ok condition for the socket manager being created because of insufficient memory. The socket manager is not created.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: ISCSOCKT

Procedure name: isc_socketmgr_create

EZZ9394I  pipe() failed: error_text, errno2=errnojr

Explanation: The named server failed to create a pipe.

error_text describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: ISCSOCKT

Procedure name: isc_socketmgr_create

EZZ9395I  isc_thread_create() failed

Explanation: The named server failed to start the select/pool thread because of insufficient memory or the system cannot support another thread.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server. Ensure that the user ID used by the named server has the correct security privileges. See the z/OS Communications Server IP Configuration Reference.

Module: ISCSOCKT

Procedure name: isc_socketmgr_create

EZZ9396I  isc_thread_join() failed

Explanation: The named server failed to destroy the socket manager because the thread will not end. The thread might be incorrect, undetached, or in a deadlock condition. Thread cleanup continues.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
EZZ9397I • EZZ9398I

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: ISCSOCKT

Procedure name: isc_socketmgr_destroy

---

EZZ9397I  setsockopt(socket_file_descriptor) failed

Explanation: An attempt to set socket option SO_REUSEADDR in isc_socket_bind() or SO_EioIfNewTP in isc_socket_create() failed. Socket bind continues.

socket_file_descriptor

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: ISCSOCKT

Procedure name: isc_socket_bind/isc_socket_create

---

EZZ9398I  bind: error_text, errno=errno, errno2=errnojr

Explanation: The named server bind() failed.

error_text describes the error.

errno is the z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:
- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: ISCSOCKT

Procedure name: isc_socket_bind
EZZ9399I  listen: description, errno2=errnojr

Explanation: The named server listen() failed.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

• The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested

Module: ISCSOCKT

Procedure name: isc_socket_listen

EZZ9401I  description, errno, errno2=errnojr

Explanation: The named server failed to connect a socket.

description describes the error.

errno is the decimal z/OS UNIX System Services return code. These return codes are listed and described in the return codes (errnos) information in z/OS UNIX System Services Messages and Codes.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

• The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested

Module: ISCSOCKT

Procedure name: isc_socket_connect

EZZ9401I  internal_connect: connect() description, errno2=errnojr

Explanation: The named server encountered a socket error while processing a pending socket connection.

description describes the error.

errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC,
UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

**Module:** ISCSOCKT

**Procedure name:** internal_connect

---

**EZ9402I**

getsockname: description, errno2=errnojr

**Explanation:** The named server failed to get a socket name for a connection. The connection ends.

*description* describes the error.

*errnojr* is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes.

**System action:** The named server continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

**Module:** ISCSOCKT

**Procedure name:** isc_socket_getsockname

---

**EZ9403I**

isc_mutex_init() failed

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

**Module:** TASK

**Procedure name:** isc_task_create

---

**EZ9404I**

isc_mutex_init() failed

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

**System action:** The named server ends.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

**Module:** TASK
Procedure name: isc_taskmgr_create

EZZ9405I isc_condition_init() failed
Explanation: The named server failed to initialize a conditional variable because of insufficient memory.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: TASK
Procedure name: isc_taskmgr_create

EZZ9406I description, errno2=errnojr
Explanation: The named server failed to obtain the time of day. Messages will not have the correct time values.
description describes the error.
errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the
reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes
System action: The named server continues.
Operator response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.
System programmer response: None.
Module: ISCTIME
Procedure name: isc_time_now

EZZ9407I description, errno2=errnojr
Explanation: The named server failed to obtain the time of day. Messages will not have the correct time values.
description describes the error.
errnojr is the hexadecimal reason code. The format of the 4-byte reason code is explained in the introduction to the
reason codes (errnojrs) information of the z/OS UNIX System Services Messages and Codes
System action: The named server continues.
Operator response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.
System programmer response: None.
Module: ISCTIME
Procedure name: isc_time_nowplusinterval

EZZ9408I isc_time_now() failed: error_text
Explanation: The named server failed to create a timer while obtaining the time of day. An internal manager will
not have a timer.
error_text describes the error.
System action: If the named server was processing server functions it ends. If the named server is initially loading,
it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.
System programmer response: None.
Module: TIMER
Procedure name: isc_timer_create

EZZ9409I  isc_mutex_init() failed
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: TIMER
Procedure name: isc_timer_create

EZZ9410I  isc_time_now() failed: error_text
Explanation: The named server failed to obtain the time of day. The timers type, expire, and interval value will not be changed. the current time.
error_text describes the error.
System action: The named server continues.
Operator response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.
System programmer response: None.
Module: TIMER
Procedure name: isc_timer_reset

EZZ9411I  isc_time_now() failed: error_text
Explanation: The named server failed to obtain the time of day. The timer will not have the correct time.
error_text describes the error.
System action: The named server continues.
Operator response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command.
System programmer response: None.
Module: TIMER
Procedure name: isc_timer_touch

EZZ9412I  couldn't allocate event
Explanation: The named server timer dispatcher failed to post an event because of insufficient memory. A thread will not be dispatched.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: TIMER
Procedure name: dispatch
EZ9413I couldn't schedule timer: result

Explanation: The named server failed to schedule a thread timer because of insufficient memory or the time of day is incorrect. A thread will not be dispatched. The event is not scheduled.

result is the result returned from the schedule function.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Use the z/OS UNIX date command to ensure that the CPU time is correct. See the z/OS UNIX System Services Command Reference for more information about the date command. Otherwise, increase the TSO address space or region size and restart the named server.

Module: TIMER
Procedure name: dispatch

---

EZ9414I isc_mutex_init() failed

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: TIMER
Procedure name: isc_timermgr_create

---

EZ9415I isc_condition_init() failed

Explanation: The named server failed to create a condition variable for a thread because of insufficient memory.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: TIMER
Procedure name: isc_timermgr_create

---

EZ9416I isc_thread_create() failed

Explanation: The named server failed to create a thread because of one of the following reasons:

- The system could not create another thread.
- The thread is not valid.
- There is not enough memory to create the thread.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Ensure that adequate resources are available for the thread or increase the TSO address space or region size and restart the named server. Otherwise, re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
The component trace requested.
A dump of the named server address space. See the z/OS Communications Server: IP Diagnosis Guide for information about dumping an address space.

Module: TIMER
Procedure name: isc_timermgr_create

**EZZ9417I isc_thread_join() failed**

Explanation: The named server failed waiting for a thread to end. The named server is shutting down and continues with the clean up process.
System action: The named server ends.
Operator response: None.
System programmer response: None.
Module: TIMER
Procedure name: isc_timermgr_destroy

**EZZ9419I isc_rwlock_init() failed: error_text**

Explanation: The named server failed to create a transaction signature lock because of insufficient memory. error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: TSIG
Procedure name: dns_tsigkeyring_create

**EZZ9421I isc_mutex_init() failed: error_text**

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock. error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.
Module: VIEW
Procedure name: dns_view_create

**EZZ9422I isc_rwlock_init() failed: error_text**

Explanation: The named server failed to create a view lock because of insufficient memory. error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the user ID used by the named server has sufficient authority to
perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: VIEW
Procedure name: dns_view_create

EZZ9423I dns_zt_create() failed: error_text
Explanation: The named server failed because of insufficient memory.
error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server. Ensure that the user ID used by the named server has the correct security privileges. See the z/OS Communications Server: IP Configuration Reference.

Module: VIEW
Procedure name: dns_view_create

EZZ9424I dns_keytable_create() failed: error_text
Explanation: The named server failed to create a key table for secured roots because of insufficient memory.
error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server. Ensure that the user ID used by the named server has the correct security privileges. See the z/OS Communications Server: IP Configuration Reference.

Module: VIEW
Procedure name: dns_view_create

EZZ9425I dns_keytable_create() failed: error_text
Explanation: The named server failed to create a key table for trusted keys because of insufficient memory.
error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server. Ensure that the user ID used by the named server has the correct security privileges. See the z/OS Communications Server: IP Configuration Reference.

Module: VIEW
Procedure name: dns_view_create

EZZ9426I isc_mutex_init() failed: error_text
Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.
error_text describes the error.
System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ZONE
Procedure name: dns_zone_create

---

EZZ9427I unexpected zone type zone_type

Explanation: The named server found a zone with a type other than master, secondary, or stub. The zone will not be loaded or reloaded.

zone_type is the zone type of the zone being processed.

System action: The named server continues.
Operator response: Ensure that the zone type being processed is master, secondary, or stub.
System programmer response: None.

Module: ZONE
Procedure name: dns_zone_create

---

EZZ9428I isc_rwlock_init() failed: error_text

Explanation: The named server failed to create a zone manager lock because of insufficient memory.

error_text describes the error.

System action: The named server ends.
Operator response: Contact the system programmer.
System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ZONE
Procedure name: dns_zonemgr_create

---

EZZ9430I isc_rwlock_init() failed: error_text

Explanation: The named server failed to create a zone table read/write lock because of insufficient memory. The named server is creating a view or a bind view, or searching for a view.

error_text describes the error.

System action: The named server continues.
Operator response: Contact the system programmer.
System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: ZONE
Procedure name: dns_zonemgr_create
Operator response: Contact the system programmer.

System programmer response: Ensure that the user ID used by the named server has sufficient authority to perform locking. Increase the TSO address space or region size and restart the named server. See the Z/OS Communications Server: IP Configuration Reference.

Module: ZT
Procedure name: dns_zt_create

---

EZZ9500I forward zones do not have a max-retry-time field

Explanation: The max-retry-time option is specified in a forward zone in the named server configuration file. The option max-retry-time is only allowed in master, secondary, or stub zones. This option is ignored.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the max-retry-time option from all forward zones or hint zones.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getmaxretrytime

---

EZZ9500I hint zones do not have a min-refresh-time field

Explanation: The min-refresh-time option is specified in a hint zone in the named server configuration file. The option min-refresh-time is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the min-refresh-time option from all forward zones or hint zones.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getminrefreshtime

---

EZZ9502I forward zones do not have a min-refresh-time field

Explanation: The min-refresh-time option is specified in a forward zone in the named server configuration file. The option min-refresh-time is only allowed in master, secondary, or stub zones.

System action: The named server ends.

Operator response: Remove the min-refresh-time option from all forward zones.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getminrefreshtime

---

EZZ9503I hint zones do not have a min-refresh-time field

Explanation: The min-refresh-time option is specified in a hint zone in the named server configuration file. The option min-refresh-time is only allowed in master, secondary, or stub zones.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Remove the min-refresh-time option from all hint zones.

System programmer response: None.

Module: CONFZONE
Procedure name: dns_c_zone_getminrefreshtime
EZZ9504I  forward zones do not have a min-refresh-time field
Explanation: The min-refresh-time option is specified in a forward zone in the named server configuration file. The option min-refresh-time is only allowed in master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the min-refresh-time option from all forward zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getminrefreshtime

EZZ9505I  hint zones do not have a max-refresh-time field
Explanation: The max-refresh-time option is specified in a hint zone in the named server configuration file. The option max-refresh-time is only allowed in master, secondary, or stub zones.
System action: The named server ends.
Operator response: Remove the max-refresh-time option from all hint zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setmaxrefreshtime

EZZ9506I  forward zones do not have a max-refresh-time field
Explanation: The max-refresh-time option is specified in a forward zone in the named server configuration file. The option max-refresh-time is only allowed in master, secondary, or stub zones.
System action: The named server ends.
Operator response: Remove the max-refresh-time option from all forward zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_setmaxrefreshtime

EZZ9507I  hint zones do not have a max-refresh-time field
Explanation: The max-refresh-time option is specified in a hint zone in the named server configuration file. The option max-refresh-time is only allowed in master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the max-refresh-time option from all hint zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getmaxrefreshtime

EZZ9508I  forward zones do not have a max-refresh-time field
Explanation: The max-refresh-time option is specified in a forward zone in the named server configuration file. The option max-refresh-time is only allowed in master, secondary, or stub zones.
System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Remove the max-refresh-time option from all forward zones.
System programmer response: None.
Module: CONFZONE
Procedure name: dns_c_zone_getmaxrefreshtime

**EZZ9509I unsupported database type** database_type

Explanation: The named server failed to build a database because the database requested is not supported.

*database_type* is the type of database.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Contact the system Programmer

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Dump the named address space. See the z/OS Communications Server: IP Diagnosis Guide for instructions on dumping an address space. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use the rndc dumpdb utility to dump the named servers cache to a file.
- The component trace requested.
- The dump of the named address space.

Module: DB
Procedure name: dns_db_create

**EZZ9510I dumping master file: file_name: close: error_text**

Explanation: The named server failed to close the dump file.

*file_name* is the dump file name.

*error_text* describes the error.

System action: The named server continues.

Operator response: Ensure that there is enough disk space to hold the master file being dumped.

System programmer response: None.

Module: MSTERDU
Procedure name: dns_master_dumpnode

**EZZ9511I $GENERATE: source_name:source_line: invalid range range**

Explanation: The named server does not load the zone data. An invalid range is specified as a parameter to the zone file directive $GENERATE. See the z/OS Communications Server: IP Configuration Reference for details on the correct syntax of the $GENERATE directive.

*source_name* is the file name of a zone file that contains a $GENERATE error.

*source_line* is the zone file line number that contains a $GENERATE error.

*range* is the range parameter of the $GENERATE directive.

System action: The named server continues.

Operator response: Specify a valid range to the $GENERATE directive and restart the named server.

System programmer response: None.

Module: MASTER
Procedure name: generate

EZ9512I $GENERATE: source_name source_line: unknown RR type gtype

Explanation: The named server does not load the zone data. An unknown resource record type is specified as a parameter to the zone file directive $GENERATE. See the z/OS Communications Server: IP Configuration Reference for details on the correct syntax of the $GENERATE directive.

source_name is the file name of a zone file that contains a $GENERATE error.
source_line is the zone file line number that contains a $GENERATE error.
gtype is the resource record type that is not supported by the $GENERATE directive.

System action: The named server continues.

Operator response: Specify a valid RR type to the $GENERATE directive and restart the named server.

System programmer response: None.

Module: MASTER

Procedure name: generate

EZ9513I $GENERATE: source_name source_line: unsupported type gtype

Explanation: The named server does not load the zone data. An unsupported resource record type is specified as a parameter to the zone file directive $GENERATE. The supported resource record (RR) types for the $GENERATE directive are name server (NS), pointer (PTR), conical name (CNAME), address (A) and IPv6 address (AAAA). See the z/OS Communications Server: IP Configuration Reference for details on the correct syntax of the $GENERATE directive.

source_name is the file name of a zone file that contains a $GENERATE error.
source_line is the zone file line number that contains a $GENERATE error.
gtype is the resource record type that is not supported by the $GENERATE directive.

System action: The named server continues.

Operator response: Specify a valid RR type to the $GENERATE directive and restart the named server.

System programmer response: None.

Module: MASTER

Procedure name: generate

EZ9514I $GENERATE: error_text

Explanation: An out of memory error was encountered while processing a $GENERATE zone file directive. The named server does not load the zone data.

error_text describes the error.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Increase the TSO address space or region size and restart the named server.

Module: MASTER

Procedure name: generate

EZ9515I $GENERATE: source_name source_line: error_text

Explanation: An error other an insufficient memory occurred while processing a $GENERATE directive. The named server does not load the zone data.

source_name is a file name of a zone file that contains a $GENERATE error.
source_line is the zone file line number that contains the $GENERATE error.

error_text is the error describing the problem with the $GENERATE directive.

System action: The named server continues.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use the `rndc dumpdb` utility to dump the named servers cache to a file.
- The component trace requested.

Module: MASTER

Procedure name: generate

EZZ9516I    dns_master_load: source_name source_line no TTL specified

Explanation: No $TTL directive was specified in the source_name zone file and no start of authority (SOA) resource record (RR) time-to-live (TTL) is specified to act as a default TTL value. In this case, the $TTL directive is required to provide a default value. Consult RFC 1035 and RFC 2308 for more details on zone file TTL values. The named server does not load the zone data. See [Appendix A, “Related protocol specifications,” on page 931](#) for directions to get a copy of the RFC.

source_name is the file name of the zone file that lacks a $TTL directive.

source_line is the line number of the first resource record that does not have an explicit TTL specified.

System action: The named server continues.

Operator response: Specify a $TTL value or specify an SOA record TTL value to act as the default TTL.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9517I    dns_master_load: source_name source_line error_text

Explanation: An error other than insufficient memory occurred while processing a zone file. The named server does not load the zone data.

source_name is the zone file name.

source_line is the zone file line number that caused the error.

error_text describes the error.

System action: The named server might end depending on the severity of the problem.

Operator response: Correct the problem described by this message. Otherwise, contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file.
- The SYSLOG DAEMON logging file.
- All configured named logs.
- Use the `rndc dumpdb` utility to dump the named servers cache to a file.
- The component trace requested.

Module: MASTER
Procedure name: load

EZZ9518I  lame server on name (in domain?): address

Explanation: The named server found a server that is registered as authoritative for some zone but is not itself configured as authoritative for that zone. Lame servers are misconfigurations in remote servers, discovered by BIND 9 when trying to query those servers during resolution.

name is the name of lame server.
domain is the domain found to be associated with the host.
address is the address of the host.

System action: The named server continues.
Operator response: None.
System programmer response: None.
Module: RESOLVER
Procedure name: log_lame

EZZ9519I  the TSIG key for name is too short to be secure

Explanation: The named configuration file defines a transaction signature (TSIG) key that is fewer than 64 bits in length. Keys smaller than 64 bits are insecure and should not be used.

name is the name of the TSIG key.

System action: The named server continues.
Operator response: Ensure that the keys used is at least 64 bits in length.
System programmer response: None.
Module: TSIG
Procedure name: dns_tsigkey_createfromkey

EZZ9520I  TTL differs in rdataset, adjusting TTL_data -> rdatalist_TTL

Explanation: The named server set the resource record being added time-to-live (TTL) value to that specified by a previous resource record.

TTL_data is the TTL for the resource record being added.
rdatalist_TTL is the TTL value that is being used for the new resource record.

System action: The named server continues.
Operator response: None.
System programmer response: None.
Module: DNSDIFF
Procedure name: dns_diff_apply

EZZ9521I  update with no effect

Explanation: The named server encountered an update that did not produce any changes to the zone data files. This is not an error.

System action: The named server continues.
Operator response: None.
System programmer response: None.
Module: DNSDIFF
Procedure name: dns_diff_apply

EZZ9522I update with no effect
Explanation: The named server encountered an update that did not produce any changes to the zone data files. This is not an error.
System action: The named server continues.
Operator response: None.
System programmer response: None.
Module: DNSDIFF
Procedure name: dns_diff_load

EZZ9523I dns_fwdtable_create() failed: error_text
Explanation: The named server failed to create a forwarding table because of insufficient memory.
error_text describes the error.
System action: If the named server is initially loading, and it ends. If the named server is reloading, it stops reloading and continues.
Operator response: Contact the system programmer.
System programmer response: Increase the TSO address space or region size and restart the named server.
Module: VIEW
Procedure name: dns_view_create

EZZ9543I notify failed: failing_reason error_text
Explanation: The named server failed to process a notify request.
failing_reason describes the error.
error_text is the error code in text from the zone change notification process.
System action: The named server ignores the notify message and continues.
Operator response: Set the debug level to 3 in the named logging files to determine the source of the notify requested.
System programmer response: None.
Module: NOTIFY
Procedure name: FAILC

EZZ9548I named BIND 9 is using default messages
Explanation: The named server will use the English only version of its messages.
System action: The named server continues.
Operator response: Ensure that a valid message catalog file named ns9.cat exists in the path specified by the NLSPATH z/OS UNIX shell environment variable.
System programmer response: None.
Module: B9MSGCAT
Procedure name: ibm_msgcat_init
EZZ9549I  named BIND 9 is using message catalog msgcat_name

Explanation: The named server will be retrieving its messages from the msgcat_name message catalog.
msgcat_name is the name of the message catalog where message are extracted.

System action: The named server continues.
Operator response: None.
System programmer response: None.
Module: B9MSGCAT
Procedure name: ibm_msgcat_init

EZZ9557I  error: error_text - during zone transfer of the following RR: resource_record

Explanation: An error was detected when receiving a zone transfer. A resource record (RR) was being processed at the time the error was detected.
error_text explains the error.
resource_record is the resource record that was being processed at the time the error was detected. The DNS name in the resource record is fully qualified, thus showing the zone name affected by the error.

System action: The zone in which the error was detected is not loaded by this name server. The name server continues.
Operator response: Contact the system programmer.
System programmer response: Contact the DNS administrator of the name server the zone was being transferred from and inform them of this error. The zone name is contained in the DNS name of resource_record. Usually this error is caused by a back-level name server that allows illegal resource records or combinations of resource records. The errors should be corrected on the primary name server of the zone in error.
Module: DNSDIFF
Procedure name: dns_diff_load

EZZ9558I  stopping command channel on socket_address

Explanation: The named server socket on socket_address is being closed and will no longer be used to process commands from an rndc client. rndc will no longer communicate with this named server on the socket, socket_address.
socket_address is the IP address on which rndc is no longer listening.

System action: The named server continues. The control channel was most likely stopped by a server shutdown or control channel reconfiguration. rndc client commands will no longer be processed by this named server until a new control channel is opened.
Operator response: If the command channel was not closed intentionally, check the logs for previous messages describing why the channel was closed.
System programmer response: None.
Module: CNTLCONF
Procedure name: shutdown_listener

EZZ9567I  no more recursive clients: error_text

Explanation: The named server is temporarily unable to allocate the necessary resources to accept new queries because of a large amount of outstanding recursive queries. When the answers to the outstanding queries are returned to this named server, the resource shortage will be relieved.

System action: The named server continues. New queries to the named server might temporarily be refused.
Operator response: None.
System programmer response: None.
Module: QUERY
Procedure name: query_recurse

EZZ9583I isc_mutex_init() failed: error_text

Explanation: An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

text describes the error.

System action: If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

Operator response: Contact the system programmer.

System programmer response: Ensure that the named server user ID has sufficient authority to perform locking. Increase the region size and restart the named server. See the z/OS Communications Server: IP Configuration Reference.

Module: DNSCACHE
Procedure name: dns_cache_create

EZZ9585I source_file: file does not end with newline

Explanation: An unexpected end-of-file condition caused the named server to end the parsing of the master file. source_file is the name of the master file being processed.

System action: The named server continues.

Operator response: Ensure that the master file data being processed is not a partial file.

System programmer response: None.

Module: MASTER
Procedure name: WARNUNEXPECTEDEOF

EZZ9586I dns_master_load: file_namedline_number: isc_lex_gettext() failed: error_text

Explanation: The named server failed to load a master file because the master file resource record token being processed was not one of the following:

- end-of-line
- end-of-file
- multiple line condition
- escape character

The master file being processed will not be loaded.

file_name is the name of the master file where the error was encountered.

line_number is the line number in the master file where the error was encountered.

error_text describes the error.

System action: The named server continues.

Operator response: Ensure that the master file being loaded contains valid resource records.

System programmer response: None.

Module: MASTER
Procedure name: gettoken
EZZ9590I  dns_master_load: source_file:line_number: ignoring out-of-zone data (name)

Explanation: The named server found records that belong to another zone. This record is ignored and the master file processing continues.

source_file is the name of the master file being processed.

line_number is the line number in the master file.

name is the domain name of the resource record in error.

System action: The named server continues.

Operator response: Ensure that the record in error is associated with the correct zone. After correcting the error, reload the named server.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9591I  source_file:line_number: no TTL specified; using SOA MINTTL instead

Explanation: The named server accepts (with a warning) master files beginning with an SOA record without an explicit TTL field and lacking a $TTL directive, by using the SOA MINTTL as a default TTL. This is for backwards compatibility with old versions of BIND 8, which accepted such files without warning although they are illegal according to RFC 1035. See [Appendix A, “Related protocol specifications,” on page 931] for information about accessing RFCs.

source_file is the master file where the error was encountered.

line_number is the line number in the master file where the error was encountered.

System action: Processing continues.

Operator response: Define an explicit TTL field on the affected SOA record or add a $TTL directive to the zone master file.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9592I  source_file:line_number: no TTL specified; zone rejected

Explanation: Zone loading is rejected because a resource record, which is not an SOA, has no defined TTL, and there is no $TTL directive to specify a default TTL for the zone records.

source_file is the master zone file where the error was encountered.

line_number is the line number in the master zone file where the error was encountered.

System action: Processing continues without loading the affected zone.

Operator response: Update zone file with $TTL directive or specify TTL value on every resource record where such value is not specified.

System programmer response: None.

Module: MASTER

Procedure name: load

EZZ9593I  retrieving the address of an IPv6 socket from the kernel failed.

Explanation: The named server attempted an AF_INET6 getsockname() C Runtime call, but the call failed, indicating that IPv6 is not enabled on the TCP/IP stack on which the named server is running.

System action: The named server continues. All communication over IPv6 in the named server is disabled.
Operator response: Contact the system programmer.

System programmer response: The named server is unable to successfully issue the getsockname() C Runtime call. This call is issued to test whether IPv6 support is enabled on the system. Check to make sure that an IPv6 enabled TCP/IP stack is running on this system. After an IPv6 enabled TCP/IP stack has been started, restart the named server.

Module: NET

Procedure name: try_proto

EZZ9594I IPv6 support is disabled.

Explanation: The named server will no longer use IPv6 for any communications.

System action: The named server continues. IPv4 communications will still be enabled unless specifically disabled by the listen-on option in named.conf.

Operator response: Notify the system programmer.

System programmer response: This message is issued with EZZ9593I indicating that IPv6 is not enabled on this system. Ensure that an IPv6 enabled TCP/IP stack is running on this system. After an IPv6 enabled TCP/IP stack has been started, the named server will automatically detect and use its IPv6 interfaces.

Module: NET

Procedure name: try_proto

EZZ9595I could not set master file style

Explanation: The named server failed to convert the resource data set or question section because of a problem with the master file style. The data being processed might be too long or there might be insufficient buffer space to convert the data from column format.

System action: The named server continues.

Operator response: Ensure that the master file data being processed is correct. If you are unable to resolve this problem, then contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
- The SYSLOG DAEMON logging file
- All configured named logs
- The component trace requested

Module: MASTERDU

Procedure name: dns_master_dumpnodetostream

EZZ9596I internal_accept(): accept() returned peer address family peer_family (expected expected_peer_family)

Explanation: The named server failed to accept a client connection because of an incorrect socket address family. peer_family is the family of the peer address. expected_peer_family is the expected socket peer family.

System action: The named server continues.

Operator response: Contact the system programmer.

System programmer response: Re-create this problem with a SYSTCPIP component trace active specifying the TC, UDP and IOCTL options and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
The SYSLOG DAEMON logging file
All configured named logs
The component trace requested

Module: ISCSOCKT
Procedure name: internal_accept

EZZ9599I setsockopt(socket_descriptor, IPV6_V6ONLY) failed: errno, errno2=errnojr

Explanation: A setsockopt call with the IPv6_V6ONLY option failed.
socket_descriptor is the socket descriptor of the socket affected by the failing call.
errno is the hexadecimal z/OS UNIX System Services return code. These return codes are listed and described in the
return codes (errno) information in z/OS UNIX System Services Messages and Codes.
(errnojr is the hexadecimal z/OS UNIX System Services reason code. The format of the 4-byte reason code is explained
in the introduction to the reason codes (errnojrs) information of the z/OS UNIX System Services Messages and
Codes where the reason codes are listed.

System action: The named server continues. IPv4 data sent to the named server might be received on an IPv6
socket as an IPv4-mapped IPv6 address. Consequently, any named.conf options that see the pure IPv4 address form
(in an address match list, for example) will not take effect on the intended data because the named server is using an
IPv4-mapped IPv6 address instead of the pure IPv4 address.

Operator response: Notify the system programmer.
System programmer response: Ensure that the TCP/IP stack is IPv6 enabled in the BPXPRMxx SYS1.PARMLIB
member.

Module: ISCSOCKT
Procedure name: isc_socket_create

EZZ9600I SNTP server ready

System action: The SNTP server is waiting for requests from SNTP clients.

Operator response: None.
System programmer response: None.

Module: sntpd.c
Procedure name: main()

EZZ9601I SNTP server ended

Explanation: The Simple Network Time Protocol (SNTP) server ended. This might be caused by a kill command
from the z/OS UNIX shell, a stop command from the MVS console, or an internal error.

System action: SNTP ends

Operator response: Restart the SNTP server.
System programmer response: None.

Module: sntpd.c
Procedure name: main()
EZZ96021  SNTP server initializing

Explanation: The Simple Network Time Protocol (SNTP) server is initializing.

System action: SNTP server continues.

Operator response: None.

System programmer response: None.

Module: sntpd.c

Procedure name: main()

EZZ9650I  VIPADISTRIBUTE WITH SYSPLEXPORTS REJECTED FOR DVIPA ip_addr

Explanation: A SYSPLEXPORTS keyword was found on a VIPADISTRIBUTE statement for a Dynamic VIPA (DVIPA) that already had a VIPADISTRIBUTE statement specified without the SYSPLEXPORTS keyword. The SYSPLEXPORTS keyword must be specified on the first VIPADISTRIBUTE statement specified for a specific DVIPA.

ip_addr is the IP address specified on the VIPADISTRIBUTE statement containing the rejected SYSPLEXPORTS keyword.

System action: Processing continues. The VIPADISTRIBUTE statement is rejected.

Operator response: Contact the system programmer.

System programmer response: To enable SYSPLEXPORTS, delete all previous VIPADISTRIBUTE statements for this DVIPA, then reissue the VIPADISTRIBUTE with SYSPLEXPORTS specified.

Module: EZBXFDYN

Procedure name: ValidateVDIST

EZZ9651I  TCPSTACKSOURCEVIPA IP ADDRESS ip_addr WAS NOT USED BY tcp_jobname

Explanation: An outbound connection request was processed but the IP address configured with TCPSTACKSOURCEVIPA could not be used as the source address because the address was not in the stack Home List, and did not fall in a configured VIPARANGE so a Dynamic VIPA could not be created.

ip_addr is the IP address specified on the TCPSTACKSOURCEVIPA parameter on the IPCONFIG statement. To avoid flooding the system console, this informational message will not be issued again for at least five minutes.

tcp_jobname is the name of the job associated with the procedure that was used to start TCP/IP.

System action: TCP/IP continues. The local address of the socket will be the address of the physical interface, unless there is a static VIPA in the HOME list above the physical link. If so, the static VIPA will be used.

Operator response: Contact the system programmer.

System programmer response: Change the TCPSTACKSOURCEVIPA address to an IP address in the stack's HOME list, or an IP address that falls in a configured VIPADYNAMIC VIPARANGE.

Module: EZBXFUT2

Procedure name: EZBXFSSV

EZZ9652I  INTERFACE dvipaintfname ALREADY EXISTS AS A type

Explanation: A specified interface name on a VIPADEFINE or VIPABACKUP statement, or the interface for a target DVIPA, has already been defined on this stack by an interface, link, or device statement.

dvipaintfname is the interface name associated with the dynamic VIPA.

type is either INTERFACE, LINK or DEVICE, indicating how this interface name was previously created.

System action: TCP/IP continues. The dynamic VIPA creation will be rejected. This message will be followed by another message indicating which statement or DVIPA activation failed.

Operator response: Contact the system programmer.
System programmer response: Change the dynamic VIPA statement to specify an interface name that is unique on this stack.

Module: EZBX6DVI
Procedure name: ValidateInterface

**EZZ9653I** VIPABACKUP *dvipaintfname* WAS REJECTED

Explanation: A VIPABACKUP statement was in error. A previous message with this interface name indicates the reason for the rejection.

*dvipaintfname* is the name of the interface specified on the VIPABACKUP statement.

System action: TCP/IP continues. The VIPABACKUP statement is rejected. This message will be preceded by another message indicating why the statement was rejected.

Operator response: Contact the system programmer.

System programmer response: Change the VIPABACKUP statement to correct the error.

Module: EZBX6DVI
Procedure name: PreValidateVBKUP6

**EZZ9654I** VIPADEFINE *dvipaintfname* WAS REJECTED

Explanation: A VIPADEFINE statement was in error. A previous message with this interface name indicates the reason for the rejection.

*dvipaintfname* is the name of the interface specified on the VIPADEFINE statement.

System action: TCP/IP continues and the VIPADEFINE statement is rejected. This message will be preceded by another message indicating why the statement was rejected.

Operator response: Contact the system programmer.

System programmer response: Change the VIPADEFINE statement to correct the error.

Module: EZBX6DVI
Procedure name: PreValidateVdef6

**EZZ9655I** DVIPA INTERFACE *dvipaintfname* CANNOT BE CHANGED WITH *vipadynamic*

Explanation: The Dynamic VIPA Interface is already defined and active on the current stack, and cannot be changed by a VIPADEFINE or VIPABACKUP directly.

*dvipaintfname* is the name of the interface specified on the VIPADEFINE or VIPABACKUP statement.

*vipadynamic* is either VIPADEFINE or VIPABACKUP.

System action: TCP/IP continues.

Operator response: Contact the system programmer.

System programmer response: If the Interface was incorrectly specified, correct the error and try the command or activation again.

If the Interface is correct and you want to change how the dynamic VIPA is defined, delete the dynamic VIPA with a VIPADELETE statement before the VIPADEFINE/VIPABACKUP.

**ATTENTION:** VIPADELETE will break any connections that might exist.

Module: EZBX6DVI
Procedure name: ValidateVDEF6
EZZ9656I  DVIPA INTERFACE dvipa_interface IS NOT CONFIGURED AS A DYNAMIC VIPA
Explanation:  A VIPADELETE statement was in error. The interface name specified does not exist as an active or backup DVIPA interface on this stack.

dvipa_interface is the name of the interface specified on the VIPADELETE statement.

System action:  TCP/IP continues. The VIPADELETE statement is rejected.

Operator response:  Contact the system programmer.

System programmer response:  Change the VIPADELETE statement to specify a valid dynamic VIPA interface name.

Module:  EZBX6DVI
Procedure name:  Validate_VDelIntf

EZZ9657I  VIPADELETE dvipa_interface WAS REJECTED
Explanation:  A VIPADELETE was in error. A previous message explains the error.

dvipa_interface is the name of the interface specified on the VIPADELETE statement.

System action:  TCP/IP continues and the VIPADELETE statement is rejected. This message will be preceded by another message indicating why the statement was rejected.

Operator response:  Contact the system programmer.

System programmer response:  Correct the VIPADELETE statement.

Module:  EZBX6DVI
Procedure name:  Validate_VDelIntf

EZZ9658I  dvipa IS ALREADY DEFINED ON INTERFACE intfname
Explanation:  A DVIPA being defined already exists on a different interface.
dvipa is the IPv6 dynamic VIPA address specified in the DVIPA define request.

intfname is the name of the interface for which this IPv6 address is already defined.

System action:  TCP/IP continues. The VIPADYNAMIC statement is rejected.

Operator response:  Contact the system programmer.

System programmer response:  Correct the VIPADYNAMIC statement to specify a unique interface name and dynamic VIPA.

Module:  EZBX6DVI
Procedure name:  ValidateVDEF6

EZZ9659I  VIPADISTRIBUTE REJECTED - DYNAMIC XCF IS NOT ENABLED FOR IPV6
Explanation:  An IPv6 VIPADISTRIBUTE statement appears in a profile data set, but Dynamic XCF is not enabled for IPv6 on this stack.

System action:  TCP/IP continues. The VIPADISTRIBUTE statement is ignored.

Operator response:  Contact the system programmer.

System programmer response:  Enable Dynamic XCF for IPv6 with the IPCONFIG6 DYNAMICXCF configuration statement. Either correct the original profile or submit a profile.

Module:  EZBX6DVI
Procedure name:  ValidateVDIST6
EZZ9660I  VIPADISTRIBUTE REJECTED - dvipaintfname IS NOT CONFIGURED AS A DYNAMIC VIPA

Explanation: A VIPADISTRIBUTE was in error. The IPv6 DVIPA interface name is not configured on this stack by a VIPADEFINE or a VIPABACKUP statement.

dvipaintfname is the name of the interface specified on the VIPADISTRIBUTE statement.

System action: TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response: Contact the system programmer.

System programmer response: Correct the VIPADISTRIBUTE statement.

Module: EZBX6DVI

Procedure name: PreValidateVDIST6

EZZ9661I  VIPADISTRIBUTE WITH SYSPLEXPORTS REJECTED FOR dvipaintfname

Explanation: A SYSPLEXPORTS keyword was found on an IPv6 VIPADISTRIBUTE statement for an interface that already had a VIPADISTRIBUTE statement specified without the SYSPLEXPORTS keyword. The SYSPLEXPORTS keyword must be specified on the first VIPADISTRIBUTE statement specified for a specific interface.

dvipaintfname is the name of the interface specified on the VIPADISTRIBUTE statement.

System action: TCP/IP continues. The VIPADISTRIBUTE statement is rejected.

Operator response: Contact the system programmer.

System programmer response: To enable SYSPLEXPORTS, delete all previous VIPADISTRIBUTE statements for this interface, then reissue the VIPADISTRIBUTE with SYSPLEXPORTS specified.

Module: EZBX6DVI

Procedure name: ValidateVDIST6

EZZ9662I  VIPADISTRIBUTE dvipaintfname port_num destip REJECTED - CURRENTLY DISTRIBUTED TO ALL STACKS

Explanation: The specified interface and port in a VIPADISTRIBUTE DEFINE statement with a specific DESTIP address is rejected because this DVIPA and port are already distributed to all target stacks.

dvipaintfname is the name of the interface specified on the VIPADISTRIBUTE statement.

port_num is the port number specified on the VIPADISTRIBUTE statement.

destip is the dynamic XCF address specified on the DESTIP parameter of the VIPADISTRIBUTE statement.

Operator response: Contact the system programmer.

System programmer response: To change distribution to go to specific targets, issue VIPADISTRIBUTE DELETE for the existing distribution, then issue VIPADISTRIBUTE to specific targets.

Module: EZBX6DVI

Procedure name: ValVDISTdefHash6

EZZ9663I  VIPADISTRIBUTE DELETE dvipaintfname port_num destip REJECTED - CURRENTLY DISTRIBUTED TO ALL STACKS

Explanation: The specified interface and port in a VIPADISTRIBUTE DELETE statement with a specific DESTIP address is rejected because this interface and port are already distributed to all target stacks.

dvipaintfname is the name of the interface specified on the VIPADISTRIBUTE statement.

port_num is the port number specified on the VIPADISTRIBUTE statement.

destip is the dynamic XCF address specified on the DESTIP parameter of the VIPADISTRIBUTE statement.

Operator response: Contact the system programmer.

**System programmer response:** To change distribution to remove a specific target, issue VIPADISTRIBUTE DELETE for the existing distribution, then issue VIPADISTRIBUTE for the specific targets you need.

**Module:** EZBX6DVI

**Procedure name:** ValVDISTdeleteHash6

---

**EZZ9665I**  CANNOT ACTIVATE type DVIPA INTERFACE dvipaintfname

**Explanation:** An attempt was made to activate an IPv6 DVIPA interface on this stack, but the activation failed and the DVIPA interface was not created. Message EZZ9652I will precede this message, indicating the reason for the failure.

*type* is either BACKUP or TARGET, indicating the type of DVIPA interface that was not created.

*dvipaintfname* is the DVIPA interface that was not created.

**System action:** TCP/IP continues. The DVIPA is not created.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error indicated by message EZZ9652I.

**Module:** EZBX6DVI

**Procedure name:** Create_DV_Interface

---

**EZZ9666I** DVIPA INTERFACE dvipaintfname CANNOT BE DELETED

**Explanation:** An attempt was made to delete a dynamic VIPA interface on this stack, but the interface cannot be deleted. A subsequent message will be issued to indicate the reason for the failure.

*dvipaintfname* is the name of the DVIPA interface that cannot be deleted.

**System action:** TCP/IP continues. The profile statement is rejected.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the profile statement in error based on the reason indicated in the subsequent message.

**Module:** EZBX6DVI

**Procedure name:** ValidateVDEL6

---

**EZZ9668I** UNABLE TO CREATE ipver devtype1 XCF DEVICE devname - devtype2 DEVICE IS ALREADY DEFINED

**Explanation:** An attempt was made to create a dynamic or static XCF device when a static or dynamic XCF device already existed for the same host. You cannot mix static and dynamic XCF devices to the same host regardless of the address type (IPv4 or IPv6).

*ipver* is the address type, IPv4 or IPv6, of the address for which the create was attempted.

*devtype1* is the type of device you are trying to create and is either DYNAMIC or STATIC.

*devname* is the name of the device for which the create was attempted.

*devtype2* is the type of device that already exists and is either DYNAMIC or STATIC.

**System action:** The XCF link is not created. Processing continues with the next profile statement.

**Operator response:** Contact the system programmer.

**System programmer response:** Either delete the static XCF definitions or remove DYNAMICXCF from your IPCONFIG statement.

**Module:** EZBXFDYN

**Procedure name:** CheckForExistingDefinitions
EZZ9669I • EZZ9671E

EZZ9669I   ERRORS WERE DETECTED WHILE PROCESSING VIPADYNAMIC STATEMENTS - SEE SYSTEM LOG FOR DETAILED MESSAGES

Explanation: Errors were detected processing statements in a VIPADYNAMIC block. Detailed error messages were sent to the system log.

System action: TCPIP continues.

Operator response: None.

System programmer response: Check the system log for the detailed error messages and follow the system programmer response for each message.

Module: EZBXFDFYN

Procedure name: None.

EZZ9670E tcpstackname SYSPLEX PROCESSING ENCOUNTERED A NONRECOVERABLE ERROR - abendcode - abendreasoncode

Explanation: An unrecoverable error was encountered during TCP/IP sysplex processing.

tcpstackname is the name of the TCP/IP stack.

abendcode is the abend code.

abendreasoncode is the abend reason code.

System action: TCP/IP continues.

• If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
  – This stack will leave the TCP/IP sysplex group.
  – This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
  – When the stack leaves the TCP/IP sysplex group, this operator message will be deleted.
• If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken.

Operator response: Save the documentation taken when the problem occurred.

If NORECOVERY is active, no further actions are needed.

If RECOVERY is active, then even if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will not automatically rejoin the TCP/IP sysplex group, due to the severity of the problem encountered. Message EZZ9676E will be displayed if the TCP/IP stack successfully deactivates all DVIPAs and leaves the TCP/IP sysplex group. After EZZ9676E is displayed, issue the VARY TCPIP,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

System programmer response: Contact your IBM support center with the TCP/IP profile, system log, and dump.

Module: EZBXFPDC

Procedure name: EZBXFPDC

EZZ9671E tcpstackname DETERMINED THAT VTAM WAS INACTIVE FOR AT LEAST timevalvalue SECONDS

Explanation: Sysplex problem detection determined that VTAM was not available.

tcpstackname is the name of the TCP/IP stack.

timevalue is the number of seconds that VTAM was not available.
**EZZ9672E**

**System action:** TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
  - This stack will leave the TCP/IP sysplex group.
  - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deleted; however, the DVIPA definitions will be saved.
  - If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the saved DVIPA definitions and rejoin the TCP/IP sysplex group.
- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

See [Sysplex problem detection and recovery](https://www.ibm.com/support/knowledgecenter/SSS7NH_8.5.0/com.ibm.zos.zos/comm_sip_conf_toc.html#n0174857) in *z/OS Communications Server: IP Configuration Guide* for more information.

See [GLOBALCONFIG statement](https://www.ibm.com/support/knowledgecenter/SSS7NH_8.5.0/com.ibm.zos.zos/comm_sip_conf_toc.html#n0174857) in *z/OS Communications Server: IP Configuration Reference* for the definition of the SYSPLEXMONITOR parameters.

**Operator response:** Start VTAM.

- If VTAM successfully starts, this operator message will be deleted.
- If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.
- If RECOVERY and AUTOREJOIN are active, no further actions are needed. The stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.
- If NORECOVERY is active, no further actions are needed.

**System programmer response:** If VTAM cannot be started, contact your IBM support center with the system log.

**Module:** EZBXFPDM

**Procedure name:** EZBXFPDM

---

**EZZ9672E tcpstackname DETERMINED THAT OMPROUTE WAS NOT RESPONSIVE FOR AT LEAST timeval SECONDS**

**Explanation:** OMPROUTE is unresponsive. If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and OMPROUTE continues to be unresponsive, Sysplex Problem Detection and recovery will issue message EZZ9672E and take appropriate action at that time. See the *z/OS Communications Server: IP Configuration Guide* and the *z/OS Communications Server: IP Configuration Reference* for more information about the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option.

*tcpstackname* is the name of the TCP/IP stack.

timeval is the number of seconds OMPROUTE was not responsive. This value is determined by the GLOBALCONFIG SYSPLEXMONITOR timersecs parameter in the TCP/IP profile. See the *z/OS Communications Server: IP Configuration Guide* and the *z/OS Communications Server: IP Configuration Reference* for more information about the timersecs parameter and how it is used to detect OMPROUTE unresponsiveness.

**System action:** TCP/IP continues.

**Operator response:** If OMPROUTE is not active and if OSPF is not being used (only RIP), start the OMPROUTE procedure for this stack. If OSPF is being used, then the OMPROUTE procedure should be started after a suitable delay. See the *z/OS Communications Server: IP Configuration Guide* for more information about when to restart OMPROUTE if OSPF is being used.

**System programmer response:** If OMPROUTE is not currently active, then the operator should start the OMPROUTE procedure for this stack.

If OMPROUTE is active, then it might not be getting enough CPU cycles to complete the task; OMPROUTE should run under the WLM service class SYSTC (the default service class for started tasks). It might be necessary to run OMPROUTE as non-swappable. For more information about improving OMPROUTE performance see the *z/OS Communications Server: IP Configuration Guide* in the section about Configuring OSPF and RIP, subsection Network...
Design Considerations with z/OS CS. If you are getting this message excessively but not experiencing problems, consider increasing the value of the GLOBALCONFIG SYSPLEXMONITOR timersecs value. See the z/OS Communications Server: IP Configuration Guide and the z/OS Communications Server: IP Configuration Reference for more information about the timersecs parameter and how it is used to cause this message. Further messages will be issued if this problem continues.

Module: EZBXFPDM
Procedure name: EZBXFPDM

---

EZZ9673E tcpstackname DETERMINED THAT DYNAMIC XCF CONNECTIVITY TO ALL PARTNERS WAS NOT AVAILABLE FOR AT LEAST timevalue SECONDS

Explanation: Sysplex problem detection has determined that dynamic XCF connectivity is not available.

tcpstackname is the name of the TCP/IP stack.

timevalue is the number of seconds that connectivity was not available.

System action: TCP/IP continues.

• If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
  – This stack will leave the TCP/IP sysplex group.
  – This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
  – If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

• If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

See GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference for the definition of RECOVERY and NORECOVERY.

Operator response: Contact your system administrator.

System programmer response: Issuing the Netstat DEVLINKS/-d command will show which underlying XCF interfaces used by the XCF routes are active; check the system log for any messages related to the status of the XCF interfaces. If you cannot determine why the XCF routes or interfaces were lost, contact your IBM support center with the system log and TCPIP profile.

If this problem can be corrected, this operator message will be deleted.

• If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

• If RECOVERY and AUTOREJOIN are active, no further actions are needed. As mentioned above, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

• If NORECOVERY is active, no further actions are needed.

Module: EZBXFPDM
Procedure name: EZBXFPDM

---

EZZ9674E tcpstackname SYSPLEX PROCESSING WAS NOT RESPONSIVE FOR AT LEAST timevalue SECONDS

Explanation: Sysplex problem detection has determined that sysplex processing was not responsive.

tcpstackname is the name of the TCP/IP stack.

timevalue is the number of seconds that sysplex processing was not responsive.
System action: TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
  - This stack will leave the TCP/IP sysplex group.
  - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved. As the stack leaves the TCP/IP sysplex group, this operator message will be deleted.
  - TCP/IP sysplex problem detection will issue an ABEND with system code 4C5, reason code TcpSysplexUnresponsive ('0405'x) and capture an SVC dump.

- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken.

See GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference for the definition of the SYSPLEXMONITOR parameters.

Operator response: If RECOVERY is active, save the documentation taken when the problem occurred. If NORECOVERY is active, and the problem is not corrected, then take a dump of the TCP/IP address space and dataspaces.

If RECOVERY is active, then even if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will not automatically rejoin the TCP/IP sysplex group, due to the severity of the problem encountered. Message EZZ9676E will be displayed if the TCP/IP stack successfully deactivates all DVIPAs and leaves the TCP/IP sysplex group. If the problem can be corrected, then after EZZ967E is displayed, issue the VARY TCPIP,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.

System programmer response: Contact your IBM support center with the ABEND documentation. If the problem cannot be corrected, the stack will need to be restarted to be able to rejoin the TCP/IP sysplex group.

Module: EZBXFPDX

Procedure name: EZBXFPDX

---

EZZ9675E

 SYSPLEX PROBLEM DETECTION CLEANUP HAS FAILED FOR tcpstackname

Explanation: Sysplex problem detection has caused the stack to leave the sysplex group. All DVIPA resources could not be cleaned up. The stack must be restarted before it will be able to rejoin the sysplex group.

tcpstackname is the name of the TCP/IP stack.

System action: As part of the cleanup, the dynamic routing daemon should stop advertising DVIPAs that are owned by this TCP/IP stack. If the cleanup fails, the stack is terminated. This stack then leaves the sysplex group. Only some of the DVIPAs that are defined on this stack could be deleted. This stack will no longer participate in sysplex distribution (as a distributor, target, or backup for DVIPAs). See the information about connectivity in a sysplex and sysplex problem detection and recovery in z/OS Communications Server: IP Configuration Guide for more information.

Operator response: Save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and dataspaces.

System programmer response: Contact your IBM support center. The stack will need to be restarted to rejoin the sysplex group.

Module: EZBXFPDC

Procedure name: EZBXFPDC
**EZZ9676E • EZZ9678E**

**EZZ9676E**  
**SYSPLEX PROBLEM DETECTION CLEANUP HAS SUCCEEDED FOR tcpstackname**

**Explanation:** Sysplex problem detection caused the stack to leave the sysplex group and cleaned up all DVIPAs. Prior messages explain why this action occurred.

*tcpstackname* is the name of the TCP/IP stack.

**System action:** TCP/IP continues. This stack has left the TCP/IP sysplex group. This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack are now deactivated; however, the DVIPA definitions were saved. Prior messages explain why this action occurred.

If the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active and the problem that caused the stack to leave the TCP/IP sysplex group is corrected, depending on the severity of the problem, the stack might be able to reprocess the DVIPA definitions and rejoin the TCP/IP sysplex group. See the explanation of the previously issued eventual action problem message to determine how to proceed.

**Operator response:** See the explanation of the previously issued message to determine how to proceed.

**System programmer response:** See the explanation of the previously issued message to determine how to proceed.

**Module:** EZBXFPDC

**Procedure name:** EZBXFPDC

**EZZ9677I**  
**THE SYSPLEX PROFILE DEFINITION CANNOT BE APPLIED TO tcpstackname BECAUSE SYSPLEX PROBLEM DETECTION CLEANUP COULD NOT COMPLETE SUCCESSFULLY**

**Explanation:** Sysplex problem detection caused the stack to leave the sysplex group. Because it was not able to clean up all DVIPA resources, no sysplex profile changes can be applied. The stack must be restarted to rejoin the sysplex group. See message EZZ9675E issued earlier for more information.

*tcpstackname* is the name of the TCP/IP stack.

**System action:** TCP/IP continues. This stack has left the sysplex group. All DVIPA resources could not be deleted. This stack will no longer participate in sysplex distribution (as a distributor, target, or backup for DVIPAs). See the [z/OS Communications Server: IP Configuration Guide](https://publib.boulder.ibm.com/infocenter/zos/v2r1/topic/com.ibm.zos.r13.doc/commcnfg/guide/cfipconfd.html) in the chapter about TCP/IP in a sysplex, in the section about Connectivity in a sysplex and the section about Sysplex Problem Detection and Recovery for more information.

**Operator response:** Before restarting the stack, save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and dataspaces.

**System programmer response:** Contact the IBM system support center with the documentation collected when the problem occurred.

**Module:** EZBXFDYN

**Procedure name:** EZBXFDYN

**EZZ9678E**  
**tcpstackname DETERMINED THAT OMPROUTE WAS NOT RESPONSIVE FOR AT LEAST timeval SECONDS**

**Explanation:** Sysplex problem detection has determined that OMPROUTE was not responsive.

*timevalue* is the number of seconds OMPROUTE was not responsive. This value is determined by the GLOBALCONFIG SYSPLEXMONITOR timersecs parameter in the TCP/IP profile. See the [z/OS Communications Server: IP Configuration Guide](https://publib.boulder.ibm.com/infocenter/zos/v2r1/topic/com.ibm.zos.r13.doc/commcnfg/guide/cfipconfd.html) and the [z/OS Communications Server: IP Configuration Reference](https://publib.boulder.ibm.com/infocenter/zos/v2r1/topic/com.ibm.zos.r13.doc/commcnfg/guide/cfipconfd.html) for more information about the timersecs parameter and how it is used to detect OMPROUTE unresponsiveness.

**System action:** TCP/IP continues.
If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:

- This stack will leave the TCP/IP sysplex group.
- This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
- If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

If the operator did not stop OMPROUTE, TCP/IP sysplex problem detection will assume there is a problem with OMPROUTE and will issue an ABEND with system code 4C5, reason code TcpLostOMPROUTE ('0404'x) and capture an SVC dump of both the TCP/IP and the OMPROUTE address spaces.

See GLOBALCONFIG statement in z/OS Communications Server: IP Configuration Reference for the definition of the SYSPLEXMONITOR parameters.

**Operator response:** If RECOVERY is active, and no 4C5 abend occurred, start the OMPROUTE procedure for this stack.

If OMPROUTE successfully starts, this operator message will be deleted.

- If RECOVERY and NOAUTOREJOIN are active, then issue the VARY TCPIP,SYSPLEX,JOINGROUP command to cause the DVIPA definitions to be processed, and the stack to rejoin the TCP/IP sysplex group.
- If RECOVERY and AUTOREJOIN are active, no further actions are needed. The stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.
- If NORECOVERY is active, no further actions are needed.

If an abend occurred, save this documentation and contact the system programmer.

**System programmer response:** If this message is displayed, but OMPROUTE is active, then it might not be getting enough CPU cycles to complete the task; OMPROUTE should run under the WLM service class SYSSTC (the default service class for started tasks). It might be necessary to run OMPROUTE as non-swappable. See the network design considerations with z/OS Communications Server information in z/OS Communications Server: IP Configuration Guide for more information about improving OMPROUTE performance. If the OMPROUTE performance problem cannot be determined, contact the IBM support center with any supporting ABEND documentation.

**Module:** EZBXFPDM

**Procedure name:** EZBXFPDM

---

**EZZ9679E** tcpstackname DETERMINED THAT CSM WAS CRITICAL FOR AT LEAST timevalue SECONDS

**Explanation:** Sysplex problem detection determined that there is a critical shortage of storage managed by the communications storage manager (CSM).

**tcpstackname** is the name of the TCP/IP stack.

**timevalue** is the number of seconds that sysplex problem detection has determined that CSM has been at a critical level.

**System action:** TCP/IP continues.

- If the GLOBALCONFIG SYSPLEXMONITOR RECOVERY option is active and this stack is not the only member of its TCP/IP sysplex group, the following RECOVERY actions will occur:
  - This stack will leave the TCP/IP sysplex group.
  - This stack will no longer participate in sysplex distribution (as a distributor or target) or act as an owner or a backup for DVIPAs. All DVIPAs defined on this stack will be deactivated; however, the DVIPA definitions will be saved.
- If the problem is corrected, this operator message will be deleted; if the GLOBALCONFIG SYSPLEXMONITOR AUTOREJOIN option is active, the stack will process the DVIPA definitions and rejoin the TCP/IP sysplex group.

- If the GLOBALCONFIG SYSPLEXMONITOR NORECOVERY option is active, no action will be taken. If the problem is corrected, this operator message will be deleted.

**Operator response:** Save the TCP/IP profile and system log. If a dump was not created, then take a dump of the TCP/IP address space and its dataspaces, and the CSM dataspace.

**System programmer response:** Messages were issued before this message to report that CSM storage is at a critical level. Those messages identify the type of CSM storage that is at a critical level. See the documentation for those messages for the actions that you must take to resolve the storage problem.

Issue the Display CSM command for more details about current CSM allocation and limits. CSM limits can be increased by using the Modify CSM command (no re-ipl is necessary). See the [z/OS Communications Server: CSM Guide](https://www.ibm.com/docs/en/zosip?topic=csm-guide) for more information.

If the CSM storage problem cannot be corrected, contact your IBM support center with the documentation taken when the problem occurred.

If the CSM storage problem can be corrected:

- If RECOVERY is being used, enable the stack to rejoin the sysplex group. Message EZZ9676E is issued after the process of leaving the sysplex group has successfully completed. After this message is issued, reapply the sysplex profile definitions by issuing VARY OBEY. This will cause the stack to rejoin the sysplex group.

- If NORECOVERY is being used, no further actions are needed.

**Module:** EZBXFPDM

**Procedure name:** EZBXFPDM

---

**EZZ9680I IPv6 structures in kernel and user space do not match**

**Explanation:** The compile-time and run-time sizes of the sockaddr_in6 C program structure differ.

**System action:** The named server continues. All IPv6 support in the named server is disabled.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify that you are running the IBM Communications Server for z/OS on the same version of z/OS with which it was shipped. If you believe this is the case, contact the IBM software support center with this message description.

**Module:** NET

**Procedure name:** try_proto

---

**EZZ9681I internal_accept(): accept() failed to return remote address**

**Explanation:** An accept() C Runtime call completed successfully but the remote (peer) address that is normally returned by the call was not present.

**System action:** The named server continues. The named server is unable to verify that the connected socket is with the expected client.

**Operator response:** Contact the system programmer.

**System programmer response:** Re-create this problem with a SYSTCPPIP component trace active specifying the TC option and set the debug level on the named log files to 99. Obtain the following documentation and contact the IBM software support center:

- The named server configuration file
• The SYSLOG DAEMON logging file
• All configured named logs
• The component trace requested

Module: ISCSOCKT
Procedure name: internal_accept

EZZ9682I  dns_master_load: file_name:line_number: $INCLUDE not allowed
Explanation: A $INCLUDE directive was found but is not allowed in this file.
file_name is the name of the file where the $INCLUDE was found.
line_number is the line number in the file where the $INCLUDE was found.
System action: The named server will end.
Operator response: Place the data from the $INCLUDE file directly into the file where the $INCLUDE directive appeared and remove the $INCLUDE directive. Restart the named server.
System programmer response: None.
Module: MASTER
Procedure name: load

EZZ9683I  dns_master_load: error_text
Explanation: The named server failed to successfully parse and load a zone from a zone data file because of insufficient memory.
error_text gives more information about the error.
System action: The named server ends.
Operator response: Notify the system programmer.
System programmer response: Increase the region size and restart the named server.
Module: MASTER
Procedure name: load

EZZ9684I  dns_master_load: file_name:line_number: dns_name error_text
Explanation: The named server failed to successfully parse and load a zone because of a problem with a resource record or set of resource records.
file_name is the name of the master zone file being processed at the time of the error.
line_number is the line number of the master zone file where the error was encountered.
dns_name is the owner name of the resource record in error.
error_text gives more information about the error.
If error_text is CNAME and other data, then the master zone file contains a CNAME and at least one other resource record with the same owner name as the CNAME resource record, which is not allowed.
System action: The named server continues.
Operator response: Correct the error in the master zone file and reload or stop and restart the named server.
System programmer response: None.
Module: MASTER
Procedure name: commit
EZZ9685I  no_references: dns_rbt_deletenode: error_text

Explanation: The call to the procedure, dns_rbt_deletenode to delete a node from the procedure, no_references failed because of an internal error. The failing call was to remove a node from the named server's internal Red-Black Tree Database.

error_text gives more information about the error.

System action: The named server continues.

Operator response: This is an internal error. Provide a storage dump of the named server address space and contact the IBM software support center.

System programmer response: None.

Module: RBTDB

Procedure name: no_references

EZZ9686I  lame server resolving 'dns_name' (in 'domain_name'): ip_address

Explanation: The named server received a response from a named server at ip_address while attempting to resolve the name, dns_name in the domain, domain_name. The parent named server of the domain_name named server incorrectly delegated the domain_name domain to the named server at ip_address, and the named server at ip_address is not authoritative for the domain, domain_name. That server is termed a 'lame server' because of the misconfiguration.

dns_name is the name that was being resolved by the named server.

domain_name is the domain name that was incorrectly delegated.

ip_address is the address of the named server that is not actually authoritative for domain_name, but is believed to be authoritative by the named server that is authoritative for domain_name's parent domain.

System action: The named server continues. The name, dns_name will not be resolved.

Operator response: Notify the DNS administrator of the named server authoritative for the parent domain of domain_name that it incorrectly delegated the domain_name domain to the wrong named server.

System programmer response: None.

Module: RESOLVER

Procedure name: log_lame

EZZ9687I  transfer of 'zone_name' from ip_address: message_text

Explanation: This message is issued during an incoming zone transfer for multiple situations, which are described by message_text. This message might be issued as an error, warning, or informational message.

zone_name is the zone that is being transferred to this named server.

class is the class of the zone that is usually IN.

ip_address is the TCP/IP address this named server is receiving the zone transfer from.

message_text describes why this message was issued

System action: In all cases, the named server continues. If the severity of the message is error, the zone transfer failed. If the severity of the message is warning the zone transfer might have partially succeeded. If the severity is info the zone transfer might or might not have succeeded.

Operator response: If the zone transfer failed, contact the DNS administrator of the master server for zone_name to correct the problem indicated by message_text.

System programmer response: None.

Module: XFRIN

Procedure name: xfrin_logv
**EZ98681** zone zone_name: message_text

Explanation: The named server uses this message to log zone processing errors. If the severity of the message is not informational, this message should be preceded by another message with more information about the error.

zone_name is the name of the zone being processed.
message_text describes the error or informational message.

System action: The named server continues.

Operator response: If the message severity is not informational, correct the error described in the message_text and any previous error messages. Reload or stop and restart the named server.

System programmer response: None.

Module: ZONE

Procedure name: dns_zone_log

---

**EZ98691** zone zone_name: message_text

Explanation: The named server uses this message to log information related to the NOTIFY process between master and secondary named servers of a particular zone.

zone_name is the name of the zone being processed.
message_text describes the informational message.

System action: The named server continues. The NOTIFY process proceeds normally.

Operator response: None.

System programmer response: None.

Module: ZONE

Procedure name: notify_log

---

**EZ9701I** isc_condition_init() failed

Explanation: The named server failed to initialize a conditional variable (using pthread_cond_init()) because of insufficient memory.

System action: The named server ends.

Operator response: Contact the system programmer.

System programmer response: Increase the region size and restart the named server.

Module: TASK

Procedure name: isc_taskmgr_create

---

**EZ9701I** key 'key_name': already exists

Explanation: The key was already defined.

key_name is the name of the key in error.

System action: The named server ends.

Operator response: Remove or rename the duplicate key and restart the named server.

System programmer response: None.

Module: CHECK

Procedure name: check_viewconf

---

Chapter 9. EZ9xxx messages 871
**EZZ9704I • EZZ9714I**

**EZZ9704I  dns_master_load: source_file:line_number: SOA record not at top of zone (zone_name)**

**Explanation:** The zone name of the SOA record did not match the zone name of the zone statement in the named.conf file.

source_file is the file where the error was detected.

line_number is the line number in the file where the error was detected.

zone_name is the zone statement in the named.conf file.

**System action:** The named server continues. The zone data in source_file might be ignored.

**Operator response:** Either change zone_name on the zone statement in named.conf or change the zone name of the SOA record in source_file so that they match. Reload the named server.

**System programmer response:** None.

**Module:** MASTER

**Procedure name:** load

---

**EZZ9706I  dns_master_load: file_name:line_number: include_file_name: error_text**

**Explanation:** An error occurred processing the $INCLUDE directive.

file_name is the name of the file that includes include_file_name.

line_number is the line number in file_name where include_file_name is included.

include_file_name is the name of the file on the $INCLUDE directive.

error_text gives more information about the error.

**System action:** The named server continues. Data in the included file will not become a part of the zone data.

**Operator response:** Use the error_text information to correct any errors in the name server zone data file or the included file. Ensure that the file to be included exists, is not corrupted, and the permission bits allow the file to be read. If there are too many open files, try to reduce the number of nested $INCLUDE statements or the number of zone files.

**System programmer response:** None.

**Module:** MASTER

**Procedure name:** load

---

**EZZ9709I  Unexpected label type label_type**

**Explanation:** The program failed to create a file name from a DNS name because the DNS name contained a label that was longer than 63 characters and was not a bitstring label.

label_type is the non-bitstring label type contained in the DNS name.

**System action:** The program does not complete successfully.

**Operator response:** In most cases, the label is a domain name. If so, shorten the domain name and try the program again.

**System programmer response:** None.

**Module:** DNSNAME

**Procedure name:** dns_name_tofilenametext

---

**EZZ9714I  dns_master_load: source_file:line_number: signature has expired**

**Explanation:** A SIG (signature) resource record expired according to the system clock. When signatures are created, they have an expiration time associated with them. When that time has elapsed, the signature is considered to be expired.

source_file is the file containing the signature that expired.
**EZ9715I**  source_file:warning "ip_address" is not a decimal dotted quad

**Explanation:** The IP address is not a valid IPv4 address.

**source_file** is the file where the error was found.

**source_line** is the line number in the file where the error was found.

**ip_address** is the IP address that is not valid.

**System action:** The named server continues. The resource record containing the error will not be usable.

**Operator response:** Use **source_file** and **source_line** information to find and change the IP address to be a valid IPv4 address. Reload the named server.

**System programmer response:** None.

**Module:** RDATA

**Procedure name:** getquad

---

**EZ9716I**  the key 'key_name' is too short to be secure

**Explanation:** The named server configuration file defines a key that is fewer than 64 bits in length. Keys smaller than 64 bits are insecure and should not be used.

**System action:** The named server continues. The key remains usable.

**Operator response:** In order to provide adequate security, ensure that the key used is at least 64 bits in length.

**System programmer response:** None.

**Module:** TSIG

**Procedure name:** dns_tsigkey_createfromkey

---

**EZ9717I**  dumping master file: tempfile_name: fsync: description

**Explanation:** The named server could not write to the temporary dump output file.

**tempfile_name** is the unique temporary file being closed.

**description** describes the error.

**System action:** The named server deletes the temporary dump file and continues.

**Operator response:** Ensure that there is adequate space on the output device to contain the entire zone database being dumped.

**System programmer response:** None.

**Module:** MASTERDU

**Procedure name:** dns_master_dump
**EZZ9718I • EZZ9780I**

**EZZ9718I**  
Extra data in root hints 'file_name'

**Explanation:** The root hints file might not contain the necessary information to locate the root zone named servers, or it might contain extraneous data. The root hints file should contain only NS resource records for the root zone and A resource records corresponding to those root named servers.

`file_name` is the name of the root hints file where the error was discovered.

**System action:** The named server continues. The extra data will be ignored.

**Operator response:** Examine the root hints file, `file_name` and remove all resource records except the NS and A records needed to find the root named servers. Reload the named server.

**System programmer response:** None.

**Module:** ROOTNS  
**Procedure name:** dns_root_create

**EZZ9719I**  
file_name line_number error_text

**Explanation:** A syntax error was encountered.

`file_name` is the file where the error was found.

`line_number` is the line number in the file where the error was found.

`error_text` gives specific information about the error.

**System action:** Messages with a severity level of WARNING will allow the named server to continue. Messages with a severity level of ERROR will cause the named server to end. The severity of the message can be displayed in the named server logging file with the message if the print-severity option is enabled in the channel phrase of the logging statement in named.conf.

**Operator response:** Use the `error_text` information to correct the error in `file_name` at or near the line, `line_number`. Restart or reload the named server.

**System programmer response:** None.

**Module:** PARSER  
**Procedure name:** parser_complain

**EZZ9724I**  
isc_mutex_init() failed: error_text

**Explanation:** An attempt to acquire a mutually exclusive lock failed because of insufficient memory or inadequate security to create a lock.

`error_text` describes the error.

**System action:** If the named server is initially loading, it ends. If the named server is reloading, it stops reloading and continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Ensure that the named server user ID has sufficient authority to perform locking. Increase the region size and restart the named server. See the [z/OS Communications Server: IP Configuration](http://www.ibm.com/systems/z/os/zos/books/ipconfig/index.html).

**Module:** DNSSCACHE  
**Procedure name:** cache_cleaner_init

**EZZ9780I**  
DUPLICATE ADDRESS DETECTED FOR type CONFIGURED HOME ADDRESS addr ON INTERFACE interface

**Explanation:** During the verification of the home address for this node, another node on the link indicated that it was already using the address. The home address cannot be used.

`type` specifies how the home address was configured, and is one of the following:
IIndicates that the home address was manually configured in the TCP/IP profile.

AUTO Indicates that the address is either a link-local automatically generated address or an automatically configured address.

addr specifies the address that is a duplicate.

interface is the interface name.

System action: TCP/IP continues.

Operator response: None.

System programmer response: Another node is already using the address. TCP/IP cannot use this address if the other node is using the same address. If this is a manually configured address, you can update the TCP/IP profile to specify a different address and issue a VARY TCPIP,OBEYFILE command to activate the new profile. If this is an automatically configured address, duplicate interface identifiers might be assigned to multiple interfaces. Ensure that each interface has a unique interface identifier.

Module: EZB6PDAD, EZB6PNBR

Procedure name: DAX_otherLifs, EZB6PAHA, EZB6PANA

AUTOCONFIGURED ADDRESS addr EXPIRED ON INTERFACE interface

Explanation: The valid lifetime for the autoconfigured address expired and can no longer be used.

addr specifies the address that is no longer valid.

interface is the interface name.

System action: TCP/IP continues.

Operator response: None.

System programmer response: No action is required if the address was expected to expire. Otherwise, configure the router to indicate the valid lifetime for this address.

Module: EZB6PNBR

Procedure name: EZB6PRHA

ALTERNATE LINK LOCAL ADDRESS addr ON INTERFACE interface FAILED

Explanation: A full, manually configured address was configured for the specified interface. The link-local address generated by using the hardware-provided interface ID failed the duplicate-address detection process. A randomly generated interface ID was tried and also failed the duplicate-address detection process. If this is the first randomly generated interface ID, a second randomly generated interface ID will be tried. No more than two randomly generated interface IDs will be tried.

addr is the alternate address generated using a random interface ID.

interface is the interface name.

System action: TCP/IP continues.

Operator response: None.

System programmer response: Message EZZ9780I indicates the original link-local address that failed duplicate-address detection. Check the OSA setup to determine why its interface ID is not unique. If both attempts with alternate interface IDs failed, restarting the interface again might generate a unique ID successfully. If subsequent attempts fail with the same error, consider bypassing duplicate-address detection (by specifying DUPADDRDET 0 on the INTERFACE statement) until the source of the problem can be resolved.

Module: EZB6PDAD, EZB6PNBR

Procedure name: Fail_DAD, AHA_tryrandomifcid
**EZZ9783I • EZZ9785I**

**EZZ9783I** ACTIVATION OF ADDRESS addr ON interface STOPPED - reason

Explanation: During the activation of a device, an error occurred that prevented the completion of the activation process. 

addr is the address that was not activated. 

interface is the interface name. 

reason indicates the source of the problem and is one of the following:

**STORAGE NOT AVAILABLE**
Indicates that storage could not be obtained to create the required control blocks.

**SOLICITED NODE JOIN FAILED**
Indicates that the multicast solicited node join failed.

**ALL NODES JOIN FAILED**
Indicates that the multicast all nodes join failed.

**LINK LOCAL ALREADY EXISTS**
Indicates that a link-local address had been requested but an active or activating link-local address already exists.

System action: The address was not activated. TCP/IP continues.

Operator response: None.

System programmer response: If STORAGE COULD NOT BE OBTAINED is the reason, resolve storage constraints before restarting the interface. For other reasons, stopping and restarting the interface might resolve the problem.

Module: EZB6PDAD, EZB6PNBR

Procedure name: EZB6PDAX, EZB6PANA

**EZZ9784I** ALTERNATE LINK LOCAL ADDRESS addr ON INTERFACE interface SUCCESSFUL

Explanation: A full, manually configured address was configured for the specified interface. The link-local address generated by using the hardware-provided interface ID failed the duplicate-address detection process. A randomly generated interface ID was tried and successfully completed the duplicate-address detection process.

addr is the alternate address generated by using a random interface ID. 

interface is the interface name.

System action: TCP/IP continues.

Operator response: None.

System programmer response: Message EZZ9780I indicates that the original link-local address failed duplicate-address detection. Check the OSA setup to determine why its interface ID is not unique.

Module: EZB6PDAD

Procedure name: EZB6PDAX

**EZZ9785I** PURGECACHE FAILED FOR name - reason

Explanation: The PURGECACHE request could not be processed for one of the reasons listed below. 

name is the name specified on the vary command.

reason is one of the following:

**LINK OR INTERFACE DOES NOT EXIST**
The link or interface name does not exist.

**CACHE NOT SUPPORTED**
The link or interface does not support an ARP or neighbor cache.
OSA FLUSH SUPPORT NOT AVAILABLE
The installed level of OSA does not support the ARP Assist Flush subcommand. The cache was not purged.
This error applies to OSA outboard ARP cache entries only. The minimum IPv4 OSA-Express microcode level required for this support is GA3.

STORAGE NOT AVAILABLE
CSM storage required to complete the PURGECACHE request could not be obtained.

System action: TCPIP continues.
Operator response: If the error reason is LINK OR INTERFACE DOES NOT EXIST or CACHE NOT SUPPORTED, verify that the correct link or interface name was specified.
System programmer response: If the error reason is OSA FLUSH SUPPORT NOT AVAILABLE, a new level of the OSA microcode might be needed if purging of outboard ARP cache is required.
If the error reason is STORAGE NOT AVAILABLE, issue the D NET,CSTM command and determine if sufficient CSM storage has been defined.
Module: EZB6PNBC
Procedure name: EZB6PPRG

EZZ9786I PURGECACHE PROCESSED FOR type name
Explanation: The PURGECACHE request was processed. If the cache is maintained by OSA (for example, IPv4 QDIO), the request to purge the ARP cache has been sent to OSA to perform. Otherwise, the local cache for the requested link or interface has been purged.

**type** indicates whether the name matches a link or interface. **type** can be either LINK or INTERFACE.

**name** is the link name or interface name of the cache that was purged.

System action: TCPIP continues.
Operator response: None.
System programmer response: None.
Module: EZB6PNBC
Procedure name: EZB6PPRG

EZZ9787I ERROR error_code REGISTERING MULTICAST ADDRESS mcast_address FOR DEVICE device_name
Explanation: The adapter reported an error while attempting to register a multicast address with the device.

**error_code** is the error code reported by the adapter.

**mcast_address** is the multicast address.

**device_name** is the name of the device.

System action: TCPIP continues, but is unable to receive any packets destined for this multicast address over this device.
Operator response: Inform the system programmer about the error.
System programmer response: See OSA Reject Codes and Internal Errors in zEnterprise System and System z10 OSA-Express Customer's Guide and Reference for information about the OSA Reject Codes and a description of the error.
Module: TCPIP
Procedure name: EZBIFIND
**EZZ9788I • EZZ9790I**

**EZZ9788I**  
**ERROR error_code REGISTERING MULTICAST ADDRESS mcast_address FOR INTERFACE interface_name**

**Explanation:** The adapter reported an error while attempting to register a multicast address with the interface.  
*error_code* is the error code reported by the adapter.  
*mcast_address* is the multicast address.  
*interface_name* is the name of the interface.

**System action:** TCPIP continues, but is unable to receive any packets destined for this multicast address over this interface.

**Operator response:** Inform the system programmer about the error.

**System programmer response:** See OSA Reject Codes and Internal Errors in zEnterprise System and System z10 OSA-Express Customer’s Guide and Reference for information about the OSA Reject Codes and a description of the error.

**Module:** TCPIP  
**Procedure name:** EZBIFIND

**EZZ9790I**  
**ALTERNATE INTERFACE ID newid ASSIGNED TO INTERFACE interface_name**

**Explanation:** The Interface ID generated from the OSA-provided data is mapped to a reserved value and is replaced with an alternate value. The alternate interface ID will not be preserved across an interface restart. If an interface is stopped and restarted, autoconfigured addresses on the interface will change.

*newid* is the alternate Interface ID.  
*interface_name* is the name of the interface.

**System action:** TCPIP continues.

**Operator response:** None.

**System programmer response:** None.

**Module:** EZB6PNBR  
**Procedure name:** EZB6PAHA

**EZZ9790I**  
**MBDATACONN incorrect syntax. Specify MBDATACONN=(file_system_cp,network_transfer_cp). MBDATACONN ignored.**

**Explanation:** A LOCSITE subcommand was entered with an MBDATACONN parameter that has incorrect syntax. The MBDATACONN parameter must be a pair of codepage names.

*file_system_cp* is the name of the file system codepage.  
*network_transfer_cp* is the name of the network transfer codepage.

**System action:** FTP continues.

**Operator response:** Reissue the LOCSITE subcommand with a valid value for the MBDATACONN parameter. See the z/OS Communications Server: IP User’s Guide and Commands for information about the parameters of the LOCSITE subcommand.

**System programmer response:** None.

**Module:** EZAFTPCK  
**Procedure name:** locsite
EZZ9791I  MBDansoc parameter is too long. Maximum length for code page name is length.
MBDansoc ignored.

Explanation:  A LOCSITE subcommand was entered with an MBDansoc parameter specifying a code page
name that is too long. The MBDansoc parameter is ignored.

length is the maximum name length allowed.

System action:  FTP continues.

Operator response:  See the z/OS XL C/C++ Programming Guide for information about supported code set
converters and valid code set names. Resubmit the corrected LOCSITE subcommand.

System programmer response:  None.

Module: EZAFTPCCK

Procedure name: locsite

EZZ9792I  No conversion available to cp_name1 from cp_name2. MBDansoc ignored.

Explanation:  A LOCSITE subcommand was entered with the MBDansoc parameter, but there is no supported
code set converter for the code sets that are specified. The MBDansoc parameter is ignored.

cp_name1 is the codepage name to which the code is converted.

cp_name2 is the codepage name from which the code is converted.

System action:  FTP continues.

Operator response:  See the z/OS XL C/C++ Programming Guide for information about supported code set
converters and valid code set names. Resubmit the corrected LOCSITE subcommand.

System programmer response:  None.

Module: EZAFTPCCK

Procedure name: locsite

EZZ9793I  Multi-byte encoding requested but codepages are not defined.

Explanation:  A file transfer subcommand was issued and the client program determined that a multi-byte data
transfer was needed because the data type was ASCII and ENCODING=MBCS was coded in FTP.DATA or was
specified on a LOCSITE subcommand. However, no MBDansoc value was specified.

System action:  The requested transfer subcommand failed.

Operator response:  Specify the MBDansoc parameter on a LOCSITE subcommand or specify the
MBDansoc statement in the FTPDATA file. See the z/OS XL C/C++ Programming Guide for information about
supported code set converters and valid code set names. Resubmit the data transfer subcommand.

System programmer response:  None.

Module: EZAFTPCG EZAFTPCP

Procedure name: checkMB

EZZ9794I  Multi-byte encoding requires a structure of FILE

Explanation:  A file transfer subcommand was issued and the current structure is not FILE.

System action:  The requested transfer subcommand failed.

Operator response:  Specify the FILE subcommand and resubmit the data transfer subcommand.

System programmer response:  None.

Module: EZAFTPCG EZAFTPCP

Procedure name: checkMB
EZZ9795I  Multi-byte encoding requires a mode of STREAM
Explanation:  A file transfer subcommand was issued and the current transfer mode is not STREAM.
System action:  The requested transfer subcommand failed.
Operator response:  Specify the STREAM subcommand and resubmit the data transfer subcommand.
System programmer response:  None.
Module:  EZAFTPCG EZAFTPCP
Procedure name:  checkMB

EZZ9796I  Multi-byte encoding requires FILETYPE=SEQ
Explanation:  A file transfer subcommand was issued and the current filetype is not SEQ.
System action:  The requested transfer subcommand failed.
Operator response:  Specify the FILETYPE=SEQ parameter on a LOCSITE subcommand or specify the FILETYPE SEQ statement in the FTP.DATA file
System programmer response:  None.
Module:  EZAFTPCP
Procedure name:  checkMB

EZZ9797I  Multi-byte encoding not supported for RECFM=recfm
Explanation:  A file transfer subcommand was issued and the file that is sent from or received into is an MVS data set.
recfm is the record format (RECFM) of the data set. The only record formats that are allowed for multi-byte encoded data transfers are V, VB, and U.
System action:  The requested transfer subcommand fails.
Operator response:  If the subcommand is a get, and the local data set is new, use the LOCSITE subcommand with either RECFM=V, RECFM=VB, or RECFM=U to cause FTP to create a data set with the correct format. Multi-byte encoding is not supported if the existing data set is not record format V, VB, or U.
System programmer response:  None.
Module:  EZAFTPCG EZAFTPCP
Procedure name:  mvs_rcvFile setFileAccessStructF

EZZ9798I  Multi-byte encoding not supported for the SRESTART subcommand
Explanation:  An SRESTART subcommand was entered and multi-byte encoding processing is also requested. A stream mode restart requires that FTP count the bytes that were successfully transferred. FTP cannot correctly count bytes transferred when multi-byte conversions are occurring.
System action:  The SRESTART subcommand failed.
Operator response:  Restart the data transfer without the SRESTART subcommand.
System programmer response:  None.
Module:  EZAFTPCB
Procedure name:  srestart
EZZ9799I Multi-byte encoding not supported when transferring RDWs

Explanation: A data transfer subcommand was entered for a variable format data set while the option to send record descriptor words (RDWs) was also in effect. The FTP client cannot send RDWs and also do multi-byte encoding.

System action: The requested subcommand failed.

Operator response: Issue a LOCSITE NORDW subcommand and resubmit the data transfer subcommand.

System programmer response: None.

Module: EZAFTPCP

Procedure name: setFileAccessStructF

EZZ9808I File transfer failed during multi-byte data conversion

Explanation: The data cannot be translated using the iconv() code conversion library function. This error is reported when the iconv_open() fails, or when one or more codepoints in the data cannot be converted, or when data corruption such as a missing line terminator is detected.

System action: FTP continues.

Operator response: Enter the DEBUG FSC subcommand and the DUMP 42 subcommand to gather information about the conversion failure. Reissue the file transfer subcommand that failed. The DEBUG subcommand will display the reason the conversion failed. For some types of conversion errors, the DUMP subcommand will display the actual data that could not be converted.

System programmer response: None.

Module: EZAFTPCG, EZAFTPCP

Procedure name: hfs_rcvFile, mvs_rcvFile, sndFile

EZZ9809I Multi-byte encoding does not support codepage as a file system codepage. MBDATACONN ignored.

Explanation: The format of the MBDATACONN parameter is the following:

MBDATACONN=(file_system_cp,network_transfer_cp)

The multi-byte encoding support for the FTP client allows codepages IBM-1388 and UTF-8 to be specified as the file system codepage.

codepage is the codepage name that was entered as the file system codepage.

System action: FTP continues.

Operator response: Resubmit the subcommand with one of the supported file system codepages.

System programmer response: None.

Module: EZAFTPCK

Procedure name: locsite

EZZ9810I Multi-byte encoding does not support codepage as a network transfer codepage. MBDATACONN ignored.

Explanation: The format of the MBDATACONN parameter is the following:

MBDATACONN=(file_system_cp,network_transfer_cp)

The multi-byte encoding support for the FTP client allows codepage IBM-5488 to be specified as the network transfer codepage.

codepage is the codepage name that was entered as the network transfer codepage.

System action: FTP continues.
EZZ9811I ENcoding parameter parm is not valid. Encoding ignored.

Explanation: The LOCSITE subcommand was issued with the ENcoding parameter, but the value parm specified for the parameter is not valid. The value specified for ENcoding should be SBCS or MBCS.

System action: The ENcoding parameter is ignored. FTP continues.

Operator response: Reissue the LOCSITE subcommand with a valid value for the ENcoding parameter. See the z/OS Communications Server: IP User's Guide and Commands for information about the parameters of the LOCSITE subcommand.

System programmer response: None.

Module: EZAFTPCK
Procedure name: locsite

EZZ9813I FTPKEEPALIVE is number_of_seconds

Explanation: FTPKEEPALIVE is the number of seconds between keepalive packets the stack sends on the FTP control connection when it would be otherwise idle.

number_of_seconds is the current setting of FTPKEEPALIVE as coded on the FTPKEEPALIVE statement in the client FTPDATA file. See the z/OS Communications Server: IP Configuration Reference for information about the FTPKEEPALIVE statement.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: ezaftpcl
Procedure name: locstat

EZZ9815I local site variables have changed

Explanation: You entered a subcommand that requires the FTP client to change the local site variables to finish. The FTP client modified the local site variables for the current session.

System action: Processing continues.

Operator response: Use the locstat subcommand to display local site variables, and the locsite subcommand to set local site variables. See the z/OS Communications Server: IP User's Guide and Commands for information about the locstat and locsite subcommands.

If you do not want the FTP client to change the site variables, avoid using the subcommand that generated this message.

System programmer response: None.

Module: ezaftpcd
Procedure name: lmkdir()
System action: The FTP client rejects the subcommand. Processing continues.

Operator response: If pathname is a local data set or file, look for messages preceding this one that provide more specific information about why the information could not be obtained. If you cannot correct the error yourself, report the error to the system programmer.

If pathname is a remote data set or file, look for server replies indicating why the information could not be obtained. If you cannot correct the error yourself, report the error to the system programmer.

System programmer response: If pathname is a local data set or file, use the debug subcommand to activate the FSC(2) trace option prior to issuing the subcommand again to get details of why the request failed. Correct the error, and instruct the user to reissue the subcommand.

If pathname is a remote data set or file, look for server replies preceding this message that indicate why the information could not be obtained. If the server is a z/OS server, have the FTP server administrator activate FSC(3) tracing, repeat the subcommand, and inspect the FTP trace for information about the failure to obtain data. Correct the error, and instruct the user to reissue the subcommand.

Module: ezaftpcd, ezaftpcr

Procedure name: lmkdir(), mkdir()

---

EZ9817I cannot create new_remote_directory like existing_local_directory

Explanation: The client is processing a mkdir subcommand with the like option. The client could not configure the remote host to allocate a directory like the directory on the local host, probably because the server does not implement z/OS parameters of the SITE command.

new_remote_directory is the directory the client is trying to create.

existing_local_directory is the directory the client is trying to mimic.

System action: The client stops processing the current subcommand. The FTP client prompts for the next subcommand.

Operator response: Save the client session log for problem determination.

System programmer response: If the server software is z/OS, ensure that the server is at level V1R5 or later.

Module: ezaftpcr

Procedure name: mkdir()

---

EZ9818I ftp_data file, line line_number: statement ftp_statement accepted but will be obsolete in a future release

Explanation: While processing the FTP.DATA file ftp_data, the server or client processed the statement ftp_statement. The statement was accepted, but will be obsolete in a future release.

In the message text:

ftp_data
  The name of the file being used as the FTP.DATA file.

line_number
  The number of the line in the FTP.DATA file that contains the statement.

ftp_statement
  The FTP configuration statement that will be obsolete.

System action: The statement is accepted. FTP.DATA file processing continues with the next line of the file.

Operator response: Contact the system programmer.

System programmer response: See the description of the FTP configuration statement, specified by the ftp_statement value, in the information about FTP configuration statements in FTP.DATA in z/OS Communications Server: IP Configuration Reference to determine a replacement for the statement.

User response: Not applicable.

Problem determination: Not applicable.
**EZZ9819I**

**Source:** z/OS Communications Server TCP/IP: FTP  
**Module:** Not applicable.  
**Routing code:** 10  
**Descriptor code:** 12  
**Example:**  
EZZ9818I SYS1.TCPPARMS(FTPDATA) file, line 100: statement KEYRING accepted  
but will be obsolete in a future release.

**EZZ9819I** FTP unable to obtain type use of ds_name which is held by: as_id jobname access_mode on q_name

**Explanation:** A client issued an FTP subcommand that required access to a local MVS data set name. The local MVS data set name is being held by one or more jobs. This message might be issued as a sequence of EZZ9819I messages that identify some of the jobs that are holding the MVS data set.

If FTP is unable to identify the job that is holding the data set, the as_id, jobname, access_mode, and q_name values are UNKNOWN. The following conditions that can cause FTP to be unable to identify the job.

- The data set is being held by a job that is running on another processor.
- The device on which the data set resides prohibits access to the MVS data set.

See the [IPSF or ISPF/PDF](z/OS MVS Planning: Global Resource Serialization) information in z/OS MVS Planning: Global Resource Serialization for information about how MVS serializes the use of resources.

In the message text:

**type**  
The type of access that FTP was attempting to obtain. Possible values are:

- **EXCLUSIVE**  
  FTP requires exclusive use of the MVS data set.

- **SHARED**  
  FTP requires shared use of the MVS data set.

**ds_name**  
The name of the local MVS data set that is being held by another job.

**as_id**  
The address space identifier of the job that is holding the local MVS data set. If FTP is unable to identify the job that is holding the data set, the as_id value is UNKNOWN.

**jobname**  
The job that is holding the local MVS data set. If FTP is unable to identify the job that is holding the data set, the jobname value is UNKNOWN.

**access_mode**  
The way the MVS data set is being held. Possible values are:

- **EXCLUSIVE**  
  A job is accessing the data set exclusively.

- **SHARED**  
  A job is accessing the data in shared mode.

- **UNKNOWN**  
  FTP is unable to identify the job that is holding the data set.

**q_name**  
The name of the queue used by z/OS to control access to MVS data set. If FTP is unable to identify the job that is holding the data set, the q_name value is UNKNOWN. The following are the most likely queue names.

- **SPFEDIT**  
  The queue is used by FTP when access to a member of an MVS partitioned data set is required.
SYSDSN

The queue is used by z/OS when access to an MVS data set is required.

System action: The FTP client continues to try to access the local MVS data set.

Operator response: Not applicable.

System programmer response: Perform the following steps:
1. Use the information in the EZA9819I and EZA9820I messages to determine which job or jobs are holding the MVS data set and resolve the contention.
2. Purge or cancel the job that is causing the MVS data set contention, if appropriate.

User response: If you need immediate access to the MVS data set, contact the system programmer and provide the sequence of EZA9819I and EZA9820I messages.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: FTP

Module: EZAFTPMK

Routing code: *

Descriptor code: *

Automation: Not applicable for automation.

Example:
EZA1459I NAME (9.42.104.19:USER1):
user1
EZA1701I >>> USER user1
331 Send password please.
EZA1789I PASSWORD:
EZA1701I >>> PASS
230 USER1 is logged on. Working directory is "USER1."
EZA1460I Command: get 'user.example' 'user1.testfile'
EZA9819I FTP unable to obtain SHARED use of USER1.TESTFILE which is held by:
005C MYJOB EXCLUSIVE ON SYSDSN
EZA9820I Data set access will be retried in 1 minute intervals - 1 attempts remaining
EZA9819I FTP unable to obtain SHARED use of USER1.TESTFILE which is held by:
005C MYJOB EXCLUSIVE ON SYSDSN
EZA2562W Allocation of USER1.TESTFILE failed (error code 0210 info code 0000 S99ER
SN 00000000)
EZA2799W The data set is allocated to another job and is unavailable.
EZA1460I Command:

EZZ9820I Data set access will be retried in 1 minute intervals - number attempts remaining

Explanation: The FTP client issued one of the following subcommands: GET, PUT, MGET, or MPUT. The local MVS data set specified by the subcommand is being held by one or more jobs. This message is issued as part of a sequence of EZZ9819I and EZZ9820I messages. Message EZZ9819I describes the jobs that are holding the local MVS data set, and Message EZZ9820I ends this sequence of messages. The FTP client pauses for approximately 1 minute until the next attempt is made to access the local MVS data set.

In the message text:

number

The number of times the FTP client will attempt to access the MVS data set.

System action: The FTP client continues to try to access the local MVS data set.

Operator response: Not applicable

System programmer response: Perform the following steps:
1. Use the information in the EZA9819I and EZA9820I messages to determine which job or jobs are holding the MVS data set and resolve the contention.
2. Purge or cancel the job that is causing the MVS data set contention, if appropriate.
User response: If you need immediate access to the MVS data set, contact the system programmer and provide the sequence of EZA9819I and EZA9820I messages.

Problem determination: None.

EZA2799W The data set is allocated to another job and is unavailable.
EZA1460I Command:

EZZ9821I DATAKEEPALIVE value value out of range - value must be 0 or in the range 60 - 86400 - value is ignored

Explanation: While processing either the FTP.DATA file or the LOCSITE subcommand, a DATAKEEPALIVE value was encountered that was not 0 or that was not in the acceptable range.

In the message text:

value
  The number of seconds of inactivity before a keepalive packet is sent out on the FTP data connection. Valid values are 0 or in the range of 60 - 86 400.

System action: Processing continues.

Operator response: If the FTP.DATA file was in error, contact the system programmer and provide the error message.

System programmer response: Correct the DATAKEEPALIVE value in the FTP.DATA file. See the summary of FTP client and server configuration statements in z/OS Communications Server: IP Configuration Reference for information about the parameters in the FTP.DATA file.

User response: If the LOCSITE subcommand failed, specify a valid value for the DATAKEEPALIVE parameter. See the LOCSITE subcommand information in z/OS Communications Server: IP User's Guide and Commands for more information.

Problem determination: None.

Source: z/OS Communications Server TCP/IP: FTP

Module: EZAFTPEP, EZAFTPMK

Routing code: *

Descriptor code: *

Automation: None.
Example:
EZZ9821I DATAKEEPALIVE value 89000 out of range - value must be 0 or in the range 60 and 86400 - parameter is ignored

EZZ9830I asname FTP failed - Cmd = cmd_code(cmd_name) Reply = reply_code exit_used rc_type RC = computed_rc

Explanation: This message reports a failure in the FTP client. If the FTP client is running interactively, the message is displayed to the end user interface. Otherwise, the message is written to the system log and the batch job log.

In the message text:

asname
  The name of the address space of the FTP client.

cmd_code
  The 2-digit subcommand code of the failing subcommand; cmd_name is the name of the failing subcommand. For example:
  Cmd = 16(get)

reply_code
  The last reply code received from the FTP server. If a subcommand failed before a reply was received from the server, reply_code is n/a.

exit_used
  Indicates whether the client exited as a result of this error. Values are:

  EX    The FTP client was configured to exit on error, and the client exited because of this error.
  NX    The FTP client was not configured to exit on error, and the client did not exit because of this error.

Tip: The FTP client is configured to exit on error if you code the CLIENTEXIT TRUE statement in the FTP.DATA file, or if you specify the EXIT or EXIT=nn parameter on the FTP command when you start the FTP client.

rc_type
  The type of return code displayed in computed_rc. It is one of the following:

  STD   standard return code
  FIX   fixed return code
  CEC   client error code
  CEE   client error code extended

computed_rc
  The computed value used to determine the return code. In cases where no EXIT parameter was specified when starting the FTP client and the CLIENTEXIT FALSE statement was specified or defaulted to in the FTP.DATA file, this value might not match the return code observed in the FTP client. This is because the FTP client might not end when the error is reported. Also, the computed_rc reflects the return code value prior to any conversion to a value modulo 4096 in a batch job.

The computed_rc value depends on the FTP command parameters and configuration options as follows:

• If EXIT=nn was specified as a start option on the FTP command, computed_rc is the fixed return code nn.

• Otherwise, computed_rc is one of the following:
  - A client error code concatenated with the subcommand code, if CLIENTERRCODES EXTENDED was coded in FTP.DATA.
  - A standard return code (formed by concatenating cmd_code with reply_code), if CLIENTERRCODES FALSE is specified or defaulted in FTP.DATA. In batch, this value will be converted modulo 4096 to produce the return code observed in the batch job step and recorded in the SMF TYPE 30 record.

System action: If the FTP client is configured to exit on error, the client ends. Otherwise, the client continues. The
FTP client is configured to exit on error if you code the CLIENTEXIT TRUE statement in the FTP.DATA file, or if you specify the EXIT or EXIT=nn parameter on the FTP command when you start the FTP client.

Operator response: The message indicates that the FTP client program experienced an error and reports the subcommand, the error reply, and the return code related to the error. See z/OS Communications Server: IP User’s Guide and Commands for information about FTP subcommands and error return codes. If you cannot correct the error, contact the system programmer.

System programmer response: See z/OS Communications Server: IP User’s Guide and Commands for information about the FTP subcommand that failed. If you cannot resolve the problem, contact the IBM software support center.

Module: EZAFTPcx
Procedure name: main

EZZ9891I orderq: directory_name too long, max_length max characters
Explanation: The name used for the queue directory is too long. It must be no more than max_length characters.
directory_name is the queue directory that temporarily holds messages.
max_length is the maximum length of the queue directory name.
System action: Processing continues.
Operator response: Contact the system programmer.
System programmer response: Change the queue name in the configuration file to be no more than max_length characters.
Module: queue
Procedure name: gatherq

EZZ9892I unable to setreuid from real_uid to effective_uid
Explanation: sendmail was unable to change from real_uid to effective_uid.
real_uid is the real user ID.
effective_uid is the effective user ID.
System action: sendmail ends.
Operator response: Contact the system programmer.
System programmer response: Change the RunAsUserid keyword in the configuration file to a valid user ID or give sendmail permission to change to the effective user ID.
Module: sndmmain
Procedure name: main

EZZ9893I setgroups(1, empty_group_id) failed while trying to drop privileges (returncode reasoncode) : description
Explanation: The setgroups() API failed to drop the privileges of sendmail tasks. sendmail does not have permission to change to the new group ID. For example, a return code of 157 and a reason code of 0BD602A4 indicate EMVSERR (157) and JRMultiproc (02A4). This means that the specified function does not support running multiple processes. In this case, ensure that the environment variable _BPX_SHAREAS is set to NO (export _BPX_SHAREAS=NO).
empty_group_id is the group ID to which sendmail is to be set.
returncode is the z/OS UNIX System Services return code returned from the setgroups() API. These return codes are listed and described in z/OS UNIX System Services Messages and Codes.
reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the setgroups() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of z/OS UNIX System Services Messages and Codes, where these reason codes are listed.
description is a description of the error.
System action: Processing continues.
Operator response: Contact the system programmer.

System programmer response: Update the configuration file to set RunAsUser to a user ID that sendmail has permission to change. Use returncode and reasoncode to determine the cause of the error. See z/OS XL C/C++ Runtime Library Reference for more information about the setgroups() API.

Module: sndmmain
Procedure name: drop_privileges

EZZ9894I setgid(group_id) failed (returncode reasoncode) : description
Explanation: The setgid() API failed with the return and reason code specified.

returncode is the z/OS UNIX System Services return code returned from the setgid() API. These return codes are listed and described in z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the setgid() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of z/OS UNIX System Services Messages and Codes where these reason codes are listed.

description is a description of the error.

System action: sendmail ends.
Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See z/OS XL C/C++ Runtime Library Reference for more information about the setgid() API.

Module: sndmmain
Procedure name: drop_privileges

EZZ9895I setuid for user_id failed with return code reason code: reasoncode description
Explanation: The setuid() API failed with the return and reason code specified.

user_id is the user ID specified in the configuration file as RunAsUser.

returncode is the z/OS UNIX System Services return code returned from the setuid() API. These return codes are listed and described in z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the setuid() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of z/OS UNIX System Services Messages and Codes where these reason codes are listed.

description is a description of the error.

System action: sendmail ends.
Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See z/OS XL C/C++ Runtime Library Reference for more information about the setuid() API. For installations running in a Program Control environment, where BPX.DAEMON is defined to RACF or another security server, ensure that /bin/sendmail is owned by the uid:gid specified in the /etc/mail/submit.cf RunAsUser parameter and that the Set UID and Set GID bits are set.

Module: sndmmain
Procedure name: drop_privileges
EZZ9897I cannot open task file

Explanation: open of file failed (returncode reasoncode): description

The open() API failed with the return and reason code specified.

returncode is the z/OS UNIX System Services return code returned from the open() API. These return codes are listed and described in z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the open() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of z/OS UNIX System Services Messages and Codes where these reason codes are listed.

description is a description of the error.

System action: sendmail continues.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See z/OS XL C/C++ Runtime Library Reference for more information about the open() API.

Module: sndmmain

Procedure name: fill_fd

EZZ9900I mailer mailer_name has a null root directory

Explanation: The mailer definition contains an empty root directory definition.

mailer_name is the name of the invalid mailer.

System action: sendmail ends after completing configuration processing.

Operator response: Contact the system programmer.

System programmer response: Change configuration file to include a non-NULL root directory for the mailer.

Module: readcf

Procedure name: makemailer

EZZ9901I mailer mailer-name has a null queue

Explanation: mailer-name contains an empty queue.

mailer-name is the name of the invalid mailer.

System action: sendmail ends after completing configuration processing.

Operator response: Contact the system programmer.

System programmer response: Change the configuration file to complete the Q= option for the mailer.

Module: readcf

Procedure name: makemailer

EZZ9902I mailer mailer_name has an unknown queue queue_name

Explanation: The mailer queue name is unknown.

mailer_name is the name of the invalid mailer.

queue_name is the name of the queue.

System action: sendmail ends after completing configuration processing.

Operator response: Contact the system programmer.

System programmer response: Change the configuration file to include a known queue for the mailer.

Module: readcf
Procedure name: makemailer

**EZZ9903I**  
*mailer mailer_name has an unknown mailer equate definition =*  

**Explanation:** The *mailer_name* has an unknown equate definition after the equal sign.  
*mailer_name* is the name of the invalid mailer.  
*definition* is the definition in configuration file.  
**System action:** sendmail ends after completing configuration processing.  
**Operator response:** Contact the system programmer.  
**System programmer response:** Change the configuration file to complete the equate for the mailer.  
**Module:** readcf  
**Procedure name:** makemailer

**EZZ9904I**  
*Mailer mailer_name must replace P=[TCP] with P=[IPC]*  

**Explanation:** The P definition of the mailer must be changed to IPC.  
*mailer_name* is the name of the mailer.  
**System action:** sendmail ends after completing configuration processing.  
**Operator response:** Contact the system programmer.  
**System programmer response:** Change the configuration file to use P=[IPC] instead of P=[TCP].  
**Module:** readcf  
**Procedure name:** makemailer

**EZZ9905I**  
*Mailer mailer_name has too few parameters for option*  

**Explanation:** Mailer *mailer_name* does not have enough parameters for option *option*.  
*mailer_name* is the mailer name.  
*option* is the mailer option.  
**System action:** sendmail ends after completing configuration processing.  
**Operator response:** Contact the system programmer.  
**System programmer response:** Change the configuration file to include an option for the mailer program.  
**Module:** readcf  
**Procedure name:** makemailer

**EZZ9906I**  
*The first argument to mailer_name must be FILE*  

**Explanation:** The first argument to the mailer must be the constant FILE.  
*mailer_name* is the name of the invalid mailer.  
**System action:** sendmail ends after completing configuration processing.  
**Operator response:** Contact the system programmer.  
**System programmer response:** Change the configuration file for the mailer to use the option FILE.  
**Module:** readcf  
**Procedure name:** makemailer
**EZZ9907I** missing valid ruleset for *rulesetname*

**Explanation:** The sendmail configuration file is missing a ruleset for *rulesetname*.

*rulesetname* is the expanded macro in the configuration file.

**System action:** sendmail ends after completing configuration processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the configuration file to include the missing ruleset.

**Module:** readcf

**Procedure name:** readcf

---

**EZZ9908I** more than *max* daemons defined

**Explanation:** The daemon count exceeded the maximum allowed.

*max* is the maximum number of daemons allowed.

**System action:** sendmail ends after completing configuration processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the configuration file to use less than or equal to the maximum daemons allowed.

**Module:** readcf

**Procedure name:** setoption

---

**EZZ9909I** fileclass is missing the file name

**Explanation:** The file name is missing.

**System action:** sendmail ends after completing configuration processing.

**Operator response:** Verify that the file and directory exist and have the correct permissions.

**System programmer response:** Change the configuration file to include the file with the file class. Use debug option 37.2 and 36.5 to see how the F class command gets processed into the symbol table.

**Module:** readcf

**Procedure name:** fileclass

---

**EZZ9910I** fileclass *file_name* default LDAP string is too long

**Explanation:** The fileclass LDAP string violates LDAP naming rule.

*file_name* is the specified file name that will use LDAP.

**System action:** sendmail ends after completing configuration processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the configuration file to use the valid LDAP string for the fileclass.

**Module:** readcf

**Procedure name:** fileclass

---

**EZZ9911I** fileclass *file_name* missing map class

**Explanation:** The configuration file contains a map class that is not in the proper syntax. It should be F(*file_name*):

*file_name* is the name of specified file.

**System action:** sendmail ends after completing configuration processing.

**Operator response:** Contact the system programmer.
System programmer response: Change the configuration file to ensure that the file name exists and that sendmail has permission to the file and directory. Use debug option 37.2 and 36.5 to see how the F class command gets processed into the symbol table.

Module: readcf
Procedure name: fileclass

EZZ9912I fileclass file_name class class_name is not available
Explanation: The fileclass class is not defined in the configuration file.
file_name is the name of specified file.
class_name is a defined class associated with the specified file.
System action: sendmail ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file to define the class for the file name. Use debug option 37.2, -d37.2 to see how the F command gets processed into the symbol table.
Module: readcf
Procedure name: fileclass

EZZ9913I fileclass file_name map open failed
Explanation: The map defined in the specified file could not be opened.
file_name is the name of specified file.
System action: sendmail ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file to ensure that the map file for the fileclass allows sendmail permission to the map file and directory.
Module: readcf
Procedure name: fileclass

EZZ9914I fileclass file_name map lookup failed
Explanation: The map lookup for file_name failed.
file_name is the name of specified file.
System action: sendmail ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file to use a valid file name and ensure that sendmail has permission to the file and directory. Use debug option 37.2, -d37.2, to see how the F command gets processed into the symbol table.
Module: readcf
Procedure name: fileclass

EZZ9915I readcf: DontBlameSendmail option: value unrecognized
Explanation: The configuration file specified a DontBlameSendmail option specifying an unknown value.
value is the unknown value.
System action: sendmail ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response:  Change the configuration file to use a correct DontBlameSendmail option.
Module: readcf
Procedure name: setoption

EZZ9916I  readcf: option ConnectOnlyTo: invalid IP address address
Explanation:  The configuration file specified a ConnectOnlyTo option specifying an unknown address.
address is the unknown address.
System action:  sendmail ends after completing configuration processing.
Operator response:  Contact the system programmer.
System programmer response:  Change the configuration file to use a correct ConnectOnlyTo address.
Module: readcf
Procedure name: setoption

EZZ9917I  readcf: option TrustedUser: unknown user user_name
Explanation:  A TrustedUser option specifying an unknown user name was encountered.
user_name is the unknown user name.
System action:  sendmail ends after completing configuration processing.
Operator response:  Contact the system programmer.
System programmer response:  Change the configuration file to use a correct TrustedUser value.
Module: readcf
Procedure name: setoption

EZZ9918I  illegal filename filename
Explanation:  An illegal filename is used in configuration file.
filename is the illegal filename found.
System action:  sendmail ends after completing configuration processing.
Operator response:  Contact the system programmer.
System programmer response:  Change the file name in the configuration file to a valid file name.
Module: readcf
Procedure name: readcf

EZZ9919I  queueup: cannot commit data file filename, uid=uid
Explanation:  sendmail failed to create a file in the mail queue.
filename is the name of the file that could not be committed.
uid is the effective uid of the process.
System action:  sendmail ends.
Operator response:  Contact the system programmer.
System programmer response:  Use the messages preceding EZZ9920I to determine the reason why the queue file could not be created.
Module: queue
Procedure name: queueup
EZZ9920I queueup: cannot save data temp file filename, uid=uid
Explanation: sendmail failed to save a data temporary queue file and failed.
filename is the name of the file that could not be saved.
uid is the effective uid of the process.
System action: sendmail ends.
Operator response: Contact the system programmer.
System programmer response: Use the messages preceding EZZ9920I to determine the reason why the queue file could not be saved.
Module: queue
Procedure name: queueup

EZZ9921I User user_name cannot rebuild aliases in mail submission program
Explanation: The user tried to rebuild the alias file using the mail submission program.
user_name is the user rebuilding the aliases.
System action: sendmail ends.
Operator response: Contact the system programmer.
System programmer response: Rebuild the aliases using newaliases.
Module: sndmmain
Procedure name: main

EZZ9922I Can not use -q with -b flag
Explanation: sendmail cannot be invoked using both -q and flag options.
flag is the single character option flag that followed -q on the command line.
System action: sendmail ends after processing command line options.
Operator response: Contact the system programmer.
System programmer response: Invoke sendmail without flag specified.
Module: sndmmain
Procedure name: main

EZZ9923I The -q and the -G options are mutually exclusive.
Explanation: sendmail was invoked with both -q and -G.
System action: sendmail ends after processing command line options.
Operator response: Contact the system programmer.
System programmer response: Invoke sendmail with either -q or -g options but not both.
Module: sndmmain
Procedure name: main

EZZ9924I Can't initialize mailbox database database: status
Explanation: sendmail encountered an error while initializing a mailbox database.
database is the specified database to use.
status is the exit status when initializing database.
EZZ9925I • EZZ9928I

System action: sendmail ends after processing command line options.
Operator response: Contact the system programmer.
System programmer response: Update the configuration file to specify database files that were created by z/OS Communications Server sendmail.
Module: sndmmain
Procedure name: main

EZZ9925I Mail submission program cannot be used as daemon
Explanation: sendmail was invoked with an invalid mode specified.
System action: sendmail ends after processing command line options.
Operator response: Invoke the mail submission program as an end user and not as a daemon.
System programmer response: None.
Module: sndmmain
Procedure name: main

EZZ9926I The mail submission program (MSP) must have RunAsUser set to nonroot user
Explanation: Sendmail was invoked with an invalid RunAsUser setting to nonroot user.
System action: sendmail ends after processing command line options.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file to have RunAsUser set to a valid value.
Module: sndmmain
Procedure name: main

EZZ9927I Permission denied (real uid not trusted)
Explanation: sendmail was run by a user who does not have access permissions to the mail queues or configuration files.
System action: Program ends after processing command line options.
Operator response: Contact the system programmer.
System programmer response: If the user is allowed to run sendmail, give the user access to the RunAsUserid in the configuration file.
Module: sndmmain
Procedure name: main

EZZ9928I Queue group group_name unknown
Explanation: The group is unknown when selecting a particular queue group to run.
group_name is the queue group that is to be processed.
System action: Program ends after completing configuration processing.
Operator response: Contact the system programmer.
System programmer response: Change the configuration file to point to a valid queue.
Module: sndmmain
Procedure name: main
EZZ9929I  opendaemonsocket: daemon daemon_name : can't create server SMTP socket (returncode reasoncode)

description

Explanation: sendmail failed when creating an optional daemon socket.

descriptor is the optional daemon name in configuration file.

returncode is the z/OS UNIX System Services return code returned from the socket() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the socket() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

description is a description of the error.

System action: sendmail ends after completing configuration processing.

Operator response: Contact the system programmer.

System programmer response: Change the DaemonPortOption in the configuration file to a valid daemon name.

Module: daemon

Procedure name: opendaemonsocket

EZZ9930I  opendaemonsocket: daemon daemon-name : problem creating SMTP socket (returncode reasoncode)

description

Explanation: sendmail failed to create an optional daemon.

descriptor is the optional daemon in configuration file.

returncode is the z/OS UNIX System Services return code returned from the socket() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the socket() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

description is a description of the error.

System action: sendmail ends after completing configuration processing.

Operator response: Contact the system programmer.

System programmer response: Change the DaemonPortOption option in the configuration file to a valid daemon.

Module: daemon

Procedure name: opendaemonsocket

EZZ9932I  ASCII to EBCDIC conversion failed (returncode reasoncode) description

Explanation: The conversion from ASCII to EBCDIC failed. The returncode, reasoncode, and description for __atoe_l are shown.

returncode is the z/OS UNIX System Services return code returned from the _atoe_l() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the _atoe_l() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

description is a description of the error.

System action: The z/OS Communications Server sendmail program ends the mail item delivery.

Operator response: Verify the response for the _atoe_l() API in the z/OS XL C/C++ Runtime Library Reference using the return and reason code listed.

System programmer response: None.
Module: ls_convc.c
Procedure name: atoe

EZZ9933I  EBCDIC to ASCII conversion failed (returncode reasoncode) description

Explanation: The conversion from EBCDIC to ASCII failed. The returncode, reasoncode, and description for __etoa_l are shown.

returncode is the z/OS UNIX System Services return code returned from the __etoa_l() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes. reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the __etoa_l() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed. description is a description of the error.

System action: The z/OS Communications Server sendmail program ends the mail item delivery.

Operator response: Verify the response for the __etoa_l() API in the z/OS XL C/C++ Runtime Library Reference using the return and reason code listed.

System programmer response: None.

Module: ls_convc.c
Procedure name: etoe

EZZ9941I  filtername: smfi_register: version mismatch application: filterversion != milter: SMFI_VERSION

Explanation: The version of the filter program is greater than the SMFI_VERSION of z/OS Communications Server sendmail.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API. filterversion is the version of the filter registered by the filter program in the xxfi_version of the smfiDesc variable used on smfi_register() API. SMFI_VERSION is the version of the filter used by z/OS Communications Server sendmail.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Change the xxfi_version is in the filter program to the constant SMFI_VERSION and then recompile the filter program.

Module: If_main
Procedure name: smfi_register

EZZ9942I  filtername: missing connection information

Explanation: Connection information is empty or missing.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

System action: The mail filter program ends and returns MI_FAILURE to the filter program.

Operator response: Contact the system programmer.

System programmer response: Check that smfi_setconn() was called in the filter program before invoking smfi_main and that smfi_setconn() returned MI_SUCCESS.

Module: If_main
Procedure name: smfi_main
EZZ9943I  

**filtername: sigwait returned error: (returncode reasoncode) description**

**Explanation:** The filter program cannot wait for an asynchronous signal.

*filtername* is the name of the filter registered by the filter program in the `xxfi_name` of the `smfiDesc` variable used on the `smfi_register()` API.

*returncode* is the z/OS UNIX System Services return code returned from the `sigwait()` API. These return codes are listed and described in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com). 

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the `sigwait()` API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of [z/OS UNIX System Services Messages and Codes](https://www.ibm.com), where the reason codes are listed. 

*description* is a description of the error.

**System action:** Processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Use *returncode* and *reasoncode* to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com) for more information about the `sigwait()` API.

**Module:** `lf_sgnl`

**Procedure name:** `mi_signal_thread`

---

EZZ9944I  

**filtername: sigwait returned unmasked signal: sig**

**Explanation:** The `sigwait()` API returned an unmasked signal `sig`.

*filtername* is the name of filter registered by the filter program in the `xxfi_name` of the `smfiDesc` variable used on the `smfi_register()` API.

*sig* is the signal number returned by `sigwait()`.

**System action:** Processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** EZZ9944I is preceded by EZZ9943I. Use the information from EZZ9943I to determine the response.

**Module:** `lf_sgnl`

**Procedure name:** `mi_signal_thread`

---

EZZ9945I  

**filtername : mask of HUP and KILL signals failed (returncode reasoncode) : errdescription**

**Explanation:** The program cannot mask the HUP and KILL signals using the `sigprocmask()` API.

*filtername* is the name of filter registered by the filter program in the `xxfi_name` of the `smfiDesc` variable used on the `smfi_register()` API.

*returncode* is the z/OS UNIX System Services return code returned from the `sigprocmask()` API. These return codes are listed and described in [z/OS UNIX System Services Messages and Codes](https://www.ibm.com). 

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the `sigprocmask()` API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of [z/OS UNIX System Services Messages and Codes](https://www.ibm.com), where the reason codes are listed. 

*errdescription* is the description of the error.

**System action:** The program ends and returns `MI_FAILURE`.

**Operator response:** Contact the system programmer.

**System programmer response:** Use *returncode* and *reasoncode* to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com) for more information about the `sigprocmask()` API.

**Module:** `lf_sgnl`
**Procedure name: mi_spawn_signal_thread**

**EZZ9946I**  
filtername : Could not set connection information

**Explanation:** Either filter API smfi_setbacklog or smfi_setconn was invoked with an invalid parameter (information).

filtername is the name of filter registered by filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

information is the parameter passed to the API.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the parameter to smfi_setbacklog or smfi_setconn to use a valid parameter and then recompile the filter program.

**Module:** If_main

**Procedure name:** smfi_setconn smfi_setbacklog

---

**Procedure name: mi_control_startup**

**EZZ9947I**  
filtername : pthread_mutex_init for control pipe failed (returncode reasoncode), errdescription

**Explanation:** The program cannot initialize control pipe mutex using the pthread_mutex_init() API.

filtername is the name of the filter registered by filter programmer in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

returncode is the z/OS UNIX System Services return code returned from the pthread_mutex_init() API. These return codes are listed and described in z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the pthread_mutex_init() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

errdescription is the description of the error.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the pthread_mutex_init() API.

**Module:** If_sgnl

**Procedure name:** mi_control_startup

---

**Procedure name: mi_control_startup**

**EZZ9948I**  
filtername : Could not spawn signal thread

**Explanation:** The filter program cannot spawn the signal thread when masking or creating.

filtername is the name of filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** None.

**System programmer response:** EZZ9948I is preceded by other messages. Use the response to the preceding messages to determine the response.

**Module:** If_sgnl

**Procedure name:** mi_control_startup
**EZZ9949I**  
*filtername : empty or missing socket information*

**Explanation:** The connection information is empty or missing when called from in smfi_main().

*filtername* is the name of filter registered by filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the filter program so the smfi_register() is called before smfi_main() is called and rerun the filter program.

**Module:** lf_lstnr

**Procedure name:** mi_milteropen

---

**EZZ9950I**  
*filtername : no valid socket protocols available*

**Explanation:** The mail filter program cannot find the socket protocol.

*filtername* is the name of filter registered by filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the socket protocol. For example, if an inet6 protocol is specified in the filter invocation, then ensure that the stack supports inet6.

**Module:** lf_lstnr

**Procedure name:** mi_milteropen

---

**EZZ9951I**  
*filtername : unknown socket type protocol*

**Explanation:** The socket family is unknown.

*filtername* is the name of the filter registered by the filter programmer in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*protocol* is the unknown socket protocol. It should be unix, local, inet, or inet6 and should not include an S= as is used in the sendmail.cf file.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the configuration file to specify a valid socket type and rerun the filter program.

**Module:** lf_lstnr

**Procedure name:** mi_milteropen

---

**EZZ9952I**  
*filtername : z/OS UNIX socket name socketname is longer than maxsocketlen*

**Explanation:** The z/OS UNIX socket path name is too long.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*socketname* is the name of the z/OS UNIX socket.

*maxsocketlen* is the maximum length of the socket name.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Change the socket name to be less than or equal to the maximum socket name length and rerun the filter program.
System programmer response: None.
Module: lf_lstnr
Procedure name: mi_milteropen

**EZZ9955I**  
filtername : **unknown port name** port

Explanation: The mail filter program cannot get a port number by getservbyname().
Filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.
Port is the port number.

System action: The filter program ends and returns MI_FAILURE.
Operator response: Contact the system programmer.

System programmer response: Change the port number defined in the services file. See the z/OS Communications Server: IP Configuration Reference for information about configuring the services file.
Module: lf_lstnr
Procedure name: mi_milteropen

**EZZ9956I**  
filtername : **Invalid numeric domain spec** domainname

Explanation: Cannot interpret character strings representing host addresses into a suitable Internet Network Byte Order.
Filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.
Domainname is the character string representing the host addresses.

System action: The filter program ends and returns MI_FAILURE.
Operator response: None.

System programmer response: Change the configuration file so the filter uses a valid domain name.
Module: lf_lstnr
Procedure name: mi_milteropen

**EZZ9957I**  
filtername : **Unknown host name** hostname

Explanation: The mail filter program used the gethostbyname that returned NULL for the hostname.
Filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.
Hostname is the character string representing the host addresses.

System action: The filter program ends and returns MI_FAILURE.
Operator response: None.

System programmer response: Change the configuration file so the filter uses a valid host name.
Module: lf_lstnr
Procedure name: mi_milteropen

**EZZ9958I**  
filtername : **Unknown protocol for hostname** addrtype

Explanation: The addrtype returned from the gethostbyname() for the hostname is not AF_INET nor AF_INET6.

System action: The filter program ends and returns MI_FAILURE.
Operator response: Contact the system programmer.
System programmer response: Change the host name in the configuration file by making sure that it is correct and that the address family type for the host name is either AF_INET or AF_INET6.

Module: lf_lstnr

Procedure name: mi_milteropen

EZZ9959I  filtername : Unable to create new socket (returncode reasoncode) description

Explanation: The program cannot create a new socket using the socket() API.

returncode is the z/OS UNIX System Services return code returned from the socket() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes. reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the socket() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the socket() API.

Module: lf_lstnr

Procedure name: mi_milteropen

EZZ9960I  filtername : Unable to setsockopt (returncode reasoncode) description

Explanation: The program cannot set the socket option SO_REUSEADDR using the setsockopt() API.

returncode is the z/OS UNIX System Services return code returned from the setsockopt() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes. reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the setsockopt() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the setsockopt() API.

Module: lf_lstnr

Procedure name: mi_milteropen

EZZ9961I  filtername : Unable to bind (returncode reasoncode) to port port : description

Explanation: The program cannot bind a socket using the bind() API.

returncode is the z/OS UNIX System Services return code returned from the bind() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes. reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the bind() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes where the reason codes are listed.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the bind() API.

Module: lf_lstnr

Procedure name: mi_milteropen
reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the bind() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed. port is the port to be bound to.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the bind() API.

Module: If_lstnr

Procedure name: mi_milteropen

EZZ9962I filtername: listen call failed (returncode reasoncode) description

Explanation: The mail filter program cannot listen to a socket using the listen() API.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

returncode is the z/OS UNIX System Services return code returned from the listen() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the listen() API.

Module: If_lstnr

Procedure name: mi_milteropen

EZZ9963I filtername: malloc of length bytes failed sockpath (returncode reasoncode): description

Explanation: Cannot allocate memory using the malloc() API.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

length is the size of memory allocated.

sockpath is the smfiDesc structure's xxfi_name.

returncode is the z/OS UNIX System Services return code returned from the malloc() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the malloc() API.

Module: If_lstnr
**Procedure name:** mi_milteropen

**EZ9964I**  
**select() returned**  
**result (returncode reasoncode) description**

**Explanation:** The select() API failed with the result, return code and reason code specified.

*result* is the returned value of select() API.

*returncode* is the z/OS UNIX System Services return code returned from the select() API. These return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/knowledgecenter/SSEQK8_1.15.0/com.ibm.zos体现/ux_msgs.htm).

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the select() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/knowledgecenter/SSEQK8_1.15.0/com.ibm.zos体现/ux_msgs.htm), where the reason codes are listed.

*description* is the error description.

**System action:** Processing continues to retry up to 16 times. The filter program ends and returns MI_FAILURE after the last retry failed.

**Operator response:** Contact the system programmer.

**System programmer response:** Use *result*, *returncode*, and *reasoncode* to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/knowledgecenter/SSEQK8_1.15.0/com.ibm.zos体现/rothmis.htm) for more information about the select() API.

**Module:** lf_lstnr

**Procedure name:** mi_milteropen

---

**EZ9965I**  
**filtername : Unable to create listening socket on conn connection**

**Explanation:** An error occurred when creating the filter socket using the socket(), bind(), or listen() API.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*connection* is the connection description, such as protocol:filename or protocol:port@host.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** None.

**System programmer response:** EZ9965I is preceded by other messages. Follow the response from the preceding message and rerun the filter.

**Module:** lf_lstnr

**Procedure name:** mi_listener

---

**EZ9966I**  
**filtername : fd listenfd is larger than FD_SETSIZE size**

**Explanation:** The socket descriptor is larger than FD_SETSIZE. FD_SETSIZE, 2048, is the default file descriptor maximum size.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*listenfd* is the listening socket descriptor.

*size* is the value of FD_SETSIZE.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** None.

**System programmer response:** Restart the filter program after verifying that the socket descriptor ctx_sd used in the filter program is correct.

**Module:** lf_lstnr

**Procedure name:** mi_listener
**EZZ9967I**  
**filtername**: select() failed (returncode reasoncode description), action

**Explanation**: The program cannot monitor this socket using the select() API.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*returncode* is the z/OS UNIX System Services return code returned from the select() API. These return codes are listed and described in the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview.wss?uid=swg27044973).

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the select() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview.wss?uid=swg27044973), where the reason codes are listed.

*description* is a description of the error.

*action* is the resulting action to be taken by sendmail. *action* will be either "abort" or "retry".

**System action**: Processing continues to retry up to 16 times. The filter program ends and returns MI_FAILURE after the last retry failed.

**Operator response**: Contact the system programmer.

**System programmer response**: Use *returncode* and *reasoncode* to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27044973) for more information about the select() API.

**Module**: lf_lstnr

**Procedure name**: mi_listener

---

**EZZ9968I**  
**filtername**: select() returned exception for socket, abort

**Explanation**: The select() API returned an exception. There is a mismatch between the listen socket descriptor and the read set returned by the select() API.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

**System action**: The filter program ends and returns MI_FAILURE.

**Operator response**: Contact the system programmer.

**System programmer response**: Use the response from earlier error messages.

**Module**: lf_lstnr

**Procedure name**: mi_listener

---

**EZZ9969I**  
**filtername**: accept() failed (returncode reasoncode description), action

**Explanation**: The program cannot accept a socket using the accept() API.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

**System action**: Processing continues to retry up to 16 times. The filter program ends and returns MI_FAILURE after the last retry fails.

**Operator response**: Contact the system programmer.

**System programmer response**: Use *returncode* and *reasoncode* to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27044973) for more information about the accept() API.
C/C++ Runtime Library Reference for more information about the accept() API.

Module: lf_lstnr

Procedure name: mi_listener

EZZ9970I transient .forward open error: message queued

Explanation: There was no successful .forward open and at least one transient open.

System action: This mail address will be deferred for later delivery.

Operator response: Contact the system programmer.

System programmer response: Change the .forward file to correctly set the address forwarding.

Module: alias

Procedure name: forward

EZZ9971I filtername: pthread_create() failed (returncode reasoncode) description

Explanation: The filter program cannot create a thread using the pthread_create() API.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

returncode is the z/OS UNIX System Services return code returned from the pthread_create() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the pthread_create() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

description is a description of the error.

System action: Processing continues to retry up to 16 times. The filter program ends and returns MI_FAILURE after the last retry failed.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the pthread_create() API.

Module: lf_lstnr

Procedure name: mi_listener

EZZ9972I filtername: st_optionneg connectionid length length shorter than minlength

Explanation: The argument length is shorter than the minimum length minlength.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

connectionid is the thread ID for this filter.

length is the length of the argument buffer.

minlength is the minimum length in bytes of the option.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Correct the argument length of the filter. It must be greater than the minimum length.

Module: lf_engn

Procedure name: st_optionneg
**EZZ9973I**  
**filtername : st_optionneg connectionid version cversion less than milter version mversion**

**Explanation:** The mail filter version is earlier than SMFI_VERSION.

`filtername` is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

`connectionid` is the thread ID for this filter.

`cversion` is the version of this filter.

`mversion` is the version of the mail filter program.

**System action:** The program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the xxfi_version that is in the filter program to the constant SMFI_VERSION and then recompile the filter program.

**Module:** If_engn

**Procedure name:** st_optionneg

---

**EZZ9974I**  
**filtername : st_optionneg connectionid cflag does not fulfill action requirements fflag**

**Explanation:** The st_optionneg connection `connectionid` with `cflag` flag cannot fulfill action requirement `fflag`.

`filtername` is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

`connectionid` is the thread ID for this filter.

`cflag` is the flag of this command thread.

`fflag` is the flag of this filter.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the mail filter flag on the smfi_register() API to a valid action.

**Module:** If_engn

**Procedure name:** st_optionneg

---

**EZZ9975I**  
**filtername : st_optionneg connectionid cflag does not fulfill protocol requirements fflag**

**Explanation:** The st_optionneg connection `connectionid` with `cflag` flag cannot fulfill protocol requirement `fflag`.

`filtername` is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

`connectionid` is the thread ID for this filter.

`cflag` is the flag of this command thread.

`fflag` is the flag of this filter.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Change the mail filter flag on the smfi_register() API to a valid option.

**Module:** If_engn

**Procedure name:** st_optionneg
**EZZ9976I**  
*filtername: portlength is greater than or equal to bufferlength for connection connectionid*

**Explanation:** The length of the port in Host Byte Order is larger than the generic argument buffer.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*connectionid* is the thread ID for this filter.

*portlength* is the length in bytes of port number.

*bufferlength* is the length of argument buffer.

**System action:** The program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the length of the generic argument buffer and restart the filter program.

**Module:** if_engn

**Procedure name:** st_connectinfo

---

**EZZ9977I**  
*filtername: inet_addr() failed for connection connectionid*

**Explanation:** Cannot interpret character strings representing host addresses expressed in standard dotted-decimal notation to host addresses suitable for use as an Internet address.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*connectionid* is the thread ID for this filter.

**System action:** The program ends and returns MI_FAILURE.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the filter IPv4 address and rerun the filter program.

**Module:** if_engn

**Procedure name:** st_connectinfo

---

**EZZ9978I**  
*filtername: mi_inet_pton() failed for connection connectionid*

**Explanation:** The filter program cannot convert an address in its standard text presentation form into its numeric binary form.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*connectionid* is the thread ID for this filter.

**System action:** The filter program ends and returns MI_FAILURE.

**Operator response:** None.

**System programmer response:** Correct the filter IPv6 address and rerun the filter program.

**Module:** if_engn

**Procedure name:** st_connectinfo

---

**EZZ9979I**  
*filtername: the path for connect ctxid is too long*

**Explanation:** The z/OS UNIX socket path is greater than 252 characters.

*filtername* is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

*ctxid* is the thread ID for this filter.

**System action:** The filter program ends and returns MI_FAILURE.
EZZ9980I  •  EZZ9982I

Operator response: None.

System programmer response: Specify a shorter z/OS UNIX socket path name.

Module: lf_engn

Procedure name: st_connectinfo

EZZ9980I  filtername : unknown family familyname for connection connectionid

Explanation: The socket family familyname is not known by sendmail. Valid socket family names are inet6, inet, local, or unix.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

connectionid is the thread ID for this filter.

familyname is the family that is unknown.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Change to socket family to a valid socket family name.

Module: lf_engn

Procedure name: st_connectinfo

EZZ9981I  filtername : mi_rd_cmd: read returned result (returncode reasoncode): description

Explanation: The filter program cannot read data from a socket.

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

result is the value returned from the read() API.

returncode is the z/OS UNIX System Services return code returned from the read() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the read() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where the reason codes are listed.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.

Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the read() API.

Module: lf_comm

Procedure name: mi_rd_cmd

EZZ9982I  filtername : mi_rd_cmd: select returned result (returncode reasoncode): description

Explanation: The filter program cannot monitor this socket using select().

filtername is the name of the filter registered by the filter program in the xxfi_name of the smfiDesc variable used on the smfi_register() API.

result is the value returned from the select() API.

returncode is the z/OS UNIX System Services return code returned from the select() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

reasoncode is the hexadecimal z/OS UNIX System Services reason code returned from the select() API. The format of

910  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZZ, SNM)
the 4-byte reason code is explained in the introduction to the Reason Code section of the 
"z/OS UNIX System Services Messages and Codes" where the reason codes are listed.

description is a description of the error.

System action: The filter program ends and returns MI_FAILURE.
Operator response: Contact the system programmer.

System programmer response: Use returncode and reasoncode to determine the cause of the error. See the "z/OS XL C/C++ Runtime Library Reference" for more information about the select() API.

Module: lf_comm
Procedure name: mi_rd_cmd

EZZ9983I mailstats:
Explanation: This is a message header output from the mailstats command.
System action: None.
Operator response: None.
System programmer response: None.
Module: mailstat.c
Procedure name: main

EZZ9984I mailstats: incorrect magic number in stfile
Explanation: An error occurred in the status file specified using the -f parameter of mailstats.
stfile is the status file name.

System action: mailstats returns EX_OSERR
Operator response: Determine that the status file specified on the -f parameter is a valid status file.
System programmer response: None.
Module: mailstats
Procedure name: main

EZZ9985I mailstats version STAT_VERSION incompatible with filename version mailstatsversion
Explanation: The version of mailstats is incompatible with the statistics file.
STAT_VERSION is the version of mailstats.
filename is the name of the statistics file.
mailstatsversion is the version read from the statistics file.

System action: sendmail ends.
Operator response: Contact the system programmer.
System programmer response: Start mailstats without a statistics file or start it with a statistics file created by z/OS Communications Server sendmail.
Module: mailstats
Procedure name: main
EZZ9986I  STARTTLS option option can be specified only in the zOS.cf file

Explanation:  option specified in the sendmail.cf file might be specified only in the zOS.cf file.  The z/OS Communications Server sendmail requires that all TLS options be specified in the zOS.cf file.

option is the option specified in the sendmail.cf file.

System action:  The option is ignored.

Operator response:  Contact the system programmer.

System programmer response:  Move the TLS option from the sendmail.cf file to the zOS.cf file.

Module:  readcf

Procedure name:  setoption

EZZ9987I  STARTTLS option option is not supported.

Explanation:  The specified option is not supported in z/OS Communications Server sendmail.

option is the option specified in the zOS.cf or sendmail.cf file.

System action:  The option is ignored.

Operator response:  None.

System programmer response:  Remove the option from the sendmail.cf or zOS.cf file.

Module:  readcf

Procedure name:  setoption

EZZ9988I  map_file: count aliases, longest length bytes, total_bytes bytes total

Explanation:  This message describes the rebuilt alias database.

map_file is the alias map file.

count is the number of aliases in the alias map file.

length is the length of the longest alias in the alias map file.

total_bytes is the total number of bytes in the alias map file.

System action:  None.

Operator response:  None.

System programmer response:  None.

Module:  alias

Procedure name:  readaliases

EZZ9989I  Alias file alias is locked

Explanation:  The specified alias file is locked and cannot be read.  It might be being rebuilt.

alias is the alias file name.

System action:  None.

Operator response:  Unlock the alias file and try the command again.

System programmer response:  None.

Module:  alias

Procedure name:  readaliases
**EZ9990I**  
**fstat of file failed (returncode reasoncode): description**

**Explanation:** The fstat() API failed with the return and reason code specified.

*file* is the name of the alias file.

*returncode* is the z/OS UNIX System Services return code returned from the fstat() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the fstat() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where these reason codes are listed.

*description* is a description of the error.

**System action:** The alias file is not rebuilt.

**Operator response:** Contact the system programmer.

**System programmer response:** Use *returncode* and *reasoncode* to determine the cause of the error. See the z/OS XL C/C++ Runtime Library Reference for more information about the fstat() API.

**Module:** alias  

**Procedure name:** rebuildaliases

---

**EZ9991I**  
**Aliased to alias**

**Explanation:** The alias name is shown.

*alias* is the alias name.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**Module:** alias  

**Procedure name:** alias

---

**EZ9992I**  
**alias database alias is out of date**

**Explanation:** The alias database is out of date and should be rebuilt.

*alias* is the alias database file.

**System action:** sendmail continues.

**Operator response:** None.

**System programmer response:** Rebuild the alias file with the command newaliases or sendmail -bi.

**Module:** alias  

**Procedure name:** alias

---

**EZ9993I**  
**newaliases: cannot open file (returncode reasoncode): description**

**Explanation:** The new aliases file specified cannot be opened.

*file* is the alias file.

*returncode* is the z/OS UNIX System Services return code returned from the open() API. These return codes are listed and described in the z/OS UNIX System Services Messages and Codes.

*reasoncode* is the hexadecimal z/OS UNIX System Services reason code returned from the open() API. The format of the 4-byte reason code is explained in the introduction to the Reason Code section of the z/OS UNIX System Services Messages and Codes, where these reason codes are listed.

*description* is a description of the error.
**System action:** The alias file is not rebuilt. sendmail continues using the existing alias file.

**Operator response:** Contact the system programmer.

**System programmer response:** Use `returncode` and `reasoncode` to determine the cause of the error. See the [z/OS XL C/C++ Runtime Library Reference](https://www.ibm.com/support/docview.wss?uid=swg27016533) for more information about the open() API.

**Module:** alias

**Procedure name:** rebuildalias
Chapter 10. SNMxxxx messages

SNM000W  MSG number does not exist in SNMPMSGS message table DSISNMnn

Explanation:  SNMP attempted to display the indicated message but could not find this message number in the DSIMSG data set.

System action:  The missing message is not displayed. Processing continues.

Operator response:  Tell the system programmer about the error.

System programmer response:  Check that the data set containing SNMP messages (members DSISNMxx) is properly specified on the DSIMSG DD statement of the NetView® start procedure.

Module:  SNMPMSGS

Procedure name:  snmpmsgs

SNM010E  command Invalid netmask or desired network specified

Explanation:  SNMP encountered an error converting an IP address specified in a command. This message indicates that the netmask or network specified is incorrect.

System action:  The command is ignored.

Operator response:  If the command was issued at the NetView command line, reenter the command with the correct network and netmask specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.

System programmer response:  If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct network and netmask.

Module:  SNMPSNMP

Procedure name:  snmp

SNM011E  command Invalid function: function

Explanation:  An SNMP command specified an incorrect function.

System action:  The command is ignored.

Operator response:  If the command was issued at the NetView command line, reenter the command with the correct function. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.

System programmer response:  If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct function.

Module:  SNMPSNMP

Procedure name:  snmp

SNM012E  command Function function needs at least count parameter(s)

Explanation:  An SNMP command omitted the required function parameters.

System action:  The command is abnormally ended.

Operator response:  If the command was issued at the NetView command line, reenter the command with the correct parameters. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.

System programmer response:  If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct parameters.
Module: SNMPSNMP
Procedure name: snmp

SNM013E command Missing function
Explanation: An SNMP command omitted the required function specification.
System action: The command is ignored.
Operator response: If the command was issued at the NetView command line, reenter the command with the correct function specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.
System programmer response: If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct function.
Module: SNMPSNMP
Procedure name: snmp

SNM014E command Missing variable name
Explanation: An SNMP command omitted a variable name.
System action: The command is abnormally ended.
Operator response: If the command was issued at the NetView command line, reenter the command with the correct variable name specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.
System programmer response: If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct variable name.
Module: SNMPSNMP
Procedure name: snmp

SNM015E command Missing set value for variable
Explanation: SNMP found a SET function with no value specified.
System action: The command is abnormally ended.
Operator response: If the command was issued at the NetView command line, reenter the command with the correct value for the set variable. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.
System programmer response: If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct value for the set variable.
Module: SNMPSNMP
Procedure name: snmp

SNM016E command Missing or invalid destination host identification
Explanation: An SNMP command omitted a required host ID specification.
System action: The command is abnormally ended.
Operator response: If the command was issued at the NetView command line, reenter the command with the correct host ID specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.
System programmer response: If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct host ID.
Module: SNMPSNMP
SNM017E  command  Missing community name
Explanation:  An SNMP command omitted a required community name specification.
System action:  The command is ignored.
Operator response:  If the command was issued at the NetView command line, reenter the command with the correct community name specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.
System programmer response:  If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct community name.
Module:  SNMPSNMP
Procedure name:  snmp

SNM018E  command  Request rejected, task task not active
Explanation:  An SNMP request was rejected because the referenced SNMP IUCV task was not active.
System action:  SNMP requests are rejected until the SNMPIUCV task is activated.
Operator response:  Start the SNMPIUCV task first, wait for the connection with the SNMP Query Engine, and reissue the SNMP request.
System programmer response:  None.
Module:  SNMPSNMP
Procedure name:  snmp

SNM019E  command  Request rejected, task task not (yet) connected
Explanation:  An SNMP request was rejected because the indicated task had not yet established an IUCV connection with the SNMP Query Engine.
System action:  The connection is still pending. The system continues operation.
Operator response:  Wait for the connection to complete, and reissue the SNMP request.
System programmer response:  None.
Module:  SNMPSNMP
Procedure name:  snmp

SNM020E  command  Error error on DSIGET
Explanation:  SNMP encountered an error allocating memory for a packet.
System action:  The command ends abnormally. The system tries to continue operation.
Operator response:  Try the command again. If the error persists, contact the system programmer.
System programmer response:  Use the indicated error value to determine the reason for the error. The cause of this error is probably insufficient storage. See NetView Customization: Using Assembler for DSIGET error codes.
Module:  SNMPSNMP
Procedure name:  snmp

SNM021E  command  Error error on DSIMQS
Explanation:  SNMP encountered an error queuing a packet to the SNMP IUCV task.
System action:  The command ends abnormally. The system tries to continue operation.
Operator response:  Try the command again. If the error persists, tell the system programmer about the error.
SNM022E • SNM031I

System programmer response: Use the indicated error value to determine the reason for the error. See NetView Customization: Using Assembler for DSIMQS error codes.

Module: SNMPSNMP
Procedure name: snmp

SNM022E command Missing or invalid trap filter id

Explanation: An SNMP command failed to specify or specified an incorrect trap filter ID.

System action: The command ends abnormally.

Operator response: If the command was issued at the NetView command line, reenter the command with the correct trap filter ID specified. If the command was issued from a NetView CLIST, ask the system programmer to correct the CLIST.

System programmer response: If the command was issued from a NetView CLIST, correct the NetView CLIST to specify the correct trap filter ID.

Module: SNMPSNMP
Procedure name: snmp

SNM023W Error code on DSIDKS service, DDname is ddname - using internal defaults

Explanation: The indicated NetView disk service received the indicated return code while accessing a data set specified on the indicated DD statement in the NetView start procedure. This error occurs when SNMPIUCV cannot access the SNMPARMS member of the DSIPARM data set.

System action: The SNMPARMS member is not read. Internal default values are used for the parameters contained in SNMPARMS.

Operator response: Tell the system programmer about the error.

System programmer response: Check that the data set containing the SNMPARMS member is properly specified on the DSIPARM DD statement in the NetView start procedure. See NetView V1R3 Customization: Using Assembler for information about DSIDKS services and return codes.

Module: SNMPTASK
Procedure name: snmpiucv

SNM030I SNMP request filter_id received the following trap:

Explanation: The indicated SNMP trap filter received a trap. This message is the first of a series of messages (SNM030I-SNM039I) that contain the detailed trap information. The indicated filter ID is associated with the SNMP TRAPSON request that set the trap filter.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: SNMPTASK
Procedure name: snmpiucv

SNM031I Agent Address: ip_address

Explanation: The indicated ip address is the address of the SNMP agent that issued the trap. This message is part of the trap message series beginning with SNM030I.

System action: Processing continues.

Operator response: None.

System programmer response: None.

This message is part of the response message series beginning with SNM040I.

**System action:** Processing continues.

**Operator response:** See SNM048I for information about the various major and minor error codes.

**System programmer response:** None.

**Module:** SNMPTASK

**Procedure name:** snmpiucv

---

**SNM047I  Error Index: index**

**Explanation:** If the SNMP agent detected an error, SNM047I indicates the position of the first variable in error. For example, if a GET request is issued with a list of four variables, and the major or minor error code indicates an agent detected error, the error index shows which of the four variables (1, 2, 3, or 4) is in error. This message is part of the response message series beginning with SNM040I.

**System action:** Processing continues.

**Operator response:** See SNM048I for information about the various major and minor error codes.

**System programmer response:** None.

**Module:** SNMPTASK

**Procedure name:** snmpiucv

---

**SNM048I  Error Text: error**

**Explanation:** This message gives a textual description of the error code in message SNM045I and SNM046I. The following is a list of errors and actions:

**Bad value:**
- A Set request was issued for a variable, but the value specified to set the variable was out of range or had incorrect syntax.

**General error:**
- The agent detected an error other than one of the indicated errors. If this message was received in response to a Get request for one of the enterprise-specific 3172 variables at a VM or MVS SNMP agent, the TCP/IP virtual machine console (on VM) or address space output file (on MVS) should have additional error messages.

**I/O error:**
- An Input/Output error occurred. If this message appeared in response to a PING request, check that the name of the SNMP query engine address space is authorized to use RAW sockets.

**Illegal request:**
- An incorrect request was received. Contact the IBM software support center.
SNM049I

No error:  
The request was completed successfully with no detected errors.

No response:  
The SNMP query engine sent a request to an SNMP agent, but no response was received. Check that the  
route to the specified host is available and that the SNMP agent was started.

No such filter:  
An SNMP TRAPSOFF command was issued for a trap filter ID, but the specified trap filter ID does not  
exist.

No such name:  
The SNMP request sent to the agent contained a request for a variable that the SNMP agent does not  
support.

Out of memory:  
The SNMP query engine address space ran out of memory. Restart SQESERV with a larger region size. If the  
error persists, contact the IBM software support center.

Protocol error:  
A protocol error occurred. Contact the IBM software support center.

Read only:  
A Set request was issued for a variable, but the SNMP agent did not allow write access to the variable.

Too big:  
When the SNMP agent was generating the SNMP response PDU, the total length of all the requested  
variables and their values was too large for the response PDU. This happens when multiple variables, each  
with a large value, are requested on the same SNMP request PDU. To recover from this error, break the  
SNMP request into many smaller requests, and reissue the SNMP commands.

Too many elements:  
An SNMP command was issued with more than 10 MIB variables requested. A maximum of 10 variable  
names and values can be specified in one SNMP command. Issue the variable names using multiple SNMP  
commands instead of one.

Unknown host:  
The SNMP command specified a host name that could not be resolved into an IP address. Check that the  
host name was entered correctly. Check that the SNMP query engine can reach the domain name server or  
has access to the HOSTS.INFO data set (whichever is used for name resolution). Check that the host name is  
specified correctly at the domain name server or in the HOSTS.LOCAL data set.

Unknown variable:  
An SNMP command was entered with a MIB variable that was specified in textual form. The variable could  
not be found in the hlq.MIB@DESC.DATA data set. Check that the variable name was entered correctly. Add  
the variable to the hlq.MIB@DESC.DATA data set, if necessary.

This message is part of the response message series beginning with SNM040I.

System action:  Processing continues.

Operator response:  See the previous description.

System programmer response:  None.

Module:  SNMPTASK

Procedure name:  snmpicuv

SNM049I  SNMP Request request End of response

Explanation:  This message indicates the end of the response message series beginning with SNM040I.

System action:  Processing continues.

Operator response:  None.

System programmer response:  None.

Module:  SNMPTASK

924  z/OS V2R1.0 Communications Server: IP Messages Volume 4 (EZ, SNM)
Procedure name: snmpiucv

SNM050I SNMP Request request from operator accepted, sent to Query Engine

Explanation: The SNMP command that the indicated operator just entered was accepted by the SNMP command processor and passed to the SNMP query engine. This request was assigned the indicated request number. The same request number is displayed in SNM040I when the response is received and is used to correlate incoming responses with outstanding requests.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: SNMPTASK

Procedure name: snmpiucv

SNM051E SNMP Request request from originator discarded, MsgComplete IPAUDIT=X=value

Explanation: SNMP received an IUCV Message Complete notification, indicating the message was discarded rather than received. Execution continues. The indicated origin identifies the operator that issued the request, and the indicated request identifies the request that this operator issued.

System action: The system tries to continue operation but discards the request that failed.

Operator response: Check that the SNMP Query Engine is operating correctly, and reissue your SNMP request. If the error persists, tell the system programmer about the error.

System programmer response: Determine why the IUCV Message was not received by the Query Engine. The IPAUDIT code can be used to determine the cause. See VM CP Programming Services for more information about the IPAUDIT value. Correct the situation, and reissue the SNMP request.

Module: SNMPTASK

Procedure name: snmpiucv

SNM052E SNMP Request request from originator discarded, IUCV SEND error (R15)=error

Explanation: SNMP encountered the indicated error while attempting an IUCV SEND. Consequently, the indicated request from the indicated user could not be processed and was discarded.

System action: The system continues to operate.

Operator response: Check that the SNMP Query Engine is operating correctly. Check that the SNMPPIUCV task is connected to the SNMP Query Engine. Reissue your SNMP request. If the error persists, tell the system programmer about the error.

System programmer response: Determine the cause of the error by analyzing the error code. See VM CP Programming Services for more information about the error code on the IUCV SEND. Correct the situation, and reissue the SNMP request.

Module: SNMPTASK

Procedure name: snmpiucv

SNM053E SNMP Request request from originator discarded, IUCV Connection Severed

Explanation: The indicated SNMP request from the indicated operator was discarded because the SNMP IUCV connection was severed.

System action: Because the connection was severed, no new SNMP requests are accepted until the connection with the SNMP Query Engine is reestablished.

Operator response: Reestablish the IUCV connection with the SNMP Query Engine and reissue your SNMP request.

System programmer response: None.
SNM100I・SNM103E

Module: SNMPTASK
Procedure name: snmpiucv

SNM100I SNMP task task connecting to Query Engine name path=path

Explanation: The SNMP task running under NetView is trying to connect to the SNMP query engine. The indicated name is the name of the query engine address space. The indicated path is the IUCV path ID that the connection is using.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: SNMPTASK
Procedure name: snmpiucv

SNM101W SNMP task task found Query Engine name not ready

Explanation: SNMP attempted to connect to the Query Engine but found the Query Engine was not ready. The indicated name identifies the started task of the Query Engine.

System action: Depending on the reason that the engine is not ready, SNMP can end this attempt abnormally to contact the engine or continue execution. The SNMP task task retries the connection to the Query Engine name based on the retry value specified in the SNMP initialization parameters.

Operator response: Start the SNMP query engine. If the Query Engine cannot be started, or if the error persists, tell the system programmer about the error.

System programmer response: Check the SNMP Query Engine log for error messages. Check that the value of the SNMPQE parameter in the SNMPARMS parameter list corresponds to the name of the SNMP Query Engine address space.

Module: SNMPTASK
Procedure name: snmpiucv

SNM102I SNMP task task connected to Query Engine name, path=path, msglim=msglim

Explanation: The indicated SNMP task running under NetView successfully connected to the SNMP query engine. The indicated name is the name of the SNMP query engine address space. The indicated path ID is the IUCV path ID being used. The indicated msglim is the IUCV MSGLIM.

System action: Processing continues.

Operator response: None.

System programmer response: None.

Module: SNMPTASK
Procedure name: snmpiucv

SNM103E SNMP task task got error error on function sub-function

Explanation: SNMP encountered the indicated error from the indicated IUCV function.

System action: The request is abnormally ended. If possible, the system continues operation.

Operator response: Tell the system programmer about the error.

System programmer response: Use the indicated error code, function, and subfunction values to determine the cause of the error. See VM CP Programming Services for more information about IUCV error codes. Correct the situation, and reissue the command.

Module: SNMPTASK
SNM104E SNM108E

Procedure name: snmpiucv

SNM104E SNMP task task has count IUCV interrupts pending, path severed
Explanation: SNMP received more IUCV interrupts than it can handle with its current preallocated queue. The indicated number of IUCV interrupts are pending. The IUCV path was severed.
System action: The system tries to reestablish the connection with the SNMP Query Engine and restart.
Operator response: Tell the system programmer about the error. You can reissue your SNMP requests after the connection with the SNMP Query Engine has been reestablished.
System programmer response: Check that you do not have a CLIST that issues SNMP requests in a endless loop. If the error persists, contact the IBM software support center.
Module: SNMPTASK
Procedure name: snmpiucv

SNM105E SNMP task task ignored IUCV interrupt, unexpected IPTYPE type
Explanation: SNMP received an IUCV interrupt with an unexpected IPTYPE field.
System action: The interrupt is ignored. The system continues operation.
Operator response: Tell the system programmer about the error.
System programmer response: Check that the version and level of SNMP Query Engine are in sync with the version of the SNMPIUCV task.
Module: SNMPTASK
Procedure name: snmpiucv

SNM106E SNMP task task connection to Query Engine id now severed
Explanation: The IUCV connection between SNMP and the indicated query engine was severed. The connection can be reopened.
System action: If any requests are still outstanding, the system discards them. Execution continues.
Operator response: Reestablish the connection with the SNMP Query Engine if SNMP requests need to be issued.
System programmer response: None.
Module: SNMPTASK
Procedure name: snmpiucv

SNM107E SNMP task task received sever for path= path
Explanation: SNMP received notification of a severed IUCV connection for the indicated path. SNMP did not have this connection open before this notification.
System action: The system continues operation.
Operator response: If the error persists, contact the system programmer.
System programmer response: Contact the IBM software support center.
Module: SNMPTASK
Procedure name: snmpiucv

SNM108E SNMP task task cannot find IUCV PC numbers in CVT.
Explanation: SNMP could not locate the IUCV Program Call numbers.
System action: Initialization is terminated. The SNMPIUCV task cannot operate in this situation.
Operator response: Tell the system programmer about the error.
SNM109I • SNM122W

System programmer response: Check that TCP/IP was installed correctly on your MVS system.
Module: SNMPTASK
Procedure name: snmpiucv

SNM109I  SNMP task task awaiting Connection Complete from Query Engine name
Explanation: The SNMP task running under NetView sent a request for a connection to the SNMP query engine, but the query engine has not yet responded. The indicated name is the name of the query engine address space.
System action: The indicated SNMP task waits for the connection complete message from the query engine.
Operator response: None.
System programmer response: None.
Module: SNMPTASK
Procedure name: snmpiucv

SNM120W  SNMP task task got error error on DSIGET
Explanation: SNMPIUCV encountered an error allocating memory with a DSIGET call.
System action: During initialization, this error can prevent the startup of the SNMPIUCV task. During normal operation, this error can cause one or more SNMP requests to fail, or never receive a response.
Operator response: If the error persists, tell the system programmer about the error.
System programmer response: Use the indicated error value to determine the reason for the error. The probable cause of the error is not enough storage. See NetView Customization: Using Assembler for DSIGET error codes. If the error indicates not enough storage, start NetView with a larger region size.
Module: SNMPTASK
Procedure name: snmpiucv

SNM121W  SNMP task task incoming packet has invalid packet length length
Explanation: SNMP received a packet with an incorrect length.
System action: Incorrect packets are ignored.
Operator response: If the error persists, tell the system programmer about the error.
System programmer response: Check that you have a correct level of the SNMP Query Engine that is in sync with the SNMPIUCV task on NetView side.
Module: SNMPTASK
Procedure name: snmpiucv

SNM122W  SNMP task task incoming packet has invalid character set value
Explanation: SNMP received a packet specifying an incorrect character set.
System action: The packet is ignored. The system continues operation.
Operator response: Tell the system programmer about the error.
System programmer response: Check that the version and level of SNMP Query Engine are in sync with the version of the SNMPIUCV task.
Module: SNMPTASK
Procedure name: snmpiucv
SNM123W  SNMP task task incoming packet has invalid packet type value
Explanation:  SNMP received a packet with an incorrect packet type.
System action:  The packet is ignored. The system continues operation.
Operator response:  Tell the system programmer about the error.
System programmer response:  Check that the version and level of SNMP Query Engine are in sync with the
version of the SNMPIUCV task.
Module:  SNMPTASK
Procedure name:  snmpiucv

SNM124I  SNMP task subtask received: Connection condition
Explanation:  The state of the IUCV connection between the indicated NetView subtask and the SNMP query engine
changed to either Quiesced or Resumed. If the NetView subtask is sending more requests than the query engine can
handle, the query engine halts the connection. The requests are queued at the NetView subtask. When the query
engine is ready for more requests, it resumes the connection, and the NetView subtask sends the requests again.
System action:  When the connection is quiesced, the NetView subtask accepts requests from the operator but
queues the request rather than forward the requests to the query engine. When the connection resumes, the NetView
subtask begins forwarding queued and new requests to the query engine again.
Operator response:  None.
System programmer response:  None.
Module:  SNMPTASK
Procedure name:  snmpiucv

SNM128W  SNMP task task found missing value or invalid value for parameter
Explanation:  SNMP found an initialization parameter with a missing or incorrect value.
System action:  The missing or incorrect value is ignored, and the default value is used. Initialization continues.
Operator response:  Tell the system programmer about the error.
System programmer response:  Correct the missing or incorrect value in SNMPARMS.
Module:  SNMPTASK
Procedure name:  snmpiucv

SNM129W  SNMP task task found invalid initialization parameter value
Explanation:  SNMP found an incorrect initialization parameter.
System action:  The incorrect initialization parameter is ignored. Initialization continues and assumes the default
value for the incorrect parameter.
Operator response:  Tell the system programmer about the error.
System programmer response:  Correct the incorrect initialization parameter in SNMPARMS.
Module:  SNMPTASK
Procedure name:  snmpiucv
Appendix A. Related protocol specifications

This appendix lists the related protocol specifications (RFCs) for TCP/IP. The Internet Protocol suite is still evolving through requests for comments (RFC). New protocols are being designed and implemented by researchers and are brought to the attention of the Internet community in the form of RFCs. Some of these protocols are so useful that they become recommended protocols. That is, all future implementations for TCP/IP are recommended to implement these particular functions or protocols. These become the de facto standards, on which the TCP/IP protocol suite is built.

You can request RFCs through electronic mail, from the automated Network Information Center (NIC) mail server, by sending a message to service@nic.ddn.mil with a subject line of RFC nnnn for text versions or a subject line of RFC nnnn.PS for PostScript versions. To request a copy of the RFC index, send a message with a subject line of RFC INDEX.

For more information, contact nic@nic.ddn.mil or at:

Government Systems, Inc.
Attn: Network Information Center
14200 Park Meadow Drive
Suite 200
Chantilly, VA 22021

Hard copies of all RFCs are available from the NIC, either individually or by subscription. Online copies are available at the following Web address:

Draft RFCs that have been implemented in this and previous Communications Server releases are listed at the end of this topic.

Many features of TCP/IP Services are based on the following RFCs:

FYI on Questions and Answers—Answers to Commonly Asked “New Internet User” Questions A. Marine, J. Reynolds, G. Malkin

RFC 1644
T/TCP — TCP Extensions for Transactions Functional Specification R. Braden

RFC 1646
TN3270 Extensions for LUname and Printer Selection C. Graves, T. Butts, M. Angel

RFC 1647
TN3270 Enhancements B. Kelly

RFC 1652
SMTP Service Extension for 8bit-MIMEtransport J. Klensin, N. Freed, M. Rose, E. Stefferud, D. Crocker

RFC 1664
Using the Internet DNS to Distribute RFC1327 Mail Address Mapping Tables C. Allochio, A. Bonito, B. Cole, S. Giordano, R. Hagens

RFC 1693
An Extension to TCP: Partial Order Service T. Connolly, P. Amer, P. Conrad
RFC 1695
Definitions of Managed Objects for ATM Management Version 8.0 using SMIv2
M. Ahmed, K. Tesink

RFC 1701
Generic Routing Encapsulation (GRE) S. Hanks, T. Li, D. Farinacci, P. Traina

RFC 1702
Generic Routing Encapsulation over IPv4 networks S. Hanks, T. Li, D. Farinacci, P. Traina

RFC 1706
DNS NSAP Resource Records B. Manning, R. Colella

RFC 1712
DNS Encoding of Geographical Location C. Farrell, M. Schulze, S. Pleitner D. Baldoni

RFC 1713
Tools for DNS debugging A. Romao

RFC 1723
RIP Version 2—Carrying Additional Information G. Malkin

RFC 1752
The Recommendation for the IP Next Generation Protocol S. Bradner, A. Mankin

RFC 1766
Tags for the Identification of Languages H. Alvestrand

RFC 1771
A Border Gateway Protocol 4 (BGP-4) Y. Rekhter, T. Li

RFC 1794
DNS Support for Load Balancing T. Brisco

RFC 1819

RFC 1826
IP Authentication Header R. Atkinson

RFC 1828
IP Authentication using Keyed MD5 P. Metzger, W. Simpson

RFC 1829
The ESP DES-CBC Transform P. Karn, P. Metzger, W. Simpson

RFC 1830
SMTP Service Extensions for Transmission of Large and Binary MIME Messages G. Vaudreuil

RFC 1831

RFC 1832
XDR: External Data Representation Standard R. Srinivasan

RFC 1833
Binding Protocols for ONC RPC Version 2 R. Srinivasan

RFC 1850
OSPF Version 2 Management Information Base F. Baker, R. Coltun
RFC 1854
SMTP Service Extension for Command Pipelining N. Freed

RFC 1869
SMTP Service Extensions J. Klensin, N. Freed, M. Rose, E. Stefferud, D. Crocker

RFC 1870
SMTP Service Extension for Message Size Declaration J. Klensin, N. Freed, K. Moore

RFC 1876
A Means for Expressing Location Information in the Domain Name System C. Davis, P. Vixie, T. Goodwin, I. Dickinson

RFC 1883
Internet Protocol, Version 6 (IPv6) Specification S. Deering, R. Hinden

RFC 1884
IP Version 6 Addressing Architecture R. Hinden, S. Deering, Eds.

RFC 1886
DNS Extensions to support IP version 6 S. Thomson, C. Huitema

RFC 1888
OSI NSAPs and IPv6 J. Bound, B. Carpenter, D. Harrington, J. Houldsworth, A. Lloyd

RFC 1891
SMTP Service Extension for Delivery Status Notifications K. Moore

RFC 1892
The Multipart/Report Content Type for the Reporting of Mail System Administrative Messages G. Vaudreuil

RFC 1894
An Extensible Message Format for Delivery Status Notifications K. Moore, G. Vaudreuil

RFC 1901
Introduction to Community-based SNMPv2 J. Case, K. McCloghrie, M. Rose, S. Waldbusser

RFC 1902

RFC 1903

RFC 1904

RFC 1905

RFC 1906
RFC 1907

RFC 1908

RFC 1912
Common DNS Operational and Configuration Errors D. Barr

RFC 1918
Address Allocation for Private Internets Y. Rekhter, B. Moskowitz, D. Karrenberg, G.J. de Groot, E. Lear

RFC 1928

RFC 1930
Guidelines for creation, selection, and registration of an Autonomous System (AS) J. Hawkkinson, T. Bates

RFC 1939
Post Office Protocol-Version 3 J. Myers, M. Rose

RFC 1981
Path MTU Discovery for IP version 6 J. McCann, S. Deering, J. Mogul

RFC 1982
Serial Number Arithmetic R. Elz, R. Bush

RFC 1985
SMTP Service Extension for Remote Message Queue Starting J. De Winter

RFC 1995
Incremental Zone Transfer in DNS M. Ohta

RFC 1996
A Mechanism for Prompt Notification of Zone Changes (DNS NOTIFY) P. Vixie

RFC 2010
Operational Criteria for Root Name Servers B. Manning, P. Vixie

RFC 2011
SNMPv2 Management Information Base for the Internet Protocol using SMIv2 K. McCloghrie, Ed.

RFC 2012

RFC 2013
SNMPv2 Management Information Base for the User Datagram Protocol using SMIv2 K. McCloghrie, Ed.

RFC 2018
TCP Selective Acknowledgement Options M. Mathis, J. Mahdavi, S. Floyd, A. Romanow

RFC 2026
The Internet Standards Process — Revision 3 S. Bradner

Appendix A. Related protocol specifications 943
RFC 2030
Simple Network Time Protocol (SNTP) Version 4 for IPv4, IPv6 and OSI D. Mills

RFC 2033
Local Mail Transfer Protocol J. Myers

RFC 2034
SMTP Service Extension for Returning Enhanced Error Codes N. Freed

RFC 2040

RFC 2045
Multipurpose Internet Mail Extensions (MIME) Part One: Format of Internet Message Bodies N. Freed, N. Borenstein

RFC 2052
A DNS RR for specifying the location of services (DNS SRV) A. Gulbrandsen, P. Vixie

RFC 2065
Domain Name System Security Extensions D. Eastlake 3rd, C. Kaufman

RFC 2066
TELNET CHARSET Option R. Gellens

RFC 2080
RIPng for IPv6 G. Malkin, R. Minnear

RFC 2096
IP Forwarding Table MIB F. Baker

RFC 2104
HMAC: Keyed-Hashing for Message Authentication H. Krawczyk, M. Bellare, R. Canetti

RFC 2119
Keywords for use in RFCs to Indicate Requirement Levels S. Bradner

RFC 2133
Basic Socket Interface Extensions for IPv6 R. Gilligan, S. Thomson, J. Bound, W. Stevens

RFC 2136
Dynamic Updates in the Domain Name System (DNS UPDATE) P. Vixie, Ed., S. Thomson, Y. Rekhter, J. Bound

RFC 2137
Secure Domain Name System Dynamic Update D. Eastlake 3rd

RFC 2163
Using the Internet DNS to Distribute MIXER Conformant Global Address Mapping (MCGAM) C. Allocchio

RFC 2168
Resolution of Uniform Resource Identifiers using the Domain Name System R. Daniel, M. Mealling

RFC 2178
OSPF Version 2 J. Moy

RFC 2181
Clarifications to the DNS Specification R. Elz, R. Bush
RFC 2205

RFC 2210
The Use of RSVP with IETF Integrated Services J. Wroclawski

RFC 2211
Specification of the Controlled-Load Network Element Service J. Wroclawski

RFC 2212
Specification of Guaranteed Quality of Service S. Shenker, C. Partridge, R. Guerin

RFC 2215
General Characterization Parameters for Integrated Service Network Elements S. Shenker, J. Wroclawski

RFC 2217
Telnet Com Port Control Option G. Clarke

RFC 2219
Use of DNS Aliases for Network Services M. Hamilton, R. Wright

RFC 2228
FTP Security Extensions M. Horowitz, S. Lunt

RFC 2230
Key Exchange Delegation Record for the DNS R. Atkinson

RFC 2233
The Interfaces Group MIB using SMIv2 K. McCloghrie, F. Kastenholz

RFC 2240
A Legal Basis for Domain Name Allocation O. Vaughn

RFC 2246
The TLS Protocol Version 1.0 T. Dierks, C. Allen

RFC 2251

RFC 2253

RFC 2254
The String Representation of LDAP Search Filters T. Howes

RFC 2261
An Architecture for Describing SNMP Management Frameworks D. Harrington, R. Presuhn, B. Wijnen

RFC 2262

RFC 2271
An Architecture for Describing SNMP Management Frameworks D. Harrington, R. Presuhn, B. Wijnen

RFC 2273
SNMPv3 Applications D. Levi, P. Meyer, B. Stewart
RFC 2404
The Use of HMAC-SHA–1–96 within ESP and AH C. Madson, R. Glenn

RFC 2405
The ESP DES-CBC Cipher Algorithm With Explicit IV C. Madson, N. Doraswamy

RFC 2406
IP Encapsulating Security Payload (ESP) S. Kent, R. Atkinson

RFC 2407
The Internet IP Security Domain of Interpretation for ISAKMPD. Piper

RFC 2408

RFC 2409
The Internet Key Exchange (IKE) D. Harkins, D. Carrel

RFC 2410
The NULL Encryption Algorithm and Its Use With IPsec R. Glenn, S. Kent,

RFC 2428
FTP Extensions for IPv6 and NATs M. Allman, S. Ostermann, C. Metz

RFC 2445
Internet Calendaring and Scheduling Core Object Specification (iCalendar) F. Dawson, D. Stenerson

RFC 2459
Internet X.509 Public Key Infrastructure Certificate and CRL Profile R. Housley, W. Ford, W. Polk, D. Solo

RFC 2460
Internet Protocol, Version 6 (IPv6) Specification S. Deering, R. Hinden

RFC 2461

RFC 2462
IPv6 Stateless Address Autoconfiguration S. Thomson, T. Narten

RFC 2463
Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification A. Conta, S. Deering

RFC 2464
Transmission of IPv6 Packets over Ethernet Networks M. Crawford

RFC 2466

RFC 2476
Message Submission R. Gellens, J. Klensin

RFC 2487
SMTP Service Extension for Secure SMTP over TLS P. Hoffman

RFC 2505
Anti-Spam Recommendations for SMTP MTAs G. Lindberg

Definitions of Managed Objects for the Ethernet-like Interface Types  J. Flick, J. Johnson

RFC 2671  
Extension Mechanisms for DNS (EDNS0)  P. Vixie

RFC 2672  
Non-Terminal DNS Name Redirection  M. Crawford

RFC 2675  
IPv6 Jumbograms  D. Borman, S. Deering, R. Hinden

RFC 2710  
Multicast Listener Discovery (MLD) for IPv6  S. Deering, W. Fenner, B. Haberman

RFC 2711  
IPv6 Router Alert Option  C. Partridge, A. Jackson

RFC 2740  
OSPF for IPv6  R. Coltun, D. Ferguson, J. Moy

RFC 2753  
A Framework for Policy-based Admission Control  R. Yavatkar, D. Pendarakis, R. Guerin

RFC 2782  
A DNS RR for specifying the location of services (DNS SRV)  A. Gubrandsen, P. Vixix, L. Esibov

RFC 2821  
Simple Mail Transfer Protocol  J. Klensin, Ed.

RFC 2822  
Internet Message Format  P. Resnick, Ed.

RFC 2840  
TELNET KERMIT OPTION  J. Altman, F. da Cruz

RFC 2845  
Secret Key Transaction Authentication for DNS (TSIG)  P. Vixie, O. Gudmundsson, D. Eastlake 3rd, B. Wellington

RFC 2851  
Textual Conventions for Internet Network Addresses  M. Daniele, B. Haberman, S. Routhier, J. Schoenwaelder
RFC 2852
Deliver By SMTP Service Extension D. Newman

RFC 2874
DNS Extensions to Support IPv6 Address Aggregation and Renumbering M. Crawford, C. Huitema

RFC 2915
The Naming Authority Pointer (NAPTR) DNS Resource Record M. Mealling, R. Daniel

RFC 2920
SMTP Service Extension for Command Pipelining N. Freed

RFC 2930
Secret Key Establishment for DNS (TKEY RR) D. Eastlake, 3rd

RFC 2941
Telnet Authentication Option T. Ts’o, ed., J. Altman

RFC 2942
Telnet Authentication: Kerberos Version 5 T. Ts’o

RFC 2946
Telnet Data Encryption Option T. Ts’o

RFC 2952
Telnet Encryption: DES 64 bit Cipher Feedback T. Ts’o

RFC 2953
Telnet Encryption: DES 64 bit Output Feedback T. Ts’o

RFC 2992
Analysis of an Equal-Cost Multi-Path Algorithm C. Hopps

RFC 3019
IP Version 6 Management Information Base for The Multicast Listener Discovery Protocol B. Haberman, R. Worzella

RFC 3060
Policy Core Information Model—Version 1 Specification B. Moore, E. Ellesson, J. Strassner, A. Westerinen

RFC 3152
Delegation of IP6.ARPA R. Bush

RFC 3164
The BSD Syslog Protocol C. Lonvick

RFC 3207
SMTP Service Extension for Secure SMTP over Transport Layer Security P. Hoffman

RFC 3226
DNSSEC and IPv6 A6 aware server/resolver message size requirements O. Gudmundsson

RFC 3291
Textual Conventions for Internet Network Addresses M. Daniele, B. Haberman, S. Routhier, J. Schoenwaelder

RFC 3363
RFC 3376
Internet Group Management Protocol, Version 3 B. Cain, S. Deering, I. Kouvelas, B. Fenner, A. Thyagarajan

RFC 3390
Increasing TCP’s Initial Window M. Allman, S. Floyd, C. Partridge

RFC 3410
Introduction and Applicability Statements for Internet-Standard Management Framework J. Case, R. Mundy, D. Partain, B. Stewart

RFC 3411

RFC 3412

RFC 3413

RFC 3414

RFC 3415
View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP) B. Wijnen, R. Presuhn, K. McCloghrie

RFC 3416

RFC 3417

RFC 3418

RFC 3419
Textual Conventions for Transport Addresses M. Daniele, J. Schoenwaelder

RFC 3484
Default Address Selection for Internet Protocol version 6 (IPv6) R. Draves

RFC 3493

RFC 3513
Internet Protocol Version 6 (IPv6) Addressing Architecture R. Hinden, S. Deering

RFC 3526
More Modular Exponential (MODP) Diffie-Hellman groups for Internet Key Exchange (IKE) T. Kivinen, M. Kojo
RFC 3542

Advanced Sockets Application Programming Interface (API) for IPv6 W. Richard Stevens, M. Thomas, E. Nordmark, T. Jinmei

RFC 3566

The AES-XCBC-MAC-96 Algorithm and Its Use With IPsec S. Frankel, H. Herbert

RFC 3569

An Overview of Source-Specific Multicast (SSM) S. Bhattacharyya, Ed.

RFC 3584

RFC 3602

The AES-CBC Cipher Algorithm and Its Use with IPsec S. Frankel, R. Glenn, S. Kelly

RFC 3629

UTF-8, a transformation format of ISO 10646 R. Kermode, C. Vicisano

RFC 3658

Delegation Signer (DS) Resource Record (RR) O. Gudmundsson

RFC 3678

Socket Interface Extensions for Multicast Source Filters D. Thaler, B. Fenner, B. Quinn

RFC 3715

IPsec-Network Address Translation (NAT) Compatibility Requirements B. Aboba, W. Dixon

RFC 3810

RFC 3826

RFC 3947

Negotiation of NAT-Traversal in the IKE T. Kivinen, B. Swander, A. Huttunen, V. Volpe

RFC 3948

UDP Encapsulation of IPsec ESP Packets A. Huttunen, B. Swander, V. Volpe, L. DiBurro, M. Stenberg

RFC 4001

Textual Conventions for Internet Network Addresses M. Daniele, B. Haberman, S. Routhier, J. Schoenwaelder

RFC 4007

IPv6 Scoped Address Architecture S. Deering, B. Haberman, T. Jinmei, E. Nordmark, B. Zill

RFC 4022

Management Information Base for the Transmission Control Protocol (TCP) R. Raghunarayan

RFC 4106

The Use of Galois/Counter Mode (GCM) in IPsec Encapsulating Security Payload (ESP) J. Viega, D. McGrew
RFC 4109
Algorithms for Internet Key Exchange version 1 (IKEv1) P. Hoffman

RFC 4113
Management Information Base for the User Datagram Protocol (UDP) B. Fenner, J. Flick

RFC 4191
Default Router Preferences and More-Specific Routes R. Draves, D. Thaler

RFC 4217
Securing FTP with TLS P. Ford-Hutchinson

RFC 4292
IP Forwarding Table MIB B. Haberman

RFC 4293
Management Information Base for the Internet Protocol (IP) S. Routhier

RFC 4301
Security Architecture for the Internet Protocol S. Kent, K. Seo

RFC 4302
IP Authentication Header S. Kent

RFC 4303
IP Encapsulating Security Payload (ESP) S. Kent

RFC 4304
Extended Sequence Number (ESN) Addendum to IPsec Domain of Interpretation (DOI) for Internet Security Association and Key Management Protocol (ISAKMP) S. Kent

RFC 4307
Cryptographic Algorithms for Use in the Internet Key Exchange Version 2 (IKEv2) J. Schiller

RFC 4308
Cryptographic Suites for IPsec P. Hoffman

RFC 4434
The AES-XCBC-PRF-128 Algorithm for the Internet Key Exchange Protocol P. Hoffman

RFC 4443
Internet Control Message Protocol (ICMPv6) for the Internet Protocol Version 6 (IPv6) Specification A. Conta, S. Deering

RFC 4552
Authentication/Confidentiality for OSPFv3 M. Gupta, N. Melam

RFC 4678
Server/Application State Protocol v1 A. Bivens

RFC 4753
ECP Groups for IKE and IKEv2 D. Fu, J. Solinas

RFC 4754
IKE and IKEv2 Authentication Using the Elliptic Curve Digital Signature Algorithm (ECDSA) D. Fu, J. Solinas

RFC 4809
RFC 4835
Cryptographic Algorithm Implementation Requirements for Encapsulating
Security Payload (ESP) and Authentication Header (AH) V. Manral

RFC 4862
IPv6 Stateless Address Autoconfiguration S. Thomson, T. Narten, T. Jinmei

RFC 4868
Using HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 with IPsec S.
Kelly, S. Frankel

RFC 4869
Suite B Cryptographic Suites for IPsec L. Law, J. Solinas

RFC 4941
Privacy Extensions for Stateless Address Autoconfiguration in IPv6 T. Narten, R.
Draves, S. Krishnan

RFC 4945
The Internet IP Security PKI Profile of IKEv1/ISAKMP, IKEv2, and PKIX B.
Korver

RFC 5014
IPv6 Socket API for Source Address Selection E. Nordmark, S. Chakrabarti, J.
Laganier

RFC 5095
Deprecation of Type 0 Routing Headers in IPv6 J. Aley, P. Savola, G.
Neville-Neil

RFC 5175
IPv6 Router Advertisement Flags Option B. Haberman, Ed., R. Hinden

RFC 5282
Using Authenticated Encryption Algorithms with the Encrypted Payload of the
Internet Key Exchange version 2 (IKEv2) Protocol D. Black, D. McGrew

RFC 5996
Internet Key Exchange Protocol Version 2 (IKEv2) C. Kaufman, P. Hoffman, Y.
Nir, P. Eronen

Internet drafts

Internet drafts are working documents of the Internet Engineering Task Force
(IETF), its areas, and its working groups. Other groups can also distribute working
documents as Internet drafts. You can see Internet drafts at [http://www.ietf.org/
ID.html](http://www.ietf.org/ID.html)
Appendix B. Accessibility

Publications for this product are offered in Adobe Portable Document Format (PDF) and should be compliant with accessibility standards. If you experience difficulties when using PDF files, you can view the information through the z/OS Internet Library website or the z/OS Information Center. If you continue to experience problems, send an email to mhvrcfs@us.ibm.com or write to:

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
USA

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. See z/OS TSO/E Primer, z/OS TSO/E User's Guide, and z/OS ISPF User's Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer or Library Server versions of z/OS books in the Internet library at www.ibm.com/systems/z/os/zos/bkserv/
Notices

This information was developed for products and services offered in the USA.

IBM may not offer all of the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.

Copyright © 1995-1998 Eric Young (eay@cryptsoft.com)

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com). The implementation was written so as to conform with Netscape’s SSL.

This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, Lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young’s, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must display the following acknowledgment: "This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)". The word 'cryptographic' can be left out if the routines from the library being used are not cryptographic related.

4. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include acknowledgment:
   "This product includes software written by Tim Hudson (tjh@cryptsoft.com)"

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License.]

This product includes cryptographic software written by Eric Young.

X Window System is a trademark of The Open Group.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

You can obtain softcopy from the z/OS Collection (SK3T-4269), which contains BookManager and PDF formats.

Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see [http://www-01.ibm.com/software/support/systemsz/lifecycle/](http://www-01.ibm.com/software/support/systemsz/lifecycle/)

- For information about currently-supported IBM hardware, contact your IBM representative.
Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at Copyright and trademark information at www.ibm.com/legal/copytrade.shtml.

Intel is a registered trademark of Intel Corporation or its subsidiaries in the United States and other countries.

Java™ and all Java-based trademarks are trademarks or registered trademarks of Oracle and/or its affiliates.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, and Windows NT are trademarks of Microsoft Corporation in the United States, other countries, or both.

Adobe and PostScript are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Other product and service names might be trademarks of IBM or other companies.
Bibliography

This bibliography contains descriptions of the documents in the z/OS Communications Server library.

z/OS Communications Server documentation is available in the following forms:
- In softcopy on CD-ROM collections. See “Softcopy information” on page x.

### z/OS Communications Server library updates

### z/OS Communications Server information

z/OS Communications Server product information is grouped by task in the following tables.

#### Planning

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: New Function Summary</td>
<td>GC27-3664</td>
<td>This document is intended to help you plan for new IP or SNA function, whether you are migrating from a previous version or installing z/OS for the first time. It summarizes what is new in the release and identifies the suggested and required modifications needed to use the enhanced functions.</td>
</tr>
<tr>
<td>z/OS Communications Server: IPv6 Network and Application Design Guide</td>
<td>SC27-3663</td>
<td>This document is a high-level introduction to IPv6. It describes concepts of z/OS Communications Server's support of IPv6, coexistence with IPv4, and migration issues.</td>
</tr>
</tbody>
</table>

#### Resource definition, configuration, and tuning

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
</table>
| z/OS Communications Server: IP Configuration Guide | SC27-3650 | This document describes the major concepts involved in understanding and configuring an IP network. Familiarity with the z/OS operating system, IP protocols, z/OS UNIX System Services, and IBM Time Sharing Option (TSO) is recommended. Use this document with the z/OS Communications Server: IP Configuration Reference.
<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
</table>
| z/OS Communications Server: IP Configuration Reference | SC27-3651 | This document presents information for people who want to administer and maintain IP. Use this document with the z/OS Communications Server: IP Configuration Guide. The information in this document includes:  
  • TCP/IP configuration data sets  
  • Configuration statements  
  • Translation tables  
  • Protocol number and port assignments |
| z/OS Communications Server: SNA Network Implementation Guide | SC27-3672 | This document presents the major concepts involved in implementing an SNA network. Use this document with the z/OS Communications Server: SNA Resource Definition Reference. |
| z/OS Communications Server: SNA Resource Definition Reference | SC27-3675 | This document describes each SNA definition statement, start option, and macroinstruction for user tables. It also describes NCP definition statements that affect SNA. Use this document with the z/OS Communications Server: SNA Network Implementation Guide. |
| z/OS Communications Server: SNA Resource Definition Samples | SC27-3676 | This document contains sample definitions to help you implement SNA functions in your networks, and includes sample major node definitions. |
| z/OS Communications Server: IP Network Print facility | SC27-3658 | This document is for systems programmers and network administrators who need to prepare their network to route SNA, JES2, or JES3 printer output to remote printers using TCP/IP Services. |

**Operation**

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: IP User’s Guide and Commands</td>
<td>SC27-3662</td>
<td>This document describes how to use TCP/IP applications. It contains requests with which a user can log on to a remote host using Telnet, transfer data sets using FTP, send and receive electronic mail, print on remote printers, and authenticate network users.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP System Administrator's Commands</td>
<td>SC27-3661</td>
<td>This document describes the functions and commands helpful in configuring or monitoring your system. It contains system administrator’s commands, such as TSO NETSTAT, PING, TRACERTE and their UNIX counterparts. It also includes TSO and MVS commands commonly used during the IP configuration process.</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Operation</td>
<td>SC27-3673</td>
<td>This document serves as a reference for programmers and operators requiring detailed information about specific operator commands.</td>
</tr>
<tr>
<td>z/OS Communications Server: Quick Reference</td>
<td>SC27-3665</td>
<td>This document contains essential information about SNA and IP commands.</td>
</tr>
</tbody>
</table>
## Customization

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
</table>
| z/OS Communications Server: SNA Customization | SC27-3666 | This document enables you to customize SNA, and includes the following information:  
  - Communication network management (CNM) routing table  
  - Logon-interpret routine requirements  
  - Logon manager installation-wide exit routine for the CLU search exit  
  - TSO/SNA installation-wide exit routines  
  - SNA installation-wide exit routines |

## Writing application programs

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z/OS Communications Server: IP Sockets Application Programming Interface Guide and Reference</td>
<td>SC27-3660</td>
<td>This document describes the syntax and semantics of program source code necessary to write your own application programming interface (API) into TCP/IP. You can use this interface as the communication base for writing your own client or server application. You can also use this document to adapt your existing applications to communicate with each other using sockets over TCP/IP.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP CICS Sockets Guide</td>
<td>SC27-3649</td>
<td>This document is for programmers who want to set up, write application programs for, and diagnose problems with the socket interface for CICS® using z/OS TCP/IP.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP IMS Sockets Guide</td>
<td>SC27-3653</td>
<td>This document is for programmers who want application programs that use the IMS™ TCP/IP application development services provided by the TCP/IP Services of IBM.</td>
</tr>
<tr>
<td>z/OS Communications Server: IP Programmer's Guide and Reference</td>
<td>SC27-3659</td>
<td>This document describes the syntax and semantics of a set of high-level application functions that you can use to program your own applications in a TCP/IP environment. These functions provide support for application facilities, such as user authentication, distributed databases, distributed processing, network management, and device sharing. Familiarity with the z/OS operating system, TCP/IP protocols, and IBM Time Sharing Option (TSO) is recommended.</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programming</td>
<td>SC27-3674</td>
<td>This document describes how to use SNA macroinstructions to send data to and receive data from (1) a terminal in either the same or a different domain, or (2) another application program in either the same or a different domain.</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programmer's LU 6.2 Guide</td>
<td>SC27-3669</td>
<td>This document describes how to use the SNA LU 6.2 application programming interface for host application programs. This document applies to programs that use only LU 6.2 sessions or that use LU 6.2 sessions along with other session types. (Only LU 6.2 sessions are covered in this document.)</td>
</tr>
<tr>
<td>z/OS Communications Server: SNA Programmer's LU 6.2 Reference</td>
<td>SC27-3670</td>
<td>This document provides reference material for the SNA LU 6.2 programming interface for host application programs.</td>
</tr>
<tr>
<td>z/OS Communications Server: CSM Guide</td>
<td>SC27-3647</td>
<td>This document describes how applications use the communications storage manager.</td>
</tr>
</tbody>
</table>
### Title Number Description

**z/OS Communications Server: CMIP Services and Topology Agent Guide**

SC27-3646 This document describes the Common Management Information Protocol (CMIP) programming interface for application programmers to use in coding CMIP application programs. The document provides guide and reference information about CMIP services and the SNA topology agent.

### Diagnosis

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>z/OS Communications Server: IP Diagnosis Guide</strong></td>
<td>GC27-3652</td>
<td>This document explains how to diagnose TCP/IP problems and how to determine whether a specific problem is in the TCP/IP product code. It explains how to gather information and describe problems to the IBM Software Support Center.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: ACF/TAP Trace Analysis Handbook</strong></td>
<td>GC27-3645</td>
<td>This document explains how to gather the trace data that is collected and stored in the host processor. It also explains how to use the Advanced Communications Function/Trace Analysis Program (ACF/TAP) service aid to produce reports for analyzing the trace data information.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: SNA Diagnosis Vol 1, Techniques and Procedures and SNA Diagnosis Vol 2, FFST Dumps and the VIT</strong></td>
<td>GC27-3667, GC27-3668</td>
<td>These documents help you identify an SNA problem, classify it, and collect information about it before you call the IBM Support Center. The information collected includes traces, dumps, and other problem documentation.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: SNA Data Areas Volume 1 and SNA Data Areas Volume 2</strong></td>
<td>GC31-6852, GC31-6853</td>
<td>These documents describe SNA data areas and can be used to read an SNA dump. They are intended for IBM programming service representatives and customer personnel who are diagnosing problems with SNA.</td>
</tr>
</tbody>
</table>

### Messages and codes

<table>
<thead>
<tr>
<th>Title</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>z/OS Communications Server: SNA Messages</strong></td>
<td>SC27-3671</td>
<td>This document describes the ELM, IKT, IST, IUT, IVT, and USS messages. Other information in this document includes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Command and RU types in SNA messages</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Node and ID types in SNA messages</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Supplemental message-related information</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: IP Messages Volume 1 (EZA)</strong></td>
<td>SC27-3654</td>
<td>This volume contains TCP/IP messages beginning with EZA.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: IP Messages Volume 2 (EZB, EZD)</strong></td>
<td>SC27-3655</td>
<td>This volume contains TCP/IP messages beginning with EZB or EZD.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: IP Messages Volume 3 (EZY)</strong></td>
<td>SC27-3656</td>
<td>This volume contains TCP/IP messages beginning with EZY.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: IP Messages Volume 4 (EZZ, SNM)</strong></td>
<td>SC27-3657</td>
<td>This volume contains TCP/IP messages beginning with EZZ and SNM.</td>
</tr>
<tr>
<td><strong>z/OS Communications Server: IP and SNA Codes</strong></td>
<td>SC27-3648</td>
<td>This document describes codes and other information that appear in z/OS Communications Server messages.</td>
</tr>

Communicating your comments to IBM

If you especially like or dislike anything about this document, you can send us comments electronically by using one of the following methods:

**Internet email:**
comsvrcf@us.ibm.com

**World Wide Web:**

If you would like a reply, be sure to include your name, address, and telephone number. Make sure to include the following information in your comment or note:

- Title and order number of this document
- Page number or topic related to your comment

Feel free to comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this document. However, the comments you send should pertain to only the information in this manual and the way in which the information is presented. To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.
