About This Document

This document supports z/OS® (5694–A01).

This document is intended for any JES3 complex that runs z/OS MVS.

Who Should Use This document

This document is intended for JES3 operations staff, applications or system programmers, or by anyone who is responsible for controlling JES3 or diagnosing problems in JES3.

How To Use This document

The first section of this document provides information to customize the message library for your installation, including corequisite and related documents. It also provides information for the use of this document, as well as a message directory showing where different messages are documented.

Later sections are organized by sequential message number with each section containing those messages which relate to a specific function. All sections list the messages produced by the IBM-supplied JES3 component of the operating system. The causes of the messages are explained, the accompanying actions by the operating system are described and appropriate responses are suggested. The module that issues the message is also listed. Where applicable, problem determination information is included.

JES3 completion codes can be found in z/OS JES3 Diagnosis Reference.

Where to find more information

Where necessary, this document references information in other documents, using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see z/OS Information Roadmap.

Information updates on the web

For the latest information updates that have been provided in PTF cover letters and Documentation APARs for z/OS, see the online document at:
http://publibz.boulder.ibm.com/cgi-bin/bookmgr_OS390/Shelves/ZDOCAPAR

This document is updated weekly and lists documentation changes before they are incorporated into z/OS publications.

The z/OS Basic Skills Information Center

The z/OS Basic Skills Information Center is a Web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS system programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:

• Provide basic education and information about z/OS without charge
• Shorten the time it takes for people to become productive on the mainframe
• Make it easier for new people to learn z/OS.
To access the z/OS Basic Skills Information Center, open your Web browser to the following Web site, which is available to all users (no login required): [http://publib.boulder.ibm.com/infocenter/zosinctr/v1r7/index.jsp](http://publib.boulder.ibm.com/infocenter/zosinctr/v1r7/index.jsp)
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or give us any other feedback that you might have.

Use one of the following methods to send us your comments:

1. Send an email to mhvrcfs@us.ibm.com
3. Mail the comments to the following address:
   IBM Corporation
   Attention: MHVRCFS Reader Comments
   Department H6MA, Building 707
   2455 South Road
   Poughkeepsie, NY 12601-5400
   U.S.A.
4. Fax the comments to us as follows:
   From the United States and Canada: 1+845+432-9405
   From all other countries: Your international access code +1+845+432-9405

Include the following information:
- Your name and address
- Your email address
- Your telephone or fax number
- The publication title and order number:
  z/OS V1R12.0 JES3 Messages
  SA22-7552-10
- The topic and page number related to your comment
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you submit.

If you have a technical problem

Do not use the feedback methods listed above. Instead, do one of the following:
- Contact your IBM service representative
- Call IBM technical support
- Visit the IBM zSeries support web page at [http://www.ibm.com/systems/z/support/](http://www.ibm.com/systems/z/support/)
Summary of changes

Summary of changes
for SA22-7552-10
z/OS Version 1 Release 12

The document contains information previously presented in z/OS JES3 Messages, SA22-7552-09, which supports z/OS Version 1 Release 11.

New information
• IAT9371
• IAT9379
• IAT9384

Changed information
• IAT1145
• IAT1146
• IAT3231
• IAT3802
• IAT3804
• IAT3900
• IAT4029
• IAT4034
• IAT4035
• IAT5515
• IAT6363
• IAT6364
• IAT6369
• IAT6370
• IAT7130
• IAT8055
• IAT8539
• IAT8932
• The "Readers' Comments - We'd Like to Hear from You" section at the back of this publication has been replaced with a new section "How to send your comments to IBM" on page xi. The hardcopy mail-in form has been replaced with a page that provides information appropriate for submitting readers comments to IBM.

You may notice changes in the style and structure of some content in this document—for example, headings that use uppercase for the first letter of initial words only, and procedures that have a different look and format. The changes are ongoing improvements to the consistency and retrievability of information in our documents.

This document contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

- IAT8709
- IAT9122

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.
Chapter 1. Introduction

The MVS/Enterprise Systems Architecture Message Library is designed so that you can have the messages and codes documentation that fits your specific needs. Figure 1 illustrates the way that you can customize your z/OS Message Library.

Message Prefix Identification

The message prefix identifies the component of the operating system that issues that message. The prefix IAT identifies messages supplied by the JES3 component.

Message Format

JES3 messages appearing on a display console have the following format:

```
hhmssstp*IATnnnn text
```

The time stamp (hhmssst) shows the time, by hour, minute, second, and tenth of second, that the message was issued.

The prefix character (p) is used to alert you to unusual system conditions. Your system programmer may define these characters on an initialization statement; they appear in messages issued after initialization is complete. The message prefix characters and their IBM-supplied defaults are described below.

- **Blank**: This is a normal output message.
- **Switch character**: This is used to flag messages initially routed to one RJP console but switched to another because of operator intervention. The switch character is a number sign (#).

An asterisk (*) appearing in the next position indicates an action message; operator action is required. The message serial number (IATnnnn) consists of a component prefix, which is IAT for JES3; and the message number.

The message itself (text) follows the serial number. Very long message texts are often issued as a series of messages, with each part having its own serial number. When an 8 character jobid (JOBxxxxx) appears in a message and you need to issue a command, use the numerical characters in the jobid (xxxxx) when the command operand is *jobno*.

On a hard-copy console, the message format consists of the date stamp, time stamp, serial number and message text; there are no prefix characters.

The JES3 hardcopy log (DLOG) records all communication in the complex, both commands and messages. The DLOG format includes the console destination class for messages, the name of the receiving or issuing console, a date stamp, a time stamp, a prefix symbol (blank for normal messages, * for action messages, + for JES3 input commands, and - for MVS™ input commands), and the message or command text. The message text is also prefixed by the suppression character if display of the message was suppressed through MPF or by a subsystem routine. The suppression character is defined by the MPFHCF parameter in the MPFLSTxx parmlib member.

Messages recorded by DLOG include both write-to-operator (WTO) messages that appear on the operators' consoles and write-to-log (WTL) messages that are sent to DLOG only.

Variable data within the text of messages in this document is indicated by a lowercase representation of the item, listed in Table 1 on page 3.

Symbols preceding JES3 message numbers convey information to the operator or system programmer (see Table 2 on page 6). Messages displayed at the console for the operator are preceded by an asterisk.
(*) when operator action is required. Other symbols preceding messages directed to the operator are
installation-dependent and may be changed by the JES3 initialization stream.

Messages IAT0000 through IAT0899 are reserved for the JES3 user. If a message in this range appears,
consult the system programmer.

Message numbers are grouped by functional area, as follows:

<table>
<thead>
<tr>
<th>Number</th>

Figure 1. Customizing Your z/OS Message Library

1. Select the z/OS publications that are compatible with your system.
2. Select the supplementary messages publications that fit the needs of your installation.
3. If your installation uses a particular compiler or application program, you may want to append the program’s messages to your message library. These messages are located in the associated programmer’s guides, user’s guides, installation reference manuals, or messages books.

How to Read a Syntax Diagram
Syntax is described using the structure defined below.

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line.
  - The ─── symbol indicates the beginning of a message syntax.
  - The ─── symbol indicates that the message syntax is continued on the next line.
  - The ─── symbol indicates that the message syntax is continued from the previous line.
  - The ─── indicates the end of the message syntax.
  - A lower-case word indicates a variable.

- Strings of fixed text, keywords (and their value), and positional items that always appear in the message are shown on the horizontal line (the main path).
  ─── positional_item,required_item,KEYWORD= required_value

- Strings of fixed text, keywords (and their value), and positional items that might not appear in the message are shown below the main path.
  ─── optional_item,KEYWORD= optional_item

- If one of several items might appear in a message, they appear vertically, in a stack. If some item always appears in the message, an item is shown on the main path.
  ─── positional_choice1,KEYWORD= required_choice1
  ─── positional_choice2,required_choice2

- If there is a possibility that none of the items will appear in the message, the entire stack is shown below the main path.
  ─── positional_item,optional_choice1,optional_choice2

- If one of the items has a default, it appears above the main line (for that item) and the overriding choices will be shown on and/or below the main line. For POSITIONAL items the syntax is as follows:

Chapter 1. Introduction  7
Notes:
1 If a positional parameter is not specified, the positional default is used.
2 If a positional parameter is coded, then any one of the 3 positional parameters can be specified.

Note: This does not apply to messages.
For KEYWORD items the syntax is as follows:

Notes:
1 If KEYWORD is not coded, the keyword_default is used.
2 If the KEYWORD is coded, then the keyword_default or the keyword value override MUST be coded.

Note: This does not apply to messages.
• An arrow returning to the left above the main line indicates an item that can be repeated indefinitely.

• A repeat arrow with a syntax note indicates how many times this can be repeated.

Notes:
1 (1) Specify the <repeatable_item> 1 to n times.
• Syntax is occasionally broken into fragments if the inclusion of the fragment would overly complicate the main syntax diagram.

fragment:
Routing Codes

Routing codes send system messages to the consoles where they are to be displayed. More than one routing code can be assigned to a message to send it to more than one console. For more information on message routing, see the following documents:

- [z/OS MVS Programming: Authorized Assembler Services Guide](#)
- [z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO](#)
- [z/OS MVS Installation Exits](#)
- [z/OS MVS Initialization and Tuning Reference](#)
- [z/OS MVS Planning: Operations](#)

Routing Code Meaning

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>Operator Action</strong>&lt;br&gt;The message indicates a change in the system status. It demands action by the operator at the console with master authority.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Operator Information</strong>&lt;br&gt;The message indicates a change in system status. It does not demand action; rather, it alerts the operator at the console with master authority to a condition that might require action.&lt;br&gt;This routing code is used for any message that indicates job status when the status is not requested specifically by an operator inquiry. It is also used to route processor and problem program messages to the system operator.</td>
</tr>
<tr>
<td>3</td>
<td><strong>Tape Pool</strong>&lt;br&gt;The message gives information about tape devices, such as the status of a tape unit or reel, the disposition of a tape reel, or a request to mount a tape.</td>
</tr>
<tr>
<td>4</td>
<td><strong>Direct Access Pool</strong>&lt;br&gt;The message gives information about direct access storage devices (DASD), such as the status of a direct access unit or volume, the disposition of a volume, or a request to mount a volume.</td>

<td>8</td>
<td><strong>Teleprocessing Control</strong>&lt;br&gt;The message gives the status or disposition of teleprocessing equipment, such as a message that describes line errors.</td>
</tr>
<tr>
<td>9</td>
<td><strong>System Security</strong></td>
</tr>
</tbody>
</table>
The message gives information about security checking, such as a request for a password.

10  **System/Error Maintenance**
The message gives problem information for the system programmer, such as a system error, an uncorrectable I/O error, or information about system maintenance.

11  **Programmer Information**
The message is intended for the problem programmer. This routing code is used when the program issuing the message cannot route the message to the programmer through a system output (SYSOUT) data set. The message appears in the job log.

12  **Emulation**
The message gives information about emulation. (These message identifiers are not included in this document.)

13-20  For customer use only.
21-28  For subsystem use only.
29  The message gives information about Disaster Recovery.
30-40  For IBM® use only.
41  The message gives information about JES3 job status.
42  The message gives general information about JES2 or JES3.
43-64  For JES use only.
65-96  Messages associated with particular processors.
97-128  Messages associated with particular devices.

**Routing Codes in This Document**
Routing codes appear to the right of the message identifiers in the **Routing Code** column. The column can also contain the following special characters or notes:

* The message will be routed back to the consoles that initiated the associated requests.
/ The message will be routed to different locations according to the task issuing it. For example, */2/3 means the message is routed back to the console that initiated the request, to the console with master authority, or to the tape pool.
# The message will be routed in one of the following ways:
  • According to the routing indicators specified by the operator
  • According to the default routing instructions previously specified by the operator
  • Back to the console that initiated the associated request
— The message has no routing code.

**Note 2** The message is issued by a WTO or WTOR macro, but has no routing or descriptor codes (old format WTO or WTOR macro).

**Note 3** The message has a routing code of 1, which sends it to the console with master authority, and is also routed to the console that the message describes.

**Note 4** The message is sent to all active consoles; this is a broadcast message.

**Note 5** The message has a routing code of 2, which sends it to the console with master authority, and is also routed to the consoles that are assuming the duties of the failing console. (This message indicates that console switching has occurred.)
Note 6  The message is routed only to non-printer consoles. This message is not issued by a WTO or WTOR macro.

Note 7  The message is routed to consoles where one or more of the following are active:
  • MONITOR JOBNames
  • MONITOR SESSIONS
  • MONITOR STATUS

Note 8  The message is also routed to the MSS space manager's console specified by an alternate console routing code on the MSFMSG parameter in the MVIKEY00 parmlib member.

Note 9  The message is issued during the nucleus initialization program (NIP) processing.

Note 10 The message is issued by the WTL macro.

Note 11 The message is routed to a SYSPRINT data set by data management.

Note 12 The message is issued by a WTO or WTOR macro with SYNCH=YES. See z/OS MVS Initialization and Tuning Reference for more information.

Note 13 The message is routed only to receivers of the hardcopy message set.

Note 14 The message is routed back to the console that initiated the request and to all associated consoles.

Note 16 The message is routed to the IPCS print file IPCSPRNT.

Note 17 The message is issued by JES3. A JES3 destination class is specified either by the initialization stream or by operator commands.

Note 18 The message is sent in response to a command to the console where the command was entered.

Note 19 The message is written to a data set. If routing and descriptor codes are also included for the message, the message might also be displayed according to the specified routing and descriptor codes. (The descriptor code does not apply to writing the message to the data set.)

Note 20 JES3 does not issue the message. JES3 sends the message to another subsystem for processing.

Note 21 This message is a trailer attached to multiple messages previously issued. It has the same routing and descriptor codes as the first line of the conglomerate.

Note 22 This message is routed to the transaction program (TP) message log.

Note 23 This message is issued by the device controller. The routing code will vary according to the device controller's task.

Note 24 This message is routed to the assembly listing.

Note 25 When this message is issued during IPL, the routing codes are 2 and 10 and the descriptor code is 12. When it is issued after IPL, it has no routing code and the descriptor code is 5.

Note 26 When this message is issued during NIP processing, the descriptor code is 12. When it is issued after NIP processing, the descriptor code is 4.

Note 27 The indicated route codes are used only if this message is issued in response to a reply of CKPTDEF during a JES2 checkpoint reconfiguration. This message might be issued to a specific console ID rather than directed by route code. For further information concerning the routing of JES2 messages issued during a reconfiguration, see z/OS JES2 Initialization and Tuning Guide.
Note 28  These routing and descriptor codes apply only when SMS issues the message. If SMS returns the message to its caller and the caller issues the message, the codes do not apply.

Note 29  This message is written to the JES3OUT data set.

Note 30  This message is issued by JES3. The message is written to the *MODIFY,CONFIG (*F MODIFY) log and/or the issuer of the *MODIFY,CONFIG command.

Descriptor Codes
Descriptor codes describe the significance of messages. They indicate whether the system or a task stops processing, waits until some action is completed, or continues. This code also determines how the system will display and delete the message.

Descriptor Code Meaning

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>System Failure</strong></td>
</tr>
<tr>
<td></td>
<td>The message indicates an error that disrupts system operations. To continue, the operator must reIPL the system or restart a major subsystem. This causes the audible alarm to be issued.</td>
</tr>
<tr>
<td>2</td>
<td><strong>Immediate Action Required</strong></td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action immediately. The message issuer could be in a wait state until the action is performed or the system needs the action as soon as possible to improve performance. The task waits for the operator to complete the action. This causes the audible alarm to be issued.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When an authorized program issues a message with descriptor code 2, a DOM macro * must be issued to delete the message after the requested action is performed.</td>
</tr>
<tr>
<td>3</td>
<td><strong>Eventual Action Required</strong></td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action eventually. The task does not wait for the operator to complete the action.</td>
</tr>
<tr>
<td></td>
<td>If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.</td>
</tr>
<tr>
<td>4</td>
<td><strong>System Status</strong></td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a system task or of a hardware unit.</td>
</tr>
<tr>
<td>5</td>
<td><strong>Immediate Command Response</strong></td>
</tr>
<tr>
<td></td>
<td>The message is issued as an immediate response to a system command. The response does not depend on another system action or task.</td>
</tr>
<tr>
<td>6</td>
<td><strong>Job Status</strong></td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a job or job step.</td>
</tr>
<tr>
<td>7</td>
<td><strong>Task-Related</strong></td>
</tr>
<tr>
<td></td>
<td>The message is issued by an application or system program. Messages with this descriptor code are deleted when the job step that issued them ends.</td>
</tr>
<tr>
<td>8</td>
<td><strong>Out-of-Line</strong></td>
</tr>
</tbody>
</table>
The message, which is one line of a group of one or more lines, is to be displayed out-of-line. If a message cannot be printed out-of-line because of the device being used, descriptor code 8 is ignored, and the message is printed in-line with the other messages.

9  Operator's Request
The message is written in response to an operator's request for information by a DEVSERV, DISPLAY, TRACK, or MONITOR command.

10 TRACK Command Response
The message is issued in response to a TRACK command.

11 Critical Eventual Action Required
The message indicates that the operator must perform an action eventually, and the action is important enough for the message to remain on the display screen until the action is completed. The task does not wait for the operator to complete the action. This causes the audible alarm to be issued.

Avoid using this descriptor code for non-critical messages because the display screen could become filled.

If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.

12 Important Information
The message contains important information that must be displayed at a console, but does not require any action in response.

13 Automation Information
Indicates that this message was previously automated.

14-16 Reserved for future use.

Descriptor Codes in This Document
The descriptor codes appear in the Descriptor Code column. The column can also contain the following special characters.

/ The message will have different descriptor codes according to the task issuing it. For example, 4/6 means the message can describe system status or job status.
— The message has no descriptor code.
Chapter 2. Dynamic System Interchange Messages

IAT0900

Explanation:

DSI - SWITCH GLOBAL DEVICES

DSI has been called, and the operator is requested to switch global devices.

System action: DSI waits for operator response.

Operator response: Set the switching devices to enable channel paths from the new global to all JES3 devices and mains as required. When this function is complete, enter the *S,DSI command to continue, or the *C,DSI command to end DSI.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDSI1</td>
<td>IATDSI1</td>
<td>IATDSI1</td>
</tr>
</tbody>
</table>

Routing Code: 2    Descriptor Code: 7

IAT0905

Explanation:

DSI - STARTED FOR main

DSI is active.

System action: The active local JES3 system main was ended. JES3 was reinitialized in global hot start mode.

Operator response: Proceed with a JES3 global hot start. Continue normal operation on the new global. If the old global was disabled by pressing SYSTEM RESET, JES3 on the old global can be initialized by performing a local start after an MVS IPL.

If the old global was disabled by entering *X,DSI and then *START,DSI, the old global can be initialized as a local without an intervening MVS IPL.

Module:

Routing Code: 2    Descriptor Code: 7

IAT0910

Explanation:

DSI - DISABLE OLD GLOBAL PROCESSOR

This message informs the operator DSI processing has started on the local. After this message is issued the operator is requested to disable the old global.

Note: This message may be issued more than once during a DSI. First, it is issued for the current global. If a previous DSI never completed, this message is issued for the global before the previous, incomplete, DSI.

System action: DSI waits for operator response.

Operator response:

- If you do not want DSI processing to continue, enter the *C,DSI command. DSI processing ends and JES3 processing continues.
- If you want DSI processing to continue, and the old global has failed; press SYSTEM RESET on the old global. DSI processing will automatically continue on the new global.
- If you want DSI processing to continue, and the old global is still active: enter the *X,DSI command on the old global and wait for message IAT0920. Then review the global DSI procedure. After you issue the *S,DSI command on the old global to bring JES3 down, DSI processing will automatically continue on the new global.

Module:

<table>

</tbody>
</table>

Routing Code: 10    Descriptor Code: 7
IAT0912  IAT0921

Routing Code: 10  Descriptor Code: 7

IAT0912
Explanation:

A *CANCEL command was issued to end DSI. JES3 was unable to locate the DSI FCT on the FCT chain.

System action: DSI continues processing.

Operator response: Contact your system programmer.

System programmer response: Use the information listed in Chapter 30, "Problem Determination," on page 711.

Problem determination: See Chapter 30, "Problem Determination," on page 711, Table I, items 4, 5, 7, and 16; Table III, item 7.

Module:

Routing Code: 2  Descriptor Code: 7

IAT0915
Explanation:

DSI has been called on local processor main, and the operator is requested to review the local DSI procedure.

System action: DSI waits for operator response.

Operator response: Review any installation guidelines or procedures for dynamic system interchange. When this review is complete, enter *S,DSI to continue or *C,DSI to end DSI.

Module:

Routing Code: 2  Descriptor Code: 7

IAT0920
Explanation:

DSI has been called on global processor main, and the operator is requested to check the global DSI procedure.

System action: DSI waits for operator response.

Operator response: Review any installation guidelines for dynamic system interchange. When finished, enter *S,DSI to continue or *C,DSI to end DSI.

Module:

Routing Code: 2  Descriptor Code: 7

IAT0921
Explanation:

This message is issued during a DSI when both of the following conditions hold:

• At least one system in the complex (not necessarily the new global) is at a level lower than HJS7730.
• At least one Netserv is active. This message is issued once for every system that has an active Netserv.

In the message text:

mmmmmmmm
The system name containing active Netservs.

nnnnn
The number of Netservs on the indicated system.

System action: This message is highlighted along with message IAT0920, and the highlighting is removed when the *S,DSI command is entered in response to IAT0920.

Operator response: If the new global is running at the HJS7730 level or higher, no action is necessary. If the new global is at a level below HJS730, you must stop all of the Netservs before continuing the DSI. If necessary, enter a *C,DSI command and begin the DSI procedure later after canceling these Netservs.

Module:
IAT0925

Explanation:

DSI has ended on system main because one of the following occurred:

- The operator entered ‘CANCEL,DSI.’
- The main processor control (MPC) table for the global could not be found.
- The MPC table for the main on which the ‘X,DSI’ command was issued could not be found.
- There are no locals in the configuration.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>

Chapter 3. Data Management Messages

IAT1005

Explanation:
•— SPOOL PARTITION— spart1— IS FULL AND ——
•— OVERFLOWED INTO— spart2 ————

JES3 has allocated all track groups in spool partition spart1; space is not available in any spool data set in that partition.

System action: All subsequent spool space allocation requests that specify spool partition spart1 will be satisfied from partition spart2 as long as space is available in spart2 or until space is released in spart1.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMGB</td>
<td>IATDMTK</td>
<td>IATDMGB</td>
</tr>
</tbody>
</table>

Routing Code: 10  Descriptor Code: 7

IAT1016

Explanation:
•— SPOOL PARTITION— spart ——————
•— HAS LESS THAN ————
•— pp— % SPACE REMAINING. SYSOUT BUFFER ————
•— PROCESSING SUSPENDED. ————

JES3 has allocated space down to the minimal spool space threshold for spool partition spart. Less than pp% of the total number of track groups in the partition is currently available.

System action: Spool partition spart does not allow overflow; therefore, JES3 suspends SYSOUT buffer processing for jobs requiring this partition or jobs that overflow into this partition until more space is available. If partition spart is the default partition, JES3 will not accept any new jobs (including an operator *CALL command) until the condition is corrected.

Operator response: Inform your system programmer that spool partition spart has reached the minimal condition and that SYSOUT buffer processing is suspended.

Programmer response: To recover from this condition, several alternatives are available:
• Move a spool data set from another spool partition into the partition with the shortage condition. See

Routing Code: 10  Descriptor Code: 7

IAT1017

Explanation:
•— IAT1017 ————
•— SPOOL PARTITION— spart— HAS LESS THAN ———
•— pp— % SPACE REMAINING. JOB SELECTION ———
•— HAS BEEN SUSPENDED. ————

JES3 has allocated space down to the marginal spool space threshold for spool partition spart. Less than pp% of the total number of track groups in the partition is currently available.

System action: JES3 processing of work currently in progress continues; however, jobs which require space

© Copyright IBM Corp. 1988, 2010
from this partition will not be initiated because spool partition spart does not allow overflow. When more than pp% of the space on this partition becomes available, JES3 will start to initiate job selection again.

**Operator response:** Inform you system programmer that this partition has reached the marginal threshold and that JES3 has suspended job selection.

**Programmer response:** To recover from this condition, several alternatives are available:

- Move a spool data set from another spool partition into the partition with the shortage condition. See [z/OS JES3 Commands](https://www.ibm.com) for more information on this alternative.
- Add a spool data set to the initialization stream and perform a warm start. See [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com) for more information on this alternative.
- Modify the partition to allow overflow from the partition into another partition which has available track groups. See the MODIFY command in [z/OS JES3 Commands](https://www.ibm.com) for more information.
- Purge jobs which are using space within the partition, selectively or by using the "*MODIFY,U" command. See [z/OS JES3 Commands](https://www.ibm.com) for more information.
- Modify the partition assignments for jobs (through main affinity), jobs classes, or mains. See [z/OS JES3 Commands](https://www.ibm.com) for more information.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMGB</td>
<td>IATDMTK</td>
<td>IATDMGB</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT1018**

**Explanation:**

✧--SPool PARTition--spart--HAS LESS THAN✧

✧--pp-- % SPACE REMAINing✧

JES3 has allocated space down to the minimal or marginal threshold for spool partition spart. Only pp% of the total number of track groups in the partition is currently available. There is no immediate impact on the system because partition spart currently allows overflow into another partition.

**System action:** JES3 continues to allocate space from partition spart.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMGB</td>
<td>IATDMTK</td>
<td>IATDMGB</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT1050**

**Explanation:**

✧--SPool PARTition--spart--iS FULL AND iS✧

✧--NOT PERMITTED TO OVERFLOw✧

JES3 has allocated all track groups in the indicated spool partition. Overflow from the partition is not allowed.

**System action:** All subsequent spool space allocation requests that specify the indicated partition will wait for track groups within the partition to become available. JES3 will not schedule any jobs that are waiting for execution using this partition. If space within this partition becomes available, this message is deleted from the JES3 action message queue.

**Operator response:** Inform your system programmer that partition spart is not allowed to overflow and that jobs requesting that partition will be forced to wait until space becomes available.

**Programmer response:** If you cannot afford to wait for space to become available, the following alternatives can be considered:

- Move a data set from another spool partition into the partition with the shortage condition. See [z/OS JES3 Commands](https://www.ibm.com) for more information on this alternative.
- Add a spool data set to the initialization stream and perform a warm start. See [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com) for more information on this alternative.
- Modify the partition to allow overflow from the partition into another partition which has available track groups. See the MODIFY command in [z/OS JES3 Commands](https://www.ibm.com) for more information on this alternative.
- Purge jobs which are using space within the partition. See [z/OS JES3 Commands](https://www.ibm.com) for more information.
- Use the "*MODIFY command to route jobs submitted on a main to another spool partition. See [z/OS JES3 Commands](https://www.ibm.com) for more information.

**Routing Code:** 10  **Descriptor Code:** 7
IAT1100

Explanation:

JES3 spool I/O did not end normally.

System action: This message is issued four times and then, message IAT1110 is issued.

Operator response: Following messages will direct operator action.

Module:

Routing Code: 42      Descriptor Code: 7,11

IAT1101

Explanation:

A minimal buffer condition for the specified CI FSS address space has been reached. name specifies the name of the CI FSS and nnnn specifies the address space id.

System action: If all JSAM buffers are used, JES3 could stop processing, otherwise JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Record the name of the CI FSS address space and notify the system programmer.

Programmer response: If a minimal JSAM buffer condition recurs, the JSAM buffer pool may need to be enlarged and the minimal threshold may need to be changed. Use the MINBUF parameter on the BUFFER statement to change the value JES3 uses to calculate the minimum number of free JSAM buffers. Use the PAGES parameter on the BUFFER statement to change the size of the JSAM buffer pool in the specified CI FSS address space. For additional information on the BUFFER statement see z/OS JES3 Initialization and Tuning Reference. See message IAT1103 for more information.

Module:

Routing Code: 10      Descriptor Code: 7,11

IAT1102

Explanation:

A request was made for a JSAM buffer and failed because all buffers are currently in use. Depending on where the shortage occurred, variable text is one of the following:

- JES3 GLOBAL ADDRESS SPACE
- JES3 LOCAL ADDRESS SPACE
- FSS name, ASID=nnnn

System action: Processing continues. If a buffer becomes available, the message is deleted. If the condition is not relieved, the message is not deleted.

Operator response: Notify the system programmer about the shortage and where it occurred.

Programmer response: If the condition is not relieved, a JES3 hotstart without IPL is necessary to rebuild the JSAM buffer pool. If the condition occurs again, the size of the pool may need to be enlarged. Enlarging the pool requires an initialization stream change and a warmstart. The PAGES= parameter on the buffer initialization statement controls the size of the pool.

Module:

Routing Code: 2       Descriptor Code: 2

IAT1103

Explanation:

Minimal buffer condition for the JES3 global address space or a JES3 local address space has been reached.

System action: If all JSAM buffers are used, JES3 could stop processing, otherwise JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Notify the system programmer. If this condition does not resolve itself and is allowed to continue, it is possible JES3 will exhaust all available JSAM buffers and issue message IAT1102. Therefore, try to quiesce certain JES3 functions (for example, shut
down initiators) until the condition is relieved.

System programmer response: Use OPTION=JIO of dump core or take a system dump and use the IPCS command VERBX JES3 ‘OPTION=JIO’ to determine which FCT is using JSAM buffers. If a minimal JSAM buffer condition reoccurs, the JSAM buffer pool may need to be enlarged and the minimal threshold may need to be changed. Use the MINBUF parameter on the BUFFER initialization statement to change the value JES3 uses to calculate the minimum number of free JSAM buffers. Use the PAGES parameter on the BUFFER initialization statement to change the size of the JES3 buffer pool in the specified address space. For additional information about the BUFFER initialization statement, see z/OS JES3 Initialization and Tuning Reference. Restart FSS.

Module: IATDMNC  IATDMNC  IATDMNC
Routing Code: 2  Descriptor Code: 2,7

IAT1104
Explanation:
>>> BUFFER USAGE:

jobid - nnnn jobid - nnnn jobid — nnnn

This message is issued along with message IAT1103 when a minimal buffer condition for the JES3 global address space has been reached. It identifies the three jobs that account for the most JSAM buffers. This is an action message. If fewer than three jobs are found, the message displays fewer jobs. If a job owns more than 9999 buffers, JES3 displays 9999.

Note: If UNKNOWN is listed instead of a job identifier, this indicates that some buffers could not be associated with a particular job.

System action: JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Notify the system programmer. If this condition does not get relieved by itself and is allowed to continue, it is possible JES3 will exhaust all available JSAM buffers and issue message IAT1102. If appropriate, cancel jobs that are responsible for the buffer shortage.

System programmer response: Determine if any of the jobs listed in the message text should be canceled.

Module: IATDMNC  IATDMNC  IATDMNC
Routing Code: 2,10  Descriptor Code: 2,7

IAT1105
Explanation:

>>> nn% — OF FILE DIRECTORY ENTRIES IN USE ——

JES3 detected that nn% (80%, 85%, 90%, 95% or ALL) of the File Directory entries are in use. JES3 uses File Directory entries to keep track of opened multi-record files and access to some single record files.

System action: JES3 continues. This message is accompanied by non-action message IAT1106, which lists the three FCTs using the most File Directory entries.

Operator response: Determines if this is a problem and if necessary, take action to remove the source of the problem. For example, if a DSP is using the majority of FD entries, consider canceling it.

System programmer response: If a user DSP is the source of the problem, correct it. If the DSP is an IBM DSP, call IBM for support.

Module: IATDMNC  IATDMNC  IATDMNC
Routing Code: 2,10  Descriptor Code: 2,7

IAT1106
Explanation:

>>> FILE DIRECTORY USAGE: ————

dspname1 addinfo nnnn ————

dspname2 addinfo nnnn —— dspname3 addinfo nnnn

JES3 issues this message to accompany message IAT1105. It indicates the three FCTs that use the most File Directory entries and the number of them (nnnn). If fewer than three FCTs use File Directory entries, the message displays fewer FCTs. Each FCT is identified by a DSP name, and optionally, a GETUNIT DD name. If an FCT uses more than 9999 entries, JES3 displays the number 9999.

In the message text:

dspnamen  The DSP name of the FCT using the File Directory.

addinfo  One of the following:

(jname)  A JNAME from the associated device.
The address of the associated FCT.

System action: JES3 continues.

Operator response: Determine if this is a problem and, if necessary, take action to remove the source of the problem. For example, if a DSP is using the majority of FD entries, consider canceling it.

System programmer response: If a user DSP is the source of the problem, correct it. If the DSP is an IBM DSP, call IBM for support.

Module:

Routing Code: 2,10 Descriptor Code: 2,7

IAT1110

Explanation:

JES3 spool I/O has ended because of a program or machine check. Part of the I/O for the request may be lost. Some JES3 and USAM functions may have issued an AWAIT macro to wait for a resource that is permanently unavailable.

System action: The JES3 I/O error recovery DSP forces a dump with a failsoft DM code of DM750. After the dump, JES3 tries to validate the I/O associated with the request. I/O is restarted if it is still valid.

Operator response: Submit the dump and the hard-copy message log to the system programmer for analysis. You may have to restart some JES3 functions and jobs.

Programmer response: Check the dump to determine the reason for the failure. See z/OS JES3 Diagnosis Reference for a description of DM750.

Module:

Routing Code: 42 Descriptor Code: 7,11

IAT1140

Explanation:

An error occurred while JES3 was trying to read or write on a spool device. The I/O is associated with the specified job or with DSP dspname. When listed with DSP jobid is the job identifier (JOBnnnnn) of the DSP or of the job that the DSP was working with at the time of the error. N/A appears in the message text when information is not available at the time of the error. The IOERR DSP has generated output and JES3 will print that output when error recovery is complete.

System action: Spool I/O error recovery continues.

Operator response: Submit the IOERR output to the system programmer for analysis.

Programmer response: Check the IOERR output to determine the reason for the spool I/O error.

Module:

Routing Code: 42 Descriptor Code: 7,11
IAT1141 • IAT1145

DSP was working with at the time of the error. N/A appears in the message text when information is not available at the time of the error. The TYPE field indicates the type of JES3 spool I/O that was in progress at the time of the error. main indicates the main that was using the spool device.

**System action:** Spool I/O error recovery continues.

**Operator response:** Record the ddname, cylinder and track information from the message and give this information to the system programmer.

**Programmer response:** If the error occurs on any ddname other than JES3JCT, prepare a BADTRACK initialization statement from the information supplied and include it in the JES3 initialization stream on the next warm or cold start.

If you receive persistent or multiple errors on the JES3JCT, create a new JES3JCT and perform a cold start.

**Module:**

<table>
<thead>
<tr>

<tr>
<td>IATDMER</td>
<td>IATDMER</td>
<td>IATDMER</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT1145**

**Explanation:**

- ENTRY ADDED TO BADTRACK TABLE:

- DDNAME=ddn, CYL=cyl, TRK=trk, REC=rec

An I/O error occurred while JES3 was trying to write to the indicated track address on the spool device. The BADTRACK *MODIFY command (*F Q,DD=ddn, CYL=cyl, TRK=trk) was entered.

In the message text, ddn indicates the ddname with which the spool data set is associated.

**System action:** JES3 dynamically adds an entry to the BADTRACK checkpoint record that describes the identified track. JES3 will not allocate space on that track until the next warm or cold start is performed. This message is preceded by IAT1140, which provides more information about the write error.

**Operator response:** Record the ddname, cylinder and track information from the message and give this information to the system programmer.

**Programmer response:** Add a BADTRACK statement to the JES3 initialization stream before the next warm or cold start. If you do not update your initialization stream, you may lose jobs and data because of intermittent spool I/O errors. If you want to know more about the error, enter the *INQUIRY, Q, BT operator command.

</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT1141**

**Explanation:**

- NO RECORD FOUND ON DDNAME=

- ddn, cy=, TRK=, REC=

JES3 attempted to access a record on a spool volume, but could not find the record. Possibly, the spool volume was not formatted correctly or was not formatted at all. The cylinder, track, and record identify the physical location of the record. This message is always preceded by message IAT1140. In the message text:

ddn Indicates the ddname with which the spool data set is associated.

cyl The cylinder on which the record is located.

trk The track on which the record is located.

rec The record.

**System action:** Spool input/output (I/O) recovery continues.

**Operator response:** Record the ddname, cylinder, track, and record information and give this information to the system programmer.

**System programmer response:** If this message is issued for several records on the same spool volume, inspect the data on the track. If the records do not appear, this could indicate that the track has been erased. Drain the spool volume and reformat the extent.

By issuing the *INQUIRY, Q, BT command, determine if JES3 automatically added a BADTRACK statement. If a BADTRACK statement was not added, add one to the initialization deck on the next warm or cold start.

z/OS V1R12.0 JES3 Messages

24
IAT1146
Explanation:

รายการ: READ WRITE  
รายการ: READ WRITE

รายการ: r  BAdtrack ENTRY LOST: 
รายการ: r  BAdtrack ENTRY LOST:

รายการ: dDname= ,cyl= ,trk= 
รายการ: dDname= ,cyl= ,trk=

An error occurred while JES3 was trying to checkpoint the JES3 BADTRACK table. READ indicates that JES3 was unable to read the BADTRACK checkpoint record. WRITE indicates that JES3 successfully read and updated the record but could not write the updated record back to the spool.

This message is always preceded by message IAT1140. In the message text:

rc The return code from the IATXCKPT macro.
ddn Indicates the ddname with which the spool data set is associated.
cyl The cylinder on which the record is located.
trk The track on which the record is located.

System action: For a WRITE error, JES3 updates the resident BADTRACK table to describe the indicated spool track. However, the BADTRACK table on the spool does not reflect the bad spool track.

For a READ error, JES3 continues processing.

Operator response: Inform your system programmer and provide the return code, ddname, and physical address of the track.

Programmer response: The return codes from the IATXCKPT TYPE=READ macro are:

Return Code Reason
4 The request could not be performed because another JES3 function is currently using the checkpoint capability.
8 The checkpoint record name is incorrect.
12 JES3 could not find the checkpoint record.
16 The record exists, but JES3 could not read it in because there is insufficient virtual storage.
20 JES3 could not read the record because it contained a bad segment.
24 JES3 could not read the record because a permanent I/O error occurred.
28 JES3 read in a down-level copy of the requested checkpoint record. A current copy exists but it is incorrect or an I/O error occurred while trying to read it.

The return codes from the IATXCKPT TYPE=WRITE macro are:

Return Code Reason
4 The request could not be performed because another JES3 function is currently using the checkpoint function.
8 The checkpoint record name is incorrect.
12 JES3 could not write the record because of insufficient space in the data set. A previous level of the record does not exist in the data set.
16 JES3 could not write the record because of insufficient space in the data set. A previous level of the record exist in the data set but was not altered.
20 JES3 could not write the record because of insufficient space in the data set. A previous level of the record was destroyed in the process.
24 JES3 was unable to write the record because of a permanent I/O error.
28 JES3 was unable to write the record because of an error that occurred in updating the track maps in the checkpoint data set.

The return codes provide an explanation of what happened. In order to avoid any problems as a result of the mismatch of BADTRACK tables, you should add a BADTRACK statement to the JES3 initialization stream and perform a warm start as soon as possible.

</thead>
<tbody>
<tr>
<td>10</td>
<td>7</td>
</tr>
</tbody>
</table>

IAT1500

Explanation:

A control block necessary for servicing a data management request is not valid.

System action: The job ends with a system completion code of X'1FB'; a dump is taken.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Routing Code</th>
<th>Descriptor Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>7</td>
</tr>
</tbody>
</table>

IAT1501

Explanation:

No more user memory buffers are available with which to service a PUT request.

System action: The job ends with a system completion code of X'1FB'; a dump is taken.

Operator response: Resubmit the job.

Module:

<table>
<thead>
<tr>
<th>Routing Code</th>
<th>Descriptor Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>6</td>
</tr>
</tbody>
</table>

Routing Code: 11  Descriptor Code: 6

IAT1502

Explanation:

An end-of-data condition was encountered while reading the next data buffer during a GET request for the BDT. The validation field of the buffer does not match the validation field of the data set being processed. If a warm or hot start was just performed, this message indicates the normal end of a SYSOUT data set which was active when JES3 was restarted.

System action: JES3 returns a normal end-of-data return code to the BDT.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Routing Code</th>
<th>Descriptor Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>6</td>
</tr>
</tbody>
</table>

IAT1600

Explanation:

The indicated job limits the output as specified in the CARDS=, LINES=, BYTES= or PAGES= parameters on the STANDARDS initialization statement, or as specified on the JOB or MAIN statement. When a number is followed by the letter K, the number is a multiple of 1000.

This message is issued when you specify CANCEL, DUMP, or WARNING on the STANDARDS initialization statement. BY nnn or BY nnnK appears only if you specify WARNING on the STANDARDS initialization statement and the message has already been issued.

You can override the specifications on the STANDARDS initialization statement using the /*MAIN statement.

System action: Processing continues.

Operator response: None. This is an informational message.
IAT1601

Explanation:

\[\text{DATA SET CLOSED}\]
\[\text{DSS AND DSB NOT AVAILABLE}\]

A USAM request could not be serviced because the DSB and DSS control blocks were not available, indicating that the data set had already been closed.

System action: The step ends with a system completion code of X'1FB'.

Operator response: Notify the system programmer.

Programmer response: See \[\text{z/OS MVS System Codes}\] for an explanation of the X'1FB' system completion code.

IAT1604

Explanation:

\[\text{ERROR FROM READ OPERATION}\]

IATDMEB initiated a READ macro I/O operation but encountered an error condition which prevented I/O completion.

System action: The step ends with a system completion code of X'1FB'.

Operator response: Notify the system programmer.

Programmer response: See \[\text{z/OS MVS System Codes}\] for an explanation of the X'1FB' system completion code.
IAT1606 • IAT1610

**Operator response:** Notify the system programmer.

**Programmer response:** See [z/OS MVS System Codes](https://www.ibm.com/support/knowledgecenter/en/SSLTBW_21.1.0/com.ibm.zos.r21.1.0/zqs0500z.html) for an explanation of the X'1FB' system completion code.

</table>

Routing Code: 2,11  Descriptor Code: 7
IAT1611
Explanation:

A USAM request could not be completed because the JES3 SSVT was incorrect or could not be found.

System action: IATDMEB ends the request with a system completion code of X'1FB'.

Operator response: Notify the system programmer.

Programmer response: See z/OS MVS System Codes for an explanation of the X'1FB' system completion code.

Module:

Routing Code: 2
Descriptor Code: 7

IAT1612
Explanation:

JES3 received a request to allocate a SYSOUT class that is not alphabetic (A-Z) or numeric (0-9). The requested class is displayed in hexadecimal within the message.

System action: The job ends with a system completion code of X'1FB'. The system dumps.

Operator response: Notify the system programmer.

System programmer response: Examine the IEFJSSOB and IEFSSAL data areas in the dump to determine the source of the incorrect SYSOUT class. See z/OS MVS System Codes for an explanation of the X'1FB' system completion code.

Module:

Routing Code: 2,11
Descriptor Code: 7

IAT1613
Explanation:

A severe error occurred while JES3 was processing a

Module:

Routing Code: —
Descriptor Code: —

IAT1614
Explanation:

The number of lines that the job has written to the system message data set either explicitly (through the use of the WTO macro with routing code 11) or implicitly (through system action) has exceeded the SYSLINES limit specified on the STANDARDS initialization statement.

In the message text:

- `jobname` The job name.
- `jobid` The job identifier.
- `n,nnn,nmn` Specifies the current number of lines written to the system message data set. If ">10M" is displayed, the number is larger than 9,999,999.

System action: JES3 processing continues. This message will be repeated when the number of lines written to the system message data set exceeds a certain percentage of the original number of lines. This percentage is defined on the SYSLINES parameter of the STANDARDS statement.

Operator response: If the message appears infrequently for a job, this may be a normal condition (for example, a long running started task that issues messages at a reasonable pace).

If the message appears frequently, the job or started task might be producing system messages in a loop. A loop can lead to loss of available spool space and/or staging areas if left uncorrected for an extended period of time.

Determine whether the job indicated in the message should be canceled.

System programmer response: If the message appears frequently for a normal condition, examine the SYSLINES parameter on the STANDARDS initialization statement. It may be necessary to increase the limit and/or percentage interval during the next warm start, cold start, or hot start with refresh.

Module:
IAT1800 • IAT1802

started task or TSO logon request from Started Task Control.
In the message text:

xxxxxxx The name of the started task or TSO logon.

yy The reason for the failure

01 A GETMAIN request terminated abnormally while JES3 was processing a PUT request.

02 The job stream contains more statements than JES3 can process.

03 A GETMAIN request terminated abnormally while JES3 was processing an ENDREQ request.

System action: The started task or TSO logon is not submitted for execution. For reason codes 01 and 03, the job is terminated with a completion code of 1FB and a dump is taken. For reason code 02, an error return code is passed back to Started Task Control.

Operator response: Notify the system programmer.

System programmer response: For reason code 02, modify the JCL stream to contain no more than 700 records.

Chapter 4. Main Service Messages

IAT2000
Explanation:

Logical storage availability changes dynamically as jobs are selected, processed, and ended. This message provides the current status as a result of job status changes. LSTOR is the amount of logical storage currently assigned to main (in thousands of bytes); ALLOC is the amount of logical storage in use (in thousands of bytes); and AVAIL is the amount of logical storage available (in thousands of bytes).

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 128  Descriptor Code: 7

IAT2001
Explanation:

Initiator availability changes dynamically as initiators are started and ended. This message provides the current status. MPAINIT is the total count of initiators allocated to main. Of these, DI is the current number of dedicated initiators; AI is the current number of pending initiators; and PI is the current number of initiators with jobs in execution.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 128  Descriptor Code: 7

IAT2004
Explanation:

© Copyright IBM Corp. 1988, 2010
A significant error has been detected by GMS validity checking routines. Possible message texts and explanations are:

**INVALID S.A. ID**
the staging area ID field is incorrect

**INVALID JSQ ID**
the job select queue ID field is incorrect

**INVALID JSQ POST**
the bit configuration of JSQ post is incorrect

**JOBSEL GROUP=group NOT FOUND**
a normal job selection contains an incorrect name

**GROUP HAS NO EXRESC**
one execution resource entry exists for group

**COUNTER LT ZERO**
GMS attempted to decrement a counter below zero

**MPC NOT IN MLBCB**
the MLBCB has no entry for the specified main

**BAD MAIN FCT CHAIN**
the main FCT chain has been incorrectly modified by GMS

**EOJ NOT ON MPRQONMN**
an EOJ JSQ was received for a job not on the MPRQONMN chain

**INVALID RQGRPSEQ**
the group sequence number in the RESQ entry is incorrect

**JOB jobname (jobid) - RAB DESTROY**
an error return code was received from RAB DESTROY

**JOB jobname (jobid) - RAB CREATE**
an error return code was received from RAB CREATE

**EXRESC HAS NO GROUP**
the execution resource entry has no group

**INVALID LSTOR MOD**
GMS attempted to decrement the allocated LSTOR below zero

**JOB jobname (jobid) - JMR READ**
an error return was taken on a JESREAD macro while JES3 was reading a JMR

**JOB jobname (jobid) - JDAB READ**
an error return was taken on a JESREAD macro while JES3 was reading a JDAB

**JOB jobname (jobid) - JESMSG ERR**
an error return called was received from the JESMSGLG macro.

**JOB jobname (jobid) - NO FSS TAB**
the specified job has just ended. The job is marked as a functional subsystem (FSS) job (the demand-select job created to run an FSS address space), but there is no matching FSS table entry.

**System action:** If the error is described as RECOVERABLE, GMS has attempted to purge or reconfigure incorrect data areas and will attempt to continue normal operation. If the error is described as NON-RECOVERABLE, the error disrupts operations and cannot be corrected. JES3 job selection for the main is ended (GMS enters a permanent AWAIT). If the error is described as JOB CANCELED, JES3 cancels the job and allows GMS to continue job selection for this main.

**Operator response:** On an unrecoverable error, restart the JES3 system as soon as possible to allow scheduling of jobs to the specified main. If the job has been canceled, resubmit at a later time.

**Problem determination:** See Table III, items 2 and 12.

**Module:**

</tbody>
</table>

**Routing Code:** Note 17  **Descriptor Code:** 7

**IAT2006**

**Explanation:**

- **PREMATURE JOB TERM - JOB**
- **RESTARTED**
- **CANCELED**
- **HELD**
- **PRINTED**

During connect processing for the specified main, one of the following occurred:

- An IPL was performed on the specified main and the specified job is a demand-select job for that main.
- A RESQUEUE entry with the status of ON MAIN was found for the specified job, but the job was not shown in the restart connect record. This is normal processing for jobs that were active on a main when the main was undergoing an IPL.
- The specified job was selected by an initiator. The initiator ended, possibly in the job-select-subsystem-interface routine.

**System action:** The job is processed using its specified JES3 failure option as indicated by the STANDARDS initialization statement and FAILURE= keyword.

**Operator response:** None. This is an informational message.

**Module:**
The specified job was contained in the restart connect record for the specified main. The type of job is as indicated.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

IAT2008

Explanation:

A START command failed on the specified main. JES3 was notified of this using the subsystem interface by message IEA890I. Possible reasons for the failure are insufficient storage defined to MVS or insufficient paging space. It is possible that one or more groups may lose initiators because of the command failure. It is necessary to reconnect or to repeat the IPL of the main to reuse these initiators.

**System action:** The maximum number of initiators JES3 will start on the main is set to nnn.

**Operator response:** Determine or modify the maximum initiator value with an *INQUIRY,G,main,S,MAXI or *MODIFY,G,main,S,MAXI,nnn command. These commands are not valid until the maximum initiator value has been set. See z/OS JES3 Commands for more information. Reconnect the main by issuing an *S,main,connect command to validate GMS counters.

**Module:**

IAT2010

Explanation:

The JES3 WLM subtask has unexpectedly terminated.

**System action:** JES3 continues processing but without the WLM subtask. The WLM subtask provides information to WLM so that it can adjust the number of WLM initiators selecting work for a service class. Without the WLM subtask, this information is no longer provided to WLM. As a result, the system may show service classes with too many initiators being started, other service classes with no initiators being started, or not enough initiators being started.

**Operator response:** Contact the system programmer.

**Programmer response:** Examine the dump that was taken. Try to determine the cause of the subtask failure. Contact the IBM Support Center. If the message was issued on a local processor, the WLM subtask function can be reactivated by performing a JES3 local start. If the message was issued on the global processor, the
WLM subtask function can be reactivated by performing a JES3 hot start.

**IAT2011**

**Explanation:**

>>> WLM RECLASSIFICATION IS IN PROGRESS

JES3 detected a new WLM service definition that has been installed and a new WLM policy that has been activated. Since the WLM classification rules and service classes may have changed, JES3 must reclassify all jobs that have completed C/I processing but have not as yet completed main service. While JES3 is reclassifying jobs, job selection is suspended. That is, no additional jobs will be selected for execution until reclassification has completed. Message IAT2016 is issued when reclassification is complete.

**System action:** Job selection is suspended until the jobs are reclassified.

**Operator response:** None

**Module:**

<td>IATWLSRV</td>
<td>IATWLSRV</td>
</tr>
</tbody>
</table>

**Routing Code:** 42  **Descriptor Code:**

**IAT2014**

**Explanation:**

>>> WLM POLICY QUERY REQUEST FAILED

An error occurred while JES3 was attempting to extract the active WLM policy information using the IWMPQRY macro. The return and reason codes from IWMPQRY macro are displayed in the message.

**System action:** If the error occurred during JES3 initialization, message IAT3115 is issued to indicate that WLM initialization failed.

If the error occurred on the global processor after JES3 initialization has completed, then JES3 is reacting to a
WLM policy change. If a new WLM service definition was installed and is active, the WLM classification rules may have changed and JES3 needs to reclassify all jobs. Because JES3 was unable to extract the active WLM policy information, reclassification has not take place. If the installation is using WLM-managed job class groups, then no new WLM-managed initiators are started. Jobs may or may not be selected for execution depending on whether there are already WLM initiators started.

If the error occurred on a JES3 local processor, then no new WLM-managed initiators will be started on that system. Jobs may or may not be selected for execution on that system depending on whether there are already WLM initiators started.

Operator response: Contact the system programmer.

Programmer response: Use the return codes and reason codes from the IWMPQRY macro, which is described in z/OS MVS Programming: Workload Management Services, to determine the cause of the failure.

Module:

IATWLSRV IATWLSRV IATWLSRV

Routing Code: 1 Descroter Code: 4

IAT2015

Explanation:

If an error occurred while JES3 was attempting to classify a job (to assign a service class and optionally a report class) through the IWMCLSFY macro. The return and reason codes from the IWMCLSFY macro are displayed in the message.

System action: The job is not classified. If the job is in a JES managed group, it will be classified when it begins execution. If the job is in a WLM managed group, the job will not be selected for execution until the job is assigned a service class either through a modify J=jobno,SRVCLASS=svrclass or some other event that causes the job to be classified (e.g. a new WLM service definition is installed and activated)

Operator response: Contact the system programmer.

Programmer response: Use the return codes and reason codes from the IWMCLSFY macro, which is described in z/OS MVS Programming: Workload Management Services, to determine the cause of the failure.

Module:

IATWLCLF IATWLCLF IATWLCLF

Routing Code: 42 Descriptor Code:

IAT2015

Explanation:

WLM reclassification (as indicated by message IAT2011) has completed. That is, all jobs that have completed C/I and not main service have been reclassified according to the classification rules in the WLM policy. Job selection, which had previously been suspended, is resumed.

System action: Job selection is resumed.

Operator response: None.

Module:

IATWLCLF IATWLCLF IATWLCLF

Routing Code: 2 Descriptor Code:

IAT2015

Explanation:

The connecting system main is downlevel and cannot run WLM-managed groups. There is at least one group that is defined to the connecting system that is in WLM mode (MODE=WLM on the GROUP initialization statement), but the connecting system does not support WLM batch initiator management. That is, it is not at the JES3 OS/390® Version 2 Release 8 level.

System action: The connect is successful, but jobs in WLM-managed groups will not run on the connecting system.

Operator response: None.

System programmer response: In order to allow jobs in WLM-managed groups to run on this system, plan to upgrade JES3 on the specified local to a level that supports WLM batch initiator management.
When processing job termination, the JES3 global found the job jobname ARM-registered. Normally, the job is deregistered with ARM (Automatic Restart Manager) in the execution address space during job termination. Then a job termination request is sent to the JES3 global. Either the system where the job was executing failed or the job was canceled using an *F J=nn,C,ARMR command which caused the deregistration to be bypassed on the execution address space.

**System action:** The job is deregistered with ARM and JES3 continues its processing.

**Operator response:** None. This is an informational message.

**System programmer response:** None.

---

A processor (system) in the JESplex is still running. For certain JES3 functions, further processing of the requested JES3 function requires that the processor be disabled, in which case this message is highlighted until you either disable the system shown or cancel the function by replying CANCEL to message IAT2064. For other JES3 functions, this message is informational and requires you to confirm the state of the JES3 complex with respect to the specific environment of the JES3 function that caused this condition to be detected. It is possible that more than one processor will be affected in this manner. If this is the case, a separate IAT2061 message is issued for each processor.

In the message text:

- **system** The name of the system that was found to be active.
- **group** The name of the JESXCF group in which the processor is active.

**System action:** If the message is highlighted, JES3 also issues message IAT2064 and waits for you to respond.

**Operator response:** If the message is highlighted, disable the processor in question by resetting it and replying to the resulting XCF messages, or by using the MVS command VARY XCF,system,OFF and replying to the resulting XCF messages. If you do this, no further reply to message IAT2064 is required. If you prefer that...
the requested JES3 function not continue, reply CANCEL to message IAT2064.

If the message is not highlighted, see other messages issued by the particular JES3 function informing you of your options.

If the group name shown is incorrect or "<NAVAIL>", notify the system programmer.

System programmer response: If the group name is incorrect, this is an indication that the JES3 procedure is pointing to the wrong checkpoint data set. A particularly dangerous example of this is that JES3 procedures on processors residing in different JES3 complexes could be using a common checkpoint data set. This is an incorrect configuration which, if left undetected, would have caused data integrity problems possibly requiring a cold start to recover.

If this message (with an incorrect group name) is highlighted, reply CANCEL to message IAT2064, otherwise cancel the JES3 function in question using its prescribed method. Identify the erroneous procedure, and correct it.

If the group name is "<NAVAIL>", then message IAT2063 will also be issued. See message IAT2063 for instructions on how to proceed in this case.

IAT2062

Explanation:

- JES3 IS ACTIVE ON SYSTEM - system
- IN JEXSCF GROUP - group

The JES3 address space on a processor (system) in the JES3 complex is still running. For certain JES3 functions, further processing of the requested JES3 function requires that the JES3 address space be brought down, in which case this message is highlighted until you either end JES3 on the system shown or reply CANCEL to message IAT2065. For other JES3 functions, this message is informational and requires you to confirm the state of the JES3 complex with respect to the specific environment of the JES3 function that caused this condition to be detected.

It is possible that more than one processor will be affected in this manner. If this is the case, a separate IAT2062 message is issued for each processor. In the message text:

- system The name of the system that was found to be active.
- group The name of the JEXSCF group in which the processor is active (as determined by the OPTIONS,XCFGRPNM= parameter on the most recent warm or cold start).

System action: IF the message is highlighted, JES3 also issues message IAT2065.

Operator response: If the message is highlighted, bring the JES3 address space on the processor in question down by issuing the *RETURN command. If you prefer, you can disable the processor completely as described in the operator response for message IAT2061. If you perform either of these actions, no further reply to message IAT2065 is required. If you prefer that the requested JES3 function not continue, reply CANCEL to message IAT2065.

If the message is not highlighted, see other messages issued by the particular JES3 function informing you of your options.

If the group name shown is incorrect or "<NAVAIL>", notify the system programmer.

System programmer response: If the group name is incorrect, this is an indication that the JES3 or IATUTJCT procedure is pointing to the wrong checkpoint data set. A particularly dangerous example of this is that JES3 or IATUTJCT procedures on processors residing in different JES3 complexes could be using a common checkpoint data set. This is an incorrect configuration which, if left undetected, would have caused data integrity problems possibly requiring a cold start to recover.

If this message (with an incorrect group name) is highlighted, reply CANCEL to message IAT2065, otherwise cancel the JES3 function in question using its prescribed method. Identify the erroneous procedure, and correct it.

If the group name is "<NAVAIL>", then message IAT2063 will also be issued. See message IAT2063 for instructions on how to proceed in this case.

Module:

<table>

<td>IATMSSTA</td>
</tr>
</tbody>
</table>

Routing Code: 1  Descriptor Code: 4, 7

IAT2063

Explanation:

- msn - UNABLE TO DETERMINE THE STATUS OF
- IN JESCF GROUP - group - rsn

A JES3 function needs to inquire on the system status of all members in the JESXCF group or requires one or more of these members to be disabled or to have the
JES3 address space brought down in order to ensure system data integrity. However, an error occurred when the service that is responsible for performing this task attempted to do so. The nature of the error is described in the reason text.

In the message text:

- **main**: The processor name on which the failure occurred.
- **group**: The name of the group for which the failure occurred.
- **rsn**: The reason text identifying the cause of the failure.

**STORAGE OBTAIN RC=storretn**

An error occurred when attempting to obtain working storage. The return code from the STORAGE macro (storretn) is shown as part of this error text.

**IXZXIXIF RC=ixifresn**

An error occurred when attempting to issue the IXZXIXIF service. The return code (IXIFRETN) and reason code (IXIFRESN) from the IXZXIXIF macro are shown as part of this error text. (The below text was originally NOT PRESENT IN PREVIOUS JES3 RELEASE. The new text is more general and the reason for the change can be found in the description of the text.)

**NOT PRESENT IN COMPLEX STATUS RECORD**

The JESXCF group name is not present in the Complex Status Record. This will happen if you have just migrated to z/OS 1.4.0 JES3 and you did not have required migration maintenance on the previous JES3 release. Normally, you will get this text only if you are trying to do a warm or cold start at the same time that you are migrating, or if you have IPLed this processor with z/OS 1.4.0 JES3 but have not yet started JES3, and you are attempting to run IATUTJCT.

This text will also appear when JES3 is started after a previous warm or cold start that failed, or was interrupted, before a valid complex status record could be written.

This text can also appear if JES3 was started with an incorrect checkpoint data set, which could contain either an incorrect group name or no group name. If the group name shown is incorrect, or contains the text "<NAVAIL>" and there was no previous failed or interrupted warm or cold start, notify the system programmer.

**System action:** If the function that called the system status service requiring one or more processors to be brought down has a contingency procedure that lets you manually confirm the status of processors in the complex and continue, you can use that procedure. Otherwise, the function is automatically canceled.

**Operator response:** If there is a contingency procedure to manually confirm the status of processors in the complex, follow it. Otherwise, notify the system programmer.

**System programmer response:** If the group name is incorrect or the text "<NAVAIL>", confirm that required migration maintenance is installed and that the JES3 procedure points to the correct checkpoint data set.

If the cause of the error cannot be determined from the reason text, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:**

**IAT2064**

**Explanation:**

```
➤➤RESET ALL SYSTEMS SHOWN➤➤ OR REPLY CANCEL➤➤
```

Message IAT2061 has been issued for at least one processor (system). Each processor shown must be disabled according to the instructions in message IAT2061, otherwise you must reply CANCEL to cancel the JES3 function that caused this message to be issued.

**System action:** JES3 waits for you to either disable all of the processors for which IAT2061 was issued or reply CANCEL.

**Operator response:** If you want the JES3 function to continue, follow the instructions for each occurrence of message IAT2061. If you prefer that the JES3 function not continue, reply CANCEL.

**System programmer response:** None.

Explanation:

CONNECT REJECTED FOR main-reasontext

<table>
<thead>
<tr>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRONG INISHID</td>
</tr>
<tr>
<td>WRONG SYSTEM NAME</td>
</tr>
<tr>
<td>JSS NOT STARTED</td>
</tr>
<tr>
<td>JES3 INCOMPATIBLE</td>
</tr>
<tr>
<td>SMS NOT ON GLOBAL</td>
</tr>
<tr>
<td>JOB NUMBERS INCOMPATIBLE</td>
</tr>
</tbody>
</table>

An attempt to connect the global JES3 to a local JES3 has failed for one of the following reasons:

WRONG INISHID
The spooled records used for local initialization were not from the last warm or cold start performed on the global.

CPU NOT IPLED
JES3 was warm or cold started and a local did not have a required IPL.

WRONG SYSTEM NAME
The JES3 system name does not match the MVS system name (in other words, the name of the processor on the MAINPROC statement is not the same system name specified by SYSTYPE= in the IEASYxx parmlib member).

JSS NOT STARTED
An *START,JSS command has been issued before starting JSS. The connect processing cannot be done until JSS is started. This is a warning message only.

JES3 INCOMPATIBLE
The service and release level of the local JES3 system is incompatible with level of the global JES3 system.

WRONG SPOOLID
The status of the spool data set has changed.

SMS NOT ON GLOBAL
A local processor with SMS active is attempting to connect to the global processor, which does not have SMS active.

JOB NUMBERS INCOMPATIBLE
The OPTIONS statement has defined a maximum job number greater than 65534, but the connecting system is not at a high enough JES3 release to support the global's job number range.

System action: The connection is ended.
Operator response: Respond as appropriate:

WRONG INISHID
Restart JES3 on the local.

CPU NOT IPLED
Repeat the MVS IPL and restart JES3 on the local.

WRONG SYSTEM NAME
After the main name and/or system name has been corrected, re-IPL the local processor.

JSS NOT STARTED
If the main is online, connect processing will start when the *START,JSS command is issued.

JES3 INCOMPATIBLE
Verify that the level of JES3 on the local is one that is capable of coexisting with the level on the global.

WRONG SPOOLID
Restart JES3 on the local.

SMS NOT ON GLOBAL
Re-IPL the local processor without SMS active or re-IPL the global with SMS active for the specified main.

JOB NUMBERS INCOMPATIBLE
Notify the system programmer.

System programmer response: For WRONG SYSTEM NAME, check whether the initialization MAINPROC statement correctly specifies the main name. Also check whether the IEASYxx parmlib member correctly specifies the system name. For SMS NOT ON GLOBAL, correct the appropriate SYS1.PARMLIB members so that the local processor can be brought up without SMS active or the global processor can be brought up with SMS active. For JOB NUMBERS INCOMPATIBLE, either bring up the local at a JES3 release that supports job numbers greater than 65534, or reduce the maximum job number on the OPTIONS statement and perform a warm start or hot start with refresh on the global. If you reduce the range, keep in mind that jobs in the range of deleted numbers will be removed from the JES3 queue, and that, if any jobs in this range are active, you must wait for them to end, cancel them, or IPL the system on which they are active. You can preserve jobs that are to
be deleted by calling the Dump Job (DJ) DSP and
dumping jobs using the RANGE parameter, before
reducing the job number range. You can reload dumped
jobs on a JES3 system that has a smaller job number
range defined, in which case, reloaded jobs will be
reassigned job numbers in the defined range.

Note 18

IAT2641

Explanation:

>-CONNECT IN PROCESS FOR—main—
>-WAITING COMPLETION OF—VERIFIES
—GMS—
—WTDDRVR—
—LOCATE—

During connect processing with the specified main,
JES3 has waited a specified time for the completion of
one of the following actions:

VERIFIES

Initial verifies (by IATMDDR and IATLVVR) for the
specified main have not been completed.

GMS

Generalized main scheduling (IATMSMC) has not
completed processing of the restart records for the
specified main.

WTDDRVR

JCT Scan (IATGRWM) for the specified main has
not completed.

LOCATE

Locate Restart (IATLVIN) for the specified main has
not completed.

System action: JES3 waits for the completion of the
specific function.

Operator response: If the wait seems abnormal for
the current workload, issue the *START,main,CONNECT
command to restart the connect sequence. Notify the
system programmer.

Programmer response: Determine why the indicated
action has not completed.

Problem determination: See Table III, items 1 and 2.

IAT2642

Explanation:

>-FSS TABLE NOT FOUND FOR FSS JOB—
>-jobname (jobid)— ON PROCESSOR—main—
>- FSS STATUS REMOVED—

The specified job is active on a connecting main. The
job is marked as a functional subsystem (FSS) job (the
demand select job created to run an FSS address
space), but there is no matching FSS entry.

System action: JES3 clears the fields in the
RESQUEUE entry that identify the job as an FSS job
and allows the job to continue in execution.

Operator response: Cancel the job as soon as
possible.

IAT2643

Explanation:

>- FSS fssname— STATUS MISMATCH WITH FSS—
>- jobname (jobid)— ON PROCESSOR—main—
>- CANCEL COMMAND SENT—

The specified job is active on a connecting processor. The
job is marked as a functional subsystem (FSS) job
(the demand select job created to run an FSS address
space), but the matching FSS table entry is marked as
inactive or shows no owning FCT.

System action: JES3 sends a CANCEL command to
the system where the FSS job is running.

Operator response: Start a new FSS job, if
appropriate.
IAT2644
Explanation:

\[\text{FSS JOB NOT FOUND FOR FSS--'fssname'---} \]
\[\text{ON PROCESSOR--main-- FSS FAILURE SET} \]

The specified functional subsystem (FSS) is marked as active on a connecting main, but there is no matching FSS job (the demand select job created to run an FSS address space) active on the main.

System action: JES3 marks the FSS as having failed.

Operator response: Start a new FSS job, if appropriate.

Module:

Chapter 5. SNA RJP Messages

IAT2801
Explanation:

This message, issued in response to a *CALL,SNAJRP command, indicates that the JES3/VTAM interface is active and JES3 will accept logons of logical units from SNA RJP workstations.

System action: The SNARJP DSP automatically logs on to the logical units for which AUTO=Y is specified in the RJPWS initialization statement. At this time any manual logons of logical units from workstations will also be processed.

Operator response: None. This is an informational message.

Module:

Routing Code: 8          Descriptor Code: 7

IAT2802
Explanation:

A logon from workstation wsname has been rejected because a workstation cancel (either internally generated or with operator command) is in progress.

System action: Processing continues.

Operator response: When the cancel is completed, logons will be allowed.

Module:

Routing Code: 8          Descriptor Code: 7

IAT2803
Explanation:

The SNARJP DSP is not active. Logons cannot be accepted by JES3 because the *CANCEL,SNAJRP command has been issued, or the SNARJP DSP is ended.

System action: All SNA RJP modules are deleted and control returns to JES3 job segment scheduler (JSS) routine. The SNARJP DSP is ended.

Operator response: Issue a *CALL,SNAJRP command to activate the SNARJP DSP. See previous messages when an abend occurs.

Module:

Routing Code: 8          Descriptor Code: 7

IAT2804
Explanation:

A *CALL,SNAJRP command was issued with no SNA RJP workstations defined in the initialization stream.

System action: The *CALL,SNAJRP command is ignored.

Operator response: None. This is an informational message.

Programmer response: Use the RJPWS initialization statement to define the SNA RJP workstations. See z/OS JES3 Initialization and Tuning Reference

Module:

Routing Code: 8          Descriptor Code: 7

IAT2806
Explanation:

Compaction table tab failed to load. This loss is due to the inability to access the table from spool. Spool errors may have occurred.

System action: SNA RJP continues, but requests for the specified compaction table are ignored.

Operator response: Notify the system programmer.
Notify the workstation operators that compaction table tab will not be supported.

IAT2810

Explanation:  

\[\text{SESSION ESTABLISHED, WS=wsname, LU=luname, CID=network adr}\]

Logical unit luname has been connected with JES3 SNA RJP with or without console support as indicated in the message text. Given in the message are:  

workstation name wsname, logical unit name luname, and communication identifier (CID) network adr. This information is useful in conjunction with the VTAM® generalized trace facility (GTF) to obtain information about data flowing on a session.  

System action: Processing continues.  

Operator response: None. This is an informational message.  

Module:

<table>

Routing Code: 8    Descriptor Code: 7

IAT2811

Explanation:  

\[\text{ERROR LOADING MODULE mod, SNARJP CANCELLED}\]

An error occurred during the loading of module mod.  

System action: All SNA RJP modules are deleted and the SNARJP DSP is ended.  

Operator response: Notify the system programmer.  

Programmer response: The ALOAD macro instruction is used for loading the SNA RJP modules. The module may not exist on the program library, or an I/O error may have occurred during reading the module from auxiliary storage.  

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

<td>IATSNLC</td>
</tr>
</tbody>
</table>

Routing Code: 8    Descriptor Code: 7
IAT2812

Explanation:

A remote workstation has been defined but a CONSOLE statement for the remote workstation has not been defined in the initialization stream.

System action: The workstation is marked inactive.

Operator response: Contact your system programmer.

Module:

Routing Code: 8, Note 18  Descriptor Code: 7

IAT2814

Explanation:

A logon from workstation wsname has been rejected because the maximum number of logons allowed has been reached. This number is specified at initialization time in the LU=parameter of the COMMDEFN initialization statement.

System action: The logon is rejected.

Operator response: None for the system operator. The workstation operator should attempt to log on later.

Module:

Routing Code: 8  Descriptor Code: 7

IAT2815

Explanation:

A logon has occurred or a command has been entered for a workstation that is not defined by the N= parameter on a RJPWS initialization statement.

System action: The logon is not accepted or the command is ignored.

Operator response: Notify the system programmer.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2816

Explanation:

Workstation wsname has become inactive because the maximum number of attempts allowed to log on with the password incorrectly specified has been reached. This number is represented by \( n \) and is specified in the PL=parameter of the RJPWS initialization statement.

System action: No logons from this workstation are allowed.

Operator response: An attempt may be under way to break password security. Notify the system programmer or system security personnel. When this problem is solved and the workstation is to be used, issue the *START,SNARJP,T=wsname command to activate the workstation. Then the workstation operator should log on using the valid password.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2817

Explanation:

An attempt to log on to workstation wsname has been rejected because the logical unit name specified during logon did not match any of the logical unit names specified on the RJPWS initialization statement.

System action: The logon is rejected.

Operator response: Notify the system programmer.
Programmer response: Verify that the logical unit name specified for this workstation to VTAM matches the logical unit name defined to JES3 in the LU=parameter of the RJPWS initialization statement.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2818
Explanation:
LOGON REJECTED - CANNOT READ
WSB/SUPUNITS FOR WS=<wsname>

The workstation definition information cannot be read from spool.

System action: The logon is rejected.

Operator response: Notify the system programmer. Notify the workstation operator that the logon failed.

Programmer response: Verify the workstation name defined in the N=parameter of the RJPWS initialization statement. If spool errors have occurred, a warm start or a hot start with refresh may be required.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2819
Explanation:
INVALID BIND PROFILE - WS=<wsname>

An attempt to log on to workstation <wsname> has been rejected because the mode table entry used contained an incorrect FMPROF (function management profile), TSPROF (transmission sub-system profile), or PSERVIC (lu profile). Information about the mode table is contained in VTAM Installation.

System action: The logon is rejected.

Operator response: Verify that the correct mode table is used.

Module:

Routing Code: 8  Descriptor Code: 7

IAT2821
Explanation:
INVALID PASSWORD FROM WS=<wsname> LU=<luname>

An attempt to log on from the logical unit= <luname> of workstation= <wsname> has been rejected because of an incorrect password.

System action: The logon is rejected. JES3 continues processing.

Operator response: None for the system operator.

The workstation operator should attempt to log on after JES3 completes processing.

Module:
IAT2830

Explanation:

- ABEND DURING INITIALIZATION OF SNARJP.
- SNARJP CANCELLED

The initialization of the SNARJP DSP abended.

System action: All SNA RJP modules are deleted and control is passed to the JES3 return to JSS routine. The SNARJP DSP is ended.

Operator response: Issue a *CALL,SNARJP command after message IAT2803 has been issued to activate the SNARJP DSP and notify the system programmer.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</table>

Routing Code: 10  Descriptor Code: 7

IAT2835
Explanation:

An error occurred while SNA RJP was running in an exit under service request block (SRB). The workstation name wname and the logical unit name luname is given.
System action: The session with the specified logical unit ends.

Operator response: Notify the system programmer, and log on at the workstation.

Module:

Routing Code: 10, Note 18  Descriptor Code: 7

IAT2836
Explanation:

While attempting to end a session following an error, a second error occurred.

System action: The session is unavailable.

Operator response: After the network has quiesced, issue a *CANCEL,SNARJP command and then a *CALL,SNARJP command.

Module:

Routing Code: 8  Descriptor Code: 7

IAT2837
Explanation:

An error occurred during the process of activating the SNARJP DSP during SNA RJP initialization.

System action: Message IAT2801 SNARJP IS ACTIVE is issued. All automatic logon support is suspended. Control returns to the SNA RJP initialization routine. SNA RJP initialization continues.

Operator response: Notify the system programmer. Notify all workstation operators for which AUTO=Y is specified on the RJPWS initialization statement that automatic logon is suspended. Workstation operators will have to log on manually.

Module:

Routing Code: 10  Descriptor Code: 7
IAT2840
Explanation:

**ABEND IN—ESTAE RETRY ROUTINE**

An error has occurred during SNARJP subtask ESTAE processing.

**System action:** The subtask is ended. The SNARJP DSP is posted to return to JSS.

**Operator response:** Notify the system programmer.

**Programmer response:** See Table V for an explanation of the current load indicator from message IAT2841.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

IAT2845
Explanation:

**LOTERM ENTERED, WORKSTATION=wsname**

**LU=luname REASON CODE=rc**

VTAM scheduled the SNA RJP LOSTERM exit routine for workstation *wsname*. For information about the reason code *rc*, see VTAM Programming. Some of the more common reason codes are listed below.

**Reason Code**

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'0C'</td>
<td>Network operation deactivated LU</td>
</tr>
<tr>
<td>X'14'</td>
<td>Unconditional logoff</td>
</tr>
<tr>
<td>X'20'</td>
<td>Conditional logoff</td>
</tr>
</tbody>
</table>
**X’24’** Buffer limit exceeded

**System action:** For the indicated reason code the following occurs:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>System Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’0C’ or X’14’</td>
<td>The session is ended immediately.</td>
</tr>
<tr>
<td>X’20’</td>
<td>The session is ended when all I/O operations scheduled for this session have completed.</td>
</tr>
<tr>
<td>X’24’</td>
<td>The session is reset (using CLEAR and start data traffic) unless the maximum buffer limit exceeded is reached. In that case, the session is ended.</td>
</tr>
</tbody>
</table>

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT2846**

**Explanation:**

- ATTEMPT TO LOGON—LU={luname}—REJECTED.
- LOGON COMMAND TOO LONG

A SNARJP workstation attempted to log on using LU={luname}. The logon command passed to SNARJP exceeded the maximum logon command buffer size.

**System action:** The LU is ended. JES3 and SNARJP continue processing.

**Operator response:**

- Local operator: This message is not displayed at the remote workstation (it is not logged on yet). This message can be used to determine why the remote operator cannot log on.
- Remote operator: If possible re-enter the logon command correctly and reduce the size of the comment field. If the remote operator does not enter the logon command directly, investigate whether there is an error in the workstation software/hardware.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATSNL</td>
<td>IATSNLS</td>
<td>IATSNLS</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT2848**

**Explanation:**

- SNARJP ESTAE PROCESSING HAS DETECTED
- AN INCORRECT WORK WORD,
- SNARJP WILL BE ENDED.

The work word used by the SNARJP ESTAE exit was found to be incorrect. The work word is used to determine which retry routine should get control. Since the work word was incorrect, retry is impossible and the SNARJP DSP is posted to end.

**System action:** The SNARJP DSP and subtask are ended.

**Operator response:** Restart SNARJP by issuing a *X SNARJP command.

**Problem determination:** See table III, items 1 and 4.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

</tr>
</thead>
<tbody>
<tr>
<td>IATSNLS</td>
<td>IATSNLS</td>
<td>IATSNLS</td>
</tr>
</tbody>
</table>

**Routing Code:** 2,8,10  **Descriptor Code:** –
IAT2850

Explanation:

VTAM has returned an error code which requires disconnecting all logical units and deactivating the JES3/VTAM interface.

System action: VTAM disconnects all workstation logical units and deactivates the JES3 logical unit.

Operator response: Restart the JES3/VTAM interface by issuing a *CALL,SNARJP command.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2852

Explanation:

While JES3 was using the specified Virtual Telecommunications Access Method (VTAM) function, an error occurred for the logical unit (LU) specified by luname. Generally, this message will be issued only for failure conditions.

In the message text, the VTAM function, specified by xxxxxxx, is one of the following:

<table>
<thead>
<tr>
<th>Function</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSE</td>
<td>Close access method control block (ACB)</td>
</tr>
<tr>
<td>CLSDST</td>
<td>Close destination</td>
</tr>
<tr>
<td>OPEN</td>
<td>Open ACB</td>
</tr>
<tr>
<td>OPNDST</td>
<td>Open destination</td>
</tr>
<tr>
<td>SETLOGON</td>
<td>Set logon processing</td>
</tr>
<tr>
<td>SIMLOGON</td>
<td>Simulated logon (AUTO=YES)</td>
</tr>
<tr>
<td>SEND</td>
<td>Send data</td>
</tr>
<tr>
<td>INQUIRE</td>
<td>Session inquiry</td>
</tr>
<tr>
<td>RECEIVE</td>
<td>Receive data</td>
</tr>
<tr>
<td>RESETSR</td>
<td>Session direction reset</td>
</tr>
</tbody>
</table>

Note: If UNKWN is indicated on the WS= parameter, then the workstation name is unknown.
System action: The system ends the specified LU immediately. If no logical unit is specified in the message text, the error may cause SNARJP to end.

Operator response: Notify the system programmer.

System programmer response: See VTAM Programming for information about the RC, RTNCD, FDBK2, and SENSE CODE.

Module:

Routing Code: 10  Descriptor Code: 7

IAT2853

Explanation:

- JES3/VTAM OPEN ACB FAILURE, SPECIFY
- "RETRY"—TO ATTEMPT OPEN AGAIN OR "TERM"—
- TO TERMINATE SNARJP

SNA/RJP did not initialize because the JES3/VTAM interface was not established.

System action: SNA/RJP waits until a valid response, either "TERM" or "RETRY", is entered.

Operator response: First, determine if VTAM has initialized by entering this command:

DISPLAY A, LIST

- If VTAM has initialized, enter "TERM" and contact your system programmer.
- If VTAM has not initialized, wait until VTAM has initialized and then enter "RETRY".

System programmer response: Message IAT2851 is issued after "TERM" is entered. Use this message to determine the cause of the failure.

Module:

<table>

IAT2880
Explanation:

 TRACE TABLE—GETMAIN FAILED FOR WS=wsname

An error occurred while getting storage, using the AGETMAIN macro, for the trace table.

System action: The SNA RJP trace facility is not initialized. Processing continues.
IAT2881 • IAT2886

Operator response: None. This is an informational message.

Routing Code: 8,Note 18   Descriptor Code: 7

IAT2881

Explanation:

TRACE ON INITIATED
FOR INACTIVE WORKSTATION—WS—wsname

This message, issued in response to a *START,SNARJP, T=wsname,TRACEON command, indicates that the SNA RJP trace facility is on; however, the workstation is not logged on. The trace request will still be honored when the workstation logs on.

System action: Processing continues.

Operator response: None. This is an informational message.

Routing Code: 8,Note 18   Descriptor Code: 7

IAT2882

Explanation:

TRACE HALTED FOR—WS—wsname

This message, issued in response to a *START,SNARJP, T=wsname,TRACEOFF command, indicates that the SNA FJP trace facility has been halted on the specified workstation.

System action: Processing continues.

Operator response: None. This is an informational message.

Routing Code: 8,Note 18   Descriptor Code: 7

IAT2883

Explanation:

DATASET—1001—TRTBL—wsname—lcname—

The specified data set has been spun off.

System action: Processing continues.

Operator response: None. This is an informational message.

Routing Code: Note 18   Descriptor Code: 7

IAT2884

Explanation:

LU—luname

This message, issued in response to a *START,SNARJP, T=wsname, TRACEON command indicates that the SNA RJP trace facility has been started.

System action: Processing continues.

Operator response: None. This is an informational message.

Routing Code: 8,Note 18   Descriptor Code: 7

IAT2886

Explanation:

DISCONNECT FORCED—REASON—xx—WS—

An *CANCEL SNARJP,T=WSNAME,I command to immediately end all JES3 activity was entered, but the normal end hung.

In the message text, reason xx is one of the following:

Reason Explanation
The Virtual Telecommunications Access Method (VTAM) CLSDST request issued by JES3 did not complete.

A synchronization problem occurred in JES3 close down processing.

**System action:** JES3 forces the session to end before completing SNARJP processing. Once the workstation is gone, the LU should be able to log on to JES3 again.

**Operator response:** Notify the system programmer.

**System programmer response:** If the reason for the forced disconnection is because the VTAM CLSDST did not complete, the session may still be in VTAM. If so, have the operator enter an V NET,TERM,SLU=**luname** command to clear the session; then the remote operator might log on again.

If the reason for the forced disconnection is due to JES3 close down synchronization problem and this problem repeatedly occurs for the workstation, run the workstation with the SNARJP trace active for the workstation. When the problem occurs again, save the system log and SNARJP trace output for the workstation. Also, invoke the dump core facility and have the operator enter an *S DC,OPTION=WSB command to dump the SNARJP workstation blocks. The disconnected workstation may still be in the DC output with an indication that it is ‘pending free’ processing. Once this output is collected, contact the IBM Support Center.

IAT3001

Explanation:

JES3 CSR RECORD INVALID

JES3 read the complex status record (CSR) from the
checkpoint data set to update the status of the
processor on which JES3 was ending. In reading the
CSR, JES3 detected that the initialization time stamp in
the CSR on the spool did not match the time stamp in
the resident CSR.

System action: JES3 continues to end processing;
however, status information for this processor in the
checkpointed CSR is either incorrect or absent. If this
message is issued while you are performing a DSI, then
the DSI ends.

Operator response: Perform a warm start and if that
fails, notify the system programmer.

Programmer response: If the warm start failed,
perform a cold start.

Problem determination: See Table III, items 4 and 6.

Module:

</tr>
</tbody>
</table>

Routing Code: 2,10  Descriptor Code: 4

IAT3002

Explanation:

ERROR ON FSS—START COMMAND FOR FSS—
fssname, ASID=—asid

JES3 issued a START command for a functional
subsystem (FSS) address space. The command
contained syntax errors. The FSS name fssname
indicates the name of the requested FSS and the ASID
asid indicates the requested address space ID.

System action: FSS initialization ends with a system
completion code of 2FB and a dump is taken.

Operator response: Notify the system programmer.

Programmer response: Look at the ABEND dump
generated by module IATINTK to determine what was
wrong with the START command. Verify that the
parameters on the START command are correct.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

</thead>
<tbody>
<tr>
<td>IATINTK</td>
<td>IATINTK</td>
<td>IATINTK</td>
</tr>
</tbody>
</table>

Routing Code: 2,10  Descriptor Code: 4

IAT3003

Explanation:

INVALID FSS START FOR FSS—fssname,
ASID=—asid

An incorrect START command was issued for a
functional subsystem (FSS) address space. The START
command can only be issued internally by JES3. The
START command cannot be issued from the operator
console. The FSS fssname indicates the name of the
requested FSS and the ASID asid indicates the
requested address space ID.
IAT3004 • IAT3007

**System action:** FSS initialization ends with a system completion code of 2FB and a dump is taken.

**Operator response:** Starting an FSS with an operator START command is not allowed and will always fail. If you did not issue a START command to bring up the FSS address space, then notify the system programmer.

**Programmer response:** Verify that the START was issued internally by JES3 as opposed to by a START command from the console. This can be checked by looking for the existence of a token in the command input buffer (CIB). There will be no token if a START command was issued by the operator.

**Module:**

<table>

</table>

**Routing Code:** 2,10  **Descriptor Code:** 4

---

**IAT3004**

**Explanation:**

> JES3 SUBSYSTEM VERIFY REQUEST FAILED

> FOR FSS=fssname, ASID=asid

Either JES3 was trying to verify itself as the primary subsystem or an FSS was trying to verify that JES3 is a defined subsystem. If the error occurred during FSS initialization, the FSS name and ASID are included in the message.

**System action:** JES3 or FSS initialization ends with a system completion code of 2FB.

**Operator response:** Notify the system programmer.

**Programmer response:** Check SYS1.PARMLIB to make sure that JES3 is defined there as the primary subsystem. Ensure that the name used for JES3 in SYS1.PARMLIB is the same name that is used to start JES3. Also make sure the failing job step includes SYSABEND DD, SYSUDUMP DD, and SYSMDUMP DD statements. Then restart JES3.

**Problem determination:** Obtain the following items:

- The console log from initialization
- The JES3 dump

**Module:**

<table>

---

**IAT3005**

**Explanation:**

> IATINAX UNABLE TO ATTACH IATAUX TASK

JES3 initialization module IATINAX was not able to attach the JES3 auxiliary task; ATTACH processing issued a non-zero return code.

**System action:** JES3 initialization ends with a system completion code of CFB.

**Operator response:** Notify the system programmer.

**Programmer response:** Verify that module IATAUX is present in one of the following:

- The STEPLIB concatenation defined in the JES3 procedure, if used.
- A library included in the linklist specified in response to message IEA101A, SPECIFY SYSTEM PARAMETERS FOR RELEASE xxx.yy.zz.

**Problem determination:** See Table I, items 2, 5a, 7c, 13, and 16; Table III, items 2, 6, and 21.

**Module:**

**Routing Code:** 2,10  **Descriptor Code:** 4

---

**IAT3007**

**Explanation:**

> message text

An error was encountered while processing a prefix specified on the SYN= or PLEXSYN= keyword on the CONSTD initialization statement. The message text can be one of the following:

**PREFIX prefix IGNORED - CONTAINS ALL NUMERICs**

Prefix consists of all numeric characters.

**PREFIX prefix IGNORED - CONTAINS GREATER THAN EIGHT CHARACTERS**

Prefix consists of greater than eight characters.

**PREFIX prefix IGNORED - CONTAINS INVALID CHARACTERS**

Prefix consists of one or more characters that are not in the range of X‘41’ to X‘FE’

**PREFIX prefix IGNORED AS A SYSPLEX PREFIX, ALREADY DEFINED WITH SYSTEM SCOPE**

The same prefix was specified on both the SYN= and PLEXSYN= keywords of the CONSTD initialization statement. The PLEXSYN definition is ignored.
**PREFIX prefix HAS BEEN ADDED AS A SYSPLEX SCOPED PREFIX**

The prefix "*" was not specified on either the SYN= or PLEXSYN= keywords of the CONSTD initialization statement. JES3 adds "*" to its sysplex scoped prefix table.

**NO ALLOWABLE SYSTEM SCOPED PREFIX FOUND, DEFAULT PREFIX "8" WILL BE USED**

All prefixes specified on the SYN= keyword on the CONSTD initialization statement were in error. The default SYSTEM scoped prefix, "8" will be used.

**"*" IS NOT A SYSPLEX SCOPED PREFIX, USE IT AS A SYSTEM SCOPED PREFIX**

The prefix "*" was specified on the PLEXSYN= keyword of the CONSTD initialization statement however, JES3 was unable to register the "*" with the COMMAND PREFIX FACILITY (CPF) as a sysplex scoped prefix. The "*" prefix should be used as a JES3 system-scoped prefix.

**DEFAULT SYSPLEX PREFIX "*" CANNOT BE DEFINED TO CPF, USE IT AS A SYSTEM PREFIX**

The prefix "*" was not specified on either the SYN= or PLEXSYN= keywords of the CONSTD initialization statement. JES3 added "*" to its sysplex scoped prefix table but then was unable to register the "*" with the COMMAND PREFIX FACILITY (CPF) as a sysplex scoped prefix. The "*" prefix should be used as a JES3 system-scoped prefix.

**NO ALLOWABLE SYSPLEX SCOPED PREFIX FOUND, NO SYSPLEX SCOPED PREFIX IN EFFECT**

JES3 was unable to successfully define any sysplex scoped prefixes to the COMMAND PREFIX FACILITY (CPF). Therefore, only the system scoped prefixes may be used to communicate with JES3.

**PREFIX prefix IGNORED - ALREADY DEFINED FOR [SYSPLEX] [sysname]**

JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received a return code indicating that the prefix is already defined to CPF. If SYSPLEX is specified, the conflicting prefix is already defined as a sysplex-scoped prefix. If sysname is specified, the conflicting prefix is already defined as a system-scoped prefix on the indicated system.

**PREFIX prefix IGNORED - SUBSET OF PREFIX ALREADY DEFINED FOR [SYSPLEX] [sysname]**

JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received a return code indicating that the prefix is a superset of a prefix that has already been defined to CPF. If SYSPLEX is specified, the conflicting prefix is already defined as a sysplex-scoped prefix. If sysname is specified, the conflicting prefix is already defined as a system-scoped prefix on the indicated system.

**PREFIX prefix IGNORED - CPF REQUEST=DEFINE ERROR ENCOUNTERED, RC=rc, RSN=rsn, FOR [SYSPLEX] [sysname]**

JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received the specified return and reason code. If SYSPLEX is specified, the error occurred attempting to define a sysplex-scoped prefix. If sysname is specified, the error occurred attempting to define a system-scoped prefix on the indicated system.

**SYSTEM IS RUNNING IN AN XCF-LOCAL ENVIRONMENT, NO SYSPLEX SCOPED PREFIX IN EFFECT.**

Due to an environmental error, JES3 could not define any prefix(es) specified on the PLEXSYN= parameter of the CONSTD initialization statement to the command prefix facility (CPF). Upon return, CPF indicated that the system is running in XCF-local mode. This could occur if you specified either PLEXCFG=MONOPLEX or PLEXCFG=XCFLOCAL in the IEASYSxx member of SYS1.PARMLIB. Therefore, only system-scoped prefixes can be used to communicate with JES3.

**System action:** Either the specified prefix has not been defined to the COMMAND PREFIX FACILITY (CPF) as a SYSTEM or SYSPLEX scoped prefix or, a default SYSTEM or SYSPLEX scoped prefix has been defined as specified. Initialization continues.

**Operator response:** The system programmer can use the D OPDATA,PREFIX command to see which prefixes are already in use in the sysplex. On the next JES3 warm or cold start, replace the prefix in error with a valid prefix.

If the error reason is "NO ALLOWABLE SYSPLEX SCOPED PREFIX FOUND, NO SYSPLEX SCOPED PREFIX IN EFFECT", currently the system is running without a SYSPLEX scoped prefix defined to the COMMAND PREFIX FACILITY (CPF). If the failure to define the sysplex scoped prefixes to CPF was due to another subsystem having already defined the prefixes with SYSPLEX scope, using these prefixes could result in the command being routed to another processor (i.e. if that subsystem registered its SYSPLEX scoped prefix on another processor). In this case, use the remaining SYSTEM scoped prefixes to communicate with JES3, or precede the command with another sysplex scoped prefix which directs the command to the appropriate processor.
IAT3008 • IAT3011

processor (e.g. a prefix defined by the IEECMDPF sample program).

See [z/OS JES3 Initialization and Tuning Reference] for information on defining prefixes. Some forms of this message are written to JES3OUT and an operator's console. Others are written exclusively to JES3OUT.

IAT3008

Explanation:

<table>
<thead>
<tr>
<th>COLD, —WARM, —reasonext</th>
</tr>
</thead>
</table>

| OR HOT/REFRESH START REQUIRED, —reasonext |

JES3 encountered an error during initialization processing of records within the checkpoint data set(s). reasonext can be the following:

ERROR READING DYNALLOC CKPT RECORD
An error was encountered while reading the DYNALLOC record (S99) from the checkpoint data set(s), or the S99 record was not found.

DYNALLOC CKPT RECORD NOT VALID
The DYNALLOC record (S99) was successfully read but is not usable or contains incorrect status.

System action: JES3 issues message IAT3011 and restricts the current restart to cold, warm, or hot start with refresh.

Operator response: Notify the system programmer. Respond to message IAT3011. The only acceptable replies are C (cold start), W (warm start), HR (hot start with refresh), or CANCEL (to end JES3 initialization).

System programmer response: Obtain the information listed in [Chapter 30, “Problem Determination,” on page 711] and use the data to determine the error. See [z/OS JES3 Initialization and Tuning Guide] for more information on restarting JESS.

Problem determination: See [Chapter 30, “Problem Determination,” on page 711, Table III, items 6, 20, and 21].

IAT3011

Explanation:

<table>
<thead>
<tr>
<th>SPECIFY JES3 START TYPE</th>
</tr>
</thead>
</table>

| (C, L, H, HA, HR, HAR, W, WA, WR, WAR, OR CANCEL) |

JES3 requests that the operator specify a start type before resuming initialization processing.

System action: JES3 initialization waits for an operator response.

Operator response: Enter one of the following:

C             cold start as the global
L             local start (note 2 below)
H             hot start as the global (note 2 below)
HA            hot start as the global and perform spool control block validity analysis on all jobs in the queue (note 2 below)
HR            hot start as the global, read the initialization stream, and process some of the initialization parameters (note 2 below)
HAR           hot start as the global, read the initialization stream, and process some of the initialization parameters, and perform spool control block validity analysis on all jobs in the queue (note 2 below)
W             warm start as the global
WA            warm start as the global and perform spool control block validity analysis on all jobs in the queue
WR  warm start as the global processor and allow replacement of spool data sets
WAR  warm start as the global processor, perform spool control block validity analysis for all jobs in the queue, and allow replacement of spool data sets
CANCEL  immediately end JES3 initialization

Notes:
1. A reply of W, WA, WR, WAR, or C also requires the IPL of all processors in the complex.
2. Valid on a processor that was global at the last JES3 start; the processor remains global.

System programmer response: None

If your reply is incorrect, JES3 reissues the message.

Routing Code: 1,10  Descriptor Code: 4,7

---

IAT3014

Explanation:

▷—ddn—DID NOT OPEN,—INIT TERMINATED

The data set specified by the DD statement ddn failed to open. The JES3 procedure probably does not include a valid DD statement with this name.

System action: JES3 initialization ends.

Programmer response: Verify that the named DD statement in the JES3 procedure represents a valid data set or unit allocation.

Problem determination: See Table III, items 5, 6, 20, and 21.
IAT3015 • IAT3020

IAT3015
Explanation: JES3IN BLKSIZE NOT MULTIPLE OF 80, INIT TERMINATED

The data set represented by the DD statement JES3IN in the JES3 procedure is not in blocked 80-character card image format. Only 80-character multiple blocks are acceptable for use as JES3IN.

System action: JES3 initialization ends.

Programmer response: Recreate the data set that contains the JES3 initialization statements, specifying a block size that is an integer multiple of 80. Or correct the DD statement in the JES3 procedure to specify the proper data set.

Operator response: Reinitialize JES3 and specify an alternate JES3 procedure if you did not change the JES3IN data set in the original procedure.

Problem determination: See Table III, items 6, 20, and 21.

Module:

Routing Code: 2,10  Descriptor Code: 1,7

IAT3020
Explanation: UNABLE TO LOAD JES3 MODULE module, FOR FSS fssname, ASID asid, ABEND CODE=xxxx, RETURN CODE=xxxx, DUMP CODE=xxxx

JES3 was unable to load the MVS or JES3 module. If JES3 attempts to load the specified module while executing in a functional subsystem (FSS), the functional subsystem name fssname and address space id appear in the message. If the message does not identify the name and ASID of an FSS, the error occurred while attempting to load the specified module in a JES3 address space.

JES3 displays the abend code and return code when the LOAD macro is used to place the specified module in storage. The dump code is displayed when an ALOAD macro was used to place the module in storage.

System action: The action depends on the module being loaded and the module that requested the load. The following conditions cause JES3 or FSS initialization to end with a system completion code of 2FB:
- The module is needed for JES3 or FSS initialization.
- The module is needed during normal JES3 operation.

If the module is not critical to JES3 operation, or if the module name starts with IATUX, initialization continues, but message IAT3102 indicating, probable failure, is issued at the end of initialization.

Operator response: Notify the system programmer.

Programmer response: Verify that the module is present in one of the following:
- The STEPLIB concatenation defined in the JES3 or FSS procedure
- The linklist specified in response to message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zzz

If the module in error is required in LPA, you must make sure it is not in a STEPLIB or JOBLIB data set.

Problem determination: See Table I, items 2, 7d, and 13; Table III, items 4, 5, 6, 20, and 21.

Module:
IAT3021

Explanation:

The JES3 subsystem is already active. Only one JES3 subsystem can be active at a time.

System action: The last JES3 subsystem that was started ends.

Operator response: The active JES3 subsystem must be ended before a second START JES3 is issued.

Module:

IAT3022

Explanation:

The JES3 INI member name is absent in the JES3 initialization deck. The member JES3IN00 has been internally set as the default.

System action: The member name JES3IN00 remains as the default for JES3 initialization.

Programmer response: Change the JES3 procedure to specify a member whose name starts with JES3IN for the DD statement JES3IN.

Problem determination: See Table III, items 6 and 21.

Module:
determine the cause of the previous address space failure. Acquire the cancellation dump and if no dump was taken, take a stand-alone dump.

Module:

Routing Code: 2,10   Descriptor Code: 1,7

---

IAT3025

Explanation:

The member `mem` of the indicated data set was not found. The data set was specified in the JES3 procedure. The member was either specified in the JES3 procedure (reply N), specified by the operator (reply M=nn), or defaulted by the system (reply N or M=nn), followed by messages IAT3022 or IAT3023.

System action: JES3 reissues message IAT3012.

Operator response: Specify a member known to exist.

Programmer response: Verify that the JES3IN DD statement in the JES3 procedure correctly names a valid member.

Problem determination: See Table III, items 6 and 21.

Module:

Routing Code: 2   Descriptor Code: 4,7

---

IAT3026

Explanation:

There was a permanent I/O error encountered while searching for the member-name entry in the directory of the JES3IN data set. This message is issued after return code 08 from a BPAM FIND. It is possible that an out-of-storage condition caused the error.

System action: JES3 reissues message IAT3012.

Operator response: Specify the same (N or M=nn) initialization stream member again. If this second attempt fails, specify an alternate member, if one is applicable.

Problem determination: See Table III, item 6.

Module:

Routing Code: 2,10   Descriptor Code: 4,7

---

IAT3027

Explanation:

In reply to message IAT3011, the operator selected a warm start or a cold start, but the IPL of the processor has not been repeated since JES3 was last initialized on this processor. An IPL is required to ensure that JES3 control blocks residing in the common service area (CSA) are rebuilt according to the current initialization statements. Conversely, when CSA is intact (no IPL) during a hot (or local) start, it is not necessary to perform the initialization routines that build those control blocks.

System action: JES3 reissues message IAT3011.

Operator response: If a warm start or a cold start must be performed, first repeat the IPL. Otherwise, perform a hot start or local start, as appropriate.

Problem determination: See Table III, item 6.

Module:

Routing Code: 2,10   Descriptor Code: 4,7

---

IAT3028

Explanation:

JES3 was unable to extract the name of the data set specified on the JES3IN DD statement. As a result, *MODIFY,CONFIG commands will not work after JES3 has completed initialization.

System action: JES3 initialization continues.

Operator response: None. This is an informational message.

Module:
IAT3029

Explanation:

A dynamic allocation attempted has not been successful.

In the message text:

- `ddn dsn` the ddname/dsname combination for which the dynamic allocation attempt was unsuccessful.
- `unitname` the unitname for which the dynamic allocation attempt was unsuccessful.

System action: JES3 issues message IAT3030 to detail the reason for the failure. The rest of the DYNALLOC statements in the initialization stream are checked for validity.

Operator response: None. This is an informational message.

Programmer response: Correct the condition that caused the allocation to fail. You may have to change only the initialization statement, or you may have to make available a data set or unit that was previously not found. Other MVS messages may have been issued that will help to determine the cause of failure.

Problem determination: See Table III, items 5, 6, and 21.

Module:

IAT3031

Explanation:

A dynamic allocation concatenation function for the indicated ddname has not been successful.

System action: JES3 issues message IAT3030 to detail the reason for the failure. The rest of the DYNALLOC is checked for validity. JES3 initialization then ends.

Programmer response: Correct the condition that caused concatenation to fail. Other MVS messages may have been issued that will help to determine the cause of failure.

Problem determination: See Table III, Items 5, 6, and 21.

Module:

IAT3032

Explanation:

A DYNALLOC statement contains an incorrect keyword. The statement containing the error is duplicated on the operator's console immediately preceding this message.

System action: The rest of the DYNALLOC statements in the initialization stream are checked for validity. JES3 initialization ends.

Programmer response: Correct the statement in error.
Problem determination: See Table III, items 5 and 6.

Module:

<table>

Routing Code: 1  Descriptor Code: 7

IAT3035

Explanation:

- DYNALLOC concatenation—limit exceeded

JES3 attempted to dynamically concatenate more than 16 DD statements with the same ddname. The statement that exceeded the limit is duplicated on the operator’s console immediately preceding this message.

System action: JES3 checks the remaining DYNALLOC statements in the initialization stream for validity. JES3 initialization ends.

Programmer response: Remove the excess statement.

Problem determination: See Table III, items 5 and 6.

Module:
IAT3038

Explanation:

*ERROR WRITING THE*

COMPLEX STATUS CKPT RECORD

DYNAMIC ALLOCATION CKPT RECORD

An error occurred while JES3 was writing the complex status record or the dynamic allocation record (IATYS99) to the checkpoint data set during JES3 initialization.

If checkpoint duplexing was being used (for example, both CHKPNT and CHKPNT2 defined), this message is issued only if the write operation failed on both checkpoint data sets.

System action: JES3 initialization processing continues, however, subsequent global processor hot or warm starts may not be possible.

Operator response: Notify the system programmer.

If initialization completes, reduce the queue backlog, especially if there are JES3 local processors still active.

Programmer response: If there are indications of permanent errors, allocate the checkpoint data sets again and perform a cold start.

Problem determination: See Table I, items 18 and 37; Table III, items 4 and 6.

IAT3040

Explanation:

*STATUS OF PROCESSORS IN JESXCF GROUP—group—*

*main1 (status1), mainn (statusn)*

The status of the processors (main1[,mainn...]) in this complex as last recorded in the complex status record (CSR) is provided for operator information. The parentheses enclosing the status information are set as follows:

Current system is a global: +status+

Global on another system: *status*

Current system is a local: <status>

Local on another system: (status)

The status field can be as follows:

**UP** the main has completed initialization

**IN** the main has not completed initialization

**DS** the main has not completed dynamic system interchange

**blank** the main has either ended normally or has never been initialized by JES3

The status is updated at the beginning and end of JES3 initialization and cleared as JES3 ended. The status may be incorrect if a normal end has not been possible.
IAT3041 • IAT3042

(for example, main failure) or if an I/O error has precluded complex status record (CSR) update.

Note: Up to 32 mains can be displayed in this message.

In the message text:

group The name of the JESXCF group containing the processors listed in this message.

mainn The name of a processor within the complex.

statusn The status of the associated processor.

System action: JES3 initialization continues.

Operator response: None. This is an informational message. However, if the group shown is incorrect, or the text "<NAVAIL>" or "<NAVAIL>"., notify the system programmer.

System programmer response: If the group name is incorrect, it means that the JES3 procedure is pointing to an incorrect set of checkpoint data sets. Do not allow JES3 to initialize further. When message IAT3011 appears for the start type, reply CANCEL to end JES3, and correct the JES3 procedure before restarting JES3.

If the group is "<NAVAIL>", see message IAT2063.

IAT3041

Explanation:

PREVIOUS GLOBAL COLD START INCOMPLETE

PREVIOUS GLOBAL WARM START INCOMPLETE

ERROR READING COMPLEX STATUS RECORD

COMPLEX STATUS RECORD NOT VALID

ERROR READING JESCKPNT RECORD

ERROR READING SPOOL DATASET CKPT RECORD

ERROR READING SPOOL PARTITION CKPT RECORD

An error was encountered during JES3 initialization processing of records within the checkpoint data set(s), requiring a cold start of JES3:

PREVIOUS GLOBAL COLD START INCOMPLETE

The previous JES3 start type was a cold start and that restart failed to complete.

ERROR READING COMPLEX STATUS RECORD

An error was encountered while reading the complex status record (CSR) from the checkpoint data set(s), or the CSR record was not found.

COMPLEX STATUS RECORD NOT VALID

The complex status record (CSR) was successfully read but failed validity checking.

ERROR READING JESCKPNT RECORD

An error was encountered while reading the JESCKPNT (CKP) record from the checkpoint data set(s), or the CKP record was not found.

ERROR READING SPOOL DATASET CKPT RECORD

An error was encountered while reading the spool data set CKPT record (VOL) from the checkpoint data set(s), or the VOL record was not found.

ERROR READING SPOOL PARTITION CKPT RECORD

An error was encountered while reading the spool partition CKPT record (SPR) from the checkpoint data set(s), or the SPR record was not found.

This message will always appear the first time that JES3 is initialized with newly allocated checkpoint data set(s) because the contents of new checkpoint data set(s) is unpredictable.

System action: JES3 issues message IAT3011 and restricts the current restart to a cold start.

Operator response: The only acceptable replies to message IAT3011 are C (cold start) or CANCEL (to end JES3 initialization).

Programmer response: Obtain the data listed in Chapter 30, “Problem Determination,” on page 711 and use the information to determine the error.

IAT3042

Explanation:

COLD OR WARM START REQUIRED.

reasontext

JES3 encountered an error during initialization processing of records within the checkpoint data set(s). The reason text is one of the following:

PREVIOUS GLOBAL WARM START INCOMPLETE

The previous JES3 start type was a warm start that failed to complete.

ERROR READING COMPLEX STATUS RECORD

JES3 encountered an error during reading the complex status record (CSR).
COMPLEX STATUS RECORD NOT VALID
The complex status record (CSR) was successfully read but is not usable or contains incorrect status.

THIS CPU NOT DEFINED
This processor was not defined by its sysname on a MAINPROC statement the last time a warm or cold start was performed for the global processor.

ERROR READING INITIALIZATION CKPT RECORD
JES3 encountered an error while reading the initialization CKPT record (ICP).

INITIALIZATION CKPT RECORD NOT VALID
The initialization CKPT record (ICP) was successfully read but is not usable or contains incorrect status.

JESCKPT RECORD NOT VALID
The JESCKPT record (CKP) was successfully read but is not usable or contains incorrect status.

ERROR READING BADTRACK CKPT RECORD
JES3 encountered an error while reading the badtrack CKPT record (BTR) from the checkpoint data set(s), or JES3 could not find the BTR record.

BADTRACK CKPT RECORD NOT VALID
The badtrack CKPT record (BTR) was successfully read but is not usable or contains incorrect status.

SPOOL DATASET CKPT RECORD NOT VALID
The spool data set CKPT record (VOL) was successfully read but is not usable or contains incorrect status.

SPOOL PARTITION CKPT RECORD NOT VALID
The spool partition CKPT record (SPR) was successfully read but is not usable or contains incorrect status.

System action: JES3 issues message IAT3011 and restricts the current restart to a cold or warm start.

Operator response: The only acceptable replies to message IAT3011 are C (cold start), W (warm start), or CANCEL (to end JES3 initialization).

System programmer response: Obtain the information listed in Chapter 30, “Problem Determination,” on page 711 and use that data to determine the error.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: 1,10          Descriptor Code: 4,7

IAT3043
Explanation:

COLD OR WARM START ON globproc HAS NOT COMPLETED.

DO YOU NEED TO TAKE CONTROL? (YES, NO, OR RETRY)

JES3 initialization has determined that a local processor is being started. This processor cannot be initialized until global initialization has successfully completed. Initialization data for local and hot starts is not available until the end of a successful initialization performed from initialization statements.

In the message text:

globproc
The name of the processor on which a cold or warm start was most recently attempted.

System action: JES3 waits for an operator reply.

Operator response: Reply NO or CANCEL to end JES3. Reply YES to ignore any other global initialization in process; message IAT3011 is then issued. The only valid replies to message IAT3011 (issued next) are W, WA, WR, WAR, or C.

To continue, reply RETRY after the global has successfully completed JES3 initialization. A reply of YES is needed only if JES3 had started a warm or cold initialization and had not successfully completed it. This might be due to hardware or software failure, incorrect initialization stream, or operator intervention.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: 2          Descriptor Code: 2,7

IAT3044
Explanation:

THE OPTIONAL JES3 FEATURE

IS NOT ENABLED ON THIS SYSTEM

Parnlib member IFAPRDxx indicates that JES3 is disabled and therefore cannot register as an z/OS element.

System action: JES3 fails to be enabled on this system and abends with a 2FB.

Operator response: Verify that the system is using the correct parmlib member (IFAPRDxx) and that the state (ENABLE or DISABLE) is correct. Once verified, restart JES3.
IAT3045 • IAT3047

Routing Code: 1  Descriptor Code: 2

IAT3045
Explanation:

➤— THIS PROCESSOR IS THE GLOBAL; ➤— START TYPE MUST BE COLD
➤ OR WARM

OR HOT/REFRESH

JES3 previously issued message IAT3041, IAT3042, or IAT3008 to display the acceptable responses to message IAT3011. The operator reply was not one of the acceptable responses.

If COLD only appears in the message, then a reply of C for a cold start is acceptable.

If COLD OR WARM appears in the message, then a reply of W, WA, WR, or WAR for a warm start, or C for a cold start is acceptable.

If COLD OR WARM OR HOT/REFRESH appears in the message, then a reply of HR or HAR for a hot start with refresh; or W, WA, WR, or WAR for a warm start; or C for a cold start is acceptable.

System action: JES3 reissues message IAT3011.

Operator response: If this processor is to be initialized as the global, reply HR, HAR, W, WA, WR, WAR, or C to message IAT3011. Otherwise, reply CANCEL to end JES3. Any other reply will cause message IAT3011 to be reissued.

System programmer response: See message IAT3063.

Problem determination: See Table III, item 6.

Module:

IAT3047
Explanation:

➤— BSC RJP DEVICE— dev_name— ➤— CANNOT BE ADDED DYNAMICALLY

During *MODIFY,CONFIG processing, it was determined that a DEVICE statement that was being added is associated with a BSC RJP workstation. BSC RJP devices cannot be added using the *MODIFY,CONFIG command.

In the message text:

dev_name The name of the BSC RJP device that you attempted to add using the *MODIFY,CONFIG command.

System action: JES3 ignores the DEVICE statement and processing continues.

Operator response: Contact your system programmer to get the list of device names that can be added using the *MODIFY,CONFIG command.

Module:
IAT3048
Explanation:
>>> "L" INVALID,

>>> THIS SYSTEM IS THE GLOBAL PROCESSOR

On the JES3 global processor, the operator has replied L to message IAT3011. The reply should have been H if a hot start was desired.

System action: JES3 reissues message IAT3011.

Operator response: None. This is an informational message.

Problem determination: See Table III, item 6.

Module: See Table III, item 6.

Routing Code: 2,10   Descriptor Code: 4,7

IAT3049
Explanation:
>>> "H" INVALID, THE MAIN NAME OF THIS SYSTEM

>>> DOES NOT MATCH THE PREVIOUS GLOBAL

>>> glblname

The operator replied H to message IAT3011 while initializing a local. The reply should have been L if the intent was to bring this system online in the complex. In the message text:

glblname The name of the previous global.

System action: JES3 reissues message IAT3011. Reply L to bring the main online as a local.

Operator response: None. This is an informational message.

Problem determination: See Table III, item 6.

Module: See Table III, item 6.

Routing Code: 1   Descriptor Code: 7

IAT3050
Explanation:
>>> nnn—DYNAMIC ALLOCATIONS FAILED. ENTER

>>> CONTINUE OR CANCEL.

JES3 failed when it tried to dynamically allocate one or more data sets. The value nnn specifies the number of dynamic allocation tries that failed. Messages IAT3029, IAT3030, and IAT3053 provide more information about the failures.

System action: JES3 waits for an operator response.

Operator response: Contact the system programmer to determine whether to reply CONTINUE or CANCEL. Enter one of the following replies:

CONTINUE JES3 processing continues without the affected data sets.

CANCEL JES3 ends processing.

Programmer response: See messages IAT3029, IAT3030, and IAT3053. If JES3 can continue without the affected data sets, have the operator reply CONTINUE. Otherwise, have the operator reply CANCEL.

Problem determination: See Table III, items 5 and 6.

Module: See Table III, items 5 and 6.

Routing Code: 2,10   Descriptor Code: 4,7

IAT3051
Explanation:
>>> OPEN ABENDED FOR PROCLIB— ddn dsn

Open processing for the indicated procedure library data set has ended.

System action: JES3 attempts to unallocate the data set. If unallocation is not successful, then message IAT3053 will be issued followed by message IAT3030, which details the reason for the failure. Regardless of the outcome of the unallocation attempt, JES3 validity checks the rest of the DYNALLOC statements in the initialization stream.

Operator response: Notify the system programmer.

Programmer response: Correct the conditions that caused the open request to end. You may have to change only the initialization statement, or you may have to make a data set or unit available that was previously not found. Other MVS messages may have
been issued that will help to determine the cause of the failure.

**Problem determination:** See Table III, items 5, 6, and 21.

**Routing Code:** Note 30  **Descriptor Code:** 5

---

**IAT3055**

**Explanation:**

Type=CI FSSDEF statement cannot.

**System action:** JES3 issues message IAT3030 stating the reasons for the failure. The rest of the DYNALLOC statements in the initialization stream are checked for validity.
IAT3056

Explanation:

During *MODIFY,CONFIG processing, an FSSDEF statement for a C/I FSS (TYPE=CI) was detected. JES3 does not allow C/I FSSs to be added using the *MODIFY,CONFIG command.

System action: JES3 ignores the initialization statement. Processing continues.

Operator response: Contact your system programmer.

System programmer response: Do not specify TYPE=CI on any FSSDEF statements that are used with the *MODIFY,CONFIG command.

Module:

IATINFS

Routing Code: Note 30

Descriptor Code: 5

IAT3061

Explanation:

JES3 encountered an error while writing the initialization checkpoint record or the complex status record on the checkpoint data set(s). JES3 can issue this message during JES3 initialization or at JES3 termination. If checkpoint duplexing was being used, the message occurs only if the read or write failed on both checkpoint data sets.

In the message text:

recordtype The type of record that was being read or written. It can be one of the following:

• INITIALIZATION CHECKPOINT RECORD
IAT3062 • IAT3063

- COMPLEX STATUS RECORD
- CHECKPOINT DATA AREA
- DYNALLOC CHECKPOINT RECORD

System action: If this message occurs during initialization, JES3 continues processing. Global hot starts and local starts in the complex might not be possible because initialization data might not be valid or might be unavailable.

If this message is issued during JES3 termination, the CSR is not updated and contains obsolete processor status. Future warm starts should be possible unless there is physical damage to the recording medium.

Operator response: Before ending JES3, reduce the queue backlog as much as possible, particularly if JES3 local processors are in use.

Programmer response: If there are indications of permanent errors, reallocate the CHKPNT data set and cold start the complex.

Problem determination: See "TABLE III" on page 715 item 18; "TABLE V" on page 718 items 5, 6, and 11.

IAT3062

Explanation:

- RESET—sysname—AND REPLY CONTINUE, ————

- OR REPLY CANCEL ————

JES3 has attempted to automatically enforce the state of the active processor, but a system error occurred during this process. Message IAT2063 is also issued describing the nature of the error. This message should not normally appear; messages IAT2061 and IAT2064 should appear instead.

Message IAT3101 was previously issued because a job was found active on a local system. The global was deleting its job number, during a hot start with refresh, during which the OPTIONS, JOBNO range is being changed. This must not be done unless the system on which the job was active is reset.

In the message text:

sysname The system name on which the job was active.

System action: JES3 waits for a reply. If you reply CONTINUE, it is assumed that the system sysname has been reset and no further IAT3101 or IAT3062 messages will be issued for that system if additional active jobs are detected. Any subsequent jobs that are found active on that system are eligible to be deleted. You must reset the system otherwise the active jobs can cause damage to the JES3 spool.

JES3 does not delete the jobs until messages IAT4174 and IAT4133 are issued, so you can still stop the jobs from being deleted by replying TERMINATE to message IAT4174.

Operator response: Notify the system programmer.

System programmer response: If you want to delete the active jobs, reset the system indicated and reply CONTINUE. If you do not want to delete the jobs, reply CANCEL, which will end JES3 initialization. Perform another hot start with refresh using an initialization stream that restores the original job number range.

Refer also to message IAT3063.

</table>

Routing Code: 2,10 Descriptor Code: 4
IAT3067
Explanation:

A DEVICE with DTYPE=SYSMAIN defined but no MAINPROC with the same name has been defined.

System action: The statement is ignored.

Operator response: None

System programmer response: Remove the DEVICE statement from the initialization stream or supply the missing MAINPROC statement. Keep in mind that when you supply the MAINPROC statement, the SYSMAIN device is needed only if you want the initial ON/OFF setting to be different from the default (which is ON to all processors).

Module:

IAT3069
Explanation:

During a hot start with refresh, it was determined that one or more MAINPROC statements were added or deleted in such a way that the sequence of existing MAINPROC statements changed. The main listed in this message is one that would move if this restart were to complete. This change of sequence is not allowed.

In the message text:

main The main processor specified on the NAME parameter of the MAINPROC statement.

System action: JES3 initialization ends.

Operator response: None

System programmer response: Correct the order of the MAINPROC statements and perform another hot start with refresh, or perform a hot start to return to the previous configuration.

Module:

Routing Code: 1    Descriptor Code: 4

IAT3070
Explanation:

The main processor name main that was specified on the JUNIT parameter of a DEVICE statement is not defined in the XUNIT parameter. The main processor names specified in the JUNIT parameter must be a subset of the main processor names in the XUNIT parameter when the device is a shared device (that is, the device used as both a JES3 DSP device and an execution device).

If the system name specified on the JUNIT parameter is *ALL, the system name for the XUNIT parameter must also be *ALL; the XUNIT parameter cannot list system names in this case.

In the message text:

main The main processor name that was specified in the JUNIT parameter of the DEVICE statement.

System action: JES3 ignores the statement. JES3 initialization continues.

Operator response: None

System programmer response: Remove the main processor name from the JUNIT parameter or add it to the XUNIT parameter. If *ALL is specified for the JUNIT main, it must also be specified for the XUNIT main. XUNIT mains cannot be listed when JUNIT specifies *ALL even if the list of systems is complete.

Module:

Routing Code: 1    Descriptor Code: 4

IAT3071
Explanation:

A JUNIT parameter on a DEVICE statement specifies an undefined MAINPROC.

In the message text:

unittype The type of unit being defined, either XUNIT or JUNIT.
The name of the undefined system specified on the XUNIT or JUNIT.

If unitype is JUNIT, the JNAME of the DEVICE statement.

If unitype is XUNIT, the device number associated with the undefined main.

System action: If unitype is JUNIT, the entire DEVICE statement is ignored. Otherwise the device is ignored for the specified main. JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: Change the JUNIT or XUNIT to specify an existing processor or *ALL to indicate all processors.

Routing Code: 1    Descriptor Code: 3,7,11

IAT3073

Explanation:

JES3 issues this message in conjunction with IAT3072 to allow the operator to cancel the wait for the configuration to become available.

There are a few reasons why the configuration might not be available:

- A local processor is in the process of starting and waiting for the operator to respond to message IAT3011. This will prevent a global from performing a hot start with refresh because the local needs only shared access to the configuration while the global requires exclusive access. Before you perform a hot start with refresh, make sure that there are no outstanding IAT3011 messages for local processors.

- An FSS address space is in the process of starting and has requested services from the JES3 global. For example, the FSS address space can be in the process of dynamically allocating a data set, and a request has been sent to the JES3 global to determine if the data set is available to be allocated. This prevents a global from performing a hot start with refresh because the FSS address space needs only shared access to the configuration while the global requires exclusive access.

The FSS address space will not release the configuration until the JES3 global has responded to the request. But the JES3 global can't respond to the request until it completes initialization. In this case, either cancel the FSS address space to allow JES3 to continue, or respond CANCEL to IAT3073 to cancel the hot start with refresh, and then perform a hot start.

In the message text:
The main processor name if this is the JES3 global or a JES3 local address space.

**fssname**
The FSS name if this is an FSS address space.

**asid**
The address space id if this is an FSS address space.

**System action:** JES3 waits for the configuration to become available or for the operator to cancel the request.

**Operator response:** Respond "CANCEL" if you want to cancel the request. For example, during a hot start with refresh of the global processor, if the configuration is not immediately available, instead of waiting you may want to cancel the request and perform a hot start in order to get the global processor up as soon as possible.

**System programmer response:** None

**Module:**

Routing Code: 1  Descriptor Code: 7

**IAT3074**

**Explanation:**

[Diagram: unable to serialize configuration for main FSS fssname ASID asid, ENQ return code rc]

JES3 was unable to serialize the configuration. See Services Reference EDT-IXG for more information on the return codes from the ENQ macro.

In the message text:

**main**
The main processor name if this is the JES3 global or a JES3 local address space.

**fssname**
The FSS name if this is an FSS address space.

**asid**
The address space id if this is an FSS address space.

**rc**
The return code from the ENQ macro.

**System action:** If JES3 issues this message as a result of a *MODIFY,CONFIG command, the requested changes have been made in storage, but the configuration was not updated to reflect those changes. The changes are lost if you restart the JES3 global. If you need to restart the JES3 global, add the changes to your initialization stream and perform a hot start with refresh.

If JES3 issues this message as a result of a JES3 global, local, or FSS address space initialization, initialization ends.

**Operator response:** Provide the ENQ return code to the system programmer.

**System programmer response:** Contact the IBM support center.

**Module:**

Routing Code: 1  Descriptor Code: 12

**IAT3075**

**Explanation:**

[Diagram: FSS fssname cannot be deleted during a hot start with refresh]

JES3 determined that FSS fssname is active, but the FSSDEF and/or DEVICE statements were removed from the initialization stream during a hot start with refresh. You cannot delete an FSS that is active during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

**System action:** JES3 initialization fails.

**Operator response:** Restart JES3 after the system programmer adds the FSSDEF and/or DEVICE statements to the initialization stream.

**System programmer response:** Add the FSSDEF and/or DEVICE statements to the initialization stream.

**Module:**

Routing Code: 1  Descriptor Code: 4

**IAT3076**

**Explanation:**

[Diagram: device devname cannot be added to active FSS]

JES3 determined that device devname cannot be added to an active FSS. This may occur if the device was not previously defined in the initialization stream or if the device is not supported by the current FSS.

**System action:** JES3 initialization fails.

**Operator response:** Contact the system programmer if the device was not defined in the initialization stream. If the device is supported by the current FSS, ensure that the device is correctly defined in the initialization stream.

**System programmer response:** Add the correct definitions for the device to the initialization stream.
One of the following changes were made to the initialization stream used to perform a hot start with refresh:

- A DEVICE statement was added to the initialization stream, and the FSSNAME parameter on the DEVICE statement refers to an FSS that is active.
- The FSSNAME parameter on an existing DEVICE statement in the initialization stream was changed so that it refers to an FSS that is active.

Devices cannot be added to an active FSS during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

In the message text:

- **devname** — The device name on the JUNIT parameter of the DEVICE statement.
- **fssname** — The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:** JES3 initialization fails.

**Operator response:** Restart JES3 after the system programmer corrects the initialization stream.

**System programmer response:** Delete the DEVICE statement from the initialization stream, or change the reference to an active FSS, and reinitialize JES3.

**Module:**

**Routing Code:** 1  **Descriptor Code:** 4

---

One of the following changes were made to the initialization stream used to perform a hot start with refresh:

- A DEVICE statement was deleted from the initialization stream and the FSSNAME parameter on the original DEVICE statement referred to an FSS that is active.
- The FSSNAME parameter on an existing DEVICE statement in the initialization stream was changed. The FSSNAME on the original DEVICE statement referred to an FSS that is active.

During a hot start with refresh, the device number in the JUNIT parameter of the DEVICE statement for an active FSS was changed.

In the message text:

- **devname** — The device name on the JUNIT parameter of the DEVICE statement.
- **fssname** — The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:** JES3 initialization fails.

**Operator response:** If an FSA device was deleted dynamically from the MVS configuration through the HCD facility since the last JES3 restart, perform steps 1 through 5. If this is not the case, skip to step 6.

1. Use the MVS HCD facility to activate the previous IODF configuration (before the devices identified in this message was deleted).
2. Use a hot start to start JES3.
3. Use HCD to activate the required IODF configuration with the devices deleted.
4. Deactivate the FSS.
5. Perform a hot start with Refresh using the initialization stream with the appropriate DEVICE statements deleted.
6. Restart JES3 after the system programmer corrects the initialization stream.

**System programmer response:** Return the DEVICE statement to the initialization stream, or change the FSSNAME parameter to refer to the original FSS.

**Module:**

**Routing Code:** 1  **Descriptor Code:** 4
devname The device name on the JUNIT parameter of the DEVICE statement.

fssname The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:** Message IAT3079 is issued to display the old and new device numbers. JES3 initialization fails.

**Operator response:** Restart JES3 after the system programmer corrects the initialization stream.

**System programmer response:** Change the device number to what it was in the initialization stream when the FSS was started.

**Explanation:**

\[ \begin{align*}
\text{olddevno} & = \text{olddevno} \\
\text{newdevno} & = \text{newdevno}
\end{align*} \]

JES3 issues this message in conjunction with message IAT3078 when the device numbers are changed for a device associated with an active FSS.

In the message text:

- **olddevno** The device number that was in the JUNIT parameter of the DEVICE statement when the FSS was started. If the device is not channel attached, this field is blank.
- **newdevno** The device number that is in the JUNIT parameter of the DEVICE statement in the initialization stream used to perform the hot start with refresh. If the device is not channel attached, this field is blank.

**System action:** JES3 initialization fails.

**Operator response:** Restart JES3 after the system programmer corrects the initialization stream.

**System programmer response:** Change the device number to its original (olddevno) value.

IAT3081

**Explanation:**

\[ \begin{align*}
\text{olddevno} & = \text{olddevno}
\end{align*} \]

A hot start with refresh was performed and JES3 determined that the FSS/FSA checkpoint is down-level. This can occur if you attempt to perform a hot start with refresh after you first migrated to OS/390 Version 2 Release 4 (HJS6604). Before attempting to perform a hot start with refresh, you should first perform a cold, warm, or hot start to reformat the FSS/FSA checkpoint; only thereafter, can you perform a hot start with refresh.

**System action:** JES3 initialization fails.

**Operator response:** Restart JES3 and perform a cold, warm, or hot start.

**System programmer response:** None

**Module:**

Routing Code: 1  Descriptor Code: 4
IAT3082

Explanation:

During a hot start with refresh, one or more main processor names were removed from the JUNIT parameter of the DEVICE statement for an active FSS. One of the main processor names that was removed is the main processor where the FSS is active. This is not allowed during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

In the message text:

devname The device name on the JUNIT parameter of the DEVICE statement.
main The main processor name where the FSS is active.
fsname The FSS name on the FSSNAME parameter of the DEVICE statement.

System action: JES3 initialization fails.

Operator response: Restart JES3 after the system programmer corrects the initialization stream.

System programmer response: Remove the main processor name from the DEVICE statement.

Module:

Routing Code: Note 30  Descriptor Code: 5

IAT3084

Explanation:

This message is issued during any type of JES3 start when the specified module is not found in LPA.

System action: If the module is a required LPA module, JES3 initialization ends with a U001 abend. If the module is not required, JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: Do one of the following:

- Make sure that the module is in linklist concatenation specified in response to message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zzz, and then re-IPL the system.
- Issue the SETPROG LPA,DDD command to add the module to LPA and then restart JES3.

Module:

Routing Code: 1  Descriptor Code: 4

IAT3083

Explanation:

During a *MODIFY,CONFIG command, a main processor name was added to the JUNIT parameter of the DEVICE statement that was not defined in the initialization stream that was used during the last warm or cold start.

Note: If a MAINPROC statement for this main processor name was added to the initialization stream used by the *MODIFY,CONFIG
IAT3085
Explanation:
LPA MODULES

CHANGE: module module module

This message is informational and displays the LPA modules that were changed since JES3 was last started. LPA modules can be changed dynamically by the operator by issuing a SETPROG LPA,ADD command. If JES3 is restarted without IPLing the system, JES3 will detect the new versions of the LPA modules and issue message IAT3085.
On the JES3 global processor, this message appears in the JES3OUT data set only. On JES3 local processors, this message is displayed on the console.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module:

Routing Code: 2  Descriptor Code: 10

IAT3086
Explanation:
NUMDEV USED AMD JNAME EXCEEDS
FOUR CHARACTERS,
SHORTENED TO: pppp

A DEVICE statement with a JNAME was defined with the NUMDEV parameter, but the specified JNAME parameter exceeds the valid JNAME prefix length of four characters.
In the message text:

pppp
The first four characters of the value specified on the JNAME parameter, which will be used as a prefix instead of an actual device name.

System action: JES3 uses the first four characters of the specified JNAME as a prefix to build the actual JNAMEs for all devices defined by this statement.

System programmer response: Correct the JNAME parameter or remove the NUMDEV parameter.
Module:

Routing Code: 2  Descriptor Code: 10

IAT3087
Explanation:
DEVICE IGNORED,
ALL MUST BE ONLY JUNIT/XUNIT MAIN

A DEVICE statement was defined with multiple JUNIT or XUNIT system name specifications, and the system name of *ALL was used in at least one of them. When *ALL is used, it must be the only XUNIT or JUNIT system name specification.

System action: The statement is ignored. JES3 initialization continues.
System programmer response: Correct or remove the DEVICE statement.
Module:

Routing Code: 2  Descriptor Code: 10

IAT3088
Explanation:
stmttype name IGNORED,
PREVIOUSLY DEFINED

An instance of a statement definition has already been defined in the initialization stream. For the purposes of determining statement uniqueness, the following attributes uniquely identify a statement:
• The JNAME on a DEVICE statement.
• The NAME= parameter on an NJERMT statement.
• The NAME= parameter on the NETSERV statement.
• The NAME= parameter on the SOCKET statement.
• When compared with XUNIT and main name, a JUNIT and main name that appear on a different statement from the compared XUNIT and main name.

The following attributes of a DEVICE statement can also cause a duplicate statement even if the duplication was not literally coded:
• Duplicate device numbers can result from a range of devices that are created by using the NUMDEV parameter.
• The same XUNIT and system name were defined on multiple DEVICE statements.
• The same JUNIT and system name were defined on multiple DEVICE statements.
• A JUNIT and system name pair was defined after previously being defined on another statement as an XUNIT and system name pair.
• An XUNIT and system name pair was defined after previously being defined on another statement as a JUNIT and system name pair.
• The XUNIT or JUNIT parameter of one DEVICE statement defines a device or device number with a specific system name and the XUNIT or JUNIT parameter of another DEVICE statement defines the same device number with a system name of *ALL.

In the message text:

stmttype
Indicates the type of statement that is duplicated.

onmain1
If the duplication is a unique statement name, the text is ON MAIN main1 where main1 is the main for which the current definition is being reported in error. If the duplication is a unique statement name, this text is omitted from the message.

onmain2
If the duplication is a unique statement name, the text is ON MAIN main2 where main2 is the main on which the previous occurrence of the device was found. If the duplication is a unique statement name, this text is omitted from the message.

The values main1 and main2 are the same unless one of them is *ALL and the other is a specific name.

System action: If the NUMDEV parameter is specified, the duplicate device is ignored, but the rest of the range is processed and all other devices in the range that are not duplicates and have no other errors are defined. In all cases where a duplicate is detected, the first definition prevails. JES3 initialization continues.

System programmer response: Correct or remove the duplicate statement.

Module: Containing Detecting Issuing

Routing Code: 2 Descriptor Code: 10

IAT3090

Explanation:

An RJPLINE statement incorrectly specifies a system name of *ALL.

System action: The statement is ignored. JES3 initialization continues.

System programmer response: Correct or remove the RJPLINE statement.

Module:

Routing Code: 2 Descriptor Code: 10

IAT3089

Explanation:

An end-of-file condition has occurred on the JES3 initialization statement data set. More statements were expected: The appropriate logical-end-of-initialization statement was not recognized, an ENDJSAM or ENDINISH statement is missing.

System action: When possible, initialization will insert an appropriate statement (which may be ENDJSAM, or ENDINISH) to complete as much checking as possible. If the missing statements cause an error, JES3 initialization ends. If initialization is completed, message IAT3102 states that JES3 failure is likely.

Programmer response: Update the initialization stream member to include the ENDJSAM or ENDINISH statements.

Problem determination: See Table III, items 5, 6, 20, and 21.
IAT3091

Explanation:

```plaintext
•••• INSUFFICIENT STORAGE•••••

•••• FOR JES3 INITIALIZATION•••••
```

, FOR FSS— fsname,— ASID=— asid—

An AGETMAIN macro instruction has been rejected because there is not enough main storage to satisfy the request.

If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name fsname and address space ID asid appear with the message. The absence of this text indicates the failure occurred during JES3 initialization.

System action: JES3 or FSS initialization ends with a DM002 and message IAT3713 is issued. See z/OS JES3 Diagnosis for information on the abend code that is issued with this message. The registers contain the following information. Register 14 contains the return address to the requesting module. Register 15 contains the following information:

**Byte 0**

- XX'02' is on when the BUSY= parameter was specified on the GETMAIN macro.
- XX'01' is on when the BNDRY=PAGE parameter was specified on the GETMAIN macro.

**Byte 1**

- XX'00' LOC=RES. JES3 tried to obtain storage from the same area as the calling program.
- XX'01' LOC=BELOW. JES3 tried to obtain storage from below 16M virtual.
- XX'04' LOC=(RES,ANY). JES3 tried to obtain storage from the same area as the calling program
- XX'05' LOC=(BELOW,ANY). JES3 tried to obtain storage from below the 16m virtual.
- XX'07' LOC=(ANY,ANY) or LOC=ANY. JES3 tried to obtain storage, but there was an inadequate amount.

**Byte 3** contains the subpool number

Operator response: Consult the system programmer. This is probably a system error. However, if it results from an inadequate allocation of CSA, repeat the IPL of the processor. Then message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zzz will be displayed. (See z/OS MVS System Messages, Vol 6 [GOS-IEA] Next, specify a CSA = quantity that is 200K greater than the default amount (the amount specified in SYS1.PARMLIB, IEASYS00), or 600K, whichever is larger. Then reinitialize JES3.

**Problem determination:** See Table III, items 2, 5, 6, and 21.

IAT3099

Explanation:

- **newproc—IS NOT DEFINED,**
- **-COLD OR WARM START HERE OR**
- **-HOT START WITH REFRESH ON-globproc**
- **-REQUIRED**

JES3 has been started on a processor that was not previously defined. An undefined processor requires a cold or warm start to define itself and become a global. An undefined processor can be defined and become a local by a hot start with refresh on the current global.

In the message text:

- \( newproc \): The processor that is initializing, and that is currently not known to JES3.
globproc The name of the currently active global.

System action: JES3 issues message IAT2061 and IAT2064 requiring you to reset the current global.

Operator response: If you want the new processor to become the global, reset the current global and any other processors in the complex and perform a cold or warm start. If you want to avoid re-IPLing these processors, reply CANCEL. JES3 will end on the initializing processor.

System programmer response: To define the new processor, create an initialization stream containing a MAINPROC initialization statement for the new processors and reference this MAINPROC on any other required statements. Then perform a hot start with refresh on the global using the new initialization stream.

Module:

Routing Code: 2 Descriptor Code: 4, 7

IAT3100

Explanation:

>>> JES3 z v rr m SYSTEM COLD
 warmth HOT LOCAL

JES3 has completed initialization. The program level is indicated, where v rr m represents the JES3 release level. If a global initialization was performed, the start type (hot, warm, or cold) is indicated, or a local start is indicated. The Julian date is indicated by yyyy ddd, and the initialization-assigned name of this processor by main.

System action: If this is the global system, a wait is entered. If this is a local system, global communication will commence when this processor is varied online at the global.

Operator response: If this is the global system, issue the *S,JSS command after any V, *SWITCH, *MODIFY,...J, or *X commands have been entered. If this is a local system, all system control is directed by the global system.

Module:

Routing Code: 1,10 Descriptor Code: 4, 7

IAT3102

Explanation:

>> POSSIBLE IMPACT OF FUNCTION

ERROR(S) LIKELY TO FAIL JES3
CATASTROPHIC ERRORS WERE DETECTED DURING INITIALIZATION,
SEE JES3OUT
Errors were detected before JES3 initialization was complete. The JES3OUT data set contains the message describing the errors.

System action: If the errors will not disrupt a JES3 function, this warning is issued and JES3 continues initialization processing. If the errors make further execution impossible, JES3 ends with a dump. If JES3 continues initialization processing, message IAT3100 is issued next.

Operator response: Notify the system programmer.

System programmer response: Review the JES3OUT listing. Change the initialization stream to eliminate the errors listed during JES3 initialization. Restart JES3 to ensure that the changes in the initialization stream take effect.

Problem determination: See Table III, items 5, 6, and 21.

Module: Detecting Issuing
IATINJB IATINJB IATINJB

Routing Code: 42 Descriptor Code: 7

IAT3103

Explanation:

JES3 has detected that a function used in a higher JES3 release is not supported at the current JES3 release. For example, a large job number range was defined and an attempt was made to fall back using a hot start without refresh to a release that does not support that range.

System action: JES3 fails with a DM025.

Operator response: Notify the system programmer.

System programmer response: If the initialization stream used by the higher JES3 release contains a definition that would not be supported in the current JES3 release, correct the parameter to specify a value that is supported in the current JES3 release and perform a hot start with refresh or a warm start, depending on the individual parameter's restart requirement. Or, bring up the higher JES3 release again to continue using the function.

You can determine whether the current release would allow the function by performing a hot start with refresh with the initialization stream containing the parameter definition in question, or by running IATUTIS. In either case a syntax error message will be written to JES3OUT if the parameter is not supported.

Module: Detecting Issuing
IATINJQ IATINJQ IATINJQ

Routing Code: 1 Descriptor Code: 4

IAT3105

Explanation:

During JES3 initialization or connect processing, JES3 was attempting to build an information string for the subsystem version information SSI call (SSI function code 54). The string could not be built because the length supplied by IATUX63 in field YUX63LNR was not valid. It was either zero or a value greater than the maximum length allowed (2048 bytes in size).

System action: JES3 initialization continues. The SSI routine will operate without the information string.

Operator response: Notify the system programmer. If the reason text indicates that the installation string length is not valid, then installation exit IATUX63 should be examined to ensure that the string is built correctly.

IAT3113
Explanation:

An error occurred while JES3 was attempting to connect to WLM through the IWMCONN macro. The return and reason codes from the IWMCOMM macro are displayed in the message.

System action:

Operator response: Contact the system programmer.

Programmer response: Programmer Response: Use the return and reason codes from the IWMCONN macro, which is described in "z/OS MVS Programming: Workload Management Services", to determine the cause of the error.

Module:

Routing Code: 1     Descriptor Code: 4

IAT3115
Explanation:

Initialization of the JES3 WLM batch initiator function was unsuccessful. This message is typically proceeded by message IAT2014, IAT3113, IAT4083, or IAT4084 or a failure in module IATINWLM.

System action: JES3 initialization continues, but the WLM batch initiator function for JES3 is disabled. No WLM managed initiators will be started and any job class groups that are defined as WLM managed will be changed to JES managed.

IAT3114
Explanation:

An error occurred while JES3 was attempting to establish an Event Notification Facility (ENF) listen exit through the ENFREQ macro for the specified event. The return code from the ENFREQ macro is displayed in the message.

System action: JES3 initialization continues but JES3 will not be notified for the specified event. The following list of events describe what happens if JES3 is not notified:

- WLM POLICY CHANGES - A new WLM policy was activated, for example, through the V WLM,POLICY= command. If the WLM classification rules were changed, and a new WLM service service definition was installed before activating the new policy, jobs will be reclassified (i.e. assigned a service class) to advantage of the new classification rules. If JES3 is not notified when this event occurs, jobs will not be reclassified until they are selected for execution.

- SWITCH TO WLM GOAL MODE - WLM was switched to goal mode on a system through the MODIFY WLM,MODE=GOAL command. When WLM is switched to goal mode on a system, all jobs in execution are reclassified based on the current WLM policy. If JES3 is not notified when this event occurs, JES3 will not update its own control blocks to reflect the service class that was assigned to each job. As a result, JES3 inquiry commands (e.g. *I,J=jobno,X) will not show the same service class that is assigned to a particular job as the MVS D A,jobname command.

- RESET JOB COMMAND - The MVS RESET command can be used to change a job's service class while it is in execution. If JES3 is not notified when this event occurs, JES3 will not update its own control blocks to reflect the new service class that was assigned to the job. As a result, JES3 inquiry commands (e.g. *I,J=jobno,X) will not show the same service class that is assigned to the job as the MVS D A,jobname command.

Operator response: Contact the system programmer.

Programmer response: Use the return code from the ENFREQ macro, which is described in "z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG" to determine the cause of the error.

IAT3121

Explanation:

\(\text{TRACK/FORMAT CARD NOT FOUND IN}\)

\(\text{INISH DECK}\)

At least one TRACK or FORMAT statement is required for JES3 initialization, and none was found.

System action: JES3 initialization ends after all JES3 spool data management statements have been checked.

Programmer response: Insert the TRACK or FORMAT statement and reinitialize JES3. See z/OS JES3 Initialization and Tuning Reference for a description of the statements.

Problem determination: See Table III, item 5.

Module: IATINIC

Routing Code: Note 19

Descriptor Code: –

IAT3122

Explanation:

\(\text{JESABEND DATA SET WOULD NOT OPEN}\)

\(\text{FSS} fssname \text{ ASID=} asid\)

The JESABEND data set failed to open properly. If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name \(fssname\) and address space ID \(asid\) appear with the message. The absence of this text indicates the failure occurred during JES3 initialization.

System action: JES3 or FSS initialization continues; however, the JES3 or FSS formatted portions of storage dumps will not be available.

Operator response: Notify your system programmer.

Programmer response: Verify that a valid JESABEND DD statement is included in the JES3 or FSS procedure.

Problem determination: See Table III, items 20 and 21.

Module: IATINIC

Routing Code: Note 19

Descriptor Code: –

IAT3123

Explanation:

\(\text{JES3 relid}\)

\(\text{COLDSTART} / \text{WARMSTART} / \text{ANALYSIS}\)

\(\text{DATE=} yyyy.ddd \text{ TIME=} hh.mm.ss\)

\(\text{CPU=} main/cpuid\)

This is the header message on the JES3OUT data set that precedes the listing of the initialization statements. Information includes: JES3 version and level \(relid\), the type of start specified by the operator, the Julian date, the time of day, and processor identification.

Although no initialization statements are read or printed during a hot start, JES3 might produce diagnostic messages. If there are none, this will be the only message directed to JES3OUT. In JES3 local starts, all messages are directed to the operator's console; JES3OUT is not used.

System action: JES3 initialization continues.
IAT3124  IAT3127

Operator response: None. This is an informational message.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3124

Explanation:

The DDNAME parameter on this TRACK or FORMAT statement duplicates a previously submitted name. Each ddname must be uniquely described.

System action: JES3 initialization ends after all JES3 spool data management statements have been checked.

Programmer response: Remove multiple ddname definitions.

Problem determination: See Table III, item 5.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3125

Explanation:

The user is warned that the value specified in the SE parameter of the OPTIONS statement exceeds the maximum possible, based on the current JES3 buffer size. The buffer size limits the number of JDAB SEs that can be built by input service. The value (decimal) indicated in the message will be used by the system.

System action: JES3 initialization continues.

Programmer response: If the SE parameter specified on the OPTIONS statement is mandatory for successful system utilization, increase the system BUFSIZE on the BUFFER statement.

Problem determination: See Table III, items 5, 6, 7, and 11.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3126

Explanation:

The specified parameter, DEF=YES or INIT=YES, is specified on two SPART statements.

System action: JES3 ignores the specified parameters on all SPART statements beyond the first statement on which the parameter was found.

Programmer response: Correct the SPART statement that is in error. The SPART statement in error appears immediately before this message.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3127

Explanation:

A SPART statement specified an incorrect name as a subparameter of the NAME parameter. The names DELETED, DRAINED, UNAVAIL, YES, or NO are not allowed. If the name is more than 8 characters long or the first character is numeric, the name is incorrect.

System action: JES3 initialization ends.

Programmer response: Correct the SPART statement that is in error (it appears immediately before this message) and then restart JES3.

Problem determination: See Table III, items 5 and 6.

Module:
IAT3128
Explanation:

Two SPART statements specify the same spool partition name.

System action: JES3 initialization ends.

Programmer response: Change the spool partition name on one of the two SPART statements, and then restart JES3.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: 2  Descriptor Code: 7

IAT3129
Explanation:

The value specified for the GRPSZ= parameter on the SPART or BUFFER initialization statement is outside of the acceptable range of 1 to 999.

System action: JES3 initialization ends.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the GRPSZ parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:

Routing Code: 2  Descriptor Code: 7

IAT3130
Explanation:

The minimum value specified for the SPLIM= parameter on the SPART or BUFFER initialization statement is larger than the marginal value specified.

System action: JES3 initialization ends.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the SPLIM parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:

Routing Code: 2  Descriptor Code: 7

IAT3131
Explanation:

The minimum value specified for the SPLIM= parameter on the SPART or BUFFER initialization statement is outside of the acceptable range of 0 to 99.

System action: If the error was on the BUFFER initialization statement, the system default values of SPLIM=(10,25) are used; if the error was on an SPART initialization statement, the SPLIM values associated with the BUFFER statement are assigned to the partition.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the SPLIM parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:
One type of JES3 initialization statement is intended to make cross-reference to another type of JES3 initialization statement. However, the statement that is made cross-reference to is either not found or is defined in such a way that the cross-reference is disallowed. For example, a SOCKET statement specifies a NODE= parameter but the specified node was not defined with TYPE=TCP/IP; then the cross-reference is disallowed.

In the message text:

- **xstmt**: The statement type that is made cross-reference to.
- **xname**: The statement name that is made cross-reference to.
- **stmt**: The current statement type.
- **name**: The current statement name.
- **errtext**: Reason text identifying the error.

**System action**: The statement that makes the cross-reference is allowed and JES3 initialization continues; however, the statement that is made cross-reference to is ignored.

**Operator response**: Notify the system programmer.

**System programmer response**: Correct the statement during the next hot start with refresh, warm start, or cold start. If the structure defined by the statement that is made cross-reference to is modifiable, you can use the *MODIFY command to supply the correct parameter in the meantime.

---

Device (for example, a BSC NJE printer or sender). Because a NETSERV definition also results in a system generated device, the two devices cannot exist with the same name. JES3 therefore must reject the NETSERV definition because the device is more critical to JES3 function.

2. During *MODIFY,CONFIG processing, a dynamically added printer has the same name as a previously existing NETSERV definition. Because a NETSERV definition is internally represented as a system generated device, the dynamically defined printer is rejected because the NETSERV already exists.

Unlike the previous condition, a system generated device is never created during *MODIFY,CONFIG processing.

In the message text:

- **name**: The name that is defined as both a DEVICE and NETSERV.
- **stmttype**: The type of statement that is ignored (DEVICE or NETSERV).

**System action**: During a cold start, warm start, or hot start with refresh, the NETSERV statement is ignored, even if it appears before the current statement. JES3 initialization continues. During *MODIFY,CONFIG processing, the device is ignored.

**Operator response**: Notify the system programmer.

**System programmer response**: If this is a JES3 restart, correct either the NETSERV or DEVICE statement during the next cold start, warm start, or hot start with refresh. If this is *MODIFY,CONFIG, correct the DEVICE statement.

---

The JES3 spool buffer size specified was different from that used during the previous JES3 cold start. The current JES3 start type is warm or hot start with refresh; the buffer size may be modified only during a cold start.
**System action:**  JES3 initialization continues, using buffer size \textit{nnnn}.  

**Programmer response:**  Change the BUFSZ parameter of the BUFFER initialization statement to the value \textit{nnnn} before the next JES3 cold start. 

**Module:**  

**Routing Code:** Note 19  
**Descriptor Code:** –

\begin{verbatim}
IAT3135
Explanation:

\begin{itemize}
\item \texttt{DSI HAS NOT COMPLETED}
\item FIRST START GLOBAL ON \texttt{glbname}
\end{itemize}

The operator either requested a local start after a DSI before the global came up, or requested a hotstart on a processor that was intended as the new global during a preceding DSI. \texttt{glbname} is the name of the global.

**System action:**  JES3 terminates. 

**Operator response:**  None. This is an informational message.

**Programmer response:**  None.

**Module:**  

**Routing Code:** 2, 10  
**Descriptor Code:** 4, 7
\end{verbatim}

\begin{verbatim}
IAT3136
Explanation:

\begin{itemize}
\item CHANGE IN NUMBER OF
\item SCHEDULER ELEMENTS (SE=) NOT
\item ALLOWED, CHECKPOINTED VALUE OF \texttt{nn} USED
\end{itemize}

The maximum number of JCT scheduler elements specified was different from that used during the previous JES3 cold start. The current JES3 start type is warm or hot/refresh. The number of scheduler elements may be modified only during a cold start.

**System action:**  JES3 initialization continues with a maximum of \texttt{nn} scheduler elements.

**Programmer response:**  Change the SE parameter of the OPTIONS initialization statement to the value \texttt{nn} before the next JES3 cold start.

**Module:**

**Routing Code:**  
**Descriptor Code:**  

\begin{verbatim}
IAT3138
Explanation:

\begin{itemize}
\item \texttt{keyword} KEYWORD ALREADY SPECIFIED
\end{itemize}

This is a warning message. It indicates a keyword has been specified more than once on the same initialization statement. This message is issued for the keyword \texttt{XCFGRPNM=} on the OPTIONS initialization statement. This message is also issued when the LIMIT or INTERVAL parameters are specified more than once.

**System action:**  JES3 initialization continues. JES3 will use the value specified on the last instance of the keyword on the initialization statement.

**Programmer response:**  None required, however, the system programmer should determine which instance of the keyword is correct and delete any duplicate instances of the keyword on the initialization statement.

**Module:**

Chapter 6. Initialization Messages  99
IAT3139

Explanation:

- INVALID
- DUPLICATE
- PARAMETER SPECIFIED -- parm

The operator's reply to message IAT3146 specified an incorrect or duplicate job number or job name. An incorrect job number or job name may have contained more than eight characters. In the message text, parm identifies the job number or job name in error.

System action: JES3 finishes processing the job numbers or job names that were correctly entered in reply to IAT3146 and then reissues message IAT3146.

Operator response: None. The following message (IAT3146) will direct operator action. The operator can enter the correct job number or job name or END.

Module:

Routing Code: 2      Descriptor Code: 7

IAT3145

Explanation:

- THE--keyword--VALUE OF--value
- IS NEITHER YES NOR NO, NO ASSUMED

The keyword value, if specified, must be either YES or NO but some other keyword value was specified. In the message:

- value   The value that was defined.

System action: The keyword value is assumed to be NO. JES3 initialization continues.

Operator response: None.

System programmer response: None.

Module:

Routing Code: Hardcopy      Descriptor Code: 5

IAT3146

Explanation:

- ENTER JOB NUMBER OR JOB NAME
- OF JOBS TO BE PURGED PRIOR TO
- ANALYSIS (JOB NUMBER, JOB NAME, OR END)

The JES3 operator has restarted JES3 and has specified HA, HAR, WA, or WAR as the restart mode. This message allows the operator to cancel one or more jobs before JES3 looks for control blocks that contain incorrect data and are associated with jobs in the job queue.

System action: JES3 cancels the specified jobs.

Operator response: Enter the job number or job name of each job that you want to cancel. You can enter the job numbers or job names in any order and in any combination always separated by a blank or a comma. After specifying all of the jobs that JES3 is to cancel, enter END. If you do not want to cancel any jobs at this time, enter END. Enter your response in the following format:
If you incorrectly enter a job number or job name, JES3 reissues this message. If this happens, enter the correct job number or job name, or specify END.

If message IAT3139 precedes this message, you have entered an incorrect or duplicate job number or job name (identified by parameter in message IAT3139). Enter the correct job number or job name or enter END.

**Module:**

**IATINAL**

**Routing Code:** 1  
**Descriptor Code:** 7

---

**IAT3148**

**Explanation:**

The sum of total transmitters (sum of job transmitters and SYSOUT transmitters) or receivers (sum of job receivers and SYSOUT receivers) cannot exceed 8.

**System action:** The values for both keywords appearing in the message take the default value 1. JES3 initialization continues.

**Operator response:** None.

**System programmer response:** None.

**Module:**

**IATINAL**

**Routing Code:** 1  
**Descriptor Code:** 7

---

**IAT3152**

**Explanation:**

This is a warning message. It indicates a keyword has been specified which exceeds the length restriction for the specified keyword in the message. This message is issued for the keyword XCFGRPNM= on the OPTIONS initialization statement.

**System action:** JES3 initialization continues. JES3 will use the default value for the keyword specified.

**Programmer response:** None required, however, the system programmer should correct the parameter specified on the indicated keyword so that it conforms to the parameter length restriction as well as any other fields.

**Module:**

**IATINAL**

**Routing Code:** 1  
**Descriptor Code:** 7

---

**IAT3154**

**Explanation:**

This is a warning message. It indicates an incorrect character was specified in the parameter for the indicated keyword. The naming conventions support alphabetic, numeric and standard symbols (@,#,$). A character other than those supported was specified in the parameter. This message is issued for the keyword.

**System action:** JES3 initialization continues without the affected data and/or jobs.

**Operator response:** None.

**System programmer response:** None.

**Module:**

**IATINAL**
XCFGRPNM= on the OPTIONS initialization statement.

**System action:** JES3 initialization continues. JES3 will use the default value for the keyword specified.

**Programmer response:** None required, however, the system programmer should correct the parameter specified on the indicated keyword so that it conforms to the naming convention as well as any other restrictions.

**Module:**
- **IATINIC**
- **IATINIC**
- **IATINIC**

---

**IAT3155**

**Explanation:**

- SPOOL DATA INTEGRITY

- CHECKING IS ACTIVE; DO YOU WANT

- TO TURN IT OFF? (OFF OR CONTINUE)

This message is issued when the operator requested a Hotstart with Analysis (HA in response to message IAT3011) and Spool Data Integrity (SDI) checking is active. The message allows the operator to turn SDI checking off.

**System action:** JES3 waits for an operator response.

**Operator response:** If abends DM760 have preceded the hotstart, you should consider replying OFF. Otherwise reply CONTINUE.

**Programmer response:** Analyze any DM760 dumps to determine their cause. SDI should be turned on as soon as possible to eliminate any potential for spool corruption.

**Module:**
- **IATINIC**
- **IATINIC**
- **IATINIC**

---

**IAT3156**

**Explanation:**

- SPOOL OR JCT ALLOCATION FAILED. ENTER

- RETRY OR CANCEL

A dynamic allocation for a JCT data or a dynamic allocation of a SPOOL data set has failed on a local processor. This message was preceded by messages IAT3029 and IAT3030, which identify the data set and the reasons for the failure.

**System action:** JES3 waits for an operator response.

**Operator response:** Contact the system programmer to determine whether to attempt to correct the problem and reply RETRY, or to reply CANCEL. Enter one of the following replies:

- **RETRY**
  - JES3 attempts the allocation again.

- **CANCEL**
  - JES3 ends processing.

**System programmer response:** See messages IAT3029 and IAT3030. Perform either of the following tasks:

- If the problem can be corrected immediately, have the operator correct the problem and reply RETRY. For example, you are able to correct the problem by only varying a device online period.

- If the problem cannot be corrected immediately, have the operator reply CANCEL, and correct the condition that caused the allocation to fail. For example, you have to make changes to the JES3 initialization stream.

**Module:**
- **IATINIC**
- **IATINIC**
- **IATINIC**

---

**IAT3157**

**Explanation:**

- DEVICE—devname—FOR FSS—fssname

- IS NO LONGER VALID

An FSA device entry was found in the FSA checkpoint but not in the FSA tables while the tables were being rebuilt. The FSA device might have been dynamically deleted from the MVS configuration through the HCD facility. Devices should not be deleted from an FSS during a hot start; however JES3 will tolerate this condition until a hot start with refresh can be scheduled to delete the device from JES3.

In the message text:

- **devname**
  - The device name on the JNAME parameter of the DEVICE statement.

- **fssname**
  - The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:** JES3 initialization continues.

**Operator response:** If the FSS is not active, perform a hot start with refresh after the system programmer corrects the initialization stream.

If the FSS is active, JES3 does not allow a configuration to be activated if that configuration deletes the device or
changes it from static to dynamic, so this message should not appear.

System programmer response: Remove the DEVICE statements for the deleted devices from the JES3 initialization stream.

IAT3158

Explanation:

TCP INTERNAL MODIFY ERROR(S) WERE DETECTED.
errtotal—ERROR(S) WERE LOGGED

During a restart of JES3, JES3 attempted to restore various pieces of the checkpoint information about TCP/IP NJE definitions to the configuration made by the initialization statements. Some of the restore attempts were not successful. These errors resulted in additional messages being written to SYSLOG. This is a summary message to indicate to the operator the presence of the other messages, and the number of errors that were detected.

In the message text:

errtotal  The number of errors that were detected.

System action: JES3 initialization continues; however, some of the changes made by modify commands prior to the restart have been lost. JES3 uses the definitions made by the initialization statements.

Operator response: Examine the SYSLOG for messages IAT8161, IAT8163, IAT8164, IAT8165, IAT8166, and IAT8464 to determine the exact error(s) that occurred. Report these to the system programmer.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Routing Code: 2      Descriptor Code: 7
IAT3161

Explanation:

The initialization stream does not contain a MAINPROC statement. At least one is required.

System action: JES3 initialization ends.

Programmer response: Supply a MAINPROC statement. (See z/OS JES3 Initialization and Tuning Reference for additional information.)

Problem determination: See Table III, item 5.

Module:

Routing Code: 2 Descriptor Code: 7

IAT3163

Explanation:

If RMTxxxx appears in the message, a DEVICE statement with DTYPE=RMTxxxx has been found in the initialization stream, where xxxx is a remote card reader. The RMTxxxx parameter can only be one of the following: 1403, 3211, 3203, or 2540.

If CNSxxxx appears in the message, a DEVICE statement with DTYPE=CNSxxxx has been found in the initialization stream. This type of initialization statement is no longer supported by JES3.

System action: The DEVICE statement is ignored. JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: If RMTxxxx appears in the message, correct the initialization statements.

If CNSxxxx appears in the message, when you are sure that you will not need to migrate back to a level of JES3 where this statement is supported, you should remove the statement from the initialization stream.

Module:

Routing Code: Note 19 Descriptor Code: –

IAT3164

Explanation:

The specified main from the SYSTEM keyword of the FSSDEF statement has not been defined on a MAINPROC statement.

System action: The FSS is marked as unusable and initialization processing continues.

Programmer response: Correct the FSSDEF initialization statement.

Module:

Routing Code: Note 19 Descriptor Code: –

IAT3165

Explanation:

Two or more FSSDEF statements, or an FSSDEF statement with a TYPE=CI and a DEVICE statement, have the same functional subsystem name fssname.

System action: The current FSS definition replaces the previous entry.

Programmer response: Correct the appropriate initialization statements.

Module:

Routing Code: Note 19 Descriptor Code: –
The output writer device `devname` is not attached to any system in the complex.

**System action:** Functional subsystem (FSS) `fssname` is marked as unusable and initialization processing continues.

<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINFS</td>
<td>IATINFS</td>
<td>IATINFS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  **Descriptor Code:** –
The definition of the specified device is incompatible with the definition of the corresponding output writer FSS. The reason text for the incompatibility is one of the following:

**COMP MODE REQUIRE GLOBAL ATTACHMENT**
Compatibility mode requires that the device be attached to the global processor; this device has no such attachment.

**FSS MODE REQUIRE ATTACHMENT TO main**
FSS mode requires that the device be attached to the processor where the FSS is assigned to run, specified by main; this device has no attachment to processor main.

**FSS fssname HAS NO ASSIGNED SYSTEM**
FSS mode has been specified for the device, but the assigned FSS fssname is unusable or has not been assigned a processor on which to run in conjunction with the current global processor.

**System action:** The device is marked offline.

**Operator response:** Use the *MODIFY,F command to correct the device mode specification or the FSS processor assignments. Use the *MODIFY,V command to vary the device online.

**Programmer response:** Change either the DEVICE statement or the FSSDEF statement to remove the incompatibility and recall the writer.

An odd number of names (3 or more) has been supplied on the SYSTEM= keyword of the FSSDEF initialization statement.

**System action:** JES3 ignores all values specified on the SYSTEM= keyword and substitutes system assigned defaults based on the type of FSS (C/I or writer).

**Programmer response:** Correct the FSSDEF statement.

System main appears more than once as a potential global processor in the SYSTEM= operand on the FSSDEF statement for FSS fssname.

**System action:** JES3 ignores the FSSNAME or MODE parameter and continues initialization.

**Programmer response:** At the next restart, correct the DEVICE initialization statement. Either change the DTYPE parameter to specify a device eligible to be supported by an FSS or remove the FSSNAME or MODE parameter.
**System action:** The last system assignment overrides the previous one.

**Programmer response:** Correct the FSSDEF statement.

**Routing Code:** Note 19  
**Descriptor Code:** –

---

**IAT3175**

**Explanation:**

- **ERROR FSS/FSA CHECKPOINT**  
- **REASON=reason text**
- **NEW CHECKPOINT BUILT**

During a JES3 hot start or hot start with refresh, an error occurred in FSS/FSA checkpoint (FCK) processing. Either the format of the existing checkpoint is incorrect, or a permanent I/O error occurred during the reading of the existing checkpoint.

If the format of the existing checkpoint is incorrect, JES3 also provides an error reason code (in hex) as follows:

- **01** The FCK low value in the first buffer is incorrect.
- **02** The FCK low value is less than the FCK high value from the previous FCK buffer.
- **03** The FCK high value is less than the FCK low value in the current buffer.
- **04** The FCK variable length is incorrect in an FCK entry.
- **05** End-of-data occurred while processing the FSA FCK entries associated with an FSS FCK entry.
- **06** The middle or end of split record flags are not on in an FCK continuation buffer.
- **07** Both the middle and end of split record flags are on in an FCK continuation buffer.
- **08** The FCK low value in an FCK continuation buffer is incorrect.
- **09** The middle and end of split record flags are not off in an FCK buffer that is supposed to start with an FSS FCK entry.
- **0A** The FCK low value is incorrect in an FCK buffer that is supposed to start with an FSS FCK entry.
- **0B** During a hot start, the FCK high value in the last buffer was not equal to the number of FSSs defined.
- **0C** The FCK fixed length is incorrect in an FCK buffer.
- **0D** The FCK total length points past the end of the FCK buffer.
- **0E** When you add the FCK total length to the address of the beginning of the FCK buffer, that location is not an FCK buffer terminator.

**System action:** JES3 builds a new FSS/FSA checkpoint and cancels each active FSS address space when the system where it is running connects to the JES3 global.

**Operator response:** After each FSS address space ends, restart the FSS.

- FOR DEVICE TYPE— devtype— IS AMBIGUOUS—
- USE DEVICE NAME— devname—

The assignment of device number dev, described in message IAT3176, has caused two or more JES3 global devices including the one described in this message, to have the same device number.

System action: JES3 rejects any operator command that attempts to use device number dev.

Operator response: Any command that uses this device must use the indicated device name devname.

IAT3178

Explanation:

- IPL REQUIRED ON SYSTEM— system—
- INITIALIZATION STREAM MISMATCH DETECTED—

SYSTEM system is initialized using an initialization stream that does not match that currently in use by the global. Likely, you either started the local before the global completed initialization processing or you performed a cold- or warmstart without IPLing the local. JES3 requires that you IPL all processors in the JES3 complex for either a cold- or warmstart.

System action: JES3 initialization ends.

Operator response: IPL system system and restart JES3 on that system.

Programmer response: None.

IAT3179

Explanation:

- IAT3179 stmt STATEMENT—
- keyword KEYWORD—
- TO BE REMOVED IN A FUTURE JES3 RELEASE—

JES3 has detected the use of a statement or a keyword within a statement that is going to be removed in a future JES3 release.

In the message text:

STMT The name of the statement
KEYWORD The name of the keyword

System action: JES3 initialization continues. The statement, the keyword, or both continue to be honored in this JES3 release.

Operator response: Notify the system programmer.

Programmer response: Remove the keyword or statement from the initialization stream at your earliest convenience and restart JES3 to pick up the change (hot start with refresh or warm start, as required by the keyword or statement in question).

IAT3180

Explanation:

- JOB— jobname (jobid)— PUT IN HOLD—
- CLASS— class— NOT DEFINED—
- FSID— fsid— NOT DEFINED—
- main— NOT DEFINED—
- CI DRIVER NOT INITIALIZED—
- PROCLIB RESTART UNSUCCESSFUL—
- EXRESC group ON main NOT DEFINED—

This message is issued after a hot start or warm start is performed on the JES3 global. Initialization is complete, and restart processing is being performed to setup the environment that existed before JES3 ends (for
example, jobs that are active in the MAIN scheduler element). If an error occurs, restart processing is bypassed for the job:

**CLASS=class NOT DEFINED**

The job is active in the MAIN scheduler element. The class information is not in the job class table. Restart of the job is bypassed because MDS and GMS require class information to schedule jobs.

**FSID=fsid NOT DEFINED**

When a job is scheduled for converter/interpreter (C/I) processing to a functional subsystem (FSS) address space, the FSS's FSID is put into the JCT. If the FSID is incorrect, JES3 cannot determine where the job is currently. The job is marked active so that it cannot be rescheduled for C/I until the system is warm started. If the job was allowed to be rescheduled, it is possible to have it active in C/I in two address spaces.

**main NOT DEFINED**

Before restart, the initialization statement, specifying the name of the main, was changed.

**CI DRIVER NOT INITIALIZED**

The CI driver FCT was not setup by JES3 initialization (messages IAT3120, IAT3527, and/or IAT3528 indicate the reason) and there are jobs active in C/I in FSS address spaces. The CI driver controls all work returning from the C/I FSS address spaces, including jobs which have completed MVS C/I and prescan. The job is marked active and the job waits until the CI driver is initialized, or the system is warm started.

**PROCLIB RESTART UNSUCCESSFUL**

An error has occurred during proclib restart processing. A proclib restart is required for a proclib update job, if it had completed the DISABLE scheduler element, but not the ENABLE scheduler element before JES3 was restarted. The proclibs that the job updates are held for update and unallocated in the JES3 address space. This is done to prevent jobs that use these proclibs, from being scheduled for C/I while they are being updated. Proclib restart is unsuccessful if module IATIIPC encounters an error.

**EXRESC group ON main NOT DEFINED**

The job is active in the main scheduler element. The EXRESC definition for the group and main is not defined. Restart of the job is bypassed because GMS requires EXRESC information to schedule jobs.

**System action:** JES3 puts the job in hold and processes the next job.

**Operator response:** Notify the system programmer.

**Programmer response:** The type of response depends on the type of error, and the status of the job:

**CLASS=class NOT DEFINED**

When this occurs, all MDS restart is also bypassed. If the job is currently executing on main (hot start only), it may be using JES3 managed devices, etc. The job should be canceled or the system should be restarted so that the devices are not re-allocated to another job. This is not a problem if the job is not executing, or if JES3 has been warm started. However, the job remains in operator hold until the system is restarted, and the class is defined.

**main NOT DEFINED**

The job remains in operator hold until the system is restarted and the main is defined in the initialization stream.

**FSID=fsid IS INVALID**

In order to have the job rescheduled for C/I, JES3 must be warm started. Since a warm start requires an IPL of all the processors, no CI FSSs can be active and processing jobs. JES3 initialization clears the FSS ID in the JCT during a warm start.

**CI DRIVER NOT INITIALIZED**

To prevent jobs hanging in C/I, the system should be restarted and the CI driver initialized after main connect processing has occurred. The reason is that during main connect processing, a STOP FSS ORDER is sent to each FSS that is active, and is not being controlled by an FCT. When the FSS ends, all status indicators for the FSS are reset. If the system is restarted again, jobs being processed by the FSS address space will look as if they are still active in C/I, even though the FSS has ended.

**PROCLIB RESTART UNSUCCESSFUL**

Since restart was unsuccessful, jobs may be scheduled for C/I which use the proclib that the job is updating. If the job is active in the MAIN scheduler element, it should be canceled. This is not a problem if the MAIN scheduler element is complete, since the job is no longer updating the proclibs.

**EXRESC group ON main NOT DEFINED**

When this occurs, all MDS restart is also bypassed. If the job is currently executing on main (hot start only), it may be using JES3 managed devices, etc. The job should be canceled or the system should be restarted so that the devices are not re-allocated to another job. This is not a problem if the job is not executing, or if JES3 has been warm started. However, the job remains in operator hold until the system is restarted, and the indicated main (or *ALL) is defined to the group as an EXRESC.

**Routing Code:**  **Descriptor Code:** 7
For channel attached devices, a device number must be specified for every main included on the JUNIT parameter of the DEVICE initialization statement. For non-channel attached devices, device numbers must be omitted for every main included on the JUNIT parameter of the DEVICE initialization statement.

If **SPECIFICATION OF** `dev` appears as the variable-text, the JUNIT keyword list of the DEVICE initialization statement indicates that a device number should be included for all mains because a device number is included for the first main on the statement. When a device number is specified for the first main defined to your complex, a device number must be specified for all mains.

If **NO DEVICE NUMBER** appears as the variable-text, the JUNIT keyword list of the DEVICE initialization statement indicates that a device number should be omitted for all mains because a device number is omitted for the first main on the statement. When the device number is omitted for the first main, it must be omitted for all mains.

**System action:** JES3 uses the specification from the first main and continues processing.

**Operator response:** Notify the system programmer.

**Programmer response:** JES3 might be initialized with an undesirable value for the keyword. If so, correct the initialization statement that has been flagged. See z/OS JES3 Initialization and Tuning Reference for statement requirements. Perform a warm start or hot start with refresh to implement the correct value.

**Problem determination:** See Table III, item 5.

Explanation:

//- DEFAULT COMPACTION TABLE REQUESTED---------

//- ON MULTIPLE COMPACT CARDS--------------------

Two COMPACT initialization statements with the
DEFAULT=Y parameter specified have been included in the initialization stream.

**System action:** All COMPACT initialization statements after the first assume the default DEFAULT=N. JES3 initialization continues.

**Operator response:** Notify the system programmer.

**Programmer response:** Change the DEFAULT=Y parameter on the COMPACT initialization statement to DEFAULT=N.

---

**IAT3196**

**Explanation:**
```
➤➤—DEVICE— devname— IS IGNORED - NOT IN CONTIGUOUS SEQUENCE➤➤
```

The JNAME of SNA RJP devices that you defined to a workstation must be defined in an uninterrupted sequence within that particular type of device. For example, when defining SNA RJP printers to SNA RJP workstation WKST1, the JNAME of these devices must be in an unbroken sequence such as WKST1PR1, WKST1PR2, ..., WKST1PR9, WKST1PRA, WKST1PRB, ..., WKST1PRF.

In the message text:

`devname` The name of the SNA RJP device that is attempted to be added dynamically.

**System action:** JES3 ignores the DEVICE statement and processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Define the device names of DEVICE statements in an uninterrupted sequence. You can then issue the "*MODIFY,CONFIG" command again to add these devices.

---

**IAT3198**

**Explanation:**
```
➤➤—DEVICE— devname— IS IGNORED - INVALID JNAME➤➤
```

The JNAME for the specified remote DEVICE statement is incorrect. The JNAME for a remote device must consist of the remote workstation name, the characters PR, PU, or PD, followed by a hex digit (0-F).

In the message text:

`devname` The JNAME specified on the DEVICE statement.

**System action:** JES3 ignores the initialization statement and processing continues.

**Operator response:** Contact your system programmer.

**System programmer response:** Define the device names of DEVICE statements in an uninterrupted sequence. You can then issue the "*MODIFY,CONFIG" command to add the device dynamically.
IAT3200

Explanation:

.vendor GLOBAL DEVICE—devname (dev)

.vendor DOES NOT EXIST

An initialization control statement refers to a device devname (dev) which was not defined in the MVS system generation.

System action: JES3 initialization continues.

Operator response: Correct the erroneous statement and perform a hot start with refresh or warm start at your earliest convenience.

Problem determination: See Table I, item 17a; Table III, item 5.

Module:

Routing Code: 2

Descriptor Code: 7

---

IAT3201

Explanation:

.vendor NO JES3 PROCESSOR FOR DEVICES

.vendor DEFINED FOR—main

A JES3 initialization DEVICE statement has a reference in the JUNIT parameter to a JES3 processor main that was not defined in an initialization MAINPROC statement as TYPE=JES3.

System action: JES3 initialization continues.

Programmer response: Either define a JES3 processor with the indicated name or change the JUNIT reference to this name.

Problem determination: See Table III, item 5.

Module:

Routing Code: Note 19

Descriptor Code: N/A

---

IAT3206

Explanation:

.vendor SYSOUT CLASS TABLE TYPE NOT—PRINT

The message class defined on the CIPARM statement must be defined in the SYSOUT class table with a type of PRINT.

In the message text:

class The name of the class referenced on the CIPARM statement.

id The PARMID identifier on the CIPARM statement.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

Problem determination: See Table III, item 5.

**IAT3220**  
**Explanation:**  
††† CHKPN T AND SPOOL DATA SETS DO NOT MATCH THOSE USED FOR LAST WARM/COLD  
††† MATCH THOSE USED FOR LAST WARM/COLD  
††† START. JES3 TERMINATED.  

JES3 initialization data on the CHKPNT data set is not consistent with its accompanying data on the JES3 queues. This condition, which can occur only on local or hot start, results when the JES3 procedure has been changed so that the combination of data sets is not the same as it was when the initialization stream was last used.  
**System action:** JES3 initialization ends.  
**Programmer response:** The JES3 procedure must be corrected so that the data sets properly match.
IAT3222

Explanation:

The spool partition named *spart* was not defined on an SPART statement but was specified on the SYSOUT statement for the SYSOUT class.

System action: JES3 initialization continues. JES3 uses the default spool partition for the SYSOUT class.

Programmer response: Correct the initialization stream by defining the spool partition named SPART on an SPART statement or by specifying an existing spool partition for the SYSOUT class.

Problem determination: See Table III, item 5.

IAT3224

Explanation:

During the current start, JES3 was unable to create the virtual unit, real device status, or locate checkpoint record because of a permanent JSAM I/O error.

System action: Processing continues. If REAL DEVICE was indicated in the message, the real device will be initialized as defined in the initialization stream at the next hot start. If LOCATE was indicated in the message, the locate checkpoint area is cleared.

Operator response: Notify the system programmer.

Note: If the on/offline status specified in the initialization stream is not desired, you will also need to vary on/offline any real devices after you issue the *START,JSS command.

Programmer response: Take a dump by placing an INTDEBUG,n,message-text$$ statement in the initialization stream.

IAT3225

Explanation:

During the current hot start, JES3 was unable to read the real device checkpoint status record, or during a local start, JES3 was unable to read the checkpoint data set.

System action: JES3 initialization continues. For
REAL DEVICE CHECKPOINT or CHECKPOINT DATA SET, all real devices are initialized as defined in the initialization stream.

**Operator response:** Before issuing the *START,JSS command, vary on/offline any real devices after you issue the *START,JSS command. Notify the system programmer.

**Programmer response:** Take a dump by placing an INTDEBUG.n,MESSAGE-TEXT$ statement in the initialization stream.

### Module:

**Routing Code:** 2  **Descriptor Code:** 7

**IAT3232**

**Explanation:**

- UNRECOVERABLE ERROR WHILE
- ASSIGNING NON-JES3 DEVICES

During JES3 initialization, an unrecoverable error occurred in the MVS assign service. JES3 invokes the MVS assign service to assign all the online devices that JES3 does not manage.

**System action:** JES3 initialization fails.

**Operator response:** Notify the system programmer.

**Programmer response:** Gather the system log and the dump associated with the MVS Assign failure. Perform initial diagnosis using the error recovery information saved by the MVS Assign Service during its recovery processing. If the problem persists, contact the IBM Support Center.

Routing Code: Note 19  Descriptor Code: –

---

**IAT3237**

**Explanation:**

- UNABLE TO BUILD
  - CI RQ
  - MAIN RQ
  - OUTSERV RQ
  - COMMON RQ

FSS initialization was unable to create either the CI, MAIN, OUTSERV, or COMMON RQ cellpool. The CI RQ cellpool is the only RQ cellpool that is created for a CI FSS address space.

**System action:** The return code from the IATXBPL (Build Cellpool) Service routine is put into register two, and a FAILDSP (DM101) is issued to end FSS initialization. See z/OS JES3 Customization for a description of the return codes.

**Operator response:** Notify the system programmer.

**Programmer response:** Check the return code to
determine the type of error that occurred.

</table>

IAT3254

Explanation:

I/O ERROR DURING BUILD OF TABLE FUNCTION IS DISABLED INCOMPLETE

During construction of the JES3 internal table or control block tab, an I/O error occurred on the JES3 queue used for intermediate work files during initialization.

System action: A noncritical system function may be left partially operable, INCOMPLETE; or be blocked out completely, DISABLED. (An I/O failure during initialization of a vital system function always results in JES3 ending. Such an error will not produce this message.)

Operator response: If the named function is necessary to continued operation, attempt a hot or local restart of JES3. If this fails, attempt a global warm start with analysis (WA). If this fails, cold start and reformat the queue extents.

Problem determination: See Table III, items 5, 6, 20, and 21.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</tr>
</tbody>
</table>

**Routing Code:** Note 19  **Descriptor Code:** –

---
IAT3260

Explanation:

The specified parameter is no longer supported on the JES3 initialization statement.

System action: JES3 ignores the parameter and continues processing the remaining parameters on the JES3 initialization statement. The system continues JES3 initialization.

Operator response: Inform the system programmer that the JES3 initialization statement contains an obsolete parameter. The statement should be corrected for the next restart.

System programmer response: Remove the parameter from the JES3 initialization statement.

Module:

IAT3263

Explanation:

The initialization statement specified by stmt is no longer supported, but will be ignored in the initialization stream.

System action: None. JES3 ignores the initialization statement.

Operator response: None. This is an informational message.

System programmer response: When you are sure that you will not need to migrate back to a level of JES3 where this statement is supported, you should remove the statement from the initialization stream.

This is only an informational message.

Module:

IAT3264

Explanation:

An error occurred while attempting to initialize an event listen routine for the Event Notification Facility (ENF). This occurs for one of the following reasons:  
- The event listen module was not found in LPA or ELPA.
- The ENFREQ request to establish the listen routine failed.

System action: JES3 initialization continues.

If the text specifies IATMDEN, jobs which require unavailable SMS resources will not continue using JES3.
setup when their resources become available. To continue, these jobs must be restarted using the *RESTART,SETUP command.

If the text specifies IATCNNF, JES3 will not be able to handle console buffer constraint situations.

If the text specifies IATMSEWL, JES3 will not be notified of scheduling environment status changes. As a result, jobs may not be scheduled for execution when the scheduling environment is available or they may be scheduled for execution when the scheduling environment is not available. In the first case, if the job requires setup, a *RESTART,SETUP command will have to be issued to get the job to be scheduled for execution.

**Operator response:** Contact the system programmer.

**System programmer response:** Check SYS1.LPALIB to ensure modules IATCNNF and/or IATMDEN are defined. Also check for message IEA883I MODULE IATCNNF NOT FOUND or IATMDEN NOT FOUND in the messages that are issued during nucleus initialization processing. See [z/OS MVS System Messages, Vol 6 (GOS-IEA)] for more information.

IAT3266  Explanation:  
PARAMETER OMITTED, DEFAULT USED

A statement specifies a keyword without a value (for example, JESMSG=).

System action:  JES3 ignores the keyword and takes the default value. JES3 processing continues.

Operator response:  None. This is an informational message.

System programmer response:  None.

Module:

Routing Code:  Note 19  Descriptor Code:  N/A

IAT3267  Explanation:  
BUILD CELLPOOL FAILED

JES3 Spool Data management encountered an error when attempting to build a cellpool for the File Directory. R3 contains the return code from the IATXBPL service.

System action:  JES3 is terminated with a U0021 abend code.

Operator response:  None.

System programmer response:  Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:

Routing Code:  Note 19  Descriptor Code:  N/A

IAT3268  Explanation:  
keyword CAN ONLY BE SPECIFIED WITH WANTDUMP=YES

This message is issued during initialization stream processing. keyword is either LIMIT or INTERVAL.

System action:  The keyword and its value are ignored and initialization continues.

Operator response:  None.

System programmer response:  Specify a non-zero value for the LIMIT keyword, remove the INTERVAL keyword or change the INTERVAL value to zero.

Module:
IAT3271

Explanation:

**DUPLICATE**—statement—

**STATEMENT - FIRST STATEMENT HONORED**

A duplicate statement was detected. The first statement is honored.

**System action:** The duplicate statement is ignored. JES3 initialization continues.

**Operator response:** None.

**Programmer response:** None required, however, the system programmer should remove the extraneous statement.

**Module:**

</table>

IAT3274

Explanation:
IAT3276 • IAT3362

The number of parameters specified for a keyword exceeded the maximum number of allowed parameters.

System action: If applicable, a default is provided. Otherwise, the keyword is ignored. JES3 initialization continues.

Operator response: None.

Programmer response: None required, however, the system programmer should properly specify the parameter(s).

Routing Code: 130

IAT3359

Explanation:

An error was encountered during JES3 macro IATXBPL, IATXGCL, or IATXRCL processing for an output service restart record (OSR). For information about the return codes rc, see [z/OS JES3 Customization] for the specified macro.

System action: Output service processing continues. However, the functional subsystem (FSS) writers active before the hot start will not restart correctly. Some of the data sets being processed on the FSS writers may be re-scheduled on different writers.

Operator response: Notify the system programmer.

Programmer response: Issue the "DUMP command to provide sufficient diagnostic information. (See Chapter 30, "Problem Determination," on page 711.) If double printing of the output is intolerable, restart the system.

Problem determination: See Chapter 30, "Problem Determination," on page 711. If double printing of the output is intolerable, restart the system.

Routing Code: 10

IAT3362

Explanation:

An error occurred while restoring the volume unavailable table from the checkpointed spool records.

System action: The volume unavailable table is initialized as empty.

Operator response: If the volume serial numbers of the unavailable volumes are known, issue the *MODIFY,S,VU= command.

Routing Code: Note 19

IATINN3

Explanation:

An incorrect pool partition name was found on a SPART= parameter in an NJERMT statement in the initialization deck. The spool partition might be deleted or not defined.

System action: JES3 ignores the SPART parameter for that NJE node. It will assume the default spool partition and JES3 initialization continues.

Operator response: None.

Programmer response: JES3 will be initialized with the default spool partition which may be undesired. If you want to spool the NJE streams from a node to a particular spool partition, enter a valid SPART parameter in NJERMT statement for that node.

Routing Code: Note 19

IATIN3

Explanation:

An error occurred while restoring the volume unavailable table from the checkpointed spool records.

System action: The volume unavailable table is initialized as empty.

Operator response: If the volume serial numbers of the unavailable volumes are known, issue the *MODIFY,S,VU= command.

Module:

IATINAL

Routing Code: Note 19

IATIN3

Explanation:

An incorrect pool partition name was found on a SPART= parameter in an NJERMT statement in the initialization deck. The spool partition might be deleted or not defined.

System action: JES3 ignores the SPART parameter for that NJE node. It will assume the default spool partition and JES3 initialization continues.

Operator response: None.

Programmer response: JES3 will be initialized with the default spool partition which may be undesired. If you want to spool the NJE streams from a node to a particular spool partition, enter a valid SPART parameter in NJERMT statement for that node.

Routing Code: Note 19

IATIN3

Explanation:

Module:

IATINAL

Routing Code: Note 19

IATIN3

Explanation:

An incorrect pool partition name was found on a SPART= parameter in an NJERMT statement in the initialization deck. The spool partition might be deleted or not defined.

System action: JES3 ignores the SPART parameter for that NJE node. It will assume the default spool partition and JES3 initialization continues.

Operator response: None.

Programmer response: JES3 will be initialized with the default spool partition which may be undesired. If you want to spool the NJE streams from a node to a particular spool partition, enter a valid SPART parameter in NJERMT statement for that node.

Routing Code: Note 19

IATIN3
IAT3366

Explanation:

An error occurred while restoring the deadline scheduling data from the checkpointed deadline spool records. Some or all of the deadline-scheduled jobs no longer have a deadline entry.

System action: The jobs remain in the system and are scheduled normally without any priority changes generated by deadline scheduling.

Operator response: If the deadline-scheduled jobs in the system are known, either cancel and resubmit them or raise their priority with the *MODIFY,T=type,PRTY=+n command.

Problem determination: See Table III, item 11.

Module:

Routing Code: 2 Descriptor Code: 7

IAT3390

Explanation:

The spool files created during JES3 initialization are on one or more spool data sets that are unavailable to JES3 during current global processor hot start or local processor restart.

System action: JES3 initialization ends with a DM017 abend.

Operator response: IPL the system and perform a warm start to recreate the initialization data.

Module:

Routing Code: 10 Descriptor Code: 4

IAT3395

Explanation:

JES3 is attempting to use a JESXCF service and the PC table has not yet been initialized. JES3 will wait a short time and recheck the JESXCF status.

Operator response: If the message persists, check the status of the JESXCF address space.

Programmer response: None

Module:

Routing Code: 42 Descriptor Code: 7

IAT3397

Explanation:

The old global is being restarted as a local after a DSI was performed. Before the old global reattaches to JESXCF, it must wait until all other mains that were active when the DSI occurred have either reconnected to the new global, or have themselves been re-IPLed. Message IAT3397 is issued to inform the operator that the old global is waiting for this condition to be satisfied.

System action: The old global will wait for all active mains to reconnect before completing its initialization. IAT3397 will be issued periodically to remind the operator that the old global is still waiting. Once all active mains have reconnected, the old global will continue with initialization.

Operator response: Make sure that all active mains have reconnected to or are in the process of reconnecting to the new global.

Programmer response: None

Module:

Routing Code: 42 Descriptor Code: 7
IAT3398

Explanation:

***FAILURE***
***READING***
***WRITING***

**CHECKPOINT TO TURN SDI OFF, RC=nn**

This message is issued in response to a request to turn SDI off in response to message IAT3155. JES3 attempted to checkpoint the new SDI value and failed. In the message text:

nn.

the return code from the IATXCKPT macro. See the macro description in [z/OS JES3 Customization](https://www.ibm.com/support/knowledgecenter/SSEQ26_2.3.2/ies3ctm/ies3ctm_ies3ctm_w001.htm) for an explanation of the reported value.

**System action:** JES3 processing continues. Because the result of the request may not have been checkpointed, it is unpredictable whether a subsequent JES3 hotstart will use SDI checking or not.

**Operator response:** You may attempt to issue the *F,SDI=OFF command as soon as JES3 is active. Otherwise, a JES3 warmstart should be scheduled to rebuild the checkpointed information based on the initialization stream specification.

**Programmer response:** Analyze the return code reported by the message and take the appropriate corrective action. If this problem persists, a JES3 warmstart should be scheduled to rebuild the initialization checkpoint. Waiting. Once all active mains have reconnected, the old global will continue with initialization.

**Operator response:** Make sure that all active mains have reconnected to or are in the process of reconnecting to the new global.

Routing Code: 2, Note 19  Descriptor Code: 7

IAT3404

Explanation:

- CONFLICTING DEVICE REQUIREMENTS ON
- GROUP CARD

A GROUP statement incorrect for one of the following reasons:

- The DEVPOOL parameter was specified more than once. You may specify only one DEVPOOL parameter.
- Both the DEVPOOL and EXRESC parameters were used to dedicate devices. You may use only one of these parameters to dedicate devices.

System action: JES3 initialization continues, but the second device specification encountered is ignored.

Programmer response: Examine the GROUP statement at fault and correct it as required for any subsequent reinitialization of JES3.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMP</td>
<td>IATINMP</td>
<td>IATINMP</td>
</tr>
</tbody>
</table>

Routing Code: Note 19  Descriptor Code: –

IAT3405

Explanation:

- TOO MANY
- DEDICATED DEVICE TYPES SPECIFIED

A GROUP statement containing dedicated devices contained too many different device types. It overflowed the work area obtained to build the device fence control block (DFCB) associated with this GROUP statement.

System action: JES3 initialization continues, but the device specification for this group is ignored.

Programmer response: Examine the GROUP statement for too many dedicated devices and correct it as needed. This error is unlikely to occur; it is caused by specifying approximately 80 device types when using the smallest available JES3 buffer size (1K).

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINGP</td>
<td>IATINGP</td>
<td>IATINGP</td>
</tr>

Routing Code: Note 19  Descriptor Code: –

IAT3408

Explanation:

- DUPLICATE MAINPROC—xxxxxxx—
- IGNORED

JES3 detected a MAINPROC statement in the initialization stream that has a system name that matches a previous MAINPROC statement. System name is specified in the SYSTEM= parameter of the MAINPROC statement.

System action: The duplicate MAINPROC statement is ignored, and JES3 initialization continues.

Programmer response: Either correct or remove the duplicate MAINPROC statement.

Module:

IATINMP

IATINMP

IATINMP

IAT3409

Explanation:

- SPIN VALUE of xxx INCORRECT,
  rsrn, SPIN=NO ASSUMED

An incorrect SPIN value was coded on the CLASS statement. In the message text:

xxx The SPIN value as it was specified on the CLASS statement.
rsrn The reason for the error. The text will be one of the following:
  • UNKNOWN FORMAT
  • HOUR EXCEEDS 23
  • MINUTE EXCEEDS 59
  • MINUTES EXCEED 59
  • INTERVAL BELOW +00:10
  • LINE INTERVAL BELOW 500

Note: If hour, minute, or length exceeds the maximum number of digits, for example 100:01 or 1000K, the error that will be generated as a result is “UNKNOWN FORMAT”.

System action: JES3 defines the class as if SPIN=NO had been specified.

Operator response: None.

Module:

IATINMP

IATINMP

IATINMP

IAT3410

Explanation:

- JOB CLASS class
  GROUP group
  REFERENCED BY ccs IS NOT DEFINED

A job class, name class, or job group name is referenced on a CLASS or SELECT control statement ccs; however, the class or group name is not defined by a CLASS or GROUP control statement.

System action: JES3 initialization ends.

Programmer response: Correct the CLASS or SELECT control statement so that all references are to defined classes. (See z/OS JES3 Initialization and Tuning Reference for more information on CLASS and SELECT statements.)

Module:

IATINMP

IATINMP

IATINMP

IAT3411

Explanation:

- MAIN PROCESSOR main
  REFERENCED BY ccs IS NOT DEFINED

The processor main is referenced by a CLASS or GROUP initialization control statement ccs; however, the processor is not defined by a MAINPROC initialization statement.

System action: JES3 initialization ends.

Programmer response: Correct the CLASS or GROUP statement so that all references are to processors defined by a MAINPROC statement. Restart JES3.

Module:

IATINMP

IATINMP

IATINMP

Routing Code: 2  Descriptor Code: 7
IAT3412

Explanation:

MORE THAN ONE GROUP WITHOUT DEDICATED INITIATORS ON main

Only one GROUP statement may specify batch initiators for a processor main; all others must indicate their dedicated initiator counts.

System action: JES3 initialization ends.

Programmer response: Correct the GROUP statement to specify dedicated initiator counts. (See z/OS JES3 Initialization and Tuning Reference for an explanation of GROUP statements.)

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3421

Explanation:

SPOOL PARTITION—spart

FOR MAIN PROCESSOR—main—DOES NOT EXIST.

A spool partition named on a MAINPROC statement is not defined by an SPART statement. In the message text, spart identifies the spool partition; main identifies the processor.

System action: JES3 assigns spool output for jobs that run on the affected processor to the default spool partition.

Programmer response: If you accidentally omitted the spool partition definition during JES3 initialization, add an SPART statement to the initialization stream to define the partition. If the spool partition is incorrectly
named on the MAINPROC statement, correct the MAINPROC statement.

**Problem determination:** See Table III, item 5.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMPC</td>
<td>IATINMPC</td>
<td>IATINMPC</td>
</tr>
</tbody>
</table>

Routing Code: 2  Descriptor Code: 7

---

**IAT3422**

**Explanation:**

- GROUP—group
- WILL NOT BE CHECKPOINTED FOR PROCESSOR—main

The EXPRESC parameter on the GROUP initialization statement was used to specify the execution resources for a job class group. JES3 will not checkpoint the execution resources for the group because the number of resources would cause the checkpoint record to exceed the length of the buffer.

**System action:** JES3 will not checkpoint the record and continues initialization processing.

**Operator response:** Contact the system programmer.

**System programmer response:** None.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

<tr>
<td>IATINM2</td>
<td>IATINM2</td>
<td>IATINM2</td>
</tr>
</tbody>
</table>

Routing Code: Note 19  Descriptor Code: –

---

**IAT3423**

**Explanation:**

- CHANGE IN THE parm
- PARAMETER REQUIRES main TO BE IPLED

During a hot start with refresh, a MAINPROC statement for a processor was changed, but the processor that the statement describes has not been IPLed. The parameter in question defines a table or resource that is created at IPL time and therefore requires the processor to be IPLed.

In the message text:

- parm The parameter for which a change was detected; this will be either FIXPAGE, PRTPAGE/CSA, or PRTPAGE/AUX.
- main The name of the MAINPROC where the change was detected.

**System action:** JES3 waits for you to reset the processor in question, or reply CANCEL.

**Operator response:** Reset the processor in question or reply CANCEL. If you reply CANCEL, JES3 issues a DM026 abend.

**System programmer response:** None.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMPC</td>
<td>IATINMPC</td>
<td>IATINMPC</td>
</tr>
</tbody>
</table>

Routing Code: 2  Descriptor Code: 7

---

**IAT3424**

**Explanation:**

- DELETED SYSTEM main MUST BE RESET

During a hot start with refresh, a MAINPROC statement for a processor was deleted or renamed. In order for this restart to complete, the deleted processor must be reset.

In the message text:

- main The name of the MAINPROC statement that was deleted or renamed.

**System action:** JES3 waits for you to reset the processor in question, or reply CANCEL.

**Operator response:** Reset the processor in question or reply CANCEL. If you reply CANCEL, JES3 issues a DM026 abend.

**System programmer response:** None.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMPC</td>
<td>IATINMPC</td>
<td>IATINMPC</td>
</tr>
</tbody>
</table>

Routing Code: 2  Descriptor Code: 7
**Explanation:**

During a hot start with refresh, an attempt was made to delete the MAINPROC statement for the global processor. This is not allowed.

In the message text:

- **main** The name of the current global processor.

**System action:** JES3 initialization ends with a DM026.

**Operator response:** If the current global processor must be deleted, either perform a cold or warm start on another processor with the new initialization stream, or perform a DSI to another processor and then perform a hot start with refresh on the new global. If the deletion was inadvertent, perform a hot start with refresh using the correct initialization stream.

**System programmer response:** None.

**Module:**

**Routing Code:** 2 \n**Descriptor Code:** 7

---

**Explanation:**

During a hot start with refresh, one or more MAINPROC statements were changed, added or deleted, and there is at least one active processor that is not at the z/OS V1R4 JES3 level or higher. All such processors must be re-IPLed in order to pick up the MAINPROC changes.

**System action:** JES3 waits for you to reset the processor in question, or reply CANCEL.

**Operator response:** Reset all down level processors, or reply CANCEL. An IAT2061 message will be issued for each processor that must be reset. If you reply CANCEL, JES3 issues a DM026 abend.

**System programmer response:** None.

**Module:**

**Routing Code:** 2,10 \n**Descriptor Code:** 7

---

**Explanation:**

The JUNIT parameter on a DEVICE statement does not define this processor main as the JES3 processor which is being initialized. This is not a valid condition since JES3 builds a DEVICE definition for any system that is not explicitly defined as a DEVICE,DTYPE=SYSMAIN if a MAINPROC statement exists and is defined correctly.

**System action:** JES3 initialization ends.

**System programmer response:** If no fix exists, contact the IBM Support Center.

**Module:**

**Routing Code:** 2,10 \n**Descriptor Code:** 7

---

**Explanation:**

The SYSNAME of the processor being initialized does not match any system name specified on a MAINPROC statement. The system name of the processor is xxxxxxx.

**System action:** JES3 initialization ends.

**Programmer response:** Correct the NAME= parameter on the MAINPROC statement for the system being initialized. It must match the MVS SYSNAME of the processor to initialize JES3.

**Module:**

**Routing Code:** 2 \n**Descriptor Code:** 7

---

**Explanation:**

**System action:** JES3 initialization ends.

**System programmer response:** None.

**Module:**

**Routing Code:** 2 \n**Descriptor Code:** 7

---

**Explanation:**

**System action:** JES3 initialization ends.

**System programmer response:** None.
During initialization of a JES3 local processor, the JES3
global processor could not be located. A local processor
cannot be initialized unless a global processor exists.

**System action:** JES3 initialization ends.

**Operator response:** Restart local initialization after a
global processor has been initialized.

JES3 appends *** ABEND *** to message IAT3441
when module IATINXM ends and the reason code in
message IAT3441 is anything except 0B or 10.
System action:  JES3 dumps one or two address spaces. If the system programmer has directed the dump to a printer, JES3 dumps only the JES3 address space. If the system programmer has directed the dump to the SYS1.DUMP data set, JES3 dumps the JES3 address space as well as the JES3 auxiliary address space.

For all reason codes, JES3 initialization continues. The JES3 address space is not created, however.

Programmer response:  Check the PRTPAGE parameter on the MAINPROC statement to verify that you did not request more storage than is available. If the request for storage is valid, analyze the dump to determine what caused the error.

Problem determination:  See Table III, items 5, 6, and 7.

Module:

IAT3442
Explanation:

- JES3AUX FAILURE REQUIRES RE-IPL
- BEFORE ANY RESTART

JES3 initialization for the JES3 auxiliary address space is ending.

System action:  JES3 initialization ends.

Programmer response:  See the programmer response for message IAT3441.

Module:

IAT3442
Explanation:

- JES3AUX FAILURE REQUIRES RE-IPL
- BEFORE ANY RESTART

JES3 initialization for the JES3 auxiliary address space is ending.

System action:  JES3 initialization ends.

Programmer response:  See the programmer response for message IAT3441.

IAT3490
Explanation:

- DUPLICATE PARAMETER parm
- FOR KEYWORD keywd

The specified parameter was found more than once on the OUTSERV or SETPARAM statement.

System action:  JES3 initialization continues. The first parameter is accepted and the duplicate is ignored.

Operator response:  Notify the system programmer.

Programmer response:  Remove the duplicate parameter to avoid receiving this message on future cold starts, warm starts, or hot starts with refresh.

Module:

IAT3504
Explanation:

- CONVERTER/INTERPRETER
- FAILED INITIALIZATION
- FSS—fssname, ASID=asid

The JES3 global or a CI FSS address space failed in its...
attempt to initialize a converter/interpreter subtask. If the error occurred during the initialization of a functional subsystem (FSS), the FSS name and ASID are included in the message.

System action: The converter/interpreter subtask that ended is cleaned up. Messages IAT4235 and IAT4236 are issued if additional action is taken.

Operator response: Notify the system programmer.

Programmer response: Check the SDUMP taken by the subtask’s ESTAE exit to determine why the failure occurred.

Module:

Routing Code: 42, Note 19  Descriptor Code: 7

IAT3505

Explanation:

- **INVALID KEYWORD**

- "keyd—statement—**WARNING**"

The keyword that appears on the JES3 initialization statement is not valid.

System action: JES3 ignores the statement and continues initialization.

Operator response: Notify the system programmer.

Programmer response: Correct the keyword and perform a cold start, warm start, or hot start with refresh if required.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3507

Explanation:

- **ERROR WHILE ATTEMPTING OPEN**

*FOR DDNAME—ddn,— **ERROR***

An attempt to perform the indicated operation on the procedure library data set defined by the specified DD statement was unsuccessful.

System action: JES3 attempts to continue, but any references to the specified procedure library will probably result in the job abending.

Programmer response: Check the DD statement for validity and ensure that the specified data set actually exists.

Problem determination: See Table III, item 5.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3508

Explanation:

- **PARAMETER CONFLICT FOR PARMID=xx.**

* **WARNING**

More than one option list for the same CIPARM (PARMID=xx) has been supplied.

System action: JES3 honors only the first option.

Programmer response: Correct the statements in error before the next JES3 initialization.

Problem determination: See Table III, item 5.

**IAT3509**

**Explanation:**

- **MISSING DD STATEMENT, DNAME=ddn**
- **SEVERE ERROR**

The specified ddbname is not allocated to JES3. This is issued only when the procedure library ddbname IATPLBST (the standard, default procedure library) is not allocated.

**System action:** JES3 initialization ends.

**Operator response:** Notify the system programmer.

**Programmer response:** The procedure library may not have been allocated for one of the following reasons:

- The procedure library was deleted before the restart. If the procedure library is desired, run a job to recreate the procedure library using started system; then restart JES3.
- The DD statement for this procedure library in the JES3 procedure is missing. Add a DD statement for this procedure library to the JES3 procedure and restart JES3.
- The DYNALLOC statement for this procedure library in the JES3 initialization stream is missing. Add a DYNALLOC statement for this procedure library to the JES3 initialization stream and restart JES3.
- The dynamic allocation of this procedure library (DYNALLOC statement) failed, and the operator allowed initialization to continue. Check the dynamic allocation error messages/return codes to determine the cause of the problem.

---|---|---
IATINIP  | IATINIP  | IATINIP

---

JES3 initialization continues.
IAT3514
Explanation:
An incorrect value was specified for the REGION= parameter on the CIPARM initialization statement. REGION=nnnNx identifies the parameter in error. See z/OS JES3 Initialization and Tuning Reference.

System action: JES3 uses the region size specified or defaulted to in the CIPARM option list. JES3 initialization continues.

Operator response: Contact the system programmer.

System programmer response: Correct the field in error for the next restart.

Module:

IAT3516
Explanation:
JES3 detected an incorrect parameter on the CIPARM initialization statement. The parameter was either inconsistent with other valid parameters previously specified with the same AUTH parameter, or the parameter is not one of the allowable AUTH parameters.

In the message text:
parm The non-valid AUTH parameter specification.

System action: JES3 ignores the parameter. If there are no valid AUTH parameters specified, JES3 uses the default of AUTH=ALL.

Operator response: None. The messages is only written to the JES3OUT data set.

System programmer response: Correct the parameter for next restart.

Module:

IAT3517
Explanation:
A converter/interpreter subtask has ended and has completed DETACH processing. This occurs after the operator decreases the batch or demand select CI DSP max counts using the *MODIFY X or *MODIFY F commands.

System action: JES3 processing continues.
IAT3518 • IAT3526

Operator response: None. This is an informational message.

Module: Containing Detecting Issuing
IATIMSIATINIIATINAT

Routing Code: 42 Descriptor Code: 7

IAT3518
Explanation:

DSNAME on RESDSN statement is invalid. DSN=dsn
A data set name specified on a RESDSN statement does not follow the JCL standards for coding a data set name.

System action: JES3 ignores the statement and JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: Correct the data set name and perform a cold start, warm start, or hot start with refresh.

Module: Containing Detecting Issuing
IATINIIATINIIATINIF

Routing Code: Note 19 Descriptor Code: –

IAT3520
Explanation:

TSOPMID STCPMID INTMPID = procid
STPROCICIPARM ID=01 used. **WARNING**
The default CIPARM ID to be used for TSO logons, started tasks, or internal reader submitted jobs was not found in the CIPARM table.

System action: JES3 initialization continues. The default CIPARM ID (IATPLBST) is used for all jobs of this type that use a procedure library (during C/I), and did not specify a procedure library on the //*MAIN statement. Note: IATPLBST is required or JES3 initialization fails.

Operator response: Notify the system programmer.

Programmer response: The error may be caused because of incorrect syntax, or because the procedure library is not allocated to JES3:

- Correct the parameter on the STANDARDS statement (if incorrect), and restart the system.
- Add a IATPLBxx (where xx is the procedure library ID) DD statement to the JES3 procedure. This causes the procedure library to be allocated when JES3 is started.
- Add a DYNALLOC statement for this ddname to the JES3 initialization stream. This causes the procedure library to be dynamically allocated during JES3 initialization.

Module: Containing Detecting Issuing
IATINIFIATINIF

Routing Code: Note 19 Descriptor Code: –

IAT3525
Explanation:

TSOPROC STCPROC INTPROC = procid
IPROC ID=ST used. **WARNING**

IATINIF

Routing Code: Note 19 Descriptor Code: –

IAT3526
Explanation:

Proclib ddname=dsn
The specified or default dsn is not allocated to JES3. A PROCLIB entry was not built for the specified ddname.
System action: JES3 continues but does not build the table for this procedure library.

Operator response: Notify the system programmer.

System programmer response: The procedure library may not have been allocated for one of the following reasons:
- The procedure library was deleted before the restart. If the procedure library is desired, run a job to recreate the procedure library; then restart the system.
- The DD statement for this procedure library in the JES3 procedure is missing. Add a DD statement for this procedure library to the JES3 procedure and restart the system.
- The DYNALLOC statement for this procedure library in the JES3 initialization stream is missing. Add a DYNALLOC statement for this procedure library to the JES3 procedure and restart the system.
- The dynamic allocation of this procedure library (DYNALLOC statement) failed, and the operator allowed initialization to continue. Check the dynamic allocation error messages/return codes to determine the cause of the problem.

Module:

**IAT3527**

Explanation:

The installation defined CI FSSs (FSSDEF statements) but the CI driver FCT could not be initialized. Messages IAT3020 and/or IAT3528 may also be issued to indicate what happened.

System action: The CI driver FCT is not initialized; therefore, no CI FSS address spaces can be started. If this is a hot start, communication between the global and any active CI FSSs is not possible. In addition, the CI scheduling installation exits, IATUX46 and IATUX49, will not be called for jobs scheduled for C/I processing.

Operator response: Notify the system programmer.

Programmer response: Messages IAT3020 and IAT3528 provide more detail about the problem. If neither of these messages was issued, the CI driver was not initialized because the CI driver DSP dictionary entry in module IATGRPT is incorrect or missing.

Module:

**IAT3550**

Explanation:

JES3 could not build the indicated table because of insufficient storage.

System action: JES3 initialization ends.

Operator response: Contact your system programmer.

Programmer response: Take a dump of JES3.

Module:

**IAT3599**

Explanation:

The installation defined CI FSSs (FSSDEF statements) but the CI driver FCT could not be initialized. Messages IAT3020 and/or IAT3528 may also be issued to indicate what happened.

System action: The CI driver FCT is not initialized; therefore, no CI FSS address spaces can be started. If this is a hot start, communication between the global and any active CI FSSs is not possible. In addition, the CI scheduling installation exits, IATUX46 and IATUX49, will not be called for jobs scheduled for C/I processing.

Operator response: Notify the system programmer.

Programmer response: Messages IAT3020 and IAT3528 provide more detail about the problem. If neither of these messages was issued, the CI driver was not initialized because the CI driver DSP dictionary entry in module IATGRPT is incorrect or missing.
IAT3600  •  IAT3603

**WARNING**

No (SETUNIT) device statements have been defined to JES3 in the initialization stream.

**System action:** JES3 initialization continues.

**Operator response:** Contact the system programmer.

**System programmer response:** If you expect devices to be used, ensure that the device statements are coded in the initialization stream. Also ensure proper syntax of any device statements. See **z/OS JES3 Initialization and Tuning Reference** for more information about device statements.

**Routing Code:** Note 19  
**Descriptor Code:** N/A

IAT3603

**Explanation:**

```
**ERROR**
```

No SETPARAM statement was found or a STANDARDS statement with SETUP=NONE was specified in the JES3 initialization stream.
System action: The main device scheduler facility is not included in the JES3 system just initialized.

Operator response: Consult the system programmer. If the main device scheduling facility is desired, reinitialize the JES3 system with a SETPARAM statement without specifying SETUP=NONE in the STANDARDS statement in the initialization stream.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT3605

Explanation: 

►—NAME—xxx

►—SPECIFIED ON SETNAME CARD(S) AS BOTH

►—POOLNAM AND STANDARD NAME **WARNING**

The name indicated has appeared in one or more SETNAME statements in both the NAMES and POOLNAMS parameters. A name may be specified in either parameter, but not both.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: The POOLNAMS parameter is used only to dedicate devices and cannot appear in a JCL statement. The indicated name must be either a standard name (if it is to be allowed in the UNIT parameter of a DD statement) or a pool name (if it is to be used only to dedicate devices). Remove the name from the inappropriate parameter. See z/OS JES3 Initialization and Tuning Reference

Module:

Routing Code: 2  Descriptor Code: 7

IAT3608

Explanation: 

►—SUBGENERIC SPLIT FOR SETNAME—name

►—**ERROR**

The units associated with the SETNAME name are not a subgeneric group under the MVS UNITNAME name. If any of the units of a lowest level MVS subgeneric group are defined in the JES3 initialization stream, they all must be defined.

System action: Message IAT3640 is issued. JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: See message IAT3640.

Module:

Routing Code: 2  Descriptor Code: 7

IAT3609

Explanation: 

►—INSUFFICIENT CORE FOR VERIFYING SETNAME

►—xxy—**ERROR**

JES3 was unable to obtain storage to verify the units specified on the SETNAME statement, where xxy is the name not verified.

System action: JES3 continues processing the remainder of the initialization stream and then ends.
Operator response: Notify the system programmer.

Programmer response: Correct any other initialization stream errors and retry. If the JES3 initialization stream has no other errors, verify the MVS system generation parameters.

Problem determination: See Table III, items 5 and 6.

Module:

IAT3610

Explanation:

- THE DEVICE NUMBER—devnum—
- ASSOCIATED WITH SETNAME—xxx—IS
- UNDEFINED, DEFINED INCONSISTENTLY
- IN MVS **ERROR**

The device number specified on the XUNIT parameter for a DEVICE statement was either:

- Not defined in the MVS I/O definition.
- Defined in the MVS I/O definition, but with a different device type than the one specified on the XTYPE parameter of the DEVICE statement.

In the message text:

devnum
  The device number of the XUNIT parameter.

xxx
  The XTYPE specified on the DEVICE statement.

er
  One of the following error texts:
  - UNDEFINED, which indicates that the device unit is undefined in MVS.
  - DEFINED INCONSISTENTLY, which indicates that the MVS and JES3 definitions specify different device types.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: If the device is undefined to MVS, add its definition or remove the definition from JES3. If the device is defined inconsistently, change the JES3 XTYPE parameter to match the MVS definition, or change the MVS definition to match the JES3 XTYPE parameter.

Module:

IAT3620

Explanation:

- xxx— DOES NOT CONFORM TO REQUIREMENTS
- (0<ALWIO<= MAXIO<100).
- DEFAULT SUBSTITUTED

The value specified in either the ALWIO or the MAXIO parameter on the SETPARAM initialization statement violated one of the following requirements: (1) ALWIO parameter must be greater than zero and not greater than the MAXIO parameter; (2) MAXIO must be less than 100.

System action: JES3 initialization continues using the default values (ALWIO=10 and MAXIO=25).
**IAT3621**

**Explanation:**

- **MORE THAN ONE SETNAME XTYPE—xxxxxxx**
- **CONTAINS NAME—nnnnnnn,**
- **THE NAME IS IGNORED. **ERROR**

More than one SETNAME statement with XTYPE xxxxxxxx used the same SETNAME nnnnnnnn. A SETNAME can be used more than once if it is used on a different XTYPE.

**System action:** The duplicate name is ignored. JES3 initialization continues.

**Operator response:** Notify the system programmer.

**Programmer response:** Correct the incorrect parameter on the SETNAME initialization statement to meet requirements.

**Module:**

</table>

IAT3627

Explanation:

```
>>>DEVICE---(---devnum---)

UNIT CONTROL BLOCK NOT FOUND ON---main.** ERROR **
```

The Unit Control Block (UCB) associated with device devnum defined on main could not be found. The UCB address may not have been generated or may be in an incorrect format.

System action:  JES3 continues to process the remainder of the initialization stream and then ends.

Operator response:  Notify the system programmer.

System programmer response:  Correct the initialization stream. Check MVS and JES3 device definitions.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMD</td>
<td>IATINMD</td>
<td>IATINMD</td>
</tr>
</tbody>
</table>

IAT3628

Explanation:

```
>>>IPL REQUIRED, NO MORE ---SETNAMES
```

```
---XUNITS
```

```
---CAN BE ADDED
```

This message is issued on the local system during JES3 initialization to indicate that the number of SETNAME or XUNIT additions made during a hot start with refresh have exceeded the maximum. In order to make the additions, an IPL is now required on the local. The maximum number of additions that can be made between IPLs of a local are:

- 20 SETNAME definitions, where each entry specified in either the NAMES= or XTYPES= parameter counts as a definition
- \( m \times 100 \) XUNITS, where \( m \) is the number of MAINPROC statements and each XUNIT defined with a main name of *ALL counts as \( m \) definitions.

In the message text:

SETNAMES

Indicates that the maximum number of SETNAME additions has been exceeded.

XUNITS

Indicates that the maximum number of XUNIT additions has been exceeded.

System action:  JES3 initialization ends.

Operator response:  Notify the system programmer.
**System programmer response:** In order for the latest SETNAME or XUNIT additions to take effect, the local system must be IPLed. However, you can postpone the IPL further by deleting some XUNITs or SETNAMEs (which may or may not be the ones most recently added), performing a hot start with refresh on the global, and restarting JES3 on the local. In order to postpone an IPL in this manner, the same type of entry as indicated in this message must be deleted. You cannot postpone an IPL that is required because of XUNIT additions by deleting SETNAMEs, nor can you postpone an IPL that is required because of SETNAMEs additions by deleting XUNITs.

**Module:**

```
IATINMD
```

Routing Code: 2  Descriptor Code: 7

---

**IAT3630**

**Explanation:**

```
| DATA SET NAME CONTAINS SEGMENT |
```

```
| INVALID CHARACTER(S) TOO MANY |
```

The indicated character is used incorrectly in the data set name specified on the DYNALDSN initialization statement. An asterisk (*) can be used only in the final character position of the entire data set name specification. A question mark (?) can be used only in the final character position of a qualified segment of the data set name specification. Adjacent periods (.) are not allowed. Parentheses (either left or right) are only allowed at the beginning or end of a list of data set names.

**System action:** JES3 continues to process the remainder of the initialization statements and then ends.

**Operator response:** Notify the system programmer.

**Programmer response:** Correct the data set name and reinitialize JES3.

**Module:**

```
IATINDYD
```

Routing Code: 2  Descriptor Code: 7

---

**IAT3632**

**Explanation:**

```
| NO DEFAULT DYNALDSN SPECIFICATION |
```

```
| PROTECT=(*) ASSUMED |
```

No default was specified on the DYNALDSN initialization statement. The final specification should be either BYPASS=(*) or PROTECT=(*). Since neither was specified, PROTECT=(*) is assumed. This means that all data sets not specifically bypassed will be protected through JES3 data set allocation.

**System action:** JES3 initialization continues with PROTECT=(*) assumed.

**Operator response:** Notify the system programmer.

**System programmer response:** Add a default DYNALDSN statement specifying either BYPASS=(*) or PROTECT=(*).

**Module:**

```
IATINDYD
```

Routing Code: Note 19  Descriptor Code: –
An illogical sequence of either PROTECT= or BYPASS= parameters has been read on the DYNALDSN initialization statement. The specification *dsn1* was read first and *dsn2* was read last, but *dsn2* will not be used since the range of data set names read first entirely covers the data set name or names specified as *dsn2*.

**System action:** JES3 continues to process the initialization statements. If both specifications are the same (both PROTECT or both BYPASS), the message is treated as a warning only. Otherwise JES3 initialization ends.

**Operator response:** Notify the system programmer.

**Programmer response:** Verify the specifications on the DYNALDSN initialization statement. See z/OS JES3 Initialization and Tuning Reference.

### IAT3640

**Explanation:**

- THE FOLLOWING DEVICES WITH UNITNAME
- ARE UNAVAILABLE FOR ALLOCATION:

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMD</td>
<td>IATINMD</td>
<td>IATINMD</td>
</tr>
</tbody>
</table>

**Routing Code:** 2  **Descriptor Code:** 7

### IAT3634

**Explanation:**

- SYSTEM NAMES DO NOT MATCH FOR
- SMS DISABLED

During JES3 initialization, JES3 determined that the *main* specified on the NAME parameter of the MAINPROC initialization statement did not match the system name specified at IPL time. At IPL time the *main* is specified by the SYSPARM parameter in the IERSYsxx member that is used to IPL the processor.

**System action:** JES3 does not invoke SMS on the specified processor. JES3 processing continues.

**Operator response:** Notify your system programmer.

**System programmer response:** To correct the problem, do one of the following:

- Re-IPL the system and specify SYSP=xx so that the SYSPARM parameter in the *sys*s1.PARMLIB member

IEASYsxx matches the NAME parameter specified on the MAINPROC statement, or

- Change the NAME parameter on the MAINPROC statement so that it matches the SYSPARM parameter. Warm start JES3.

**Routing Code:** 2  **Descriptor Code:** 7
dev are not physically attached to the JES3 system that received this message, or if the device(s) are SMS-managed, no action is required. Otherwise, take one of the following actions:

- Define all devices in the subgeneric group to JES3 by ensuring that the initialization stream contains a DEVICE statement for each device in the subgeneric group.
- Remove DEVICE statements from the initialization stream for all devices that belong to the same subgeneric group as the device identified by dev, and that were defined to JES3.

After taking one of these actions, reinitialize JES3.

Problem determination: See Table III, items 5, 6, and 11.

Module:

Routing Code: Note 19   Descriptor Code: –

IAT3642

Explanation:

- UNABLE TO BUILD CELL POOL, name
- RETURN CODE=rc

The main device scheduler attempted to build a cell pool used to contain allocation requirements lists (ARL). JES3 uses an ARL to contain information on resources that are unavailable to the job.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: Use Z/OS MVS System Codes and the return code from the IATXBPL macro to diagnose the problem.

Module:

Routing Code: 2   Descriptor Code: 7

IAT3690

Explanation:

- (consname)
- IS AN INVALID MSGROUTE CONSOLE **ERROR**
- IS AN UNDEFINED MSGROUTE CONSOLE **WARNING**

If INVALID is indicated, the console consname specified on the MSGROUTE statement for the active system is an invalid or reserved console name, or an error occurred validating the name.

If UNDEFINED is indicated, the console consname specified on the MSGROUTE statement for the active system is not known to the sysplex at this time.

System action: JES3 initialization continues. If INVALID is indicated, the console name is ignored. If UNDEFINED is indicated, the console name is used to build the MSGROUTE table.

For an MCS console, message delivery will begin when the system to which the console is attached joins the sysplex. For an extended MCS console, message
delivery will begin when the program defining the console is started.

**Programmer response:** Correct the console name if INVALID is indicated before the next JES3 initialization.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>

</table>

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT3692**

**Explanation:**

- CONSOLE FOR SNARJP WS=wsname
- NOT SPECIFIED **ERROR**

JES3 issues this message during initialization or during *MODIFY,CONFIG command processing. This message indicates that there is no corresponding CONSOLE initialization statement for a RJPWS statement.

In the message text:

- wsname: The workstation name that is missing a CONSOLE definition.

**System action:** JES3 initialization or *MODIFY,CONFIG processing continues, but the specified console is ignored.

If this message is issued during a hot start with refresh where a RJPWS or RJPTERM statement that was previously defined has been removed, but the corresponding CONSOLE statement has not also been removed, the console is deleted.

**Operator response:** Notify the system programmer.

**Programmer response:** For an RJP console, add a correct RJPTERM statement or remove the CONSOLE statement.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>

<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCS04</td>
<td>IATCS04</td>
<td>IATCS04</td>
</tr>
</tbody>
</table>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT3695**

**Explanation:**

- NO RJPWS/RJPTERM
- STATEMENT FOR CONSOLE—cor **ERROR**

There is no RJPTERM or RJPWS statement which contains a name (N= parameter) that matches the JNAME on the CONSOLE statement.

If the message is issued during JES3 initialization, the text RJPWS/RJPTERM is present. If the message is issued during the processing of the MODIFY,CONFIG command, the text RJPWS is present.

In the message text:

- cor: The name of the console that is missing an RJP definition.

**System action:** JES3 initialization or *MODIFY,CONFIG processing continues, but the specified console is ignored.

**Operator response:** Notify the system programmer.

**Programmer response:** Remove the duplicate console.
Chapter 7. Failsoft and Abend Messages

IAT3700
Explanation:

► INPUT SERVICE UNABLE TO
► REBUILD FRP CHAIN AFTER RECOVERED I/O ERROR

When this message is issued, a dump is taken. Input service was unable to rebuild the FRP chain after a recoverable JSAM I/O error on an AWRITE macro. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

System action: JES3 issues message IAT3713.

Operator response: See message IAT3713. Message IAT3713 contains information to help determine the error.

Module:

Containing  Detecting  Issuing
IATFSLG      IATISFR     IATFSLG

Routing Code: 10  Descriptor Code: 3,4

IAT3701
Explanation:

► ERROR ACCESSING DEADLINE QUEUE,
► REGISTER 3 CONTAINS ERROR CODE
► FROM READ/WRITE ERROR

An error from either a JESREAD macro or AWRITE macro occurred while accessing a record on the deadline queue. This message is embedded in the failsoft formatted display of the failure.

System action: JES3 attempts to recover from the error. Register 3 contains the error return code from the JESREAD or AWRITE macro.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATFSLG      IATPURG    IATFSLG

IAT3702
Explanation:

► dspname    devname
► ABENDED — ABEND code
► FAILED — DMxxx
► JES3 FAILURE NO. — nnn

This message identifies a failing DSP dspname and provides a device name devname, if available. The system abend code or the DM type is given, along with a unique failsoft identifier nnn for this failure. Abend codes are described in "z/OS MVS System Codes". DM codes are described in "z/OS JES3 Diagnosis".

System action: A dump will be taken according to the OPTIONS initialization statement.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATFSLG      IATABRT   IATFSLG

Routing Code: 10  Descriptor Code: 3,4

IAT3703
Explanation:

► DEADLINE UNABLE TO REINITIALIZE
► AFTER ABEND

The DEADLINE DSP ended. The recovery routine is unable to successfully reinitialize the DSP. This message is embedded in the DM851 formatted display.

System action: The DEADLINE DSP ends.

Operator response: Issue the *X,DEADLINE command to call the DSP.

Module:

Containing  Detecting  Issuing
IATFSLG      IATDLND    IATFSLG

Routing Code: 10  Descriptor Code: 3,4

IAT3707
Explanation:
>>>OUTPUT SERVICE RESTART OSR
>>>FREE CELL ERROR

An error was encountered when invoking module IATOSRS to delete a non-existing cell.

System action: The WTR DSP fails with an abend code of DM657. JES3 attempts to reinstate a writer for the printer.
Operator response: Notify the system programmer.
Programmer response: See [z/OS JES3 Diagnosis] for a description of the abend code DM657.

Problem determination: Table I, items 2, 3, 4, 16, 29; Table III, items 1, 2, 3, and 4.
Module:
IAT3708

**Explanation:**

```
--dspname (devname) IS BEING REINSTATED--
```

The designated DSP is being reinstated for a retry attempt.

If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name and address space ID `asid` appear with the message. The absence of the text enclosed by brackets indicates the failure occurred during JES3 initialization.

**System action:** The DSP is reinstated.

**Operator response:** None. This is an informational message.

**Module:**

IATFSLG IATOSRS IATFSLG

Routing Code: 10 Descriptor Code: 3,4

IAT3709

**Explanation:**

```
--dspname (devname) IS BEING TERMINATED--
```

After a program check, a FAILDSP macro, or *FAIL command, the DSP could not recover through its JESTAE exit routines (recovery routines).

If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name and address space ID `asid` appear with the message. The absence of this text indicates the failure occurred during JES3 initialization.

**System action:** The DSP ends.

**Operator response:** None. This is an informational message.

**Module:**

IATFSLG IATOSRS IATFSLG

Routing Code: 10 Descriptor Code: 3,4

IAT3710

**Explanation:**

```
--ERROR PROCESSING SWB CONTROL BLOCKS--
```

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

The scheduler work block (SWB) data was in error. If the function control table (FCT) reported in message IAT3713 is a JES3 output writer, JES3 found the error during exit initialization processing for either installation Exit IATUX20 or IATUX21.

If the reported FCT is a modify output service FCT, JES3 found the error when reading the SWB file before JES3 could modify that file.

**System action:** The FCT fails with abend code DM670. If the FCT is an output service writer, JES3 continues to process the data set without the data from the SWB file. If the FCT is a modify output service FCT, JES3 could not make some or all of the changes.

**Operator response:** Notify the system programmer. If the problem persists, place the active job in operator hold status (*F J=nnn,H), and then, if the job is on an output writer, restart the writer with the RSCD parameter (*R wr,RSCD).

**Programmer response:** See z/OS JES3 Diagnosis for a description of abend code DM670.

**Module:**

IATFSLG IATOSRS IATFSLG

Routing Code: 10 Descriptor Code: 3

IAT3711

**Explanation:**

```
--AN IATXCKPT REQUEST TO WRITE A NEW CHECKPOINT--
```

```
--RECORD, OR TO CHANGE THE SIZE OF AN EXISTING--
```

```
--RECORD, OR TO PURGE A RECORD WAS ILLEGALLY--
```

```
--ISSUED BY A DSP EXECUTING IN OTHER THAN THE--
```

```
--JES3 GLOBAL ADDRESS SPACE.--
```

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout for a DM060 failure. This message results when a DSP running on a JES3 local processor or in a functional subsystem...
(FSS) address space attempts to create a new checkpoint record, attempts to update and change the size of an existing record, or attempts to purge a checkpoint record. These operations are not allowed from a JES3 local processor or an FSS address space.

System action: If the DSP that issued the request does not elect to retry, JES3 ends the DSP and continues processing. If the error occurred during JES3 initialization, JES3 ends with a system completion code of 2FB.

Operator response: Notify the system programmer.

Programmer response: Follow the instructions listed in Chapter 30, “Problem Determination,” on page 711.

Problem determination: See Chapter 30, “Problem Determination,” on page 711, Table III, item 1.

Module:

Containing  Detecting  Issuing
IATFSLG     IATGRCK     IATFSLG

Routing Code: 10  Descriptor Code: 3,4

IAT3712

Explanation:

\[ \text{UNCORRECTABLE ERROR DURING} \]
\[ \text{INITIALIZATION OF SNARJP WSB.} \]
\[ \text{JES3 IS TERMINATED.} \]

An error has been detected while reading a workstation block (WSB) from spool. Either a WSB could not be found for a remote line table (RLT) entry, or the WSB size exceeded the buffer size.

System action: JES3 initialization ends.

Operator response: Notify the system programmer.

Programmer response: Attempt to reinitialize JES3.

Module:

Containing  Detecting  Issuing
IATFSLG     IATINWS     IATFSLG

Routing Code: 10  Descriptor Code: 3,4

IAT3713

Explanation:

\[ \text{DATE=}yyyydd=\text{TIME=}hhmmsst=\text{JES3 level=} \]

This multi-line message gives logout information for a JES3 or FSS failure. If the failure occurred in a functional subsystem (FSS), the functional subsystem name fssname and address space ID asid appear in the message. If this text does not appear in the message, the failure occurred in JES3.

This message provides the following information:

DATE=yyyydd
Year and day the failure occurred

TIME=hhmmsst
Hour, minute, second, and tenth of a second of the time of day the failure occurred

JES3|FSS FAILURE NUMBER=nnnn
The unique JES3 or FSS failure number

ABEND or FAILED
Type of failure
IN FSS=fssname, ASID=asid
The functional subsystem (FSS) fssname and address space ID asid of the failing FSS.

Sxxx or Uyyy or DMzzz
Failure code where Sxxx is a system completion code, Uyyy is a user completion code, and DMzzz is a JES3 diagnostic message code. See [z/OS JES3 Diagnosis] for explanation of the DM codes.

ACTIVE FCT=dspname
The name of the function control table that was active at the time of the failure

DEVICE=dev or NONE
The number of the device used with the failing FCT, or NONE if no device was used

INITIALIZATION
The failure occurred during initialization

FCT FAILURE NO=nnnn
The failure count for the failing FCT

{ JOB NAME=jobname, JOB NUMBER=jobno } { jobname (jobid) }
Name, number and identifier of the job active at the time of failure

MODULE=module
Name of either the failing module or the calling module

MOD BASE=adr
Base address of either the failing module or the calling module

DISPLACEMENT=xxxxxx or DISP=xxxxxx
Displacement into the failing module or into the calling module

APAR NUMBER=xxxxxxx
The specified number is the most recent APAR number that applies to the specified module. If ?????? appears after APAR NUMBER, JES3 could not find the apar number of the failing module in the IATYMOD. A possible cause is the IATYMOD macro was not expanded within the first 255 bytes of the failing module.

PTF NUMBER=xxxxxxx
The specified number is the most recent PTF number that applies to the specified module. If ?????? appears after PTF NUMBER, JES3 could not find the PTF number of the failing module in the IATYMOD. A possible cause is the IATYMOD macro was not expanded within the first 255 bytes of the failing module.

PSW AT TIME OF FAILURE xxx
Program status word at the time of failure

ILC n
Instruction length code. If an abend occurred because you pressed the RESTART key, the information in this field is not valid.

REASON nnnnnnn
Reason code associated with the abend code.

THE FAILING INSTRUCTION IS instruction or IMPRECISE (ILC = 0) or INACCESSIBLE
The instruction is given, or IMPRECISE indicates that no instruction could be found, or INACCESSIBLE indicates the instruction could not be accessed

REGISTERS AT TIME OF FAILURE
Lists general registers 0-15 and their contents at the time of failure

System action: JES3 may or may not print a dump of the failing address space. The WANTDUMP= parameter on the OPTIONS initialization statement determines if a dump should be taken. If WANTDUMP=ASK, the operator is asked if a dump should be taken before JES3 attempts to reinstate the DSP. If WANTDUMP=NO, JES3 will not print the contents of the address space and will attempt to reinstate the DSP. If WANTDUMP=YES, JES3 will print the contents of the address space and will attempt to reinstate the DSP.

Operator response: If the DSP could not be reinstated, the DSP is no longer active. To reinstate the DSP, issue the appropriate *CALL command. See [z/OS JES3 Commands] for additional information on the *CALL command that is used to restart the failed DSP. Message IAT3713 may scroll off the screen. If the MCS message action retention facility is active, the message may be retrieved by issuing a D R,L command. If the JES3 action message retention facility is active, the message may be retrieved by issuing a *I,R command. The active action message retention facility, retains the last JES3 failsoft banner if a DSP in the JES3 address space abends. If a DSP abends in an FSS address space, the failsoft banner is not retained by the action message retention facility.

Problem determination: See Table I items 2, 16; Table III items 1 or 2 or 3, and items 4 and 7. Also, collect any other related information.

Routing Code: 10     Descriptor Code: 3,4

IAT3714

Explanation:

| SPECIFY DUMP OPTION FOR |

Chapter 7. Failsoft and Abend Messages 159
WANTDUMP=ASK was specified on the OPTIONS initialization statement, or has been assumed because the number of failures within the defined WANTDUMP=Yes interval has exceeded the WANTDUMP=Yes limit. The address space requesting the operator to specify the type of dump is identified as follows:

- For the JES3 global address space, the message contains the characters JES3 GLOBAL, and the main processor name.
- For a JES3 local address space, the message contains the characters JES3 LOCAL, and the main processor name.
- For an FSS address space, the message contains the FSS name and ASID.

Message IAT3822 is then issued which lists the valid dump options.

In the message text:

- **main** The name of the main processor, if the failure occurred in the JES3 address space.
- **fssname** The name of the functional subsystem, if the failure occurred in a functional subsystem.
- **asid** The address space identifier of the functional subsystem, if the failure occurred in a functional subsystem.

System action: JES3 or the FSS waits for an operator response.

Operator response: Enter a valid dump option specified in message IAT3822. If message IAT3822 has rolled off the screen, you can retrieve the valid options by issuing the command D R,MSG=IAT3822.

IAT3735  •  IAT3739

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3735

Explanation:

►—A WRITE OPERATION HAS BEEN REQUESTED
►—FOR A JES3SDM SINGLE RECORD FILE AND THE
►—FIRST WORD OF THE FDB DOES NOT CONTAIN THE
►—PROPER BUFFER ADDRESS

The message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3736

Explanation:

►—A JESREAD MACRO HAS BEEN ISSUED ON A
►—JES3SDM SINGLE RECORD FILE AND THE FIRST WORD
►—OF THE FDB CONTAINS ZEROS, OR THE VALIDATION
►—IDENTIFIER DID NOT MATCH WITH THE BUFFER CONTENTS

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3737

Explanation:

►—A BUFFER ADDRESS TO BE RETURNED TO THE JES3SDM BUFFER POOL VIA AN
►—APUTBUF MACRO IS INVALID.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3738

Explanation:

►—AN ACLOSE MACRO HAS BEEN ISSUED AND
►—NO ENTRY EXISTS IN THE JES3SDM FILE DIRECTORY
►—(FD) FOR THE FDB ADDRESS SUPPLIED.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3739

Explanation:

►—ILLEGAL INTERCOM COMMAND WAS ISSUED

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:
IAT3740
Explanation:

- No job TAT was provided on an AOPEN of a
- JES3SDM output multi record file or on an
- ANWRITE of a new single record file.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3741
Explanation:

- A track group being returned to
- The partition track
- Allocation table (TAT) already
- Exists in the TAT,
- The job TAT does not contain
- The TAT identifier,
- Or a purge of a single
- Record file back into the single
- Track table (STT) has
- Been attempted and the track
- Address already exists in the STT.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3742
Explanation:

- An I/O request to JES3SDM
- On a multi record file is issued
- For a file that is not open.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3743
Explanation:

- A count specified in either
- An ALOCATE or ABLOCK macro
- Can not be processed by JES3SDM

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3744
Explanation:

- An FDB passed
- To the ATRACK routine
- In JES3SDM is not valid

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
IAT3745 • IAT3749

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMTK</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10      Descriptor Code: 3,4

IAT3745

Explanation:

- A SINGLE RECORD FILE FDB PASSED TO THE
- JES3SDM PURGE ROUTINE VIA THE APURGE MACRO
- CONTAINS A TRACK ADDRESS WHICH DOES NOT EXIST
- IN THE SINGLE TRACK TABLE (STT)

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMST</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10      Descriptor Code: 3,4

IAT3746

Explanation:

- AN AOPENED MACRO HAS BEEN ISSUED
- FOR A JES3SDM
- MULTI RECORD FILE THAT IS OPEN

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>

Routing Code: 10      Descriptor Code: 3,4

IAT3747

Explanation:

- AN AOPENED MACRO IS ISSUED

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10      Descriptor Code: 3,4

IAT3748

Explanation:

- AN ALOCATE MACRO IS ISSUED
- FOR A JES3SDM OUTPUT
- MULTI RECORD FILE AND THE PREVIOUS CALL FOR
- THE FILE WAS ALSO AN ALOCATE

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMST</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10      Descriptor Code: 3,4

IAT3749

Explanation:

- TWO SUCCESSIVE ABLOCK MACROS HAVE BEEN ISSUED
- AGAINST A JES3SDM OUTPUT MULTI RECORD FILE WITHOUT AN
- ALOCATE MACRO, OR AN ABLOCK WITHOUT A PRIOR ALOCATE

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

Routing Code: 10  Descriptor Code: 3,4

IAT3755

Explanation:

- ERROR ACCESSING SYSOUT DATA SET JOB NUMBER IS IN REGISTER 3

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:
IAT3757

Explanation:

AN UNRECOVERABLE ERROR

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

IAT3760

Explanation:

AN ERROR OCCURRED DURING IATXSYSU PROCESSING

An error occurred while attempting to create a SYSUNITS entry through the IATXSYSU macro during *MODIFY,CONFIG processing. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

IAT3758

Explanation:

THE FCT ENQUEUED ON A RESOURCE IT ALREADY OWNS.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

IAT3761

Explanation:

AN ERROR OCCURRED DURING SWB UPDATE (IATXSWBU) PROCESSING

An error occurred while attempting to update the output SWB's on spool for a job. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

IAT3759

Explanation:

AN ERROR OCCURRED IN JOB

VALIDATION I/O SERVICES

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

IAT3762

Explanation:

A GENERALIZED SUBTASK WAS CANCELED WHEN THE ATTACHING FCT WAS TERMINATED

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.
Module: Containing Detecting Issuing
IATFSLG IATGRGS IATFSLG
Routing Code: 10  Descriptor Code: 3,4

IAT3764
Explanation:
- THE RESQUEUE ENTRIES HAVE BEEN ACCESSED INCORECTLY.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.

Module: Containing Detecting Issuing
IATFSLG IATGRJR IATFSLG
Routing Code: 10  Descriptor Code: 3,4

IAT3766
Explanation:
- THE DSP RETURNED TO JSS DRIVER WITH OUTSTANDING SAVE AREAS.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.

Module: Containing Detecting Issuing
IATFSLG IATGRLG IATFSLG
Routing Code: 10  Descriptor Code: 3,4

IAT3767
Explanation:
- THE SCHEDULER ELEMENT FOR THE DSP COULD NOT BE FOUND IN THE JDAB WHILE PROCESSING A LOGOUT REQUEST.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.

Module: Containing Detecting Issuing
IATFSLG IATGRLG IATFSLG
Routing Code: 10  Descriptor Code: 3,4

IAT3768
Explanation:
- THE FCT ISSUED A LOGOUT MACRO WITHOUT A PRECEDING LOGIN MACRO.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.

Module: Containing Detecting Issuing
IATFSLG IATGRLG IATFSLG
Routing Code: 10  Descriptor Code: 3,4

IAT3769
Explanation:
- THE FCT ISSUED AN AGETMAIN FOR ZERO CORE.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
IAT3771  •  IAT3776

Operator response: See message IAT3713.
### IAT3782

**Module:**
- Containing: IATFSLG, IATDMDT, IATFSLG
- Detecting: IATDMNC, IATINRN, IATOSSI
- Issuing: IATFSLG

**Routing Code:** 10  
**Descriptor Code:** 3,4

---

**Explanation:**

- **DSP FAILED BY SNARJP.**

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

**Operator response:** Specify a dump and notify the system programmer. See message IAT3713.

---

### IAT3783

**Module:**
- Containing: IATFSLG, IATDMDT, IATFSLG
- Detecting: IATDMNC, IATINRN, IATOSSI
- Issuing: IATFSLG

**Routing Code:** 10  
**Descriptor Code:** 3,4

---

**Explanation:**

- **A JES3SDM SINGLE RECORD FILE TO BE USED DURING INITIALIZATION IS NOT AVAILABLE.**

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

**Operator response:** See message IAT3713.

---

### IAT3784

**Module:**
- Containing: IATFSLG, IATDMDT, IATFSLG
- Detecting: IATDMNC, IATINRN, IATOSSI
- Issuing: IATFSLG

**Routing Code:** 10  
**Descriptor Code:** 3,4

---

**Explanation:**

- **NO TRACK GROUPS WERE AVAILABLE TO JES3SDM FOR ALLOCATION DURING INITIALIZATION.**

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

**Operator response:** See message IAT3713.

---

### IAT3785

**Module:**
- Containing: IATFSLG, IATSNFI, IATFSLG
- Detecting: IATDMNC, IATINRN, IATOSSI
- Issuing: IATFSLG

**Routing Code:** 10  
**Descriptor Code:** 3,4

---

**Explanation:**

- **SPOOL SPACE COULD NOT BE ALLOCATED TO A MULTI RECORD FILE OR A NEW SINGLE RECORD FILE DUE TO A JOB/DATA SET TAT ERROR.**

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

**Operator response:** See message IAT3713.
IAT3787
Explanation:
A JSAM OUTPUT REQUEST has been initiated on a processor other than GLOBAL.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

Routing Code: 10    Descriptor Code: 3,4

IAT3788
Explanation:
AN ERROR OCCURRED DURING ALESERV FOR A JES3 DATA SPACE.

The message is embedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM099 failure.
System action: The JES3 address space is ended.
Operator response: See message IAT3713.
Problem determination: Use message IAT3713 and the System Programmer Response for DM099 in JES3 Diagnosis Reference to determine the cause of the error.
Module:

Routing Code: 10    Descriptor Code: 3,4

IAT3790
Explanation:
The FCT issued an XPRT CLOSE OR DATA MACRO without previous OPEN REQUEST.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

Routing Code: 10    Descriptor Code: 3,4

IAT3791
Explanation:
INVALID RETURN CODE

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
IAT3792 • IAT3797

IAT3792
Explanation:
THE ATTACH MACRO ISSUED.
TO START A GENERALIZED SUBTASK HAS FAILED.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

IAT3793
Explanation:
A GENERALIZED SUBTASK ABNORM.
TERMINATED WHILE PROCESSING A REQUEST FOR THIS FCT.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

IAT3794
Explanation:
RECURSIVE ABEND IN DISPDJC

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout. A recursive failure has occurred in the DISPDJC DSP. This message is issued with DM955.

Operator response: Notify the system programmer and issue an *CALL, DISPDJC command when the problem has been corrected.

IAT3795
Explanation:
ERROR OCCURRED
WHILE PROCESSING CONSOLE CELL POOLS

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

IAT3796
Explanation:
ERROR HAS OCCURRED
IN GMS IN IATMSMS. MESSAGE IAT2004 WILL DESCRIBE THE ERROR AND THE RECOVERY ACTION TAKEN.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

IAT3797
Explanation:
ABEND IN IATDCNC UNRECOVERABLE

An error occurred in the unrecoverable I/O error routine in module IATDCNC. This message is embedded in the abend processing for DM953.
IAT3799  •  IAT3802

IAT3799

Explanation:

JRP ATTEMPTED TO ISSUE A SECOND STARTIO WITHOUT AN INTERVENING CHANNEL END.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing  IATFSLG  IATDCNC  IATFSLG
Detecting    IATRJM3  IATFSLG
Issuing      IATABN0  IATABN0  IATABN0

Routing Code: 10  Descriptor Code: 3,4

IAT3802

Explanation:

SDUMP/SDUMPX UNSUCCESSFUL BY MODULE:module:
RC=rc RSN=rsn

An SDUMP/SDUMPX request issued by the indicated module was unsuccessful. Either the dump could not be taken or only a partial dump was produced.

System action: If the issuing module is IATABN0, JES3 attempts to produce a dump, SYSABEND or SYSDUMP in IABM. If the issuing module is IATGRSV, no dump is taken and JES3 ends. If the issuing module is IATNTTCT or IATNTTXR, no dump is taken and the Netserv Communications Task retries processing one time.

Operator response: None. This is an informational message.

Programmer response: The return and reason codes are from SDUMP/SDUMPX macro. For a description, see z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU.

Module:

Containing  IATABN0  IATABN0  IATABN0
Detecting    IATABN0  IATABN0  IATABN0

Routing Code: 10  Descriptor Code: 3,4
IAT3803

Explanation:

- VERBX COMMAND REJECTED;
- UNDEFINED PARAMETER
- INCORRECT PARAMETER LENGTH
- INVALID PARAMETER COMBINATION
- TRACE ID MAXIMUM EXCEEDED
- INVALID TRACE ID
- EMPTY OR UNBALANCED PARENTHESSES
- DUPLICATE PARAMETERS
- PARAMETERS OUT OF ORDER
- INVALID IN THIS ADDRESS SPACE
- INVALID NUMERIC VALUE

This message is issued as a result of specifying the VERBX JES3 OPTION= xxx. The parameter is not three characters or it is not a valid option as defined in z/OS JES3 Diagnosis.  

System action: JES3 continues processing.  

System programmer response: See z/OS JES3 Diagnosis for the values on the OPTION= xxx parameter.  

Module:

Containing   Detecting   Issuing
IATABPR      IATABPR      IATABPR

Routing Code: Note 19  Descriptor Code: –

IAT3804

Explanation:

DAE SUCCESSFULLY SUPPRESSED THE DUMP

Dump analysis and elimination (DAE) successfully suppressed the dump.  

System action: If the issuing module is IATABNO, JES3 continues processing. If the issuing module is IATNTTCT or IATNTTXR, no dump is taken and the Netserv Communications Task retries processing one time.  

Operator response: None. This is an informational message.  

Module:

Containing   Detecting   Issuing
IATFSLG      IATOSWS      IATFSLG
IATOSPC

Routing Code: 10  Descriptor Code: –

IAT3805

Explanation:

BAD VALIDATION FIELD DETECTED

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.  

Operator response: See message IAT3713.  

Module:

Containing   Detecting   Issuing
IATFSLG      IATFSLG      IATFSLG

Routing Code: 10  Descriptor Code: 3

IAT3806

Explanation:

OSS FOUND WITH NO MATCHING DISK OSE.

A function control table (FCT) that was attempting to process output found an output service summary entry (OSS) in storage describing eligible output. However, no output scheduler element (OSE) describing the eligible output was found on the disk. This indicates a mismatch between the OSS and OSE control blocks.  

If register 3 does not contain zeros, it contains the address of the OSS. Register 6 contains the address of the job's resqueue.  

System action: The DSP fails with dump code DM206. JES3 will attempt to rebuild the OSS chain for the job and continue processing.  

System programmer response: Determine the cause of the error from the DM206 dump.  

Module:

Containing   Detecting   Issuing
IATFSLG      IATOSWS      IATFSLG
IATOSPC

IAT3807

Explanation:

CONFIRM "RETURN"

A potentially disruptive command, "RETURN" is about to be executed on processor 'systemname'. The processor is currently a global or local main as indicated in the
message. If this command was entered with an incorrect prefix, this command may have inadvertently been routed to another processor when it was intended for the processor on which it was entered. Verify that this command should continue to be executed on the specified processor.

**System action:** None.

**Operator response:** The system programmer should reply ‘U’ or ‘CONTINUE’ to allow the command to be processed or ‘CANCEL’ to cancel the command.

This message is sent in response to a command to the console where the command was entered.

**IATCNIN**

**Explanation:**

- **PREFIX—**prefix—**IGNORED** - CPF REQUEST
- **ENCOUNTERED, RC—**rc, **RSN—**rsn, ..
- **FOR**—SYSPLEX—sysname—

JES3 attempted to delete the prefix from the COMMAND PRE LEX FACILITY (CPF) and received the specified return and reason code. If SYSPLEX is specified, the error occurred attempting to delete a sysplex-scoped prefix. If sysname is specified, the error occurred attempting to delete a system-scoped prefix on the indicated system.

**System action:** Depending on the error, the prefix definition may not have been deleted from the COMMAND PREFIX FACILITY (CPF). JES3 termination continues. If the JES3 address space is terminating, CPF will delete all prefixes defined by JES3. If the error occurs during DSI processing on a local processor which is to become the new global processor, the new global may not be able to successfully define its SYSTEM scoped prefixes to CPF.

**Operator response:** The system programmer can use the D OPDATA, PREFIX command to see which prefixes are defined to CPF in the sysplex.

**Routing Code:** Note 18  **Descriptor Code:** 5

**IAT3809**

**Explanation:**

- **NAME**—**WARNING**—JES3 DUMP FORMAT
- **ROUTINE EXCEEDED 3 MINUTES**

More than 3 minutes elapsed while a JES3 dump formatting routine was in control. This indicates a possible hang condition.

Each JES3 dump formatting routine is timed, as it is entered, not to exceed 3 minutes execution time.

**System action:** JES3 resumes formatting routine execution.

**Operator response:** Cancel the dump formatting job with the "C;main,jjj,DUMP command.

**Problem determination:** See Table I, items 4, 5, 7, and 16; Table III item 7.

**Module:**

**IATABPR**

**IAT3811**

**Explanation:**

- **NAME**—**WARNING**—JES3 DUMP FORMAT
- **ROUTINE EXCEEDED 3 MINUTES**

The IPCS VERBEXIT JES3 subcommand was entered with the TABLE parameter, but the system cannot access the table. The table cannot be accessed because either:

- The specified trace table is not in the dump.
- The pointers to the trace table are not valid and the table cannot be accessed.

**System action:** The JES3 verb exit ends and IPCS processes the next control statement or subcommand. JES3 continues processing.

**System programmer response:** Reenter the IPCS subcommand with the correct value on the parameter.

**Module:**
**IAT3812**

**Explanation:**

```
*NO TRACE ENTRIES FOUND*
```

The IPCS VERBEXIT JES3 subcommand was entered with the ID or FCT parameters or both specified, but there are no trace entries found that match the search criteria.

**System action:** The JES3 verb exit ends and IPCS processes the next control statement or subcommand. JES3 continues processing.

**System programmer response:** Reenter the IPCS subcommand with the correct value on the subparameter.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

**Routing Code:** Note 19    **Descriptor Code:** –

---

**IAT3814**

**Explanation:**

```
*NO RSQ FOUND FOR jobname jobnum*
```

The IPCS VERBEXIT JES3 subcommand was entered with the jobname or jobnum parameter, but JES3 could not find the matching job name or job number within the resqueue chain.

Possible reasons the job could not be located are:

- Processing for the job completed
- Chaining for the resqueue chain is broken

**System action:** IPCS and JES3 continue processing.

**Programmer response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>

178  z/OS V1R12.0 JES3 Messages
IAT3817

Explanation:

- dsname IS NOT AVAILABLE
- ALLOCATE THE DATE SET OR AN ALTERNATE
- DATE SET UNDER DD 'IATTABL' THEN TRY AGAIN.

JES3 cannot locate data set SYS1.IATTBL0

System programmer response: Allocate data set SYS1.IATTBL0 or allocate a data set that contains members IATIPCS, IATIPCSG, and IATIPCSS with a DD statement that designates IATTABL as the DDNAME. Then, re-invoke the JES3 panel driver (IATJIPCS). The data set cannot be concatenated.

Module:

<td>IATJIPCS</td>
<td>IATJIPCS</td>
</tr>
</tbody>
</table>

Routing Code: Note 19 
Descriptor Code: –

IAT3818

Explanation:

- MEMBER (IATIPCSx) IS NOT IN
datasetname.

The data set does not have the specified member. In the message text:

datasetname

Specifies the name of the data set where IATJIPCS expected to find the specified member, IATIPCS, IATIPCSG, or IATIPCSS.

System programmer response: Copy the missing member to the specified data set and then re-invoke the JES3 panel driver (IATJIPCS).

Routing Code: Note 19 
Descriptor Code: –

IAT3821

Explanation:

- ABRT SNAPED TCB=tcbaddress
- ID=snapid RC=returncode

The SNAP macro has been issued for the task control block (TCB) associated with the failing function control table (FCT). The SNAP output is sent to DDNAME JES3SNAP.

In the message text:

tcbaddress The address of the TCB for which the SNAP macro was issued.

snapid The ID printed in the identification heading with the dump. The ID is used to correlate the message with the correct dump.

returncode The return code from the SNAP macro. See the SNAP macro in MVS Programming: Authorized Assembler Services Reference SET-WTC for return code definitions.

System action: JES3 continues processing.

System programmer response: Analyze the SNAP dump to determine the error and correct the problem.

</thead>
<tbody>
<tr>
<td>IATABRT</td>
<td>IATABRT</td>
<td>IATABRT</td>
</tr>
</tbody>
</table>

Routing Code: – 
Descriptor Code: –
IAT3822
Explanation:

- **NO** - NODUMP,
- **J** - JES3 CONTROL BLOCKS ONLY,
- **U** - JES3 DEFAULT, T - TERMINATE

This lists the valid dump options because one of the following conditions occurred:

- The operator issued a *DUMP command for the JES3 global or a JES3 local address space.
- The operator issued a *FAIL J=jobno,DUMP command for a job that was being processed by the JES3 global or a CI FSS.
- An unexpected error occurred.
- The operator issued a *FAIL fssname,DUMP command for a CI FSS.
- A DSP encountered an error and issued a FAILDSP command with the DUMP=YES option.

Message IAT3714 is issued as a WTOR and identifies the address space requesting the dump as follows:

- For the JES3 global address space, the message contains the characters JES3 GLOBAL, and the main processor name.
- For a JES3 local address space, the message contains the characters JES3 LOCAL, and the main processor name.
- For an FSS address space, the message contains the FSS fssname and ASID.

**Note:** These messages are only issued if the installation specified WANTDUMP=ASK on the OPTIONS initialization statement, or WANTDUMP=YES was specified but WANTDUMP=ASK was assumed because more failures than the number specified on the LIMIT= parameter occurred during the time interval specified on the INTERVAL= parameter.

**System action:** JES3 or the FSS waits for the operator to reply to message IAT3714. If the operator gives an incorrect reply, the messages are displayed again.

If an error occurred, data management messages IEC501, IEC502 and IEC705 will be displayed on an MCS console.

**Operator response:** Notify the system programmer. Reply to message IAT3714 with one of the following options:

- **NO** - Do not take a dump
- **J** - Format the JES3 or FSS control blocks only

IAT3824
Explanation:

- **ABEND DMxx**
- SUPPRESSED BY JES3 DUMP SUPPRESSION

JES3 dump suppression suppressed a JES3 failure and no dump was produced.

**System action:** JES3 continues processing.

**Operator response:** None. This is an informational message.

IAT3825
Explanation:

- **WARNING: FCT CHAIN ERROR,**
- FCTS LOST BETWEEN dspname1 AND dspname2

An error was encountered during JES3 recovery while following the chain pointers for the FCT dispatching chain. To continue, the system has validated FCT control blocks from each end of the chain, and removed FCTs where errors were found. These represent the functions (DSPs) which execute in the JES3 address space.

In the message text:

- **dspname1**
  
  The name of the DSP represented by the last valid FCT found starting at the top of the FCT chain.
The name of the DSP represented by the last valid FCT found when validation was begun at the end of the FCT chain.

Displayed if no valid FCT control blocks were found from one end of the chain or the other.

**System action:** JES3 processing continues.

**Operator response:** Notify the system programmer. Call the JES3 dumpcore (DC) utility, then use the OPTION=FCT command option to determine if critical functions (DSPs) have been lost. If this is the case, a JES3 hotstart should be scheduled.

If the message contains ‘********’, the chain was badly damaged and cannot be sufficiently mended. Issue a *DUMP command and restart JES3.

**Programmer response:** Compare the DSP names in the message with the DSP names contained in the DSP dictionary in module IATGRPT. Determine if any critical FCTs were lost and advise the operator on whether a JES3 hotstart should be scheduled.

If a dump was taken before JES3 issuing this message or by the operator, analyze the dump to determine the reason for the FCT chain error.

**Module:**

<table>

</table>

**Routing Code:** 10  **Descriptor Code:** 3, 4

---

IAT3831

**Explanation:**

A job has created the maximum possible number of Output Scheduling Element (OSE) records on SPOOL. No more SYSOUT can be processed for this job. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout for a DM674 ABEND.

**System action:** JES3 takes a dump if requested and continues processing.

**Operator response:** Cancel and restart the job if possible.

**System programmer response:** If EXTOSENUM=NO is specified on the OUTSERV statement of the JES3 initialization stream, consider whether this parameter can be removed. EXTOSENUM=NO is no longer needed after all JES3 processors have been migrated to z/OS V1R9 JES3 or above. There is no possibility of a fallback to an earlier release.

IAT3860

Explanation:

➤➤ INVALID RECORD FOUND IN INBOUND STREAM ➤➤

An incorrect record was encountered while using SNA protocols to receive the network stream.

System action: The NJERDR DSP fails with an abend code of DM530. Additional work sent with SNA protocols cannot be processed until a *CALL NJERDR command is issued.

Operator response: If SNA protocols are used to transmit data between your installation and the remote node, the network job is placed in operator hold. At the node that receives the network stream:

• notify the user that the network stream could not be transmitted and ask the user to resubmit the job.
• issue a *CALL NJERDR command to reinitialize the NJERDR DSP.
• use the *F,U,Q=BDT,NH=N to release the job from operator hold.

Take a dump and notify the system programmer.

Programmer response: Analyze the dump to determine why the record is not valid. See the z/OS JES3 Diagnosis for information on how to determine the error.

Explanation:

➤➤ AN ERROR WAS DETECTED BY ➤➤
THE ABACKR ROUTINE ➤➤

The message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM748 failure.

Operator response: See message IAT3713.

Module:
IAT3870

Explanation:

\textbf{AN IATXPRT MACRO HAS BEEN ISSUED WITH AN INVALID SIZE PARAMETER.}

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

\textbf{Operator response:} See message IAT3713.

\textbf{Module:}

\begin{tabular}{lccc}
\textbf{Containing} & \textbf{Detecting} & \textbf{Issuing} \\
IATFSLG & IATGRPR & IATFSLG \\
\end{tabular}

\textbf{Routing Code:} 10 \hspace{1cm} \textbf{Descriptor Code:} 3,4

IAT3872

Explanation:

\textbf{IATFSLG IS NOT AVAILABLE TO LOGOUT FAILURE, FOR FSS \textit{fssname}, ASID=\textit{asid}.}

JES3 or FSS recovery was unable to issue a logout failure message because IATYTVT does not point to IATFSLG, the module that issues the failsoft messages. The TVT table was not set up correctly during initialization.

The functional subsystem (FSS) \textit{fssname} and address space ID \textit{asid} appear in the message if the failure occurred in an FSS address space. If the text does not appear in the message, the failure occurred in JES3.

\textbf{System action:} ESTAE retry processing continues.

\textbf{Operator response:} Notify the system programmer.

\textbf{Programmer response:} Verify that module IATFSLG is present in one of the following:

- The STEPLIB concatenation defined in the JES3 or FSS procedure, if used.
- A library included in the linklist specified in response to message IEA101A, SPECIFY SYSTEM PARAMETERS FOR RELEASE \textit{xxx.yyy.zz}.

IAT3875
Explanation:
AN ATTEMPT HAS BEEN MADE TO USE AN ACTIVE RPL.

While execution was taking place under control of the SNARJP DSP, an attempt was made to reuse a request parameter list (RPL) that was still active.

System action: JES3 issues message IAT3713 and ends with failsoft code DM551.

Operator response: See message IAT3713.

Module:

Routing Code: 10   Descriptor Code: 3,4

IAT3877
Explanation:
FUNCTIONAL SUBSYSTEM ERROR.

An FSS-related error has occurred during execution of the driver DSP of the FSS writer. The error reason code in register 2 is described in z/OS JES3 Diagnosis.

System action: The writer DSP fails with dump code DM656. JES3 attempts to reinstate the writer DSP to clean-up and end.

Operator response: Notify the system programmer.

Problem determination: See Chapter 30, "Problem Determination," on page 711, Table I, items 2, 3, 4, 16, and 29; Table III, item 1, 2, or 3, and item 4.

Module:

Routing Code: 10   Descriptor Code: 3,4

IAT3880
Explanation:
OUTPUT SERVICE UNUSABLE, COULD NOT CREATE CELL POOL FOR WRITER DMC(S), RETURN CODE IN REGISTER 9.

JES3 could not initialize the cell pool for WRITER data management control blocks (DMCs) because storage was unavailable. Register 9 contains the error return code passed from the build pool routine in module IATGRQC.

System action: The OUTSERV FCT fails with failsoft code DM734. The OUTPUT service functions are unavailable until the next restart of JES3.

Operator response: Notify the system programmer immediately.

Programmer response: Determine the reason for the failure using the error code in register 9. See z/OS JES3 Diagnosis for a description of DM734.

Module:
IAT3881
Explanation:
➤ WRITER FAILING, ➤ PROBLEM IN CELL POOL MANAGEMENT ➤ FOR WRITER DMC(S), RETURN CODE IN REGISTER 9.

An error occurred in the cell pool management services in module IATGRQC. Register 9 contains the error return code passed to module IATOSSI from module IATGRQC.

System action: The WRITER FCT fails with failsoft code DM735.
Operator response: Notify the system programmer.

Problem determination: Determine the reason for the failure using the error code in register 9. See z/OS JES3 Diagnosis for a description of DM735.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3882
Explanation:
➤ ERROR OCCURRED DURING ➤ RAB DESTROY PROCESSING ➤ REASON CODE IS IN REGISTER 4.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3

IAT3883
Explanation:
➤ CI ENCONTERED ERROR RETURN—FROM SJF

An error occurred while the scheduler JCL facility (SJF) was processing a request to GET, FIND, RETRIEVE or UPDATE the information supplied in the scheduler work area (SWA) during the converter interpreter phase of JES3.

System action: The CI DSP fails with a failsoft code of DM209. See z/OS JES3 Diagnosis for a description of DM209.

Operator response: Notify the system programmer.

Problem determination: Determine the reason for failure by using the information supplied in the following registers:

<table>
<thead>
<tr>
<th>Register</th>
<th>Contents</th>

Explanation:
➤ ERROR ENCOUNTERED WHILE PROCESSING ➤ AN INTERNAL READER DATA SET.

The message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM872 failure.

Operator response: See message IAT3713.

Problem determination: Use message IAT3713 and the system programmer response for DM872 in z/OS JES3 Diagnosis to help determine the error.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3886
Explanation:
➤ AN ERROR CONDITION WAS DETECTED

Chapter 7. Failsoft and Abend Messages 187
IAT3887 • IAT3891

While processing an IATXCN macro—

An error condition or abend has occurred during the IATXCNs macro processing. The error or an abend could have been caused while:

- attempting to read the JDAB
- attempting to read the input parameter buffer
- reconstructing the input buffer

This message is embedded in message IAT3713 when a DM105 occurs.

**Operator response:** See message IAT3713. Also see [z/OS JES3 Diagnosis](#) for information on DM105.

**Module:**

IAT3906

Explanation:
DATA MANAGEMENT CHAINED SRF SERVICES RECEIVED AN
ERROR RETURN TRYING TO GET/RETURN A CELL. REGISTER 2 CONTAINS THE FOLLOWING INFORMATION:

BYTE 0: X'01' - GET CELL, X'02' - RETURN CELL
BYTE 1: THE TYPE OF CELL INVOLVED - X'01' - RCE,
X'02' - CSBT/JO S, X'03' - CSBT/JST, X'04' - CSBT/OSE,
X'05' - CSBT/DJST
BYTE 2: RETURN CODE FROM IATXGCL
BYTE 3: RETURN CODE FROM IATXRCL

This message is embedded in the IAT3713 multiple-line message as part of the failsoft logout.

Operator response: See message IAT3713.

Module:

Routing Code: 10  Descriptor Code: 3,4

IAT3907

Explanation:
AN ATTEMPT HAS BEEN MADE TO USE AN ACTIVE RPL

An attempt was made to reuse a request parameter list (RPL) that was still active while execution was taking place under control of the SNARJP DSP.

System action: JES3 issues message IAT3713 and ends with failsoft code DM551.

Operator response: Notify the system programmer.

System programmer response: See message IAT3713. It contains information to help you determine the error.

Module:

Routing Code: 10  Descriptor Code: 3

IAT3910

Explanation:

An error occurred while the NJESND DSP attempted to decompress a record that was too long.

System action: The NJESND DSP fails with a DM532 abend. The network job is placed in operator hold.

Operator response: Issue a dump and notify the system programmer.

Programmer response: z/OS JES3 Diagnosis contains more information about the DM532 dump code. If the data on spool is in error, delete the job and notify the job owner. If the error is a system problem which has been corrected, release the job from operator hold.

Problem determination: See Table I, item 29 and Table III, items 2, 4, and 7.

Module:

Routing Code: 10  Descriptor Code: 3

IAT3913

Explanation:
INCORRECT USE OF CSBT AND/OR RCE FOR JST PROCESSING

JES3 was unable to access or encountered an error while processing either:
- A chained SRF buffer table (CSBT).
- An RQ-chained SRF extension (RCE) for job summary table (JST).

This message is embedded in the IAT3713 multiple-line message as part of the JES3 failure logout.

System action: The DSP fails with a dump code of
DM736. Reason codes further identify the reason for the failure. [z/OS JES3 Diagnosis](#) contains additional information for the dump code.

**Programmer response:** Correct and re-link-edit the DSP.

**Problem determination:** Use message IAT3713 and the DM736 code to determine the error.

Chapter 8. Spool Initialization Messages

IAT4000
Explanation:

None of the TRACK or FORMAT initialization statements specified DDNAME=ddn even though the corresponding spool data set was defined during the previous JES3 restart.

System action: Message IAT4000 is written to the JES3OUT data set and JES3 initialization waits for an operator reply of one of the following:

CONTINUE
   JES3 initialization continues; spool data set with the ddname of ddn is removed from the checkpointed spool configuration. Any jobs found to have data on the spool data set will be deleted from the complex.

CANCEL
   JES3 initialization ends with a DM011 abend; the status of jobs which have data on the spool data set is not modified.

Operator response: Consult the system programmer for the proper actions to be taken.

Programmer response: If deletion of the data set was unintentional, correct the JES3 initialization stream, IPL the processor, and perform a warm start of JES3.

Because deletion of a spool data set, the *INQUIRY,Q,DD=ddn command may be issued to determine if any jobs in the complex have data on the spool data set to be deleted; the DISPLAY utility may be used to determine which jobs have space allocated on the data set.

Module:

Routing Code: 2   Descriptor Code: 7

IAT4001
Explanation:

None of the TRACK or FORMAT initialization statements specified DDNAME=ddn even though the corresponding spool data set was defined during the previous JES3 restart.

System action: This message is written to the JES3OUT data set to provide a hardcopy log of changes being made to the JES3 spool configuration during the current warm start. Message IAT4000 is issued in conjunction with this message to ask the system operator to confirm deletion of the spool data set.

Programmer response: If the operator response to message IAT4000 is CONTINUE, all knowledge of the spool data set will be deleted; additional messages may be issued as a result of the data set deletion. If the operator response to message IAT4000 is CANCEL, this message provides documentation in the JES3OUT data set of the JES3 initialization failure reason (DM011).

Module:
IAT4003 • IAT4006

Routing Code: 2     Descriptor Code: 7

IAT4003
Explanation:

JES3 was unable to open the spool data set with a
ddname of \textit{ddn}.
JES3 initialization cannot continue if either of the
following is true:
\begin{itemize}
  \item The \textit{ddn} is JES3\textsc{Jct} because access to the JCT
data set is required.
  \item This is a local processor because all local processors
must have access to all of the global's spool data
sets.
\end{itemize}

System action: This message is written to the
JES3\textsc{Out} data set to provide a hardcopy log of
changes being made to the JES3 spool configuration
during the current restart. If this is a global processor
and the failure was not for the JCT data set, message
IAT4006 or IAT4007 is issued in conjunction with this
message. They ask the system operator if JES3 should
be allowed to continue execution without the data set.

Programmer response: If the operator response to
message IAT4006 or IAT4007 is CONTINUE, the data
set will be made unavailable. If the operator response is
CANCEL, or if neither message was issued because
JES3 initialization cannot continue without the data set,
this message will provide documentation in the
JES3\textsc{Out} data set of the JES3 initialization failure
reason (DM011).

Module:

Routing Code: 2     Descriptor Code: 7

IAT4005
Explanation:

During JES3 global processor hot start processing,
initialization of spool data set with a ddname of \textit{ddn} has
been bypassed because formatting of the data set failed
during the previous JES3 warm or cold start. Formatting
of the data set is necessary before using the data set and
formatting is not performed during hot starts.

System action: The data set is placed into an
unavailable state; JES3 initialization processing
does not perform any checks to determine if the data set was
allocated to JES3 and does not attempt to open the
data set.

Programmer response: If access to the spool data
set is required, IPL the system and perform a warm
start of JES3.

Module:

Routing Code: 2     Descriptor Code: 7

IAT4006
Explanation:

JES3 was unable to open the spool data set with a
ddname of \textit{ddn}; the data set was not allocated to JES3
or dynamic allocation of the data set failed. The data set
was not used by JES3 during the previous JES3 global
processor restart.
OPEN FAILED FOR OLD SPOOL DATASET—ddn—>

(CONTINUE OR CANCEL)

JES3 was unable to open the spool data set with a ddname of ddn; the data set was probably not allocated to JES3 or dynamic allocation of the data set failed.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE
the spool data set is placed into an unavailable state; JES3 initialization processing continues without requiring access to the data set. The spool space allocation maps will be restored from the checkpoint data set if possible, to allow jobs with data on the spool data set to be retained in the job queue.

CANCEL
JES3 initialization ends with a DM012 abend.

Programmer response: If access to the spool data set is required, determine why the data set was not allocated and correct the situation; IPL the system and perform a warm start.

If JES3 can continue without the data set, reply CONTINUE. During subsequent hot or local starts, no open will be attempted for the data set and no *INQUIRY (*INQUIRY,Q,DD) or *MODIFY (*MODIFY,Q,DD) commands will be accepted that specify the ddname of the data set.

Module:

Routing Code: 1 Descriptor Code: 7

IAT4007

Explanation:
OPEN FAILED FOR NEW SPOOL DATASET—ddn—>

(CONTINUE OR CANCEL)

JES3 was unable to open the spool data set with a ddname of ddn; the data set was probably not allocated to JES3 or dynamic allocation of the data set failed. The spool data set was not previously used by JES3 and is being added during the current restart.

System action: JES3 initialization waits for an operator reply of:

CONTINUE
JES3 initialization continues; spool data set with a ddname of ddn is removed from the checkpointed spool configuration.

CANCEL
JES3 initialization ends with a DM012 abend.

If CONTINUE is replied, the spool data set definition is deleted; subsequent global processor hot starts and local processor restarts will not attempt to access the data set.

Programmer response: If access to the spool data set is required, determine why the data set was not allocated and correct the situation; IPL the system and perform a warm start.

If JES3 can continue without the data set, reply CONTINUE. During subsequent hot or local starts, no open will be attempted for the data set and no *INQUIRY (*INQUIRY,Q,DD) or *MODIFY (*MODIFY,Q,DD) commands will be accepted that specify the ddname of the data set.

Module:

Routing Code: 1 Descriptor Code: 7

IAT4008

Explanation:

ENTER DDNAME(S) OF

REPLACED PRE-FORMATTED

SPOOL DATASET(S), END, OR CANCEL

JES3 initialization is in progress with a start type of WR (warm with spool data set replace) or WAR (warm, with analysis and with spool data set replace). This WTOR is issued to obtain from the operator the ddnames, if any, of the previously used pre-formatted spool data sets that are to be replaced during this restart.

System action: JES3 initialization waits for an operator reply of:

dd1,dd2,ddn
specifies that the spool data sets with ddnames of dd1, dd2, and ddn were previously formatted and are being replaced during this JES3 restart.

END
specifies that input of the pre-formatted data set ddnames is complete.

CANCEL
specifies that JES3 initialization should end immediately.

Message IAT4010 is issued for each replied ddname to confirm that the requested data set will be processed as a replaced data set. Message IAT4008 will then be reissued until a reply of END is received. Jobs which are found to have data on a replaced spool data set will be deleted from the complex.
**Operator response:** Reply with the ddnames of the spool data sets to be replaced for which formatting is not necessary, or reply END. If the operator specified a wrong ddname and message IAT4010 was issued, a reply of CANCEL to IAT4008 ends JES3 initialization before the deletion of jobs that have data on the data set.

**Routing Code:** 1  
**Descriptor Code:** 7

---

**IAT4009**

**Explanation:**

- **ENTER DDNAME(S) OF REPLACED SPOOL DATASET**
- **DATASET(S) TO BE FORMATTED, END, OR CANCEL**

JES3 initialization is in progress with a start type of WR (warm with spool data set replace) or WAR (warm, with analysis and with spool data set replace). This WTOR is issued to obtain the ddnames, if any, of the spool data sets that are to be replaced during this restart for which formatting is required.

**System action:** JES3 initialization waits for an operator reply of:

- **dd1,dd2,ddn** specifies that the spool data sets with ddnames of dd1, dd2, and ddn require formatting to take place with this JES3 restart.
- **END** specifies that input of the data set ddnames is complete.
- **CANCEL** specifies that JES3 initialization should end immediately.

Message IAT4013 is issued for each replied ddname for which formatting is not mandatory to confirm that formatting is indeed required. Message IAT4010 is then issued for each replied ddname to acknowledge that the requested data set will be processed as a replaced data set. Message IAT4009 will then be reissued until a reply of END is received.

Jobs which are found to have data on a replaced spool data set will be deleted from the complex.

**Operator response:** Reply with the ddnames of the spool data sets to be replaced for which formatting is required, or reply END. If the operator specified a wrong ddname and message IAT4010 was issued, a reply of CANCEL to IAT4009 ends JES3 initialization before formatting of the data set or deletion of jobs that have data on the data set.

**Descriptor Code:** 7

---

**IAT4010**

**Explanation:**

- **SPOOL DATASET ddn REPLACED**
- **TO BE FORMATTED**

The system operator specified a ddname of ddn in response to message IAT4008 or IAT4009, and the ddname was found to be valid. This message acknowledges that JES3 initialization has accepted the ddname and that the corresponding spool data set will be processed as being replaced.

If the ddname was specified in response to message IAT4009, the TO BE FORMATTED section of the message will be displayed. The corresponding spool data set will be formatted when END is responded to message IAT4009.

**System action:** JES3 processing continues with the processing of the next ddname in the reply. When processing of the reply is complete, the WTOR (IAT4008 or IAT4009) is reissued.

**Operator response:** None. This is an informational message.

**Module:**

- **Containing:** IATINSD  
- **Detecting:** IATINSD  
- **Issuing:** IATINSD

**Routing Code:** 2  
**Descriptor Code:** 7

---

**IAT4011**

**Explanation:**

- **DDNAME ddn NOT DEFINED OR INELIGIBLE**

The system operator specified a ddname of ddn in response to message IAT4008 or IAT4009, and one of the following conditions was detected:

- there is no spool data set defined with a ddname of ddn.
- the spool data set with a ddname of ddn was previously deleted.
the spool data set with a ddname of \textit{ddn} is not available during the current JES3 restart.

\textbf{System action:} JES3 processing continues with the processing of the next ddname in the reply; the input \textit{ddn} is ignored. When processing of the reply is complete, the WTOR (IAT4008 or IAT4009) is reissued.

\textbf{Operator response:} Consult the system programmer to determine the correct ddname for your next response to IAT4008 or IAT4009.

\begin{table}[h]
\centering
\begin{tabular}{ccc}
\textbf{Containing} & \textbf{Detecting} & \textbf{Issuing} \\
IATINSD & IATINSD & IATINSD \\
\end{tabular}
\caption{Routing Code: 10 \hspace{1cm} Descriptor Code: 4}
\end{table}

\textbf{IAT4012}

\textbf{Explanation:}
\begin{itemize}
\item INVALID REPLY---xxx---FOR A DDNAME
\end{itemize}

The system operator specified a ddname of \textit{xxx} in response to message IAT4008 or IAT4009, and one of the following conditions was detected:
\begin{itemize}
\item \textit{xxx} is more than 8 characters in length.
\item \textit{xxx} contains characters which are not valid in a ddname.
\end{itemize}

\textbf{System action:} JES3 processing continues with the processing of the next ddname in the reply; the input \textit{ddn} is ignored. When processing of the reply is complete, the WTOR (IAT4008 or IAT4009) is reissued.

\textbf{Operator response:} Consult the system programmer to determine the correct ddname for your next response to IAT4008 or IAT4009.

\begin{table}[h]
\centering
\begin{tabular}{ccc}
\textbf{Containing} & \textbf{Detecting} & \textbf{Issuing} \\
IATINSD & IATINSD & IATINSD \\
\end{tabular}
\caption{Routing Code: 1 \hspace{1cm} Descriptor Code: 7}
\end{table}

\textbf{IAT4013}

\textbf{Explanation:}
\begin{itemize}
\item CONFIRM FORMAT REQUEST
\item FOR SPOOL DATASET---\textit{ddn}---ON---\textit{vol}---(U)
\end{itemize}

The system operator specified a ddname of \textit{ddn} in response to message IAT4009 and one of the following conditions was detected:
\begin{itemize}
\item ddname \textit{ddn} was defined in the JES3 initialization stream by a TRACK initialization statement.
\item the corresponding spool data set was previously used by JES3 and completed spool data set validation in a previous JES3 restart.
\end{itemize}

This message asks the system operator to confirm that formatting of the data set is to be allowed.

\textbf{System action:} JES3 initialization processing waits for one of the following operator replies:
\begin{itemize}
\item \textit{U} indicates that the ddname \textit{ddn} was valid and that the corresponding spool data set resides on the proper DASD volume; JES3 formatting of the data set is to be performed.
\item anything other than \textit{U} indicates that the input \textit{ddn} was in error; the spool data set is not to be formatted nor is it to be processed as being replaced.
\end{itemize}

When processing of the reply completes, message IAT4009 is reissued.

\textbf{Operator response:} If the spool data set which requires formatting resides on the proper DASD volume, reply \textit{U}.

\begin{table}[h]
\centering
\begin{tabular}{ccc}
\textbf{Containing} & \textbf{Detecting} & \textbf{Issuing} \\
IATINSD & IATINSD & IATINSD \\
\end{tabular}
\caption{Routing Code: 10 \hspace{1cm} Descriptor Code: 4}
\end{table}

\textbf{IAT4025}

\textbf{Explanation:}
\begin{itemize}
\item SPOOL DATASET---\textit{ddn}---MOVED FROM---\textit{old vol}---TO---\textit{new vol}---(CONTINUE OR CANCEL)
\end{itemize}

Spool data set with a ddname of \textit{ddn} was found on DASD volume ID "new"; however, the data set resided on the volume ID "old" the last time JES3 accessed the data set.

\textbf{System action:} For local processor restarts, message IAT4025 is written to the JES3OUT data set and JES3 initialization ends immediately with a DM012 abend.

For global processor restarts, this message is written as a WTOR to check with the system operator that the proper DASD volume is mounted and/or that the catalog is correct (if the data set was allocated to JES3 using the system catalog). JES3 initialization waits for one of the following operator replies:
\begin{itemize}
\item CONTINUE
\end{itemize}

JES3 initialization continues; the checkpointed
volume serial for this spool data set is updated for subsequent JES3 restarts.

CANCEL
JES3 initialization ends immediately with a DM011 abend.

Operator response: Contact the system programmer to determine the proper actions to be taken.

Programmer response: The proper procedure for moving a spool data set to a new DASD volume requires that the global processor be restarted, with the new volume mounted, before initiating any local processor restarts.

If the wrong spool volume is mounted, have the system operator reply CANCEL, mount the correct volume, and restart JES3. If the volume serial was changed, or the data set was moved to the new volume, reply CONTINUE.

Module: Containing Detecting Issuing
IATINSR IATINSR IATINSR

Routing Code: 1 Descriptor Code: 7

IAT4026
Explanation:

►—EXTENT FOR SPOOL DATASET—ddn—►

►—CHANGED OVER RESTART—(CONTINUE OR CANCEL)◄

The characteristics of the spool data set with a ddname of ddn were found to be different from the characteristics of the data set that was last accessed by JES3 using the same ddn. The modified characteristics may be one or more of the following:

- Data set starting track address (CCHH)
- Data set ending track address (CCHH)
- Number of records that will fit on a track
- Number of tracks per cylinder

To allow proper translation of DASD record addresses (CCHHR) to the form internally maintained by JES3, the above characteristics must always remain constant. A change in any of the characteristics may only be affected over a JES3 cold start or by performing a replace on the spool data set.

System action: For local processor restarts, message IAT4026 is written to the JES3OUT data set and JES3 initialization ends immediately with a DM012 abend.

For global processor restarts, this message is written as a WTO to determine if JES3 can continue processing without the affected spool data set. JES3 initialization waits for one of the following operator replies:

CONTINUE
The spool data set is dynamically unallocated and is placed into an unavailable state. Jobs which have written data to the affected spool data set will be placed into a spool hold state or will be purged from the system if necessary.

CANCEL
JES3 initialization ends immediately with a DM011 abend.

Operator response: Contact the system programmer to determine the proper actions to be taken.

Programmer response: If the wrong spool volume is mounted, have the system operator reply CANCEL, mount the correct volume, and restart JES3. If the volume serial was changed, or if the data set was moved to the new volume, reply CONTINUE.

The proper procedure for replacing a spool data set requires that the global processor be restarted with the replaced data set before initiating any local processor restarts.

►—(CONTINUE OR CANCEL)—►

An error was encountered during validation or formatting of a previously used spool data set. The return code, error code, and error reason indicate the specific error; for each return code rc, one or more error codes err further qualifies the error.

rc=04

data set not usable.

err=2c FORMAT VERIFY FAILURE
the entire spool data set is described by BADTRACK entries.

err=30 FORMAT VERIFY FAILURE
track format verification failed; the data set is not properly formatted.

err=34 FORMAT ERRORS EXCEEDED
data set formatting prematurely ended because of consecutive formatting errors on a given DASD head.
**err=38** FORMAT ERRORS EXCEEDED  
data set formatting prematurely ended because  
of consecutive formatting errors.

**err=3C** FORMAT ERRORS EXCEEDED  
data set formatting prematurely ended because  
of total number of formatting errors.

**rc=08**  
data set extent error.

**err=04** IATYIOP EXTENT ERROR  
the IATYIOP extent entry for the spool data set  
did not contain a valid data set control block  
(DCB) address.

**err=08** IATYIOP EXTENT ERROR  
the data set control block (DCB) for the spool  
data set was not open.

**err=0C** IATYIOP EXTENT ERROR  
the buffer size (spool record length) for the  
data set was larger than the maximum allowed.

**err=14** DEVICE TYPE ERROR  
DEVTYPE SVC error.

**err=18** DEVICE TYPE ERROR  
the device type on which the spool data set  
resides is not supported by JES3 for use in the  
spool.

**err=1C** MULTI-EXTENT DATA SET  
the spool data set consists of multiple DASD  
 extents.

**err=20** NULL DATA SET  
the spool data set contains no tracks (null data  
set).

**err=24** TRACK CAPACITY ERROR  
TRKCALC service routine error.

**err=28** TRACK CAPACITY ERROR  
the spool buffer size is greater than the device  
track size.

**err=48** UNABLE TO ACCESS UCB  
the UCB address for the spool data set could  
not be translated by the IOS IOSCAPU service.

**err=4C** ERROR ACCESSING UCB  
the IOS IOSCAPU service encountered an  
unexpected error while processing a UCB  
request.

**rc=0C**  
insufficient virtual storage.

**rc=10**  
IATDMVR parameter error.

**System action:** JES3 initialization waits for one of the  
following operator replies:

**CONTINUE**  
the spool data set is placed into an unavailable  
state; JES3 initialization processing continues  
without requiring access to the data set. The spool  
space allocation maps will be restored from the  
checkpoint data set if possible, to allow jobs with  
data on the spool data set to be retained in the job  
queue.

**CANCEL**  
JES3 initialization ends with a DM012 abend.

**Operator response:** Contact the system programmer  
to determine the proper action to be taken.

**Programmer response:** If access to the spool data  
set is required, correct the situation, restart JES3 on the  
global processor, and then restart JES3 on all local  
processors.

**Module:**

**Routing Code:** 1  
**Descriptor Code:** 7
IAT4029

Explanation:

- INVALID BADTRACK
- INITIALIZATION STATEMENT

An incorrect BADTRACK statement was read from the JES3 initialization stream. One or more of the following errors was detected:

- The specified ddname ddn is not valid; there is no TRACK OR FORMAT initialization statement with this ddname.
- Cylinder address cyl is not within the extent for the spool data set with a ddname of ddn.
- Track trk is not within the valid range for the DASD device type on which the data set with a ddname of ddn is allocated, or the combination of cylinder cyl and track trk is not within the extent for the spool data set.

System action: JES3 ignores the BADTRACK initialization statement.

Programmer response: Correct the associated BADTRACK initialization statement before the next JES3 warm or cold start or delete the statement in error.

Module:

Routing Code: 1

IAT4030

Explanation:

- SPOOL DATA SETS IN USE

This is an informational message displayed during initialization of the JES3 spool to indicate the total number of accessible spool data sets.

System action: If no spool data sets were successfully opened and available for use, JES3 initialization ends with a DM012 abend. At least one spool data set must be available to JES3 at all times.

Module:

Routing Code: Note 19

IAT4031

Explanation:

- FORMATTING OF SPOOL DATASET—ddn—
- IN PROGRESS

Formatting of the spool data set with a ddname of ddn has been initiated as a result of one of the following:

- the spool data set with a ddname of ddn was described by a FORMAT initialization statement and the data set was not previously used by JES3.
- the spool data set with a ddname of ddn was previously used by JES3 but is being replaced with formatting during the current restart; ddname ddn was replied to message IAT4009.
- formatting of the spool data set with a ddname of ddn failed during the previous JES3 restart (warm or cold) but the data set was defined by a TRACK or FORMAT initialization statement during the current warm start of JES3.

System action: JES3 initialization processing continues. JES3 issues message IAT4032 when formatting of the data set completes. If the data set is not acceptable for use in the JES3 spool, JES3 issues message IAT4027 or IAT4028.

Operator response: None. This is an informational message.

Module:

Routing Code: 2

IAT4032

Explanation:

- FORMATTING OF SPOOL DATASET—ddn—
- COMPLETE—nnn—ERRORS

Formatting of the spool data set with a ddname of ddn has completed. This message follows message IAT4031.
which indicated that JES3 had initiated formatting of the data set. If all DASD tracks within the data set were properly formatted, NO will be displayed in the message text. If there were formatting errors, nnn indicates the total number of tracks that were not formatted.

**System action:** JES3 initialization processing continues; JES3 writes message IAT4035 to the JES3OUT data set for each of the nnn tracks that were not successfully formatted.

**Operator response:** If errors were encountered during format processing of the data set, notify the system programmer.

**Programmer response:** Add a BADTRACK statement to the JES3 initialization stream for each spool track not formatted before the next warm or cold start. The JES3OUT data set indicates which DASD tracks were not formatted with message IAT4035.

**Module:**

<table>
<thead>

<td>IATINSR</td>
<td>IATINSR</td>
</tr>
</tbody>
</table>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4034**

**Explanation:**

- FORMAT COMPLETED FOR DDNAME=ddn
- CYL=cyl, TRK=trk

A BADTRACK statement was read from the JES3 initialization stream identifying the track CYL=cyl and TRK=trk on the spool data set with a ddname of ddn; however, JES3 has formatted the spool data set and formatting of the identified track has successfully completed.

**System action:** JES3 ignores the corresponding BADTRACK initialization statement and permits allocation and use of the identified track unless I/O errors are later encountered for the track.

**Programmer response:** Delete the BADTRACK statement from the JES3 initialization stream that defines the identified track. The BADTRACK statement contains the following parameters:

- BADTRACK, DDNAME=ddn, CYL=cyl, TRK=trk

Failure to update the initialization stream before performing the next warm start results in JES3 bypassing allocation of the track. If the identified track is actually usable, this can result in unnecessary performance degradation and wasting of the logical track group within which the track lies.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINSR</td>
<td>IATDMVR</td>
<td>IATINSR</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT4035**

**Explanation:**

- FORMAT FAILED FOR DDNAME=ddn
- CYL=cyl, TRK=trk

Formatting failed for track CYL=cyl and TRK=trk within the data set with the ddname of ddn and no
BADTRACK initialization statement describing the track was found.

System action: JES3 dynamically adds an entry to the BADTRACK checkpoint record describing the track and suspends allocation of the identified track until the next restart of JES3.

Programmer response: Add a BADTRACK statement to the JES3 initialization stream before the next warm or cold start to prevent JES3 from accessing the unformatted track. The BADTRACK statement contains the following parameters:

BADTRACK,DDNAME=ddn, CYL=cyl, TRK=trk

Failure to update the initialization stream before performing the next warm start can cause unnecessary JES3 spool error recovery processing when I/O is attempted to that track. For intermittent errors, failure to update the initialization stream can result in a loss of jobs and/or data.

Module:

Routing Code: 10

IAT4036

Explanation:

An error occurred during initialization processing of the spool data set with a ddname of ddn; the data set was allocated to JES3 but was later found to be unusable. This message is preceded by one of messages IAT4026, IAT4027, IAT4028, or IAT4040 indicating why the data set is unusable. The data set has been dynamically unallocated to allow the system programmer access to the data set and/or DASD volume containing the data set without JES3 conflicts.

System action: JES3 initialization processing continues without further access to the data set. Access to the volume containing the data set will not be required if the volume contained only the single spool data set.

Programmer response: If the volume containing the affected spool data set contains no other data sets, the volume can be removed from the system for offline recovery.

Module:

Routing Code: 10

IAT4038

Explanation:

A FORMAT statement was read from the JES3 initialization stream for spool data set ddname ddn; however, the data set was previously formatted and used by JES3.

System action: JES3 does not format the spool data set because formatting would destroy data previously written to the spool data set.

Programmer response: Replace the FORMAT statement in the initialization stream with an equivalent TRACK statement. If formatting of the data set is required, JES3 should be restarted with a start type of WR or WAR (in response to message IAT3011) and ddn should be replied to message IAT4009.

Module:
IAT4039

**Explanation:**

- Error(s) encountered formatting.
- The JCT dataset.

During JES3 cold start processing, at least one error was encountered while formatting the job control table (JCT) data set.

**System action:** JES3 initialization ends with a DM012 abend.

**Operator response:** Notify the system programmer.

**Programmer response:** Use the IEHLIST utility program to analyze the JCT data set and to assign alternate tracks to those found to be defective, or reallocate the JCT data set on a new DASD volume and restart JES3.

**Problem determination:** Table I, items 18 and 37; Table III, items 2, 4, 5, and 6.

**Module:**

**IAT4040**

**Explanation:**

- Spool dataset ddn format required.

During a JES3 global processor hot start or local processor restart, an available spool data set was found that requires formatting. Spool data set formatting can be performed only during JES3 warm or cold starts.

**System action:** JES3 initialization ends with a DM012 abend.

**Operator response:** Contact the system programmer to determine the proper action to be taken.

**Programmer response:** To circumvent the problem, IPL the processor, make the identified spool data set unavailable to JES3, and perform a warm start.

The procedure for reinstating a previously unavailable data set requires that the global processor be restarted with the data set available before initiating any local processor restarts.

**Problem determination:** Table III, items 2, 4, 5, 6, and 7.

**Module:**

**IAT4050**

**Explanation:**

- No SPART statement found.
- For partition spart, partition deleted.

An SPART initialization statement was not found for a spool partition defined in the previous JES3 warm or cold start.

**System action:** JES3 deletes spool partition spart and deletes all references to the partition from the system during JES3 initialization. For jobs previously read into the system requesting the spool partition, JES3 issues message IAT4125 and satisfies subsequent spool space.
allocation requests from the default spool partition. Spool data sets defined in the partition are placed into the default partition.

**Programmer response:** If the SPART statement was unintentionally modified or deleted, correct the initialization stream and restart JES3.

**System action:** JES3 disables overflow out of spool partition spart2 and processes space allocation from the partition as if OVRFL=NO was specified.

**Operator response:** Consult the system programmer for the proper action to be taken. If applicable, issue the *MODIFY,Q,SP=spart2,OVRFL=option command to enable space allocation overflow from spart2 to an appropriate spool partition.

**Programmer response:** If a previous JES3 initialization error has occurred processing the SPART initialization statement for spool partition spart2, modify the SPART initialization statement for one or more of the partitions in the partition overflow hierarchy for spart2 and perform a JES3 warm or cold start.

---

The SPART initialization statement for spool partition spart2 specified OVRFL=spart1 and spool spart1 was found to:

- overflow into partition spart2.
- overflow into a partition that overflows into partition spart2.

The resulting partition overflow hierarchy would have resulted in a circular overflow process.

**System action:** JES3 places spool data set ddn into the spool partition defined as the default partition (DEF=YES on the SPART initialization statement) or a partition that was selected to be the default partition (DEF=YES was not specified).

**Operator response:** Consult the system programmer for the proper action to be taken. If applicable, issue the *MODIFY,Q,DD=ddn,SP=spart command to move the spool data set to the required spool partition without performing a JES3 warm start.

**Programmer response:** If a previous JES3 initialization error has occurred processing the SPART
Initialization for spool partition **spart**, correct the SPART initialization statement before the next JES3 warm start. Otherwise, modify the TRACK or FORMAT initialization statement for data set **ddn** to specify a valid spool partition name.

**Module:**

### IAT4054

**Explanation:**

**ERROR READING SPOOL SPACE ALLOCATION**

**CHECKPOINT RECORD, RC=rc**

At least one spool data set was found to be unavailable during JES3 global processor initialization and an error has occurred attempting to read the spool space allocation maps (PTATs) from the checkpoint data sets. The type of checkpoint error is indicated by *rc* which is the error return code from the IATXCKPT macro. See [z/OS JES3 Customization](https://www.ibm.com/support/knowledgecenter/SANS5G_8.1.0/com.ibm.zos.bmki.os/zosjcust.html).

**System action:** JES3 recreates the spool space allocation maps (PTATs) by reading the job and data set space allocation maps (TATs) for each job in the complex. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set. Otherwise, JES3 cancels the jobs.

**Operator response:** None. This is an informational message.

**Module:**

**IATINSP**  
**IATINSP**  
**IATINSP**

**Routing Code:** 10  
**Descriptor Code:** 4

---

### IAT4056

**Explanation:**

**SPOOL SPACE ALLOCATION MAPS RESTORED**

**FROM CHECKPOINT (USE OR CREATE)**

At least one spool data set was found to be unavailable during JES3 global processor initialization. The spool space allocation maps (PTATs) were successfully read from the checkpoint data sets and have been restored. This message requests system operator confirmation that the checkpointed space allocation maps should be used.

**System action:** JES3 initialization waits for one of the following operator replies:

**USE**

specifies that the restored spool space allocation maps are to be used. If jobs are found that have data on the unavailable spool data set, JES3 issues message IAT4140 to determine if the jobs should be canceled or placed into a spool hold.

**CREATE**

specifies that the restored spool space allocation maps are to be discarded and that the space allocation maps are to be recreated. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set.

**Operator response:**

- **Reply USE** if no JES3 spool related failures have occurred since the previous JES3 warm start or if the current restart was preceded by an orderly shutdown of the global processor.
- **Reply CREATE** if previously encountered situations indicated that the checkpointed spool space allocation maps might not be valid.

**Module:**

---

### IAT4055

**Explanation:**

**SPOOL SPACE ALLOCATION CHECKPOINT**

**RECORD IS NOT USABLE**

At least one spool data set was found to be unavailable during JES3 global processor initialization and the spool space allocation maps (PTATs) were successfully read from the checkpoint data sets. However, the spool space allocation maps were not successfully checkpointed during the previous JES3 failure.

**System action:** JES3 recreates the spool space allocation maps (PTATs) by reading the job and data set space allocation maps (TATs) for each job in the complex. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set. Otherwise, JES3 cancels the jobs.

**Operator response:** None. This is an informational message.

**Module:**

---

Chapter 8. Spool Initialization Messages 209
IAT4057

Explanation:

At least one spool data set was found to be unavailable during JES3 global processor initialization. The spool space allocation maps (PTATs) were successfully read from the checkpoint data sets; validity checking has determined that the checkpoint record was successfully written when JES3 previously ended. However, an error has occurred during restoration of the checkpointed space allocation maps.

This message is issued to ask the system operator if JES3 is to recreate the spool space allocation maps.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE

the spool space allocation maps (PTATs) will be recreated by reading the job and data set space allocation maps (TATs) for each job in the complex. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set. Otherwise, JES3 cancels the job.

CANCEL

JES3 initialization ends with a DM012 abend; data is left in storage for diagnostic purposes.

Operator response: Consult the system programmer for the proper action to be taken. If the impact of the failure is minimal, reply CONTINUE to allow JES3 initialization to continue. If diagnostic data (a dump) is required, reply CANCEL.

Problem determination: Table III, items 2, 5, and 6.

Module:

IAT4059

Explanation:

At least one spool data set was found to be unavailable during JES3 global processor initialization and the spool space allocation maps (PTATs) were successfully restored from the checkpoint data sets. A change in status of one or more spool data sets was detected, requiring that the space allocation maps be reconfigured to match the new spool configuration. However, the load failed for module IATMOSP, which performs PTAT modifications.
**System action:** JES3 recreates the spool space allocation maps by recovering the spool space previously allocated to each job and sysout data set in the complex. Spool space recovery requires that each TAT (IATYJBT) for each job and spinoff data set be read and validated. JES3 cancels all jobs that have a job data set record (IATYJDS) or space allocation record (IATYJBT) on an unavailable data set.

**Operator response:** None. This is an informational message.

**Module:**

</table>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4060**

**Explanation:**

- **THE DEFAULT SPOOL PARTITION—spart**
- **HAS NO DATASETS**

Upon completion of JES3 spool initialization, no spool data sets were defined in the default spool partition. At least one spool data set must be available in the default partition to complete JES3 initialization.

**System action:** JES3 initialization ends with a DM012 abend.

**Programmer response:** Modify the JES3 spool configuration such that one or more spool data sets are in the default partition. This can be accomplished by:
- adding a new spool data set to the default partition.
- moving a data set from one partition into the default partition.
- changing a partition to become the default.
- making an unavailable data set that is in the default partition available again.

**Problem determination:** Table III, item 5.

**Module:**

<table>
<thead>
<tr>

</table>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4061**

**Explanation:**

**LOGICAL TRACK GROUP SIZE**

- **FOR PARTITION—spart**
- **CHANGED FROM—xxx—toyyy**

The number of records per logical track group for all spool data sets in partition spart has been changed from xxx to yyy. The change may have been effected by:
- addition of the GRPSZ parameter to the SPART initialization statement for partition spart.
- addition of GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the SPART statement for partition spart.

**System action:** JES3 initialization continues. The number of records per track group remains at xxx for all data sets previously added to or replaced within partition spart. The number of records per track group for data sets subsequently added to the partition or replaced within the partition is set to yyy.

JES3 issues message IAT4063 for each spool data set in partition spart whose logical track group size of xxx is still in use.

**Operator response:** Notify the system programmer.

**Programmer response:** If the logical track group size was unintentionally modified, correct the initialization stream before the next JES3 warm or cold start. If spool data sets were being added or replaced during the current restart, those data sets should be replaced during the JES3 warm start in which the corrected initialization stream is read.

To modify the logical track group size for the entire spool partition, it will be necessary to invoke replace processing for each spool data set in the partition eventually.

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT4062**

**Explanation:**

Chapter 8. Spool Initialization Messages  211
At least one spool data set was found to be unavailable during JES3 global processor initialization and JES3 was unable to restore the spool space allocation maps (PTATs) from the checkpoint data set. This message will be preceded by one or more of the following messages IAT4054, IAT4055, IAT4056, and IAT4057 indicating why the PTATs are being recreated.

**System action:** JES3 recreates the spool space allocation maps by recovering the spool space previously allocated to each job and sysout data set in the complex. Spool space recovery requires that the TAT (IATYJBT) for each job and spinoff data set be read and validated. JES3 cancels all jobs having a job data set record (IATYJDS) or space allocation record (IATYJBT) on an unavailable data set.

**Operator response:** None. This is an informational message.

**Explanation:**

- SPOOL DATASET—ddn—GRPSZ—xxx
- INCONSISTENT WITH PARTITION—spart (yyy)

The number of records per logical track group for all spool data sets in partition spart is currently defined as yyy; however, the number of records per track group for the data set with a ddname of ddn is xxx. This inconsistency may have been caused by:

- addition of the GRPSZ parameter to the SPART initialization statement for partition spart.
- addition of GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the SPART statement for partition spart.
- movement of the data set with a ddname of ddn from another partition into partition spart, where the originating partition’s track group size was defined as xxx.
- the spool partition specified on the TRACK or FORMAT initialization statement for data set ddn was in error and the data set was moved to the default partition during JES3 initialization.

**System action:** JES3 initialization continues; the number of records per track group remains at xxx for data set ddn. However, the spool space utilization and access objectives defined by the installation may have been defeated.

**Operator response:** Notify the system programmer.

**Programmer response:** If the logical track group size was unintentionally modified, correct the initialization stream before the next JES3 warm or cold start.

To modify the logical track group size for the data set ddn, it will be necessary to invoke replace processing (start type WR or WAR) and specify ddn in response to message IAT4008 or IAT4009.

**Explanation:**

- MAXIMUM NUMBER OF JOBS—nnnnnnn
- IS LIMITED TO—nnnnnnn
- BY JOB NUMBER RANGE—nnnnnnn
- JCT DATASET SIZE—nn

The maximum number of jobs that may reside in the JES3 job queue was found to be less than the number defined by the job limit subparameter of the JOBNO keyword parameter of the OPTIONS initialization statement. The maximum number of jobs is being restricted by either:

- the number of job numbers in the defined job number range is less than the defined maximum number of jobs. For example, the JOBNO keyword parameter of the OPTIONS initialization statement specified JOBNO=(1,100,1000). For this example, the job number range will support only 100 jobs, where the job queue size has been defined to allow 1000 jobs.
- the JES3JCT data set is not large enough to contain the JCT records for the defined maximum number of jobs.

**System action:** The storage resident job queue is
constructed to support nnnnnnnn jobs. An out-of-space condition on the JES3JCT data set can result if the storage resident job queue contains more jobs than the JES3JCT data set.

**Operator response:** Contact the system programmer to determine if this restriction requires his immediate attention.

**System programmer response:** If the maximum number of jobs is being restricted by the defined job number range, modify the JOBNO parameter such that the job number range is at least as large as the maximum number of jobs and perform a JES3 warm start or hot start with refresh.

If the maximum number of jobs is being restricted by the size of the JCT data set, do one of the following things:

1. Create a larger JCT data set, copy the existing JCT data set to it using the IATUTJCT utility, and restart JES3 using the new JCT data set.
2. Reallocate the JCT data set and perform a JES3 cold start.
3. Modify the JOBNO parameter to limit the storage resident job queue size.

**Module:**

**IAT4079**

**Explanation:**

**CONTINUE**

JES3 initialization continues.

**CANCEL**

JES3 initialization ends immediately with a DM025 abend. The status of the affected jobs is left intact in the JES3JCT data set.

**Operator response:** Contact the system programmer to determine the action to be taken.

**System programmer response:** If the job number range was intentionally changed, have the system operator reply CONTINUE to allow JES3 initialization to continue. Otherwise, reply CANCEL to end JES3.

**IAT4083**

**Explanation:**

An error occurred while JES3 was attempting to create

Before modification of the job number range, the JES3 job queue should be queried to determine how many jobs would be affected by the change.

**Module:**

**IAT4080**

**Explanation:**

An error was detected during JES3 initialization processing of the JES3JCT data set, which has resulted in the loss of one or more jobs.

**System action:** JES3 initialization waits for one of the following operator replies:

**CONTINUE**

JES3 initialization continues. The affected jobs are deleted from the job queue upon completion of JES3 initialization.

**CANCEL**

JES3 initialization ends immediately with a DM008 abend. The status of the affected jobs is left intact in the JES3JCT data set.

**Operator response:** Contact the system programmer to determine the action to be taken.

**Programmer response:** Examine the preceding messages to determine if the errors are recoverable.

**Module:**

**IAT4083**

**Explanation:**

An error occurred while JES3 was attempting to create
IAT4084 • IAT4085

An error occurred while JES3 was attempting to add a data space to its access list through the ALESERV macro. The return and reason codes from the ALESERV macro are displayed in the message.

Message IAT3115 or IAT4085 follows describing the JES3 function that is affected by the error and the action JES3 is taking.

System action: The data space function is disabled. JES3 initialization continues.

Operator response: Notify the system programmer. When the problem is fixed, hotstart JES3 to create the data space.

Programmer response: Use the return codes and reason codes for the MVS ALESERV macro described in *z/OS MVS Programming: Assembler Services Reference ABE-HSP* to determine the cause of the failure.

Routing Code: 10  Descriptor Code: 7,11

IAT4100

Explanation:

Recovery of the spool space previously allocated to the single track table (STT) has failed during JES3 global processor warm or hot start processing. One of the following conditions was encountered:

STT TAT INVALID
    the STT TAT (IATYJBT chain) failed validity checking or the STT TAT FDB (in the JESCKPNT data area) was not valid.

STT TAT ON AN UNAVAILABLE DATASET
    one or more JBT records in the STT TAT chain were on a spool data set which is not accessible to JES3 during this restart.
**STT TAT ON A REPLACED DATASET**

one or more JBT records in the STT TAT chain were on a spool data set which was replaced during this restart.

**DUPLICATE TRACK CONDITION**

one of the JBT records in the STT TAT chain described a logical track group which (during some unknown time interval) was simultaneously allocated to another job.

**STT TRT ON A NONEXISTENT DATA SET**

An STT extent pointer was found in the STT track allocation table. There is no corresponding entry in the JES3 volume table that was checkpointed during the last JES3 warm start.

JES3 eventually aborts initialization and abends with a DM743.

**System action:** JES3 attempts reconstruction of a JBT to describe the STT spool space from the spool data set checkpoint (IATYVOL) record STT definitions. If reconstruction of the STT spool space is successful, no message will be issued; JES3 initialization continues. Failure of the STT reconstruction logic results in message IAT4101.

**Operator response:** Notify the system programmer.

**Programmer response:** If STT JBT recovery fails, the initialization debugging aid (INTDEBUG) facility may be used to obtain a dump where the error is detected.

For the "STT TAT ON A NONEXISTENT DATA SET" condition, there has been a mismatched set of spools and a checkpoint data set being used. Verify that the same configuration is in use as was used the last time JES3 was initialized.

**Problem determination:** Table III, item 11.

</tr>
</thead>
</table>

---

**IAT4101**

**Explanation:**

►-SINGLE TRACK TABLE RECONSTRUCTION

►-FAILED – UNABLE TO RESTART JES3

During JES3 global processor warm or hot start processing, one of the following conditions was encountered:

- all spool data sets which previously contained STT spool space were deleted during this restart.
During global processor hot or warm start initialization, an error was encountered recovering the spool space that is used internally by JES3. This message will have been preceded by one or more messages that describe the lost data. This message requests system operator confirmation that JES3 initialization is to be allowed to continue without the affected data and/or system status.

**System action:** JES3 initialization waits for one of the following operator replies:

- **CONTINUE**
  - JES3 initialization continues; the affected checkpointed data areas are reconstructed if possible.

- **CANCEL**
  - JES3 initialization ends with a DM011 abend.

**Operator response:** Contact the system programmer to determine the action to be taken.

**Programmer response:** Analyze the error/warning messages which describe the specific errors that were encountered. If the lost data will not significantly affect JES3 performance or cause jobs to be affected, reply **CONTINUE**.

**Module:**

- **Containing**
  - IATINST

- **Detecting**
  - IATINST

- **Issuing**
  - IATINST

**Routing Code:** 1  
**Descriptor Code:** 7

---

The single track table (STT) entry range specified for the spool data set with ddname `ddn` was not valid. One or more of the following conditions were encountered:

- **STT=(startcy,endcy)** was specified and the ending cylinder address was higher than the cylinder on which the data set ends.

- **STTL=(startcy,count)** was specified and the starting cylinder address was lower than the cylinder on which the data set starts.

**System action:** JES3 initialization continues; no single track table space is created on the identified spool data set.

**Programmer response:** Run the IEHLIST system utility to determine the cylinder boundaries for the spool data set and correct the associated TRACK or FORMAT initialization statement. To effect the desired STT range it will be necessary to:

  - perform a JES3 cold start.
  - perform a JES3 warm start with replace (start type WR or WAR) and specify `ddn` in response to message IAT4008.

If insufficient STT spool space is available to JES3 even without the data intended to be on data set `ddn`, JES3 will dynamically extend the STT space as required. Performance degradation is possible because the STT extension logic does not take into consideration all variables which may affect spool performance.

If the STT or STTL range specified for any of the format or track statements is not valid, JES3 allocates the centermost two track groups of each data set in the default spool partition as the initial STT allocation.

- If there is an incorrect STT or STTL range specified for any of the format or track statements, JES3 allocates the centermost two track groups of each data set in the default spool partition as the initial STT allocation.

**Problem determination:** Table I, item 25; Table III, item 5.

**Module:**

  - IATINST

**Routing Code:** 2  
**Descriptor Code:** 7

---

The TRACK or FORMAT initialization statement for spool data set `ddn` contained the STT=(startcy,count) or the STT=(startcy,endcy) parameter. The starting cylinder address was within the bounds of the data set;
however, the data set has fewer than count logical track groups between the starting cylinder address and the end of the data set.

**System action:** JES3 initialization processing continues; single track table space is created on the spool data set from the starting cylinder address to the end of the data set.

**Programmer response:** Run the IEHLIST system utility to determine the cylinder boundaries for the spool data set and correct the associated TRACK or FORMAT initialization statement. To effect the desired STT range it will be necessary to:

- perform a JES3 cold start.
- perform a JES3 warm start with replace (start type WR or WAR) and specify ddn in response to message IAT4008.

If insufficient STT spool space is available to JES3 without the data intended to be on data set ddn, JES3 will dynamically extend the STT space as required. Performance degradation is possible because the STT extension logic does not take into consideration all variables which may affect spool performance.

IAT4106

**Explanation:**

- **STT EXPANSION SEGMENT(S) LOST**
- **FOR SPOOL DATASET—ddn**

Recovery of the spool space previously allocated to the single track table (STT) has failed during JES3 global processor warm or hot start processing; this message will be preceded by message IAT4100 which describes the type of error that was encountered. During reconstruction of the STT TAT, spool data sets were found to contain logical track groups that were dynamically added to the STT.

**System action:** Reconstruction of the STT job track allocation table (JBT) continues; additional messages may be issued during JES3 internal spool space recovery which identify the specific STT data that was lost (if any).

**Operator response:** None. This is an informational message.

**Programmer response:** During the next JES3 cold start, define enough sufficient STT spool space to prevent STT expansion in the future.

---

IAT4107

**Explanation:**

- **WILL NOT ACCEPT A RESUBMITTED JOB WITH A JOB NUMBER GREATER THAN 65,534**

JES3 has detected that a Dependent Job Control network has been submitted on a release that does not support job numbers greater than 65,534 and is in the system. This message is a warning that until this net has completed, you should not attempt to increase the job number range beyond 65,534.

In the message text:

`netname`

The name of the net.

**System action:** JES3 initialization continues.

**Operator response:** Notify the system programmer.

**System programmer response:** If you have not made plans to increase the job number range beyond 65,534 no immediate action is needed. If you do make plans to increase the job number range you must either wait for this net to complete or cancel it. If you increase the job number range beyond 65,534 while the net is still in the system, and any job within the net is resubmitted and assigned a job number greater than 65,534, the job will fail with message IAT6179.

---

IAT4109

**Explanation:**

- **ERROR RESTORING JES3 DUMP**
- **SUPPRESSION LIST**

JES3 initialization was unable to restore the JES3 dump suppression checkpoint record spool space for one or
more of the following reasons:
- The checkpoint FDB is incorrect
- The checkpoint record is on an unavailable spool data set
- The checkpoint record is on a replaced spool data set.

**System action:** JES3 issues message IAT4103, asking the operator if JES3 should continue initialization or cancel it. If the operator replies continue, the JES3 dump suppression checkpoint record is lost, and a new one is built with no dumps suppressed. If cancel is specified, JES3 ends with an DM011 code.

**Operator response:** Notify the system programmer to determine the action to take.

**System programmer response:** Reenter the operator commands to obtain the list of JES3 failsoft codes that are a result of the JES3 dump suppression checkpoint records being suppressed. Or, reply cancel to message IAT4103 and analyze the abend with DM011 code. See [z/OS JES3 Diagnosis](#) for more information on the DM011 code.

**Problem determination:** See Table III, items 4 - 6 and Table I, item 29.

---

**IAT4118**

**Explanation:**

1. **ERROR RESTORING DEPENDENT JOB**
2. **CONTROL STATUS**

JES3 initialization was unable to restore the dependent job control (DJC) network status checkpoint data because of one or more of the following:

- The DJC checkpoint FDB (in the JESCKPNT data area) is incorrect.
- One or more of the DJC checkpoint records were on unavailable spool data sets.
- One or more of the DJC checkpoint records were on spool data sets which were replaced during this restart.

**System action:** JES3 initialization continues; the status of some (or all) DJC networks are lost. Message IAT4146 will be issued for each job in the complex which is part of a DJC network.

**Operator response:** None. This is an informational message.

**Problem determination:** Table III, item 11.

**Module:**

---

**IAT4119**

**Explanation:**

1. **ERROR RESTORING MAIN SCHEDULING STATUS**

JES3 initialization was unable to restore the generalized main scheduling (GMS) checkpoint data because of one or more of the following:

- The GMS checkpoint FDB (in the JESCKPNT data area) is incorrect.
- One or more of the GMS checkpoint records were on unavailable spool data sets.
- One or more of the GMS checkpoint records were on spool data sets which were replaced during this restart.

**System action:** JES3 initialization continues; the GMS scheduling algorithms are reconstructed from the JES3 initialization stream data. All scheduling algorithm modifications are lost.

**Operator response:** Reenter any GMS scheduling algorithm modifications using the *MODIFY,G command.
Problem determination: Table III, item 11.

Module:

IAT4120

Explanation:

FSS CHECKPOINT DATA LOST—OVER RESTART

JES3 initialization was unable to restore the functional subsystem (FSS/FSA) checkpoint data because of one or more of the following:

- The FSS checkpoint FDB (in the JESCKPNT data area) is not valid.
- One or more of the FSS checkpoint records were on unavailable spool data sets.
- One or more of the FSS checkpoint records were on spool data sets which were replaced during this restart.

System action: JES3 initialization continues; the status of previously active functional subsystems is lost.

Operator response: None. This is an informational message.

Problem determination: Table III, item 11.

Module:

---

Routing Code: 2  Descriptor Code: 7

IAT4121

Explanation:

ERROR RESTORING DJC NETWORK—netname:

JOB(S) WILL BE PLACED INTO—OPERATOR HOLD

JES3 initialization was unable to restore the status of a specific dependent job control (DJC) network because of one or more of the following:

- The network checkpoint FDB (in the NCK checkpoint record) is not valid.
- The network checkpoint record was on an unavailable spool data set.
- The network checkpoint record was on a spool data set that was replaced during the current JES3 restart.

System action: JES3 initialization continues; the system writes message IAT4146 to JES3OUT for each job in the complex that is a part of the dependent job control (DJC) network.

Operator response: None. This is an informational message.

Problem determination: Table III, item 11.

Module:

---

Routing Code: 2  Descriptor Code: 7

IAT4122

Explanation:

BDT CHECKPOINT DATA LOST—OVER RESTART

JES3 initialization was unable to restore the Bulk Data Transfer (BDT) subsystem communication table checkpoint record (IATYBCK) because of one or more of the following reasons:

- The BCK checkpoint FDB (in the JESCKPNT) data area is not valid.
- One or more of the BCK checkpoint records were located on unavailable spool data sets.
- One or more of the BCK checkpoint records were on spool data sets which were replaced during this restart.

System action: Message IAT4103 follows this message. Message IAT4103 gives the operator the opportunity to allow initialization to continue or end.

Operator response: If initialization is allowed to continue, the MVS/BDT VARY JES3 online command should be issued to reestablish communication between BDT and JES3. This command should be entered after *S JSS processing has completed.

Module:

---

Routing Code: 2  Descriptor Code: 7

IAT4123

Explanation:

ERROR RESTORING LOCATE—CHECKPOINT DATA

JES3 initialization was unable to restore the locate checkpoint data (LCP) because of one or more of the following reasons:

---

Chapter 8. Spool Initialization Messages  221
The checkpoint file descriptor block (FDB), in the JESCKPNT data area, is incorrect.

One or more of the checkpoint records were on unavailable spool data sets.

One or more of the checkpoint records were on spool data sets that were replaced during this restart.

**System action:** Message IAT4103 follows this message. Message IAT4103 allows you to continue initialization or end initialization.

**Operator response:** Notify the system programmer.

**System programmer response:** If there are jobs currently in locate processing on any of the local processors, reply “cancel” to message IAT4103 or restart JES3 on those processors. A spool integrity exposure may exist if jobs are active in locate processing on any of the local processors.

**Module:**

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4124**

**Explanation:**

- **JOB—jobname(jobid)**
- **IS ACTIVE IN LOCATE ON MAIN—main**
- **DISABLE JES3 ON MAIN—main**

During JES3 global processor initialization, an error was encountered during recovery of spool space previously allocated to the specified job. The job is to be deleted from the job queue; however, the last known status of the job indicates that the job is in locate processing on one of the JES3 local processors. This message follows message IAT4137.

**System action:** JES3 puts the job in a “delete only” state. Further scheduling of the job is suspended. Processing continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Ensure that the job is no longer active in locate processing on the specified processor by issuing the *RETURN command or IPLing the local processor.

**Module:**

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4126**

**Explanation:**

- **JOB—jobname(jobid)**
- **HAS DATA ON—REPLACED**
- **SPOOL DATASET—ddn**

During JES3 global processor initialization, the specified job was found to have data on one or more spool data sets that were replaced or deleted during this restart:

- if **REPLACED** appears, spool data set *ddn* was replaced during this restart (*ddn* is replied to in messages IAT4008 or IAT4009); the data set is available during this restart; but, it no longer contains the data written on behalf of the specified job.

- if **DELETED** appears, spool data set *ddn* is deleted during this restart (the TRACK or FORMAT statement is deleted and the operator confirmed deletion of the data set by responding “continue” to message IAT4000).
**System action:** JES3 deletes the job from the job queue.

**Programmer response:** Resubmit the canceled job, if possible.

**Module:**

<table>
<thead>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4127**

**Explanation:**

\[ \Rightarrow \text{JOB—jobname(jobid)—HAS DATA ON}\]

\[ \Rightarrow \text{MULTIPLE UNAVAILABLE SPOOL DATASETS—ddn}\]

During JES3 global processor initialization, the specified job was found to have data on one or more spool data sets which are not available during this restart. The display of a single ddname does not indicate that ddn is the only unavailable spool data set that the job requires.

**System action:** If the spool space allocation maps (PTATs) were restored from the JES3 checkpoint data set the operator replied USE to message IAT4056. If the unavailable spool data sets are not required for recovery of the spool space allocated to the job, message IAT4140 is issued to allow the disposition of the job. Message IAT4140 is bypassed if the operator previously replied ALL in response to IAT4140.

If the spool space allocation maps (PTATs) were not restored from the JES3 checkpoint data set and:

- if the unavailable spool data sets are not required for recovery of the spool space allocated to the job (all TATs for the job are accessible), message IAT4136 is issued and the job is placed into a spool hold.
- if the unavailable spool data sets are required for recovery of the spool space allocated to the job, the job is deleted.

**Operator response:** None. This is an informational message.

</tr>
</tbody>
</table>

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4131**

**Explanation:**

\[ \Rightarrow \text{SPOOL RECORD ERROR DETECTED—err}\]

\[ \Rightarrow \text{FOR JOB—jobname(jobid)}\]

During JES3 global processor initialization, the system found an incorrect spool resident control block for the specified job.

In the message text, err is one of the following:

- **JBT** One or more records in the track allocation table (TAT) chain (IATYJBT).
- **JDAB** The job accounting block (IATYJDA).
- **JDS** The job data set control block (IATYJDS).
- **OSE** One or more records of the output service scheduling chain (IATYOSE).
- **WOSE** One or more records of the output service status chain (IATYOSE).
- **PARM** One of the JDAB parameter records.
JMR

The job management record (IATYJMR).

JCT

The job control table (IATYJCT).

System action: During a warm start, or during any restart, if the job was not active on main, JES3 issues message IAT4133 to indicate that the job is to be deleted and message IAT4174 to give the operator the option to delete the job or to end JES3 initialization.

During a hot start without refresh where the job was active on main, JES3 retains the job in the queue in a delete only state and issues message IAT4134.

During a hot start with refresh, where the job was active on main and is being deleted because of a change to the job number range on the OPTIONS initialization statement, JES3 issues message IAT4133 to indicate that the job is to be deleted and message IAT4174 to give the operator the option to delete the job or to end JES3 initialization. If the job number range is not changed, or is changed without deleting the active job, JES3 retains the job in the queue in a delete only state and issues message IAT4134.

Application Programmer Response: Resubmit the canceled job, if possible.

System programmer response: See message IAT4174 to determine what action to take.

Routing Code: 2       Descriptor Code: 7

IAT4133

Explanation:

During JES3 global processor initialization, an error was encountered during spool space recovery processing for the specified job. If the jobid displayed in this message is JOB*****, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. The job is to be deleted from the job queue for one of the following reasons:

BY OPERATOR

The job has data on one or more spool data sets which are unavailable during this restart and the operator replied CANCEL or CANCEL,ALL to message IAT4140.

JCT READ ERROR

An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

JCT VALIDATION ERROR

An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

INVALID JCT JOB NUMBER

The specified job had an incorrect job number.

JCT WRITE ERROR

An error prevented JES3 from writing to the job control table (JCT).

JQE ALLOCATION ERROR

An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

ABEND DURING VALIDATION

JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.

UNAVAIL SPOOL DATA SET(S)

The job has data on an unavailable spool data set and the operator has replied ‘CANCEL’ or ‘CANCEL,ALL’ to message IAT4140.

REPLACED SPOOL DATA SET(S)

One or more spool data sets were replaced and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.
SPool Ownership Error(S)
A duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

Spool Reallocation Failure
The job has data on one or more spool data sets which are unavailable during this restart and the checkpointed space allocation maps (PTATs) were not restored.

Spool Record Error(S)
An error was detected validating spool control blocks or a user exit determined there was an error for the specified job. Message IAT4174 was previously issued.

Deleted Spool Data Set(S)
One or more spool data sets were deleted and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

DSP Failure
Before the restart, a JES3 dynamic support program (DSP) failed to run. Message IAT4149 was previously issued.

Incomplete Job Purge
The specified job was still active in PURGE processing. Message IAT4150 was previously issued.

Outserv Validation Error
An error was found in the output processing for the specified job.

Operator Analysis Request
A warm start with analysis or hot start with analysis is being performed and the job was flagged for deletion.

Error in Previous Restart
A warm start is being performed and the job was flagged for deletion by analysis in a previous JES3 restart. Message IAT4148 was previously issued.

Incompatible Function
The job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

System action: The job is deleted from the job queue.
Programmer response: Resubmit the canceled job, if possible.
Module:

</tbody>
</table>

Routing Code: 2 Descriptor Code: 7

During JES3 global processor initialization, an error was encountered during spool space recovery processing for the specified job and the job is to be deleted from the job queue. However, the current restart type is hot (start type H or HA) and the status of the job indicates that the job may be executing on a processor in the complex. If the jobid displayed in this message is JOB*****, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. The job was to be deleted from the job queue for one of the following reasons:

Jct Read Error
An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

Jct Validation Error
An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

Invalid Jct Job Number
The specified job had an incorrect job number.

Jct Write Error
An error prevented JES3 from writing to the job control table (JCT).

Jqe Allocation Error
An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

Abend During Validation
JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.

Unavail Spool Data Set(S)
The job has data on an unavailable spool data set and the operator has replied ‘CANCEL’ or ‘CANCEL,ALL’ to message IAT4140.

Replaced Spool Data Set(S)
One or more spool data sets were replaced and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

Spool Ownership Error(S)
A duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

Spool Reallocation Failure
The job has data on one or more spool data sets...
which are unavailable during this restart and the checkpointed space allocation maps (PTATs) were not restored.

DELETED SPOOL DATA SET(S)
One or more spool data sets were deleted and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

DSP FAILURE
before restart, a JES3 dynamic support program (DSP) failed to run. Message IAT4149 was previously issued.

INCOMPLETE JOB PURGE
The specified job was still active in PURGE processing. Message IAT4150 was previously issued.

OUTSERV VALIDATION ERROR
An error was found in the output processing for the specified job.

OPERATOR ANALYSIS REQUEST
A warm start with analysis or hot start with analysis is being performed and the job was flagged for deletion.

ERROR IN PREVIOUS RESTART
A warm start is being performed and the job was flagged for deletion by analysis in a previous JES3 restart. Message IAT4148 was previously issued.

INCOMPATIBLE FUNCTION
The job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

Deletion of the job at this time is not possible because the job is executing.

System action: JES3 sets the job to a delete only state; further scheduling of the job is suspended. The job will be automatically deleted from the queue during the next JES3 warm start.

Operator response: Upon completion of JES3 initialization, cancel the job with the "MODIFY,J=jobno,C command.

Programmer response: Resubmit the canceled job, if possible.

Module:

IAT4136

Explanation:

During JES3 global processor initialization, the specified job was found to have data on one or more spool data sets that are not available during this restart. HOLD or HOLD,ALL was replied to message IAT4140 to request that jobs with unavailable data be retained in the job queue in a spool hold state.

System action: JES3 places the job into a spool hold; no further scheduling of the job is performed.

Operator response: To release the job from the spool hold it is necessary to return the unavailable spool data sets that the job requires to the spool and perform a hot start. JES3 initialization processing will release the job from the spool hold when all unavailable data sets that the job requires are again available.

Module:

IAT4137

Explanation:

During JES3 global processor initialization, one or more spool data sets were unavailable and the spool space allocation maps (PTATs) were not restored from the checkpoint data set. At least one job is active in execution and must be deleted; for each such job, this message was preceded by a message which identifies the job and describes the reason for deleting the job. In the below description of the error, jobid refers to the job identification shown in a message issued for any job that was found to be active.

The situation exists where JES3 could reallocate the spool space which is presently in use by job jobid while the job is still reading and/or writing to that spool space:

- The space allocation maps (job/ data set TATs) for job jobid were on unavailable spool data sets.
- The job uses JES3 managed devices.
- An error was encountered in the space allocation maps (JBT chains) for the job.
- An error was encountered in the job data set block (JDS chains) for the job.
System action: JES3 issues message IAT4138 and retains the job in the job queue in a delete only state.

Operator response: Disable the processor identified by message IAT4138 immediately.

Programmer response: Resubmit the canceled job, if possible.

Module:

**IATINJR**

**IATINJR**

**IATINRN**

Routing Code: 2  Descriptor Code: 7

---

IAT4138

**Explanation:**

\[
\text{\textasciitilde JOB } jobname (jobid) \text{- IS ACTIVE ON MAIN main CANCEL JOB OR DISABLE MAIN}
\]

During JES3 global processor initialization, an error was encountered during recovery of spool space previously allocated to the specified job. The job is to be deleted from the job queue; however, the last known status of the job indicates that the job is executing on the specified main.

If CANCEL JOB OR DISABLE MAIN is present, this message was preceded by message IAT4137.

System action: JES3 sets the job to a delete only state; further scheduling of the job is suspended.

Operator response: If CANCEL JOB OR DISABLE MAIN is present, ensure that the job is no longer active on processor main. If necessary, disable the processor with a system reset.

Programmer response: Resubmit the job, if possible.

Module:

**IATINJR**

**IATINJR**

**IATINRN**

Routing Code: 2  Descriptor Code: 7

---

IAT4140

**Explanation:**

\[
\text{\textasciitilde JOB } jobname (jobid) \text{- HAS DATA ON AN UNAVAILABLE SPOOL DATASET, ENTER: HOLD (,ALL) CANCEL (,ALL)}
\]

During JES3 global processor initialization, a job was found to have data on one or more spool data sets which are not available during this restart and the spool space allocation maps (PTATs) were not restored from the checkpoint data set.

System action: JES3 initialization waits for one of the following operator replies:

**HOLD**

the job is placed into a spool hold state; the job may only be released from the spool hold by reinstatement of the unavailable spool data sets.

This message will be reissued as each job that has data on an unavailable spool data set is encountered.

**HOLD,ALL**

the job is placed into a spool hold state; the job may only be released from the spool hold by reinstatement of the unavailable spool data sets. All jobs subsequently found to have data on an unavailable data set will be placed into a spool hold; this message will not be reissued.

**CANCEL**

the job is deleted from the queue if a warm start is being performed or placed into a delete only state if a hot start is in progress. This message will be reissued as each job that has data on an unavailable spool data set is encountered.

**CANCEL,ALL**

the job is deleted from the queue if a warm start is being performed or placed into a delete only state if a hot start is in progress. All jobs subsequently found to have data on an unavailable data set will be deleted; this message will not be reissued.

Operator response: Display the JES3OUT data set for a list of jobs that have been released from the spool. Consult the system programmer for the proper action to be taken.

If a large number of jobs are affected by the unavailable spool data sets or if the type of jobs affected is known or predictable, determine the action to be taken and use the ,ALL option to minimize operator interaction.

System programmer response: If the unavailable spool data sets must remain unavailable to JES3 for a
long time period, retention of the jobs with unavailable data may significantly affect JES3 performance and scheduling ability.

Module:

IATINJR Detecting Issuing
IATINJR

Routing Code: 1 Desciptor Code: 7

IAT4141

Explanation:

One of the following situations occurred:

- The operator replied CANCEL, ALL to message IAT4140 or message IAT4175, requesting that all jobs that contain space on unavailable spool data sets be canceled; this message asks the operator to confirm that response.
- The operator replied SNAP, ALL to message IAT4174, requesting that diagnostic information for all faulty jobs in the system are to be written to the JES3 snap data set; this message asks the operator to confirm that response.
- The operator replied TERMINATE JES3 to message IAT4174, requesting that JES3 end with a DM011 abend.; this message asks the operator to confirm that response.

System action: JES3 initialization waits for an operator reply:

U to indicate that the specified processing is to be allowed; no further confirmation will be requested.

anything other than U to change the reply to message IAT4140 or message IAT4175; the previous response to the message is discarded and the message is reissued.

Operator response: To request that the message IAT4140 or message IAT4175 be reissued, enter N (anything other than U). To allow the specified processing to begin, reply U.

Module:

IATINJR Detecting Issuing
IATINJR

Routing Code: 1 Desciptor Code: 7

IAT4142

Explanation:

Updating of one of the JES3 spool related checkpoint records has failed during JES3 initialization. The type of write error is indicated by the IATXCKPT macro return code, rc. If checkpoint duplexing was being used, this message will occur only if the write operation failed on both checkpoint data sets.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE - JES3 initialization processing continues.

CANCEL - JES3 initialization ends with a DM011 abend.

Operator response: Consult the system programmer for the actions to be taken.

Programmer response: See the IATXCKPT macro return codes in the z/OS JES3 Customization. If the reply to this message is CONTINUE, JES3 initialization will proceed; however:

- other unrelated access requests to the checkpoint data set may fail.
- future checkpointing of the spool space allocation maps (PTATs) may fail; recreation of the PTATs may be required during subsequent JES3 restarts in which one or more spool data sets are unavailable.
- use of the checkpointed spool space allocation maps (PTATs) should be avoided; reply CREATE to message IAT4056 in all subsequent JES3 restarts.

Problem determination: Table I, items 18 and 37; Table III, items 4 and 6.

Module:

IATINJR Detecting Issuing
IATINJR

Routing Code: 2 Desciptor Code: 7
IAT4143
Explanation:

**CONFIRM JOB OR FSS CANCEL AND MAIN**

**DISABLE REQUEST (U OR CANCEL)**

During JES3 global processor initialization, at least one job was found to have data on an unavailable spool data set and the job was active in C/I in a functional subsystem (FSS) address space. If the job was active in MAIN processing, JES3 issues message IAT4138 to display the name and number of each job and the name of the processor on which the job was active. Message IAT4143 prompts the system operator to confirm job or fss cancellation and that the identified processors have been disabled (system reset) or to cancel initialization (CANCEL). A reply of CANCEL ends JES3 with a DM011 abend.

**System action:** JES3 initialization waits for an operator reply of U, CONT, CONTINUE or CANCEL. Any reply other than U or CANCEL results in this message being reissued.

**Operator response:** After disabling all of the processors identified in the preceding occurrences of message IAT4138, reply U to continue, or CANCEL to cancel initialization with a DM011 abend.

IAT4147
Explanation:

**JOB — jobname (jobid)netname — IS ACTIVE**

**IN CI. FSID — fsid**

**CANCEL FSS OR DISABLE MAIN**

During JES3 initialization, JES3 attempts to recover the job's spool space. The job is being processed by a C/I functional subsystem (FSS) address space and one of the following conditions has occurred:
The job has data on an unavailable spool data set.
- A potential duplicate track condition was detected.
- An error was encountered while validating the job's control blocks.

If a potential duplicate track condition is detected, the message also contains the text "CANCEL FSS OR DISABLE MAIN".

**System action:** Depending on the error, JES3 places the job either into spool hold, or flags the job for deletion.

**Operator response:** Notify the system programmer.

**Programmer response:** If a potential duplicate tracks condition is detected, it is possible that the job's spool space may be allocated to another job, while this job is still using it. This can be prevented by disabling the FSS that is processing the job. The FSID indicates the relative number of the FSSDEF statement that defines the FSS in the initialization stream. The FSSNAME parameter can be used on an MVS cancel command to cancel the FSS. It must be issued on the processor where the FSS is executing. Another alternative is to IPL the processor where the FSS processes. Cancelling the job will not have any effect at this point. The FSS must be disabled before *S JSS is issued in order to prevent re-allocation of the job's spool space.

**Routing Code:** 2  **Descriptor Code:** 7

---

**IAT4151**

**Explanation:**

- ERROR READING THE JES3 JOB
- COMPLEX STATUS

The error was reading the JES3 job.

**System action:** The job remains flagged for deletion and is deleted when no longer active.

**Operator response:** Notify the system programmer.

**Programmer response:** Resubmit the canceled job, if possible.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINJR</td>
<td>IATINJR</td>
<td></td>
</tr>
</tbody>
</table>

**Routing Code:** 2  **Descriptor Code:** 7
The error is dependent on the checkpoint record being read:

- Complex Status Record - Either the record could not be read from the checkpoint data set, or the record is not valid.
- Initialization Checkpoint - Either the record could not be read from the checkpoint data set, or the initialization identifier (date/time) is not the same as the one in the complex status record.

**System action:** FSS initialization ends with a 2FB abend (no dump).

**Operator response:** Notify the system programmer.

**Programmer response:** Verify that the contents of the checkpoint record(s) are valid. Additional messages issued by module IATGRCK may provide more information about the error.

**Explanation:**

A non-zero return code was returned from the IATXCKPT (checkpoint) routine. Either the routine was unsuccessful in reserving the checkpoint data set or the routine failed to release the checkpoint data set and/or the checkpoint access method.

**System action:** FSS initialization ends with a 2FB abend (with a dump). Register 15 contains the ABEND subcode (XX'4152')

**Operator response:** Notify the system programmer.

**Programmer response:** Verify that the contents of the CSR are valid. An error may have occurred when JES3 (global or local) attempted to update the CSR (message IAT3001 was issued). If so, FSSs cannot be started until a warm or cold start is performed (to reinitialize the CSR).

**Explanation:**

During analysis, it was determined that a job specified by the operator in response to message IAT3146 is an active functional subsystem and cannot be deleted. In the message text:

- **jobname** The name of the job.
- **jobid** The jobid of the job.
- **sys** The name of the system where the job is active.

**System action:** The job is not deleted by the analysis request.

**Operator response:** Typically, this is an informational message only; however, if you really need to delete the active FSS, you must reset the system indicated in the sys message text and perform another hot start with analysis.

**System programmer response:** None. this is an informational message.
IAT4159

Explanation:

> ERROR RESTORING TCP/IP CHECKPOINT

JES3 initialization was unable to restore the TCP/IP/NJE status checkpoint record because of one or more of the following reasons:

- The TCP/IP checkpoint FDB, in the JESCKPNT data area, is incorrect. The typical reason for this is because a JES3 release that supports TCP/IP/NJE was previously installed, backed out to an earlier release (including a DSI that moves the global to an earlier release), and is being reinstalled.
- One or more of the TCP/IP checkpoint records were on unavailable spool data sets.
- One or more of the TCP/IP checkpoint records were on spool data sets that were replaced during this restart.

System action: JES3 initialization continues; the status of some, or all, TCP/IP Netserv, sockets, and TCP/IP nodes is lost. TCP/IP connections that were active before the last JES3 restart need to be re-established. During this JES3 restart, a new TCP/IP checkpoint record is built.

Operator response: After the JES3 restart is complete, issue an *I,A command. For each IAT8524 line in the response that indicates a job name of IEESYSAS and a step name of a Netserv definition, cancel the address space using the MVS cancel command, C ntsvname, to clean up the Netserv address spaces. Then reestablish the Netserv by using a *CALL,TCP,NETSERV=ntsvname command, followed by an *S,TCP,SOCKET=scktname command for each socket that you want to activate.

System programmer response: None. This is an informational message.

IAT4174

Explanation:

CONFIRM DELETION OF JOB—jobname (jobid)->

DUE TO—reasoncontext

(CONTINUE, SNAP(ALL) OR TERMINATE)

During JES3 recovery and/or validation of job related spool space, one or more errors were encountered that will result in the loss of a job. One or more messages that identify the specific errors and the affected jobs preceded this message. If the jobid displayed in this message is JOB*****, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. The job is to be deleted from the job queue for one of the following reasons:

**JCT READ ERROR**

An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

**JCT VALIDATION ERROR**

An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

**INVALID JCT JOB NUMBER**

The specified job had an incorrect job number.

**JCT WRITE ERROR**

An error prevented JES3 from writing to the job control table (JCT).

**JQE ALLOCATION ERROR**

An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

**ABEND DURING VALIDATION**

JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.

**UNAVAIL SPOOL DATA SET(S)**

The job has data on an unavailable spool data set and the operator has replied 'CANCEL' or 'CANCEL,ALL' to message IAT4140.

**SPOOL OWNERSHIP ERROR(S)**

A duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

**SPOOL REALLOCATION FAILURE**

The job has data on one or more spool data sets which are unavailable during this restart and the checkpointed space allocation maps (PTATs) were not restored.

**SPOOL RECORD ERROR(S)**

An error was detected validating spool control blocks or a user exit determined there was an error for the specified job.

**DSP FAILURE**

Before the restart, a JES3 dynamic support program (DSP) failed to run. Messages IAT4149 and IAT4150 were previously issued.

**OUTSERV VALIDATION ERROR**

An error was found in the output processing for the specified job.

**INCOMPATIBLE FUNCTION**

The job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

System action: JES3 initialization waits for one of the following operator replies:

**CONTINUE** or **CONT** or **U**-

If a warm start is being performed, the job is deleted from the queue and message IAT4133 is issued.

If a hot start (with or without refresh) is being performed and the deletion is caused by anything other than the reduction of the JOBNO range on the OPTIONS statement, the job is placed into a delete only state if the job is active on MAIN or in a C/I FSS and message IAT4134 is issued.

If a hot start with refresh is being performed and the deletion is caused by the reduction of the JOBNO range on the OPTIONS statement, the job is deleted from the queue even if the job is active and an IPL is not being performed. JES3 does not end active jobs that are deleted. It is your responsibility to either wait for active jobs to end or cancel them before you delete them in this manner, or you can IPL the processor on which these jobs are active.
If you reply CONTINUE to delete a job, that job is deleted immediately even if you reply TERMINATE to a later occurrence of IAT4174 issued for a different job.

When JES3 detects an active job that is about to be deleted, it issues messages IAT3101 and IAT3062, requiring a reply. These messages are issued only once per processor. See these messages for further information.

**SNAP -** Diagnostic information about the job is written to a snap data set.

**SNAP,ALL -** Diagnostic information about this job and all following jobs in error is written to a snap data set.

**TERMINATE or TERM or T -** JES3 initialization ends with a DM011 abend.

**Operator response:** Examine the preceding message to determine the impact of the failure and the appropriate action to be taken.

**Module:**

**Routing Code:** 2  
**Descriptor Code:** 7

---

**IAT4175**

**Explanation:**

***TRACK ALLOCATION TABLE NOT AVAILABLE,***  

**ENTER:**  

```
 CANCEL
 CANCEL,ALL
 TERMINATE
```

During initialization, a job's track allocation table is on an unavailable spool data set. JES3 is unable to reallocate the spool space while creating new spool space allocation maps.

**System action:** JES3 waits for one of the following operator replies:

**CANCEL**

The job is deleted from the queue if:

- a warm start is being performed
- is placed into a delete only state
- a hot start is in progress.

All jobs subsequently found that have a JOBTAT on an unavailable spool data set will be deleted. Message IAT4141 will be issued to confirm the CANCEL,ALL command. Message IAT4175 will not be reissued.

**TERMINATE**

JES3 will end with a DM011. [z/OS JES3 Diagnosis](https://www.ibm.com/support/docview/form/30719) has more information concerning the DM011 code.

**Operator response:** Consult the system programmer for the appropriate action to be taken.

**Note:** If a large number of jobs are affected by the unavailable spool data sets or if the type of jobs affected is known or predictable, use the CANCEL,ALL command to minimize operator action.

**Programmer response:** Performance and scheduling maybe significantly affected if the spool data set must remain unavailable to JES3.

Routing Code: Note 19  Descriptor Code: 7

IAT4235

Explanation:

CI SUBTASK ATTACH FAILURE

FSS—fssname, ASID—asid

JES3 global or a C/I functional subsystem (FSS) address space failed in its attempt to initialize a C/I subtask. This message appears after message IAT3504 is issued informing the operator that the subtask failed to initialize. If the CI DSP max counts have been reset, message IAT4236 is also issued to indicate the new CI DSP max counts. The FSS name fssname and ASID asid are also displayed if the error occurred in an FSS address space.

System action: If the batch and demand select CI DSP max counts are greater than the number of attached batch and demand select C/I subtasks, the max counts are reset to the number of attached C/I subtasks. This prevents recursive errors by not allowing another CI DSP to initialize another C/I subtask until the operator modifies the CI DSP counts by issuing the *MODIFY,X or the *MODIFY,F commands.

Operator response: Notify the system programmer.

Programmer response: Check the SDUMP taken by the subtask's ESTAE exit to determine why the error occurred.

Module:

Routing Code: 42  Descriptor Code: 7

IAT4250

Explanation:

DSNAME—dsname—MUST BE

‘&’ FOLLOWED BY AN ALPHABETIC OR CHARACTERS @,#,$

This message is issued when the character following the ‘&’ on the DSNAME specified on the SYSIN/SYSOUT DD statement is not an alphabetic or one of the @,#,$ characters. The message will be included in the job's JESJCL data set.

System action: JES3 uses the jobname instead of the DSNAME specified when building the data set name. Processing continues.

User response: The DSNAME should be changed to start with an alphabetic or one of the @,#,$ characters following the ‘&’. For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

Module:

<table>

Routing Code: 42  Descriptor Code: 7
IAT4251
Explanation:

This message is issued when the DSNAME specified on the SYSIN/SYSOUT DD statement is longer than eight characters following the "&". The message will be included in the job's JESJCL data set.

System action: JES3 uses the jobname instead of the DSNAME specified when building the data set name. Processing continues.

User response: The DSNAME should be shortened to eight characters. For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

Module:

Routing Code: 42  Descriptor Code: 7

IAT4252
Explanation:

This message is issued when an incorrect character appears in the DSNAME specified on a SYSIN/SYSOUT DD statement. The message will be included in the job's JESJCL data set.

System action: JES3 uses the jobname instead of the DSNAME specified when building the data set name. Processing continues.

User response: The DSNAME should be changed to meet standards. The valid format is an ' & ' followed by an alphabetic character or one of the following: @,#,$, X'C0' characters. For more information on the DSNAME parameter, see z/OS MVS JCL Reference

Module:

Routing Code: 42  Descriptor Code: 7

IAT4300
Explanation:

An error was encountered while processing the DISP=(NEW,PASS) parameter on a JCL DD statement.

System action: The job is ended.

Programmer response: This is probably a JES3 error. Invoke the interpreter debug facility and rerun the job with DEBUG=ALL specified. See z/OS JES3 Diagnosis.

Module:

Routing Code: 42  Descriptor Code: 7
UNIT TYPE PARAMETER FOR xxx, yyy, ddn

The UNIT= keyword on the indicated DD statement did not include a valid unit parameter, and the job failed, where xxx is the procedure step name, yyy is the job step name, and ddn is the ddname.

Possible reasons why the unit specified was not valid are:

- The UNIT parameter was not specified when one is required (for example, when defining a new data set).
- The same volume serial number was given for two unlike devices in the job. For example, one DD statement called for the volume serial on a tape while another DD statement used the same volume serial for a DASD request. One of the DD statements is treated as not valid.
- The same volume serial number was given to two incompatible device types. Volume serial numbers must be assigned to compatible device types. For example, one DD statement was used to define the volume serial on a real type tape device while another was used the same volume serial for a cartridge type tape device.

System action: The job is ended.

Programmer response: Supply a valid unit type on the indicated DD statement and rerun the job.

Problem determination: See Table III, items 114a, 20, and 22; Table I, item 3.

SPECIFIED VOLUME SEQUENCE
INVALID FOR.xxx,yyy, ddn

A volume sequence number has been specified which exceeds the number of volume serials given for the statement specified where xxx is the procedure step name, yyy is the job step name, and ddn is the ddname.

System action: The job is ended.
Problem determination: See Table III, items 14a, 20, and 22; Table I, item 3.
Module:

Routing Code: 42,Note 19 Descriptor Code: 7

IAT4404
Explanation:
DATA SET NOT FOUND ON
MAIN PROCESSOR main

The data set specified in the preceding message, IAT4401, was not found on the indicated main (refer to the job listing). If the Hierarchical Storage Manager (HSM) is in the system, one of the following may have occurred:

- A VSAM data set that was eligible only for command migration was migrated.
- A VSAM data set was migrated automatically, but there was an error in the migration of the data set. Therefore, the data set is not eligible to be automatically recalled.

System action: The job is canceled with print.
Programmer response: Make the necessary corrections and resubmit the job. If a VSAM data set was migrated automatically and HSM is in the system, a command recall of the data set must occur before the data set can be used. When an HSM-managed VSAM data set was automatically migrated but there was an error, do one of the following:

- Access the data set by the base cluster name and it will be automatically recalled.
- Do a command recall on the base cluster name.
- Issue an HLIST DATASETNAME base cluster name SELECT VSAM command.

Problem determination: See Table III, items 14a, 20, and 22.
Module:

Routing Code: Note 19 Descriptor Code: –

IAT4405
Explanation:
LOCATE ERROR ENCOUNTERED

An error occurred during LOCATE processing for the data set indicated by preceding message IAT4401. For specific error texts, see individual explanations below. For return code explanations, see IDC3009I in z/OS MVS System Messages, Vol 8 (GOS-IEA).

System action: JES3 cancels the job with print, unless otherwise indicated under individual error texts below.
Programmer response: See programmer response
under individual error texts below.

**PASSWORD FAILURE**

**Explanation:** Catalog management would not accept the password given, or a required password was omitted.

**Programmer response:** Ensure that all correct passwords are available for the data set indicated in message IAT4401, and resubmit the job. If passwords are correct but still fail, notify the system programmer.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 711.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 711, Table I, items 13, 34, and 29.

IAT4424
Explanation:

Failing Service Return Code = hexrc (decrc),

Reason Code = hexrc (decrc)

This message is issued after message IAT4422. It contains the failing service return code and reason code from the service that was called by SMS catalog Services or SMS volref Services. The message text provides both the hexadecimal and decimal representation of the return code and reason code. The SMS Unit Affinity SSI gave an error return for the specified request. This message is followed by IAT4423 which contain the return codes and reason codes for macro IEFSSSA.

System action: The job is canceled.

Operator response: None. This is an informational message.

Programmer response: Use z/OS DFSMS Macro Instructions for Data Sets to determine the cause of failure and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: 7

IAT4426
Explanation:

AN ERROR OCCURRED DURING SMS

UNIT AFFINITY SSI PROCESSING

FOR procstep stepname ddname

The SMS Unit Affinity SSI gave an error return for the specified request. This message is followed by IAT4423 which contain the return and reason codes.

System action: The job is canceled.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 19  Descriptor Code: 7

IAT4440
Explanation:

JOB jobname (jobid) FAILED DUE TO LOCATE SUBTASK ABEND

The locate subtask, IATLVLC, has abended while processing the specified job.

System action: The specified job is canceled along with the locate subtask. JES3 continues processing.

Operator response: Notify the system programmer.

System programmer response: Examine the system dump that was taken to determine why the locate subtask abended.

Module:

Routing Code: 2, Note 19  Descriptor Code: 7
IAT4450

Explanation:

- CI DRIVER UNRECOVERABLE ERROR,
- INVALID CI FSS TABLE
- INVALID FSS TABLE
- INVALID INTERPRETER DATA AREA
- INVALID PROCLIB TABLE
- INVALID RESQUEUE CHAIN
- INVALID STAGING AREA

The CI Driver JESTAE Retry routine (IATIIICJ) has found an error in a major control block or control block chain.

System action: The CI Driver FCT goes into a permanent AWAIT. No more work will be sent to any of the active CI FSS's. All work being returned from the CI FSS's will also wait.

Operator response: Notify the system programmer, hot start the system.

Programmer response: Check the dump (if provided) that caused the CI Driver to abend.

Module:

- Containing: IATIIIDA
- Detecting: IATIIICJ
- Issuing: IATIIICJ

Routing Code: 42  Descriptor Code: 7

IAT4451

Explanation:

- INVALID COMMAND IGNORED, TEXT=tttt

The operator entered an incorrect command=tttt for the CI or the locate driver.

System action: JES3 ignores the command. Processing continues.

Operator response: Correct and reissue the command.

Module:

- Containing: IATIIIDA
- Detecting: IATIIFS

Routing Code: 42  Descriptor Code: 7

IAT4452

Explanation:

- CI FSS—fssname— IS READY FOR WORK
- The functional subsystem (FSS) specified by fssname has completed proclib processing and converter/interpreter (C/I) subtask initialization, and is now ready to start the jobs that need C/I processing.

System action: The JES3 global will begin to send jobs to the FSS.

Operator response: None. This is an informational message.

Module:

- Containing: IATIIIDA
- Detecting: IATIIFR
- Issuing: IATIIFR

Routing Code: 42  Descriptor Code: 7

IAT4461

Explanation:

- JOB—jobname (jobid)
- RESTARTED THRU C/I, CONTROL BLOCKS ARE INCOMPATIBLE

During postscan processing JES3 determined that the specified job's control blocks are incompatible with the current level of the system.

System action: The job is restarted from the beginning of C/I processing to rebuild the control blocks.

Operator response: None. This is an informational message.

Module:

- Containing: IATIIMS
- Detecting: IATIIDR
- Issuing: IATIIDR

Routing Code: Note 19  Descriptor Code: 7

IAT4462

Explanation:

- CATALOG ALLOCATION ERROR
- OCCURRED ON main, RETURN CODE=xxxx,
- REASON CODE=xxxx

The locate subtask, IATLVLC, encountered an error while attempting to allocate a catalog specified on a JOBCCAT or STEPCAT DD statement, or a catalog that was required dynamically.
System action: The job is canceled.
Operator response: Notify the system programmer.

System programmer response: The catalogs required by the job may not be available to the processors where locate processing was performed for the job. Ensure that the job is eligible to run on the processors that have access to the required catalogs.

Module:

Routing Code: Note 19  Descriptor Code: 7

Explanation:

One or more of the following errors occurred on a JOB CAT or STEPCAT DD statement:
- A unit type was specified by the UNIT parameter.
- VOL= ser was specified.
- VOL= ref was specified.

System action: The job is canceled with print.
Operator response: Notify the system programmer.

Programmer response: Remove the UNIT and VOLUME parameters and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: 7

Explanation:

An incorrect parameter was specified on the jobcat or stepcat DD statement. The request cannot specify:
- Volume or unit information
- A disposition other than KEEP

System action: The job is canceled.
Operator response: Notify the system programmer.

Programmer response: Correct or remove the invalid parameter on the JOB CAT or STEPCAT DD statement.

Module:

Routing Code: Note 19  Descriptor Code: 7

Explanation:

The relative generation number nnnn specified for a GDG in the data set name parameter on the DD statement contains a syntax error. A GDG request must meet the following requirements:
- The first character of a relative generation number must be a +, -, or 0.
- A relative generation number must be expressed in 1 to 3 numeric characters. Examples are: +002, +101, +1, 000, and -09.
- A relative generation number prefaced with a + or - must be 1 or greater.
- A relative generation number cannot exceed 255.

Note: When the data set name and qualifier are unknown, the LOCATE request is canceled. See the JESMSGLG output for additional information.

System action: The job is canceled.
Operator response: Notify the system programmer.

Programmer response: Correct the relative generation number on the JCL statements and resubmit the job.

Module:
Routing Code: 42  Descriptor Code: 7

IAT4468

Explanation:
>>> UNABLE TO CREATE SECURITY ENVIRONMENT

JES3 was unable to create the proper security environment because the user is not correctly defined to the security product.

System action: JES3 cancels the job.

Operator response: Notify the system programmer.

System programmer response: Ensure that the user is correctly defined to the security product.

IAT4700

Explanation:

A DD statement requested a generation of a generation data group (GDG) data set, but the requested disposition is not valid. The DD statement defined either:

- A new GDG data set, as indicated by a qualifier of +1 or greater, but the user coded DISP=OLD or SHR
- An old GDG data set, as indicated by a qualifier of 0, -1, or less, but the user coded DISP=NEW

In the message text:

\- \textit{ddn} \- the name of JCL DD statement requesting the GDG data set

\- \textit{dsname} \- the name of the requested GDG data set

System action: The job is canceled.

Operator response: None.

System programmer response: Correct either the relative generation number or the DISP= value on the JCL DD statement such that the two values are compatible, and resubmit the job.

Module:
IAT4725  •  IAT4727

The installation exit specified has passed a job fail return code to the interpreter DSP.

System action:  The job is canceled with print.

Operator response:  None. This is an informational message.

</tbody>
</table>

Routing Code: Note 19

IAT4727

Explanation:

The order passed to the Functional Subsystem Application FSS/FSA, through the Functional Subsystem Interface (FSI) order function has not been processed by the FSS/FSA because of an environmental error. This message is a continuation of message IAT4726.

In the message text:

ordertype  Identifies the order which was not processed.

fssname  Identifies the functional subsystem.

devname  Identifies the device name as defined on the JNAME initialization statement.

dev  Identifies the device number. If a device number does not appear in the message, the device is a non-channel attached device (for example: 3820) MVS does not assign device numbers to non-channel attached devices.

System action:  The Functional Subsystem Application sets a non-zero return code and the "environmental error" indicator in the order response area of the Functional Subsystem Interface (FSI). The order is ignored and processing continues. If the order is the result of an operator's command, the command is not processed.

Operator response:  Reenter the rejected command where applicable. If another failure results, notify the system programmer.

System programmer response:  This is probably an error in the FSS/FSA that is trying to use the FSI. Determine why the FSA has rejected the order. This message provides the order type and the return code from the FSA.
Identifies the operator command that was not processed.

**System action:** The Functional Subsystem Application sets a non-zero return code and the “environmental error” indicator in the order response area of the Functional Subsystem Interface (FSI). The order is ignored and processing continues. If the order is the result of an operator’s command, the command is not processed.

**Operator response:** Reenter the rejected command where applicable. If another failure results, notify the system programmer.

**System programmer response:** This is probably an error in the FSS/FSA that is trying to use the FSI. Determine why the FSA has rejected the order. This message provides the order type and the return code from the FSA.

**Routing Code:** 10  
**Descriptor Code:** 7

---

**IAT4730**

**Explanation:**

- **PREVIOUS FSS—**fssname
- **TERMINATING, WTR JOB—**jobname (jobid)
- **FOR—**devname(dev) WILL RETRY AFTER FSS TERMINATES

This action message is displayed when an output writer DSP trying to start a functional subsystem (FSS) was unsuccessful because the previous use of the FSS is still terminating. When the FSS address space completely ends, the WTR DSP for devname(dev) will re-attempt to start the FSS and make the device ready to process work.

**System action:** The system continues processing, but the WTR DSP for devname(dev) will wait until the FSS address space that had previously been active ends. When the FSS address space finishes terminating, the action message IAT4730 will be dequeued, and the WTR DSP will reinitiate getting the FSS address space started for the new writer.

**Operator response:** There is no operator response necessary if the FSS address space end completely. However, if the FSS address space does not end within a reasonable time frame, then the following actions may be taken:

1. Issue *I,F,FSS=**fssname** for the FSS in question to obtain FSS status, ASID and MAIN, and related devices. The **fssname** may be obtained from message IAT8562 in response to an *I,D,D=**devname** command. Or use the *I,F,TYPE=WTR option and locate the device and its FSS in the IAT8701 and IAT8702 message table.

   If the FSS status remains as STOP or FSSD for a long period, then there may be a problem with the termination of the FSS address space.

2. It may be necessary to issue the MVS DUMP command and reply with the ASID= option to get an SVC dump of the FSS address space to assist in determining why it did not finish terminating.

3. Issue *C,**device** for each FSS writer associated with the FSS.

   If this step is bypassed, then the FSS writers will be varied offline as a result of the FSSCONT DSP handling the *FAIL command.

4. Issue *FAIL,FSS=**fssname** to cause the FSSCONT to clean up the FSS table so that the FSS writers and FSS can be started fresh.

**System programmer response:** There is no system programmer response necessary if the FSS address space ends completely. If the FSS address space does not end within a reasonable time frame, follow the steps listed under the operator response section.

If a dump is taken of the FSS address space, see Chapter 30, “Problem Determination,” on page 711.

**Problem determination:** See Chapter 30, “Problem Determination.”
**Explanation:**

The indicated job was failed by the interpreter DSP for one of the following reasons:

- A JCL error was found.
- Input service found a control card error.
- The interpreter subtask DSP found either a JCL logic error in scanning the scheduler control blocks or a logic error in the ddname overrides for FETCH or SETUP.
- Subtask error occurred.

**System action:** The job is canceled with print on return from the interpreter DSP. This message is typically accompanied by another diagnostic message in the job's JESMSGLG data set.

**Operator response:** No response is required. This message signifies only that this job is canceled from the system.

**Programmer response:** This is probably a user error. Check the JESYMSG messages and JESMSGLG data set for error specifications.

**Problem determination:** See Table III, item 20; Table I, item 3.

### IAT4810

**Explanation:**

The user requested the JSTTEST facility to examine the job's setup requirements. Having completed processing of the job, the JSTTEST facility ends and the job does not pass to MAIN for execution. This is normal for a job that requests the JSTTEST facility.

**System action:** The job is canceled and printed.

**Operator response:** None. This is an informational message.

**Programmer response:** Examine JESMSGLG for any JCL syntax errors that the JSTTEST facility may have detected.

### IAT4811

**Explanation:**

This message comprises the column headings for output of the JSTTEST facility; it is followed by a series of IAT4812 messages describing the JST entries constructed for the user's job. Entries appearing under each head are:

- **STP/DD** for a step entry, the field contains the step name, preceded by an asterisk.
- For a DD entry, the field contains the ddname. If the field contains the characters "JES3CATLG", the DD entry represents a catalog residing on a JES3-managed device that was

**Operator response:** None. This is an informational message.

**Programmer response:** Examine JESMSGLG for any JCL syntax errors that the JSTTEST facility may have detected.
<table>

Routing Code: 10  Descriptor Code: 7

**IAT4880**

**Explanation:**

- DDNAME=IATPLB nn, R15=rc
- FSS=fssname, ASID=asid

A C/I subtask has attempted to open a procedure library data set. If the error occurred in a functional subsystem (FSS), the FSS name fssname and address space identifier asid are specified. Absence of the FSS text indicates the error occurred in JES3.

**System action:** The system issues message IAT4884 and disables the procedure library data set. If the error occurred in an FSS address space, the FSS ends.

**Operator response:** Notify the system programmer.

**System programmer response:** Using the return code and z/OS DFSMS Macro Instructions for Data Sets determine the nature of the problem and rerun a job to reestablish the procedure library (/MAIN UPDATE=nn).

**Module:**
IAT4881

Explanation:

PROCLIB BLOCKSIZE NOT DIVISIBLE BY 80.

DDNAME=IATPLB—nn

FSS=fssname, ASID=asid

The specified procedure library data set was created with an incorrect block size. The block size must be divisible by 80. If the error occurred in a functional subsystem (FSS), the functional subsystem name fssname and address space ID asid appear in the message. The absence of the FSS text in the message indicates the error occurred in JES3.

System action: If the error occurred in the JES3 address space, message IAT4884 is issued and the procedure library data set is disabled. If the error occurred in an FSS address space, the FSS ends.

Programmer response: Use the JES3 procedure library update facility to delete and recreate the procedure library. Specify a block size (DCB=(BLKSIZE=)) that is divisible by 80. See z/OS MVS JCL Reference for details on the DCB= parameter.

Module:

IAT4882

Explanation:

NO PROCLIB ENABLED FOR JOB jobname (jobid)

A restart has occurred, and either a procedure library or procedure library data set that a previous job was updating is no longer defined.

System action: Processing continues.

IAT4883

Explanation:

DYNAMIC ALLOCATION UNALLOCATION CONCATENATION

ERROR DDNAME=IATPLB—nn, DSNAME=dsn

An error has occurred in the dynamic allocation, unallocation, or concatenation of a procedure library data set. If the data set name dsn is indicated in the message, the data set cannot be allocated. This message is issued in conjunction with message IAT4886.

System action: If the error occurred in the JES3 address space, message IAT4884 is issued and the procedure library is disabled. If the error occurred in an FSS address space, the FSS ends.

Programmer response: See z/OS JES3 Initialization and Tuning Guide to determine the cause of failure and how to correct it.

Module:

IAT4884

Explanation:

PROCLIB HAS BEEN DISABLED FOR

ERROR

**ERROR**

An error has occurred in the allocation processing of a procedure library data set in the JES3 address space; no further use of the procedure library is allowed until reallocation is complete. This message is issued in conjunction with messages IAT4880, IAT4881, or IAT4883.
IAT4885  IAT4899

System action:  No jobs using //MAIN PROC=nn will be allowed to run.

Programmer response:  Determine the problem with the procedure library data set and submit a job to correct it with a //MAIN UPDATE=dsn statement.

Operator response:  Notify your system programmer.

Programmer response:  See Z/OS JES3 Initialization and Tuning Guide to determine the cause of the failure and how to correct it.

Module:

Routing Code: 42  Descriptor Code: 7

IAT4885

Explanation:

PROCLIB HAS BEEN DISABLED FOR

DDNAME=IATPLBnn

Procedure library processing has completed for the named procedure library, and jobs with //MAIN PROC=nn statements are now allowed to process.

System action:  Processing continues; this message is for information only.

Operator response:  None. This is an informational message.

Module:

Routing Code: 42  Descriptor Code: 7

IAT4886

Explanation:

R15=rc ERROR=xxx INFO=yyy

[
FSS=fnname, ASID=asid
]

An error has occurred in the dynamic allocation, unallocation, or concatenation of a procedure library. This message is issued in conjunction with message IAT4883. If the error occurred in a functional subsystem, the functional subsystem name fnname and address space ID asid appear in the message. The absence of the FSS text in the message indicates the error occurred in JES3. The return code rc is issued from dynamic allocation and the error code xxx and information yyy are taken from the SVC99 request block.

System action:  If the error occurred in the JES3 address space, message IAT4884 is issued and the procedure library is disabled. If the error occurred in an FSS address space, the FSS ends.

Operator response:  Notify your system programmer.

System programmer response:  Correct the DSP

Module:

Routing Code: 1  Descriptor Code: 3,7

IAT4899

Explanation:

MSG ERROR

The error message that the DSP tried to insert in macro IATXIW has a length of zero or is too long.

System action:  If the length is too long, the text is printed following this message. If the length is zero, the text will not be printed.

Operator response:  Notify the system programmer.

System programmer response:  Correct the DSP
issuing the message or contact IBM if this is an IBM-defined message.

Chapter 10. Main Device Scheduler Messages

IAT5001
Explanation:

A main device scheduler (MDS) subtask has abended.

System action: JES3 will cleanup and reinstate a new MDS subtask, if possible. The job being processed at the time of the error is put on the MDS error queue, unless installation exit IATUX61 indicates that the job is to be canceled.

Operator response: Notify the system programmer.

System programmer response: Check the SDUMP taken by the subtask's ESTAE exit for the cause of the failure.

Module:

Routing Code: 2      Descriptor Code: 4

IAT5002
Explanation:

A main device scheduler (MDS) subtask did not initialize.

System action: JES3 will perform any necessary cleanup, but will not attempt to reinstate the subtask.

Operator response: Notify the system programmer.

System programmer response: Check the SDUMP taken by the subtask's ESTAE exit for the cause of the failure.

Module:

Routing Code: 2, 42      Descriptor Code: 7

IAT5003
Explanation:

The main device scheduler (MDS) master task has experienced abends repeatedly during attach processing.

System action: JES3 fails the MDSSRS DSP. Jobs requiring SMS resources will not continue through MDS. JES3 continues processing.

Operator response: To get jobs requiring SMS to run, hotstart JES3.

System programmer response: Check the SDUMP taken by the MDS master task's ESTAE exit for the cause of the failure.

Module:
IAT5006  •  IAT5010

IAT5006

Explanation:

MDS MASTER TASK ATTACH FAILURE, RC=rc

This message is issued for any of the following reasons:

• The attach of the main device scheduler (MDS) master task did not successfully complete. The return code from the attach is displayed in the message text.
• The main device scheduler (MDS) master task abended before it completed initialization.
• The main device scheduler (MDS) master task abended repeatedly while trying to attach an MDS subtask.

System action: The MDSSRS DSP is failed with dump code DM420.

Operator response: To get jobs requiring SMS resources to run, hotstart JES3.

System programmer response: Examine registers 2 and 3.

• an error code of 1 if the attach of the MDS master task did not successfully complete or if the MDS master task abended before it completed initialization.
• an error code of 3 if the MDS master task abends repeatedly.

Register 3 will contain
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the ERROR queue.

Programmer response: Use a /*MAIN or JOB statement to place the job in a job class that does not have a setup depth of zero. Additionally, the system programmer may need to change the SDEPTH parameter on the CLASS statement.

Module:

IAT5010

Explanation:

SYSTEM MANAGED RESOURCE STATUS HAS CHANGED

This message, issued before message IAT5011, indicates the reason that the job identified in message IAT5011 was restarted. The status of system-managed resources, those resources managed by SMS, has changed between the time the job started resource allocation and the time the job completed MDS verify processing.

System action: The job is sent to MDS (main device scheduler) breakdown processing, where resources already allocated to the job are deallocated. The job is then restarted from the beginning of MDS system select processing or MDS allocation processing, depending on where the SMS-managed resources and the MDS-managed resources are currently available.

Operator response: In order for the job to continue through setup processing, all resources must be made available to the job.

Module:
IAT5011

Explanation:

This message is issued when JES3 determines that the specified job cannot continue on its normal flow through JES3 processing. The job must be restarted through an earlier function.

System action: The job is restarted through the function specified in the message text. The previous message indicates the reason this action is taken.

Operator response: None. See the operator response in message IAT5012.

Module:

IAT5012

Explanation:

This message, issued before message IAT5011, indicates the reason why the job identified in message IAT5011 was restarted through JES3 C/I or Setup processing. The resource requirements that were written to spool during JES3 C/I or Setup processing are not the same as the current SMS configuration. Your storage administrator may have activated a new SMS configuration.

System action: All resources allocated to the job are deallocated and the job is restarted from the beginning of JES3 C/I or Setup processing. This message is followed by message IAT5011. JES3 continues processing.

Operator response: Notify the system programmer.

Storage Administrator Response: Do not change the SMS configuration while jobs are in MDS allocation processing and MDS verification processing, since it may result in the jobs being restarted.

Module:

IAT5013

Explanation:

This message, issued before message IAT5011, indicates the reason why the job identified in message IAT5011 was restarted through JES3 C/I or Setup processing.

System action: The job is restarted from the beginning of JES3 C/I or Setup processing. Message IAT5011 follows this message. JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT5014

Explanation:

There is no processor that can access both the SMS resources and the JES3 managed resources required by the job.

System action: The job is put on the MDS error queue or cancel depending on IATUX61's decision.

Operator response: None. This is an informational message.

Programmer response: If possible, change the JCL to specify a different job class or change the /*MAIN statement so that the job is eligible for those processors that have access to all of the resources required by the job.

System programmer response: If possible, change the JES3 configuration or SMS configuration so that all of the required resources are available on at least one processor.

Module:
IAT5015

Explanation:

```plaintext
>>> JOB—jjjj (jobid)—REFERENCES A VOLUME
```

```plaintext
NO NOT FOUND IN ACTIVE SMS CONFIGURATION
```

The job contained an SMS request to a volume that JES3 could not find in the active SMS configuration.

**System action:** JES3 puts the job on the MDS error queue or cancels it, depending on a decision in IATUX61.

**Operator response:** None. This is an informational message.

**Programmer response:** Check the job to determine which volumes it requests. Message IGD306I (which should precede this message) and its associated LOGREC entry to determine which volume was not found. Then, either correct the reference to the volume in the job's JCL, or if correct, contact the system programmer.

**System programmer response:** If appropriate, add the requested volume to the active SMS configuration.

Module:

Routing Code: 97  Descriptor Code: 7
```

IAT5017

Explanation:

```plaintext
>>> JOB—jobname (jobid)—FAILED DUE TO
```

```plaintext
MDS SUBTASK ABEND
```

A main device scheduler (MDS) subtask abended while processing the specified job.

**System action:** The specified job is put on the MDS error queue, unless installation exit IATUX61 indicates that the job is to be canceled. Message IAT5800 follows this message.

**Operator response:** Notify the system programmer.

**System programmer response:** Check the SDUMP taken by the subtask's ESTAE exit for the cause of the failure.

Module:

```
IATMDDA  IATMDBK  IATMDRS
```

IAT5018

Explanation:

```plaintext
>>> JOB—jobname (jobid)—FAILED DUE TO
```

```plaintext
MDS SUBTASK ABEND
```

A main device scheduler (MDS) subtask abended while processing the specified job.

**System action:** The specified job is put on the MDS error queue, unless installation exit IATUX61 indicates that the job is to be canceled. Message IAT5800 follows this message.

**Operator response:** Notify the system programmer.

**System programmer response:** Check the SDUMP taken by the subtask's ESTAE exit for the cause of the failure.

Module:
IAT5019

Explanation:

The system managed storage (SMS) was active and SMSSETUP=YES was specified on the SETPARAM statement when the job was in converter/interpreter (C/I) or locate processing. However, the global processor was restarted with SMS inactive or SMSSETUP=NO specified on the SETPARAM statement before the job went through setup processing. As a result, JES3 continues processing as if the job needs SMS resources, but JES3 is no longer allocating SMS resources.

System action: The system issues message IAT5011 and restarts the job from the beginning of converter/interpreter (C/I) processing.

Operator response: None. This is an informational message.

Module:

IAT5030

Explanation:

This message is issued in response to an *INQUIRY,S,A,SUMM command to display a summary of the jobs in MDS allocation.

System action: Processing continues.

Operator response: Wait until the job can be set up through normal events, such as jobs ending on a main, or take appropriate action to make the specified job eligible for main device scheduling.

Module:
### IAT5031

**Explanation:**

- JOB jobname (jobid) HAS nnnnn REQUESTS HAVE
- SHARED USE OF THE RESOURCE

This message is issued in response to an *INQUIRY, S, A, SUMM command to display a summary of jobs in the MDS allocation. This message displays the resource the jobs are waiting for.

**System action:** Processing continues.

**Operator response:** Wait until the job can be set up through normal events, such as jobs ending on a main, or take appropriate action to make the specified job eligible for main device scheduling.

</table>
IAT5040
Explanation:

The main device scheduler was unable to identify the device associated with the specified DD statement. If DD=JS3CATLG, this message refers to a catalog, residing on a JES3-managed device, that is required by a job. The catalog was not specified by a JOBCAT or STEPCAT DD statement.

System action: The MDS restart continues processing the job, scanning for more inconsistencies.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 19 Descriptor Code: 7

IAT5050
Explanation:

The main device scheduler was unable to identify one or more devices on which the job was originally set up.

System action: The job is sent to the MDS ERROR queue unless installation exit IATUX61 selects the BREAKDOWN or DONE queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the ERROR queue.

Programmer response: This situation may be normal if the message follows a warm start in which the initialization stream was changed. If the message follows a hot start or dynamic system interchange, a system error has occurred.

Problem determination: See Table I, item 3; Table III, items 4, 23, and 24.

Module:

Routing Code: 2 Descriptor Code: 4

IAT5070
Explanation:

The data passed to IATMDEN through the ENF signal did not have the proper identifier.

System action: An 8FB abend is issued and a system dump taken. The ENF listen routine's recovery routine notifies JES3 that all SMS resources are available. In addition, the recovery routine will cause the ENF listen exit, module IATMDEN, to be marked as uncallable.

Operator response: Notify the system programmer. Hotstart JES3 to mark the ENF listen routine as callable.
Programmer response: Examine the system dump to determine the cause of the failure.

Module:

 Routing Code: 2    Descriptor Code: 4

IAT5071
Explanation:

Module IATMDEN was unable to obtain the work area for the SMS available resource block (IATYSAR).

System action: Control is returned to the caller of the ENF listen routine. JES3 is not notified that the status of the SMS resources changed.

Operator response: Notify the system programmer.

Programmer response: The ENF listen routine is invoked whenever the status of the SMS-managed resources change. Issue the command that caused the error. If that does not work, try to restart the job through JES3 Setup processing using the *R S,J=nnnnn command described in [z/OS JES3 Commands].

Note: The status can change by issuing the VARY SMS command. If jobs seem to stay on the MDS System Select queue for long periods of time when SMS resources are available, issue the *I,S,SS,J=nnnnn to display the jobs.

Module:

 Routing Code: 2    Descriptor Code: 4

IAT5110
Explanation:

This message indicates the action required, volume type, volume serial number, tape label type, and data set name for the volume referenced by the specified job.

In the message text:

GET
The volume that will be required by this job, but is currently not in use.

UNAV
The volume made unavailable by the operator.

USES
The volume that was previously fetched and has not yet been returned to the library.

nnn
The number of scratch volumes needed. For specific volume requests, this field is blank.

C
The volume type is cartridge tape.

D
The volume type is disk.

T
The volume type is reel-to-reel tape.

vol
The volume serial number of the required volume.

AL
An American National Standard label tape.

BL
Label processing is to be bypassed by the system.

NL
A non-labeled tape.

SL
An IBM standard label tape.

XL
A nonstandard label tape.

dsn
The name of the referenced data set.

Note: If the data set name is preceded by an asterisk (*), it represents a non-SMS catalog.
required by the job. Do not enter *INQUIRY commands against this data set.

**System action:** The system places the job in the main device scheduling (MDS) volume wait queue, if the MDS allocation mode is manual; otherwise, the system places the job in the MDS allocate queue.

**Operator response:** If GET appears in the message text, make the volume available for subsequent use by the job. If UNAV appears in the message text, the job cannot be set up until the operator makes this volume available. If USES appears in the message text, no action is required.

</tr>
</tbody>
</table>

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT5201**

**Explanation:**

```
> JOB jobname (jobid)
```

```
> SMS RESOURCES
```

This message indicates that a volume is required and/or that a device has been allocated. The ddname rather than the job name may appear in the JESMSGLG. If operator action is required, the jobname appears in the message with CHECK or MOUNT for the volume.

In the message text:

**CHECK**

A mount for the volume is not required, but the operator must check to see if it is mounted or not.

**MOUNT**

The operator must mount the volume on the device.

All graphics or unit record requests will show USING because there is no volume to mount.

The MOUNT section is present if the error can be corrected by mounting the correct volume and the number of attempts to correctly mount the job's volumes is below the value specified in the REMOUNT parameter of the SETPARAM JES3 initialization statement. See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com/docs/en/zos/2.4.0) for more information about SETPARAM.
RSRVD
The device is reserved for a deferred volume mount.

USING
The DASD device requires no volume mount, and no operator action is required (USING appears in JESMSGLG ONLY).

C The volume type is cartridge tape.

T The volume type is reel-to-reel tape.

D The volume type is disk.

U The volume type is unit record.

G The volume type is graphics.

vol The volume serial number of the required volume, if any.

NL A non-labeled tape.

SL An IBM standard label tape.

AL An American National Standard label tape.

XL A nonstandard label.

BL Label checking is bypassed.

RING
The file protect ring should be on the tape reel.

NORING
No file protect ring should be on the tape reel.

dsn The name of the data set referenced.

Note: If the data set name is preceded by an asterisk (*), it represents a non-SMS catalog required by the job. Do not inquire upon this data set name.

System action: The job is placed on the main device scheduler verify queue. If the message specifies MOUNT or CHECK, JES3 requests the volume be mounted or checks to ensure that the volume is mounted.

Operator response: Mount or check the tape or disk, as indicated. If you cannot respond as indicated because, for example, a volume is damaged and cannot be mounted, make the volume unavailable through the *MODIFY,S,VU= command. Then restart the job. See z/OS JES3 Commands for more information about these commands.

IATMDDA IATMDRS IATMDSB
IATMDDA IATMDFE IATMDSB

Routing Code: Note 17, Note 19
Descriptor Code: 7

IAT5230
Explanation:

Since several errors are detected by MDS allocation processing, the text of this message is variable. Messages IAT5220 and IAT5295 precede this message. The text of this message can be one of the following:

Explanation:

The job requested a device type which does not exist on the main indicated in the preceding message IAT5220. The DEVTYPE identifies the requested device type or device number.

System action: The job is sent to the MDS error queue, unless installation exit IATUX61 selects the DONE or BREAKDOWN queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J= jobno
command to determine if the:
  • error is correctable
  • job should be canceled or be allowed to remain on
    the ERROR queue

If the error is not correctable, cancel the job. If the error
is correctable, the job can be run by correcting the error
and restarting the job. If a warm or hot start is needed
to correct the error, leave the job on the ERROR queue.
When a warm or hot start is performed, JES3 tries to
restart all jobs on the error queue.

Programmer response: If the error occurred while
DB2® or SMS are active, the default unit supplied to
SMS, must be available to all systems in the JES3
complex.

Explanation:

**DEMAND ALLOCATION FOR UNSPECIFIED MAIN**

Explanation:

The job requested a device by a specific device
number, and the job is eligible for setup on more than
one main.

System action: The job is sent to the MDS error
queue, unless installation exit IATUX61 selects the
DONE or BREAKDOWN queue.

Operator response: If the job is placed on the
ERROR queue, use the *INQUIRY,S,E,J=jobno
command to determine if the:
  • error is correctable
  • job should be canceled or be allowed to remain on
    the ERROR queue

If the error is not correctable, cancel the job. If the error
is correctable, the job can be run by correcting the error
and restarting the job. If a warm or hot start is needed
to correct the error, leave the job on the ERROR queue.
When a warm or hot start is performed, JES3 tries to
restart all jobs on the error queue.

Programmer response: Include a /*MAIN statement
to specify the main on which the job is to run.

Explanation:

**MULTI VOLUME REQUEST FOR PERM/RES VOLUME**

The job requested multiple volume serial numbers on a
DD statement. One of the volumes is permanently
resident and cannot be demounted. The identified
volume and device are the resources requested by the
job.

System action: The job is sent to the MDS ERROR
queue, unless installation exit IATUX61 selects the
DONE or BREAKDOWN queue.

Operator response: If the job is placed on the
ERROR queue, use the *INQUIRY,S,E,J=jobno
command to determine if the:
  • error is correctable
  • job should be canceled or be allowed to remain on
    the ERROR queue

If the error is not correctable, cancel the job. If the error
is correctable, the job can be run by correcting the error
and restarting the job. If a warm or hot start is needed
to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

Programmer response: Do not make the specified volume permanently resident; or instruct users of the volume not to request it in a manner which requires that it be demounted.

Module:

Explanation:

The job referenced a permanently resident volume which is not attached to the main indicated in message IAT5220. Volume identifies the volume that the allocation attempt failed for.

System action: The job is sent to the MDS error queue, unless installation exit IATUX61 selects the DONE or BREAKDOWN queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

Programmer response: Change the unit parameter on the DD statement to one allowing access to the device on which the volume is mounted.

Module:

Explanation:

The job requested a permanently resident volume mounted on a device of a type that is not the same as the type specified on the UNIT= parameter of the DD statement.

System action: The job is sent to the MDS error queue, unless installation exit IATUX61 selects the DONE or BREAKDOWN queue. The identified volume and device type are the resources requested by the job.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

Programmer response: Use a //*MAIN or JOB statement to place the job in a job class that does not have a setup depth of zero. Additionally, the system programmer may need to change the SDEPTH
parameter on the CLASS statement.

Routing Code: 97, Note 13  Descriptor Code: 7

IAT5310

Explanation:

The main device scheduler has detected an error on a device during the mounting of a volume previously requested in message IAT5210.

In the message text:

dev

Identifies the device on which the error was detected.

description

Indicates the error detected and is one of the following:

UNIT NOT READY
A job requested tape unit is not ready and LABEL=BLP is specified on the job's DD statement.

INVALID VERID
JES3 encountered an incorrect verify id while mounting the volume onto the device.

VOL,LTYPE,RINGSTAT,M TD
JES3 has the specified information for the mounted tape that is in error. Compare this information with the information in mount message IAT5210 for discrepancies.

VOL,MOUNTED
JES3 has the specified information for the DASD that is in error. Compare this information with the information in mount message IAT5210 for discrepancies.

NO RESPONSE
JES3 has not been notified of the mount completion.

BUSY/UNAVAILABLE
JES3 was unable to read the volume label within the allotted time.

NON EXISTENT DEV
There is no setunits entry or JES3 is unable to locate the SETUNITS entry for the specified device.

PERM I/O ERROR
A permanent input/output (I/O) error occurred while trying to read the volume label.

VOLID READ ERROR
An input/output (I/O) read error occurred while trying to read the volume label.

VOL ALLOCATED
The device is already allocated to another job in the system.

VOL DUP VOLID
JES3 found a volume with the same volume id on another device.

NOT OPERATIONAL
An input/output (I/O) error occurred on the device.

EXPDT NOT PAST
The expiration date for the volume has not been reached.

TAPE LOAD CHECK
Intervention is required on the device.

REJECTED BY EXIT
JES3 issues this text if installation exit IATUX62 determines that the mount is incorrect.

LTYPE
The label type associated with the volume:

N  a non-labeled tape
S  an IBM standard label tape
A  an American National Standard label tape
X  a nonstandard label
B  bypass label processing

RINGSTAT
Indicates whether or not the file protect ring is on the tape reel.

RINGSTST is one of the following:

RNG  Indicates that the file protect ring is on the tape reel.
NOR  Indicates that the file protect ring is not on the tape reel.
VOL
Identifies the volume serial number of the volume that was being mounted when the error occurred.
VOL is one of the following:

NO-VLM
Indicates that a non-labeled volume was mounted or that the mounted volume has been moved to another device.

SCRTCH
Indicates that a scratch volume was mounted.

System action: If no mount action is required, the subsequent message IAT5300 indicates the job’s disposition. Otherwise, the job remains in the MDS VERIFY queue waiting for the requested mounts to be completed. Message IAT5210 may be reissued if necessary.

Operator response: If the mount message IAT5210 has been reissued, correct the described error and remount the volume.

Routing Code: 97,Note 17 Descriptor Code: 2,7

IAT5350

Explanation:

The indicated device number dev cannot be accessed from the specified main. The reason it cannot be accessed is described in message IAT5310.

System action: The job will be automatically restarted by MDS (as if an *R,S,jobno command had been issued).

Operator response: Notify the system programmer if an equipment failure is indicated.

Routing Code: 97 Descriptor Code: 7

IAT5410

Explanation:

This message is issued by the main device scheduler when a job has been processed by the MDS breakdown function; JES3 KEEP or RETAIN instructions, corresponding to previous GET and MOUNT messages, are issued to the operator based on JES3’s knowledge of the job’s volumes. For scratch tapes the MVS message IEF234E will be issued, with instructions for the operator instead of this message. This message may not correlate with message IEF234E issued by the MVS scheduler.

The meanings of the terms are:

**RETAIN**
the volume should remain in the machine room because it is required by other jobs

**KEEP**
the volume may be demounted and returned to the library

**C**
the volume type is cartridge tape

**T**
the volume type is reel-to-reel tape

**D**
the volume type is disk

vol the volume serial number of the unloaded volume

dev the unit number of the device

**NO DEV**
the volume cannot be accurately related to a device

main the name of the main if the device was allocated

**NO MAIN**
the device was not allocated

dsn the data set name last referenced

For scratch tapes the MVS message IEF234E will be issued with instructions for the operator instead of this message.

Operator response: Remove the volume from the device and return it to the library if KEEP is specified; keep the volume in the machine room if RETAIN is specified.

IAT5420 • IAT5500

Routing Code: Note 17   Descriptor Code: 7

IAT5420

Explanation:

\[\text{jobname (jobid)}\text{—TAPE—volser}\]

   HAS BEEN RELEASED RETAIN
   HAS BEEN RELEASED KEEP
   CANNOT BE RELEASED EARLY

The early volume release facility has released a tape volume, or the early volume release facility cannot release a tape volume. In the message text, \textit{jobname} identifies the affected job and \textit{volser} identifies the tape volume.

RETAIN

Keep the volume in the machine room because another job needs it.

KEEP

Return the volume to the library.

If the volume was used in a previous job step, IAT5420 will specify RETAIN.

If a volume cannot be released early, it is for one of the following reasons:

- A volume cannot be released until the end of a job step.
- The job will use the volume later.

System action:

JES3 processing continues.

Operator response:

If the message specifies RETAIN, keep the volume in the machine room.

If the message specifies KEEP, return the volume to the library.

Module:

Containing  Detecting  Issuing
IATMDDA  IATMDBK  IATMDBK

Routing Code: Note 17   Descriptor Code: 7

IAT5500

Explanation:

\[\text{xxxxxxx}\]

The first 8 characters of the command entered.

\[\text{ACCEPTED}\]

The requested action will be performed.

\[\text{REJECTED}\]

The action will not be performed.

\[\text{explanation}\]

The reason the input was accepted or rejected.

\[\text{explanation}\] can be one of the following:

- \text{parameter INVALID}\n  - The indicated parameter is not valid.

- \text{REQ NON-SPECIFIC}\n  - The job number was omitted from the command.

- \text{ERR WAS PERM I/O}\n  - The job is on the main device scheduler (MDS) error queue because of a permanent I/O error and may not be restarted thru SETUP.

- \text{I/O ERROR ON JOB}\n  - JES3 was unable to process the \astart setup command because of a JST I/O error.

- \text{USE DJC CANCEL}\n  - A \aster cANCEL SETUP command was entered for a dependent job control (DJC) job. This is not allowed.

- \text{CANCEL PENDING}\n  - A \aster cANCEL SETUP command was entered for a job that was already scheduled for deallocation. This is not allowed.

- \text{NOT AWAITING \ast S}\n  - A \aster s \astart setup command was entered for a job that was not on the WAITVOL queue.

- \text{JOB IN MAIN SERV}\n  - A \aster s \aster cANCEL SETUP, \aster s \aster cANCEL SETUP, or \aster s \aster eSTART \aster s \aster cANCEL SETUP command was entered for a job scheduled for processing or in processing.

- \text{JOB NOT FOUND}\n  - JES3 could not locate the job specified on the command.

- \text{MDS RESTARTING}\n  - The operator attempted to cancel an active job or restart a job before JES3 main device
scheduler (MDS) has completed restart processing.

**DEVICE FENCE JOB**
The operator attempted to restart a SETUP-generated device fence job through the converter/interpreter (C/I).

**MDS MOUNT JOB**
The operator attempted to restart a SETUP-generated main device scheduler (MDS) mount job through the converter/interpreter (C/I).

**CATLG SETUP JOB**
The operator attempted to restart a SETUP-generated catalog setup job through the converter/interpreter (C/I).

**PREV BKDN ERROR**
The job is on the main device scheduler (MDS) error queue because of an abend in job breakdown. It may not be restarted through SETUP.

**JOB NOT FOUND IN SETUP**
The operator issued a *START SETUP, *CANCEL SETUP, or *RESTART SETUP command for a job that is not being processed by SETUP.

**System action:** If the command was accepted, the requested function will be performed; otherwise, see the operator response for possible action.

**Operator response:** If the command was rejected because of an error in keying input, reenter it in corrected form. If the command is keyed correctly, check the text of the explanation for the reason the requested function cannot be performed.

**parameter INVALID**
None. This is an informational message.

**REQ NON-SPECIFIC**
None. This is an informational message.

**ERR WAS PERM I/O**
Cancel the job.

**I/O ERROR ON JOB**
Contact the system programmer.

**USE DJC CANCEL**
Use dependent job control (DJC) cancel.

**CANCEL PENDING**
None. This is an informational message.

**NOT AWAITING *S**
None. This is an informational message.

**JOB IN MAIN SERV**
None. This is an informational message.

**JOB NOT FOUND**
None. This is an informational message.

**MDS RESTARTING**
Re-enter the command after restart processing has completed.

**DEVICE FENCE JOB**
None. This is an informational message.

**MDS MOUNT JOB**
None. This is an informational message.

**CATLG SETUP JOB**
None. This is an informational message.

**PREV BKDN ERROR**
Cancel the job.

**JOB NOT FOUND IN SETUP**
None. This is an informational message.

**System programmer response:** If there was an I/O error on the job, examine the system dump to determine the cause of the failure.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT5510**

**Explanation:**

This message is issued in response to a *VARY dev:ONLINE command. The device has been varied online to both JES3 and MVS, and it has been assigned, if appropriate.

**Note:** After a device is varied online to a main, jobs and users running on that main can use it. After a device is varied online to global, JES3 Dynamic Support Programs (DSPs) can use it.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7
IAT5515
Explanation:

This message is issued in response to a "VARY command for device dev, or an assignable global device. The command was rejected either because the device could not be assigned to this system, or it was, and still is, allocated before MDS initialization, or the device could not be brought online to MVS.

The values of nn are:

04  Device is assigned to another system, but is allocated to the caller.
08  Device is assigned to another system, but is not allocated.
12  Device is assigned to another system, but is allocated to this system by someone other than the caller.
16  Multi-system ASSIGN is already in effect on this system (that is, the operator issued a VARY dev,ONLINE,SHR before MDS initialization).
20  I/O error occurred while processing a request for a device which is allocated to the caller.
24  I/O error occurred while performing ASSIGN.
28  An I/O error occurred while processing a request for a device. A SENSE operation failed while the system was performing I/O to assign the device.
32  An ABEND occurred during ASSIGN processing.
36  An ABEND occurred during MVS ASSIGN processing for a JES3 device. The device has been varied offline to MVS.
38  An unexpected error occurred.
41  An ESTAE create operation failed in an ASSIGN routine.
42  The requested function is not supported by the ASSGN operation.

System action:  Processing continues. The device remains offline to JES3, and the MVS status remains the same.

Operator response:  If the ASSIGN failed because the device is assigned to another system, the device may be varied offline on that system and a JES3 "VARY command may be issued (on this system). If the device could not be varied online to MVS, see the message issued by MVS VARY. Otherwise, consult the system programmer or contact the IBM Support Center to have the abend reviewed.

Programmer response:  Save the system log.

Problem determination:  Table 1, Items 2, 29

Module:

Routing Code:  Note 18  Descriptor Code: 7

IAT5520
Explanation:

JES3 (module IATMDDR) was unable to record modifications to the ERROR device online checkpoint record because of a permanent JSAM I/O error.

System action:  Processing continues. The real device online checkpoint record is (in effect) cleared. At the next JES3 restart, all real devices will be initialized as specified in the initialization stream, regardless of their previous status.

Operator response:  Notify the system programmer. Re-enter any desired VARY commands after the next restart before entering "S JSS.

Programmer response:  Save the system log.

Problem determination:  See Table III, Item 2.

Module:

Routing Code:  42  Descriptor Code: 7

IAT5525
Explanation:

The main device scheduler has detected an error while processing a verify response for direct access device dev. Volume serial number vol is online to JES3. The volume can not be moved because it is marked as permanently resident to MVS, or permanently resident to JES3, or JES3 mounted.

System action:  Device dev is marked as mounted but
is not associated with any volume.

**Operator response:** Mount the correct volume on device `dev` and vary the device online to JES3.

---

**IAT5550 OPERATOR ISSUED**

**Explanation:**

- OPERATOR ISSUED
- RESTART SETUP
- RESTART SETUP/CI
- START SETUP
- CANCEL SETUP
- CANCEL SETUP - RESCHED SETUP

The operator requested the main device scheduler to start, restart, or cancel the job. If START is indicated, the job proceeds to the device allocation phase of MDS. This action is only required by the operator when automatic allocation is not in effect. If RESTART is indicated, the operator caused the job to return to the main device scheduler allocation phase or to C/I processing. If CANCEL is indicated, the operator canceled the job while it was being processed by MDS.

**Note:** The `*MODIFY G` command specifying a `class`, `grpname`, or `select mode` results in CANCEL SETUP - RESCHED SETUP appearing in the message text. The job will not be canceled but will be rescheduled for MDS processing.

**System action:** The function requested by the operator is performed for the job.

**Operator response:** None. This is an informational message.

**Routing Code:** Note 18  **Descriptor Code:** 7
IAT5604  •  IAT5608

Routing Code: Note 18   Descriptor Code: 7

IAT5604

Explanation:

TOTAL NUMBER OF SETVOL ENTRIES IS nnn

This message, issued in response to an
*INQUIRY,S,V=ALL[E] command, indicates the total
number of volume entries known to the main device
scheduler.

System action:   Processing continues.

Operator response:   None. This is an informational
message.

Module:

Routing Code: Note 18   Descriptor Code: 7

IAT5606

Explanation:

SER=vol   TA=nnnnnnn   DA=nnnnnn

REX prty ONADEV VFYPD UNAV SETACC

This message is issued in response to either an
*INQUIRY,S,V=vol or an *INQUIRY,S,D= command.
J=nnnnnnn is the number of jobs known to MDS
referencing this volume including dynamic allocations
(which are considered jobs) by jobs that have not gone
gone through job breakdown. DA is a direct-access volume;
TA is a tape. AL=nnnnnnn is the number of jobs
allocated to the volume by MDS including dynamic
allocations which are currently allocated. The following
fields appear, if appropriate:

REX
The volume is reserved for exclusive use

RSH
The volume is reserved for shared use

prty
The priority number

ONADEV
The volume is currently on a device
VFYPD
This volume is referenced by a job in the MDS
verify queue
UNAV
The volume is unavailable
SETACC
The volume represents processor access as
specified in the SETACC JES3 initialization
statement

In Version 3 Release 1.2 and subsequent releases, the
command does not display the information in the
dummy SETVOL entries; only real volsers are
displayed.

System action:   Processing continues.

Operator response:   None. This is an informational
message.

Module:

Routing Code: Note 18   Descriptor Code: 7

IAT5608

Explanation:

vol ALLOCATED ON dev-main

LOCATED ON dev-main

This message, issued in response to an
*INQUIRY,S,V=vol command, indicates that MDS has
allocated the volume with the volume serial number vol
to a different unit than the one on which it currently
resides. For example, MDS may have requested that
the volume be moved and the move has not yet been
made.

System action:   Processing continues.

Operator response:   None. This is an informational
message.

Module:
IAT5610
Explanation:
\[ \begin{align*}
\text{AL} &= \text{n}\text{n}\text{n}\text{n}\text{n}\text{n}\text{n} \\
\text{EXC} &= \text{prty} \\
\text{RSH} &= \text{prty}
\end{align*} \]
\[-\text{DSN} = \text{dsn}\]

This message is issued in response to an
*INQUIRY,S,V=\text{vol}, *INQUIRY,S,D=\text{dsn}, or
*INQUIRY,S,DE=\text{dsn} command. AL=n\text{n}\text{n}\text{n}\text{n}\text{n}\text{n} is the
number of jobs currently allocated to the data set
indicated by \text{dsn}. AL=EXC indicates that a job currently
has exclusive use of the indicated data set. If the data
set is reserved, the message indicates the type and
priority of the reserve for it: REX if reserved for
exclusive use, or RSH if for shared use. The priority
number is indicated by \text{prty}.

Note: Use the *INQUIRY,S,D=dsn or
*INQUIRY,S,DE=dsn command to determine the
current allocation status of the indicated data set
as described in message IAT5612 (AL=YES or
AL=NO).

- **W** Jobs currently on the MDS WAITVOL queue
- **SS** Jobs currently on the MDS system select queue
- **A** Jobs currently on the MDS allocate queue
- **U** All unavailable volumes and jobs waiting because of unavailable volumes
- **V** Jobs waiting to be verified by setup
- **SV** Jobs currently on the MDS system verify queue.
- **E** Jobs currently on the MDS error queue
- **B** Jobs currently having their device requirements deallocated
- **R** Jobs currently on the MDS restart queue

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

---

**IAT5632**

**Explanation:**

---

**Chapter 10. Main Device Scheduler Messages**
IAT5636 • IAT5642

IAT5636

Explanation:

This message is issued in response to an *INQUIRY,S,(FIWISAIUIVISVIEMIR) command. If the message is listed for the V=verify queue, it has the verify count, which is the number of volumes yet to be mounted for the specified job. Any response ending with DYN indicates a dynamic allocation request.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT5642

Explanation:

This message is issued in response to an *INQUIRY,S,A,J=jobno command. It identifies the main processors that are eligible to run the job after fetch processing and why allocation could not be attempted for each of these mains.

Note: During MDS fetch processing, JES3 will limit the job to run on those systems that have access to the device types and number of devices required by the job. For example, if a job requires ten 3490 tape drives and system SY2 only has nine 3490s defined, then SY2 will not be eligible to run the job. If the job was limited to run on a certain set of systems during fetch processing, the job's JESMSGLG data set contains messages that describe why a particular system is not eligible to run the job.

RESOURCE UPDATE

the purpose of the last allocation scan was to update the available resource counters to include devices that were made available for allocation

JOB HOLD STATUS

the job is in hold status

REGION NAVAIL

the job's region requirement exceeds the maximum available region size on the specified main

RESTART PASS

the job is not a restart job. MDS will not allocate resources to this job until MDS processes all jobs that need to be restarted. If this condition persists for an extended period of time, issue an *I S R command to determine which jobs are restart jobs,
and *I S R J= commands to determine why the restart jobs have not been processed.

**MAIN NAVAIL**
the eligible main is not connected or not online, or the main was not IPLed.

**REST MAIN NAVAIL**
the job that is restarting cannot be selected on the specified main because the processor is online but not connected. Connect the specified processor or vary it offline. MDS scans for jobs that should be restarted until the processor connects or is varied offline.

**GRP/CLS NAVAIL**
the GMS GROUP/CLASS required by the job was not enabled on the specified main

**RESOURCE NAVAIL**
a resource (volume, device, etc.) required by the job was not available when allocation was last attempted for the job

**DEV FENCE NAVAIL**
the job requires a device fence which has not yet been created

**Note:** Use the *I S A J=jobno command, where *jobno is the number of the job that JES3 creates to allocate the device fence, to determine why the device fence is not available.

**MAIN DEPTH**
the setup depth on the specified main has been exceeded

**FAILED ARL SCAN**
the preallocation scan indicated the job would not be able to allocate the resources the job required.

**JOBCLASS DEPTH**
the job’s job class depth has been exceeded on the specified main

**SMS RES. NAVAIL**
SMS-managed resources are not available

**SCHENV UNDEFINED**
the scheduling environment specified by the job on the SCHENV= parameter of the JOB statement is not defined in the WLM policy. This can occur when the job enters the system with a valid scheduling environment and then a new WLM policy is activated without the scheduling environment defined. Use the *I,J=jobno,X command to determine the name of the scheduling environment that the job requires. You must either cancel the job, or redefine the scheduling environment to WLM and activate it using the V WLM,POLICY=policy command.

**SCHENV NAVAIL**
the scheduling environment specified by the job on the SCHENV= parameter of the JOB statement is not available on the specified system. A scheduling environment will not be available on a particular system if its resources are not in the proper state. Use the *I,J=jobno,X command to determine the name of the scheduling environment that the job uses. To display the status of the resources associated with a scheduling environment on that system, issue the following command: D WLM,SCHENV=schenv,SYSTEM=main. Then issue V WLM,RESOURCE=resource,status commands to change the status of the resources and cause the scheduling environment to become available.

**WLM GRP NOT SUPP**
The job’s group is WLM managed but the specified main does not support WLM batch initiator management. That is, JES3 is not at the OS/390 Version 2 Release 8 level.

**System action:** Processing continues.

**Operator response:** Wait until the job can be set up through normal events, such as jobs ending on a main, or take appropriate action to make the specified job eligible for main device scheduling.

**Routing Code:** Note 18 **Descriptor Code:** 7
This message indicates the resources that MDS could not allocate for the job and main indicated in message IAT5648.  

Note: If the resources for the job are unknown, use the *CALL, DISPLAY, J=jobnum command to determine the devices required.

THE DEVICE REQUIRED FOR SERIAL=vol, EXCL={YES I NO}
MDS was unable to allocate the device required for a reserved permanently resident volume. If EXCL=YES appears in the message, the job requested exclusive use of the volume. If EXCL=NO appears in the message, the job requested shared use of the volume.

A REQUEST FOR SERIAL=vol, EXCL={YES I NO}
MDS was unable to allocate the volume to the job. If EXCL=YES appears in the message, the job requested exclusive use of the data set. If EXCL=NO appears in the message, the job requested shared use of the data set.

A REQUEST FOR DSNAME=dsn ON SERIAL=vol, EXCL={YES I NO}
MDS was unable to allocate the specified data set on the specified volume to the job. If EXCL=YES appears in the message, the job requested exclusive use of the data set. If EXCL=NO appears in the message, the job requested shared use of the data set.

A REQUEST FOR DSNAME=dsn (SMS MANAGED), EXCL={YES I NO}
MDS was unable to allocate the specified SMS-managed data set. If EXCL=YES appears in the message, the job requested exclusive use of the data set. If EXCL=NO appears in the message, the job requested shared use of the data set.

A REQUEST FOR DSNAME=dsn (GDG BASE), EXCL={YES I NO}
MDS was unable to allocate the specified GDG base data set. A job requires access to the GDG base when it allocates a data set which is a generation data group (GDG). See the JCL User's Guide for more information about generation data groups. If EXCL=YES appears in the message, the job requested exclusive use of the GDG. If EXCL=NO appears in the message, the job requested shared use of the GDG.

System action: JES3 processing continues.

Operator response: If the job cannot wait for the resources to become available, determine if the resource required by the job are allocated to another job. Use the:
• *1,S command to determine the status of a volume or data set
• *1,D command to determine the status of the device

Issue the appropriate command to make the device available to the job. See z/OS JES3 Commands for information about the appropriate commands.

Note: When the text THE DEVICE REQUIRED FOR SERIAL=vol appears, issue the *INQUIRY D V=vol command to find out where the volume is mounted. If the volume is not found, all eligible devices are not mountable. The volume is on an unattached device or does not exist. Either attach the device or correct the job.
blocks of the job from spool because there were no available buffers.

**Operator response:** Use the *RESTART SETUP command to return the job to the allocation stage. If this is a recurring problem, notify the system programmer.

**System programmer response:** A shortage of JSAM buffers might exist in your installation. See [z/OS JES3 Diagnosis](https://www.ibm.com/support/pages/zos-jes3-diagnosis) to resolve the shortage.

**NO DEVICES AVAILABLE OF THE TYPE REQUESTED [ -DEVTYPE ={devtype | dev}]**

**Explanation:** The job requested a device type which does not exist on the main where setup was last attempted. DEVTYPE identifies the device requested by the job.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**NOT ENOUGH DEVICES AVAILABLE TO SETUP JOB [ -DEVTYPE ={devtype | dev}]**

**Explanation:** The UNIT parameters of the DD statements requested more devices of the specified type than exist on the main where setup was last attempted. DEVTYPE identifies the device requested by the job.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**DEMAND ALLOCATION FOR UNSPECIFIED MAIN**

**Explanation:** The job requested a device by a specific device number, and the job is eligible for setup on more than one main.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**MULTI VOLUME REQUEST FOR PERM/RES VOLUME [ -VOLUME = vol]**

**Explanation:** The job requested a volume in a multiple volume serial reference on the DD statement; the volume is permanently resident and cannot be demounted. Volume identifies the volume requested by the job.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**PERM/RES VOLUME NOT ON REQUIRED PROCESSOR [ -VOLUME = vol]**

**Explanation:** The job requested a permanently resident volume mounted on a device that is not defined to the last main where setup was attempted.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**PERM/RES VOLUME NOT ON REQUIRED DEVICE [ -VOLUME = vol, DEVTYPE = {devtype | dev}]**

**Explanation:** The job requested a permanently resident volume mounted on a device that cannot be allocated using the UNIT parameter on the DD statement.

**Operator response:** Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue.
When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

PERMANENT JSAM I/O ERROR
Explanation: A permanent JSAM I/O error occurred while setup was processing the job.
Operator response: Determine if the:
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue
If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

JOB QUIESCED BY MDS FAILSOFT
Explanation: Setup abended while processing the job.
Operator response: Restart setup on the indicated job. If the failure occurs again, cancel the job.

ERROR OCCURRED DURING VOLUME MOUNT VERIFICATION
Explanation: An error was detected while JES3 was verifying whether the volumes required by the job were mounted.
Operator response: If all volumes required by the job are correct and mounted, restart setup. Otherwise, cancel the job.

NO MAIN PROCESSOR WITH ACCESS TO SMS AND MDS RESOURCES
Explanation: No processor has access to all the SMS and MDS resources required by the job.
Operator response: Allow the job to run on a processor with access to the desired resources. Otherwise, contact the system programmer.

NO PROCESSOR WITH CONNECTIVITY TO ALL SMS RESOURCES
Explanation: The job requested an SMS resource to which no processor has connectivity.
Operator response: Re-configure the system if possible. Otherwise, cancel the job.

SMS PROCESSING ERROR
Explanation: An error occurred in SMS during an attempt to allocate an SMS resource.
Operator response: If the SMS problem can be fixed, restart the job through C/I in setup. Otherwise, cancel the job.

MDS SUBTASK ABENDED WHILE PROCESSING A JOB

Explanation: An MDS subtask abended while processing a job.
Operator response: Notify the system programmer.

System programmer response: Check the SDUMP taken by the ESTAE exit of the subtask for the cause of the failure.

JOB REFERENCES A VOLUME NOT IN ACTIVE SMS CONFIGURATION
Explanation: The job contained an SMS request to a volume that JES3 could not find in the active SMS configuration.
Operator response: Notify the system programmer.

System programmer response: If it is appropriate to add the volume to the active SMS configuration, add it and restart the job. Otherwise, cancel the job.

Module:

IAT5648
Explanation:

\[\text{MDS FAILED TO ALLOCATE THE FOLLOWING FOR JOB } \text{jobname (jobid)} \text{ ON } \text{main} \]

This message, issued in response to an *INQUIRY,S,A,J=jobno command, indicates the job and main to which the following message (IAT5645) applies. MDS attempted to allocate a resource on the specified main.

System action: Message IAT5645 is issued.
Operator response: None. This is an informational message.

Module:

IAT5649
Explanation:

\[\text{THE UNITNAMES MAY BE ELIGIBLE FOR UNITNAME REQUESTS} \]

This message is issued in response to an *I S A J=
command if any IAT5645 response messages specify a
count of requests with a list of unit names (as indicated
by the LIST COUNT= label).

System action: Message IAT5651 is issued next.
Operator response: None.

Module:

Routing Code: Note 18     Descriptor Code: 7

IAT5651
Explanation:

This message, following IAT5649, lists all unit names
(devtype) contained within unit name lists for any
request by the job.

System action: JES3 processing continues.
Operator response: If the job can not wait for its
resources to become available, attempt to make
available device(s) within the specified devtypes.

Module:

Routing Code: Note 18     Descriptor Code: 7

IAT5652
Explanation:

The message is issued in response to either an
*INQUIRY,S,ALWIO command or a
*MODIFY,S,ALWIO=nn command where an
asynchronous I/O list does not exist.

System action: The command is rejected. Processing
continues.
Operator response: Notify the system programmer.
Programmer response: Control blocks are in error.
The pointer to the event completion flag could not be
found. Action must be taken to isolate the error.

Module:

Routing Code: Note 18     Descriptor Code: 7

IAT5662
Explanation:

JES3 issues this message in response to command
*INQUIRY,S,THWSSEP=. This message indicates the
high watermark setup option with which JES3 is
currently processing. The following option indicates the
action JES3 takes when deciding whether to separate
scratch and specific requests during tape HWS
processing:

IGNORE
Specifies that JES3 not separate scratch and
specific tape requests during high watermark
processing.

PREFER
Specifies that JES3 attempt to allocate scratch and
specific tape requests on separate tape drives
without allocating additional devices.

REQUIRE
Specifies that JES3 should not allocate scratch and
specific requests on the same drive, even if JES3
must allocate additional tape drives to satisfy the
request.

System action: Processing continues.
Operator response: If you want to change the high
watermark option, use the command
*MODIFY,S,THWSSEP=. 
**IAT5663 • IAT5672**

**IAT5663**

**Explanation:**

- JOB—jobname (jobid)
- REQUIRES THE FOLLOWING VOLUMES:

This message is issued in response to an *I,S,W,J=nnn command to display the volumes that need to be fetched. For example, volumes that are not mounted on a device. Message IAT5664 is issued, listing the volumes that need to be mounted on a device.

**System action:** Message IAT5664 is issued listing the volumes that need to be mounted.

**Operator response:** None. This is an informational message.

---

**IAT5671**

**Explanation:**

- JOB—ACTIVE IN SYSTEM SELECT WAITING FOR PROCESSING VERIFY

JES3 issues this message in response to the *INQUIRY,S,SS,J=jobno or *INQUIRY,S,SV,J=jobno command. This command is used to obtain specific information about why the job is on the MDS system select or MDS system verify queue. The main device scheduler (MDS) subtask is still active on behalf of the job so no information can be obtained.

**System action:** JES3 ignores the command. Processing continues.

**Operator response:** Re-enter the command when the MDS subtask is no longer active on behalf of the job.

---

**IAT5672**

**Explanation:**

- JOB—jobname (jobid)
- REQUIRES UNAVAILABLE SMS RESOURCE ON (main)

This message, issued in response to an *INQUIRY,S,SS,J=jobno command, indicates that the specified job is waiting for SMS resources to become available. One IAT5672 message is issued for each main that is eligible to process the specified job, but the unavailable SMS resources may be different for each eligible processor.

**System action:** JES3 issues message IAT5673 which lists the SMS resources that are unavailable to the specified processor. JES3 processing continues.

---
This message describes the SMS-managed resources required by the job (specified in message IAT5672), but not currently available to the eligible processor (specified in message IAT5672). Explanations of the message text follow:

resource name
indicates the name of the unavailable SMS-managed resource.

VOL|SG
indicates whether the resource is a SMS volume (VOL) or a storage group (SG)

status
indicates the status that the required SMS resource should have before the job may use the resource. The possible status values follow:

**ENABLE**
An enable status is required

**ENABLE AND VOLUME**
A storage group enable status and an enabled and online volume in the group is required.

**QUIESCE/NEW**
Quiesce new only status is required.

**QUIESCE/NEW AND VOL**
A storage group quiesce new only status and an enabled and online volume in the group is required.

**DISABLE/NEW**
Disable new only status is required.

**DISABLE/NEW AND VOL**
A storage group disable new only status and an enabled and online volume in the group is required.

**VOLUME ENABLE**
You must enable or vary online a volume in the storage group.

**VARY VOLUME ONLINE**
The volume needs to be varied online to MVS and/or JES3.

**UNKNOWN**
The required status is not known.

storage group name
indicates the name of a storage group. Only one storage group in a collection is required by the job.

System action: JES3 processing continues.

Operator response: Contact the storage administrator to determine why the required SMS resources are not active. You must use the SMS commands to change the status of the unavailable SMS-managed resources. Use the JES3 *VARY or the MVS VARY command if the volume needs to be varied online.

Module:

Routing Code: Note 18 Descriptor Code: 7

---

This message is issued in response to a *INQUIRY, SETUP, D=dsn command or a *INQUIRY, SETUP, DE=dsn command. This message indicates that the requested data set is SMS-managed.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18 Descriptor Code: 7

---

This message is issued in response to an *INQUIRY, SETUP, D=dsn command or a *INQUIRY, SETUP, DE=dsn command. This message indicates that the requested data set is a GDG base.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:
IAT5700  •  IAT5708

**Explanation:**

*MODIFY,S,*{VA=|VU=} {T-|D-} serial command, indicates that the command was processed.

**VOL=vol {AVAILABLE|NOT AVAILABLE}** indicates that the volume serial number was recorded or removed by the main device scheduler.

**VOL=vol UNKNOWN TO JES3** indicates all of the following:

1. the volume is not mounted.
2. the volume is not in the VOL UNAVAILABLE table from a prior *F,S,VU=* command.
3. no user has requested the volume.

**VOL=vol ALREADY UNAVAILABLE** indicates that the vol has already been removed by the main device scheduler.

**System action:** If the volume serial number was recorded, any job references to the volume causes the job to be placed in the volume unavailable queue. If it was removed, any jobs previously referencing the volume can attempt allocation.

**Operator response:** None. This is an informational message.

**Module:**

**IAT5708**

**Explanation:**

An MVS UNLOAD command has been issued for a device which was not previously mounted.

**System action:** The MVS UNLOAD command is ignored and processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**IAT5702**

**Explanation:**

An incorrect parameter indicated by xxx has been specified in a *MODIFY,S command.

**System action:** Processing continues.

**Operator response:** Reenter the command correctly.
IAT5710 Explanation:

- JOB—jobname (jobid) —

- SENT TO MDS FOR MOUNT OF—vol —

This message, issued in response to a *MODIFY,S,M= command, indicates that the command was processed.

System action: A mount job was created and contends for main device scheduler resources to accomplish the mount.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMDMO</td>
<td>IATMDMO</td>
<td>IATMDMO</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: 7

IAT5712 Explanation:

- MOUNT—vol—REJECTED.—error text —

This message, issued in response to a *MODIFY,S,M= command, indicates the error detected while attempting to process the command. The err field can be one of the following:

ALREADY MOUNTED
the volume is currently mounted.

MOUNT PENDING
an MSS virtual volume mount was requested but there is already a mount request pending for that volume.

NO DEVICES AVAILABLE OF THE TYPE REQUESTED
the specified device is not defined for the main.

dev IS NOT DIRECT ACCESS
for a non-MSS mount request, the real device specified is not a direct access device

DEVICE NUMBER dev NOT FOUND
the specified device is not a JES3 managed device

System action: Processing continues.

Operator response: Reenter the *MODIFY,S,M= command correctly, if necessary. See z/OS JES3 Commands

- **IATMDCR**
- **IATMDCR**
- **IATMDCR**

**Routing Code:** –

**Descriptor Code:** –7

---

**IAT5731**

**Explanation:**

- **IAT5731**

IATMDCR, the JES3 configuration change exit, was in the process of updating information for a dynamic configuration change. IATMDCR used the UCBLOOK service to determine the address of a new UCB for a changed device, but the call to the UCBLOOK service did not complete successfully. In the message text:

  - `devnum` The device number of the device that IATMDCR attempted to update.
  - `rc` The return code from the UCBLOOK service.
  - `rsn` The reason code from the UCBLOOK service.

**System action:** IATMDCR continues on to the next device in the dynamic configuration change data. Dynamic configuration change exit processing continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Since IATMDCR might not have been able to complete processing, devices involved in the dynamic configuration change that were defined to JES3 might not have had corresponding information in JES3 changed. Verify that all changes performed in the configuration change did not affect devices defined to JES3. If any were affected, or you are not sure if any were affected, return the system to the previous configuration and hot start JES3 with refresh as soon as possible.

Using information from the SVC dump taken by IATMDCR’s recovery routine, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Descriptor Code:** —

**IAT5800**

**Explanation:**

- **JOB—jobname (jobid)—PLACED ON**
- **MDS ERROR**
- **QUEUE BY—xxx**
- **MDS BREAKDOWN**
- **THE DONE**

Either the main device scheduler or MDS system resource scheduling detected an error in the indicated job. Installation exit IATUX61 determines which queue the job should be placed on. JES3 issues this message to inform the operator which queue the job was placed on. If the installation exit chooses to hold the job, the job is placed on the ERROR queue. If the installation exit places the job on the ERROR queue, the operator can issue an *INQUIRY command to determine if the error is correctable. If the installation exit chooses to cancel the job, the job is placed on the BREAKDOWN QUEUE or the DONE QUEUE. When a job is placed on the BREAKDOWN or DONE queue, JES3 ends the processing for the job.

**System action:** The errors detected by the main device scheduler or by MDS system resource scheduling will not allow the job to run. Installation exit IATUX61 determines if the job should be canceled or held on the ERROR queue to be handled by the operator.

**Operator response:** If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- **A** device arm response (errors only).
- **B** initial verify response.
- **C** SYSUNITS ACL update.
- **M** volume mounted by operator.
- **R** MDS message route.
- **U** unload complete.
- **V** vary online response.

**ACL UPDATE**

indicates that JES3 detected a change in the ACL active/inactive status. In this case, the verify index (x) is blank.

**dev**

device number

**z**

UCB/STATUS byte

**E**

execution device

**G**

**IAT5810**

**Explanation:**

- **JOB—jobname (jobid)**
- **COMMAND (INQUIRY)**
- **COMMAND (MODIFY)**
- **JSTFDB=0**
- **ENCOUNTERED**
- **TEMPORARY**
- **PERMANENT**
- **NO BUFFER**
- **PLACED ON**
- **JSAM I/O ERROR**
- **READING**
- **bufferid**
- **RELEASING**
- **WRITING**

A JSAM I/O error occurred during MDS processing. The meanings of the terms are:

**JOB jobname (jobid)**

The error occurred during the processing of the specified job.
COMMAND (INQUIRY)
The error occurred during the processing of a non-job-related *INQUIRY,S command.

COMMAND (MODIFY)
The error occurred during the processing of a non-job-related *MODIFY,S command.

(MDS)
The error occurred during non-job-related processing in the MDS module IATMDDR.

TEMPORARY
Normal JSAM I/O error recovery was successful.

PERMANENT
Normal JSAM I/O error recovery failed or was not attempted.

NO BUFFER
All JSAM buffers are in use. JES3 has canceled the request to read a job's JST or JVT.

JSTFDB=0
A previous JSAM I/O error was encountered during processing for this job. As a result, JES3 has set the JST FDB in the RESQUEUE entry to zero.

READING or RELEASING or WRITING
The type of I/O operation JES3 was attempting when the error occurred.

bufferid
The JES3 buffer identifier of the record being processed—for example, JST, JVT, RES, or VUT.

System action: For permanent errors not caused by hardware, JES3 takes a storage dump. For all errors except temporary errors or a non-job-related error, if the job is not executing on main, JES3 transfers it to the MDS error queue.

Operator response: If JES3 transferred the job to the MDS error queue—indicated by message IAT5800—issue command *C,S,jobno to remove the job from the system. If MDS allocated resources to the job, hot start JES3 to release those resources.

Programmer response: If permanent I/O errors occur frequently, reallocate and reformat the spool data sets.

Problem determination: See Table I, item 13; and Table III, items 3, 4, and 22.

Module:

IAT5830
Explanation:

```
>>> SYSUNITS USE COUNT
>>> SETDAN USE COUNT
>>> SETVOL USE COUNT
>>> SETVOL ALLOCATION
```

The indicated count became negative while processing a deallocation request for the dynamic allocation file control table (DYNAL FCT).

System action: The count is set to zero. Processing continues.

Operator response: None. This is an informational message.

Module:

IAT5900
Explanation:

```
>>> JOB—jobname (jobid)
>>> SENT TO MDS FOR CATALOG SETUP
```

The indicated job requires the use of a private catalog whose access is controlled by MDS. Following the setup, the job proceeds in converter/interpreter processing.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT5910
Explanation:

```
>>> JOB—jobname (jobid)
```

Chapter 10. Main Device Scheduler Messages 301
IAT5912 • IAT5918

The indicated job is attempting to dedicate devices for the area specified. The identified area and name may be either GROUP and a job class group name, or NETID and a dependent job control network name.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

**Routing Code:** Note 13  **Descriptor Code:** 7

---

**IAT5918**

**Explanation:**

This message is written to the hard-copy message log each time a verify response message is received and processed by MDS. The *main* sends the verify response message. JES3V indicates a copy of the verify response message from an MVS processor described as follows:

x, verify descriptions

1 character, 0-F, or a blank (X'40'), corresponding to the following verify descriptions:

0 - xxxxxx VERIFIED

volume xxxxxx has completed MDS verification.

1 - xxxxxx,L MOUNTED

volume xxxxxx is mounted on the indicated device (L is label type).

2 - UNIT NOT READY

the device is not ready.

3 - NO RESPONSE

no response has been received from MDS verify on the main.

4 - VERIFY TIMEOUT

a timeout occurred during execution of a channel program.

5 - NON-EXISTENT DEV

there is no unit control block (UCB) for the indicated device.

6 - PERM I/O ERROR

a permanent I/O error has occurred on the indicated device.

Chapter 11. Input Service Messages

IAT6100

Explanation:

\[
\begin{align*}
&\text{jobid1} \\
&\text{DEMSEL} \\
&\text{jobname (jobid2), PRTY=nnn} \\
&\text{userid} \\
&\text{djnet} \\
&\text{jobid}
\end{align*}
\]

The job specified by JOB jobname (jobid2) has been read into the system by input service. This message indicates input service is processing the job. If jobid1 appears in the message, it identifies the job number assigned to one of the following DSPs:
- CR - card reader DSP
- TR - tape reader DSP
- DR - disk reader DSP
- INTRDR - internal reader DSP

If DEMSEL appears in the message, the job was a demand select job. If the job is a DJC job, the dependent job control network name is specified by the NET-ID.

ID= specifies the job owner.

If HOLD is specified, the job is held.

If the job was submitted through the internal reader, SUB= will specify the job id of the submitting job.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 10

Descriptor Code: 7

IAT6103

Explanation:

A /*PROCESS DJCPROC or DJC control statement must be included in the JCL for nonstandard DJC jobs.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct and resubmit the job.

Module:

Routing Code: 10

Descriptor Code: 7

IAT6104

Explanation:

The RELSCHCT parameter may not be specified for nonstandard DJC jobs.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct and resubmit the job.

Module:

© Copyright IBM Corp. 1988, 2010

</tr>
</thead>
<tbody>
<tr>
<td>IATGRJS</td>
<td>IATGRJS</td>
<td>IATGRJS</td>
</tr>
<tr>
<td>IATISEN</td>
<td>IATISEN</td>
<td>IATISEN</td>
</tr>
</tbody>
</table>
ENDED, DUE TO SYSTEM IPL
indicates that the job was active in MVS when an IPL of the MVS system was performed. The JES3 failure option (CANCEL, HOLD, or PRINT) is taken for the job.

Module:

FAILED BY INITIATOR
JOB jobname (jobid) STEP=stepname,
PROC=procedure stepname
errors were found in the job's JCL at initiation time

Module:

ENDED, COMP CD=SnnnUnnn
JOB jobname (jobid) STEP=stepname,
PROC=procedure stepname
indicates that the job has ended either with a system or user abend. If either code is zero, then an application program has issued an abend with a completion code of 0000.

Module:

ENDED, COND=code
JOB jobname (jobid) STEP=stepname,
PROC=procedure stepname
the job ended because the job step returned a condition code which satisfied the COND parameter specified on the JOB statement

STEP=stepname
Indicates one of the following:
• If a procedure was not called, stepname is the name of the failing job step.
• If a procedure was called, stepname is the name of the job step that called the failing procedure.
• If the job ended while starting, information is not available yet and N/A is displayed.

PROC=procedure stepname
Indicates one of the following:
• If a procedure was not called, there is no procedure stepname and NONE is displayed.
• If a procedure was called, procedure stepname is the name of the failing procedure step.

OWNER NOT SENT, NO PATH
indicates that no CTC path is currently available to the main; the user could not be notified.

Module:

Note: Do not confuse the completion code with the condition code. See z/OS MVS JCL Reference.

Module:

ENDED, MAXCC=nnnn
indicates that the job has ended normally. nnnn is the highest return code from any job step within the job.

System action: Processing continues.
Operator response: None. This is an informational message.
Routing Code: Note 7 Descriptor Code: 7

IAT6109
Explanation:
  ►INPUT SERVICE FAILED PROCESSING JOB◄
  ►JOB—(jobname), ANY REMAINING JOBS IN BATCH ARE LOST◄
While processing job (jobname), an abnormal condition caused input service to enter the failsoft routine. The remaining jobs in the batch are lost.

System action: JES3 ends input service and flushes the remaining jobs in the batch. JES3 continues processing.
Operator response: Notify the system programmer.
Programmer response: See z/OS JES3 Diagnosis for a description of the dump code returned by the failsoft routine.
Module:
IAT6110  •  IAT6116

Routing Code: 10  Descriptor Code: 7

IAT6110
Explanation:

A duplicate ddname has been detected on the /*DATASET control statement; ddnames must be unique within a job step.

System action: JES3 flushes the job.

Programmer response: Correct the ddname, and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6111
Explanation:

A JES3 control statement was coded beginning with one slash instead of two. For example, /*MAIN instead of //*MAIN. Your installation has chosen to disallow this format.

System action: The system cancels the job if JOB FLUSHED appears in the message. Otherwise, the statement is ignored.

Programmer response: Change the JCL to use the standard JES3 control statement format (/ in columns 1–3) and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6113
Explanation:

An incorrect class has been detected on the /*DATASET statement.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct the class and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6115
Explanation:

A /*DEL record was found by input service, indicating the job should be flushed.

Note: JES3 will generate a /*DEL record if a job that submits a job abends.

System action: JES3 flushes the job.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6116
Explanation:

A JES3 control statement was found in the input stream for a demand select job. The control statement appears in the JESMSGDLG data set.

System action: JES3 cancels the demand select job.
Operator response: Notify the system programmer.

Programmer response: Remove the JES3 control statement from the JCL for the demand select job and resubmit the job or command that uses the JCL.

Module:

Routing Code: 10    Descriptor Code: 7

IAT6117

Explanation:

INPUT DATA LENGTH ERROR—JOB FLUSHED.

An input record, not in an input data set, is other than 80 bytes long.

System action: JES3 flushes the job.

Programmer response: Correct the input record, and resubmit the job.

Module:

Routing Code: Note 19    Descriptor Code: –

IAT6118

Explanation:

nn—CARDS FLUSHED

BEBEFORE JOB CARD FOUND

A number of statements, indicated by nn, was either read by input service before the first JOB statement was read or was between JOB statements of a batch.

System action: JES3 ignores these statements.

Programmer response: Determine the validity of the input stream and resubmit any jobs in error.

Module:

Routing Code: Note 7    Descriptor Code: 7

IAT6119

Explanation:

INVALID JOBNAME

(BINARY ZEROS) ENCOUNTERED

FLUSHING TO NEXT JOB

CARD OR END OF FILE

A job name was not specified on the job's JCL statement. The job name must be 1-8 alphabetic or national characters.

System action: The job is discarded and JES3 starts processing the next job.

Operator response: None. This is an informational message.

User response: Correct the JOB statement to include a job name.

Module:

Routing Code: Note 7    Descriptor Code: 7

IAT6120

Explanation:

ERROR ENCOUNTERED—IN PROCESSING

FORMAT CARD

A */FORMAT statement in the job's JCL is incorrect.

System action: JES3 flushes the job.

Programmer response: Correct and resubmit the job.

See the control card section of z/OS MVS JCL Reference.

Module:

Routing Code: Note 19    Descriptor Code: –

IAT6121

Explanation:

DESTINATION DEVICE HAS INVALID

Chapter 11. Input Service Messages 309
The DEST= parameter specified on the //*FORMAT statement conflicts with the first parameter (PR, or PU).

System action: The job is scheduled for the interpreter and output service segment, and then the job is purged.

Programmer response: Correct and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6122

Explanation:

The /*FORMAT statement indicates that it is to be continued, but no continuation statement was found.

System action: JES3 flushes the job.

Programmer response: Correct the /*FORMAT statement and resubmit the job.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6124

Explanation:

While processing the job stream, input service encountered an //XMIT statement or //ROUTE statement after an MVS JCL control statement. The XMIT or ROUTE statement must appear immediately after the JOB statement or any //NETACCT statements. The possible error texts are:

- NETWORK JOB FLUSHED

JES3 flushes the network job that the user submitted to be transmitted. Any JCL after the delimiter is processed.

- ENTIRE JOB STREAM FLUSHED

If a //*ROUTE statement is used, JES3 flushes the network job until it reaches another JOB statement. If a XMIT statement is used, JES3 flushes the network job until the end-of-file is reached.

System action: Depending on the type of statement used to transmit the user’s data, JES3 flushes the indicated portion of the network job. JES3 processing continues.

User response: Correct the //ROUTE or ROUTE statement is placed immediately after the JOB or NETACCT statements.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6125

Explanation:

JES3 was able to identify the /*ROUTE statement but input service cannot parse the parameters on the statement because of syntax errors.

System action: JES3 flushes the network job until the next recognizable JOB statement or an end-of-file is reached.

User response: Correct the /*ROUTE statement so that it meets the syntax rules. See the z/OS MVS JCL Reference for the rules on coding the /*ROUTE statement.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6126

Explanation:

While processing the job stream, input service encountered an //XMIT statement or //ROUTE statement after an MVS JCL control statement. The XMIT or ROUTE statement must appear immediately after the JOB statement or any //NETACCT statements. The possible error texts are:

- NETWORK JOB FLUSHED

JES3 flushes the network job that the user submitted to be transmitted. Any JCL after the delimiter is processed.

- ENTIRE JOB STREAM FLUSHED

If a /*ROUTE statement is used, JES3 flushes the network job until it reaches another JOB statement. If a XMIT statement is used, JES3 flushes the network job until the end-of-file is reached.

System action: Depending on the type of statement used to transmit the user’s data, JES3 flushes the indicated portion of the network job. JES3 processing continues.

User response: Correct the /*ROUTE statement so that it meets the syntax rules. See the z/OS MVS JCL Reference for the rules on coding the /*ROUTE statement.
JES3 was able to identify the // XMIT statement but syntax errors prevented input service from processing the parameters on the statement. The possible error texts are:

- NETWORK JOB FLUSHED
  JES3 flushes the network job that the user submitted to be transmitted. Any JCL after the job delimiter is processed.
- ENTIRE JOB STREAM FLUSHED
  JES3 flushes the network job stream until the end-of-file is reached.

**System action:** JES3 flushes the indicated portion of the network job stream. JES3 processing continues. The error and reason codes are:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>the XMIT statement has a syntax error.</td>
</tr>
<tr>
<td>04</td>
<td>the DEST= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
<tr>
<td>08</td>
<td>the DLM= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
<tr>
<td>12</td>
<td>the SUBCHARS= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>no keyword is specified.</td>
</tr>
<tr>
<td>04</td>
<td>an incorrect keyword is specified.</td>
</tr>
<tr>
<td>08</td>
<td>the XMIT statement contains a continuation error.</td>
</tr>
<tr>
<td>12</td>
<td>the DEST= keyword is not specified.</td>
</tr>
<tr>
<td>16</td>
<td>there are duplicate keywords.</td>
</tr>
<tr>
<td>20</td>
<td>the value on the specified keyword is not the correct length.</td>
</tr>
<tr>
<td>24</td>
<td>the value on the specified keyword extends into the continuation boundary.</td>
</tr>
<tr>
<td>28</td>
<td>the second special character is missing.</td>
</tr>
<tr>
<td>32</td>
<td>the special character is not in quotes.</td>
</tr>
</tbody>
</table>

**User response:** Correct the syntax of the XMIT statement. See the [2/OS MVS JCL Reference](#).
IAT6129

Explanation:

>>> INVALID CONTINUATION RECEIVED — ‘text’ —

JES3 was processing a card that was to be continued. The next card to be processed has a label in the name field and is not a valid continuing card.

System action: JES3 flushes the job.

Programmer response: Check to make sure the cards are continued properly. Correct any errors and resubmit the job.

Module:

Containing  Detecting  Issuing
IATISLG     IATISLG     IATISLG

---

IAT6130

Explanation:

>>> ERROR IN PROCESSING JOB CARD.

An error has been detected in the JOB statement.

System action: The job is scheduled for the interpreter and output service segment, and then the job is purged.

Programmer response: Correct and resubmit the job.

Module:

Containing  Detecting  Issuing
IATISJB     IATISJB     IATISJB

Routing Code: Note 19  Descriptor Code: –

---

IAT6132

Explanation:

>>> DUPLICATE PASSWORD PARAMETER

A duplicate password parameter on a job statement was found.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Ensure that the job statement is correct and resubmit the job.

Module:

Containing  Detecting  Issuing
IATISJB     IATISJB     IATISJB

Routing Code: Note 19  Descriptor Code: –

---

IAT6133

Explanation:

>>> JOB CARD INVALID, — ‘text’ —

An error was found processing the JOB JCL statement. The text describing the error can be one of the following:

- CLOSING QUOTE MISSING indicates that an opening quote (‘) was found, but the closing quote was not found.
- CONTINUATION NOT RECEIVED the JOB JCL statement was coded to be continued, but the continuation statement was not found.
- INVALID CONTINUATION the JOB JCL statement was coded to be continued, but the following statement did not conform to the continuation syntax.
- JOB CARD NOT FOUND the character string ‘JOB’ was not found.
- FIRST CHARACTER OF THE JOBNAME IS NUMERIC indicates that the first character of the JOBNAME was not alphabetic or national. JES3 forces the
JOBNAME to be FAILnnnn, where nnnn is the number assigned to the job.

JOBNAME IS NOT ALPHAMERIC OR NATIONAL indicates that the JOBNAME does not consist of 1-8 alphameric and national(#,@,$) characters. JES3 forces the JOBNAME to be FAILnnnn, where nnnn is the number assigned to the job.

PASSWORD IS TOO LONG Indicates that a password was found that is longer than eight characters.

ACCOUNTING INFORMATION IS TOO LONG The accounting information parameter on the JOB JCL statement is longer than the allowable 142 characters.

NO CLASS SPECIFIED Indicates that a job class was not specified on the CLASS= parameter.

CLASS NAME IS TOO LONG Indicates that the job class specified on the CLASS= parameter was too long.

System action: JES3 flushes the job.

Programmer response: Correct the JOB statement and resubmit the job.

IAT6134

Explanation:

The JOBNAME on the JCL JOB statement could not be processed. The first character of the JOBNAME entered was numeric or the JOBNAME entered did not consist of 1 to 8 alphameric or national (#,@,$) characters.

System action: JES3 replaces the incorrect jobname with the characters ffffff. These characters consist of the job number left padded with zero prefixed with FAL if the job number is 99999 or less, otherwise it is prefixed by F. For example, for job number 314 the job name FAL00314 is used, and for job number 159265 the job name F0159265 is used.

Operator response: If the message is the result of an MVS START command, issue the START command again with the correct procedure name.

Programmer response: Correct the JOBNAME on the JOB statement and resubmit the job.

IAT6135

Explanation:

JES3 canceled the specified job from the system because of an error with the programmer or accounting information on the job's job statement.

System action: JES3 cancels the job and prints the canceled job. JES3 processing continues.

Operator response: None. This is an informational message.

User response: Check the programmer and accounting information on the job statement. Correct the information on the job statement and resubmit the job.

IAT6136

Explanation:

A continuation of a JES3 control statement was coded beginning with one slash instead of two. Your installation has chosen to disallow this format.

System action: The system cancels the job if JOB FLUSHED appears in the message. Otherwise, the continuation is ignored, and any other continuations coded in the standard format (//* in columns 1–3) are accepted.

Programmer response: Change the JCL to use the standard JES3 control statement format (//* in columns 1–3) and resubmit the job.
IAT6139

**Explanation:**

- **JOB**—*jobname (jobid)*
- FLUSHED. INVALID RETURN CODE FROM—IATUXnn

**System action:** The installation exit is disabled until the next restart of JES3. Input service processing cancels the specified job and continues with the next job.

**Operator response:** Notify the system programmer.

**Programmer response:** Correct the installation exit routine.

**Module:**

- Containing: IATISLG
- Detecting: IATISLG
- Issuing: IATISLG

Routing Code: Note 19  Descriptor Code: –

---

IAT6140

**Explanation:**

- **JOB ORIGIN FROM GROUP**—*group,*
- **DSP**—*dsp,* **DEVICE**—*devname,dev*

This message gives the name of the device group, the spool DSP name, the device name and device number of the origin of the job. If DSP=DR, then DEVICE= gives the name of the member from which this job was taken.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

- Containing: IATISEN
- Detecting: IATISEN
- Issuing: IATISEN

---

IAT6141

**Explanation:**

- **WARNING**—MULTIPLE //NET CONTROL CARDS
- ENCOUNTERED IN INPUT STREAM

More than one //NET statement was provided for this job. The first //NET statement was processed and used as the DJC definition for this job.

**System action:** Processing continues.

**Programmer response:** Remove the extra //NET statement from the job.

**Module:**

- Containing: IATISLG
- Detecting: IATISLG
- Issuing: IATISLG

Routing Code: Note 19  Descriptor Code: –

---
IAT6144
Explanation:
DM702 OR DM722 OCCURRED WHILE READING
- INPUT. JOB FLUSHED.
A DM702 or DM722 abend occurred while input service was reading a multi-record file containing an input job. A probable cause is the job abended that was creating the multi-record file, so that a buffer or end-of-file mark was not written. This is most likely to occur with an internal reader job.
System action: The job is flushed. If a job stream was input to the internal reader, the remainder of the stream is lost.
Programmer response: Determine why the job abended submitting the input stream, and resubmit the job.

Routing Code: Note 19    Descriptor Code: –
IAT6160
Explanation:

A previously undefined dependent job control network `djnet` has been encountered on the `//NET` control statement, and a new DJC network is now being defined. This is the network sign-on message for the specified DJC network.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT6163
Explanation:

A DJC job was a duplicate of an existing DJC job of the same network. Duplication is determined by a match on job name.

System action: The job is scheduled for the interpreter and output service segments, and then purged.

Programmer response: Find the jobs with duplicate names with the *INQUIRY,N command, and change one of the names.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6164
Explanation:

DJC allows a job that has failed in DJC processing to be resubmitted; however, the resubmit is disallowed in the following cases:

1. If the number of successor jobs has been changed on the resubmittal.
2. If the NRCMP=FLSH parameter is specified on the `//NET JECL` statement and the job is submitted after it has run to normal completion. Message IAT6166 is also issued.
3. If the net was submitted on a JES3 release that does not support job numbers greater than 65,534 and the resubmitted job is assigned a job number greater than 65,534. Message IAT6179 is also issued.

System action: For case 1 and 3, the job is scheduled for the interpreter and output service segments, and then the job is purged. For case 2, see message IAT6166.
**Programmer response:** For case 1, resubmit the job with the original number of successor jobs. For case 2, the job cannot be submitted again. For case 3, see message IAT6179.

**Module:**

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT6165**

**Explanation:**

A syntax error was encountered in processing a /*NET control statement. The message provides 9 characters of the text in the area of the error.

**System action:** The job is scheduled for the interpreter and output service segments, and then purged.

**Programmer response:** Correct the error, and resubmit the job.

**Module:**

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT6168**

**Explanation:**

A *MODIFY,N,ID= command was issued with either the C or F operand specified.

**System action:** The job is flushed. If the J= operand was not on the *MODIFY command, all of the jobs in the DJC network will be flushed.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT6171**

**Explanation:**

A //*PROCESS statement error has been detected.
System action: The job is scheduled for the interpreter and output service segments, and then purged.

Programmer response: Correct and resubmit the job.

Routing Code: Note 19  Descriptor Code: –

IAT6172

Explanation:

THE MAXIMUM NUMBER OF SCHED ELEMS
EXCEEDED DUE TO TOO MANY PROCESS CARDS

Too many //PROCESS statements were in the job stream.

System action: JES3 issues this message to the job's JESMSGLG data set. If the JOB statement is valid, JES3 scans the job for any JCL errors before flushing this job.

Programmer response: Delete extra //PROCESS statements and resubmit the job.

Routing Code: Note 19  Descriptor Code: –

IAT6173

Explanation:

THE DSP ON THE PRECEDING //PROCESS CARD
IS NOT PROCESSABLE

The DSP is not defined as processable in the JES3 DSP dictionary; therefore, this DSP cannot be used on a //PROCESS statement.

System action: JES3 flushes the job.

Programmer response: If the DSP is correctly spelled on the //PROCESS statement, then it is either incorrectly defined in the JES3 DSP dictionary or is not available for use in this manner.

Routing Code: Note 19  Descriptor Code: –

IAT6174

Explanation:

//PROCESS NOT ALLOWED AFTER PURGE
OR ENDPROCESS. JOB FLUSHED.

A //PROCESS statement was encountered in the job stream following a //PROCESS PURGE or //ENDPROCESS statement. All //PROCESS statements of one job must precede either of these statements.

System action: JES3 flushes the job.

Programmer response: Correct the sequence of statements, and resubmit the job.

Routing Code: Note 19  Descriptor Code: –

IAT6176

Explanation:

REMOTE JOB CARD NOT FOUND

JES3 encountered the //ROUTE statement but could not locate a JOB statement following the //ROUTE.

System action: JES3 flushes the job.

Programmer response: Insert the required JOB statement and resubmit the job.

Routing Code: Note 19  Descriptor Code: –

IAT6177

Explanation:

EXECUTION NODE SPECIFIED INVALID,
JOB jobname (jobid) nodename

The job contains a //ROUTE or //XMIT control statement that specifies a node that is not defined to JES3.
**IAT6178** • **IAT6182**

**System action:** JES3 purges the job from the system. JES3 processing and networking continues.

**Operator response:** Contact the user. Indicate the network job that failed.

**Programmer response:** Correct the //ROUTE or //XMIT statement so that a valid node name is specified an resubmit the job.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISNJ</td>
<td>IATISNJ</td>
<td>IATISNJ</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 17 **Descriptor Code:** 7

---

**IAT6178**

**Explanation:**

- **INVALID EXECUTION NODE,**
- **JOB— jobname (jobid) nodename**

Each node for the network is defined by a NJERMT statement in the initialization stream. Code was added to installation exit, IATUX40, to change the name of the execution node. JES3 could not locate the name of the node specified by installation exit IATUX40.

**System action:** JES3 purges the job.

**Operator response:** Notify the system programmer.

**Programmer response:** Check the networking node table to ensure the name specified in installation exit IATUX40 is in the table. If the table does not contain the name of the node, include an NJERMT statement that identifies the name of the node.

**Module:**

<table>

</tbody>
</table>

Routing Code: Note 17    Descriptor Code: 7

IAT6191

Explanation:

A DD * or DD DATA JCL statement with continuation was processed and the next statement was not a valid JCL continuation.

System action: The system flushes the job being processed flushes the following JCL until end-of-file or a valid JOB statement is read.

Operator response: Notify the system programmer.

Programmer response: Correct and resubmit the job.

IAT6192

Explanation:

Input service detected an error that causes input service to reject the internal reader data set that is being processed. The possible error texts and the associated reasons are:

- INTRDR DSP DICT NOT AVAILABLE/VALID (F1)
- PURGE DSP DICT NOT AVAILABLE/VALID (F2)
- NO JOB NUMBERS AVAILABLE(F3)
- ERROR RETURN FROM IATUX27 (F4)

System action: Input service rejects the internal reader data set and JES3 issues a 1FB system completion code.

Operator response: Notify the system programmer.

System programmer response: If the error is not from IATUX27, see z/OS JES3 Diagnosis to help determine the problem.

Module:
comprised of the first 5 characters of the JES3
ddname of the device from which the jobs were
read (except for disk reader, which is DRDR), a
hyphen, and the 2-digit count of the number of jobs
contained in this batch. If the device ddname is less
than 5 characters, blanks appear between the
name and the hyphen. If a reader device is not
available during a restart, asterisks appear in the
first 5 characters of the 8-character job name and
the number of card images read is zero.

**bb**
the number of jobs in this batch.

**nnn**
the number of card images read. After a hot start,
this may be zero.

**prty**
the scheduling priority of this interpreter job.

**HOLD**
indicates that this job is in operator hold status.

**System action:** Input service starts to process a new
interpreter job.

**Operator response:** No response is required unless
HOLD appears in the message; if so, release this job so
that the jobs it will interpret can be accessed by the
system. All operator commands referring to this
interpreter job must use the job number, for example,
*MODIFY,J=jobno,R.

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT6211**

**Explanation:**

**-** */DATASET MODE=C or DCB=MODE=C INVALID.
**-** USE *X CR,C. RDR CNX

A */DATASET statement for job (**jobname**) includes the
MODE=C or DCB=MODE=C operand; however, the
card reader was not called with the C operand
specified.

**System action:** This copy of the card reader is
canceled. If the reader is a remote job processing
device, the rest of the input stream is flushed. Message
IAT6281 is issued after the reader has reached the
end-of-file.

**Programmer response:** In the job's run instructions,
note that the C option must be used when the card
reader is called.

**Operator response:** If this is a hot reader and further
input is desired, manually clear the hopper of the job
containing card-image input and ready the reader. Otherwise, resubmit the entire failing job and recall the card reader, using the C option, with the command *X,CR,C. If the input stream is being flushed, remove all cards from the hopper. Make sure the end-of-file key is pressed on the reader, and let the reader read all cards.

Module:

Containing  Detecting  Issuing
IATISRL IATISRL IATISRL

Routing Code: Note 18  Descriptor Code: –

IAT6212

Explanation:

 repercussions: jobname
 repercussions: //DATASET MODE=C or DCB=MODE=C INVALID.
 repercussions: RDR CNX

A //DATASET statement for job jobname includes the MODE=C or DCB=MODE=C operand; however, the input stream was from a tape, disk, or remote reader.

System action: This reader is canceled. If the reader is a remote job processing device, the rest of the input stream is flushed.

Operator response: Recreate the job stream without the MODE=C operand in the //DATASET statement. The column binary parameter is meaningless for disk or tape input.

Module:

Containing  Detecting  Issuing
IATISRL IATISRL IATISRL

Routing Code: Note 18  Descriptor Code: –

IAT6221

Explanation:

 repercussions: use dev FOR JOB (jobid) TAPE

The tape reader has obtained a tape drive with the number dev for the specified input tape reader job.

System action: The tape reader waits for an operator reply.

Operator response: Mount the input tape on the designated drive and issue an *S command, for example, *S,TR.

Module:

Containing  Detecting  Issuing
IATISRL IATISRL IATISRL

Routing Code: Note 18  Descriptor Code: –

IAT6231

Explanation:

 repercussions: REQUESTED DEVICE NOT AVAILABLE
 repercussions: RDR CANX
 repercussions: RESKED

The device requested is not available because it is presently allocated to another DSP or it has been specified OFFLINE. If a particular device name was not specified using the IN= operand of the *CALL command, then all readers (card or tape) are in use or offline.

System action: If the message suffix is CANX, no further action is taken. The hot reader (K) option is not honored. If the suffix is RESKED, JES3 automatically recalls this reader when the device is available.

Operator response: Enter the *VARY,dev ONLINE command, if necessary, to make a device available. Note that the distributed JES3 system defaults to the NAV=R option on the card reader and the tape reader.

Module:

Containing  Detecting  Issuing
IATISRL IATISRL IATISRL

Routing Code: Note 18  Descriptor Code: 7

IAT6232

Explanation:

 repercussions: INVALID DEVICE REQUEST.
 repercussions: RDR CANX

The IN= operand on the *CALL command specified a nonexistent device; or the specified device is not a valid card device, if a card reader is being called, or a valid tape device, if a tape reader is being called.

System action: The call is unconditionally canceled.

Operator response: Call the reader again, specifying a valid device.

Module:

Containing  Detecting  Issuing

IAT6238
Explanation:

OPEN FAILED FOR RDR OR RJPLINE.

RDR CANX

The RJP line, tape, or card reader could not be successfully opened. If this is a reader for RJP, the RJP line was probably canceled.

System action: The reader is canceled.

Operator response: Perform any appropriate manual correction, ready the device, and reenter the *CALL command.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT6239
Explanation:

JES3DRDS DD BLKSIZE NOT A MULTIPLE OF 80

The partitioned data set (PDS) whose members were intended to be used as input to the disk reader was defined on the DD statement and the DCB=(BLKSIZE=) value is not a multiple of the card length.

System action: JES3 runs normally. If the operator attempts to call the disk reader, JES3 issues message IAT6237.

Operator response: Notify the system programmer.

Programmer response: Recreate the data set with a block size that is a multiple of 80 less than 3200 bytes.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT6240
Explanation:

JES3DRDS DD BLKSIZE LARGER THAN 3200

The partitioned data set (PDS) specified by the ddname JES3DRDS has a block size that exceeds the size acceptable to the disk reader (DR).

System action: JES3 issues message IAT6237 if the operator attempts to use DR.

Operator response: Notify the system programmer.

Programmer response: Recreate the data set with a block size that is a multiple of 80 less than 3200 bytes.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT6241
Explanation:

XR op NOT RECOGNIZED

An unrecognizable or unacceptable operand op has been detected on an operator command. The operand may be misspelled or incorrect for this reader.

System action: If the incorrect entry was on a *CALL command, the reader is unconditionally canceled, and RDR CANX is appended to the message. If the entry was on an *S or *C command, all entries up to the point of failure are accepted; operands beyond this one have not been examined.

Operator response: Repeat the entire *CALL command, or repeat the *S command, correcting the operand in error and reentering any remaining operands, (for example, *X,CR,TM=2 or *X,DR,DEN=5).

Module:

Routing Code: Note 18  Descriptor Code: –

IAT6242
Explanation:

XR op PARAMETER WRONG VALUE

The parameter value of an operator command operand op is unrecognized or of the wrong value.

System action: If the incorrect value was on a *CALL command, the reader is unconditionally canceled, and RDR CANX is appended to the message. If the entry was on an *S or *C command, all entries up to the point
of failure are accepted; operands beyond this one have not been examined.

**Operator response:** Repeat the entire *CALL command, or repeat the *S command, correcting the parameter in error and reentering any remaining operands, for example, *X,TR,DEN=7, *S,CR,B=FOUR, or *C,DR,P=20.

<th>Detecting IATISRP</th>
<th>Issuing IATISRP</th>
</tr>
</thead>
</table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT6251**

**Explanation:**

\[\text{dev— NOT READY, DATA CHECK} \]

On device number dev, the reader has encountered an intervention-required condition because an incorrect punch was in the card. If this is card-image data, possibly a */DATASET MODE=C card or a DD * ,DCB=MODE=C card does not precede the data.

**System action:** The reader waits for the operator to correct the interrupting condition. It automatically starts reading again when the device is made ready.

**Operator response:** Perform any appropriate manual correction and ready the device. If the data check was due to card-image data, enclose the data in DATASET-ENDDATASET cards.

**Problem determination:** See Table I, items 2 and 30.

**Module:**

<table>
<thead>
<tr>
<th>Containing IATISCR</th>
<th>Detecting IATISCR</th>
<th>Issuing IATISCR</th>
</tr>
</thead>
</table>

**Routing Code:** Note 18  **Descriptor Code:** –

---

**IAT6253**

**Explanation:**

\[\text{dev— NOT READY, EQUIP FAILURE} \]

On device number dev, the reader has encountered an intervention-required condition because of a hardware bus-out or an equipment failure.

**System action:** The reader waits for the operator to correct the interrupting condition. It automatically starts reading again when the device is made ready.

**Operator response:** Perform any appropriate manual correction and ready the device.

**Problem determination:** See Table I, items 2 and 30.

**Module:**

<table>
<thead>
<tr>
<th>Containing IATISCR</th>
<th>Detecting IATISCR</th>
<th>Issuing IATISCR</th>
</tr>
</thead>
</table>

**Routing Code:** Note 18  **Descriptor Code:** –
IAT6254

Explanation:

On device number dev, the reader has encountered an intervention-required condition. This can only occur on the 2501 card reader.

System action: The reader waits for the operator to correct the interrupting condition. It automatically starts readying again when the device is made ready.

Operator response: Perform any appropriate manual correction and ready the device.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISTR</td>
<td>IATISTR</td>
<td>IATISTR</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: –

IAT6255

Explanation:

An unrecoverable error has occurred on device number devnum or device name devname. If this is a card reader, a command reject (35xx only) has been encountered, or the PERM ERROR key has been pressed. If this is a tape reader, the error recovery routine has not been able to read a record.

System action: The reader is canceled.

Operator response: None. This is an informational message.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT6266

Explanation:

This message follows message IAT6265. The data for this message is extracted from the SYNADAF message buffer obtained during error analysis. The terms in the message are:

dev  the device number of the failing DASD
opr  the operand, typically READ
err  the type of error, such as DATA CHECK
cccchhhhr  in hexadecimal, the absolute location of failure (cylinder, head, record)

System action: The reader is canceled.

Operator response: Do not try to read the member again.

Programmer response: Recreate the input stream member. It is possible that the track is bad and that you must assign an alternate track.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISRI</td>
<td>IATISRI</td>
<td>IATISRI</td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT6267

Explanation:

Permanent error during directory search. Reader canceled.

BPAM has encountered an I/O error while searching for the data set member specified in the M= operand.

System action: JES3 cancels the reader DSP.

Operator response: Do not try to read the member again. Recreate the input stream member. It is possible that the track is bad and that you must assign an alternate track.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>IATISDR</td>
<td>IATISDR</td>
<td>IATISDR</td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT6271

Explanation:

Job — Jobname — lost when

System failed — REPOSITIONING

This message is issued after a JES3 restart has been completed and a reader that was active at the time of
failure has been automatically recalled by JES3. The
reader is operating under the conditions established by
the original operator *CALL commands; any
modifications made by the operator on subsequent *S
and *C commands have not been saved. The specified
job being read at the moment of failure is lost.

System action: All jobs that have been completely
read before failure will automatically be passed to an
input service interpreter job. An artificial batch-full
condition is set to force this.

If REPOSITIONING is included in the message, an
attempt is made to reposition the file to the beginning of
the job that was being read and to resume normal
operation.

Operator response: If this is a card reader, reload the
input decks, starting with the job named in the
message. Ready the reader.

Module:

IATISRI  IATISRI  IATISRI

Routing Code: Note 18    Descriptor Code: 7

IAT6272

Explanation:

A severe JSAM error condition occurred while restarting
the reader. This message is preceded by message
IAT6274.

System action: The reader is canceled.

Operator response: None. This is an informational
message.

Problem determination: Table I, items 2 and 30.

Module:

IATISRI  IATISRI  IATISRI

Routing Code: Note 18    Descriptor Code: 7

IAT6274

Explanation:

A severe JSAM error condition occurred while processing an I/O request from a JES3 reader. The file
identification (JDAB, or JDS) and DM code associated with the error are provided.

System action: The reader is canceled.

Operator response: None. This is an informational
message.

Problem determination: See Table I, items 2 and 30.

Module:

IATISRI  IATISRI  IATISRI

Routing Code: Note 18    Descriptor Code: 7

IAT6275

Explanation:

A severe JSAM error condition occurred while processing the job specified in the message.

System action: The job specified is lost. An attempt to
save all previously read jobs is made, then the reader is
canceled.
Operator response: None. This is an informational message.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISRL</td>
<td>IATISRL</td>
<td>IATISRL</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: 7

IAT6276

Explanation:

\[
\text{JOBS LOST, LAST JOB ADDED—}_{
\begin{array}{c}
\text{Jobname}\\
\end{array}
}\]

A severe JSAM error condition occurred. The last job successfully added to an input service batch for the control card scan is specified in the message.

System action: All jobs following the specified job are lost. The reader is ended.

Operator response: None. This is an informational message.

Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISRL</td>
<td>IATISRL</td>
<td>IATISRL</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: 7

IAT6281

Explanation:

\[
\text{JOB—}_{
\begin{array}{c}
\text{Jobname}\\
\end{array}
}\text{ FROM}_{
\begin{array}{c}
\text{ddn}\\
\text{dev}
\end{array}
}\]

\[
\text{FLUSHED}_{
\begin{array}{c}
\text{BEFORE JOB CARD FOUND}\\
\end{array}
}\]

A “CANCEL command was recognized while job jobname was being read. For a remote job processing reader, the ddname ddn of the device reading the input stream is given; for a locally attached reader, the 3- or 4-character device number is given.

System action: All jobs that were completely read before the cancel are passed to an input service interpreter job.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISRL</td>
<td>IATISRL</td>
<td>IATISRL</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: 7

IAT6291

Explanation:

\[
\text{nnn CARDS FROM}_{
\begin{array}{c}
\text{devname (dev)}\\
\end{array}
}\text{ FLUSHED}_{
\begin{array}{c}
\text{BEFORE JOB CARD FOUND}\\
\end{array}
}\]

The first statements read by the specified reader were not preceded by a JOB statement and were not JES3 //* command statements. The reader may be locally attached (indicated by a 3- or 4-character device number dev) or a remote job processing reader (indicated by blanks).

System action: If BEFORE JOB CARD FOUND is appended, a JOB statement was found and normal processing started. If this is not present, the reader has read to an end-of-file without recognizing a JOB statement.

Operator response: Notify the system programmer.

Programmer response: If this is a card reader, check for a missing JOB card at the front of the deck. If this is a disk reader or tape reader, recreate the input stream with a leading JOB statement.

Module:
IAT6292 • IAT6297

Routing Code: Note 18  Descriptor Code: 7

IAT6292

Explanation:

An operator *CALL or *START command included the J= operand, specifying that input start with the job named, but an end of file occurred before the specified job was found.

System action: Processing continues as usual when an end of file is encountered.

Operator response: Verify that the jobname was spelled correctly.

• If this is a disk reader (DR), verify that the correct M=member-name was specified.
• If this is a tape reader (TR), the tape may not have been positioned to the correct file or may have been positioned to a point beyond the start of the job. Rewind the tape and try again.

Module:

Routing Code: 41  Descriptor Code: 7

IAT6294

Explanation:

This message is issued in conjunction with IAT6299 when the specified data set requested on an UPDATE= parameter was not found in the PROCLIB table or has a syntax error.

System action: The job fails with a JCL error and processing continues.

Operator response: Notify the system programmer.

Programmer response: Specify the correct data set name and resubmit the job. The UPDATE= parameter should not be used for non-procedure library data sets.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6295

Explanation:

The procedure library specified in the PROC= parameter on the //*MAIN statement has not been defined in the initialization deck.

System action: JES3 flushes the job.

Programmer response: Check the parameter, or define the procedure library.

Module:

Routing Code: Note 19  Descriptor Code: –

IAT6297

Explanation:

An incorrect spool partition name was found on a SPART= parameter in a //*MAIN control statement.

System action: Job processing continues; JES3 places the job's spool data in the first valid spool partition previously defined in this job by a SPART= parameter, if any, in any partition defined during JES3 initialization for the job's class, or in the default partition.

Operator response: None. This is an informational message.

Module:
IAT6298

Explanation:

More than one SPART= parameter was found on the //*/MAIN control statements for a job.

System action: JES3 places the job's spool data in the spool partition specified in the last SPART= parameter in the job's control statements. Job processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>

Chapter 12. General Routines Messages

IAT6300
Explanation:

- USER EXIT 58
- DISABLED DUE TO FAILURE

Installation security exit IATUX58 or IATUX59 is disabled because a failure occurred while the exit was active.

System action: JES3 will not call the exit again until you restart JES3 (on the processor on which the failure occurred).

Operator response: Notify the system programmer.

System programmer response: Based on your installation's needs, determine whether or not to instruct the operator to restart JES3.

Note: Restarting JES3 will reinstate the same copy of the exit. An IPL is required to allow your system to load a new, possibly changed copy.

Module:

IATGRSC IATGRSC IATGRSC
IATGRSS IATGRSS IATGRSS

Routing Code: 10
Descriptor Code: 7

IAT6304
Explanation:

- NO UCB EXISTS FOR DEVICE dev devname

A JES3 writer has been started for, or a JESEXCP has been issued to, the indicated JES3 device that was defined during JES3 initialization with no UCB (for example, JUNIT=NONE on the DEVICE statement).

System action: No EXCP is issued and an intervention-required condition is returned to the caller of JESEXCP.

Operator response: None. This is an informational message.

Module:

IATGROP IATGROP IATGROP

Routing Code: 10
Descriptor Code: 7

IAT6302
Explanation:

- JOB jobname (jobid) IN HOLD
- CLASS= class, NOT DEFINED, DSP= dspname

The generalized main scheduling (GMS) class specified in the JCT entry for the indicated job could not be found in the GMS class table. This situation should not occur and may indicate alteration of a JES3 initialization parameter over a restart.

System action: Scheduling continues.

Operator response: Notify the system programmer.

Module:

IATGRJS IATGRJS IATGRJS

Routing Code: 10,Note 7
Descriptor Code: 7

IAT6305
Explanation:

- INVALID SPEC RESCHD, JOB jobname (jobid), ERRDEV= (ddn,type), DSP= dspname CANCELLED

After the DSP requested specialized rescheduling (the unit was not available), the JSS driver (IATGRJP) received an error return from GETUNIT. This indicates that the GETUNIT list to which FCT (FCTGLIST) pointed is incorrect.

System action: The DSP is canceled.

Operator response: Notify the system programmer.

Module:

IATGRJR IATGRGU IATGRJR

Routing Code: 10,Note 7
Descriptor Code: 7
IAT6306

Explanation:

A DSP requested by the operator or another DSP has been added to the JES3 job queue (JCT). The console name can be one of the following:

console name
- when issued by an RJP, MCS, or extended MCS console
- INTERNAL
  - when issued by an INTERCOM macro without a valid console identifier.
- NETWORK
  - when issued from a network operator.

System action: The DSP is subsequently scheduled as a JES3 job by normal job segment scheduler (JSS) processing.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18   Descriptor Code: 7

IAT6308

Explanation:

During the execution of the ALOAD macro, module IATGRLD was unable to load the specified module. Return code rc and the abend code ac from the MVS LOAD or MVS BLDL (for a module residing in a private library) macro instruction are given.

System action: JES3 abends.

Operator response: Notify the system programmer.

System programmer response: If an error address was specified when the ALOAD macro was issued, control returns to the issuing module which then issues the fail DSP. In the trace entry for the ALOAD module the abend code will be contained in register 1 and the reason code will be contained in register 14.

If the error address was not specified, module IATGRLD will issue the fail DSP. In the trace entry for the ALOAD module the abend code will be contained in register 1 and the reason code will be contained in register 4.

Problem determination: See Table III, items 2 and 6.

Module:

Routing Code: 42   Descriptor Code: 7
IAT6309
Explanation:

- (GRLD) - JES3 ABEND CODE—\textit{ac}—
- RETURN CODE—\textit{rc}—
- FROM ALOAD OF MODULE—\textit{mod}—

The JSS driver (IATGRJR) was unable to load the specified module. The abend code is the JES3 abend that would have occurred if an error exit was not specified.

The return code (hex) is one of the following:

4 A GETMAIN failure occurred because there was not enough storage to load the specified module.

14 A non-zero return code from MVS LOAD indicated an MVS LOAD error. See message IAT6308 for the MVS LOAD abend code and return code.

18 A non-zero return code from MVS BLDL indicated an MVS BLDL error. See message IAT6308 for the MVS BLDL abend code and return code.

System action: JES3 purges the DSP.

Operator response: Notify the system programmer.

Problem determination: See Chapter 30, “Problem Determination,” on page 711, Table I, item 29; Table III, items 4 and 7.

Module:

Routing Code: 10, Note 7  Descriptor Code: 7

IAT6310
Explanation:

DSP WAITING FOR RJP

A DSP has unsuccessfully attempted to obtain a BSC RJP or SNA RJP controlled device as indicated by the message text because the RJP DSP or SNA RJP DSP was not active.

System action: Processing continues.

Operator response: Call the RJP or SNARJP DSP to begin operation.

Module:

Routing Code: Note 19  Descriptor Code: N/A
IAT6313 • IAT6319

IAT6313

Explanation:

// USER PROVIDED TEXT VIA THE MSG= KEYWORD //

// ON THE JOB MODIFY COMMAND //

Appended to this message id is the operator supplied message on the *F,J=xx,MSG= 'msg text' command.

System action: JES3 processing continues.

Operator response: None.

Module:

IATMOCP      IATMOCP      IATGRWM

Routing Code: Note 19  Descriptor Code: N/A

IAT6317

Explanation:

// STAGING AREA CHECKPOINTING ABORTED //

// DUE TO JESXCF ABENDS //

The checkpoint message service exceeded the JES3 abend threshold while attempting to checkpoint the destination queue staging areas back to JES XCF.

System action: If all staging areas are not checkpointed before JES3 termination, jobs with outstanding subsystem requests could produce unpredictable results. The JES3 checkpoint routine returns to its caller, and JES3 termination processing continues.

Operator response: Notify your system programmer.

System programmer response: If the problem persists, contact the IBM Support Center.

Module:

Containing  Detecting  Issuing
IATSSCK      IEAVEQV0     IATSSCK

Routing Code: 2,10  Descriptor Code: 4

IAT6319

Explanation:

// CHECKPOINTS FAILED FOR fail_count //

// OF total_count STAGING AREAS //

During JES3 termination, JES3 was checkpointing the destination queue staging areas back to JES XCF. During verification processing, JES3 determined that checkpoint processing failed for one or more of these staging areas. In the message text:

fail_count

the number of staging areas that JES3 did not checkpoint.

total_count

The total number of staging areas that JES3 processed.

System action: If all staging areas are not
checkpointed before JES3 termination, jobs with outstanding subsystem requests could produce unpredictable results. The JES3 checkpoint routine returns to its caller, and JES3 termination processing continues.

**Operator response:** Notify your system programmer.

**System programmer response:** If the problem persists, contact the IBM Support Center.

Routing Code: 2,10   Descriptor Code: 4

---

**IAT6320**

**Explanation:**

- CRITICAL VIRTUAL STORAGE SHORTAGE
- IN THE JES3 ADDRESS SPACE
- FSS — fssname — ASID = asid

The JES3 address space or FSS address space has encountered a critical shortage of virtual storage. If the shortage occurred in a FSS address space, the name and address space id of the functional subsystem appear at the end of the message. If the shortage appears in a JES3 address space, the message will specify the JES3 address space.

**System action:** JES3 has released two reserved 8K areas of storage in an attempt to make recovery processing possible.

**Operator response:** Notify the system programmer. Consult your installation's procedures and/or the system programmer before starting any new functions in the JES3 address space.

**Programmer response:** An out-of-space abend has occurred; check SYS1.LOGREC to determine the cause. Lighten the storage load by reducing activity (such as the number of C/I subtasks) in the JES3 address space.

Routing Code: 2  Descriptor Code: 1,7

IAT6341

Explanation:

JES3 monitors the usage of job numbers. When there is
a significant increase or decrease in the percentage of job numbers used up, this message will be displayed. A significant change is considered to be 5%, and the only values displayed are 80, 85, 90, and 95. Once 95% is reached, depending on the threshold, you will see either 96%, 97%, 98% or 99% displayed and the message text JOB SUBMISSION SUSPENDED. (For example, if there are 3000 jobs, the threshold is 2900 job numbers in use, and 2900/3000=96%.)

In the message text:

\[ nn\% \]

The percentage of job numbers used up.

\[ dspname \]

The function that issued the AJOBNUM request.

\[ userid \]

The userid of the job submittor.

**CALLING DSP=**

If N/A is displayed, the \[ dspname \] or \[ userid \] was not available, indicating that JES3 is becoming more constrained. As the constraint becomes less severe, text starting with CALLING DSP= will not be displayed.

**JOB SUBMISSION SUSPENDED**

If this message is displayed, JES3 reached a threshold and only 100 job numbers (or 5% of the total, whichever is less) are available. Only started tasks or callable DSPs can be started. Batch and TSO/E jobs attempting to submit other jobs will wait until this constraint has been relieved. Jobs must be removed from the system before new jobs will be accepted.

**System action:** If the text JOB SUBMISSION SUSPENDED is displayed, jobs that are unable to obtain a job number are held and only started tasks or called DSPs will be allowed to start.

**Programmer response:** When this message is issued frequently, evaluate the need to increase the job number range by changing the JES3 OPTIONS initialization statement and specifying a larger JCT data set.

**Operator response:** When the message is displayed without the optional text, no further action is necessary.

When CALLING DSP= appears in the message, monitor the userid displayed by the USER keyword. If the message is always displayed for the same userid, that user is likely causing the problem. Verify this by monitoring message IAT6100 and its ID keyword. Contact the user immediately or cancel the userid. If the text is repeatedly CALLING DSP= N/A N/A, go to the syslog and see what function is submitting jobs at a high rate. Stop that function.

---

**IAT6345**

**Explanation:**

\[ \text{\textasciitilde\textasciitilde\textasciitilde WARNING\textasciitilde\textasciitilde\textasciitilde THE MAXIMUM} \]

\[ \text{\textasciitilde\textasciitilde\textasciitilde NUMBER OF JOBS ARE IN THE JOB QUEUE} \]

There are no JQEs available to allocate to the job. All available space for JQEs has been allocated.

**System action:** The FCT that is trying to obtain a JQE may wait until a JQE becomes available. This message will be removed from the JES3 action queue when the request is satisfied.

**Operator response:** Notify the system programmer.

**Programmer response:** You may want to ease the current situation by doing one of the following:

- Cancelling some jobs.
- Finding and correcting the error condition (output service, for example) that is causing jobs to backup in your installation.

To prevent this situation from recurring in the future, check the JOBNO parameter on the OPTIONS initialization statement. Allocate enough direct-access space to accommodate your installation’s working set for JCT records. (See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com) for an explanation of the return codes.)

---

**IAT6350**

**Explanation:**

\[ \text{\textasciitilde\textasciitilde\textasciitilde JESCKPNT ERROR-- xx} \]

\[ \text{\textasciitilde\textasciitilde\textasciitilde COLD START REQUIRED} \]

A checkpoint error occurred when writing the JESCKPNT record (CKP) to the checkpoint data set(s). As a result of the error, the JESCKPNT record in the checkpoint data set(s) is no longer valid or may have been destroyed. The type of checkpoint write error is indicated by \[ xx \] which is the error return code from the IATXCKPT service. See [z/OS JES3 Customization](https://www.ibm.com) for an explanation of the return codes.

**System action:** JES3 processing continues. JES3 will try to process any subsequent requests to update the JESCKPNT record, but the requests may end in an
error. If the error is temporary, so that a subsequent JESCKPNT request completes successfully, JES3 will issue message IAT6354 to indicate that it recovered from the error.

Operator response: Notify the system programmer. If the error is a permanent error, begin to quiesce the JES3 complex. Clear up the job backlog as much as possible before JES3 ends. You can use the dump job (DJ) DSP to save jobs for later restoration.

If message IAT6354 appears (indicating recovery from the JESCKPNT error) while you are quiescing the complex, stop the quiesce process so that normal activity can resume.

Programmer response: If the error is a temporary I/O error condition caused by an operation or configuration problem, correct the problem causing the error. If the error is a permanent I/O error condition, reallocate the checkpoint data sets and perform a cold start. If the error is not an I/O error, see Chapter 30, “Problem Determination,” on page 711.

Problem determination: See Chapter 30, “Problem Determination,” on page 711, Table I, items 18 and 37, and Table III, items 1 and 4.

Module:

Routing Code: 1
Descriptor Code: 2

IAT6351

Explanation:

SPool DATA SET CHECKPOINT ERROR

COLD START REQUIRED

An error occurred when JES3 attempted to update the status in the spool data set checkpoint record (VOL). As a result of the error, the spool data set checkpoint record in the checkpoint data set(s) is no longer valid or may have been destroyed. The error type is one of the following:

MISMATCH
The spool data set entries in the spool data set checkpoint record do not match the spool data set entries in the resident spool extent table.

READ xx
A checkpoint read error occurred, where xx is the error code returned from the IATXCKPT service. See z/OS JES3 Customization

WRITE xx
A checkpoint write error occurred, where xx is the error code returned from the IATXCKPT service. See z/OS JES3 Customization

System action: JES3 processing continues. JES3 will try to process subsequent requests to update the spool data set checkpoint record, but the requests may end in an error. If the error is temporary, so that a subsequent update of the spool data set checkpoint record completes successfully, JES3 will issue IAT6354 to indicate that it recovered from the error.

Operator response: Notify the system programmer. If the error is a permanent error, begin to quiesce the JES3 complex. Clear up the job backlog as much as possible before JES3 ends. You can use the dump job (DJ) DSP to save jobs for later restoration.

If Message IAT6354 appears (indicating recovery from the spool data set checkpoint error) while you are quiescing the complex, stop the quiesce process so that normal activity can resume.

Programmer response: If the error is a temporary I/O error condition caused by an operation or configuration problem, correct the problem causing the error. If the error is a permanent I/O error condition, reallocate the checkpoint data sets and perform a cold start. If the error is not an I/O error, see Chapter 30, “Problem Determination,” on page 711.

Problem determination: See Chapter 30, “Problem Determination,” on page 711, Table I, items 18 and 37, and Table III, items 1 and 4.

Module:

Routing Code: 1
Descriptor Code: 2

IAT6352

Explanation:

PTAT CHECKPOINT ERROR

PTAT RECORD COULD NOT BE VALIDATED

A checkpoint write error was encountered during JES3 recovery processing when attempting to validate or invalidate the partition track allocation table (PTAT) checkpoint record in the checkpoint data set(s). The type of checkpoint write error is indicated by xx which is the error return code from the IATXCKPT service. See z/OS JES3 Customization

System action: If the error occurred when attempting to validate the partition TAT checkpoint record, the record remains not valid in the checkpoint data set(s) and JES3 continues recovery processing. If JES3 recovery processing fails and JES3 ends, the partition TAT checkpoint information cannot be used when JES3 is restarted. JES3 rebuilds the partition TAT checkpoint record, but jobs or data sets that have their track allocation tables (JBTs) on an unavailable spool data set
will be canceled since there is no way of identifying the spool space allocated to them.

If the error occurred when attempting to invalidate the partition TAT checkpoint record, JES3 ends.

**Operator response:** If JES3 ends because the partition TAT checkpoint record could not be invalidated, notify the system programmer.

**Programmer response:** If the write error was due to a permanent I/O error condition, reallocate the checkpoint data set(s) and instruct the operator to restart JES3. If the error was caused by a checkpoint access method busy condition, the error can be ignored since this condition is only temporary. If any other condition caused the error, see Chapter 30, “Problem Determination,” on page 711.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 711, Table I, items 18 and 37, and Table III, items 1 and 4.

IAT6359
Explanation:

*** WARNING *** ONLY ONE JES3 CHECKPOINT

During initialization of the checkpoint data sets, JES3 has determined that one of the two possible checkpoint data sets (CHKPNT or CHKPNT2) is unavailable. Message IAT6360, which appears before this message, describes the reason why the data set is not available. As a result, no duplexing of the checkpoint records will occur.

If this condition was encountered while initializing a functional system (FSS) address space, the functional subsystem name fssname and address space ID asid appear in the message. Absence of the FSS text indicates that the condition was encountered while initializing the JES3 address space.

System action: Initialization continues.

Operator response: Notify the system programmer.

Programmer response: If checkpoint duplexing is desired, ensure that the JES3 and FSS start procedures define both the CHKPNT and CHKPNT2 data sets.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IAT6360
Explanation:

CHECKPOINT DATASET ddn UNAVAILABLE, reasontext

Initialization of the checkpoint data set associated with the indicated ddn failed for one of the following reasons:

ddn DD NOT DEFINED
the ddname ddn was not defined in the JES3 or FSS start procedure.

OPEN WAS UNSUCCESSFUL
the data set could not be opened.

DEVICE TYPE NOT VALID
the device on which the checkpoint data set resides is not supported by JES3.

MULTI-EXTENT DATA SET
the checkpoint data set does not consist of a single contiguous DASD extent.
**NOT ON CYL BOUNDARIES**  
The data set does not start and end on a cylinder boundary.

**DEVTYPE UNSUCCESSFUL**  
a DEVTYPE macro request to obtain device information completed unsuccessfully.

**TRKCALC UNSUCCESSFUL**  
a TRKCALC macro request to determine the number of checkpoint record segments per track completed unsuccessfully.

**RDJFCB UNSUCCESSFUL**  
when attempting to read the JFCB for the data set, the RDJFCB macro request completed with a zero return code, but the JFCB was not read into the work buffer.

If this error condition was detected during initialization of a functional subsystem (FSS), the functional subsystem name `fssname` and address space ID `asid` appear at the end of the message. Absence of this text indicates that the error condition was detected during initialization of JES3.

**System action:** If at least one of the two possible checkpoint data sets (CHKPNT or CHKPNT2) is available, initialization continues normally. Otherwise, JES3 or the FSS is ended with a system completion code of 2FB.

**Operator response:** This message may be ignored if your installation has elected to run with only one checkpoint data set and it is not the data set identified in the message. Otherwise, notify your system programmer.

**Programmer response:** The action required for each of the reasons that can cause the data set to be unavailable is as follows:

**ddn DD NOT DEFINED**  
include a DD statement with a ddname of `ddn` in the JES3 or FSS start procedure to define the checkpoint data set. At a minimum, only one checkpoint data set needs to be defined in the start procedure, that is, CHKPNT or CHKPNT2. Specifying both, however, will help to ensure the availability of valid checkpoint data in the event errors occur when accessing one of the data sets.

**OPEN WAS UNSUCCESSFUL**  
see Chapter 30, “Problem Determination,” on page 711.

**DEVICE TYPE NOT VALID**  
reallocate the checkpoint data set on a direct access device supported by JES3.

**MULTI-EXTENT DATA SET**  
reallocate the checkpoint data set with `SPACE=(CYL,(n,0),,CONTIG)`.

**NOT ON CYL BOUNDARIES**  
reallocate the checkpoint data set with `SPACE=(CYL,(n,0),,CONTIG)`.

**DEVTYPE UNSUCCESSFUL**  
see Chapter 30, “Problem Determination,” on page 711.

**TRKCALC UNSUCCESSFUL**  
see Chapter 30, “Problem Determination,” on page 711.

**RDJFCB UNSUCCESSFUL**  
see Chapter 30, “Problem Determination,” on page 711.

**Problem determination:** Table I, item 29, and Table III, item 6.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</thead>
<tbody>
<tr>
<td>IATYCKI</td>
<td>IATGRCK</td>
<td>IATGRCK</td>
</tr>
</tbody>
</table>

**Routing Code:** 1  **Descriptor Code:** 7,11

**IAT6361**

**Explanation:**

- ---- CHECKPOINT DATASET [ddn] IS INVALID ----
- OR NEW, -- TRACK MAP INITIALIZED ----
- , FOR FSS [fssname], -- ASID= [asid] ----
- IATUTJCT UTILITY ----

When initializing the checkpoint data set defined by the indicated `ddn`, the track map record (CMAP) either could not be read successfully because of an I/O error or the record was found to be incorrect. This condition occurs if the data set is a new checkpoint data set since the data set has never been initialized with a track map record. This condition also occurs if the track map record is bad or down level in an existing checkpoint data set previously used for checkpointing during the last JES3 start. In either case, a new track map is created and initialized in storage.

If this condition is encountered when initializing JES3 on a local or when initializing a functional subsystem (FSS), the reinitialized track map will not be written to the checkpoint data set. If encountered when initializing JES3 on the global, or running the IATUTJCT utility, the reinitialized track map will be written to the checkpoint data set when the first checkpoint read, write, or purge request is successfully processed.

If this condition is encountered when running the IATUTJCT utility, **IATUTJCT UTILITY** appears at the end of the message. If this condition is encountered when initializing a functional subsystem (FSS), the functional subsystem name (`fssname`) and address...
space identifier (asid) appear at the end of the message. Absence of the IATUTJCT and FSS text indicates the condition was detected during initialization of JES3.

Furthermore, if this message is issued by the IATUTJCT utility, the ddname CHKPNT that appears in the message actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

**System action:** If this message was issued from the JES3 address space or an FSS address space, initialization of that address space continues. If this message was issued from an address space running the IATUTJCT utility, the utility continues.

**Operator response:** If the checkpoint data set is a new data set, this message should be ignored. If the checkpoint data set is an existing data set that should contain valid JES3 checkpoint data, notify your system programmer.

**Programmer response:** If the data set is an existing checkpoint data set that should be valid, examine the data in the SYS1.LOGREC data set and the hard-copy message log. If there are permanent error indications, reallocate the checkpoint data set and restart JES3.

**Problem determination:** See Table I, items 18, and 37, and Table III, items 4 and 6.

---

**IAT6362**

**Explanation:**

An I/O error occurred when accessing one of the JES3 checkpoint data sets. If the I/O request occurred in a functional subsystem (FSS), the functional subsystem name (fssname) and address space identifier (asid) appear at the end of the message. If the I/O request occurred in the IATUTJCT utility, IATUTJCT UTILITY appears at the end of the message. The absence of the FSS and IATUTJCT text indicates the I/O request occurred in the JES3 address space. The fields in the second line of this message are as follows:

- **ddn** ddname of the checkpoint data set.
- **volser** serial number of the volume on which the data set resides.
- **dev** device number
- **rcd** the checkpoint record that was being accessed
- **cc** I/O completion code posted in the ECB.
- **op** operation code of the channel command word (CCW) that was being processed when the error occurred.
- **stat** status portion of the channel status word (CSW).

---

Both the CHKPNT and CHKPNT2 checkpoint data sets are located on the same volume. This will not affect JES3 processing, but if severe damage should occur to the volume, both data sets may be lost, requiring a cold start of the JES3 complex.

**System action:** JES3 initialization continues.

**Operator response:** Notify the system programmer.

**Programmer response:** Reallocate one of the checkpoint data sets on a different volume and then restart JES3.

---

Routing Code: 2,10  Descriptor Code: 4,7

IAT6364

Explanation:

An error occurred when reading the physical segments of a checkpoint record.
The record identifier (rcd), timestamp, version number, segment number, or segment length in the header portion of one of the physical segments did not agree with the data that was expected.
The variable fields in the message text are as follows:

rcd  the checkpoint record that was being read at the time of the error.

ddn  ddname of the checkpoint data set that was being accessed.

This problem could occur if during the last update to the record an error resulted ending the checkpoint operation before all physical record segments were written.

If the error was detected when running the IATUTJCT UTILITY, IATUTJCT UTILITY appears at the end of the message. If the error was detected when initializing a functional subsystem (FSS), the functional subsystem name (fssname) and address space identifier (asid) appear at the end of the message. The absence of the FSS and IATUTJCT text indicates the error was detected when initializing JES3.

System action:  If only one checkpoint data set is available (that is, no checkpoint duplexing), the checkpoint access method indicates the error condition to the JES3 or FSS function that issued the checkpoint read request, and that function issues an error message further clarifying the severity of the error relative to its processing.

If two checkpoint data sets are being used, the checkpoint access method attempts to read the logical checkpoint record from the other data set if it has not already done so. If the record is successfully read from the other data set, JES3/FSS/IATUTJCT processing continues normally. If the record cannot be successfully read from the other data set, the checkpoint access method indicates the error condition to the address space which issued the checkpoint read request and that function issues an error message further clarifying the severity of the error relative to its processing.

Operator response: Notify the system programmer.

Routing Code: 2,10  Descriptor Code: 4,7

IAT6365

Explanation:

CHECKPOINT WRITE FAILED

DUE TO INSUFFICIENT
A checkpoint record could not be successfully written to one of the checkpoint data sets because the data set did not have enough space to contain the record. The variable fields in the message text are as follows:

rcd  The checkpoint record.

ddn  The ddname of the checkpoint data set. If this message is issued by the IATUTJCT utility, this ddname will be CHKPNT but actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. This is because IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

**System action:** If only one checkpoint data set is available (that is, no checkpoint duplexing), the checkpoint access method indicates the error condition to the function issuing the checkpoint write request, and that function issues an error message further clarifying the severity of the error relative to its processing.

If two checkpoint data sets are being used and the record was successfully written to the other data set, processing continues normally. Otherwise, the checkpoint access method indicates the error condition to the function issuing the checkpoint write request, and that function issues an error message further clarifying the severity of the error relative to its processing.

JES3 or IATUTJCT also issues message IAT6368. If this error occurs when running IATUTJCT, IATUTJCT issues message IAT7787 and ends with a return code of 4.

**Operator response:** If the error is a permanent error, and two checkpoint data sets are being used, end the JES3 processing in the complex as soon as possible so the problem can be corrected while there is still one good data set. Notify the system programmer. Once the problem has been corrected, hot start the JES3 complex.

If the error is a permanent error and only one checkpoint data set is being used, begin quiescing the JES3 complex gradually to prepare for a cold start. Clear up the queue backlog as much as possible before JES3 finally ends. The dump job (DJ) DSP may be used to save jobs for later restoration after the cold start. Once the JES3 complex has been quiesced and the problem corrected, perform a cold start to restart the complex.

If the error occurred when running IATUTJCT, notify the system programmer.

**Programmer response:**
- If the error was in JES3 and the track map error was caused by a temporary I/O error resulting from an operation or configuration problem, correct the problem causing the I/O error. If the track map error was caused by a permanent I/O error condition, reallocate the checkpoint data set and restart the JES3 complex. If the track map error was not the result of an I/O error, see Chapter 30, “Problem Determination,” on page 711.
- If the error occurred when running IATUTJCT, reallocate the NCHKPNT data set and rerun IATUTJCT.

**Problem determination:** See Table I, items 18 and 37, and Table III items 1 and 4.
IAT6367

Explanation:

**RECOVERED FROM TRACK MAP ERROR ON**

**CHECKPOINT DATA SET**

JES3 or IATUTJCT has successfully recovered from an earlier track map error on the checkpoint data set defined by the indicated ddname ddn. The track map record in the data set is now valid.

If this message is issued by the IATUTJCT UTILITY, the ddname in ddn is CHKPNT but actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. This is because IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

**System action:** JES3 or IATUTJCT processing continues.

**Operator response:** Notify the system programmer. Any action taken as the result of the previous track map error may be stopped.

**Programmer response:**

- If the error was detected in JES3:
  
  Although JES3 has recovered from the track map error, it may still be advisable to have the operator quiesce the complex and then reallocate the data set if intermittent I/O errors are occurring on the volume containing the data set.

Routing Code: 1  Descriptor Code: 2,7

---

IAT6368

Explanation:

**CHECKPOINT SPACE PROBLEM**

**DATA SET**

The checkpoint data set associated with the indicated ddname ddn does not have enough space allocated. Attempts to write to the checkpoint data set have resulted in failure because of the lack of space. If you are running the IATUTJCT utility, note that although ddn specifies CHKPNT, the data set that ran out of space is the data set defined by the NCHKPNT DD statement for this utility.

JES3 issues message IAT6365 before message IAT6368 to indicate the checkpoint record that was lost or not updated because of lack of space. After message IAT6368 is issued, other checkpoint write requests that fail because of insufficient space will also be reported with message IAT6365.

**System action:** JES3 continues processing until terminated by your response. Message IAT6368 remains displayed until JES3 is terminated.

**Operator response:** If two checkpoint data sets are being used and the other data set is still good, end the JES3 processing in the complex immediately so the problem can be corrected while there is still one good data set. Notify the system programmer. Once the problem is corrected (the checkpoint data set is reallocated with more space), hot start the JES3 complex.

If problems exist with both checkpoint data sets or if only one checkpoint data set is being used (message IAT6365 will report this information), begin quiescing the JES3 complex gradually to prepare for a cold start because key checkpoint data may have been lost. One way to do this is to put low priority jobs on the hold queue until the checkpoint data set can be reinstated. These jobs can be run after the checkpoint data set is reallocated with more space.

Clear up the job queue backlog as much as possible before JES3 terminates. The dump job (DJ) DSP may be used to save jobs for later restoration after the cold start. Notify the system programmer. Once the JES3 complex is quiesced and the problem corrected (the checkpoint data set(s) is allocated with more space), perform a cold start to restart the complex.

**Programmer response:** Reallocate the checkpoint data set with more space.

IAT6369

Explanation:

**JES3 WAITING FOR CHECKPOINT DATA**

**RESERVE**

Chapter 12. General Routines Messages 349
The JES3 checkpoint access method issued a RESERVE to gain access to one of the JES3 checkpoint data sets, but the data set has already been RESERVED by another address space on the same main.

The variable fields in the message text are as follows:

**ddn**
The ddname of the checkpoint data set.

**volser**
Serial number of the volume on which the data set resides.

**dev**
Device number.

The combination of functional subsystem name (fssname) and address space identifier (asid), or the text IATUTJCT UTILITY appears at the end of the message if the condition is encountered within one of these environments. Absence of both of these indicates that the WAIT is being done when running in the JES3 primary address space.

**System action:** JES3, the FSS, or IATUTJCT waits for the address space that currently controls the data set to release it.

**Operator response:** Normally none, because control of the data set will typically be released by the current owner in a few seconds. However, if JES3, the FSS, or IATUTJCT appears to wait for an abnormally long time, the other address space that currently has control of the data set on this main may be waiting for the hardware reserve of the device to complete before it can continue. Check all other mains having channel accessibility to the indicated device to verify their operation. If a main has failed or a program has not canceled its reserve, no other channel can gain access to the device. If there has been a hardware failure or the program cannot be ended, reset the reserving channel with a SYSTEM RESET from the processor's console.

If this message was issued when running IATUTJCT for production, ensure that JES3 and all CIFSS address spaces are inactive on all processors in the JES3 complex. Also ensure that IATUTJCT has not been started multiple times. If IATUTJCT is to be run as a test, has not been started multiple times, and this reserve condition persists, notify the system programmer.

**Programmer response:** If no errors are found and the reserve condition persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:**

```
, 'FOR FSS -- fssname, ASID=-- asid--'
IATUTJCT UTILITY
```

The JES3 checkpoint access method issued a RESERVE to gain access to one of the JES3 checkpoint data sets, but the data set has already been RESERVED by another address space on the same main.

The variable fields in the message text are as follows:

**ddn**
The ddname of the checkpoint data set.

**volser**
Serial number of the volume on which the data set resides.

**dev**
Device number.

The combination of functional subsystem name (fssname) and address space identifier (asid), or the text IATUTJCT UTILITY appears at the end of the message if the condition is encountered within one of these environments. Absence of both of these indicates that the WAIT is being done when running in the JES3 primary address space.

**System action:** JES3, the FSS, or IATUTJCT waits for the address space that currently controls the data set to release it.

**Operator response:** Normally none, because control of the data set will typically be released by the current owner in a few seconds. However, if JES3, the FSS, or IATUTJCT appears to wait for an abnormally long time, the other address space that currently has control of the data set on this main may be waiting for the hardware reserve of the device to complete before it can continue. Check all other mains having channel accessibility to the indicated device to verify their operation. If a main has failed or a program has not canceled its reserve, no other channel can gain access to the device. If there has been a hardware failure or the program cannot be ended, reset the reserving channel with a SYSTEM RESET from the processor's console.

If this message was issued when running IATUTJCT for production, ensure that JES3 and all CIFSS address spaces are inactive on all processors in the JES3 complex. Also ensure that IATUTJCT has not been started multiple times. If IATUTJCT is to be run as a test, has not been started multiple times, and this reserve condition persists, notify the system programmer.

**Programmer response:** If no errors are found and the reserve condition persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:**
ALREADY REQUESTED (abend request only)
the abend request has been made already, and an
MVS CANCEL command has been sent.

ALREADY TERMINATED (abend request only)
the abend request has been made for an FSS that
has already ended.

System action: Processing ends.

Operator response: Following is a list of possible
actions to be taken depending on the reason for the
rejection of the request:

FSS UNUSABLE
issue the "INQUIRY,F,FSS=fssname,S command to
display the current system assignment for the FSS.
Then issue a "MODIFY,F,FSS=fssname,SYS= command to establish correct system assignments.

FSS ALREADY ACTIVE
no response is required

MAIN main NOT CONNECTED
issue an "S,main,CONNECT command to cause
the required main to be connected, or issue a
"MODIFY,F,FSS=fssname,SYS= command to change the main where the FSS is to be started

FSS CHECKPOINT DISABLED
end all active FSSs as soon as possible, then hot
start JES3 to obtain a new checkpoint spool area

Programmer response: Follow the instructions listed
in Chapter 30, “Problem Determination,” on page 711.

Problem determination: See Chapter 30, “Problem
Determination,” on page 711, Table III, items 1 and 4.

Module:

Routing Code: Note 17,Note 18
Descriptor Code: 7

IAT6372
Explanation:

The initialization of the address space in which the
specified functional subsystem fssname is to run has
been successful.

System action: FSS initialization proceeds normally.

Operator response: None. This is an informational
message.

Module:

Routing Code: Note 17,Note 18
Descriptor Code: 7

IAT6373
Explanation:

An MVS START command has been generated by
JES3 to start the address space in which the specified
functional subsystem (FSS) fssname is to run. The
command has not yet completed processing.

System action: Message IAT6374 is issued following
this message.

Operator response: See message IAT6374.

Module:
IAT6374
Explanation:

\[ \text{OR ENTER *FAIL— fssname} \]

\[ \text{OR ENTER *INQUIRY,J=— jobno} \]

This message follows message IAT6373 and provides further information about the delayed start-up. If possible, JES3 displays the job number of the job created by the START command.

System action: JES3 continues to wait for START command completion unless instructed otherwise by the operator.

Operator response: An immediate response is not required. If no apparent error has occurred, allow the process to continue unchanged. If the job number is displayed, the delay is probably in the JES3 global. Use the *INQUIRY commands to determine the job status, and take appropriate action. If the job number is not displayed, use the MVS DISPLAY command on the main named in message IAT6373, to look for a step name that matches the functional subsystem (FSS) fssname in message IAT6373, then take appropriate action.

If you decide to issue a JES3 *FAIL command, it may be necessary to repeat the *FAIL before the job is successfully removed from JES3 and the FSS made usable again.

Routing Code: Note 17,Note 18
Descriptor Code: 7
IAT6378

Explanation:

\[\text{DEVICE— } \text{devname}\]

\[\text{NUMBER— } \text{dev} \rightarrow \text{NO LONGER AMBIGUOUS}\]

The execution of a *MODIFY,F command has caused a change in the device number assigned to another JES3 global device. The number assigned to the specified device is now unique.

System action: Normal processing continues.

Operator response: Any command that refers to this device can use the device name or the device number.

Module:

IAT6379

Explanation:

\[\text{DEVICE— } \text{devname}\]

\[\text{NUMBER— } \text{dev} \rightarrow \text{NO LONGER AMBIGUOUS}\]

\[\text{FOR DEVICE TYPE— } \text{devtype}\]

\[\text{IS AMBIGUOUS - USE DEVICE NAME— } \text{devname}\]

The assignment of device number dev, described in message IAT6377 that was previously issued, has caused two or more JES3 global devices, including the one described in this message, to have the same device number.

System action: JES3 rejects any operator command that attempts to use device number dev.

Operator response: Any command that refers to this device must use the device name devname.

Module:

IAT6380

Explanation:

\[\text{DEVICE— } \text{devname}\]

\[\text{SET OFFLINE TO GLOBAL — reasontext}\]

The execution of a *MODIFY,F command has created an incompatibility within the definition of device devname or between the status of device devname and the status of the functional subsystem (FSS) with which it is associated. The reason for the incompatibility is one of the following:

COMP MODE REQUIRES GLOBAL ATTACHMENT

Compatibility mode requires that the device be attached to the global system; this device has no such attachment.

FSS MODE REQUIRES ATTACHMENT TO main

FSS mode requires that the device be attached to the system where the FSS is assigned to run, specified by main; this device is not attached to the main.

FSS fssname HAS NO ASSIGNED SYSTEM

FSS mode has been set for the device, but the assigned FSS fssname is unusable or has not been assigned a system on which to run in conjunction with the current global system.

System action: JES3 marks the device offline to JES3 global functions.

Operator response: Use the *MODIFY,F command to correct the device mode specification or the FSS system assignments, then use the *MODIFY,V command to vary the device online.

Module:

IAT6381

Explanation:

\[\text{AMBIGUOUS DEVICE NUMBER— } \text{dev},\]

\[\text{SPECIFY DEVICE NAME}\]

An ambiguous device number dev was specified on an operator command, that is, two or more devices with that number exist.

System action: If the message was issued in response to a *MODIFY,W command, JES3 processes all devices in the list except the ambiguous device.
If the message was issued in response to a `*VARY,dev-dev` command, JES3 ignores the command if the initial device is ambiguous. If a device is ambiguous within the range, JES3 ignores only that device and processes the others within the range.

Otherwise, JES3 ignores the command.

**Operator response:** Issue `*INQUIRY,D,D=dev` command to determine the device name and reenter the command with the device name.

**IAT6395**

**Explanation:**

The monitor DSP is monitoring the resource or queue referenced in `waittext`. This message is a summary message that represents the number of requests waiting for the specified reason. The monitor DSP issues this message when `SUMMARY=ONLY` or `SUMMARY=YES` is specified on the `MNTRDEF` macro or on the `*START,MONITOR,ID=` command for the monitor DSP function.

In the messages text:

- `nnnnn` The number of jobs or Function Control Tables (FCT) that are waiting for the specified reason.
- `waittext` The reason the jobs or FCTs are waiting. The following are the JES3-supplied reasons; others can be added by your installation.

**WAITING FOR JES3 RESOURCES**

The job or FCT is waiting for one or more unavailable JES3 resources.

**WAITING FOR CATALOG LOCATE**

The job is waiting for catalog locate processing.

**ACTIVE IN A C/I FSS**

The job is currently scheduled to a Converter/Interpreter Functional Subsystem (C/I FSS) and waiting for catalog locate processing.

**WAITING IN SYSTEM SELECT**

The job is waiting in the Main Device Scheduling (MDS) system select queue for Data Facility Storage Management Subsystem (DFSMS)-managed resources to become available.

**WAITING IN ALLOCATION**

The job is waiting in the Main Device Scheduling (MDS) allocate queue for a resource to become available.

**WAITING IN VERIFY**

The job is waiting in the MDS verify queue for one or more volume mounts to complete.

**WAITING IN SYSTEM VERIFY**

The job is waiting in the MDS system verify queue.
WAITING FOR A dspname DSP
   The job is waiting for the specified DSP to become available.

ENDING FUNCTION WAITING FOR I/O
   The ending function is waiting for Input/Output (I/O) to complete. When a job completes a function such as C/I, Job Segment Scheduler (JSS) checks to see if the job's control blocks are still being used. If so, the job is suspended and not scheduled for the next JES3 phase. Normally, the function that is using the job's control blocks finishes quickly and the job can then be scheduled. However, if the function does not perform the proper cleanup or abnormally ends while accessing the job's control blocks, the control blocks are not released until the next JES3 restart.

WAITING FOR A PROCLIB
   The job is waiting for a PROCLIB to become available.

WAITING FOR A MAIN, CLASS, OR GROUP
   The job is waiting for a main processor, a class, or a group to become available.

WAITING FOR SMS USER CATALOGS
   The job is waiting for DFSMS-managed user catalogs to become available.

WAITING FOR A MAIN FOR LOCATE
   The job is waiting for a main processor to become available for catalog locate processing.

System action:  JES3 processing continues.
Operator response:  None. This is an informational message.
Module:

    Containing    Detecting    Issuing
    IATGRMN      IATGRMN      IATGRMN

IAT6396
Explanation:

   ▶▶  JOB—jobname (jobid) wait text
   ▶▶  MAIN—main name ▶▶

   The specified job is waiting for the reason (wait text) indicated. The monitor DSP issues this message when both of the following occur:
   •  The value on the COUNT= parameter is greater than zero.
   •  You specified SUMMARY=YES or SUMMARY=NO on the MNTRDEF macro or the *START,MONITOR,ID= command.

In the message text:

jobname  The name of the job or "UNKNOWN" if the job name cannot be determined.
jobid  The job identifier associated with the job.

**MAIN=main name**
   Identifies the processor on which locate of C/I FSS is occurring.

wait text  The reason why the job is waiting, as follows:

WAITING FOR JES3 RESOURCES
   The job or function control table (FCT) is waiting for one or more unavailable JES3 resources.

WAITING FOR CATALOG LOCATE
   The job is waiting for catalog locate processing.

ACTIVE IN A C/I FSS
   The job is currently scheduled to a converter/interpreter functional subsystem (C/I FSS) and waiting for catalog locate processing.

WAITING IN SYSTEM SELECT
   The job is waiting in the main device scheduling (MDS) system select queue for Data Facility Storage Management Subsystem (DFSMS)-managed resources to become available.

WAITING IN ALLOCATION
   The job is waiting in the MDS allocate queue for a resource to become available.

WAITING IN VERIFY
   The job is waiting in the MDS verify queue for one or more volume mounts to complete.

WAITING IN SYSTEM VERIFY
   The job is waiting in the MDS system verify queue.

WAITING FOR A dspname DSP
   The job is waiting for the specified DSP to become available.

ENDING FUNCTION WAITING FOR I/O
   The ending function is waiting for input/output (I/O) to complete. When a job completes a function such as C/I, Job Segment Scheduler (JSS) checks to see if the job's control blocks are still being used. If so, the job is suspended and not scheduled for the next JES3 phase. Normally, the function that is using the job's control blocks finishes quickly and the job can then be scheduled. However, if the function does not perform the proper cleanup or abnormally ends while accessing the job's control blocks, the control blocks are not released until the next JES3 restart.

WAITING FOR A PROCLIB
   The job is waiting for a PROCLIB to become available.

WAITING FOR A MAIN, CLASS, OR GROUP
   The job is waiting for a main processor, a class, or a group to become available.
WAITING FOR SMS USER CATALOGS
The job is waiting for DFSMS-managed user catalogs to become available.

WAITING FOR A MAIN FOR LOCATE
The job is waiting for a main processor to become available for catalog locate processing.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

id     The identifier of the job or FCT.

z/OS V1R12.0 JES3 Messages
This message always follows the header message IAT6399. The monitor DSP issues message IAT6400 in response to the *START,MONITOR,DISPLAY command. In the message text:

- **id**: The name of the monitoring definition. The name is defined by the ID= parameter on the MNTRDEF macro.
- **interval**: The time interval, in minutes, that the resource or queue is examined.
- **threshold**: The minimum amount of time, in minutes, that a job or function control table (FCT) must have been waiting on the specified queue or for the specified resource before the monitor DSP will display it.
- **count**: The number of FCTs or jobs over the threshold value that should be displayed. The jobs or FCTs are displayed in descending order based on the amount of time they have been waiting.
- **summary**: Specifies whether a summary message describing the number of jobs or FCTs waiting is issued. If SUMMARY=YES is specified, a summary message is issued in addition to the messages issued for each job or FCT. If SUMMARY=NO is specified, messages are issued for each job or FCT; no summary message is issued; no messages are issued for each job or FCT.
- **status**: Specifies whether monitoring is being performed for the specified resource or queue. If “ACTIVE” appears under the STATUS, monitoring is active for this resource or queue. If “INACTIVE” appears under STATUS, monitoring is not active for this resource or queue.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**IAT6401**

**Explanation:**

- **MONITOR START COMMAND REJECTED**

The system rejected the *START,MONITOR command for the specified reason (**reasontext**), which is one of the following:

**SYNTAX ERROR DETECTED**

The system has detected an error in the *START,MONITOR command. For information on the correct command syntax see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands).  

**INVALID PARAMETER LENGTH**

One or more of the parameters issued on the *START,MONITOR command is incorrect in length. For information on valid parameter lengths, see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands).

**INVALID VALUE LENGTH**

The value specified on one or more of the parameters issued on the *START,MONITOR command is incorrect in length. For information on valid value lengths, see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands).

**INVALID PARAMETER NAME**

One or more of the parameters issued on the *START,MONITOR command are incorrect. For information on valid parameters see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands).

**INVALID PARAMETER VALUE**

One or more of the values specified on a parameter of the *START,MONITOR command are incorrect. For information on valid parameter values see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands).

**DUPLICATE PARAMETER**

One of the parameters of the *START,MONITOR command was entered more than once. Parameters must be stated only once for each *START,MONITOR command.

**NO PARAMETERS SPECIFIED**

No parameters were specified on the *START,MONITOR command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands) for the command syntax.

**REQUIRED PARAMETERS MISSING**

One of the required parameters is missing from the *START,MONITOR command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSS7YD_1.3.0/com.ibm.zos.v1r13.cic8635/zosjess Commands) for the required parameters.

**MUTUALLY EXCLUSIVE PARAMETERS**

The ID= and the DISPLAY parameters were issued on a single *START,MONITOR command. The ID= and DISPLAY parameters are mutually exclusive and must be issued on separate *START,MONITOR commands.
INVALID ID VALUE

The value specified on the ID= keyword is invalid. See [z/OS JES3 Commands] for information on correct values for the ID= parameter.

System action: JES3 processing continues.

Operator response: Reenter the command correctly. See [z/OS JES3 Commands].

IAT6410

Explanation:

REPLY

When issued, this message always follows messages IAT6397 and IAT6398. The messages are issued when JES3 Active FCT Monitor detected that the same FCT has been dispatched during the last monitoring interval. While this FCT is dispatched, no other FCT can perform any processing. JES3 may not respond to commands, no jobs may be selected for processing, etc.

In the message text:

nnn Seconds 10 through 99,999,999.

reply One of the following:

- JES3 if the WTOR is issued for the JES3 global address space
- System name, for example SY2, if the WTOR is issued for the JES3 local address space
- C/I FSS name, for example CIFSS1, if the WTOR is issued for a C/I FSS address space.

System action: JES3 processing continues. When the FCT gives up control the WTOR is deleted.

Operator response: Determine if the FCT is legitimately monopolizing the JES3 Nuc or Aux tasks. If you think there is a reason for the same FCT to be active for an extended period of time, you can ignore this message or respond with a number of seconds (nnn) to request that JES3 wait for that period of time before issuing another message (if it finds that the same FCT is still active).

If you respond with JES3, system name of C/I FSS name, as displayed in the WTOR, JES3 will try to terminate the active FCT and eventually invoke its JESTAE recovery.

You may have to repeat the response several times if the FCT attempts to retry and enters a loop or MVS WAIT again. In that case, you may have to terminate JES3 by either responding to message IAT3822, if one is displayed, or by issuing the FORCE JES3,ARM command.

If you feel the default interval is too short causing the message to appear too frequently, you can adjust it by issuing the F JES3,INT=n command. n specifies the interval in seconds.

Note: JES3 cannot function correctly without some critical FCTs. If a critical FCT is terminated as a result of the FCT being failed, a JES3 restart might become necessary. Some of the critical FCTs include:

- JSS
- JSAM
- MAIN
- ENSTDRV
- WTDVR

**Routing Code:** 10  **Descriptor Code:** –

---

**IAT6415**

**Explanation:**

```
>>> AT addr IN LOADMOD= modname N/A
```

```
>>> EPNAME= epname N/A
```

```
>>> EPADDR= aaaa LEN= len N/A
```

This message is issued after message IAT6398 by the active FCT monitor.

In the message text:

- `addr` The address where the execution was interrupted, or stopped in the case of a loop, of where the FCT issued an MVS WAIT.

- `modname` The module where the displayed FCT is active.

- `epname` The module entry point name.

- `aaaa` The entry point address of the module.

- `len` The length of the module.

**System action:** None.
Operator response: None. This is an informational message.

Module:

IAT6416

Explanation:

THE ACTIVE FCT MONITOR TASK TERMINATED

This message is issued when the Active FCT Monitor task terminates.

System action: None.

Operator response: Start the Active FCT Monitor as soon as possible by issuing the F JES3,SMON command.

Module:

IAT6417

Explanation:

COMMAND—command—EXCEEDED 1 MINUTE.

REPLY CANCEL TO STOP.

This message is issued when a F JES3 command has been executing for over one minute.

In the message text:

command The command verb used on the F JES3 modify command.

For example, if F JES3, CHK was issued, CHK will be displayed.

System action: None.

Operator response: If no activity seems to be taking place (for example, no messages are being issued), respond to the message with CANCEL.

Module:

IAT6418

Explanation:

REPLY—reply—TO FAIL—JES3—INITIALIZATION OR—FSS—nnn—ASK LATER

When issued, this message always follows messages IAT6397 and IAT6398. The messages are issued when JES3 active FCT monitor detects that the same FCT has been dispatched during the last monitoring interval. In the message text:

reply Indicates one of the following items:

- JES3 if the WTOR is issued for the JES3 global address space.
- System name, for example, SY2, if the WTOR is issued for the JES3 local address space.
- C/I FSS name, for example, CIFSS1, if the WTOR is issued for a C/I FSS address space.

nnn Specifies seconds 10 through 99,999,999.

System action: JES3 processing continues. When initialization gets out of the condition it is in, the WTOR is deleted.

Operator response: Determine if JES3 initialization is legitimately busy. (You can check for any outstanding WTORs, and respond to them.) If you think there is a reason for JES3 initialization to be active for an extended period of time, you can ignore this message or respond with a number of seconds (nnn) to request that JES3 wait for that period of time before issuing another message (if JES3 finds that the same FCT is still active).

If you respond with JES3, system name or C/I FSS name, as displayed in the WTOR, JES3 will terminate.

If you feel the default interval is too short causing the message to appear too frequently, you can adjust it by issuing the F JES3,INT=n command. N specifies the interval in seconds.

Module:
A labeled tape was mounted when the dump job DSP was expecting an unlabeled tape to be mounted or vice versa. The "CALL" command with LABEL= parameter determines which type of tape you want mounted. LABEL=SL specifies a standard labeled tape, and LABEL=NL specifies an unlabeled tape. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: Processing continues.

Operator response: If the dump job was called in input mode, mount the correct tape. If the dump job was called in output mode, mount a labeled tape if LABEL=SL is specified or an unlabeled tape if LABEL=NL is specified. If the proper tape is unavailable, or the parameters on the "CALL" command are incorrect, issue a "CANCEL" command.

Module:

<table>

</thead>
<tbody>
<tr>
<td>IATDMGS</td>
<td>IATDJOB</td>
<td>IATDMGS</td>
</tr>
<tr>
<td>IATDMGS</td>
<td>IATDJOT</td>
<td>IATDMGS</td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 2,7

The specified job is within the range specified for dumping but jobs containing a multi-record file (MRF) contain spanned line mode records that cannot be restored. The "CALL,DJ" command with TRANS=YES | NO specified causes DJ to translate or not translate jobs from a previous release level before restoring the jobs back. When translation is in effect, jobs that have an MRF containing spanned line mode records cannot be restored back to a previous release. DJdev-(jobid) indicates the dump job dynamic support program (DSP) that issued the message, where dev indicates the tape device number and jobid indicates the DSP.

System action: The dump job DSP completes dump processing for the specified job and backspaces over any data written to tape for the job. Dump job DSP continues processing if there are more jobs for dependent job control (DJC) networks that need to be dumped based on the selection criteria specified on the current "START" command.

Operator response: None. This is an informational message.

Chapter 13. Subsystem Interface Messages

IAT6700
Explanation:

This message is issued by JES3 when the JDS access interface routine is executing on the global. It is issued in response to an SSISERV call if the JDS entry for the indicated data set was not found. The data set is a five-part identifier and consists of nodename, userid, jobid, dsnumber, and dsid.

System action: The step is ended with a system completion code of 1FB.

Operator response: None. This is an informational message.

Module:

Routing Code: 2,10,11  Descriptor Code: 4,7

IAT6703
Explanation:

An unrecoverable error was encountered on the global system while IATSIICC was communicating with it using SSISERV.

System action: The step is ended with a system completion code of 1FB.

Operator response: None. This is an informational message.

Module:

Routing Code: 2,10,11  Descriptor Code: 4,7

IAT6704
Explanation:

A permanent I/O error was encountered while writing out the last buffer during CLOSE processing.

System action: Processing continues normally, except...
that the user's last data buffer is missing from the printed output.

Operator response: None. This is an informational message.

Module:

---
IAT6805

Explanation:

An attempt to issue a FREEMAIN macro instruction failed for the specified JES3 control block for the indicated job.

System action: Job failure or requeuing continues for the specified job. The initiator for this job is ended.

Operator response: None. This is an informational message.

Module:

Routing Code: 2,11  Descriptor Code: 6

IAT6806

Explanation:

The ESTAE routine for the specified subsystem interface could not be successfully established. The subsystem interfaces are:

JOBS
  Job select

JOBT
  Job end

JOBR
  Job requeue

RQJB
  Request job ID

RTJB
  Return job ID

System action: The job, started task, or system log associated with the error is ended. If the associated job is a problem program, the initiator which selected the job is also ended.

IAT6807

Explanation:

During job initiation, the specified system data set could not be successfully opened. A POINT operation was attempted and an unrecoverable error was encountered.

System action: The specified job is ended. If the job was a normal user job, the initiator involved selects another job. No dump is taken.

Operator response: Run the job again. If it fails, notify the system programmer. Save the console log.

Module:

Routing Code: 2,11  Descriptor Code: 6

IAT6808

Explanation:

An end of the address space (paging data set error, page table errors, etc.) or system task (initiator) occurred while the specified job was in execution.

System action: If the job was successfully journaling, it is put back in the JES3 queue in hold status for an MVS warm start to clean up any scratch or VIO data sets and to determine MVS restartability. If the journaling for the job was not begun or failed, the job's JES3 failure options are exercised.

Operator response: If this job is eligible for automatic restart, message IEF225D is issued asking you if the job should be MVS restarted. If the job is not eligible for MVS restart or you reply NO to message IEF225D, the job's JES3 failure options are exercised.
IAT6809  •  IAT6813

IAT6809
Explanation:

An abend of the address space (paging data set error, page table errors, etc.) or system task (initiator) occurred while the specified job was in execution.

System action: The job specified, which is a demand select job (that is, initiator, LOGON), is ended.

Operator response: None. This is an informational message.

IAT6810
Explanation:

A failure occurred during the SWA create phase of job initiation.

System action: The job is ended. If the job was a problem program selected by an initiator, the initiator continues running and requests another job for execution.

Operator response: None. This is an informational message.

IAT6811
Explanation:

An error has occurred while closing the specified system data set, JCBLOCK in the job select subsystem interface (SSI) and the other data sets in the job end/requeue SSI.

System action: The initiator and/or the job are ended.

Operator response: None. This is an informational message.

IAT6812
Explanation:

During exit processing for the job select, job end, job requeue, end of task, address space end, request job ID, or return job ID subsystem interface routine, the FREEMAIN request for the JSA work area was unsuccessful.

System action: Exit processing continues.

Operator response: None. This is an informational message.

IAT6813
Explanation:

The FREEMAIN request failed for the MEMENTRY JES3 control block. The data area is in subpool 241.

System action: Address space end processing continues.
IAT6814
Explanation:
>>> ERROR TERMINATING JOB
   SELECT
   TERM/REQUEUE

 ESTAE

The job select or job end/requeue subsystem interface routine attempted to cancel its outstanding ESTAE and was unsuccessful.

System action: Processing of the subsystem interface routine continues.

Operator response: None. This is an informational message.

IAT6815
Explanation:
>>> JOB—jobname (jobid)

 FAILED DUE TO JCL ERROR

The indicated job was failed by the MVS interpreter because of a JCL error.

System action: The job is ended.

Operator response: None. This is an informational message.

Module:
IATSIJS IATSIJS IATSIJS

Routing Code: 2,11 Descriptor Code: 6

IAT6816
Explanation:
>>> JOB—jobname (jobid)

 FAILED DUE TO OPERATOR CANCEL

The indicated job was either canceled by the operator or by JES3.

System action: The job is ended.

Operator response: None. This is an informational message.

Module:
IATSIJS IATMSMS IATSIJS

Routing Code: 2 Descriptor Code: 6

IAT6817
Explanation:
>>> JOB—jobname (jobid)

 FAILED DUE TO DUPLICATE JOB NAME

The indicated job was failed by JES3 because there was already a job in the system that had the same name.

System action: The job is ended.

Operator response: None. This is an informational message.

Module:
IATSIJS IATMSMS IATSIJS

Routing Code: 2 Descriptor Code: 6

IAT6818
Explanation:
>>> JOB—jobname (jobid)

 FAILED DUE TO GETMAIN FAILURE IN C/I

A GETMAIN failure occurred during either MVS conversion or interpretation for a demand select job. There was not enough available storage in the address space (JES3 or CI FSS) for the MVS converter or interpreter to create the necessary control blocks. Messages IAT4230 and IAT4227 were also issued by C/I processing when the error was detected. The error
indication is set in the job select queue (JSQ) (for the
demand select job) and used to end the address space.

**System action:** The demand select job's address
space ends.

**Operator response:** Notify the system programmer.

**Programmer response:** Use IATUX46 and IATUX49
to control the processor and address space where MVS
C/I is performed. Demand select jobs can be sent to an
address space which is not storage constrained. The
address space JCL limit can also be used to control the
amount of storage in an address space being used for
SWA control blocks. See explanations of messages
IAT4230 and IAT4227.

<td>IATSIJS</td>
</tr>
</tbody>
</table>

During excessive limit processing for a job, JES3 issues this message because of an SJFREQ service failure in module IATSIOD. The reason code from SJFREQ is included in the message text.

**System action:** JES3 cancels the job.

**Operator response:** Notify the system programmer.

**Programmer response:** Check the reason code from the SJFREQ service.

**Module:**

<table>

**Routing Code:** 2,11  **Descriptor Code:** 7

---

The job [JOB], started task [STC], TSO user [TSU], or an APPC transaction program [APP] has reached the number of WTO (limit) during a time interval (intvl).

The JESMSGLMT parameter on the MAINPROC statement in the JES3 initialization stream defines the limit and the maximum time interval allowed before this message will get issued. The interval value in the message (intvl) is the actual elapsed time when the limit was reached.

The value nnn TIMES indicates how many times in a row the limit has been reached. When the count reaches the maximum value of 999, JES3 resets its value to 1.

**System action:** None.

**Operator response:** The reported job might be issuing too many WTO messages for the JES3 global to handle. Notify the system programmer and either suspend JESMSGLG logging (using the *F JES3.NOLOG command) or cancel the job. See [z/OS JES3 Commands](https://www.ibm.com) for more information.

**Programmer response:** Verify the program logic and correct the program if appropriate. A WTO loop can be caused indirectly by repetitively invoking a system service that issues a WTO during each invocation.

Chapter 14. FSS Address Space Messages

IAT6900

Explanation:

FSS CONNECT
FSA CONNECT
FSS DISCONNECT
FSA DISCONNECT
UNKNOWN SSI

PARAMETER ERROR
ENVIRONMENT ERROR

One of the following errors occurred:

- The parameter list passed to the functional subsystem interface (FSI) connect/disconnect function was incorrect for one of the following indicated reasons:
  - INVALID FSI FUNCTION CODE
  - FSS NOT YET CONNECTED
  - INVALID FSS ID
  - INVALID FSA ID
  - FSS ALREADY CONNECTED
  - FSA ALREADY CONNECTED
  - FSS ALREADY DISCONNECTED
  - FSA ALREADY DISCONNECTED
  - FSS NOT YET DISCONNECTED
- An environmental error occurred during an FSI connect function because of the following reason:
  - SYSTEM BEING PARTITIONED

This message is followed by message IAT6998 identifying the functional subsystem (FSS).

System action: If the reason text is "SYSTEM BEING PARTITIONED", this indicates that the system that the FSS attempted to start on is being partitioned out of the SYSPLEX and all requests to join any group are permanently suspended. If the FSS is a C/I FSS, it will end abnormally with a DM207 reason code X'2C'. If the FSS is a WTR FSS, other abends are possible and can usually be ignored.

For all the other reason text, this is probably an error in the FSS that is trying to use the FSI. The FSS will end abnormally. See the description of the message or system completion code provided by the FSS when it ends.

Module:

Containing  Detecting  Issuing
IATSICD    IATSICD    IATSICD

Routing Code: 2,Note 17,Note 18  Descriptor Code: 7

IAT6901

Explanation:

FSS CONNECT ERROR
FSA

NO TOKEN WITH START COMMAND
CANNOT LOCATE MEMDATA
CANNOT ESTABLISH LISTEN TASK
MVS START PARAMETER ERROR

An unrecoverable error has occurred during the processing of a subsystem interface connect request. This message is followed by message IAT6998 identifying the functional subsystem (FSS).

System action: The FSS address space abends with a system completion code of DFB.

Operator response: Restart the FSS address space.

Problem determination: Table I, items 2, 16, 29, 33, Table III, items 4, 5.

Module:

Containing  Detecting  Issuing
IATSICD    IATSICD    IATSICD

Routing Code: 2,Note 17,Note 18  Descriptor Code: 7

IAT6902

Explanation:

FSS END-OF-TASK ERROR

UNABLE TO IDENTIFY TERMINATED TASK
PREMATURE
FSA LISTEN
FSS LISTEN
READ AHEAD
CHKPT WRITER
TASK TERMINATION

One of the JES3-created tasks in the functional
subsystem (FSS) address space has ended unexpectedly. This message is followed by message IAT6998 identifying the FSS.

**System action:** The FSS address space abends with a system completion code of DFB.

**Operator response:** Restart the FSS address space.

**Problem determination:** Table I, items 2, 16, 29, 33, Table III, items 4, 5.

---

**Module:**

</table>

**Routing Code:** 2,Note 17,Note 18

**Descriptor Code:** 7

---

**IAT6903**

**Explanation:**

- ABNORMAL STOP FSA ORDER ISSUED,
- FSA ALREADY TERMINATED

A stop order was issued to a functional subsystem application (FSA), but that application no longer exists. The stop order is ignored.

**System action:** A 'X'DFC' abend code is not issued. The FSA has already terminated.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFCOR</td>
<td>IATFCOR</td>
<td>IATFCOR</td>
</tr>
</tbody>
</table>

**Routing Code:** 2

**Descriptor Code:** 6

---

**IAT6905**

**Explanation:**

- ORDER FSI NON-ZERO RETURN CODE
- INVALID DATA ADDRESS
- INCORRECT SEND TYPE—(nnn)

A non-zero return code has been received from the functional subsystem interface (FSI) SEND function contained an incorrect data address, or an incorrect SEND type. In the message text, (nnn) identifies the hex value of the incorrect SEND type. This message is followed by message IAT6998 identifying the functional subsystem (FSS).

**System action:** JES3 sets a non-zero FSI reason code.

**Operator response:** Inform the system programmer.

**Programmer response:** This is probably an error in the FSS that is trying to use the FSI. The FSS will abend. See the description of the message or system completion code provided by the FSS when it ends.
IAT6931

Explanation:

- **WRITER FSA CONNECT ERROR**
  - BLOCK SPOOLER INITIALIZATION FAILED
  - CANNOT ESTABLISH READ-AHEAD TASK
  - CANNOT ESTABLISH CHKPT WRITER TASK

FSA connect processing failed to initialize spool access for the GETDS function, or to ATTACH the specified task, or the task failed to complete initialization. This message is followed by message IAT6998 identifying the functional subsystem (FSS).

**System action:** The FSA abends with a system completion code of DFB.

**Operator response:** Restart the FSS address space.

**Problem determination:** Table I, items 2, 16, 29, 33, Table III, items 4, 5.

---

IAT6936

Explanation:

- **GETDS FSI BLOCK SPOOLER ERROR**
  - INVALID SPOOL ADDRESS
  - INVALID PARAMETER LIST
  - CROSS-MEMORY MOVE ERROR

This is a software error that occurred during an attempt to read the data set checkpoint record. This message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

**System action:** The FSA abends with a system completion code of DFB. JES3 recovery processing places the data set in hold, and then attempts to select another data set.

---

IAT6937

Explanation:

- **GETDS FSI ERROR - I/O ERROR**
  - READING CHECKPOINT

A hardware error occurred while attempting to read the data set checkpoint record. This message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

**System action:** JES3 processes the data set from the beginning.

**Operator response:** If reprinting of the complete data set is not acceptable, issue an *S wrt;parm command where parm is any parameter except for NPRO and D. This will cause the FSS writer to release all data sets in the 'pipeline' - including this one - and to request them again. If the problem recurs, hold the data set before restarting the writer.

---

IAT6938

Explanation:

- **GETDS FSI ERROR - GETMAIN ERROR**
  - PROCESSING JESNEWS

The GETDS routine was unable to acquire the storage in which to build the required control blocks. This
message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

**System action:** JESNEWS processing is skipped for this job.

**Operator response:** If this message occurs for more than one job, inform the system programmer.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

</table>

Routing Code: –

---

**IAT6946**

**Explanation:**

- GETREC FSI ERROR –
- NO BUFFERS AVAILABLE
- READ-AHEAD SPOOL I/O ERROR
- READ-AHEAD ABEND OR LOGICAL ERROR

Either there are no available buffers in the buffer pool for the FSA, or an indication of a previous error in the read-ahead task is now being passed to the caller. This message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

**System action:** Processing of the indicated data set ends. The occurrence of the exceptional condition is noted in the GETREC FSI parameter list and a zero FSI reason code is set.

**Operator response:** Reset the data set destination to another writer if possible, or cancel the data set.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

376  

z/OS V1R12.0 JES3 Messages
IAT6950
Explanation:

The parameter list passed to the JES3 functional subsystem interface (FSI) FREERECC function, contained the indicated incorrect value. This message is followed by message IAT6998 identifying the functional subsystem (FSS). When the error is an INVALID INDEX FREED, message IAT6999 is also written to identify the data set.

System action: JES3 sets a non-zero FSI reason code.

Operator response: Inform the system programmer.

Programmer response: This is probably an error in the FSS that is trying to use the FSI. The FSS will abend. See the description of the message or system completion code provided by the FSS when it ends.

Module:

Routing Code: – Descriptor Code: 7

IAT6960
Explanation:

The buffer management service for a writer FSA detected an unrecoverable error. This message is followed by message IAT6998 identifying the functional subsystem (FSS).

System action: The task requesting buffer management services abends with a system completion code of DFB.

Operator response: Restart the FSS address space.

Module:
IAT6965  •  IAT6967

Problem determination: Table I, items 2, 16, 29, 33, Table III, items 4, 5.

<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFPQC</td>
<td>IATFPQC</td>
<td>IATFCMS</td>
</tr>
</tbody>
</table>

Routing Code: –  Descriptor Code: 7

IAT6965

Explanation:

An unrecoverable software error was detected while trying to process the data set characteristics. This message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

System action: The FSA abends with a system completion code of DFB. System recovery processing places the data set in hold, and then attempts to select another data set.

Operator response: If the data set characteristics allow, reschedule the data set to another writer. If not, cancel the data set.

Programmer response: If the data set can be processed without the characteristics defined on the applicable OUTPUT JCL statement, ask the operator to reroute the data to another (non-FSS) writer. Otherwise, rerun the job.

Problem determination: Table I, items 2, 16, 29, 33, Table III, items 4, 5.

Module:

<table>
<thead>
<tr>
<th>Containing</th>

<tbody>
<tr>
<td>IATFPSB</td>
<td>IATFPSB</td>
<td>IATFCMS</td>
</tr>
</tbody>
</table>

Routing Code: –  Descriptor Code: 7

IAT6966

Explanation:

A permanent I/O error occurred during the attempt to read a SWB. The SWB is present if an OUTPUT statement or any other Scheduler JCL Facility (SJF) statement was included in the job's JCL. This message is followed by messages IAT6998 and IAT6999 identifying the FSS and the DD associated with the data set, respectively.

System action: The data set is returned to the Output Service queue and held without being printed.

Operator response: Cancel the data set or reschedule it to another FSS writer. This data set, more than likely, cannot be processed by non-FSS writers without a loss in the setup data set characteristics and therefore in the output quality. Contact the job submitter before rescheduling the output to a non-FSS writer.
Programmer response: If the data set can be processed without the characteristics defined on the applicable OUTPUT statement, ask the operator to reroute the data to another (non-FSS) writer. Otherwise, rerun the job.

<td>INVALID MVS JCL VALUE FOR KEYWORD</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

JES3 issues this message when a bad return code was passed from the scheduler work block (SWB) processor by the Scheduler JCL Facility during processing of the data set characteristics.

System action: The system places the data set in HOLD status without being printed and the system issues message IAT7008. The system issues messages IAT6998 and IAT6999 to identify the functional subsystem (FSS) and the DD associated with the data set.

Operator response: Cancel the data set or reschedule it to another FSS writer if the characteristics allow. Otherwise, modify the characteristics to allow the data set to be processed and release the data set from being held.

**Routing Code:** –  **Descriptor Code:** 7

The read-ahead task has detected a permanent error condition.

**I/O ERROR READING SPOOL DATA**

A permanent I/O error occurred.

**UNEXPECTED END OF FILE**

The error occurred because of a failure to close the data set after it had been created. The equivalent error on the JES3 global is a recoverable DM722.

**INVALID RECORD ID**

The record ID provided with a specific GETREC request is incorrect.

This message is followed by messages IAT6998 and IAT6999 identifying the functional subsystem (FSS) and the DD associated with the data set, respectively.

**System action:** Processing of the data set ends. For a permanent I/O error, message IAT6946 is issued when the FSA is notified. For an incorrect record ID, message IAT6945 is issued. There is no second message for an unexpected end of file.

**Operator response:** None. This is an informational message.

Chapter 14. FSS Address Space Messages 381
Explanation:

This message follows message IAT6998 to identify the job and data set involved in the described error.

System action: See the previous accompanying message.

Operator response: None. This is an informational message.

Module:

Routing Code: 2  Descriptor Code: 7
Chapter 15. Output Service Messages

IAT7000

Explanation:

- **DLOG ALERT**
- **MESSAGE LIMIT ALMOST REACHED**
- **MESSAGE LIMIT REACHED**
- **MESSAGE DATA SPACE FULL**
- **CONDITION HAS ENDED**

The JES3 hardcopy log (DLOG) function has detected an alert condition associated with the DLOG extended MCS console; or an existing condition has been relieved.

**System action:** For MESSAGE LIMIT REACHED and MESSAGE DATA SPACE FULL conditions, messages will no longer be queued to the DLOG extended MCS console until the alert condition has been relieved. It is possible that messages may be missing from DLOG while this alert condition is in effect.

**Operator response:** For MESSAGE LIMIT ALMOST REACHED, MESSAGE LIMIT REACHED, and MESSAGE DATA SPACE FULL conditions, the problem may be one of the following:

- A SYSLOG WTL buffer shortage may have occurred (indicated by the display of MVS message IEE767A). Issue the **D,C,HARDCOPY** command to display the number of buffers in use. Issue the **K,M,LOGLIM=nnnn** command to increase the number of SYSLOG WTL buffers.
- A JES3 spool space shortage may have occurred. If a JES3 spool space shortage occurs (for example, JES3 displays message IAT1016 or IAT1017), SYSLOG may not be able to allocate spool space to write WTL requests to the JES3 spool. This in turn may cause all of the SYSLOG WTL buffers to be used up, which will cause messages to back up in the DLOG message data space. Issue **I,J=SYSLOG,SP=part** (where part is the spool partition being used by SYSLOG) to determine if there is a spool space shortage. If there is a spool space shortage, take the appropriate steps to eliminate the shortage (such as purging held output over a certain age).

**Note:** To determine the spool partition being used by SYSLOG, issue the **I,J=SYSLOG,SP** command.

- SYSLOG is not started. If the global has just been IPLed and the Job Segment Scheduler (JSS) has not been started, issue a **S,JSS** command to start JES3 scheduling. SYSLOG will not start until JSS has been started.
- If JSS has been started, issue an **I,J=SYSLOG** command to determine if SYSLOG is active. If not, then issue a WRITELOG START command to start SYSLOG and VARY SYSLOG,HARDCPY command to assign SYSLOG as the hardcopy medium.

If the alert condition is not caused by one of the above conditions, take a dump of the JES3DLOG address space to determine whether there is a problem with the JES3DLOG address space. Notify the system programmer.

**System programmer response:** If you cannot determine the cause of the alert condition, contact IBM support. Documentation should include the dump that was taken and the SYSLOG from the JES3 global.

IAT7001

Explanation:

- **JOB— jobname (jobid)**
- **IS ON WRITER— devname (dev)**
- **RECORDS= nnn NAVAIL**
- **PAGES= mmm (RESTARTED)**

The output for the named job has been selected by the writer (dev) for processing. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. In this message *nnn* specifies the number of records to be printed and *mmm* specifies the number of stream mode pages to be printed. NAVAIL specifies that the number of records is not available. For a 3800 printer, the named job's output has begun to appear on paper. RESTARTED is displayed in the message text when the JES3 global was hot started with this writer active.

**System action:** JES3 continues processing.

**Operator response:** None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATOSWC IATOSWC IATOSWC

Routing Code: Note 17  Descriptor Code: 7
A hot writer has done all the work in the output queue that it can process. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices. The keywords that might appear in the message are:

**WS=**
The writer selection criteria in effect. A list of the possible criteria follows:
- Carriage tape or FCB (C)
- Sysout class (CL)
- Copy modification (CM)
- Data set destination (D)
- Form Requested (F)
- Flash (FL)
- Line or Page Limit (L)
- Stack type (SS)
- Data set priority (P)
- Device type (T)
- Train Image (U)
- Process mode (PM)

**WC=**
The sysout class(es) that the writer can process.

**F=**
The forms that are mounted and held.

**CT=**
The carriage tape or FCB ID that is set up and held.

**U=**
The UCS ID of the mounted train that is held.

**CH=**
The character arrangement table(s) that is held.

**FL=**
The flash image name that is held.

**CM=**
Module is the copy modification module name that is held; refchar is the reference character that is held.

**SS=**
C means that the continuous forms stacker is held.
S means that the burster-trimmer stacker is held.

**L=**
The line limit for the device.

**PG=**
The page limit for page-mode data.

PM=
Indicates the process mode(s) defined for this printer or punch device. If the printer is a device capable of operating in either compatibility mode or FSS mode (for example, a 3800 model 3 printer), PM indicates the process mode(s) defined for the current device operating mode.

When listed, any of the preceding keywords indicates that the attribute of the device cannot be changed except by a *START or *RESTART writer command.

**System action:** The writer waits for an operator command or for new work to process. The criteria in HELD state are preventing the writer from selecting work.

**Operator response:** Issue a *START or *RESTART command to change or release the desired attributes from HELD status, or issue a *CANCEL command to cancel the writer.

When this message first appears, JES3 will display only the first line as an action message. To display all attributes of the device, including those criteria in HELD state, issue the *I,D,D=devname or devnum command.

| JOB --- jobname (jobid) --- ON --- |
| --- devname(devnum) --- COPIES--- xxx, --- |
| --- RECORDS --- nnn --- NAVAIL --- |
| --- PAGES --- nnn --- NAVAIL --- |
```

JES3 has selected the data set specified in message IAT7057 for processing. The JOB jobname (jobid) contains the transaction program job name and transaction identifier when the job exists for an Advanced Program-to-Program Communication (APPC) transaction program. The output is written to device dev. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

In this message, the number of copies to be transmitted to the output device is specified by xxx. nnn indicates the number of records to be printed and mmm indicates...
**IAT7007 • IAT7008**

the number of stream mode pages to be printed. (If the number of records or pages is unknown, NAVAIL appears).

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**IAT7007**

**Explanation:**

- **OPEN ERROR (DMnnn)** FOR DSN=— dsn—
- READ ERROR (DMnnn)
- SPLIT ERROR (DM731)
- BUFF SHORT (DM731)
- R=+nn EOF
- DS IS HELD

An error occurred when a job accessed the data set dsn. The JOB jobname (jobid) contains the transaction name and transaction identifier when the job exists for an Advanced Program-to-Program Communication (APPC) transaction program. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The system does the following, depending on the message text:

- **OPEN ERROR DM701, DM719, DM721, DM722, DM725, or DM731**
  The output of the current data set is ended.
- **READ ERROR DM724**
  Output continues with the next good block of data (if it can be found) from the current data set.
- **READ ERROR DM702, DM722, DM725, or DM731**
  Output of the current data set is ended.
- **SPLIT ERROR DM731**
  A length error has occurred while processing a record that is split across two spool buffers. More printable data may exist for this data set. JES3 waits for an operator response before processing any more data.
- **BUFF SHORT (DM731)**
  A split stream mode data record has been encountered. The non-page mode device does not have adequate input/output (I/O) buffers defined to continue processing. JES3 waits for the operator response.
- **R=+nn EOF**
  This indicates forward repositioning to the end of the data set. The writer will wait for the appropriate operator response before processing any data.
- **DS IS HELD**
  An error occurred while either JES3 or the functional subsystem (FSS) processed the data set. The exact cause is defined by preceding message IAT7061. The specified data set has been placed in operator hold. The next possible data set is selected for processing.

**Operator response:** Depending on the message text, one of the following:

- DM701, DM719, DM720, DM721, DM722, DM724, DM725, or READ ERROR DM731 displays
  No operator response is required.

Repositioning error displays
Enter a *START, *RESTART, or *CANCEL command.

SPLIT ERROR DM731 displays
Enter a *START command to continue processing at the next record. The error record is skipped. To discontinue processing of the current data set, enter a *CANCEL command.

BUFF SHORT (DM731) displays
The data set cannot continue on the current printer. Enter *CANCEL to discontinue the current data set, or enter the *RESTART command to reschedule the output to another device which has sufficient buffers to process the data set.

Notify the system programmer and inform the user of the data set in error. If the error can be corrected, JES3 releases the data set for printing.

Programmer response: Analyze the dump and correct the problem. For more information about the job, see message IAT7061.

Note that for a 3800, message IAT7001 may not have been written for the indicated job.

To define I/O buffers for BUFF SHORT (DM731), see the RECORDS= parameter in [z/OS JES3 Initialization and Tuning Reference](#).

Problem determination: See Table I, item 16.

IAT7011

Explanation:

| devname  | devnum   | INCORRECT |

This message appears when a *CALL, *START, *RESTART, or *CANCEL command contains the indicated incorrect keyword or parameter. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices.

System action: If appropriate, a storage dump is taken and the WTR is ended.

Operator response: If a dump was taken, the response is determined by the type of dump. If no dump was taken, there was a syntax error in the *CALL command; reissue the *CALL command with the correct syntax.
IAT7012  •  IAT7014

The keyword or parameter is not valid for the indicated command or device type, or it cannot be processed at this time because of the current writer status. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices.

System action:  The writer waits for you to correctly issue the command.

Operator response:  To correct the problem, reissue the command with the correct keyword or parameter. You may reissue the same command with only the error keywords or parameters specified; the valid parameters from the previously issued command will take effect.

To cancel the writer, issue a "CANCEL command.

Module:

Routing Code:  –  Descriptor Code: 2,7

IAT7013

Explanation:

This message is issued in response to a "CALL, "START, "RESTART, or "CANCEL command. The command is not valid because of the indicated parameter and a parameter that preceded it. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices.

System action:  The writer waits for you to enter the command correctly.

Operator response:  To correct the problem:

• Reissue the command.
• Use only the parameter specified.
• Use the not option(/) to reset an unwanted parameter.

To cancel the writer, issue the "CANCEL command.

Module:

Routing Code:  Note 18  Descriptor Code: 2,7

IAT7014

Explanation:

This message is issued in response to a "CALL, "START, "RESTART, or "CANCEL command. The command is not valid because of the indicated parameter and a parameter that preceded it. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices.

System action:  The writer waits for you to enter the command correctly.

Operator response:  Reissue the command specifying the keyword or parameter only once. If the first occurrence of the keyword or parameter was the correct one, you may reissue the command without the keyword or parameter, or you may correct the command by reissuing it with only the error keyword or parameter specified. To cancel the writer, issue a "CANCEL command.

Module:

Routing Code:  Note 18  Descriptor Code: 2,7
indicated parameter is not valid for the indicated keyword. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The writer waits for you to enter the command correctly.

**Operator response:** Reissue the command with the correct parameter. You may reissue the same command with only the keywords or parameters in error specified; the valid parameters from the previously issued command will take effect.

IAT7023
Explanation:

```plaintext
>>> WRITER-- devname (devnum) text,

An error was detected on the indicated device. text is one of the following:

EQUIPMENT CHECK
PRINT CHECK
PRINT QUALITY ERROR
LINE POSITION ERROR
MECHANICAL MOTION CHECK
CONTROLLER CHECK
DATA CHECK
DATA CANCELLED
DATA LOST. OUTPUT WILL RESTART.
ENTER *S, *C, OR *R.

DATA LOST is issued for a 3800 printer when a system-restart-required type of paper jam has occurred; the writer has automatically repositioned the data at the fuser, if possible. The system restart indicator will be set on the 3800.

Note that, for a 3800, message IAT7001 may not have been written yet for the indicated devname.

EQUIPMENT CHECK means that there was an equipment check or that, after a unit check, sense byte 0 was set to X'00'.

System action: The writer waits for an operator command unless the CANCEL key was pressed on a 3800 printer which would be indicated by DATA CANCELLED appearing in the message.

Operator response: If you pressed the cancel key on the 3800, you do not need to respond to this message. Ready the device.

If DATA LOST. OUTPUT WILL RESTART. ENTER *S, *R OR *C COMMAND appears in the message, clear the hardware condition for the system restart indicator in IBM 3800 Printing Subsystem Operator's Guide and then issue a *START, *RESTART or *CANCEL command. The command will apply to the data at the fuser. It is typically appropriate to issue *START without further repositioning. Note that after readying the 3800, a writer command must be entered.

Note: If message IOS002A DEV, NO PATH AVAILABLE precedes this message, respond to IOS002A before responding to IAT7024. The writer will wait for a *START, *RESTART, or *CANCEL command.

**Routing Code:** Note 17  **Descriptor Code:** 2,7
The indicated job is scheduled for device dev. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

The job's setup requirements are shown as follows:
- \( F = \) form-name
- \( U = \) UCS image name
- \( C = \) carriage tape name
- \( FL = \) flash name
- \( SS = \) the stacker to thread.

In the case of the 3800, SS will be C for the continuous-forms-stacker or S for the burster-trimmer-stacker.

If message IEE704I REPLY nn NOT OUTSTANDING is issued shortly after this message, JES3 could not automatically reply to message IAT7030. In this case the operator must reply. If the device is a 3800 and its status is known to JES3, a code is displayed on the 3800 operator panel. Following is a list of the possible codes and their meanings:

- **F1** Thread forms to continuous forms stacker. Make no changes to the forms or the flash.
- **F2** Thread forms to burster-trimmer-stacker. Make no changes to the forms or the flash.
- **F3** Change only the flash, to the value shown for FL= in this message (IAT7030).
- **F8** This message (IAT7030) shows required values for forms, forms, flash, and/or forms threading.

**System action:** The writer waits for an operator response. If the device is a 3800 printer and if the device was previously setup, it is made not ready.

**Operator response:** Ensure that the device is set up properly, then enter the command \( ^{*}S, \text{devname} \) or \( ^{*}S, \text{devnum} \) command. If the device is a 3800 printer, you must make the printer ready.

printer after the IEC message. When on the printer, this message contains the date and time and is written several consecutive times so that it stands out.

**UNEXPECTED ERROR FROM SETPRT. RC=xx** - The indicated code is either 10, 18, 1C, 28, 2C, 3C, or greater than 44. These codes are documented in z/OS DFSMS Macro Instructions for Data Sets.

**System action:** If header and burst pages have not been suppressed and a failure occurs during printer setup, IEC messages are written to the printer.

**Operator response:** Notify the system programmer.

Often the job separator pages have not been printed before this message appears. The failure commonly has been caused by the user, not the hardware, operator, or system programmer.

If this message is printed on the printer, give the pages containing the messages to the submitter of the job. Your installation may choose to adopt a policy of also giving the user information about solutions to common problems. For example, supply a list of which forms can be used with the various FCB loads and a list of the names and purposes of the modules in SYS1.IMAGELIB. This information helps when the user has misspelled a name.

Issue a *CANCEL command to cancel the job's data sets that required the setup or issue *RESTART to override or retry the setup.

**Programmer response:** For UNEXPECTED ERROR FROM SETPRT, there is a probable programming error in JES3 or in SETPRT. If you cannot determine the cause of the alter condition, contact IBM support.

**IAT7034**

**Explanation:**

Unable to start writer fss

An output writer DSP or an FSS controller DSP trying to start a functional subsystem (FSS) address space for a device was unsuccessful. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The FSS controller DSP and all output writer DSPs or the specified WRITER DSP ends. The devices are varied offline.

**Operator response:** If the device was initiated with a *CALL,WTR command, the *CALL command may be reissued. If the failure is repetitive, notify the system programmer.
The status of the FSS may be determined from message either IAT6370 or IAT6371, issued just before this message.

**Module:**  
**Containing** | **Detecting** | **Issuing**

**Descriptor Code:** –

---

**IAT7036**  
**Explanation:**

▸▸ connect not received for  
▸ FSS writer— fssname— in asid— asid— on— main  

An FSS controller DSP trying to start the address space supporting a functional subsystem (FSS) has not received a connect request from that address space.

**System action:** The FSS controller DSP resets its timer and waits again for the address space to connect or for an operator response.

**Operator response:** There is no need for an immediate response. Check for previously issued console messages IAT6373 and IAT6374. If they have been issued, follow the instructions given in the description of message IAT6374. If the messages have not been issued, you can determine device and FSS status by using *INQUIRY,D and *INQUIRY,F commands. If the message is issued several times, enter a *FAIL,devname,DUMP command and report the problem to the system programmer.

**Problem determination:** See Table III, items 3 and 4.

---

**IAT7041**

**Explanation:**

*OUTPUT SERVICE INITIALIZATION ERROR*

A system failure occurred during output service initialization processing. The failure may be due to a program check, a JSAM error, or an error in a JES3 general routine.

**System action:** If multiple OUTSERV FCTs are defined in your initialization stream through the **OUTSVFCT** parameter on the OUTSERV statement, JES3 places the OUTSERV FCT that encountered an error into a permanent wait state. When an FCT is placed into a permanent wait state, it will not accept additional work for output service writers. However, other active OUTSERV FCTs can continue to process work.

**Operator response:** Your installation may be able to continue output service processing if other OUTSERV FCTs are active. Issue an *S,DC,OPTION=(FCT=OUTSERV)* to determine if there are active OUTSERV FCTs in the complex. If there are, these FCTs can continue output service processing.

If all the OUTSERV FCTs are inoperative, perform a hot start to reinstate output service processing.

<td>IATOSDR</td>
</tr>
</tbody>
</table>

**Routing Code:** 10 **Descriptor Code:** 7
Explanation:

**IAT7046**

Output service abended while processing a spinoff data set for the job specified by **jjj**.

**System action:** The data set is removed from the output service work queue and no further processing is done for this data set. At the next JES3 restart, the data set is processed again.

**Operator response:** Notify the job submitter that one or more SYSOUT data sets may be lost, or restart JES3. This will allow output service to reprocess the data set that was removed.

**Module:**

**IATOSDR**

**Routing Code: Note 17**

**Explanation:**

A writer command (that is, *CALL WTR, *START WTR, or *RESTART WTR command) was issued to specify the number of process modes. The command would cause JES3 to define more than 8 process modes for the device or 255 process modes to the complex.

**System action:** JES3 accepts only the first eight process modes defined for a device or the first 255 process modes defined for the complex.

**Operator response:** If the new process modes are required for the device:

- issue an *I D D=dev to determine the current process modes defined for the device
- determine the process modes that can be deleted for the device
- issue a writer command with a PM=(/value) parameter to delete the undesired process mode
- issue a writer command with a PM=(value) to add the desired process mode

If there are process modes that need to be removed from the complex, contact the system programmer.

**System programmer response:** When 255 process modes are defined for the complex, the operator cannot define any new process modes for a device or the complex. You must determine which process modes are not needed for the complex. To correct the process modes for the next restart, change the DEVICE statement so that undesired process modes are deleted. To correct the process modes for current processing, issue a writer command with a PM=(/value,....) to delete the undesired process modes. Issue a writer command with a PM=(value) to add the desired process mode.

**Module:**

**IATOSMV**

**Routing Code: 10**

**Explanation:**

The address space supporting a functional subsystem (FSS) writer has failed; either because its system was IPLed or ended, or the address space was ended by a FORCE or CANCEL command, or an abend occurred. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The FSS controller DSP and all output writer DSPs supporting the FSS end.

**Operator response:** When the processor becomes available, the writers can be restarted.

**Module:**

**IATOSFD**

**Routing Code: –**

**Explanation:**

The address space supporting a functional subsystem (FSS) writer has failed; either because its system was IPLed or ended, or the address space was ended by a FORCE or CANCEL command, or an abend occurred. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The FSS controller DSP and all output writer DSPs supporting the FSS end.

**Operator response:** When the processor becomes available, the writers can be restarted.
A non-channel attached device runs under a WRITER DSP which runs under control of a functional subsystem address space (FSS). The specified writer DSP is ending because the FSA requested disconnect processing.

**System action:** JES3 ends the specified writer DSP. JES3 performs disconnect processing for the FSA and FSS address space.

**Operator response:** If a hardware failure occurred (messages were issued to indicate there was a hardware failure), vary the device offline to JES3. When the device is varied offline, it cannot be selected by output service for a dynamic writer. If the writer is a hot writer, issue a *CANCEL WTR,RSC,T command to end the hot writer.

**Module:**

**Routing Code:** Note 17  **Descriptor Code:** 2,7

---

The **jobname** writer has encountered a condition that requires operator intervention. If CHNSZ=xxx is given, the error occurred on a data set, and xxx is the current chain size. The intervention required condition at the physical device may cause loss of data.

**System action:** The writer waits for operator response.

**Operator response:** Issue a *RESTART,dev command.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 2,7

---

JES3 has taken the device identified by **devname** offline. This message is issued with messages IAT7050 and IAT7053.

**System action:** JES3 continues processing.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 17  **Descriptor Code:** 2,7
IAT7053
Explanation:

This message indicates one of the following three conditions: (1) the writer could not obtain a session to send data because a workstation cancel was in progress, (2) workstation cancel was detected while sending data, or (3) severe protocol error occurred on the session.

System action: The data set is requeued from its checkpoint, and, in case of item 1, the device is varied offline. If CHNSIZE=DS is in effect, this checkpoint will be the start of the data set.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18 Descriptor Code: 7

IAT7054
Explanation:

The writer has rejected setup header (PDIR) for the indicated reason. If SENSE=, the reject is unexpected.

System action: The writer waits for operator response, unless SENSE= is specified. In this case, processing continues with the PDIR function inoperative for writer, jobname.

Operator response: Issue a *RESTART command to respecify setup for writer, jobname.

Module:

Routing Code: – Descriptor Code: 2,7

IAT7055
Explanation:

The writer has encountered either a transmission error or has lost its session as indicated by the message text. If CHNSZ=yyy is given, the error occurred on an active data set where yyy is the current chain size.

System action: For transmission errors, JES3 waits for operator response unless the error occurred on header or trailer pages. In this case processing continues. For session errors, the writer will attempt to obtain a new session.

Operator response: If FCB= is given, it is likely that the FCB load sequence is not acceptable to the workstation. In this case, restart the writer specifying an alternate FCB or enter a *START command to continue with the current FCB. In all other cases, restart the writer.

Module:

Routing Code: Note 18 Descriptor Code: 7

IAT7056
Explanation:

The FCB image obtained from SYS1.IMAGELIB cannot be converted to an SNA set vertical forms (SVF) sequence required to load the image.

System action: JES3 waits for operator response.

Operator response: Restart the writer and specify a new FCB.

Module:

Routing Code: Note 18 Descriptor Code: 7
IAT7057

Explanation:

```plaintext
>>> JOB—jobname (jobid)

- ON DEVNAME—(devnum)—DSN—dsn
```

JES3 selected the data set specified in this message. The output is written to device `dev`. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. Message IAT7006 contains additional information about the data set.

**System action:** If the manual mode is in effect, the writer waits for an operator command to start processing. Otherwise, transmission of the data set begins.

**Operator response:** If this message is issued as a result of being in diagnostic mode, no operator response is necessary. Otherwise, the operator must issue the *START writer command to start the writer or the *CANCEL command to change the writer status or cancel the writer.

IAT7060

Explanation:

```plaintext
-devname diagfld

-devname, rqaddr, chnaddr, rcdsn, diagfld2,

- IN
```

This message is issued in response to any command for a writer after diagnosis mode is turned on by issuing a *CALL, *START, *RESTART, or *CANCEL command for that writer with the D parameter specified. This message contains a 7-byte diagnostic field `diagfld` in the writer data area (IATODWD). See `z/OS JES3 Diagnosis` for an explanation of the output service diagnostic mode information displayed in the diagnostic field `diagfld`.

For 3800 printers with the 3800 MVS enhancements installed, `rqaddr` specifies the address of the RESQUEUE for the job currently at the writer; `chnaddr` specifies the address of the RESQUEUE for the job currently at the channel; `rcdsn` specifies the address of the most recent data set or start of transmission pending page queue (PPQ) entry. The `rcdsn` field is zero if the printer is not a 3800. The `in` field specifies the current index of WTRINDX.

For FSS mode printers, `rcdsn` specifies the most recent
data sets selected to print pending data set queue (PDQ) entry. The second diagnostic field diagfld2 is obtained from WTRFFIG1-WTRFFIG5 in the writer data area (IATODFD).

**System action:** Processing continues.

**Operator response:** None. To turn off the diagnostic mode, specify the /D (diagnosis) parameter on any *X, *S, *R, or *C writer command.

**Explanation:**

\[
\text{devname \rightarrow RESPA=} \rightarrow \text{(additional information}) \\
\rightarrow \text{aaa,bb,ccpyno,pageno,recno \rightarrow id} \\
\]

This message is issued to the hardcopy message log when an FSI SYNCH or QUERY order response is received during FSS writer command processing. The output service diagnostic mode must be active for this message to be issued.

- **devname** identifies the name of the device where the data set is being printed.
- **aa** identifies the status of the device.
- **bb** identifies the processing status of the data set.
- **rc** identifies the return code from the requested function.
- **cpyno** identifies the copy number of the data set at the operator observation point (OOP) station in the printer.
- **pageno** identifies the page number of the data set at the OOP station in the printer.
- **recno** identifies the logical record number of the data set at the OOP station.
- **id** identifies the data set identifier at the OOP station.

Message IAT7077 contains the name of the data set being processed. For the possible values for **aa**, **bb**, and **rc**, see the Output Service Diagnostic Facility section in [z/OS JES3 Diagnosis](#).

**System action:** JES3 processing continues. The output diagnostic mode will continue to write messages to the hardcopy message log.

**Operator response:** None. This is a diagnostic message for the system programmer.
Programmer response: Check the hardcopy message log for the diagnostic messages.

Module:

<table>
<thead>

</table>

Routing Code: Note 13  Descriptor Code: 7

IAT7064

Explanation:

This message is issued to the hardcopy message log when an FSS releases a data set during FSS processing. The output service diagnostic mode must be active for this message to be issued. devname identifies the name of the device where the data set is being printed. DISP identifies the disposition of the data set. The possible values and the associated meanings for the data set's disposition are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNPRINTABLE</td>
<td>JES3 was unable to print the specified data set.</td>
</tr>
<tr>
<td>COMPLETE</td>
<td>JES3 printed the entire specified data set.</td>
</tr>
<tr>
<td>INCOMPLETE</td>
<td>JES3 was unable to completely print the specified data set.</td>
</tr>
</tbody>
</table>

System action: JES3 processing continues. The output diagnostic mode will continue to write messages to the hardcopy message log.

Operator response: None. This is a diagnostic message for the system programmer.

Programmer response: Check the hardcopy message log for the diagnostic messages.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATOSFR</td>
<td>IATOSFR</td>
<td>IATOSFR</td>
</tr>
</tbody>
</table>

Routing Code: Note 17  Descriptor Code: 7

IAT7066

Explanation:

An operator command was entered to change the status of the output on the specified device. If you specify both BURST=YES and HEADER=YES or you let JES3 default to BURST=YES and HEADER=YES for an FSS-supported device, JES3 prints message IAT7066 and IAT7067 on the user's output whenever you enter a command that modifies the data on this device. The meanings of the terms in the message are as follows:

JOB

Specifies that all of the data sets for the current job are to be either restarted or canceled.

GROUP

Specifies that all of the data sets processed by the same device that is processing the current job are to be either restarted or canceled.

CANCELED

Indicates that the specified data sets will be canceled.
RESTARTED
 Indicates that the specified data sets will be reprinted.

System action: The specified data sets are either canceled or reprinted. JES3 processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATOSFM</td>
<td>IATOSFM</td>
<td>IATOSFM</td>
</tr>
</tbody>
</table>

Routing Code: Note 17  Descriptor Code: 7

IAT7067
Explanation:

```plaintext
> name_-- DATA SET

CANCELED
RESTARTED
INTERRUPTED
CHANGED

FROM CHECKPOINT

FWD-SPACED nnn PAGES
BACKSPACED nnn PAGES

COPIES INCREASED BY ccc PAGES
DECREASED BY ccc PAGES
UPDATED TO ccc PAGES
HELD
```

An operator command was entered to alter the specified output. If you specify both BURST=YES and HEADER=YES or you let JES3 default to BURST=YES and HEADER=YES for an FSS-supported device, JES3 prints message IAT7066 and IAT7067 on the user's output whenever you enter a command that modifies the data on this device. The meanings of the terms in the message are as follows:

CANCELED
 Indicates that the current data set was canceled.

RESTARTED
 Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint.

INTERRUPTED
 Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint and requeued for scheduling at another time.

CHANGED
 Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint and the changes requested by the command were made.

FROM CHECKPOINT
 Indicates that the current data set was restarted, requeued, or repositioned from the last checkpoint.

FWD-SPACED nnn PAGES
 The requested number of pages are forward spaced and processing continues.

BACKSPACED nnn PAGES
 The requested number of pages are backspaced and processing continues.

COPIES
 The requested number of pages that are copied.

INCREASED BY ccc
 Indicates that the number of copies was increased by ccc.

DECREASED BY ccc
 Indicates that the number of copies was decreased by ccc.

UPDATED TO ccc
 Indicates that the number of copies was changed to ccc.

HELD
 Indicates that the current data set was interrupted and placed in operator hold.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

</table>

Routing Code: Note 18  Descriptor Code: 7

IAT7072

Explanation:

- devname (devnum)
- ISSUE CORRECTED COMMAND OR ALTERNATE COMMAND

The writer has not accepted an operator command. The specific error reason appears in the preceding message.

System action: The writer waits for you to enter the corrected command.

Operator response: You can correct the operator command using the following guidelines:

1. Re-enter only the items that need correction. JES3 will process all of the valid keywords and parameters from the original command.
2. Enter another writer command. All of the keywords and parameters from the command in error are ignored and the new command is processed.
3. If a *CALL,WTR command contained the error, correct the error with a *START,WTR command.

If JES3 allocated a device different from what you expected, you either issued the *CALL command...
without the OUT= keyword and JES3 provided the default device allocation, or the OUT= specification was not valid. Issue the *CANCEL command to cancel the writer, then reissue the *CALL,WTR command with the correct device.

Module:

Routing Code: Note 17    Descriptor Code: 7

IAT7075
Explanation:

GROUP     JOB     DSN= dsn     REQ
STARTED  RESTARTED  WITH LOAD
CANCELED

FROM    NOTE
       CHECKPOINT

APRL= nnnnnnnn
NAVAIL
APRX= ( nnnnnnnnR, nnnnnnnnP )
APRF= nnnnnnnnR, ( nnnnnnnnP,NAVAIL )

The writer has accepted an operator input command. If a device number does not appear in message IAT7089, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. This message is issued only if all the parameters or keywords on the issued command were valid.

The meanings of the terms in the message are as follows:

GROUP
The requested action applies to all data sets for the group.

JOB
The requested action applies to all data sets for the job.

DSN=dsn
The requested action applies only to the data set currently being processed by the writer. For a 3800 printer, the current data set is the data set that is visible at the transfer station. The name of the current data set is dsn.

REQ
The requested action applies to all data sets associated with the current device setup.

STARTED or RESTARTED or CANCELED
Indicates which action is being taken.

WITH LOAD
The request was for a UCS or FCB load.

FROM NOTE or CHECKPOINT
The data set will be restarted from the last note or checkpoint.

APRL=nnnnnnnn or NAVAIL
This field appears in response to a *S,writer,P command, a *R,writer,P command, or a *C,writer,P command if a data set is active on the specified writer and if all the records in the data set have not
yet been processed. When a value appears, it indicates the approximate number of records left to be processed for all copies of the current data set on the specified writer.

If NAVAIL appears, a problem occurred while the writer was processing the current data set. The system's statistics for this data set are not valid. The count of the number of records left to be processed for the data set is not available.

**APRX=**
Traditional writer (non-FSS writer). The specified values in the field have the following meanings:

\[
\text{nnnnnnnnR} \\
\text{nnnnnnnnP}
\]

- **R**: Specifies the approximate number of records remaining in the current data set that have not been sent to the device’s page buffer.
- **P**: Specifies the number of pages that are in the device’s page buffer. (Each page with copy grouping is counted only once.) If **nnnnnnnnP** appears without **nnnnnnnnR**, the last record for the last copy of the current data set has been sent to the device.

**APRF=**
This field is included in the message for all FSS supported printers in response to the ‘P’ parameter on the input command.

\[
\text{nnnnnnnnR} \\
\text{nnnnnnnnP}
\]

- **R**: Specifies the approximate number of records remaining in the current data set that have not yet been printed.
- **P**: Specifies the approximate number of pages remaining in the current data set that have not yet been printed.

**NAVAIL**
If this appears, the page and record counts were unavailable (that is, there is no current data set in the transfer station).

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

Explanation:

<table>
<thead>
<tr>
<th>JOB</th>
<th>jobname (jobid)</th>
<th>NOT PROCESSED BY</th>
<th>devname (dev)</th>
<th>REASONS=JES(SECURITY)</th>
</tr>
</thead>
</table>

This job has data set(s) that match the device selection criteria, but JES3 cannot print it because a security check failed for this job.

System action: The device attempts to process other jobs. If no other work is available for the device, JES3 issues message IAT7005, and the writer waits for additional work. If another device is able to process this job’s output, the job will be printed by that device.

Operator response: Notify the security product administrator of the JES (SECURITY) reason if this device does print this job’s output.

Programmer response: Update the security product database to allow the data set to print if that is desired. Then, cancel the writer using this device, and restart the writer after you have made the updates.

If you receive this message frequently, evaluate the security class criteria and the work selection (WS parameter) specifications for the device or advise your users of the valid destinations to use for their output.

- OUTPUT SERVICE BDT RECOVERY FCT
- RECURSIVE ERROR. THIS FCT IS NOW INACTIVE.

An error occurred while the output service Bulk Data Transfer manager recovery FCT was processing a recovery request from the JES3/BDT communications interface FCT. The output service Bulk Data Transfer manager will not retry a request if the:

- parameter list is incorrect
- JESTAE retry routine has been entered more than once for each request

System action: The recovery DSP is dechained from the FCT chain.

Programmer response: Request a dump and analyze it to determine the reason for the error. See [z/OS JES3 Diagnosis] for information on how to interpret the dump.

If this message was issued because of an authorization error, see the SYSLOG for associated authorization failure messages from the security product.

Routing Code: 42  Descriptor Code: 7

IAT7099

Explanation:

- JOB TRAILER
- JOB HEADER
- DATA SET DID NOT EXIST FOR JOB jobname (jobid)

Network streams are built by:

- input service when the network job originates at your node
- the store and forward function if the network job was transmitted by a path node
- output service when it is preparing a network stream to be transmitted.

If input service or store and forward prepare a network stream for transmission, both the job header and job trailer should be provided. Output service is responsible for preparing a network stream that will be transmitted. Output service requires the job header and job trailer in the network stream before it can be processed. Message IAT7099 is issued when output service found it necessary to build a job header or job trailer missing from the network stream.

System action: Output service builds the missing job header or trailer. Processing continues and the network stream will be prepared for transmission. However, information that may have been added to the job header or trailer by installation exit IATUX40 or IATUX43 is lost.

Operator response: Note the job number and the job name of the network job. Give the information to the system programmer so that if a problem exists, it can be corrected. JES3 networking and other JES3 processing continues.

System programmer response: This message can be issued because of one of the following reasons:

- Output service abending
  Determine if output service previously abended. If the output service abended, the job header or trailer may not have been built. This message is informational and is part of output service recovery processing.

IAT7098

Explanation:

- JOB jobname (jobid) GROUPID (groupid)
- DESTINATION (dest) IS NOT SNA, FAILED AUTHORIZATION, JOB IS PLACED IN HOLD

One of two errors occurred when the MVS/BDT communications interface FCT tried to get a network job by issuing an IATXOSBM TYPE=GET macro.

1. The network job must be transmitted using SNA protocols for MVS/BDT to process it. However, the destination node for the requested network job is not defined as a node that uses SNA protocols.
2. An authorization error occurred while attempting to get the network job.

System action: JES3 places the network job in operator hold.

Operator response: Notify the system programmer or the security product administrator.

Programmer response: Request a dump and analyze it to determine the reason for the error. See [z/OS JES3 Diagnosis] for information on how to interpret the dump.

If this message was issued because of an authorization error, see the SYSLOG for associated authorization failure messages from the security product.
• an error occurred during input service
  If a user submitted the network stream at your node, an error was encountered during input service processing that caused the job header or trailer not to be built. Determine the error from the information listed in Chapter 30, “Problem Determination,” on page 711.

• an error occurred during store and forward processing
  the store and forward DSP received a network stream that did not contain the job header or trailer data set. Determine the error from the information listed in Chapter 30, “Problem Determination,” on page 711.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 711, Table 1, items 3, 4, and 13. Also see Table 3, item 4.

Chapter 16. Console Service Messages

IAT7100

Explanation:

\[\text{dspname} \text{ xxx} \]

A DSP issued a command using the INTERCOM macro and elected to display the message on the console. The command follows this message.

System action: The specified input command is processed by the system.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCNIC</td>

Routing Code: Note 13 Descriptor Code: 7

IAT7103

Explanation:

\[\text{job} \text{ jjj (jobid)}\]
\[\text{on} \text{ devname (devnum)}\]
\[\text{waiting synchronization for job trailer} \]

An error occurred causing the FSS address space to release all data sets from that point on the printer's queue. It is necessary to send a job trailer and/or JESNEWS for the job identified in the message. If a device number devnum does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. In the message text:

\[\text{jjj}\]

The name of the job active on the device when the error occurred.

\[\text{jobid}\]

The id of the job active on the device when the error occurred.

\[\text{devname}\]

The device name.

\[\text{dev}\]

The device number

System action: The WRITER DSP ends and the device is varied offline. If the functional subsystem has another FSA active, it will remain active. Otherwise, the functional subsystem terminates.

Operator response: Notify the system programmer.

System programmer response: Change the FSSDEF and DEVICE statements for this FSS to reference device numbers with less than four digits. Four digit device numbers must not be assigned until the FSS is upgraded to support them.

Module:

<tr>
<td>IATOSFG</td>
<td>IATOSFG</td>
<td>IATOSFG</td>
</tr>
</tbody>
</table>

IAT7106

Explanation:

\[\text{fss wtr error job nnnnn on device (ddd)}\]
\[\text{missing job trailer} \]

An FSS writer pipeline error was encountered while the FSS writer was processing the indicated job. The FSS device requires that a job trailer be sent with the job, but it is omitted because of the error.

System action: The indicated job is unscheduled from the writer, and the writer will resume normal operation.
Operator response: The indicated job might require the operator to find the end of the output of this job and manually separate it from the next job. The job trailer was not able to be printed.

Module:

IAT7107
Explanation:

- COMMAND CHANGED BY EXIT ORIGINAL: 0
- (up to 60 chars of original cmd)
- and (remaining chars of original if necessary)
- MODIFIED: m (up to 60 chars of modified cmd)
- and (remaining chars of modified if necessary)

A JES3 command is modified by user exit 18. In the message text:

- Original command
- Modified command

System action: JES3 processing continues.

Operator response: None.

System programmer response: If console names changed as part of the migration to JES3 5.2.1, called DSPs may be canceled and then called again to restore message routing.

The return and reason codes from the CONVCON service are contained in the message text. See z/OS MVS Programming: Assembler Services Reference ABE-HSP for a description of these codes.

Module:

Containing Detecting Issuing
IATCNDB IATCNDB IATCNDB

Routing Code: Hardcopy Descriptor Code: –

Log

IAT7108
Explanation:

- ERROR FROM CONVCON MACRO FOR
- CONSOLE: ‘consname’ RC xx RSN xx
- CURRENT CNDB REPLACED BY DEFAULT
- CNDB, FCT ‘xxxxxx’

Following the migration to JES3 5.2.1, JES3 was not able to successfully validate the console name contained in the CNDB passed to the IATXCNDB service. The CONVCON service JES3 uses to validate the console name, returned with the indicated return and reason codes. This message does not necessarily indicate an error condition. Rather, it is intended to provide a record in the hardcopy log that a default CNDB substitution has been performed. For example, if a console defined to JES3 in the initialization stream on a JES3 SP 5.1.1 system is not defined to MCS in CONSOLxx using a console NAME on the JES3 5.2.1 system, JES3 will be unable to route messages for restarting DSPs to the same console.

consname is the console name used by the prior JES3 system.

The FCT= will display the calling FCT name if the IATXCNDB service is running under the JES3 NUC task. FCT= N/A will be displayed if the IATXCNDB service is running under a user address space.

System action: JES3 uses the dummy CNDB in place of the one passed on the IATXCNDB call. Subsequent processing for this command/message will use the dummy CNDB. Commands issued using the dummy CNDB will use console name INTERNAL. Messages issued using the dummy CNDB will be recorded only in the hardcopy log.

Operator response: None.

System programmer response: If console names changed as part of the migration to JES3 5.2.1, called DSPs may be canceled and then called again to restore message routing.

An error occurred while processing an IATXMLWO request to build or cleanup a multi-line message. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout for failure code DM761.

System action: The DSP's JESTAE exits, if any exist, are invoked. If no JESTAE exit exists, or none of the JESTAE exits request retry, the DSP is ended.
IAT7111 • IAT7122

IAT7111

Explanation:

The installation has requested that JES3 maintain the hardcopy log (DLOG), however JES3 was unable to create the JES3DLOG address space using the ASCRE system service. The return and reason codes indicate the specific error encountered.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

Module:

IAT7112

Explanation:

The installation has requested that JES3 maintain the hardcopy log (DLOG), however JES3 was unable to create the resource manager for the JES3DLOG address space using the RESMGR system service. The return and reason codes indicate the specific error encountered.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

Module:

IAT7113

Explanation:

The installation has requested that JES3 maintain the hardcopy log (DLOG). While waiting for the JES3DLOG address space to initialize, it instead terminated.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

System programmer response: Contact the IBM Support Center.

Module:

IAT7114

Explanation:

The installation has requested that JES3 maintain the hardcopy log (DLOG). The DLOG function has been successfully activated.

System action: JES3 begins recording the sysplex hardcopy message log to DLOG.

Operator response: None. This is an informational message.

Module:

IAT7122

Explanation:

The installation has requested that JES3 remain the hardcopy log (DLOG). The DLOG function has been successfully activated.

System action: JES3 begins recording the sysplex hardcopy message log to DLOG.

Operator response: None. This is an informational message.

Module:
JES3 is waiting for the JES3DLOG address space to complete either initialization or termination.

**System action:** JES3 continues waiting for the JES3DLOG address space to initialize or terminate. When either of these events occurs, JES3 deletes this message.

**Operator response:** If JES3DLOG initialization is taking too long:
1. Dump the JES3DLOG.
2. Then issue a FORCE command.

This will end the JES3DLOG address space and allow JES3 initialization to continue.

**System programmer response:** None.

**Module:**

IATCNDS IATCNDS IATCNDS

Routing Code: 10 Descriptor Code: 2,7

---

**Explanation:**

The JES3DLOG address space has unexpectedly terminated.

**System action:** JES3 marks the DLOG function inactive.

**Operator response:** Restart DLOG processing using the "F O,DLOG=ON" command, then notify the system programmer.

**System programmer response:** Determine the cause of the JES3DLOG address space failure.

---

**Explanation:**

An error return has occurred from an AWRITE or an ADEBLOCK macro instruction.

**System action:** Normal processing continues.

**Operator response:** None. This is an informational message.

Routing Code: 8  Descriptor Code: –

IAT7130

Explanation:

The named command was rejected for one of the following reasons:

**ALL INVALID ON REPLY**
This command cannot be used to respond to write-to-operator-with-reply (WTOR) requests.

**JES INIT INCOMPLETE**
The command was received before JES3 initialization was complete.

**VERB UNRECOGNIZED**
The command was not recognized.

**text TOO LONG**
The cited text exceeded the allowable number of characters.

**MUST REF DEVICE/JOB#**
A DSP was referenced by name while more than one copy was active. The reference must be made by device name, device number, or job number.

**devname NOT IN USE**
The named device does not exist or is not currently allocated.

**dspname NOT LOGGED**
The named DSP was not logged into console service.

**REFUSED BY dspname**
The message could not be accepted by the cited DSP.

**INVALID FOR IC**
The command is not recognized by the IC DSP.

**con PREV SWTCH**
A *SWITCH command could not be implemented because the cited RJP console was already switched.

**con NOT SWTCHD**
A *SWITCH restore command was ignored because the console was not previously switched.

**con NOT FOUND**
The named console does not exist.

**dspname ABENDED**
A DSP message appendage routine was abended.

**UNAUTHORIZED REQUEST**
The command is not authorized from the requesting console, or the JES3 command issued is not valid on local processors.

**NO INPUT BUFFER AVAIL**
A DSP requested the queueing of a command or reply, but there are no buffers available.

**NOT KNOWN TO JES3**
The command that was issued can only be issued from a JES3 RJP console.

**INVALID PARAMETER**
An incorrect parameter was specified on the *DUMP or *RETURN command.

**JES3 NOT ACTIVE**
A JES3 command was entered on an MCS console before the START JES3 command was issued.

**JES3 NOT INITIALIZED**
A JES3 command was entered on an MCS console before JES3 completed its initialization processing.

**INVALID PASSWORD**
An incorrect password was specified on a *DUMP or *RETURN command.

**NOT VALID ON LOCAL OR GLOBAL IS NOT AVAILABLE**
Either a command was directed to a local processor which can only be processed on the global, or a command for the global was entered while JES3 on the global was not available.

**INVALID COMMAND**
The command contains a syntax error.

**CONSOLE NOT AlLOCATED**
A *SWITCH command was rejected because the receiving console was not active.

**DDR IS ACTIVE**
A *RETURN command was issued to end JES3 but the command was rejected because dynamic device reconfiguration (DDR) was active. When DDR is active, you cannot end JES3 without affecting MVS as well.

**WTR FSS/FSA INACTIVE**
The message was not accepted by the WTR DSP because the associated FSS or FSA was not active when the command was entered.

**DEVICE NOT YET ACTIVE**
The message was not accepted by the WTR DSP because the device was not yet initialized when the command was entered.

**PREV WTR CMD ACTIVE**
The message was not accepted by the WTR DSP because previous command processing had not completed.
IAT7130

WTR SETUP IN PROGRESS
The message was not accepted by the WTR DSP because the device setup (operator intervention) was initiated but message IAT7030 was not yet displayed.

INVALID DESTINATION
A *MESSAGE command could not be honored because the destination was incorrect.

NJECONS NOT ACTIVE
A *SEND or *MESSAGE command was issued to a networking destination but was rejected because console communication has not been established with the other node.

QUALIFIER TOO LONG
A *MESSAGE or *SEND command was rejected because the qualifier exceeded the allowable number of characters.

NO TEXT SPECIFIED
A *MESSAGE or *SEND command was rejected because there was no text specified.

INVALID QUALIFIER
A *MESSAGE or *SEND command was rejected because the qualifier was incorrect.

AMBIGUOUS DEV NUMBER
This message is issued in response to an *S, *R, or *C command that specified an ambiguous device number. Issue an *INQUIRY,D,D=devnum command to obtain the unique identifier (JNAME) for the required device.

NO FSS DEFINED
FSS= was specified on a *RETURN command, but no FSS has been defined to JES3.

INVALID FSS NAME [LIST]
An incorrect combination of parameters was specified with the FSS= keyword on a *RETURN command.

fssname NOT FOUND
FSS= was specified on a *RETURN command, but the named FSS could not be located.

fssname NOT ACTIVE
FSS= was specified on a *RETURN command, but the named FSS is inactive.

operand INVALID
The indicated operand is incorrect.

INVALID LENGTH
A JES3 command was entered containing too many characters. JES3 will only accept a command of 80 characters or less for most commands. See z/OS JES3 Commands for information about those commands that support greater than 80 character length.

TRACE ID IS MISSING
You did not select any JES3 GTF trace records when you issued the *TRACE,ON command. GTF records are selected by specifying a function id on the *TRACE command. See z/OS JES3 Diagnosis for the syntax of the *TRACE command.

TRACE COMMAND FAILURE
The trace command failed.

CLEAR PRT IN PROGRESS
The requested device is undergoing clear print processing.

RJP OPERAND NOT VALID
The command was issued from a remote (RJP) workstation. During default command authorization checking, JES3 determined that either an operand and/or parameter is missing (for example, JES3 detected too many spaces), or the specified device and/or job is not associated with this remote (RJP) workstation.

DEVICE IN USE
The device specified in the command is already allocated to another MVS component.

MCS SERVICE REQ ERROR
The device specified in the command could not be obtained or released because of an MCS service request error.

ALLOC ERR,RC=return code,E=error code
The device specified in the command could not be obtained because of a dynamic allocation error described by the given return code and error code.

MCS REQ && UNALLOC ERR
The device specified in the command could not be obtained because of an MCS service request error and also cannot be released because of a dynamic unallocation error.

UNALLOC ERR,RC=return code
The device specified in the command could not be released because of a dynamic unallocation error as described by the given return code.

CONSOLE NOT ACTIVE
The console specified on the *MESSAGE command is not active.

CANCELLED BY OPERATOR
An *FAIL command was issued for an FCT name and there is more than one FCT with the given name. When JES3 requested the operator to choose from a list of FCTs with the given name, the operator replied NONE.

FCT NO LONGER ACTIVE
An *FAIL command was issued for an FCT name for which multiple FCTs exist. JES3 requested the operator to choose from a list, but the selected FCT ended.

SOCKET OR NODE REQD
A *S,TCP command was issued but did not specify either the SOCKET=socket or NODE=node parameter. One of these is required.
SOCKET REQUIRED
A *C,TCP command was issued but did not specify the SOCKET=socket parameter. This parameter is required.

NODE NOT TCP/IP
A *S,TCP,NODE=node command was issued but the specified node is not defined with TYPE=TCP/IP.

NO ELIGIBLE SOCKET
A "S,TCP,NODE=node" command was entered but rejected, because there is no socket eligible to start a session with the requested node. To make the socket eligible, all of the following requirements must be met:
- The socket is defined with NODE=, which specifies the requested node.
- The Netserv that the socket runs under is active.
- The socket is not active.

EXTRANEOUS CHARACTERS
A command was issued with extraneous characters.

ALL SOCKET(S) ACTIVE
A "S,TCP,NODE=node" command was entered but rejected, because all sockets defined for the node are currently active.

NO SOCKET(S) DEFINED
A "S,TCP,NODE=node" command was entered but rejected, because there is no socket defined to start a session with the requested node. A socket must be defined by using the "F SOCKET,ADD=" command.

NODE NOT ACTIVE
The node specified on a *C TCP,NODE= command has no active sockets.

System action: The command is ignored.
Operator response: Correct the error, and reissue the command. If NJECONS NOT ACTIVE was indicated, issue the *CALL,NJECONS command to establish communication with the other nodes in your network.

**Routing Code:** Note 17  **Descriptor Code:** 7

---

**IAT7145**

**Explanation:**

- NJECONS HAS ABENDED. COMMAND/MESSAGE DISCARDED
- DISCARDED ALL COMMANDS/MESSAGES LOST.

While processing a nodal message record (NMR), networking encountered an error that caused the NJECONS DSP to abend. COMMAND/MESSAGE DISCARDED indicates the NJECONS DSP was able to recover from the error and the NMR was discarded. Networking will continue to process any NMRs. ALL COMMANDS/MESSAGES LOST indicates the NJECONS DSP was unable to recover from the error and the DSP must end.

**System action:** If COMMAND/MESSAGE DISCARDED appears in the message, the NJECONS DSP will continue to process any commands and messages that the network must process. If ALL COMMANDS/MESSAGES LOST appears in the message, the network will not process any commands or messages. JES3 processing continues.

**Operator response:** If ALL COMMANDS/MESSAGES LOST appears in the message, issue a *CALL NJECONS to restart a NJECONS DSP so that commands and messages can be processed at your node. Contact the system programmer.

**System programmer response:** Use the abend code and [z/OS JES3 Diagnosis](z/OS JES3 Diagnosis) to determine the error.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7
IAT7150
Explanation:

A message was sent to this console from another console in the system using the *MESSAGE command. The sending console's name con precedes the message text. The console name can be one of the following:

- con when the message is issued from an MCS console.
- jname when the message is issued from a JES3 remote console.
- NETWORK when the message is issued from a network operator at another node.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18 Descriptor Code: 7

IAT7151
Explanation:

An *FAIL,fctname command was issued, but the FCT is not unique. JES3 requires you to specify which one to fail.

In the message text:

FCTNAME The name of the FCT that the operator requested to fail.

System action: JES3 issues IAT7152 for each FCT with the given name, then JES3 issues IAT7153 and waits for you to select an FCT from the list.

Operator response: See messages IAT7152 and IAT7153.

Module:

Routing Code: 1 Descriptor Code: 7

IAT7152
Explanation:

This message displays information about an FCT that was specified on the *FAIL,fctname command, along with a selection number that can be used to select the FCT in reply to message IAT7153.

In the message text:

- seleno The selection number. The header contains the text SLENO.
- fctaddr The address in storage of the FCT. The header contains the text FCT ADDR.
- awrc A reason code indicating why the FCT is waiting. The header contains the text AWRC.
- awrtex The text associated with the AWAIT reason code. The header contains the text AWAIT REASON TEXT. See z/OS JES3 Diagnosis Reference for a list of different AWAIT reason codes and associated text.

System action: JES3 processing continues. JES3 issues message IAT7153 next.

Operator response: Using the selection number displayed for each FCT, determine the reply to IAT7153.

Module:

Routing Code: 1 Descriptor Code: 7

IAT7153
Explanation:

All FCTs with the name specified in the *FAIL,fctname command have been displayed and JES3 is requesting a selection of which one to fail.

System action: JES3 waits for a response. No other commands can be issued at this point, but all JES3 processing that does not require commands to be entered continues.

Operator response: Reply with a selection number (as shown in the IAT7152 messages). To display the IAT7152 messages again, reply LIST. If you do not want to fail any of the FCTs listed, reply NONE.
IAT7154 • IAT7181

Explanation:

\[ *INCORRECT \jobname \netid \] \COMP CODE \text

\[ IN THE WTO TEXT \text \]

During step ended on an JESDJC WTO for a dependent job control (DJC) job, module IATCNSV found that the job name, net identifier, or the completion code was incorrect.

System action: The system ignores the request and continues processing.

Operator response: Notify the system programmer.

Module:

Routing Code: Note 19   Descriptor Code: –
Chapter 17. Dump Job (DJ) Messages

IAT7200
Explanation:

As a result of either a *CANCEL command or an internal error, the indicated dump job DSP is ending. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number, and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a tape device number. If an internal error occurred, a diagnostic message preceded this message.

System action: The indicated dump job DSP cleans up and ends.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18 Descriptor Code: 7

IAT7202
Explanation:

The dump job DSP has detected a syntax error in the operator command that was just entered. err indicates the parameter on the command that JES3 was processing when the error occurred. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a tape device number.

System action: If the command was *CALL, the indicated dump job DSP issues message IAT7200 and ends. If the command was *START, the dump job DSP waits for the command to be entered again.

Operator response: Correct and reenter the command.

Module:

Routing Code: Note 18 Descriptor Code: 7

IAT7203
Explanation:

System action: JES3 Dump Job processing continues.

Operator response: Notify the system programmer.

System programmer response: If you have not made plans to increase the job number range beyond 65,534, no immediate action is needed. If you make plans to increase the job number range, you must either wait for this net to complete or cancel it. If you increase the job number range beyond 65,534 while the net is still in the system, and any job within the net is resubmitted and assigned a job number greater than 65,534, the job will fail with message IAT6179.

Module:

Routing Code: Note 18 Descriptor Code: 7
The indicated operand is not valid for the command and the processing mode for which it was submitted. DJdevnum (jobid) indicate the dump job DSP that issued the message, where devnum is the tape unit number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a tape device number.

**System action:** If the command was *CALL, the indicated dump job DSP issues message IAT7200 and ends. If the command was *START, the dump job DSP waits for the command to be entered again.

**Operator response:** Correct the operand and reenter the command.

**IAT7204**

**Explanation:**

- DJdevnum (jobid):
- INVALID "NAV" PARAMETER;
- DSP DEFAULT— ( --- NAV— X— )— USED

The parameter of the NAV operand of the *CALL command was something other than C or R. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

**System action:** The NAV default assembled into the JES3 DSP dictionary for the dump job DSP is used in place of the unrecognized parameter.

**Operator response:** If the default NAV option is unacceptable, cancel the DSP and call it again with either NAV=C or NAV=R.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT7205**

**Explanation:**

- DJdevnum (jobid):— EXACTLY ONE OF "IN",—
- "OUT" MUST BE SPECIFIED

The *CALL command contained both or neither of the operands IN and OUT. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

**System action:** The dump job DSP issues message IAT7200 and ends.

**Operator response:** Issue the *CALL command for the dump job DSP again, specifying one and only one processing mode.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJOB</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT7206**

**Explanation:**

- devnum (jobid):— DJ— TAPE REQUEST—
- INCORRECTLY SPECIFIED

For nonserver mode requests (SERVER=NO was specified on the *CALL command), the GETUNIT macro issued for the device specified in the processing mode operand of the *CALL command took the error return or did not return a tape device. Or the DEN= parameter specified a density that is incorrect for the type of tape specified.

For server mode requests (SERVER=YES was specified on the *CALL command), the dynamic allocation for the device failed because the device is not valid or is not available. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape device has not yet been allocated, then the characters ### are displayed instead of a device number.

**System action:** The dump job DSP issues message IAT7200 and ends.

**Operator response:** Issue the *CALL command for the DJ DSP again, specifying a valid tape device with a density valid for the input or output device.

**Module:**
IAT7207

Explanation:

The GETUNIT macro issued for the device specified in the processing mode operand of the *CALL command took the NAVAIL return. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

System action: The dump job DSP examines the DSP NAV option, and either ends or is rescheduled when the device becomes available, depending on the option. This message is followed by message IAT7200 or message IAT7208.

Operator response: Either issue the *CALL command for the DJ DSP again, specifying a different tape drive, or wait until the required device is available.

Module:

IAT7208

Explanation:

The requested tape drive was unavailable, and the DSP NAV option was R. This message is preceded by message IAT7207.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

System action: JES3 places the dump job DSP in specialized rescheduling, with the requested tape drive as its only requirement.

Operator response: Wait until the dump job DSP is assigned its required tape drive (announced by the LOGIN message), and continue.

Module:
IAT7211

Explanation:

No parameter specified for operand.  One was expected to be entered.

The indicated operand does not have a default parameter; one was expected to be entered.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 requesting a new **START** command or a **CANCEL** command, and then waits for a command to be entered.

**Operator response:** Determine an appropriate parameter for this operand, and enter the **START** command again.

**Module:**

IAT7212

Explanation:

No job selection operand specified.

The **START** command contained no acceptable job selection operand.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 requesting a new **START** command or a **CANCEL** command, and then waits for a command to be entered.

**Operator response:** Re-enter the **START** command with a valid job selection operand.

**Module:**

IAT7213

Explanation:

No job selection operand specified.

This is the dump job DSP LOGIN message.  A dump job DSP has been successfully invoked and has obtained the necessary tape drive and storage buffers.

**System action:** The dump job DSP issues message IAT7214 requesting a tape be mounted and then waits for a **START** command to be entered.

**Operator response:** Enter a **START** command to define the job range the dump job DSP is to process.

**Module:**

IAT7214

Explanation:

A tape must be mounted on unit dev for dump job DSP input or output processing.

**System action:** The dump job DSP waits for a **START** command to be entered once the tape has been mounted and readied.

**Operator response:** Mount and ready a tape for dump job's use on the specified tape device and enter a **START** command.
IAT7215
Explanation:

WRITE RING REQUIRED IN TAPE ON UNIT dev

A tape has been mounted for output mode processing but the tape needs a write ring before processing can continue.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP rewinds and unloads the tape and waits for it to be mounted again.

Operator response: Insert a write ring in the tape volume on specified device, and mount the volume on the device.

IAT7216
Explanation:

UNACCEPTABLE COMMAND ENTERED dev

An operator command other than *START or *CANCEL has been entered.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP waits for a new command.

Operator response: Enter either a *START or *CANCEL command.

IAT7217
Explanation:

INSUFFICIENT STORAGE AVAILABLE FOR DJ PROCESSING

The dump job dynamic support program (DSP) could not obtain enough storage for its tape I/O buffers.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues message IAT7200 and ends.

Operator response: Enter a *CALL command for the dump job DSP later, when the system load on JES3 has been reduced.

IAT7218
Explanation:

READY UNIT dev, OR ISSUE '*START' OR '*CANCEL'

The dump job DSP has detected that intervention is required for the specified device.

System action: The system waits for the operator to ready the device or issue either the *START or *CANCEL command.

Operator response: Ready the device, or issue a *START command to continue processing, or issue a *CANCEL command to end the dump job DSP.

IAT7219
Explanation:
IAT7220 - IAT7222

The dump job DSP issued an ALOAD macro request for the indicated module and the request failed. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not been allocated, then the characters ### are displayed instead of a device number.

System action: The dump job DSP ends.

Operator response: Notify your system programmer.

Programmer response: Verify that the module is present in one of the following:
- The STEPLIB concatenation defined in the JES3 procedure.
- The linklist specified in response to message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zz.

Problem determination: See Table I, items 2, 7c, and 13; Table III, items 4, 5, 6, 20, and 21.

Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7220

Explanation:

The current DJ request has successfully or abnormally completed. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: JES3 also issues message IAT7228 and the dump job DSP waits for a *START or *CANCEL command.

Operator response: Enter a *CANCEL command to end the dump job DSP or a *START command to continue processing.

Module:

Routing Code: Note 13
Descriptor Code: 7

IAT7222

Explanation:

An uncorrectable tape I/O error has been detected by the dump job DSP on the indicated device. DJdevnum jobno indicates the dump job DSP that issued the message, where devnum is the tape device number and jobno is the job number assigned to the DSP.

System action: The dump job DSP stops processing of the current dump job request and issues messages IAT7220 and IAT7228 to request a new *START or *CANCEL command.

Operator response: Notify the system programmer. Enter a *CANCEL command to end the dump job DSP or a *START command to continue processing.

Programmer response: Scan the SYS1.LOGREC entries to determine the type of I/O error encountered on the tape unit. If the LOGREC entries indicate the error occurs repeatedly for the tape unit, the error is a permanent I/O error. Contact IBM for hardware support.

Problem determination: See Table I, items 18 and 30.

Module:
IAT7223

Explanation:

The indicated tape must be mounted on unit dev to process multiple volume DJ files. This message is preceded by message IAT7222, indicating that processing is suspended until a new tape is mounted. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP waits for a tape to be mounted on the specified drive. Once a tape is mounted, the dump job DSP resumes dumping the job that it was processing at the time it detected end-of-volume.

Operator response: Mount another tape for DJ output on device dev.

Module:

IAT7224

Explanation:

The indicated job is within the job range specified on the *START command, but since it is a member of a DJC network, the job cannot be dumped by itself. To dump the job, the entire DJC network must be dumped. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP bypasses dumping the indicated job and continues processing if more jobs need to be dumped based on the specified job selection criteria.

Operator response: If the job must be dumped, wait for the current dump request to complete. Then, place the network in DJC network hold, and enter the

IAT7225

Explanation:

The dump job DSP requires that a password be entered; either the password was incorrectly specified or was not specified at all on the *CALL command. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device address.

System action: The dump job DSP issues message IAT7200 and then ends.

Operator response: Verify the DJ password, and enter the *CALL command again, specifying the correct password.

Module:

IAT7226

Explanation:

When DJ examined the scheduler elements of the indicated job to determine what phase of processing the job was in, DJ detected that the job is currently scheduled for processing under the indicated DSP. Therefore, the job cannot be dumped at this time. The job can be dumped after it completes MAIN processing. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP bypasses
dumping the indicated job and continues processing if there are more jobs that need to be dumped based on the specified job selection criteria.

**Operator response:** If the job is to be dumped at the end of its currently active phase, place the job in operator hold to prevent the job from being scheduled for further processing (see [z/OS JES3 Commands](#)). Once the current dump request is complete and messages IAT7220 and IAT7228 are issued, enter the *START,DJdev,J=jobno command to try to dump the job again.

**Module:**

**Routing Code:** Note 18  
**Descriptor Code:** 7

---

**IAT7227**

**Explanation:**

- **DJdev (jobid):** SUCCESSFULLY DUMPED
- **FOR JOB— jobname (jobid)
- [NET— djcnet]

The indicated job number that was specified on the J= operand of the *START command is not in the system. **DJdev (jobid)** indicates the dump job DSP that issued the message, where **dev** is the tape device number and **jobid** identifies the DSP.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 and waits for either a *CANCEL command to end the dump job DSP or a *START command to continue processing.

**Operator response:** Check the job number of the job you intended to dump and try again.

**Module:**

**Routing Code:** Note 18  
**Descriptor Code:** 7

---

**IAT7228**

**Explanation:**

For job— jobname (jobid)

The dump job DSP is ready to accept a *START or *CANCEL command. In the message text:

- **jobid** The job identifier of the DSP that issued the message.
- **dev** The tape device number.

**System action:** Processing continues with the next job in the specified job range.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18  
**Descriptor Code:** 7

---

**IAT7230**

**Explanation:**

- **DJdev (jobid):** SUCCESSFULLY DUMPED
- **DUMP PROCESSING COMPLETE FOR**
DJ successfully completed dump processing for the indicated category of jobs. All jobs in the indicated category that could possibly be dumped were dumped. However, there may have been some jobs that could not be dumped successfully. See the DJ message log for a list of which jobs were successfully dumped and which ones were not.

**System action:** Processing continues if the category of jobs is only a subset of the job range that was specified by the current *START command request. Otherwise, messages IAT7220 and IAT7228 are issued to ask for a new *START command or a *CANCEL command.

**Operator response:** When messages IAT7220 and IAT7228 are issued, either specify a *CANCEL command to end the DSP, or enter a new *START command.

**Module:**

<table>
<thead>
<tr>

**Descriptor Code:** 7

---

IAT7231

**Explanation:**

| ►►— DJdev (jobid):— JOB jobname (jobid)►► |
|◄— DUMP PROCESSING ABORTED FOR◄— |

Due to either an error or a *CANCEL command, DJ output processing was ended before normal completion of the indicated category of jobs. If the job ended because of an error, this message will be preceded by a diagnostic message.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and either jobno or jobid identifies the DSP.

**System action:** If processing was ended prematurely by a *CANCEL command, the dump job DSP ends.

If processing was ended prematurely by an error and the indicated category of jobs is only a subset of the jobs specified by the current *START request, DJ will attempt to continue. For example, if the current *START request was a JOBS request and processing was canceled for priority level 14 jobs, DJ will attempt to continue dumping jobs in the next priority level (for example, priority 13). If processing cannot be continued because of the severity of the error, DJ ends the current *START request and issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

When processing of a specific job is canceled because of an error, DJ will always attempt to backspace over any records for the job that had been written to tape before the error.

**Operator response:** If messages IAT7220 and IAT7228 are issued, either specify a *CANCEL command to end the DSP, or enter a new *START command.

**Module:**

<table>

Routing Code: Note 18  Descriptor Code: 7

---

**IAT7233**

**Explanation:**

\[\text{<<< DJdev (jobid): DSN=---} \]

\[\text{IS NOT ALLOWED WITH SERVER=NO} \]

The DSN= parameter is not allowed to be specified with SERVER=NO on the *CALL,DJ command.

**DJdev (jobno)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters #### are displayed instead of a device number.

**System action:** The dump job DSP issues message IAT7200 and ends.

**Operator response:** Issue the *CALL,DJ command with correct syntax.

---

**IAT7235**

**Explanation:**

\[\text{<<< DJdev (jobid):} \]

\[\text{ERROR DETECTED} \]

DJ received an error return code from the JES3 spool access method (JSAM) when attempting to read, write, or release a spool buffer. DMxxx is the JES3 dump code associated with the error.

**DJdev (jobid)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** If a job was being dumped when the error occurred, DJ ends processing of the job and issues messages IAT7231 to identify the job that failed. DJ backspaces over any data written to tape for the job. Additionally, if the job is a member of a DJC network, DJ ends processing for the entire network and issues message IAT7231 a second time to identify the network that failed. In this case, DJ does not backspace over the network jobs that were written to tape before the error. Thus, a partial dump of the network may exist on the tape.

If possible, DJ attempts to continue dumping other jobs/networks that meet the selection criteria specified on the current *START request. If DJ cannot continue, DJ ends the current *START request and issues messages IAT7220 and IAT7228 to request a new *START command or a *CANCEL command.

**Operator response:** Notify your system programmer.

If messages IAT7220 and IAT7228 were issued, enter a *CANCEL command to end the dump job DSP or a new *START command request to continue processing.

**Programmer response:** See [z/OS JES3 Diagnosis](https://www.ibm.com) for a description of the indicated DMxxx code and the appropriate action to be taken.

**Problem determination:** See Table I, items 18 and 30, Table III, item 4.
DATA LENGTH MISMATCH
the data length in the header does not match the length that was actually read.

INCORRECT REEL NUMBER
the reel number in the header is not the tape reel number that was expected.

JOB NUMBER MISMATCH
the job number in the header is not the job number that was expected.

RECORD OUT OF SEQUENCE
the record number in the header is not the record number that was expected.

DJdev (jobid) indicates the jump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: If the input is at the wrong release level or contains the wrong level of data, the dump job DSP ends. In all other cases, the dump job DSP ends only the job that was being processed andspaces forward to the next file to continue processing the next job in the specified job range.

Operator response: Notify the system programmer.

Programmer response: Enter the *CALL,TD command to invoke the TD DSP. Then enter the *START,TD,...,M=H command to dump the erroneous tape file. Examine the 80-byte record header for the indicated problem.

Problem determination: See Table I, item 29, and Table III, item 4.

Explanation:

The dump job server processing failed, or the operator canceled the dump job server address space through an MVS cancel command or the *CANCEL,DJ command.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters #### are displayed instead of a device number.

System action: The dump job DSP issues message IAT7200 and ends.

Operator response: If the dump job server address space ended because of an error, notify the system programmer.

Programmer response: If the dump job server address space ended because of an error, examine the error messages that were generated to determine the cause of the error. If a dump was taken, examine the dump to determine the cause of the error and contact the IBM Support Center.

Module:

IATDJSV   IATDJSV   IATDJSV

Routing Code: Note 18  Descriptor Code: –

IAT7238

Explanation:

The dump job DSP has detected that intervention is required for the specified device. This message is issued when the dump job DSP is running in server mode (that is, SERVER=YES was specified on the *CALL,DJ command).

System action: The system waits for the operator to ready the device and issue a *START command or for the operator to issue a *CANCEL command.

Operator response: Ready the device and issue a *START command to continue processing or issue a *CANCEL command to end the dump job DSP.

Module:

IAT7243

Explanation:

- DJdev (jobid):

- NO JOBS OF PRIORITY— jobname

- LEVEL— prty— FOUND

In response to a *START,DJdev,P= command, no jobs of the specified priority level could be found on the tape. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a *START or *CANCEL command.

Operator response: Either specify a different job range, or cancel the dump job DSP.

Module:

IATDJD T IATDJ IN IATDJD T

Routing Code: Note 18  Descriptor Code: 7

IAT7246

Explanation:

- DJdev (jobid):— JOB NETWORK— djnet

- NOT FOUND

Jobs belonging to the network specified in a *START,DJdev,N= command could not be located on the input tape. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a new *START command or *CANCEL command.

Operator response: Issue a *START command to continue processing or a *CANCEL command to end DJ processing.

Module:

IATDJD T IATDJ IN IATDJD T

Routing Code: Note 18  Descriptor Code: 7

IAT7248

Explanation:

- DJdev (jobid):— END-OF-TAPE WHILE READING— djnet

- END OF TAPE WHILE READING

The end of the DJ tape was encountered while scanning for more jobs of the specified network. Since no more jobs were found before end-of-tape, DJ considers restoration of the network to be complete. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a new *START command or *CANCEL command to be entered.

Operator response: Issue a *START command to continue or a *CANCEL command to end DJ processing.

Module:
IAT7249 • IAT7252

IAT7249

Explanation:

The JES3 buffer size of the system which created the input tape is different from the buffer size of the current JES3 system. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the job DSP.

System action: If the inequality is less than (<), the dump job DSP issues message IAT7250 and then ends the *START request currently being processed. If the inequality is greater than (>), the dump job DSP continues processing after issuing a warning message, IAT7251.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18   Descriptor Code: 7

IAT7251

Explanation:

The current JES3 buffer size is larger than that of the JES3 system which created the input tape. This message is preceded by message IAT7249. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18   Descriptor Code: 7

IAT7252

Explanation:

The indicated job is within the range of jobs to be dumped, but the job cannot be dumped because DJ does not support dumping called DSPs. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape unit address and jobid identifies the DSP.

System action: The dump job DSP bypasses dumping the job and continues processing if there are

Issue a *START command to continue processing or a *CANCEL command to end DJ processing.

Programmer response: If it is necessary to restore the jobs from the input tape to the current JES3 system, the buffer size of the current JES3 system will have to be changed so it is equal to or larger than the buffer size that was used to create the tape. This will require a cold start.

Module:
more jobs to be dumped based on the job selection criteria that was specified.

Operator response: None. This is an informational message.

---

**IAT7265**

**Explanation:**

- **DJdev (jobid):**— **END-OF-TAPE WHILE READING JOB CLASS**

The end of the DJ tape was encountered while scanning the tape for more jobs in the specified job class.
IAT7266 • IAT7269

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP ends restoring of jobs in the specified job class and issues messages IAT7220 and IAT7228 to prompt for a new *START command or *CANCEL command to be entered.

Operator response: Issue a *START command to continue processing or a *CANCEL command to end DJ processing.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7266

Explanation:

This message is issued in response to a *START,DJdev,N=djnet command when the specified dependent job control (DJC) network djnet was found on tape but could not be restored because it already exists in the JES3 system.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a *START or *CANCEL command to be entered.

Operator response: Wait until the current network ends, then reissue the *START command to restore the desired DJC network.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7269

Explanation:

A tape error, spool error, translation error, or *CANCEL command occurred while dumping the network control blocks for the indicated DJC network. In the case of a tape, spool, or translation error, this message is preceded by a diagnostic message indicating the specific nature of the error.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: In the case of a tape, spool, or translation error, the dump job DSP attempts to backspace over any data for the indicated DJC network that was written to tape before the error. The dump job DSP ends dump processing for the indicated DJC network and continues processing if there are more DJC networks or jobs that need to be dumped. Based on the selection criteria specified on the current *START command request.

Operator response: Notify the system programmer.

Problem determination: See Chapter 30, “Problem Determination,” on page 711, Table I, item 18, and Table III, item 4.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7267

Explanation:

A tape error, spool error, translation error, or *CANCEL command occurred while dumping the network control blocks for the indicated DJC network. In the case of a tape, spool, or translation error, this message is preceded by a diagnostic message indicating the specific nature of the error.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: In the case of a tape, spool, or translation error, the dump job DSP attempts to backspace over any data for the indicated DJC network that was written to tape before the error. The dump job DSP ends dump processing for the indicated DJC network and continues processing if there are more DJC networks or jobs that need to be dumped. Based on the selection criteria specified on the current *START command request.

Operator response: Notify the system programmer.

**Explanation:**

➤— D Jdev (jobid):— J O B— J o b n a m e (j o b i d) —
➤— O F N E T — d j n e t — N O T D U M P E D — H A S C O M P L E T E D D J C N E T —

The indicated job has completed processing and is no longer marked as a DJC network job. Although the job may still exist on the JES3 job queue, it is no longer considered to be a part of the DJC network. Therefore, the job is not dumped with the network.

**DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.**

**System action:** Processing continues with the next member of the network.

**Operator response:** If the indicated job is still on the JES3 job queue and you want to dump it, wait for the current DJ *START command request to complete. Issue a *START,DJdev,J=jobno command to dump the job.

---

**IAT7272**

**Explanation:**

➤— D Jdev (jobid):— O UTDS N =
➤— J E S 3 . D J . D — y y y y d d d — T — h h m m ss —

After the dump job server address space has successfully initialized, dump job issues this message to indicate that it is ready to begin dumping jobs to tape. The name specified for OUTDSN= must be specified on the *CALL,DJ command when you restore the jobs from tape.

**System action:** This message is issued to indicate that dump job is ready to begin dumping jobs to tape.

**Operator response:** Issue the *CALL,DJ command using the name indicated in OUTDSN= to begin dumping jobs to tape.

---

**IAT7273**

**Explanation:**

➤— D Jdev (jobid):— E R R O R D U M P I N G D A T A S E T
➤— d sn, — C O N T I N U I N G

During dump job processing, a permanent I/O error occurred while dumping the indicated data set from spool to tape. The data set is a five-part identifier that consists of nodename, userid, jobid, dsnumber, and dsid.

**DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the job DSP.**

**System action:** The dump job DSP skips dumping any more of the data set, if any, beyond what it has
already dumped and continues with the next data set of
the job.

Operator response: Notify the system programmer.

Programmer response: See Chapter 30, “Problem
Determination,” on page 711.

Problem determination: See Chapter 30, “Problem
Determination,” on page 711, Table I, item 18, and Table
III, item 4.

</table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**Explanation:**

**IAT7280**

Due to either an error or a *CANCEL command, restore processing of jobs in the indicated category has ended before normal completion. If an error caused the job to end, this message will be preceded by a diagnostic message. 

**System action:** If processing was ended prematurely by a *CANCEL command, the dump job DSP ends.

If processing ended prematurely by an error and the indicated category of jobs is only a subset of the jobs specified by the current *START request, DJ will attempt
to continue. For example, if the current *START request
was a JOBS request and processing was canceled for a
single non-DJC job, DJ attempts to continue restoring
the next possible non-DJC job from the tape.

If processing cannot be continued because of the
severity of the error, the dump job DSP ends the current
*START request and issues messages IAT7220 and
IAT7228 to prompt for a new *START command or a
*CANCEL command.

Operator response: Depending on the nature of the
abnormal job end, either cancel the dump job DSP with
a *CANCEL command, or reenter the *START
command with a new request.

Module:

Explanation:

➤— DDjdev (jobid) jobno jobid  
➤— : RESTORE PROCESSING COMPLETE FOR

JOB RANGE— (jobid1-jobid2) 
  □ JOBCLASS— cls  
  □ NET— djnet  
  □ PRIORITY LEVEL— prty  
  □ JOBS REQUEST  
  □ NETS REQUEST  
  □ ALL REQUEST

DJ successfully completed restore processing for the
indicated category of jobs. All jobs in the indicated
category that could possibly be restored in the system
are restored. However, there may have been some jobs
that could not be restored. See the DJ message log
data set.

When restoring jobs by job class or by priority level, DJ
restores only the jobs in the specified job class that are
grouped together in sequential order on the tape.
If all the jobs in the given job class or priority level are
to be restored, reissue the *START command, using the
OLD parameter.

DDjdev (jobno|jobid) indicates the dump job DSP that
issued the message, where dev is the tape device number and
jobid identifies the DSP.

System action: The dump job DSP issues messages
IAT7220 and IAT7228 to prompt for another *START
command or a *CANCEL command to be entered.

Operator response: Reissue a *START command
with another request or a *CANCEL command to end
the dump job DSP.

Module:

IAT7283
Explanation:

➤— DDjdev (jobid):— NO DJC NETWORKS FOUND

In response to a *START,DDjdev,NETS request to
retrieve all DJC networks, no DJC networks were found.

DDjdev (jobid) indicates the dump job DSP that
issued the message, where dev is the tape device number and
jobid identifies the DSP.

System action: The dump job DSP issues messages
IAT7220 and IAT7228 to prompt for another *START
command or a *CANCEL command to be entered.

Operator response: Reissue a *START command
with another request or a *CANCEL command to end
the dump job DSP.

Module:
Routing Code: Note 18  Descriptor Code: 7

IAT7285

Explanation:

- DJdev (jobid):

OLD IS NOT ALLOWED WITH SERVER=NO

NAV=C FORCED FOR SERVER=YES

VOL= IGNORED FOR OUT=, SERVER=NO

VOL= REQUIRED FOR OUT=, SERVER=YES.

This message is issued when there is a syntax error in the "CALL,DJ" command for SERVER=YES request. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters #### are displayed instead of a device number.

System action: The dump job DSP ignores the incorrect parameter and continues processing if IAT7285 contains the following:

- NAV=C FORCED FOR SERVER=YES
- DSN= IGNORED FOR OUT=, SERVER=YES
- VOL= REQUIRED FOR OUT=, SERVER=YES.

Otherwise, the dump job DSP issues message IAT7200 and ends.

Operator response: If the dump job DSP ended, issue the "CALL,DJ" command with correct syntax.

Module:

- Containing: IATDJDT
- Detecting: IATDJOT
- Issuing: IATDJDT

Routing Code: Note 18  Descriptor Code: 7

IAT7288

Explanation:

- DJdev (jobid):

TRANSLATION ERROR – error text

DJ was invoked with the TRANS=YES parameter specified on the DJ "CALL" command. While translating a control block for a job or a DJC network, an error was detected as indicated by the error text. The error text is:

DSP dsname UNDEFINED IN TARGET RELEASE

While translating the JCT or JDAB for a job, DJ translation processing detected a scheduler element that could not be translated. The DSP associated with the scheduler element is not defined in the DSP dictionary in the target release.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: If DJ was invoked for input processing, the dump ob DSP ends restore processing for the job or DJC network and then issues message IAT7280 indicating that the job or DJC network could not be restored. In the case of a job, the dump job DSP purges any data written to spool. The dump job DSP then continues restore processing if there are more jobs or DJC networks that need to be restored based on the selection criteria specified on the current "START" request.

If DJ was invoked for output processing, the dump job DSP ends dump processing for a job or DJC network and then issues message IAT7231 indicating that the job or DJC network could not be dumped. In the case of a job, the dump job DSP backspaces over any data written to tape. The dump job DSP then continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current "START" request.

Chapter 17. Dump Job (DJ) Messages 449
Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7289

Explanation:

- DJdev (jobid):

- *CALL REJECTED, RESET IS BEING DONE

- BY ANOTHER DJ DSP

A dump job DSP that was previously invoked for output processing is currently doing a RESET operation. During a RESET, no other DJs may be invoked for output processing. Since the *CALL command that was entered specified OUT= it was rejected.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated then the characters ### appear instead of a device number in the message text.

System action: The called dump job DSP ends.

Operator response: Wait for the current RESET operation to complete. Then re-enter the *CALL command.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7290

Explanation:

- DJdev (jobid): nnnn JOBS RESET

In response to a *START,DJdev,RESET request, the number of jobs that were reset is nnnn.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 requesting a new *START command or a *CANCEL command be entered.

Operator response: Issue a new *START command with another request or issue a *CANCEL command to cancel the dump job DSP.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7291

Explanation:

- DJdev (jobid):-- RESET COMPLETE

- FOR JOB jobname (jobid)

- ,NET djnet

In response to a *START,DJdev,RESET command, the DJ dump control flags for the indicated job have been reset. If the job is a member of a DJC network, the djnet is identified in the message text.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: Reset processing continues with the next job in the specified job range if one exists.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7292

Explanation:

- DJdev (jobid):-- RESET FAILED FOR JOB jobname (jobid)

- ,NET djnet

In response to a *START,DJdev,RESET command, DJ was unable to reset the DJ dump control flags for the indicated job because an error condition was detected. If the job is a member of a DJC network, the djnet is identified in the message text.

This message will be preceded by a diagnostic message indicating the error condition that prevented the job from being reset.

DJdev (jobid) indicates the dump job DSP that issued
the message, where dev is the tape device number and jobid identifies the DSP.

System action: Reset processing continues with the next job in the specified job range, if one exists.

Operator response: None. This is an informational message.

IAT7293

Explanation:

Due to either an error or a *CANCEL command, DJ reset processing was ended before normal completion of the indicated category of jobs. If an error caused the job to end, this message will be preceded by a diagnostic message.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: If processing was ended prematurely by a *CANCEL command, the dump job DSP ends. If reset processing was ended prematurely by an error and the indicated category of jobs is only a subset of the jobs specified by the current *START request, DJ will attempt to continue. For example, if the current *START request was a RESET,JOBS request and processing was ended for priority level 14 jobs, DJ will attempt to continue resetting jobs in the next priority level (that is, priority 13).

If processing cannot be continued because of the severity of the error, the dump job DSP ends the current *START request and issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

Operator response: If messages IAT7220 and IAT7228 are issued, either specify *CANCEL command to cancel the dump job DSP, or enter a new *START command.

Module:

IAT7295

Explanation:

Due to either an error or a *CANCEL command, DJ reset processing was ended before normal completion of the indicated category of jobs. If an error caused the job to end, this message will be preceded by a diagnostic message.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: If processing was ended prematurely by a *CANCEL command, the dump job DSP ends. If reset processing was ended prematurely by an error and the indicated category of jobs is only a subset of the jobs specified by the current *START request, DJ will attempt to continue. For example, if the current *START request was a RESET,JOBS request and processing was ended for priority level 14 jobs, DJ will attempt to continue resetting jobs in the next priority level (that is, priority 13).

If processing cannot be continued because of the severity of the error, the dump job DSP ends the current *START request and issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

Operator response: If messages IAT7220 and IAT7228 are issued, either specify *CANCEL command to cancel the dump job DSP, or enter a new *START command.

Module:
DJ successfully completed reset processing for the indicated category of jobs. All jobs in the indicated category that could possibly be reset were reset; however, there may have been some jobs that could not be reset successfully. See the DJ message log for a list of which jobs were successfully reset and which ones were not.

**System action:** Reset processing continues if the category of jobs is only a subset of the jobs that were requested by the current *START command request. Otherwise, the dump job DSP issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

**Operator response:** If messages IAT7220 and IAT7228 are issued, either specify a *CANCEL command to cancel the dump job DSP, or enter a new *START request.

Chapter 18. Dependent Job Control Messages

IAT7300

Explanation:

─ DJdev (jobid):— LABEL=SL ——

─ IS NOT ALLOWED WITH TRANS=YES ——

You cannot specify both the LABEL=SL parameter and the TRANS=YES parameter on the *CALL command. In the message text:

DJdev (jobid) Indicates the dump job DSP that issued the message.

dev The tape unit address.

If a tape unit has not yet been allocated, then the characters ### are displayed instead of a unit address.

jobid Identifies the DSP.

System action: The dump job DSP issues message IAT7300 and ends.

Operator response: Issue the *CALL command for the dump job DSP again, specify parameters other than the stated combination.

Module:

IAT7301

Explanation:

─ UNRECOVERABLE I/O ERROR, ——

─ NET —— djnet — IS BEING SUSPENDED ——

DJC tried to access its control blocks and encountered an I/O error.

System action: The DJC DSP fails.

Operator response: Notify the system programmer.

Problem determination: See Table I, items 2 and 13; Table III, item 23.

Module:

Routing Code: Note 7  Descriptor Code: 7

IAT7302

Explanation:

─ DJC PROCESSING SUSPENDED UNKNOWN ——

─ NUMBER OF NETS LOST ——

DJC was writing its control blocks and encountered an unrecoverable error.

System action: The DJC DSP fails.

Operator response: Notify the system programmer.

Problem determination: See Table I, items 2 and 13; Table III, item 23.

Module:

Routing Code: Note 7  Descriptor Code: 7

IAT7304

Explanation:

─ DJdev (jobid):— JOB — jobname (jobid) ——

─ CANNOT BE DUMPED—IS HELD AWAITING ARM RESTART ——

Dump job (DJ) is unable to dump the indicated job because it is awaiting possible restart by automatic restart management. This message appears after the job ends and before automatic restart management tells JES3 whether or not to restart it.

Djdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The DJ DSP bypasses dumping the job and continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request.

Operator response: None. This is an informational message.

Module:

IAT7305
Explanation:

After a predecessor job completed dependent job control (DJC) processing, the specified successor job was missing, or a predecessor job completed with a status that required the specified successor job to be flushed. The predecessor job may belong to a different network.

System action: The network is held until the successor job enters the system.

Operator response: If the successor job is missing, submit the job to the system so that this part of the network can continue processing. No action is required when the job is flushed from the system.

Module:

Routing Code: Note 7 Descriptor Code: 7

IAT7306
Explanation:

The DJCUPDAT DSP was activated by the *START DJCUPDAT command, which was sent using the INTERCOM macro.

System action: Processing continues.

Operator response: None. This is an informational message.

IAT7384

Explanation:

```
>>> DJdev— (jobid):— NET— djnet----------
<br> CANNOT BE DUMPED-JSAM ERROR DMxxx, JOB----------
<br> jobname (jobid), blkname----------
```

A JSAM error occurred when accessing a spool control block for the indicated job which is a member of the DJC network djnet. As a result, neither the job nor the network as a whole can be dumped. DMxxx is the error code that was returned from JSAM. blkname is the name of the control block that was being accessed. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** The DJ DSP bypasses dumping the network and continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request.

**Operator response:** Notify the system programmer.

**Programmer response:** Take the appropriate action described for the DMxxx code in z/OS JES3 Diagnosis Reference.

**Problem determination:** See Table I, items 18 and 30, Table III, item 4.

**Module:**

IAT7385

Explanation:

```
>>> DJdev— (jobid):— LEVEL MISMATCH----------
<br> IATDJCR— level aparnum,— IATDJOR— level aparnum----------
<br> RECOVERY----------
```

The TRANS=YES parameter was specified on the *CALL command to translate jobs between the current JES3 release and an old JES3 release. In preparing to setup for translation, DJ detected that the IATDJCR module describing job control blocks at the old release level is not at a compatible service level with the IATDJOR module in the current release level. **Level** and **aparnum** information included in the message for each of the modules indicates the maintenance level of
the module and the number of the APAR that last caused the maintenance level to be changed. The maintenance level for the two modules must agree in order for translation to be performed successfully. 

**DJdev (jobid)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** The DJ DSP ends processing.

**Operator response:** Notify the system programmer.

**Programmer response:** Ensure that module IATDJOR is an up-to-date copy of IATDJCR from the old JES3 release. Then if the version of IATDJOR from the old release and the version of IATDJCR in the current release still are not at the same maintenance level, the module with the lowest maintenance level is the down level module and requires application of a PTF for the APAR identified by the up level module.

**Problem determination:** See Table I, item 29, TABLE III, items 4 and 7.

**Module:**

---

**IAT7388**

**Explanation:**

- DJdev— (jobid):— JOB— jobname (jobid)
- DUMPED TO TAPE
- RESTORED FROM TAPE AS JOB— (jobid)

This message is written to the JESMSGLG data set for a job when DJ dumps the job to tape or restores the job from tape. jobid1 is the job number of the job before it was dumped and jobid2 is the new job number assigned to the job when it is restored. If the job was migrated from an old release of JES3 to a new release of JES3, the JESMSGLG output may indicate only that the job was restored from tape, but not indicate that the job was dumped. On the other hand, if the job was migrated to an old release of JES3, the JESMSGLG output received under the old JES3 release may indicate only that the job was dumped to tape even though it also was restored.

DJdev (jobid) indicates the dump job DSP that issued
the message, where dev is the tape device number and jobid identifies the DSP. If the old jobid contains JOB*****, it means that the job was dumped on a higher JES3 release and had a job number that was greater than 65,534.

System action: Once the job has been restored, it will continue execution.

Operator response: None. This is an informational message.

**IAT7396**

**Explanation:**

```plaintext
djdev (jobid) DEFAULT CNDB IS BEING
- USED FOR CONSOLE conname, CNDB cndbname
```

During dump job input processing, JES3 determined that a console destination block (CNDB) was at a higher version than supported by the current release. A matching console name is not defined on the current system. This message is followed by message IAT7255 which identifies the job being processed. In the message text:

- **conname**
  - The original console name from the CNDB. If the console name was zeros or blanks, ‘N/A’ appears in the message text.

- **cndbname**
  - Indicates the specific CNDB being processed.

**System action:** JES3 uses the default values 'DUMMY' (for the console name) and X'7FFF' (for the console ID) in the CNDB.

**Operator response:** None, this is an informational message only written to the system log.

**System programmer response:** None

Chapter 19. Deadline Scheduling Messages  467
IAT7455
Chapter 20. BSC RJP Messages

IAT7500

Explanation:

RJP IS ACTIVE

BSC RJP initialization has been completed and control is being passed to the BSC RJP line manager. The line manager, on first entry, attempts to start all lines defined as requiring automatic start. The operator may now communicate with BSC RJP to start, restart, or cancel BSC RJP lines.

System action: Control is transferred to the BSC RJP line manager.

Operator response: Follow your defined BSC RJP startup procedure, and respond to BSC FJP error messages as required.

Module:

Routing Code: 8  Descriptor Code: 7

IAT7505

Explanation:

LINE lname IS ALREADY ACTIVE

A *START,RJP command was issued to a line already in use by BSC RJP.

System action: JES3 ignores the command.

Operator response: None. This is an informational message.

Module:

Routing Code: 8  Descriptor Code: 7

IAT7510

Explanation:

RJP HAS BEEN CANCELED

A *CANCEL,RJP,L=ALL command was accepted or an *START,RJP command was rejected because BSC RJP is withdrawing from the system in response to a previous *CANCEL,RJP,L=ALL command.

System action: The active BSC RJP lines are canceled when no remote device is in use by a JES3 function on that line. When all active lines have been canceled, BSC RJP withdraws from the system.

Operator response: None. This is an informational message.

Module:

Routing Code: 8  Descriptor Code: 7

IAT7520

Explanation:

RJP STARTED ON lname (dev)

A BSC RJP line has been successfully started. The line is now eligible to accept a sign-on.

System action: BSC RJP monitors the line for a sign-on attempt by a remote workstation.

Operator response: None. This is an informational message.

Module:

Routing Code: 8  Descriptor Code: 7

© Copyright IBM Corp. 1988, 2010
A *START,RJP command was rejected because the line specified is offline.

System action: The line is not started.

Operator response: Issue the *V,dev,ONLINE command to vary the line online, and repeat the *START,RJP command.

Module:

Routing Code: 8    Descriptor Code: 7

IAT7530

Explanation:

An I/O error occurred on the specified line. The meanings and values of the fields in the message are as follows.

Variable ccm is the channel command word (CCW) op code:

01 - WRITE
02 - READ
03 - NOP
08 - TIC
23 - SET MODE
27 - ENABLE
2F - DISABLE

Variable stat is the channel status word (CSW) status code. These codes are documented in the System/370 Reference Summary.

Variable sens is the sense information code:

80 - Command reject
40 - Intervention required
20 - Bus out check
10 - Equipment check
08 - Data check

Variable internal-ccw-id is a code describing the command type and sequence. It is a 2-digit hexadecimal number formed by the addition of the definition values below. For example, an internal-ccw-id of 94 indicates binary synchronous sequence (80) from a programmable-type terminal (10) for a read-type command (04): 80 + 10 + 04 = 94.

The following are CCW sequence type definitions:

80 - Binary synchronous sequence
40 - Prepare sequence
20 - Write sequence
10 - Programmable interface sequence

The following are CCW command type definitions:

00 - DISABLE
01 - SET MODE
02 - ENABLE
04 - READ
05 - READ RESPONSE (normal)
06 - READ RESPONSE (to inquiry)
07 - PREPARE
08 - WRITE
09 - WRITE RESPONSE
0A - SEND INQUIRY
0B - SEND EOT
0C - READ 3741 STATUS MSG

System action: If the error can be corrected, the I/O operation is attempted; otherwise, the line is canceled.

Operator response: None. This is an informational message.

Problem determination: See Table III, item 9.

Module:

Routing Code: 8    Descriptor Code: 7
IAT7535
Explanation:

A *CANCEL or *RESTART,RJP command was rejected because the indicated line had not been started.

System action: Processing continues.
Operator response: None. This is an informational message.

Module:

Routing Code: 8          Descriptor Code: 7

IAT7540
Explanation:

One of the following serious errors occurred on the specified line:

- INTERVENTION REQUIRED
- DISASTROUS ERROR
- NON-SIGNON CARD READ
- BLOCK SEQUENCE ERROR
- CARD DEBLOCKING ERROR
- CONSOLE COMMAND TOO LONG
- WORKSTATION RE-IPL
- RCB MATCH NOT FOUND
- INT REQ CC3 PATH/TCU INOP
- 30 CONSECUTIVE NAKS

System action: For INTERVENTION REQUIRED, NON-SIGNON CARD READ, BLOCK SEQUENCE ERROR, CARD DEBLOCKING ERROR, and CONSOLE COMMAND TOO LONG, the line is canceled and then automatically restarted.
Operator response: INT REQ CC3 PATH/TCU INOP or DISASTROUS ERROR may indicate that power is off at the control units or that modems are not ready. 30 CONSECUTIVE NAKS indicates that a potential NAK (negative acknowledgment character) loop exists. Ensure that the manual switches are properly set, then start the line again.
Problem determination: See Table III, item 4.

Module:

Routing Code: 8          Descriptor Code: 7

IAT7550
Explanation:

A *START, *RESTART, or *CANCEL,RJP,L= command was rejected.

System action: The system issues message IAT7505, IAT7510, IAT7525, or IAT7535 as explanation.
Operator response: None. This is an informational message.

Module:

Routing Code: 8          Descriptor Code: 7

IAT7560
Explanation:

A /*SIGNOFF statement was submitted from the remote workstation.

System action: When JES3 functions currently active on the workstation end, the line is canceled.
Operator response: None. The line is automatically
canceled and started with no operator intervention.

**IAT7565**

**Explanation:**

```plaintext
>>> RJP INITIALIZATION FAILED

>>> RJP IS ALREADY ACTIVE

>>> NO RJP LINES ARE DEFINED

>>> PAGE FIX ABNORMALLY TERMINATED
```

BSC RJP could not be initialized for the reason stated.

**System action:** The *X,RJP command is ignored.

**Operator response:** If BSC RJP is already active, no action is required. If no BSC RJP lines are defined, change the initialization stream and restart the system to initialize BSC RJP.

**Module:**

**Routing Code:** 8 **Descriptor Code:** 7

---

**IAT7567**

**Explanation:**

```plaintext
>>> RECURSIVE ABEND ON -- lname

>>> FOR -- xxx -- LINE BEING DEACTIVATED
```

An abend occurred on a RJP line or terminal recursively.

**System action:** The line is varied offline and then deactivated by dechaining it from the active line queue. This prevents the abend from degrading the system. Additionally, this prevents the possibility of RJP being quiesced. Any control blocks associated with the line before it was deactivated are not deleted. Any terminal signed on to the line before it was deactivated is quiesced until the next JES3 restart.

**Operator response:** The operator can vary the line back online and restart it. This restart causes new control blocks and pointers to be created.

**Module:**

<table>

- Issuing: IATRJM3

Routing Code: 8  Descriptor Code: 7

IAT7581
Explanation:

- CURRENTLY CANNOT SIGN
- OK— tname— OK— lname (dev)

A sign on to a remote terminal was unsuccessful. The sign on card could not be processed because an error occurred while trying to read in or build the required control blocks.

Operator response: Attempt the sign on again. If attempts continue to fail, notify the system programmer.

System programmer response: Obtain the SYSLOG and contact the IBM Support Center.

Module:

- Containing: IATRJM5
- Detecting: IATRJM3
- Issuing: IATRJM3

Routing Code: 8  Descriptor Code: 7

IAT7582
Explanation:

- AUTO SIGNON INVALID FOR
- LINE STARTED, AUTO SIGNON IGNORED

An RJP line is being started, but it has the AUTO sign-on parameters specified for an intelligent workstation.

System action: JES3 starts the line as if AUTO had not been specified. A workstation may sign on using the normal sign-on record.

Programmer response: Remove the AUTO parameter from the RUPLINE initialization statement.

Module:

- Containing: IATRJM5
- Detecting: IATRJM3
- Issuing: IATRJM3

Routing Code: 8  Descriptor Code: 7

IAT7583
Explanation:

- PATH VALIDATION FAILED, lname (dev)

RJP line path validation failed.

System action: The RJP line will not be started. Any line control blocks obtained will be released.

Operator response: Notify the system programmer.

Programmer response: Check any control units pertaining to the RJP line path.

Module:

- Containing: IATRJM5
- Detecting: IATRJM1

IAT7586
Explanation:

NEW PASSWORD REJECTED FOR WS= wasename
ON linename - CHANGE NOT ALLOWED

RJP password checking was performed by JES3 rather than by RACF® or another security product. The new password field on the /*SIGNON statement is ignored. In the message text:

wsname is the workstation for which the new password was rejected.

linename is the name of the line used to communicate with JES3.

System action: The RJP WS logon continues normally.

Programmer response: A new password can be assigned to the workstation only through the *MODIFY T operator command when RACF or other security product password protection is inactive.

Chapter 21. Output Service Messages

IAT7600
Explanation:

- ON THE *CALL WTR COMMAND IS NOT VALID.
- WTR(--jobid--,CANCELLED).

Indicates that there was a non-valid parameter or keyword (field) on a *CALL.WTR command. Also, there was no OUT= keyword specification on the command. Although the OUT= keyword is not required and JES3 provides a default device allocation, JES3 tries to confirm that the missing OUT= keyword is not caused by the syntax error.

In the message text:

field Indicates the parameter or keyword causing the syntax error.

jobid The jobid of the called WTR DSP.

System action: The writer is terminated.

Operator response: Reissue the *CALL.WTR command with the correct syntax.

System programmer response: None.

Module:

Routing Code: 2,10 Descriptor Code: 4

IAT7602
Explanation:

- devname-(devnum)
- WRITER PIPELINE CLEARED

After an FSS writer failed, the writer did not release the SYSOUT data sets scheduled to it. JES3 has unscheduled the data sets so that they can be processed.

System action: FSS writer termination continues.

Operator response: None. This is an informational message.

System programmer response: None.

IAT7755
Explanation:
IAT7755
Explanation:
IAT7755
Explanation:
```

When the DISPLAY DJC DSP was invoked, an incorrect parameter was specified, or the specified network is not identified to the system.

**System action:** The job is canceled.

**Operator response:** Resubmit the job using the proper parameter or network identification.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7

IAT7756

Explanation:

```plaintext
IAT7756
Explanation:
IAT7756
Explanation:
```

An error occurred while the DISPDJC DSP was executing. If a network was being processed at the time of failure, its number is given in `djnet`.

**System action:** The DISPDJC DSP will attempt to free the resources in use, then will end.

**Operator response:** Notify the system programmer and then issue a `CALL,DISPDJC` command after the problem is corrected.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 7

IAT7758

Explanation:

```plaintext
IAT7758
Explanation:
```

An error occurred while the DISPDJC DSP was accessing network control blocks.

**System action:** The DJC network being processed when the error occurred is ended. Normal processing resumes with the next network.

**Operator response:** Notify the system programmer.

**Module:**

**Routing Code:** Note 19  **Descriptor Code:** 7

IAT7759

Explanation:

```plaintext
IAT7759
Explanation:
```

This message is issued in response to an `*S,DC,SPADDR=` request to display the specified spool record. The spool address that was specified is not valid.

**System action:** JES3 issued message IAT7921 and then waits for an operator response.
IAT7760 • IAT7762

**Operator response:** Correct and reenter the command.

IAT7762

**Explanation:**

.predicate prty jobid jobname

This message is issued in response to a *CALL,DISPLAY,J= command. The entire status of the designated job, as determined by internal job-related control blocks, is displayed.

See also [Table 1 on page 3](#) for the meanings of data appearing in the message. Brackets [such as these], indicate that the enclosed information is printed only when the specific data is present. Field names provided (in parentheses) for the fields being formatted, or from where the information is being obtained. The optional information is listed below in brackets [...].

- prty jobid jobname - priority, job ID, and name of the job (JCTPRTY, JCTJOB, JCTJBNAM)
- [SE=(dspname-status,...)] - all scheduler elements, if any, for the job are listed. (DSPNAME, SEFLAGS) For each scheduler element, the status is one of the following:
  - ACTIVE - this SE is active
  - COMPLETE - this SE is complete
  - RESCHDL - this SE is returned for rescheduling
  - NOSTAT - this SE is none of the above
- JCTMAINS=(mpname,...) - JCTMAINS is a list of the mains where the job is eligible to run. ‘NONE’ indicates that no main is eligible. (JCTMAINS/MPNAME)
- [SRVCLASS=srvclass] - the service class for the job
- [SCHENV=schenv] - the job’s scheduling environment if one was specified
- [ORG=device group origin] - group of devices or node from which the job originated (JCTGPORG)
- [CLASS=cls] - job class (JCTSCHCL)
- [GROUP=group] - job class group (MGNAME)
- [TRACKS=trks-groups] - the number of track groups allocated for job (JTSGRPCT)
- [DSTRACKS=(DSNAME=dsname,DDNAME=ddn,TRACKS=trks-groups,...)]
  - DSNAME=userid.jobname.jobid.dsnumber.name, if dsnumber exists. (JCTOUSID, JCTJBNAM, JCTJOB, JDSDDSNUM, JDSDDSNAM) otherwise,
  - DDNAME=PROCSTEPNAME.STEPNAME.
  - DDNAME = (JCTDDPCT, JDSSTEPN, JDSDDTOT)
  - TRACKS=number of track groups allocated for data set. (JTSGRPCT)

Provided for each sysout data set in the job that has its own track allocation table (TAT) (DSISO).
"**** JOB TAT SEARCH INCOMPLETE ****" - an error occurred in trying for format the spool track groups.

- [RUN COMMAND] - indicates that a *MODIFY,J=n,nn,nn,nn,nn command was issued for the job
- [,IORATE=iorate] - (JCTFL3) one of:
  - LOW - low
  - MED - medium
  - HIGH - high
- [,PROCLIB=ddn] - name of procedure library, IATPLBxx. (JCTPROC)
- [,MAINTYPE=system type] - either JES or ANY (JCTSYSTM)
- [,MVTREGN=region size] - first step region size (RQMVTSIZ)
- [,VSREGN=region size] - largest step region size (RQVSSIZ)
- [,MAINS=(mpname,...)] - a list of the mains where the job is eligible to run (RQMMAINS/MPNAME)
- [,INDEX=rqindex] - the job is: (RQINDEX)
  - ACTIVE IN C/I IN AN FSS - active in a C/I FSS address space (RQFSSCI)
  - WAITING FOR POSTSCAN - waiting for postscan processing (batch job) (RPQPCSBAT)
  - WAITING FOR POSTSCAN - waiting for postscan processing (demand select) (RPQPCSDL)
  - QD MDS FETCH PROCESSING - waiting for or active in MDS fetch processing (RQFETCH)
  - WAIT ON OPER VOL FETCH - waiting for the *START SETUP,jobno command to be issued (RQVOLOVT)
  - QD FOR MDS SYS SELECT - waiting for or active in MDS system select processing (RQSYSSEL)
  - QD MDS ALLOC PROCESSING - waiting for or active in MDS allocation processing or waiting for one or more resources (RQALLOC)
  - WAIT ON UNAVAIL VOL(S) - waiting for a volume that was made unavailable because of the *MODIFY,S,Vu=T-volser or *MODIFY S,Vu=D-volser command being issued (RQVOLVAV)
  - WAIT ON OPER VOL MOUNT - waiting for a volume to be mounted or active in MDS verify processing (RQVERIFY)
  - QD FOR MDS SYS VERIFY - waiting for or active in MDS system verify processing (RQSYSVER)
  - ON MDS ERR Q (*C OR *R) - on the MDS error queue. Jobs that are put on the MDS error queue must be canceled or restarted by the operator (RQERROR)
  - QD FOR MAIN (NORMAL) - waiting to be selected on a main (RQSELECT)
- IN EXECUTION ON MAIN - scheduled to execute or executing on a main (RQONMAIN)
- QD FOR MDS BREAKDOWN - waiting for or active in MDS breakdown processing (RQBRKDW)
- QD FOR MDS RESTART - waiting for or active in MDS restart processing (RQRESTR)
- MAIN AND MDS COMPLETE - has completed GMS and MDS processing (RQDONE)
- WAITING FOR OUTSERV - waiting for output service processing (RQOUTPT)
- WAITING FOR WRITER - waiting for output service writer (RQOUTQUE)
- WAITING FOR RESVD SERV - has completed MAIN processing but has not completed output service processing (RQOSWAIT)
- OUTPUT SERVICE COMPLETE - has completed output service processing (RQCMPLT)
- QD FOR MAIN (DEMAND) - is a demand select job
  - WAITING ENDING FUNCTION - is in the ending function but is waiting for I/O to complete (RQEFWAIT)
  - FAILED ENDING FUNCTION - encountered an error while it was in the ending function (RQEFBAD)
  - OUT OF VALID RANGE - the value in RQINDEX is greater than the maximum valid value
- [,WAITING FOR wait reason] - If "WAITING FOR wait-reason" appears in the message, then the job is waiting for one of the following reasons (JQEQFLGS):
  - SCHEDULING/ENDING FUNCTION
    - The job has just become ready and is waiting for the job segment scheduler (JSS) to schedule the job, or the job has just completed a JESS function (such as C/I) and is waiting for JSS to mark the function complete and schedule the next function.
  - A DSP TO BECOME AVAILABLE
    - The job is waiting for DSP to become available. To determine which DSP the job is waiting for, examine the scheduler elements that appear in the "SE=" status messages above and find the first one marked "NOSTAT." Then issue the "I,X,D=dspname command to determine whether there are enough DSPs defined or whether the DSP is in hold.
  - AN RQ TO BECOME AVAILABLE
    - JSS was unable to create an RQ to schedule the job because there are no RQs in the RQ cellpool, and storage for another cellpool extent could not be obtained. No action is required unless the condition persists for a long time.
  - A PROCLIB TO BECOME AVAILABLE
    - The job is waiting for the procedure library (PROCLIB=ddname) to become available. Either
the procedure library could not be allocated, or another job is updating the PROCLIB. To determine the status of the procedure library, issue a *I,PROCLIB,ID=nn command, where nn is the last two characters of the DDNAME.

A MAIN/CLASS/GROUP
The job is waiting for a main processor, a job class, or a job class group to become available. Either the main processor is offline, the job class is disabled on all main processors, or the group is disabled on all main processors.

If the job is waiting to be scheduled for C/I, i.e., (SE=(...,CI-NOSTAT,...) ) appears in the message, the job can only be waiting for a main processor because the status of the job's class and group does not affect C/I scheduling. To determine on which main processors the job is waiting, issue a *I,S command (provided you are using JES3 setup), and examine the status of those main processors identified by "JCTMAINS=". At least one of these main processors must be connected or online to allow the job to be scheduled for C/I.

If the job is waiting to be scheduled for main (SE=(...,MAIN-NOSTAT,...) ) appears in the message), then the job can be waiting for a main processor, a job class, and/or a job class group. To determine on which main processors the job is waiting, issue a *I,S command (provided you are using JES3 setup), and examine the status of those main processors identified by "JCTMAINS=". At least one of these main processors must be connected or online in order for the job to be scheduled for main.

A LOCATE MAIN TO BECOME AVAILABLE
The job is waiting for a main processor to become available for locate processing. This condition occurs when a job, that needs catalog-locate processing, is scheduled for C/I and the main becomes unavailable before the job begins catalog-locate processing. To determine on which main processors the job is waiting for, issue a *I,S command (provided you are using JES3 setup), and examine the status of those main processors identified by "JCTMAINS=". At least one of these main processors must be available in order to be scheduled for C/I processing.

A JOB WITH SAME NAME TO END
The job is waiting for a some other job with the same name to end (two jobs with the same name cannot be scheduled at the same time). Issue an *I,J=jobname command to determine which job has already been scheduled.

SOME UNKNOWN REASON
JES3 was unable to identify the reason that the job is waiting, probably because of a system error. Contact the system programmer.

- [.LINEST=line estimate] - (JCTMAXL)
- [.PAGEST=page estimate] - (JCTMAXP)
- [.BYTEST=byte estimate] - (JCTMAXB)
- [.CRDEST=card estimate] - (JCTMAXC)
- [.JESMSGLG={LOG NOLOG}] - (JCTNOJLG)
- [.OUSID=owning userid] - (JCTOUSID)
- [.TUSID=submitting userid] - (JCTTUSID)
- [.HOLD=hold status] - one of
  - ARM - job is held for automatic restart management (JCTARMH in JCTFL2)
  - OPR - operator hold (JCTOPHL in JCTFL1)
  - DJC - DJC hold (dependent job control) (JCTDJCOH or JCTDJOHL in JCTDJOFL1)
- [.DJCNET=djc net id] (JCTDJNET)
- RQJSTAT, See IAT8685 for description.
- [.JUNIT=(DD=jname,TYPE=dtype,UNIT=NO/devnum),... - The name,
  type of device, and device number (or 'NO') is provided for each device required by a DSP if the job being displayed is being processed by that DSP or is active on that DSP. (FCTGLIST / SUPDD, SUPTYPE, SUPDEVAD)
- [.SETMAIN=mpname] - the ID of the main (main processor sequence number) where the job is SETUP (JES3 allocation done before the job is executed) (JSTMAIN / MPNAME). This is printed once per job.
- [.XUNIT=(...) ] - for each allocation request (JST DD entry), the following information is formatted:
  - [STEP=stepname] (JSTSTNM)
  - [.DD=ddname] (JSTDDNM)

COMPLETION OF QUEUE PROCESSING
The job is waiting for JSS to complete processing its queues so that it can later be put back on the DSP wait queue. No action is required unless the condition persists for a long time.

SMS RESOURCES TO BECOME AVAILABLE
The job requires SMS-managed user catalogs to become available. This condition occurs when the volume or storage group, where the SMS-managed user catalog resides, is quiesced or disabled. You cannot list the specific storage groups and volumes that are required by this job; however, you can issue the D SMS,SG(ALL),LISTVOL command to list all of the storage groups and volumes defined in your installation.

A PROCLIB TO BECOME AVAILABLE
The job is waiting for the procedure library to be allocated.

A LOCATE MAIN TO BECOME AVAILABLE
The job is waiting for a main processor to become available for locate processing. This condition occurs when a job, that needs catalog-locate processing, is scheduled for C/I and the main becomes unavailable before the job begins catalog-locate processing. To determine on which main processors the job is waiting for, issue a *I,S command (provided you are using JES3 setup), and examine the status of those main processors identified by "JCTMAINS=". At least one of these main processors must be available in order to be scheduled for C/I processing.

A JOB WITH SAME NAME TO END
The job is waiting for a some other job with the same name to end (two jobs with the same name cannot be scheduled at the same time). Issue an *I,J=jobname command to determine which job has already been scheduled.

SOME UNKNOWN REASON
JES3 was unable to identify the reason that the job is waiting, probably because of a system error. Contact the system programmer.

- [.DJCNET=djc net id] (JCTDJNET)
- RQJSTAT, See IAT8685 for description.
- [.JUNIT=(DD=jname,TYPE=dtype,UNIT=NO/devnum),... - The name,
  type of device, and device number (or 'NO') is provided for each device required by a DSP if the job being displayed is being processed by that DSP or is active on that DSP. (FCTGLIST / SUPDD, SUPTYPE, SUPDEVAD)
- [.SETMAIN=mpname] - the ID of the main (main processor sequence number) where the job is SETUP (JES3 allocation done before the job is executed) (JSTMAIN / MPNAME). This is printed once per job.
- [.XUNIT=(...) ] - for each allocation request (JST DD entry), the following information is formatted:
  - [STEP=stepname] (JSTSTNM)
  - [.DD=ddname] (JSTDDNM)
[SMS MANAGED] - if applicable. (JSTSMS in JSTDFLG2) Not all possible message lines appear. For example, if the data set is SMS-managed, the beginning of the formatting for XUNIT appear as:

```
,XUNIT=(STEP=stepname
 ,DD=ddname
 ,SMS_MANAGED
 ,TYPE=type of device
```

but, if the data set is not SMS-managed, this area appears as:

```
,XUNIT=(STEP=stepname
 ,DD=ddname
 ,VOL=volser
 ,UNIT=unit parm from JCL/text unit in SVC99 parmlist
 ,TYPE=type of device
 [,VOL=(SCRTCH|volser)] - (JSTSCR in JSTDFLG3 / JSTVOLID)
 [,UNIT=unit parm from JCL/text unit in SVC99 parmlist
 in JSTDFLG2) one of:
 - TAPE - tape device
 - DA - direct access device
 - UR - unit record device
 - GRPH - graphic device
 - UNKN - none of the above
 [,DISP=disposition] - (JSTDFLG2) one of:
 - OLD
 - NEW
 - SHR
 - MOD
 [,ALLOC=device number] - the number of the JES3-managed device allocated to this request, if any (JSTDEV / SETUADR)
 [,REASON=allocation failure reason] - why the job remains on the allocate queue (JSTMFAIL). One of:
 - DEV ALLOC FAILED - device allocation was unsuccessful (JSTDVNAL)
 - DSN ALLOC FAILED - data set allocation was unsuccessful (JSTDSNAL)
 - VOL ALLOC FAILED - volume allocation was unsuccessful (JSTVLNAL)
 - UNAVAIL VOLUME - the volume is unavailable (JSTVUNAL)
 - VOL MOUNT PENDING - The volume was referenced in an IAT5210 message telling the operator to mount or check this volume and now needs to be verified (JSTMVNTPD)
 [,RING] - ring required for tape (JSTRING in JSTDFLG2)
 [,LVOL] - last use of volume by job (JSTVLINC in JSTDFLG4)

[.LDSN] - last use of data set by job (JSTDSINC in JSTDFLG4)
[.LDEV] - last use of device by job (JSTDVCINC in JSTDFLG4)
[.DEFER] - UNIT=('DEFER) specified (JSTDEFFER in JSTDFLAG2)
[.NOMOUNT] - no volume mount is required for pre-execution SETUP (JSTNOMNT in JSTDFLG3)
[.NODEV] - no device required because this is not the first reference to the device (JSTNODEV in JSTDFLG3)
[.BYPDSAL] - bypass data set allocation for this data set (that is, do not build a SETDSN for this data set) (JSTBDSAL in JSTDFLG6)
[.DSN=data set name] - data set name (JSTDSNAM)

[.MDS FAILED TO ALLOCATE THE FOLLOWING ON mpname] - MDS was unable to allocate a resource to the job. mpname is the main where allocation failed during MDS processing (ARLMAIN). The reason is one of the following:

```
[,mmmm OUT OF nnnn REQUESTS FOR DEVICE=devtype] - MDS was not able to allocate all of the devices requested by the job.

mmmm - the number of devices that MDS was not able to allocate to the job (ARLDEVFL)
nnnn - the total number of devices the job requested (ARLDEVRQ)
devtype - the unit names (NAME in IATYNAM) or device number (SETUADR) of the device requested (ARLNAME)
```

[.THE DEVICE REQUIRED FOR SERIAL=vol] - the job was unable to allocate the device required for a permanently resident volume (ARLVOLAD / VLMSER).

```
[A REQUEST FOR SERIAL=volser EXCL={YES|NO}] - the job was unable to allocate the specified volume (ARLVOLAD / VLMSER). EXCL = YES/NO refers to the volume.
[A REQUEST FOR DSNAME=data set name ON SERIAL=volser EXCL={YES|NO}] - the job was unable to allocate the specified data set (ARLDSNAD / DSNAME) on the specified volume (ARLVOLAD / VLMSER). EXCL = YES/NO refers to the data set.
[A REQUEST FOR DSNAME=data set name ,SMS MANAGED EXCL={YES|NO}] - the job was unable to allocate the specified SMS managed data set (ARLDSNAD / DSNAME). EXCL = YES/NO refers to the data set.
```

**System action:** Processing continues.

**System programmer response:** The action to be taken depends on the reason for issuing the *CALL,DISPLAY command. See z/OS JES3 Commands for specific *INQUIRY commands.

</table>
IAT7775

Explanation:

Unable to identify VOL for migration.

The IATUTJCT utility was invoked with the MIGRATE parameter, but IATUTJCT could not find the JCT’s version in the VOL checkpoint record to validate the MIGRATE parameter.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:

IAT7776

Explanation:

Checkpoint operation - ckptop failed.

The checkpoint operation that failed is either RESERVE, READ, WRITE, or PURGE. The failing record will be present if the operation is READ or WRITE.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: If the number of installation-defined checkpoint record identifiers cannot be reduced, contact the IBM Support Center.

Module:
IAT7778

Explanation:

The IATUTJCT utility was invoked and accepted by IATUTJCT.

System action:  Processing continues.

Operator response:  None. This is an informational message.

Module:

Routing Code: 2  Descriptor Code: 4

IAT7779

Explanation:

While validating the checkpoint data set, the IATUTJCT utility was either unable to find a VOL (volume) record, or it was unable to find a VOL (volume) entry for the JES3JCT extent. The type of data that was not found:

VOL RECORD
   The entire VOL record

JES3JCT VOL ENTRY
   The entry for the JES3JCT extent within the VOL record.

System action:  IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response:  Notify the system programmer.

System programmer response:  Correct the allocation of the incorrect data set.

Module:

Routing Code: 2  Descriptor Code: 4

IAT7780

Explanation:

IATUTJCT was unable to accept the data set identified by the specified DD because the data set violates a restriction identified by the error text.

In the message text:

ddn   The ddname of the data set that has the error.
err   Identifies why the data set was not acceptable and is one of the following:
   •  MULTIPLE EXTENTS
      The data set was allocated with multiple extents and only one extent is allowed.
   •  NO SPACE ALLOCATED
      The data set was allocated with zero space specified.
   •  NOT ON CYLINDER BOUNDARY
      The data set was not allocated in space units of cylinders.

System action:  IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response:  Notify the system programmer.

System programmer response:  Correct the allocation of the incorrect data set.

Module:

Routing Code: 2  Descriptor Code: 4

IAT7781

Explanation:

This is diagnostic information that accompanies message IAT7772 and contains four words of the IOB. This message is issued three times, each time with the four words below, for a total of 48 bytes.

In the message text:
The address of the current 4-word fragment of the IOB being written.

Word 1 of the current IOB fragment.

Word 2 of the current IOB fragment.

Word 3 of the current IOB fragment.

Word 4 of the current IOB fragment.

System action: See message IAT7772.

Operator response: See message IAT7772.

System programmer response: See message IAT7772.

Module:

Routing Code: 2    Descriptor Code: 4

IAT7782

Explanation:

THE FAILING CCW AT ADDRESS— address

CONTAINS— ccw1 ccw2

This is diagnostic information that accompanies message IAT7772 and contents of the failing CCW. In the message text:

The address of the failing CCW.

Word 1 of the failing CCW.

Word 2 of the failing CCW.

System action: See message IAT7772.

Operator response: See message IAT7772.

System programmer response: See message IAT7772.

Module:

**Routing Code:** 2  **Descriptor Code:** 4

---

IAT7785

**Explanation:**

 errno TRACK CAPACITY ERROR FOR DDNAME== ddn ==
nr15==r15, nr0==r0

The IATUTJCT utility was attempting to determine data set space characteristics for the data set allocated under the specified ddn using the TRKCALC service, but this operation resulted in values that are not acceptable to IATUTJCT. This message is typically issued because the block size for the JCT data set exceeds the maximum allowable track size on the device where the JCT data set resides.

In the message text:

ddn  The ddname for which the TRKCALC service was being performed.

r15  Register 15 as returned by the TRKCALC service.

r0   Register 0 as returned by the TRKCALC service.

**System action:** IATUTJCT also issues message IAT7776 and ends with a return code of 4.

**Operator response:** Notify the system programmer.

**System programmer response:** Correct the allocation of the incorrect data set. If the data set is allocated correctly, see the DFSMSdip Advanced Services document for the explanation of R15 and R0 as returned by the TRKCALC macro with the FUNCTN=TRKCAP parameter. Using this information, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IAT7786

**Explanation:**

>>> POTENTIAL CONFLICT, LAST KNOWN STATE OF===

>>> JES3 ON== system WAS== status==

The IATUTJCT utility has been started on a complex where the state of JES3 is in potential conflict with IATUTJCT. This message is issued if JES3 is up or coming up. This message is also issued if a processor failed, was IPLed or reset and a "RETURN was not performed first, or if a dynamic system interchange (DSI) was in progress but not completed. This message is repeated for each processor that is identified.

In the message text:

**system**  The name of the system that was found.

**status**  The status of the system, and is one of the following:

- **UP**
  JES3 is active, or was last known to be active, on the specified system.

- **INITIALIZING**
  JES3 is initializing, or was last known to be initializing, on the specified system.

- **IN DSI AS NEW GLOBAL**
  A DSI is in progress, or was last known to be in progress, and the specified system is the new global or was going to be the new global.

**System action:** IATUTJCT also issues message IAT7787.

**Operator response:** Reply to message IAT7787.

**System programmer response:** See message IAT7787.

**Module:**

**Routing Code:** 2  **Descriptor Code:** 4

---

IAT7787

**Explanation:**

>>> CONFIRM SYSTEM STATUS AND REPLY===

>>> CONTINUE OR CANCEL===

After message IAT7786 is issued, this message is issued once for all JES3 processors that are active and
in conflict with the IATUTJCT utility.

System action: IATUTJCT waits for a reply from the operator.

Operator response: Notify the system programmer.

System programmer response:
- If you want to proceed with a test run of IATUTJCT, reply CONTINUE. After IATUTJCT completes, do not replace definitions of the old JCT and checkpoint data sets with the new ones.
- If you want to run IATUTJCT and subsequently replace the old checkpoint and JCT data set definitions, ensure that JES3 is not active on any system in the complex and then reply CONTINUE.
- If you do not want to run IATUTJCT, reply CANCEL.

---

IAT7790

Explanation:

--- JCTS WILL BE SHRUNK BELOW SIZE REQUIRED
--- BY HJS6606 AND ABOVE. TO CONFIRM REPLY
--- (CONTINUE, OR CANCEL)

This message is issued as a safeguard to ensure that shrinking JCTs is desired.

System action: IATUTJCT waits for a reply from the operator.

Operator response: If you want to proceed, reply CONTINUE. If you want to terminate this operation, reply CANCEL.
IAT7791 • IAT7796

Module:

IAT7791

Routing Code: 2

Explanation:

JCT RECORDS ARE NOW THE SIZE REQUIRED

BY HJS6606 AND BELOW

This message is issued when JCT records have been shrunk to the lowest level through a fallback request.

System action: Processing is complete.

Operator response: None.

Module:

IAT7792

Explanation:

THE IATYVOL VERSION NUMBER HAS BEEN

RESET TO THE HJS6606 AND ABOVE LEVEL

This message is issued when a straight JCT copy request results in a corrupted version number being corrected.

System action: Processing is complete.

Operator response: None.

Module:

IAT7795

Explanation:

DJ—dev—(jobid)—: NET—djnet

CANNOT BE DUMPED

IS NOT IN OPERATOR HOLD

The indicated DJC network djnet is not held and therefore cannot be dumped.

System action: The DJ DSP bypasses dumping the DJC network and continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request.

Operator response: Place the indicated DJC network in operator hold using the *MODIFY,N command. Then, after DJ processing of the current *START request is complete, issue a *START,DJdev,N=djnet command to try dumping the network again when the indicated job is no longer active.

Module:

IAT7796

Explanation:

DJ—dev—(jobid)—: NET—djnet

CANNOT BE DUMPED

IS ACTIVE IN—dspname

The DJC network cannot be dumped because the indicated job, which is a member of the specified network, is active under the indicated DSP. DJdev—(jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The DJ DSP bypasses dumping the DJC network and continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request. The indicated network can be dumped after the job completes MAIN processing.

Operator response: Place the indicated DJC network in operator hold using the *MODIFY,N command. Then, after DJ processing of the current *START request is complete, issue a *START,DJdev,N=djnet command to try dumping the network again when the indicated job is no longer active.
Routing Code: Note 18    Descriptor Code: 7

IAT7777

Explanation:

- DJ— dev-(jobid) — : NET— djnet —
- CANNOT BE DUMPED
- ERROR— rc— ON JOB— jobname(jobid)

The indicated job in DJC network djnet, cannot be dumped because of an error return code from IATXJCT or IATXJQE. As a result, the entire DJC network cannot be dumped.

System action: The DJ DSP bypasses dumping the DJC network and continues processing if there are more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request.

Operator response: Notify the system programmer.

Programmer response: See z/OS JES3 Customization for a description of the error return code.

Problem determination: See Table III, item 4.

IAT7925
Explanation:

This is the response to an *R,DC command. All traps previously entered are reset.

System action: JES3 issues message IAT7921 and then waits for an operator response.

Operator response: Enter the next request.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD0</td>
<td>IATUTDC</td>
</tr>
</tbody>
</table>

Routing Code: Note 18  Descriptor Code: 7
IAT7926

Explanation:

This message, issued in response to an "S,DC,TRAP=xxx,START=*" command, indicates that the DC wait trap at the indicated location xxx has been entered. The user FCT is waited.

System action: The dump core DSP waits for an operator response.

Operator response: You can use DC commands can be used to display or change storage locations or to look at the user program's registers. The DC parameter TRAPGO posts the user FCT, allowing that FCT to resume processing.

Module:

IAT7927

Explanation:

The JDS for the job specified is currently held by the MAIN DSP and will not be available until the job completes execution.

System action: The request to display the JDS for the specified job is ignored.

Operator response: Reenter the request after the job has completed execution.

Module:

IAT7928

Explanation:

The job number specified in the *S,DC,OPTION=(RSQ=jobno) command is not valid. It must be numeric and from 1 to 7 digits.

System action: The DC request is ignored.

Operator response: Reenter the request with the correct job number.

Module:

IAT7929

Explanation:

The password specified is incorrect.

System action: DC will be initialized. Functions requiring the password are not permitted.

Operator response: If the use of functions requiring the password is desired, cancel the current DC job and reissue the call with a valid password.

Module:

IAT7930

Explanation:

The previous request contained an error.

System action: Valid parameters preceding the one in error were processed, but their values may have been reinitialized.

Operator response: Correct the incorrect parameter, and reenter the request.

Module:
IAT7931
Explanation:

INPUT NOT VALID HEX,
DC REQUEST TERMINATED

A parameter in the last request contained data that was to be in hexadecimal format and was not.
Operator response: Correct the incorrect parameter, and reenter the request.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7932
Explanation:

MODULE— mod— NOT ON JDE QUEUE OR LOAD

A FIND= request was made, and the module was not found on the JDE queue or on the JES3 load list.
Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7933
Explanation:

TOO MANY OPTIONS, DC REQUEST TERMINATED

The last request contained too many options in the OPTION= parameter. A maximum of 6 keyword options and 15 to 30 nonkeyword options may be specified.
Operator response: Reenter the request with fewer options.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7934
Explanation:

SEVERE I/O ERROR OCCURRED. DC TERMINATED

A severe JSAM I/O error occurred while attempting to write the TAT for a DC spin data set.
System action: The DC DSP is ended.
Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7935
Explanation:

STORAGE UNAVAILABLE TO PROCESS DC

The last request required DC to obtain or save dynamic storage. There was none available.
Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT7936
Explanation:

JOB SPECIFIED IN J= WAS NOT FOUND.
DC REQUEST TERMINATED

The job specified by the job number of the J= parameter of the last request was not found.
Operator response: Verify that the job number is correct and that the job is still in the system. Then reenter the request.

Module:

Routing Code: Note 18  Descriptor Code: 7
IAT7937

Explanation:

- ERROR IN JES3 ABEND—ROUTINE PROCESSING
- UNDER DC

The DC DSP utilizes the JES3 abend formatting routines to process some of its requests. One of the JES3 abend routines found an error and returned to DC with an abnormal return code.

System action: The remaining options specified in the request are ignored, and the output created up to this point is printed or sent to the operator console as requested.

Operator response: Check the output in an attempt to determine the error.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD0</td>
<td>IATUTDC</td>

<tr>
<td></td>
<td>IATUTD1</td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT7938

Explanation:

- THE LAST REQUEST—CAUSED THE DC TASK TO FAIL. DC HAS BEEN REINSTATED

The last request was incorrect and should not be attempted again.

System action: A failure logout to the operator console should have preceded this message. A JES3 dump of the error condition should have been taken. Message IAT7921 follows this message.

Operator response: Enter a different request.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD2</td>
<td>IATUTDC</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT7939

Explanation:

- THERE IS NO DC TRAP—OUTPUT TO PRINT

The PTRAP parameter was specified, requesting DC to send the output from the trap facility of DC to output service. However, there was no output from the DC trap function.

Operator response: Enter the ACTIVE parameter and verify that the traps are correctly set.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD0</td>
<td>IATUTDC</td>
</tr>
<tr>
<td></td>
<td>IATUTD2</td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT7940

Explanation:

- TRAP TABLE FULL, REQUEST IGNORED

The active trap table is full. No additional traps can be entered.

System action: The system ignores the request.

Operator response: If the trap is required, reset all active traps and reenter those that are required.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTDC</td>
<td>IATUTD2</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 7

IAT7941

Explanation:

- FUNCTION NOT ALLOWED WITHOUT VALID PASSWORD

An *X,DC command was issued without a valid password.

System action: The request to dump core is ignored; however, DC remains initialized.

Operator response: If the use of functions requiring a password is desired, cancel the current DC job, obtain a valid password from the system programmer, and reissue the *X,DC command with the password. Then reenter the desired function.

Module:
IAT7942 • IAT7946

IAT7942

Explanation:

The trap was not reset because the storage location xxx has been freed (FREEMAIN) or the location xxx has been modified.

System action: JES3 continues processing the *RESTART or *CANCEL command.

Operator response: None. This is an informational message.

Module:

IAT7944

Explanation:

Storage was not changed because it is either permanently not modifiable or REFRPROT is enabled.

System action: JES3 issues message IAT7921 and then waits for an operator response.

Operator response: Determine the cause of the error and retry the command, if appropriate.

Module:

IAT7945

Explanation:

This message is issued in response to an *S.IC or *C.IC command. The starting to (--->) stop times, elapsed time, and month, day, and year for this iteration count sample are given.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT7946

Explanation:

This message is issued in response to an *S.IC or *C.IC command. It provides a count of the occurrences of a given event. The offset is the TVTABLE (IATYTVT) offset to the entry point occurrence specified by entry point. The call to this entry point occurred the number of times specified by nnn.

System action: Processing continues.
IAT7947  •  IAT7951

IAT7947
Explanation:

A permanent I/O error occurred while reading the parameter buffer or the JDAB (IATYJDA).

System action: The iteration counter DSP is canceled.

Operator response: Reissue the *CALL,IC command.

IAT7948
Explanation:

One or more parameters specified with the *CALL,IC command were incorrect.

System action: The iteration counter DSP is not activated.

Operator response: Reissue the *CALL command correctly.

IAT7949
Explanation:

The entry point specified is not eligible for monitoring by the iteration count DSP.

System action: The DSP is ended.

Operator response: None. This is an informational message.
**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT7952**

**Explanation:**

\[\text{\textasciitilde}(\text{module-name} + \text{offset}--\text{nnn})\]

This message is issued in response to an *S,IC or *C,IC command. The designated module, at the offset value (in hexadecimal), called the specific entry point the number of times specified by nnn.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>

---

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT7953**

**Explanation:**

\[\text{\textasciitilde}(\text{name1} - \text{name2} - \text{main} --\text{nnn})\]

This message is issued in response to an *S,IC or *C,IC command. The counter specified by name1 is mapped by the DSECT name2. If the DSECT applies to a specific processor, then that processor name is given. Otherwise, CI indicates that the DSECT relates to the converter/interpreter. The counter value (decimal) specified by nnn is the accumulation from the time the *CALL,IC command was issued.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIC</td>
<td>IATUTIC</td>
<td>IATUTIC</td>
</tr>
</tbody>
</table>

---

**IAT7954**

**Explanation:**

\[\text{\textasciitilde IC REINSTATED FOR CLEANUP}\]

\[\text{\textasciitilde IC WILL BE PURGED}\]

The iteration counter (IC) completed JESTAE exiting and cleanup will occur before the IC being purged.

**System action:** The IC DSP is ended.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT7960**

**Explanation:**

\[\text{\textasciitilde INITIALIZATION STREAM CHECKING}\]

\[\text{\textasciitilde PROGRAM, IATUTIS, ENDED RC=-- rc}\]

This message is issued when IATUTIS ended.

Following are the IATUTIS return codes and their meanings.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The initialization stream has been checked, and no errors could be detected.</td>
</tr>
<tr>
<td>4</td>
<td>The initialization stream has been checked, and warning messages have been issued.</td>
</tr>
<tr>
<td>8</td>
<td>The initialization stream contains one or more errors.</td>
</tr>
</tbody>
</table>

**System action:** If the return code rc equals 4 or 8, the JESS initialization stream checker ends. If the return code equals zero, phase two of initialization stream checking can begin.

**Programmer response:** Check messages on the JES3OUT file. If errors were encountered, correct any incorrect initialization stream statements and rerun IATUTIS.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

---
IAT7961

Explanation:

```plaintext
➤➤— STG1CODE DATA SET DID NOT OPEN, ➤➤
➤— NO MDS ANALYSIS PERFORMED ➤➤
```

During phase two of the initialization stream checker, the STG1CODE data set is needed to compare the MVS Stage1 tables against the JES3 initialization statements. STG1CODE must be a partitioned data set, and each member must be named the same as a processor name in the initialization statements.

System action: JES3 initialization stream checker bypasses phase two.

Programmer response: If only a syntax check was desired, by purposely leaving out the PDS containing processor names, then this message may be ignored. Otherwise, see [z/OS JES3 Initialization and Tuning](Reference) to assemble the MVS Stage1 statements for each processor. After assembling the Stage1 statements, allocate the PDS created by SYSPUNCH to the STG1CODE DD statement and run IATUTIS again.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</table>

Routing Code: Note 19  Descriptor Code: 7

---

IAT7962

Explanation:

```plaintext
➤➤— LOGICAL ANALYSIS HAS BEGUN ➤➤
➤— FOR PROCESSOR— main ➤➤
```

This message is to inform you that the IATUTIS program is now checking the processor main. All messages between this message and the next time it is issued see this processor.

System action: JES3 initialization stream checking continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

Routing Code: Note 19  Descriptor Code: 7

---

IAT7963

Explanation:

```plaintext
➤➤— ERROR ENCOUNTERED IN SYNTAX, ➤➤
➤— MDS ANALYSIS MAY BE WRONG ➤➤
```

During initialization stream checking, syntax error messages have been written during phase one. They appear in the initialization stream listing right after the statement in error. The error caused the corresponding statement not to be written as table entry for phase two, so phase two could not be processed for the statement in error.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the syntax error and rerun IATUTIS.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

Routing Code: Note 19  Descriptor Code: 7

---

IAT7964

Explanation:

```plaintext
➤➤— SETUNIT— dev— WAS NOT FOUND ➤➤
```

SETUNIT dev was specified in a DEVICE statement in the initialization stream, but the required corresponding IODEVICE statement in the Stage1 is missing.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the XUNIT parameter on the DEVICE statement and rerun IATUTIS.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>

IAT7970
Explanation:

 Either an IODEVICE statement for the 3525 specified FEATURE=TWOLINE, but the DEVICE statement's DTYPE was not PUN3525I, or the reverse is true.

System action: JES3 initialization stream checking continues.

Programmer response: Change either the IODEVICE FEATURE= field or the DEVICE statement's DTYPE= field so that they match.

Module:

Routing Code: Note 19   Descriptor Code: 7

IAT7971
Explanation:

 Either an IODEVICE statement for the 3525 specified FEATURE=MULTILINE, but the DEVICE statement's DTYPE was not PUN3525M, or the reverse is true.

System action: JES3 initialization stream checking continues.

Programmer response: Change either the IODEVICE FEATURE= field or the DEVICE statement's DTYPE= field so that they are equal to each other.

Module:

Routing Code: Note 19   Descriptor Code: 7

IAT7972
Explanation:

 A SETNAME statement defined unit name name, which is not a UNITNAME in MVS Stage1.

System action: JES3 initialization stream checking continues.

Module:

Routing Code: Note 19   Descriptor Code: 7

IAT7973
Explanation:

 A DEVICE statement had an XTYPE assigned to SETNAME name, but the UNITNAME statement in MVS Stage1 did not include device dev.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the XUNIT keyword on the DEVICE statement.

Module:

Routing Code: Note 19   Descriptor Code: 7

IAT7974
Explanation:

 A DEVICE statement for dev1 specified XTYPE name, but unit dev2, which belongs to the same subgeneric group, was not within the same XTYPE.

System action: JES3 initialization stream checking continues.

Programmer response: Make sure that all units of this subgeneric group are defined with the same XTYPE in order to avoid a subgeneric split. Example: MVS Stage1 defined a bank of 8 DASD devices on 160-167, but the DEVICE statements in the initialization stream incorrectly defined unit 165 to another XTYPE.

Module:
Routing Code: Note 19   Descriptor Code: 7

IAT7975
Explanation:

setter SETNAME xxx UNITNAME yyy.

setter - NO MATCHING XTYPE FOUND

The initialization stream checker could not find a matching XTYPE on any JES3 SETNAME initialization statement for SYSGEN UNITNAME device yyy.

System action: JES3 initialization stream checking continues.

Programmer response: Change the SETNAME statement XTYPE parameter.

Module:

Routing Code: Note 19   Descriptor Code: 7

IAT7979
Explanation:

setter UNDEFINED PROCESSOR proc SPECIFIED

setter FOR type ident

A DEVICE initialization statement specifies an undefined processor name on either a JUNIT or XUNIT parameter. In the message text:

proc specifies the name of the undefined processor which is referenced on the DEVICE statement.

type is one of the following:

JNAME indicates that the undefined processor is on a JUNIT parameter.

XUNIT indicates that the undefined processor is on an XUNIT parameter.

ident If type is JNAME, ident is the JNAME of the device containing the undefined processor.

IATUTIS IATUTIS IATUTIS
If type is XUNIT, ident is the XUNIT that is associated with the undefined processor.

**System action:** JES3 initialization stream checking continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Add a MAINPROC initialization statement with the specified processor name, or remove the system and its associated JUNIT or XUNIT from the DEVICE initialization statement.

---

**IAT7984**

**Explanation:**

```plaintext
>>> RJPLINE— dev— IS A DUPLICATE
```

An RJPLINE statement was found with a unit that has been defined previously for this processor.
System action: JES3 initialization stream checking continues.

Programmer response: Correct one of the duplicate statements.

Module: 

Routing Code: Note 19    Descriptor Code: 7

IAT7985

Explanation:

- NO MATCHING SETNAME- name- FOUND
- FOR SETUNIT- dev

A DEVICE statement had XTYPE=setname specified, but no SETNAME statement with XTYPE=setname could be found.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the DEVICE or SETNAME statement.

Module:

Routing Code: Note 19    Descriptor Code: 7

IAT7986

Explanation:

- UNIT- dev- NOT DEFINED TO JES

UNIT dev was defined in the MVS Stage 1 stream, but was not included as a device in the JES3 initialization stream.

System action: JES3 initialization stream checking continues.

Programmer response: If you want to define the specified device, include it in the initialization stream, and resubmit the initialization stream.

Module:

IAT7987

Explanation:

- UNITNAME- name- NOT DEFINED
- TO PROCESSOR- main

JES3 found a SETNAME statement that does not have a corresponding UNITNAME statement in the MVS Stage1 of system generation that is being analyzed for the processor main.

System action: JES3 initialization stream checking continues.

Operator response: Notify the system programmer.

Programmer response: Verify that the processor being analyzed should not have this UNITNAME included in the MVS Stage1 or add the UNITNAME if it has been omitted.

Module:

Routing Code: Note 19    Descriptor Code: 7

IAT7988

Explanation:

- RJPLINE/RJPTERM STATEMENT MISSING
- RJP WILL NOT INITIALIZE

Either RJPLINE statements but no RJPTERM statements were found or in the initialization stream RJPTERM statements but no RJPLINE statements were found. When RJP is called after JES3 initialization, RJP will not activate.

System action: JES3 initialization stream checking continues.

Operator response: Notify the system programmer.

Programmer response: At least one valid RJPLINE and one valid RJPTERM statement must be coded in the initialization stream in order for RJP to initialize when it is called. Both RJPLINE and RJPTERM statements must be included when RJP is used by JES3. If RJP is not going to be included in your installation, both RJPLINE and RJPTERM should be removed.

Module:

The initialization stream, the system programmer submitted for checking, did not contain the SETNAME statements needed to process one or more of the following:

- SETUNIT
- ALTERNATE NAMES
- SETNAME
- UNITNAME
- HWSNAME

**System action:** The system branches around the tests for the missing statements.

**Operator response:** Notify the system programmer.

**System programmer response:** Add the missing SETNAME statements.
Chapter 23. Modify Messages

IAT8000
Explanation:

- SPOOL DATA INTEGRITY CHECKING
- TURNED ON
- TURNED OFF
- IS PENDING

This message is issued in response to a *MODIFY,Q,SDI= command which enabled or disabled spool data integrity checking.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>

IAT8001
Explanation:

- FAILURE
- READING
- WRITING
- CHECKPOINT FOR THE
  - *F,Q,SDI
  - *F,WANTDUMP
- COMMAND,RC= nn

This message is issued in response to a *MODIFY,Q,SDI= or *MODIFY,WANTDUMP command if an attempt to checkpoint the result failed.

In the message text:

- nn The return code from the IATXCKPT macro. See the macro description in Z/OS JES3 Customization for an explanation of the reported value.

**System action:** JES3 processing continues. Because the result of the command may not have been checkpointed, it is unpredictable whether a subsequent JES3 hotstart will use the desired value. The command may have to be repeated. A JES3 warmstart or coldstart will rebuild the checkpointed information based on the initialization stream specification.

**Operator response:** Notify the system programmer.

**Programmer response:** Re-issue the last command entered. If this problem persists, a JES3 warmstart should be scheduled to rebuild the initialization checkpoint.

IAT8002
Explanation:

- xxx IS INVALID FIELD

This message is issued in response to a *MODIFY,J= command. An incorrect parameter has been specified.

**System action:** JES3 ignores the command.

**Operator response:** Resubmit the command using valid parameters.

**Problem determination:** See Table III, item 4.

IAT8004
Explanation:
This message is issued in response to a *MODIFY,J=jobname,LOG|NOLOG command. JES3 could not find the job as specified. If the system was specified, the text ON main is included. If the command included the ASID parameter, the message contains the text IN ASID asid. If both the system and ASID were specified, the message contains both text inserts.

System action: JES3 ignores the command.

Operator response: Correct the parameters and reissue the command.

Module:

IAT8005

Explanation:

ACTIVE
Indicates that spool data integrity checking is enabled and active.

INACTIVE
Indicates that spool data integrity checking is disabled.

PENDING
Indicates that spool data integrity checking is enabled but inactive. It will be activated upon JES3 hotstart.

Operator response: None. This is an informational message.

Module:

IAT8007

Explanation:

ACTIVE
Indicates that spool data integrity checking is enabled and active.

INACTIVE
Indicates that spool data integrity checking is disabled.

PENDING
Indicates that spool data integrity checking is enabled but inactive. It will be activated upon JES3 hotstart.

Operator response: None. This is an informational message.

Module:

IAT8008

Explanation:

The field xxx was incorrectly specified. The operator entered a zero when attempting to issue a *MODIFY,O command.
System action:  JES3 ignores the command.

Operator response:  Resubmit the request using the correct parameters, *MODIFY,O.

---

**IAT8037**

**Explanation:**

`RUN REQUEST REJECTED — reason text`

This message is issued in response to a *MODIFY,J=nnn,RUN command. reason text is one of the following:

**MAIN SERVICE COMPLETE**

The job has already completed execution.

**JOB NOT IN GMS SELECT**

The job is not on the GMS select queue waiting to be selected for execution.

**JOB NOT ELIGIBLE TO RUN**

The job is not eligible to run on any systems. Message IAT8095 is issued for each system associated with the job to describe why the job cannot run on that system.

- Class disabled.
- Group disabled.
- Job not eligible for main, based on /*MAIN specifications.
- Main offline.
- Scheduling environment unavailable.
- Scheduling environment undefined.
- Job in DJC hold.
- Marginal spool condition.

**GROUP NOT WLM MANAGED**

The job's group is not WLM managed.

**REJECTED BY WLM**

The job cannot be scheduled by WLM. Additional text is issued identifying the WLM service that failed, the return code, and the reason code.

- JOB IS IN SPOOL HOLD
- SERVICE CLASS NOT FOUND - the job's service class is not known to JES3.
- SERVICE = (IWBLOC | IWMBREQ ), RETURN CODE = retcode

This is a secondary message when "REJECTED BY WLM" appears in the initial message.

**System action:** The run request is rejected.

**Operator response:**

- GROUP NOT WLM MANAGED - Use the *MODIFY,G command to change the job's group to WLM managed or use the *MODIFY,J=jobno,CLASS=cls
command to change the job's class to one that belongs to a WLM-managed group.

- **JOB IS IN SPOOL HOLD** - If possible, use the *MODIFY,Q command to release the job from spool hold.
- **SYSTEM sysname NOT FOUND** - Contact the system programmer.
- **JOB NOT IN GMS SELECT** - None
- **JOB NOT ELIGIBLE TO RUN** - Examine the reasons why the job cannot run in message IAT8095 and if necessary, issue the required commands to allow the job to run. For example, if a job's scheduling environment is not available on any systems, you may want to issue the MODIFY,WLM command to cause the scheduling environment to become available.
- **SERVICE CLASS NOT FOUND** - Contact the system programmer.
- **JOB REJECTED BY WLM** - If the failing service is IWMBLOC and the return code is 'X'C' and the reason code is xxx0C34, WLM is unable to select a system to start an initiator for the job. Two possible reasons for this reason text are:
  1. All processors in the complex are in WLM COMPAT mode instead of GOAL mode.
  2. WLM has determined that there is not enough capacity on the available systems to run the job.

If at least one processor in the complex is in GOAL mode and the problem persists, contact the system programmer.

**Programmer response:** Contact the IBM Support Center.

**Module:**

**IAT8038**

**Explanation:**

- **NET-ID= djnet**
- **JOB= jobname (jobid),**
- **CHANGED NOT CHANGED**

This message is issued in response to a *MODIFY,N command that increments or decrements the NHOLD count of the job specified. NOT CHANGED implies that the increment or decrement would have no effect on the current NHOLD count; or that the NHOLD count is currently 0.

**System action:** The hold count is altered or not altered, as indicated.

**Operator response:** None. This is an informational message.

**Module:**

**IAT8040**

**Explanation:**

- **INVALID PARAMETER parm**

This message is issued in response to a *MODIFY,L command, where parm is the incorrect parameter.

**System action:** JES3 ignores the command.

**Operator response:** Reissue the command with valid parameters.

**Module:**
IAT8041
Explanation:
PPP NET-ID= djnet
PPP IS BEING FORCED FROM SYSTEM
This message is issued in response to a "MODIFY,N" command. The indicated dependent job control network is deleted from the system. The jobs remain in the queue in hold status.
System action: All jobs associated with the network are placed in operator hold status.
Operator response: Release each job in order for it to continue processing.

</table>

Routing Code: Note 18     Descriptor Code: 5,7

IAT8055
Explanation:

One of the following *MODIFY commands was entered:

*MODIFY,Q,DD=ddn,{ DRAIN}
   { HOLD }
   { CANCEL }
   { STOP }
   { USE }
   { RELEASE }
   { R }

*MODIFY,Q,DD=ddn,SP=spar name

*MODIFY,Q,DD=ddn,CYL=cyl,TRK=trk

In the message, reason text is one of the following:
INVALID DDNAME -
An incorrect ddn was specified. All ddnames must be valid for the command to process.

INVALID PARTITION NAME -
An incorrect partition name was specified. The partition name must be valid for the command to process.

DATA SET IS HELD -
A previous HOLD, STOP or CANCEL was done on this spool data set.

DATA SET IS IN USE -
A previous USE or RELEASE was done on this spool data set.

DATA SET IS UNAVAILABLE -
The data set specified in the MODIFY command is unavailable.

ALL DEFAULT SPECIFIED -
The MODIFY would result in no spool data sets being left in the default partition. This is not allowed and the command is ended.

MINIMAL TRACK GROUP CONDITION SURPASSED -
The MODIFY would result in the number of available track groups in the default partition decreasing below the number defined as minimal. This is not allowed and the command is ended.

ERROR PROCESSING EXTENT MODIFY -
An error was encountered processing the MODIFY request. Check the status of the spool by issuing the *INQUIRY,Q,DD=ALL command.

CYL NOT SPECIFIED -
A BADTRACK command was not processed because the cylinder value (CYL=) was missing from the command.

TRK NOT SPECIFIED -
A BADTRACK command was not processed because the track value (TRK=) was missing from the command.

INVALID CYLINDER/HEAD ADDRESS SPECIFIED -
A BADTRACK command was not processed because the cylinder or track value is not valid. The value is not valid for one of the following reasons:
• The ddname specified on the command refers to the JCT data set.
• The value is not 4 hexadecimal digits.
• The CYL or TRK value is not within the bounds of the spool data set specified.

To determine the valid range of cylinder/head addresses for the spool data set, examine the JMF spool data set description section. If JMF is not available, the Extent Table entry of the spool data set may be examined for the high and low cylinder/head addresses. The Dump Core (DC) JIO option can be used to display this table.

INTERNAL PROCESSING ERROR -
The code that processes the BADTRACK command was not able to complete the command because of one of the following conditions:
• Storage could not be obtained for a BADTRACK record.
• The Main Processor Control table entry (MPC), needed to send the BADTRACK record, could not be found.

System action: The modify is not done. The *INQUIRY,Q,DD=ALL command will display the spool data sets in the complex.

Operator response: None. This is an informational message.

Module:

Routing Code: 2,Note 18

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 5,7

---

**Explanation:**

This message is issued in response to a *MODIFY,O command which requested that the JES3 hardcopy log (DLOG) be enabled or disabled. The *reason* is one of the following:

- **DLOG IS ALREADY ACTIVE**
  - An attempt was made to enable DLOG when it was already active.

- **SYSTEM ERROR**
  - An error occurred while attempting to enable DLOG. This message is preceded by message IAT7111, IAT7112, or IAT7713 which detail the error encountered.

- **THIS IS A LOCAL PROCESSOR**
  - JES3 attempted to start the JES3DLOG address space on a local processor. This address space only runs on the global processor.

- **DLOG IS NOT TURNED ON**
  - JES3 attempted to activate DLOG under inappropriate conditions.

**System action:** None. The state of DLOG is unchanged.
**Operator response:** Verify the desired command for the current DLOG state, and resubmit the command if necessary. If *THIS IS A LOCAL PROCESSOR* or *DLOG IS NOT TURNED ON* appears in the message, contact the IBM Support Center.

IAT8068

Explanation:

This message is issued in response to a *MODIFY,T command in which an incorrect line name was specified.

System action: Processing continues.

IAT8069

Explanation:

This message is issued under the following conditions:

1. Messages were added to the log during the table build phase of *MODIFY,CONFIG processing.
2. Messages were added to the log during the statement processing phase that were not looked at (the operator did not request that the *MODIFY,CONFIG log be spun off at the end of the statement processing phase).

System action: Processing continues.

Operator response: Notify the system programmer.

System programmer response: Examine the *MODIFY,CONFIG log to see how the *MODIFY,CONFIG processing worked. If errors were reported, fix the problem and have the operator reenter the command.

INVALID CLASS CHANGE REQUEST

CLASS AND //MAIN INCONSISTENT
  JOB IS ACTIVE ON MAIN
  JOB IS ACTIVE IN BREAKDOWN
  JOB IS ACTIVE IN C/I FSS
  JOB IS ACTIVE IN MDS RESTART
  JOB DOES NOT HAVE A MAIN S.E.
  JOB HAS COMPLETED MAIN

The *MODIFY,J=,CLASS= command was rejected for one of the following reasons:
IAT8080 • IAT8081

CLASS AND //*MAIN INCONSISTENT
There are no main processors identified on the
//*MAIN statement in common with those
specified for the new class.

JOB IS ACTIVE ON MAIN

JOB IS ACTIVE IN BREAKDOWN

JOB HAS COMPLETED MAIN
The job class cannot be modified for jobs that
are in execution on a main processor or have
completed main processing.

JOB IS ACTIVE IN C/I FSS

JOB IS ACTIVE IN MDS RESTART
The job class of a job active in a
converter/interpreter (C/I), functional subsystem
(FSS), or in main device scheduler (MDS)
restart, cannot be modified.

JOB DOES NOT HAVE A MAIN S.E.
For a job that does not have main scheduler
scheduling element (SE), the job class cannot
be modified.

System action: JES3 ignores the command and does
not modify the job class.

Operator response: When either JOB IS ACTIVE IN
C/I FSS or JOB IS ACTIVE IN MDS RESTART are
displayed, retry the command when current processing
completes.

Module:

Routing Code: Note 13 Descriptor Code: 5,7

IAT8081

Explanation:

IN SPOOL HOLD
CANCELLED
IN HOLD
RELEASED FROM SPOOL HOLD
RELEASED

A *MODIFY command was issued to change the status
of a particular job or of all jobs that have data on the
spool data set(s) specified in the command. JES3
issues this message once for each job affected by the
command. The message gives the status of the
specified job after the command has completed, as
follows:

IN SPOOL HOLD
One of the following has occurred:
• JES3 has released the job from operator hold
status but the job cannot continue processing
because it is also in spool hold status.
• JES3 has released a spool data set that contains
data for the specified job from spool hold status
but the job cannot continue processing; it is still
in spool hold status. At least part of the job’s
data is located on one or more spool data sets
that are still in spool hold status.

CANCELLED
JES3 has canceled the job and all output from the
job.

IN HOLD
JES3 has released the job from spool hold status
but the job cannot continue processing because it
is being held for some other reason (for example,
at the operator’s request).

RELEASED FROM SPOOL HOLD
JES3 has released the job from spool hold status. If
the job is not being held for some other reason (for
example, at the operator’s request), the job
resumes processing. If it is being held, JES3 issues
this message again with IN HOLD appearing in the
message text.

RELEASED
JES3 has released the job from hold status. The
job resumes processing.

System action: Command processing continues.

Operator response: If IN SPOOL HOLD appears in
the message, use the *INQUIRY,J=jobname,SH
command to display the name(s) of the spool data
set(s) that are in spool hold status and contain data for
the job. Check with your system programmer to be sure
you can release the data set(s). If so, issue the
*MODIFY,Q,DD= ddn,RELEASE command to release
the data set(s).

If IN HOLD appears in the message, issue the
*INQUIRY,J=jobname command to determine why the
job is still in hold status. Respond as required.

If CANCELLED, RELEASED FROM SPOOL HOLD, or
RELEASED appears in the message, no response is
required.

Module:

**IAT8083**

**Explanation:**

```
 architectures JOB QUEUE FOR SPECIFIED EXTENTS
 architectures HELD
 architectures STOPPED
 architectures RELEASED
 architectures CANCELLED
```

This message is issued in response to a
*MODIFY,Q,DD= command. JES3 has successfully
changed the status of the spool data set(s) specified in
the command. The preceding messages describe the
status of each job affected by the command.

**System action:** If HELD, STOPPED, or CANCELLED
appears in the message, JES3 puts the specified spool
data sets in spool hold status and does not allocate any
additional space on the data set.

If RELEASED appears in the message, JES3 removes
the data set from spool hold status; the data set is now
available for use.

**Operator response:** None. This is an informational
message.

Routing Code: Note 18  Descriptor Code: 5,7
IAT8086

Routing Code: Note 13  Descriptor Code: 5,7

Explanation:

- JOB jobname (jobid) IS NOT IN DJC NET
- NOT CANCELLED

An attempt was made to cancel a DJC job using the *MODIFY,J=jobno,C command, or to cancel a non-DJC job using the *MODIFY,N command.

System action: Not applicable.

Operator response: See the *MODIFY,N command in z/OS JES3 Commands.

Module:

IAT8087

Routing Code: Note 13  Descriptor Code: 5,7

Explanation:

- JOB jobname (jobid) NOT CANCELLED
- DYN ALLOCATION ACTIVE
- MDS RESTART ACTIVE
- ACTIVE DEMAND SELECT JOB
- SYSTEN NON-CANCELABLE

The operator attempted to cancel a job that is currently active in dynamic allocation or MDS restart, or the job is a demand select job that is currently active on a main.

System action: The cancel command is ignored.

Operator response: If the job is active in MDS restart or dynamic allocation, try canceling the job again at a later time by entering *C,S,jobno. If a mount is outstanding, reply CANCEL to the WTOR message.

If the job is an active demand select job, wait until processing ends and reenter the *CANCEL command.

If the job is a system non-cancellable job, enter the MVS FORCE JOB,ARM command.

Module:

IAT8088

Routing Code: Note 18  Descriptor Code: 5,7

Explanation:

- NOT FOUND
- JCT BUSY-DJ ACTIVE
- JCT BUSY

This message is normally issued in response to a *MODIFY,J=jobno,C command or an *I,j=jobno command. For *I,j=jobname commands, when the JCT is busy, the system will respond with UNKNOWN in the job name. For *I,j=jobname commands, UNKN will be placed in the job number field. See individual explanations below for specific message texts.

JOB NOT FOUND:

- The designated job jobname or jobno could not be found or is not the correct DJC job.

JCT BUSY-DJ ACTIVE

- The JCT could not be accessed; the dump job DSP is active for the job.

JCT BUSY

- JCT is busy, in use by another FCT.

System action: Processing continues.

Operator response:

JOB NOT FOUND:

- Verify that the correct job identification is being used and retry the command. If the job is not in the correct DJC network or the job number and name are not the same as those of a job to be canceled, the DJC network may have to be forced from the system.

JCT BUSY-DJ ACTIVE

- Wait until the dump job DSP is complete and retry the command.

JCT BUSY

- Retry the command.

Module:
IAT8089

Explanation:

A *MODIFY,J= command was issued from a remote workstation to change the priority of a job but one of the following occurred:

- The workstation is not part of the same device group as the workstation originally used to enter the job.
- The job being modified has not completed main service processing.

System action: JES3 ignores the command; the job priority is not modified.

Operator response: If the command was issued from an incorrect workstation, resubmit the command from a terminal in the correct device group. If the job has not completed main service processing, wait a short time and try entering the command again.

- **IS NOT A VALID SYSTEM NAME**
- **IS NOT CONNECTED**
- **DOES NOT SUPPORT THE *I,X,M= COMMAND**

System action: Processing continues.

Operator response: Correct and reissue the command is necessary.

Module:

Containing IATIQDX  Detecting IATIQDX  Issuing IATIQDX

IAT8095

Explanation:

This message is issued when a `*MODIFY,J=job,RUN` command is rejected for the job and message IAT8037 indicates that the job is not eligible to run. Message IAT8095 is issued for each system associated with the job to describe why the job cannot run on that system.

System action: Processing continues.

Operator response: The following reasons can prompt action on your part. Do not take action blindly (e.g. enabling a class on a system where it was not intended to be enabled):

- **JOB CLASS DISABLED** - The job class is disabled on the specified system. Issue a `*MODIFY,G,sysname,C,cls,ON` command to enable the job class on that system.
- **JOB IN DJC HOLD** - The job is in DJC hold. Issue a `*MODIFY,N` command to release the job from DJC hold.
- **GROUP DISABLED** - The job class group is enabled on the specified system. Issue a `*MODIFY,G,sysname,G,grp,ON` command to enable the group on that system.
- **MAIN OFFLINE/NOT CONNECTED** - The main processor (system) has been varied offline or is not connected. Issue the `*VARY,sysname,ON` command to vary the system online or perform the required procedures to make the system available so it can connect to the global.
- **WAITING FOR SPOOL SPACE** - There is not enough spool space available to schedule the job for execution. That is, the spool partition assigned to the job, class, or system is below the marginal spool space threshold. Make spool space available in the job's, class's, or system's spool partition by canceling jobs, starting writers, dumping jobs to tape with DJ or whatever mechanism you use to free up spool space.
- **SCHEDULING ENVIRONMENT NOT DEFINED** - The job's scheduling environment is not defined in the current WLM policy. Have the system programmer modify the policy to include the scheduling environment. Then install the new WLM service definition and activate the new policy using the `VARY WLM,POLICY=` command.
- **SCHEDULING ENVIRONMENT NOT AVAILABLE** - The job's scheduling environment is not available. Issue a `MODIFY WLM,RESOURCE=` command to make the resources associated with the scheduling environment available on the specified system.
• WLM RECLASSIFICATION IS IN PROGRESS - A new WLM service definition has been installed and a new policy has been activated. JES3 is in the process of reclassifying jobs in the JES3 job queue. Wait for message, IAT2011, to be deleted and message IAT2016 to be issued indicating that reclassification has completed. Then reissue the *MODIFY,J=job,RUN command.

• SRVCCLASS MODIFY IN PROGRESS - The job’s service class is being modified (e.g. from a *MODIFY, J=job,SRVCCLASS=srvclass command). Wait for the service class modify to complete and then reissue the *MODIFY,J=job,RUN command.

• MAX JES MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in JES managed initiators (65535) is active and no new job can run on this main in a JES managed initiator until one of these active jobs ends or is canceled.

• MAX WLM MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in WLM managed initiators (65535) is active and no new job can run on this main in a WLM managed initiator until one of these active jobs ends or is canceled.

• JESLOG VALUE NOT SUPPORTED ON MAIN - The job specified (on the JOB statement or the START command) or inherited (from the class definition) a JESLOG attribute of SUPPRESS or SPIN. The main processor for which this text is displayed for the job is not at a sufficient JES3 level to allow the job to run on that processor.

However, the spool data set specified in the *MODIFY command contains spool space allocated from the single track table (STT). If the spool space can no longer be allocated from the specified spool data set, JES3 will fail any job with spool space allocated from this data set.

System action: Command processing continues.

Operator response: If you issued the command with the DRAIN or HOLD parameter after receiving I/O error messages and you plan to leave the volume containing the spool data set online, no response is required. Be aware that additional I/O errors might occur that can impact the allocated STT records on the data set.

If you issued the command with the STOP or CANCEL parameter to make the spool data set unavailable to JES3 on the global, restart JES3 to remove the spool data set from the system. Restart processing automatically cancels all jobs with STT records on the data set. (You must also restart the locals when removing a spool data set.) When restart is complete, you can resubmit the canceled jobs.

Module:

IAT8096

Explanation:

One of the following commands was issued so that JES3 cannot allocate spool space from the specified data set.

*MODIFY,Q,DD=ddn,{ DRAIN } { HOLD } { CANCEL } { STOP }
IAT8098

Explanation:

- OVERFLOW MODIFY FOR spart REJECTED,

  CIRCULAR OVERFLOW WOULD RESULT
  OVERFLOW FROM DEFAULT PARTITION NOT ALLOWED
  SAME PARTITION NAME SPECIFIED
  INVALID PARTITION NAME SPECIFIED

A *MODIFY,Q,SP=spart1,O=spart2 command was issued to change the overflow capability of the specified spool partition. One of the following error conditions occurred.

CIRCULAR OVERFLOW WOULD RESULT
The MODIFY would result in a circular overflow chain. This is part1 -> part2 -> part3 -> part1. This is not allowed and the command is ended.

OVERFLOW FROM DEFAULT PARTITION NOT ALLOWED
The MODIFY would result in the default partition overflowing. By definition the default partition cannot overflow.

SAME PARTITION NAME SPECIFIED
The operator entered the same partition name for both the overflowing spool partition and the overflow spool partition. This is not allowed and the command is ended.

INVALID PARTITION NAME SPECIFIED
An incorrect spool partition name was specified for one or both of the spool partitions referenced in the command. The command is ended.

System action: Processing continues.

Operator response: Check the partitions defined by issuing the *INQUIRY,Q,SP=ALL command.

Module:  

Routing Code: 2  Descriptor Code: 5,7

IAT8100

Explanation:

- MODIFY REJECTED FOR main
  - GROUP group IS WLM MANAGED

This message is in response to a *MODIFY,G command used to modify any of the following initiator options for a WLM-managed group:
- Number of initiators
- Initiator allocation
- Initiator deallocation
- BAR - job selection priority barrier
- JSPAN - Number of jobs to examine when attempting to select a job

System action: JES3 ignores the command.

Operator response: If you need to change the initiator or job selection options, first change the group's mode to JES3 managed using the *MODIFY,G,ALL,G,grp,MODE,JES command. Then reissue the command to change the initiator or job selection options.

Module:  

Routing Code: Note 18  Descriptor Code: 5,7

IAT8102

Explanation:

- MODE CHANGE REJECTED FOR group-reasontext

This message is issued in response to a *MODIFY,G,ALL,G,grp,MODE,(WLM|JES) command to change a job class group mode from JES managed to WLM managed or from WLM managed to JES managed. reasontext is one of the following:
- SYSTEM MUST BE SPECIFIED AS 'ALL' - ALL must be specified as the system name because the MODE setting is not system specific (you can't have a group WLM managed on one system and JES managed on another).
• WLM RECLASSIFICATION IN PROGRESS - A new WLM service definition has been installed and a new WLM policy has been activated. JES3 is in the process of reclassifying all of the jobs. Message IAT2011 is issued to indicate reclassification is in progress. Message IAT2016 will be issued when reclassification completes.

• WLM INITIALIZATION FAILED - WLM batch initiator management initialization did not complete successfully. Message IAT3115 was previously issued during JES3 initialization.

System action: JES3 ignores the command.

Operator response: If the command was rejected because ALL was not specified as the system name, correct and reissue the command. If the command was rejected because reclassification is in progress, wait until message IAT2016 is issued to indicate reclassification has completed. Then reissue the command.

IAT8103

Explanation:

This message is issued in response to a *MODIFY,G,ALL,G,group,MODE,(WLM|JES) to change a job class group mode from JES managed to WLM managed or from WLM managed to JES managed.

System action: Processing continues.

Operator response: None.

Module:

<table>

</table>

Routing Code: Note 18   Descriptor Code: 5,7

IAT8104

Explanation:

This message is issued in response to a *MODIFY,G,main,G,grp command to enable a WLM-managed group on a system that is not at least at the JES3 OS/390 Version 2 Release 8 (HJS6608) level. The group was successfully enabled, but since JES3 is not at a level that supports WLM initiator management, no WLM-managed initiators will be started, and no jobs in the job class group will be selected for execution on that system.

System action: Processing continues, but no WLM-managed initiators will be started on that system.

Operator response: None.

Routing Code: 10   Descriptor Code: 5,7

IAT8106

Explanation:

A *MODIFY,G=cls request was rejected. *reasonext specifies the reason the command was rejected and can be one of the following:

• KEYWORD kwd UNKNOWN - The keyword specified on the *MODIFY command is not valid.
• CLASS NOT FOUND - The specified job class is not defined to JES3.
• INSUFFICIENT STORAGE - Unable to obtain storage necessary to satisfy the *MODIFY request.
• SPART spart NOT FOUND - A *MODIFY,C=cls,SP=spart command was rejected because the spool partition is not defined to JES3.
• SPART spart DELETED - A *MODIFY,C=cls, SP=spart command was rejected because the spool partition is deleted.
• SPART spart ALLOCATION IS NOT ALLOWED - A *MODIFY,C=cls,SP=spart command was rejected because spool space allocation is not allowed in the spool partition.
• GROUP grp NOT FOUND - A *MODIFY,C=cls,GROUP=group command was rejected because the group is not defined to JES3.
• MDS RESTART IS NOT COMPLETE - A *MODIFY,C=cls,GROUP=group command was rejected because MDS restart has not completed.
• CLASS SYSTEMS NOT SUBSET OF GROUP SYSTEMS - A *MODIFY,C=cls,GROUP=group command was rejected because the systems defined for the class are not a subset of the systems defined for the group. For example, the class is defined to run on SY1 and SY2, but the group is defined to run on systems SY1 and SY3.
• SDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,SDEPTH= command was rejected because the value specified for SDEPTH is not a valid numeric value.
• SDEPTH xxx TOO HIGH - A *MODIFY,C=cls,SDEPTH= command was rejected because the value specified for SDEPTH is greater than the maximum allowable value.
• TDEPTH xxx TOO HIGH - A *MODIFY,C=cls,TDEPTH= command was rejected because the value specified for TDEPTH is greater than the maximum allowable value.
• TDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,TDEPTH= command was rejected because the value specified for TDEPTH is not a valid numeric value.
• TLIMIT nnn TOO HIGH - A *MODIFY,C=cls,TLIMIT= command was rejected because the value specified for TLIMIT is greater than the maximum allowable value.
• MDEPTH main NOT FOUND - A *MODIFY,C=cls,MDEPTH= command was rejected because the main specified in the MDEPTH parameter is not defined to JES3.
• MDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,MDEPTH= command was rejected because the value specified for MDEPTH is not a valid numeric value.
• MDEPTH nnn TOO HIGH - A *MODIFY,C=cls,MDEPTH= command was rejected because the value specified for MDEPTH is greater than the maximum allowable value.
• MLIMIT cls SAME AS MODIFY CLASS - A *MODIFY,C=cls,MLIMIT= command was rejected because the class specified in the MLIMIT parameter is the same as the class being modified.
• MLIMIT main NOT FOUND - A *MODIFY,C=cls,MLIMIT= command was rejected because the main specified in the MLIMIT parameter is not defined to JES3.
• MLIMIT cls NOT FOUND - A *MODIFY,C=cls,MLIMIT= command was rejected because the class specified in the MLIMIT parameter is not defined to JES3.
• MLIMIT xxx NOT A NUMBER - A *MODIFY,C=cls,MLIMIT= command was rejected because the value specified for MLIMIT is not a valid numeric value.
• MLIMIT nnn TOO HIGH - A *MODIFY,C=cls,MLIMIT= command was rejected because the value specified for MLIMIT is greater than the maximum allowable value.
• JESMSG AND SPIN INCONSISTENT - A *MODIFY,C=cls,JESMSG= or *MODIFY,C=cls,SPIN= command was rejected because it would result in mutually inconsistent SPIN and JESMSG settings. In particular, when JESMSG=NOLOG for a class, the SPIN parameter for the same class cannot be anything other than NO, and when the SPIN parameter for a class is YES, a time, time interval, or line interval, JESMSG cannot be set to NOLOG.
• SPIN xxxxxxxx UNKNOWN FORMAT - A *MODIFY,C=cls,SPIN= command was rejected because the SPIN value is not YES or NO and is not recognized as a valid time of day, time interval or line interval. This reason text includes an hour, minute, hour interval, or minute interval that exceed two digits or a line interval that exceeds three digits.
• SPIN xxxxxxxx HOUR EXCEEDS 23 - A *MODIFY,C=cls,SPIN=hh:mm command was rejected because the hour value on the specified time of day exceeds 23.
• SPIN xxxxxxxx MINUTE EXCEEDS 59 - A 
  *MODIFY,C=cls,SPIN=hh:mm command was rejected because the minute value on the specified time of
  day exceeds 59.
• SPIN xxxxxxxx MINUTES EXCEED 59 - A 
  *MODIFY,C=cls,SPIN=+hh:mm command was rejected because the minute value on the specified
  time interval exceeds 59.
• SPIN xxxxxxxx INTERVAL BELOW +00:10 - A 
  *MODIFY,C=cls,SPIN=+nnn, or 
  *MODIFY,C=cls,SPIN=nnnM command was rejected because the specified line interval is less than the
  required minimum of 500 lines.

System action: JES3 ignores the command.
Operator response: Correct and reissue the command.

IAT8107

Explanation:

**— JOB—** **jobname** (**jobid**) — SERVICE CLASS CHANGE——

This message is issued in response to a 
*MODIFY,J=jobno,SRVCLASS= srvclass command. The designated job has been changed to a new service
class. reason can be one of the following:

• srvclass IS NOT VALID - The service class that was specified on the *MODIFY command is not valid.
• C/I INCOMPLETE - The job has not completed C/I processing.
• MAIN SERVICE COMPLETE - The job has completed main service.
• main IS NOT AVAILABLE - The job is in execution on a local processor that is not connected.
• WLM NOT SUPPORTED ON main - The job is executing on a JES3 local processor that does not support WLM batch initiator management. That is, JES2 is not at the OS/390 Version 2 Release 8 level (HJS6608) on the local processor.
• main NOT FOUND - The main where the job is executing was not found.
• DEMAND SELECT JOB - The specified job is a demand select job (TSO logon or started task).
• NO MAIN SCHEDULER ELEMENT - The specified job does not have a main scheduler element.

System action: JES3 ignores the command.
Operator response:

IAT8109

Explanation:

**— CLASS ILLEGAL, MORE THAN ONE CHARACTER SPECIFIED——

This message is issued in response to a 
*MODIFY,NJE,ADDAL= command to add a new alias or a *MODIFY,NJE,NAME= command to modify the home node or an existing alias. The command was issued with a default class parameter (PRDDEF, PRDTSO, PRTXWTR, or PUNDEF), but the class specified is more than one character.

System action: JES3 rejects the command and continues processing.
Operator response: Correct and reissue the command.
IAT8110 • IAT8114

IAT8110
Explanation:
➤➤ CLASS NOT ALLOWED WITH ADD= OR DEL=➤➤

This message is issued in response to a
*MODIFY,NJE,ADD= or a *MODIFY,NJE,DEL= command. The command was issued with a default
class parameter (PRTDEF, PRTTSO, PRTXWTR, or
PUNDEF). These default classes cannot be specified
when deleting a node or adding a node other than an
alias.

System action: JES3 rejects the command and
continues processing.

Operator response: Correct and reissue the
command.

Module:

IAT8111
Explanation:
➤➤ MODULE— module— HAS BEEN LOADED➤➤

This message is issued in response to a
*MODIFYX,M=module,LOAD command. It indicates that
the specified module has been loaded.

System action: Processing continues.

Operator response: None.

Module:

IAT8112
Explanation:
➤➤ BSC PROTOCOL NOT DEFINED,➤➤
➤➤ REQUEST IGNORED➤➤

This message is issued in response to an *F
NJE,NAME=nodename,TYPE=BSC command. The
request to change the networking protocol being used
between your node and the remote node 'nodename' to
BSC could not be done because the BSC protocol was
not defined at initialization time through a DEVICE
DTYPE=NJELINE initialization statement.

System action: JES3 ignores the command.
Processing continues

Operator response: None. This is an informational
message.

Module:

IAT8113
Explanation:
➤➤ NETHOLD IS VALID ONLY FOR THE HOME NODE➤➤

This message is issued in response to a
*MODIFY,NJE,NAME= nodename,NETHOLD={YES|NO} command. The NETHOLD parameter is only valid if the
specified node is the home node.

System action: JES3 ignores the command.

Operator response: Reissue the command specifying
the home node.

Module:

IAT8114
Explanation:
➤➤ DEST— dddddddd— NOT➤➤

This message is issued in response to a
*MODIFY,NJE,ADD= or a *MODIFY,NJE,DEL= command. The command was issued with a default
class parameter (PRTDEF, PRTTSO, PRTXWTR, or
PUNDEF). These default classes cannot be specified
when deleting a node or adding a node other than an
alias.
The action specified for the named destination on the *MODIFY,DEST command was not taken. The reason is given in the message text.

System action: JES3 ignores the command and processing continues.

Operator response: Correct the command and resubmit it.

IAT8120

Explanation:

**JDS BUSY FOR J=**

**jobname**

**JDS BUSY FOR J=**

**jobno**

**JDS BUSY FOR J=**

**ddn**

Information requested for the indicated job and ddname cannot currently be provided because another JES3 function is accessing the JDS control block necessary to provide that information.

**System action:** Processing continues.

**Operator response:** Reenter the desired *INQUIRY command.

**Module:**

IATIQOI IATIQOI IATIQOI

Routing Code: Note 18  Descriptor Code: 5,7

IAT8121

Explanation:

**NO LIMITED**

**OUTPUT FOR SELECTED OPTIONS, error test**

NO indicates that an *INQUIRY,U or *MODIFY,U command was entered and no output service element (OSE) in the output queue matches the selection parameters entered. The job may already have been selected by a writer which would account for no OSE in the output queue. If received in response to a *MODIFY U command, this message may indicate that the data set's OSE or JDS control block was in use by another function. LIMITED indicates that processing of a *MODIFY,U command was prematurely ended because of system limitations.

**error test** is one of the following:

**JOB NOT FOUND**

One of the following has occurred:

- The requested job is not in the requested output queue.
- The requested job did not contain an OSE that matched the parameters of the input command.
- The requested job did not contain the requested ddname.

**OSE NOT FOUND**

An output service element was not found.

**JDS ENTRY NOT FOUND**

The JDS entry for the requested data set was not found.

This message is issued in response to a *MODIFY,U command. The specified job has been changed as requested. If DATA SET appears, the specified data set of the job has been changed.

**System action:** JES3 continues processing.

**Operator response:** None. This is an informational message.

**Module:**

IAT8131

Explanation:

• JOB= jobname(jobid)
• P= prty
• .D= destination
• ,MGE= mmmnn,nnnnn
• ,W= external-writer-name
• ,T= terminal-name
• ,DG= devgrp
• ,F= form-name
• ,C= carriage-tape-name
• ,U= train
• ,CH= chid, chid...
• ,FL= flash id
• ,C= client-jobname(client-jobid)
JES3 issues this message in response to an *INQUIRY, U command. If *I,U,Q= [ WTR | HOLD ] was entered, the parameters that appear in the message are the same as the parameters that were entered in the command. The exceptions are the L=, PG=, SR=, and BY= parameters, which always appear. COPIES= appears when DD= is specified. DG= appears when either T= or DG= is specified on the *I,U,Q= command. T= appears if no parameters are specified. If the *I,U,Q=TCP or *I,U,Q=BDT command is entered, the parameters that appear in the message are the same as the parameters that are entered in the command. The exceptions are D= and TG= or BG=. This information will always appear if J= is specified.

**jobname (jobid)**
- Specifies the job name and job identifier associated with the output.
- **P=** Specifies the priority assigned to the output.
- **D=** Specifies the destination for the output.
- **AGE=** Specifies the total number of days or hours the job has been on the spool.
- **W=** Specifies the name of the external writer that can process this output. You can use a TSO userid as the external writer name if the data set is on the HOLD queue waiting for a TSO receive request.
- **T=** or **DG=**
  - Specifies the value for the device group as assigned on the DGROUP= parameter on the DEVICE initialization statement. The T= parameter refers to the RJP terminal name.
- **F=** Specifies the form name needed to process the output.
- **C=** Specifies the name of the carriage control tape or the forms control block needed to process the output.
- **U=** Specifies the type of train that must be in a printer to process the output.
- **CH=**
  - Specifies the character generation module names.
- **FL=**
  - Specifies the flash image name.
- **CJ=**
  - Indicates that the data set was created with a spinoff name and/or job id.
- **CM= module**
  - Specifies the copy modification module name.
- **trc**
  - Specifies the table reference character.
- **SS=**
  - C specifies the continuous forms stacker.
  - S specifies the continuous forms stacker.
CL=
 Specifies the SYSOUT class assigned to the output.

ID=
 Specifies the TSO/E userid associated with the output.

DD= data set DDNAME(seq-number)
 data set specifies the ddname of the data set. The
 ddname can contain one to three levels of qualification. The sequence number is the order of occurrence of that ddname within the job.

DD=ddn NAVAIL-
 Indicates that the ddname could not be accessed at the time the *INQUIRY command was issued.

DSN=dsn
 dsn contains a five-part identifier consisting of the nodename, userid, jobid, dsnumber, and dsname

H=types
 Indicates one of the following hold types:

   OPER | O  The operator placed the data set in hold. This keyword can be used with the SYS and USER keywords.

   SYS | S  The JES3 subsystem placed the data set in hold. This keyword can be used with the OPER keyword.

   USER | U  The user placed the data set in hold. This keyword can be used with the OPER keyword.

   YES | Y  The output is currently held. This keyword will not be used with any other keyword.

   NO | N  The output is currently not held. This keyword will not be used with any other keyword.

Note: If Q,H=types was specified, the parameter types and associated reason codes are not valid.

If H=SYS and R=(002) appeared, see the accompanying message for more information.

If H=SYS appears in the message text, then R=([nnn] variable-text) will also be displayed following the hold keyword. nnn is the decimal reason code associated with one of the following variable-texts:

- (000) UNKNOWN REASON CODE
- (001) FSI RELDS UNPRINTABLE-SWB ERR
- (002) FSI RELDS UNPRINTABLE-FSA
- (003) SAF AUTH FAILED
- (101) NETWORK NODE nodename INVALID
- (105) GET DATASET PROCESSOR ERROR
- (106) FSI RELDS UNPRINTABLE-ABEND
- (111) JDSPOIN ERROR OSDPOIN ROUTINE
- (115) PROCESS SYSOUT DATA SET HELD
- (120) JDS POINT ERROR IN CHKPT ROUTINE
- (121) CHKPT ASSIGN IN STT FAILED
- (122) CHKPT ASSIGN IN JOBSTAT FAILED
- (123) CHKPT ASSIGN IN DSTAT FAILED
- (140) FSS PIPELINE ERROR - PDQJBSEL
- (141) FSS PIPELINE ERROR - PDQDSSEL
- (142) FSS PIPELINE ERROR - PDQWOSWR
- (143) FSS PIPELINE ERROR - PDQWOSRD
- (144) MISSING OUTPUT REFERENCE

PM=
 Specifies the mode needed to process the output.

L=
 Specifies the total number of lines for the output.

PG=
 Specifies the total number of pages for the output.

SR=
 Specifies the total number of spool records the output occupies.

BY=
 Specifies the number of bytes in this job's data set.

COPIES=num-of-copies[QS]
 QS indicates that this copy of the data set is queued for separate writer scheduling. Several writers may concurrently print one copy of a multiple-copy data set. This also indicates that *MODIFY,U commands that are data set specific might not produce the desired output.

BG=
 Indicates the MVS/BDT group identifier that is assigned to a network job.

BJ=bdt job# I (NAVAIL)
 Indicates the BDT job number assigned to the network job. If NAVAIL appears, no BDT job number was assigned because there is no connection or the jobpool is exhausted.

BS=
 Indicates the status that a network stream is in. The possible states are:

   INACTIVE
   JES3 has not sent the network stream to the MVS/BDT subsystem.

   SENT
   JES3 sent the network stream to the MVS/BDT subsystem.

   QUEUED
   The network job is on the MVS/BDT job queue and is waiting to be processed by the MVS/BDT subsystem.
ACTIVE
The network stream is being sent to the next node in the path.

BT=
Specifies if the network stream is a network job or SYSOUT stream.

BY=
Specifies the number of bytes in this job's data set.

SL=security label | (NAVAIL)
Indicates the security label assigned to the data set by the security product. If NAVAIL appears, the security label was not assigned by the security product.

APPC=Y|N|tpjobname(tpid)
Specifies that the data set was generated by an Advanced Program-to-Program Communication (APPC) transaction program. Specifying Y allows you to display all APPC output while specifying N display non-APPC output. The tpjobname displays a specific transaction program.

OB=outbin value
Indicates the OUTBIN value associated with the SYSOUT data.

IP={ipaddr | N}
Specifies the IP address for the output.

FD={formdef | NONE}
Specifies the FORMDEF for the output.

PD={pagedef | NONE}
Specifies the PAGEDEF for the output.

TG=
Indicates the TCP/IP group identifier that is assigned to a network job.

TS=
Indicates the status that a network stream is in. The possible states are as follows:

INACTIVE
JES3 has not sent the network stream to a Netserv.

QUEUED
JES3 sent the network stream to a Netserv. The stream is waiting to be processed by the Netserv.

ACTIVE
The network stream is being processed by a Netserv.

TT=
Specifies if the network stream is a network job or SYSOUT stream.

System action: Processing continues.
Operator response: None. This is an informational message.
Module:

IAT8132

Explanation:

\[\text{I/O ERROR, OUTPUT MAY BE LOST}\]

This message is issued when an I/O error occurs reading OSE control blocks. Recovery is attempted but the OSE chain may have been truncated, which results in a loss of output for the job. In the message text: \(jj\) is the affected job name. \(jobid\) is the affected job id.

System action: Processing continues.
Operator response: None. This is an informational message.
Module:

IAT8133

Explanation:

\[\text{UNABLE TO COMPLETE INQUIRY}\]

This message indicates that an *INQUIRY, U command was issued but JES3 was unable to respond properly. One or more of the response entries will be missing.

System action: Processing continues.
Operator response: Issue the *INQUIRY, U command again.
Module:
IAT8134

Explanation:

➤— INVALID DEST CHANGE REQUEST,

➤ USE NJE REROUTE

HOME NODE CANNOT BE USED

An *F,U,Q= BDT or *F,U,Q= {HOLD I WTR},ND= command was issued in an attempt to reroute a job's output to another node for processing.

USE NJE REROUTE

appears in the message if the operator attempted to reroute a data set from the BDT queue.

HOME NODE CANNOT BE USED

appears in the message if the operator attempted to reroute a data set to the home node.

System action: The destination change request is not made. JES3 processing continues.

Operator response: Issue a *CALL NJEROUT command to reroute the data set from the BDT queue or from the home node.

Module:

IAT8137

Explanation:

➤— INVALID CONSOLE NAME SPECIFIED

An unknown or reserved console name was specified on the CONS= parameter of the *F,U or *I,U command.

System action: JES3 rejects the command and continues processing.

Operator response: Reissue the *MODIFY,U or the *INQUIRY,U command using a known console name. To determine the known MCS consoles issue the D CONSOLES command. To determine the known JES3 consoles issue the *INQUIRY O command.

System programmer response: None. See z/OS MVS Initialization and Tuning Reference for console name restrictions.

IAT8138

Explanation:

➤— DUPLICATE PARAMETER— xxxx

➤ FOR KEYWORD H=

The H= keyword on the *INQUIRY,U or *MODIFY,U command allows you to specify multiple parameters. Each parameter type can only be specified once on a single command. The possible values of xxxx are:

• O | OPER
• S | SYS
• U | USER
• Y | YES
• N | NO

System action: JES3 processing continues.

Operator response: Respecify the command. For more information about INQUIRY or MODIFY commands, see z/OS JES3 Commands.

</tr>
</thead>
<tbody>
<tr>
<td>IATIQOS</td>
<td>IATIQOS</td>
<td>IATIQOS</td>
</tr>
</tbody>
</table>

Routing Code: Note 18   Descriptor Code: 5,7

IAT8142

Explanation:

- A SWB UPDATE WAS UNSUCCESSFUL
- FOR JOB jobname (jobid)

This message is issued in response to a *MODIFY,U,Q=WTR or *MODIFY,U,Q=HOLD command. The system attempted to update the output SWB file on the JES3 spool and failed for at least one data set in the job.

System action: SYSOUT data might be bundled between a job header and trailer correctly but might not appear in the correct printer output bin, or SYSOUT data might not be bundled correctly between a job header and trailer, in addition to not appearing in the correct printer output bin. JES3 processing will continue as follows:

- If the output SWB file for at least one data set under a variable section of an OSE (IATYOSE) had been modified on the JES3 spool before the failure occurs, the OSE and the JES3 in-storage output service data base will be updated to reflect the requested change, allowing the OSE to be synchronized with the output SWB files.
- If no SWBTU file on the JES3 spool had been updated before the failure, the variable OSE and its data set sections will not be updated for any of the information on the MODIFY command, thereby preventing the OSE and output SWB from no longer being synchronized. The MODIFY will not take place in this case.

Operator response: Contact the system programmer to correct the system problems causing the output SWB update to fail, and then reenter the MODIFY command.

System programmer response: Possible causes for an error while trying to update the output SWB file on
the JES3 spool include read or write failures on the JES3 SPOOL, a Scheduler JCL Facility SWBTU_MERGE failure, or a failure in the JDSPOINT routine. Check the SYSLOG for more information.

For additional information on SJF services, see z/OS MVS Programming: Authorized Assembler Services Guide.

---

### IAT8143

**Explanation:**

- **SPECIFIC**
  - **IP**
  - **NIP**
- **SENSITIVE**
- **AND MUST BE ENCLOSED IN QUOTES**

This message is issued in response to the following commands when the programming variable is not enclosed in quotation marks:

- `*INQUIRY,Q=(HOLD|WTR),IP=ipaddr`
- `*MODIFY,Y,Q=(HOLD|WTR),IP=ipaddr` or `NIP=ipaddr`
- `*CALL,NJEROUT,NIP=ipaddr`
- `*START,NJEROUT,NIP=ipaddr`

**System action:** The command is rejected. JES3 processing continues.

**Operator response:** Issue the command again using proper case and syntax.

---

### IAT8144

**Explanation:**

- **INCORRECT COMBINATION OF USERID**
- **anf NIP**

This message is issued when the NIP= and ND= parameters are specified on the `*MODIFY` command when the NIP= parameter specifies an IP address and the ID= parameter specifies a userid as a secondary destination. An output data set cannot have both an IP address and a secondary destination.

**System action:** The command is rejected. JES3 processing continues.

**Operator response:** None.

---

### IAT8145

**Explanation:**

- **MODIFY COMPLETE FOR JOB**
- **job name (job id)—JESMSGLG UPDATED**

**System action:** JES3 processing continues.

**Note:** When updating the JESMSGLG data set through the `*F,J=xx,MSG='msg text'` command and the job is in Output Service, the update will occur. Response message IAT8145 is issued. However, if the JESMSGLG data set was printed before the issuance of this command, the message text will not appear in the printed SYSOUT.

**Operator response:** None.
System action: JES3 processing continues. The following reason codes can be returned:

<table>
<thead>
<tr>
<th>RC</th>
<th>Reason Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>EXECUTION COMPLETED</td>
</tr>
<tr>
<td>8</td>
<td>JESMSG MACRO ERROR</td>
</tr>
</tbody>
</table>

The following JESMSG macro return codes can be returned:

<table>
<thead>
<tr>
<th>RC</th>
<th>Reason Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>The JDS FDB field of RESQUEUE contained zeros. One possible cause could be an incorrect RESQUEUE address specified on the JESMSG macro.</td>
</tr>
<tr>
<td>08</td>
<td>There is no JESMSG entry in the JDS. The RESQUEUE may contain an incorrect JDS pointer or an incorrect RESQUEUE address may have been specified on the JESMSG macro.</td>
</tr>
<tr>
<td>0C</td>
<td>An incorrect TYPE subparameter was specified on the JESMSG macro.</td>
</tr>
</tbody>
</table>

Operator response: Determine if the job's JESMSGLG data set can be updated ("F J=xx,MSG="), can be spun off ("F J=xx,SPIN"), or can have its logging option changed ("F J=xx,LOGINOLOG"). The job can be in a state which does not allow the command to be processed. See the message reason code for an explanation.

For "F J=xx LOGINOLOG" processing, a reason code of X'0E' would have return code as any one of X'04' or X'08' or X'0C'. For "F J=xx MSG=" processing, a reason code of X'08' could have any return code from X'04' to X'18'.

Reissue the command if TRY AGAIN was appended to the message.

Module:

<table>

</table>

Routing Code: Note 18  Descriptor Code: 5

---

IAT8148

Explanation:

- MODIFY FAILED FOR JOB _job name (jobid)_
  
- SPIN RSN=_rsn_ [TRY AGAIN]

System action: JES3 was not able to successfully process the command. The following reason codes can be returned:

<table>
<thead>
<tr>
<th>RC</th>
<th>Reason Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>NOT IN EXECUTION (NO RSQ)</td>
</tr>
<tr>
<td>8</td>
<td>NOT IN EXECUTION (NO MPC)</td>
</tr>
<tr>
<td>12</td>
<td>NOT SPIN ELIGIBLE</td>
</tr>
<tr>
<td>16</td>
<td>NOT IN EXECUTION</td>
</tr>
<tr>
<td>20</td>
<td>NOT IN EXECUTION (NO MEM)</td>
</tr>
<tr>
<td>24</td>
<td>NO JLSI STORAGE</td>
</tr>
<tr>
<td>28</td>
<td>SRB FAILURE</td>
</tr>
<tr>
<td>32</td>
<td>IRB FAILURE</td>
</tr>
</tbody>
</table>

Operator response: Determine if the job's JESMSGLG and JESYSMSG data set can be spun off. If yes, the job can be in a state which does not allow for the data sets to be spun off, for example, PURGE. Reissue the command if 'TRY AGAIN' was appended to the message.

IAT8161 • IAT8162

IAT8161
Explanation:

This message is issued in response to a *MODIFY,SOCKET command. The command could not be completed for the given reason.

In the message text:

verb
  The verb indicating the type of modify (MODIFY, ADD, DELETE).

sname
  The name of the socket that was added, deleted, or changed.

error
  The object that has the error. This object is either of the following items:
  • The text 'KEYWORD' if a keyword is incorrect or specified more than once.
  • The name of a keyword (for example, 'PORT') if the specified keyword is syntactically legal but the name is specified incorrectly or this keyword is not allowed to be modified under the present conditions (for example, socket is active).

errval
  The value of the object that has the error.

reasontext
  The reason the MODIFY command was rejected, as indicated below.

reasontext specifies one of the following reasons that the command was rejected:

UNKNOWN
  The keyword specified on the *MODIFY command is not valid.

NOT FOUND
  The object specified on the DELETE=, SOCKET=, NETSERV=, or NODE= parameter does not exist.

NOT A NUMBER
  The value specified for PORT=port is not a number.

TOO HIGH
  The value specified for PORT=port exceeds 65535.

NOT TCP/IP
  The node specified on the NODE=node parameter exists, but the node is not defined with TYPE=TCP/IP.

MUST BE YES OR NO
  The value specified for the indicated keyword is incorrect. YES and NO are the only acceptable values for this keyword.

DUPLICATE
  The socket specified on the ADD= keyword already exists, or the indicated keyword was specified more than once.

SOCKET IS ACTIVE
  The specified socket is active. The only keywords that can be modified for an active socket are JTRACE, ITRACE, and VTRACE.

SOCKET IS PENDING
  The socket cannot be modified or deleted at this time because a start command (either *S,TCP,SOCKET=socket or *S,TCP,NODE=node) was previously issued and the socket is in a pending state while waiting for the connection to be made.

INTERNAL ERROR
  An unexpected error occurred.

System action:  The command is rejected.

Operator response:  Take one of the actions as indicated below:

SOCKET IS ACTIVE
  Retry the command with a different socket, or cancel the socket and reissue the command.

INTERNAL ERROR
  Notify the system programmer.

Anything else
  Correct and reissue the command.

System programmer response:  For INTERNAL ERROR, retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Routing Code:  Note 18  Descriptor Code: 5, 7

IAT8162
Explanation:

This message is issued in response to a *MODIFY,NETSERV command. The command has completed successfully.

In the message text:

verb
  The verb indicating the type of request (MODIFY, ADD, DELETE).
**IAT8163 • IAT8164**

**Explanation:**

> **verb**—REJECTED FOR NETSERV—**nname**

> **errobj** **errval**—**reasontext**

This message is issued in response to a *MODIFY,NETSERV command. The command could not be completed for the given reason.

In the message text:

**verb**

The verb indicating the type of modify (MODIFY, ADD, DELETE).

**nname**

The name of the Netserv that was requested to be added, deleted, or changed.

**errobj**

The object that has the error. This object is either of the following items:

- The text ‘KEYWORD’ if a keyword is incorrect or specified more than once.
- The name of a keyword (for example, ‘PORT’) if the specified keyword is syntactically legal but the name is specified incorrectly or this keyword is not allowed to be modified under the present conditions (for example, Netserv is active).

**errval**

The value of the object that has the error.

**reasontext**

The reason the modify command was rejected, as indicated below.

**reasontext** specifies one of the following reasons that the command was rejected:

**UNKNOWN**

The keyword specified on the *MODIFY command is not valid.

**NOT FOUND**

The object specified on the DELETE=, NETSERV=, or SYSTEM= parameter does not exist.

**NOT A NUMBER**

The value specified for PORT=port is not a number.

**TOO HIGH**

The value specified for PORT=port exceeds 65535.

**MUST BE YES OR NO**

The value specified for the indicated keyword is incorrect. YES and NO are the only acceptable values for this keyword.

**DUPLICATE**

The Netserv specified on the ADD= keyword already exists, or the indicated keyword was specified more than once.

**NETSERV IS ACTIVE**

The specified Netserv is active. The only keywords that can be modified for an active Netserv are JTRACE, ITRACE, and VTRACE.

**System action:** The command is rejected.

**Operator response:** Take one of the actions as indicated below:

**NETSERV IS ACTIVE**

Retry the command with a different Netserv, or cancel the Netserv and reissue the command.

**Anything else**

Correct and reissue the command.

**System programmer response:** None.

---

**IAT8180**

**Explanation:**

- dev—VARIED ONLINE ON
- GLOBAL main

This message is issued in response to a *VARY command. The *VARY was successful.

**Note:** After a device is varied online to a main, jobs and users running on that main can use it. After a device is varied online to global, JES3 Dynamic Support Programs (DSPs) can use it. For example, if the device being varied online is a printer, the WTR DSP can now use it. If the device being varied online is a tape, jobs running on that main and the Dump Job (DJ) DSP can now use it.

If a device is varied online to a local that is not connected, you cannot use this or any other device on that local until it connects.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**IAT8183**

**Explanation:**

- dev—MARKED PENDING OFFLINE ON main

This message is issued in response to a *VARY OFFLINE command for execution device dev that is
currently allocated. This message is also issued when
an operator attempts to *VARY online a device that is
pending offline because of a library vary.

**System action:** The device is marked JES3
*pending-offline* and will be varied offline when it is
deallocated, unless it is varied online again. If the
message was issued because an operator issued a
*VARY online for a device pending-offline because of a
library vary, the device remains pending-offline and is
varied offline when it is deallocated, unless the library is
varied online again.

**Operator response:** None. This is an informational
message.

**IAT8185**

**Explanation:**

>>> VARY RECOVER NOT ALLOWED

- INVALID PARAMETER
- NON-DASD DEVICE
- DDR SWAP ACTIVE
- SPOOL DEVICE
- MOUNT PENDING

This message is issued in response to a
*VARY,devname,RECOVER,proc* command. The command
was rejected for one of the following reasons:
1. The command was entered from a console that had
   an authority level lower than 15.
2. An incorrect parameter was specified on the
   command.
3. Volume verification could not be performed for the
   specific device.

**System action:** The command is ignored. Processing
continues.

**Operator response:** Correct the problem depending
on the reason specified. The following responses
correlate to the reasons in the explanation.
1. Reenter the command from a console with authority
   level fifteen.
2. Correct or remove the incorrect parameter specified
   in the message.
3. Enter the correct device address in the *VARY
   command or modify the status of the device for
   volume verification.

>>> VARY OF device REJECTED

- PREVIOUS CONSOLE STATUS
  DEVICE CURRENTLY IN USE
  ALREADY PROCESSING VARY
  SETUP NOT IN USE

This message is issued in response to a *VARY
command of an RJP line. The command was rejected
because:

**PREVIOUS CONSOLE STATUS**
the console is allocated. If you wanted to give the
device console status, the device is already an
active console. If you wanted to change the
console status to offline, you may not do so
because the console is allocated.

**DEVICE CURRENTLY IN USE**
the device is active with another DSP.

**ALREADY PROCESSING VARY**
JES3 is currently processing a *VARY ONLINE
command for that device.

**SETUP NOT IN USE**
Varying a SETUNITS device is invalid.

**System action:** JES3 ignores the command and
processing continues.

**Operator response:** Either resubmit the command
when the device is available, or contact the system
programmer for assistance. *INQUIRY,YO may be used
to display all remote consoles and their switched status.

**IAT8187**

**Explanation:**

>>> VARY devname

- ONLINE REJECTED - DEVICE

Module:
This message is issued in response to a *VARY,devname,ONLINE command. The requested device is functional subsystem (FSS)-supported and has not been assigned a device address for one of the following reasons:

- The device is in compatibility mode but is not connected to the global.
- The device is in FSS mode but is not connected to the main where the FSS is assigned to run with the current global.
- The device is in FSS mode, but the FSS has no assigned main with the current global.

**System action:** JES3 ignores the command.

**Operator response:** Use a *MODIFY,F,D= command to change the device mode, or a *MODIFY,F,FSS= command to change FSS system assignments, then reissue the *VARY command.

**Explanation:**

►► module— (dev-dev)►►

►► IS INVALID RANGE IN VARY COMMAND►►

This message is issued in response to a *VARY command. An incorrect range of devices was specified.
IAT8195
Explanation:
\[\text{REAL DEVICE CHECKPOINT DISABLED}\]
\[\text{DUE TO PERMANENT I/O ERROR}\]

During current processing, JES3 is unable to record modifications made to the online status of a real device in a checkpoint record because of a permanent JSAM I/O error.

System action: Processing continues. The existing real device online status checkpoint record is invalidated. If a cold or warm start is used to reinitialize JES3, all real devices will be initialized as specified in the initialization stream.

Operator response: Notify the system programmer.

Note: After the next hot start, you will need to vary offline any virtual units real devices not desired that are online before you issue the *START,JSS command.

Problem determination: See Table III, item 11.

Module:

<td>IATMOFS</td>
<td>IATMOFS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18  **Descriptor Code:** 5,7

---

**IAT8309**

**Explanation:**

- DEVICE-- devname----

This message is issued in response to a *MODIFY,F or a *MODIFY,W command. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. The mode of the specified device cannot be changed for the indicated reason:

**DEVICE CANNOT RUN UNDER FSS CONTROL**

Device mode is valid only for those devices which are eligible to run under the control of a functional subsystem (FSS); this device is not eligible.

**REQUESTED DYN ALREADY SET**

The *MODIFY,W command that the operator issued specified whether or not the device can be used by JES3 as a dynamic writer. The device is already set to the requested specifications.

**DEVICE CANNOT RUN UNDER COMP MODE**

Compatibility mode is valid only for those devices which are eligible to run under the control of both a functional subsystem (FSS) and JES3; this device is not eligible.

**REQUESTED MODE ALREADY SET**

The device is already in the requested mode.

**DEVICE ONLINE OR ALLOCATED**

The device mode may not be changed while the device is in use; to prevent erroneous mode changes, the device must be both offline and not currently allocated.

**FSS fssname HAS NO ASSIGNED SYSTEM**

FSS mode has been requested, but the assigned FSS fssname is unusable or has not been assigned a system on which to run in conjunction with the current global system.

**COMP MODE REQUIRES GLOBAL ATTACHMENT**

Compatibility mode requires that the device be attached to the global system; this device has no such attachment.

**FSS MODE REQUIRES ATTACHMENT TO main**

FSS mode requires that the device be attached to the system where the FSS is assigned to run, specified by main; this device has no attachment to system main.

**DGRPONLY=YES REQUIRES A DEVICE GROUP TO BE DEFINED**

Dgroup only mode is valid only if a device group has been defined.

**REQUESTED DGRPY ALREADY SET**

The device is already set to the requested specifications.

**REQUESTED SETUPMSG ALREADY SET**

The *MODIFY,W command specified whether or not message IAT7030 is suppressed. The device is already set to the requested specifications.

**SETUPMSG VALID FOR FSS SUPPORTED DEVICES ONLY**

The suppression of message (IAT7030) is valid only for those devices which are eligible to run under the control of a functional subsystem (FSS); this device is not eligible.
The PDEFAULT= parameter on the DEVICE (I/O) initialization statement is only valid for FSS devices. It cannot be specified or modified for non-FSS devices.

**keyword VALID FOR RJP DEVICES ONLY**
The keyword specified is valid only for RJP printers or punches, but the specified printer or punch is not RJP.

**XLATE IGNORED FOR 3211 COMPATIBLE DEVICES**
The XLATE keyword is ignored for 3211 compatible devices because the device performs its own translation.

**WORKSTATION IS ACTIVE**
The printer or punch cannot be modified while the workstation owning it is signed on.

**System action:** JES3 ignores the command.

**Operator response:** The *MODIFY,V command may be used to vary the device offline. The *MODIFY,F command may be used to change the FSS system assignments. If the error condition can be corrected, and if the mode change is still desired, reenter the command.

**Module:**

<table>

<tbody>
<tr>
<td>IATMODW</td>
<td>IATMODW</td>
<td>IATMODW</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18 **Descriptor Code:** 5,7

IAT8334
Explanation:

- **MODIFY COMPLETE FOR DEVICE** device

The *MODIFY,W command has completed for the specified device. If the command parameters were correct for this device, the requested changes will have been made for the device; however, if this device did not meet the required environmental characteristics of a parameter (for example, not an FSS device and the SETUPMSG= parameter was specified) that specific parameter will not have been processed for this device.

**Note:** If a parameter did not apply to this device, the IAT8334 message should be preceded by informational messages explaining which parameters did not apply and why they did not apply.

**System action:** JES3 processing continues.

**Operator response:** None. However, using the "I D D=" command to verify the results of the MODIFY command is recommended.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

</tbody>
</table>

**Routing Code:** Note 18 **Descriptor Code:** 5,7
IAT8335
Explanation:
During *MODIFY,CONFIG processing, JES3 could not find member member in the data set dsn specified in the JES3 procedure.
In the message text:

member The member name that you specified on the *MODIFY,CONFIG command.
dsn The data set name that you specified on the JES3IN DD statement in the JES3 cataloged start procedure.

System action: *MODIFY,CONFIG processing ends.
Operator response: Reissue the command with the correct member name.
System programmer response: None

Module:

Routing Code: Note 18  Descriptor Code: 5

IAT8336
Explanation:
JES3 encountered a permanent I/O error while searching for the member-name entry in the directory of the JES3IN data set. JES3 issues this message after return code 08 from a BPAM FIND. An out-of-storage condition might have caused the error.
In the message text:

member The member name you specified on the *MODIFY,CONFIG command.

System action: *MODIFY,CONFIG processing ends.
Operator response: Reissue the command with the same member name. If this second attempt fails, notify the system programmer.
System programmer response: Recreate the JES3IN data set and reissue the *MODIFY,CONFIG command.

Module:

Routing Code: Note 18  Descriptor Code: 5

IAT8337
Explanation:
JES3 issues this message in response to the *F CONFIG,ADD= command. Verify that JES3 should continue to execute this command.

System action:
- If you specify CANCEL, JES3 cancels the *MODIFY,CONFIG request.
- If you specify CONTINUE or U, JES3 continues *MODIFY,CONFIG processing.
- The LOG option will appear in the message only if a log was requested on the *MODIFY,CONFIG command. If you specify LOG in response to IAT8337, JES3 reissues the message without the LOG option.

Operator response: Reply LOG if you need to review the *MODIFY,CONFIG log before deciding whether to continue or cancel the modify process. Then reply ‘U’, ‘CONT’, or ‘CONTINUE’ to allow JES3 to process the command or ‘CANCEL’ to cancel the command.
System programmer response: Examine the initialization statements you are attempting to add and correct the error if JES3 issued any error/warning messages.

Module:

Routing Code: Note 18  Descriptor Code: 5

IAT8338
Explanation:
An error has occurred in the dynamic allocation of the JES3IN DD data set dname. This message is issued in conjunction with message IAT8340.
In the message text:

dname The data set name (DSNAME=) specified on the JES3IN DD statement

System action: *MODIFY,CONFIG processing ends.
IAT8339

Explanation:

An error occurred in the dynamic unallocation of the JES3IN DD data set. JES3 issued this message in conjunction with message IAT8340.

System action: *MODIFY,CONFIG processing ends.

Operator response: Notify your system programmer.

System programmer response: See message IAT8340 which contains the dynamic allocation return code, the information reason code, and the error reason code.

Module:

Routing Code: Note 18  Descriptor Code: 5

IAT8340

Explanation:

An error occurred in the dynamic allocation or unallocation of the JES3IN DD data set. JES3 issued this message in conjunction with message IAT8339. The dynamic allocation provides the return code rc and SVC 99 issues the err_code error code, and information code info_code.

In the message text:

rc  The return code issued from dynamic allocation

err_code  The error reason code from dynamic allocation

System action: *MODIFY,CONFIG processing ends.

Operator response: Notify your system programmer.

System programmer response: See z/OS MVS Programming: Authorized Assembler Services Guide to determine the cause of the failure and how to correct it.

Module:

Routing Code: Note 30  Descriptor Code: 5

IAT8341

Explanation:

The data set specified by the JES3IN DD failed to open. In the message text:

rc  The return code from OPEN

System action: *MODIFY,CONFIG processing ends.

Operator response: Notify your system programmer.

System programmer response: If IEC141I was issued before this message, see the explanation of IEC141I in z/OS MVS System Messages, Vol 7 (IEB-IEE).

Module:

Routing Code: Note 30  Descriptor Code: 5

IAT8342

Explanation:

The data set represented by the DD statement JES3IN in the JES3 procedure is not in blocked 80-character card image format. Only 80-character multiple blocks are acceptable for use as JES3IN.

System action: *MODIFY,CONFIG processing ends.

Operator response: Notify your system programmer.

System programmer response: Recreate the data set that contains the JES3 initialization statements.
specifying a block size that is an integral multiple of 80, or correct the DD statement in the JES3 procedure to specify the proper data set.

IAT8349

Explanation:

**ERROR** — READING **WRITING** THE CHECKPOINT **FOR THE *F,CONFIG COMMAND, RC= rc**

During *MODIFY,CONFIG processing, the read or write of the JES3 checkpoint data set failed. If a read error occurred, *MODIFY,CONFIG processing ended before any of the requested changes could be made. If a write error occurred, the requested changes have been made in storage, but they will not be available if you perform a hot start. If you have to restart JES3, you should add the requested information to your initialization stream and perform a hot start with refresh or a warm start.

**System action:** *MODIFY,CONFIG processing ends. However, the changes that were made are not checkpointed.

**Operator response:** Notify the system programmer.

**System programmer response:** If you need to restart JES3, be certain to add the initialization statements from the *MODIFY,CONFIG command to your initialization stream and perform a hot start with refresh or a warm start.

Explanation:

The action requested in the last trace modify command entered has been completed. If a rc appears, it indicates the status of the last operation:

00 request completed successfully.
08 exclusive dump ID is less than 0001; no action.
10 exclusive dump ID is greater than 4095; no action.
12 exclusive dump ID queue is full. You may enter your exclusive trace request after resetting the existing exclusive ID queue with a *MODIFY,E,EXCL=RESET command.
16 dump ID is less than 0001; no action.
18 dump ID is greater than 4095; no action.
20 the associated exclusive dump is not permitted; no action.
22 the associated dump is not permitted; no action.
24 trace trap is active. You may enter your trap request after resetting the active trap with a *MODIFY,E,TRAP=RESET command.
26 address for trap is incorrect (must be 6 characters); no action is taken.
28 module not found on JDE queue or on CDE queue; no action is taken.
30 DSPSERV request failed while attempting to create or delete a trace data space.
32 ALESERV request failed.
34 The specified trace is already active for a *MODIFY,E,START=xx command.
36 The specified trace is not active for a *MODIFY,E,STOP=xx command.
38 The size of the trace specified by the SIZE= parameter on the *MODIFY,E,START=xx command exceeds 2048 megabytes.

If text follows the message text, it provides a reason code followed by a description. The following are the possible reason texts:

- 00 REQUEST SUCCESSFUL
- 08 EXCL ID LESS THAN 1
- 10 EXCL ID GREATER THAN 4095
- 12 EXCL ID QUEUE IS FULL
- 16 DUMP ID LESS THAN 1
- 18 DUMP ID GREATER THAN 4095
- 20 EXCL = nn NOT PERMITTED
- 22 DUMP = nn NOT PERMITTED
- 24 TRACE TRAP ALREADY ACTIVE
- 26 INVALID TRAP ADDRESS
- 28 MODULE NOT FOUND
- 30 nnnnnnn DSPSERV xx/yyyyyyyy
  - Where nnnnnnn is the data space name, xx is the return code from DSPSERV service, and yyyy yyyy is the reason code from DSPSERV service.

<tr>
<td>IS NOT ALLOWED FOR— nodetypef</td>
</tr>
</tbody>
</table>

This message is issued in response to a `*MODIFY,NJE,N=nodename` command. This message is also issued if the `PATH` keyword on the `*MODIFY,NJE` command specifies the home node or an alias.

In the message text:

<table>
<thead>
<tr>
<th>errkeywd</th>
</tr>
</thead>
</table>

The keyword on the `*MODIFY` command that does not apply to the requested node. The keyword is one of the following:

- FORCE
- HOLD
- NOHOLD
- PATH
- PRTDEF
- PRTTSO
- PRTXWTR
- PUNDEF
- PWcntl
- RETRYCT
- TYPE
- JT
- JR
- OR
- OT
- SS

**nodetype**

The type of node for which the modify was requested.

- **A SNA CONNECTED NODE**
  The node requested was defined as `TYPE=SNA`.

- **AN INDIRECTLY CONNECTED NODE**
  The node requested was defined with the `PATH` parameter.

- **THE HOME NODE**
  The node requested was defined with the `HOME=YES` parameter.

- **AN ALIAS**
  The node requested is an alias of the home node.

- **A NODE OTHER THAN HOME/ALIAS**
  The node requested is not the home node or an alias of the home node. This node type appears in this message only when the rejected keyword is `PRTDEF`, `PRTTSO`, `PRTXWTR`, or `PUNDEF`.

- **A TCPIP CONNECTED NODE**
  The node requested was defined as `TYPE=TCPIP`.

- **AN ACTIVE TCPIP NODE**
  The node requested was defined as `TYPE=TCPIP` and is currently active.

- **A TCPIP NODE WITH SOCKETS**
  The node requested was defined as `TYPE=TCPIP` and has sockets referencing the node even though the node is not necessarily active.

**System action:** The system rejects the command.

**JES3 processing continues.**

**Operator response:** Correct and reissue the command.

IAT8470

Explanation:

** NODE— nodename reasontext**

** REQUEST IGNORED**

This message is issued in response to a *MODIFY,NJE,ADD= nodename, *MODIFY,NJE,ADDAL= nodename, or a *MODIFY,NJE,DEL= nodename command. The command was not accepted for the specified reason.

In the message text:

*nodename* The nodename specified on the *MODIFY,NJE,ADD= nodename, *MODIFY,NJE,ADDAL= nodename, or the *MODIFY,NJE,DEL= nodename command.

*reasontext* The reason the command was not accepted.

*reasontext* is one of the following:

** HAS ACTIVE SOCKETS**

an attempt was made to delete a directly connected TCPIP node that is signed on to the home node by one or more sockets.

** ALREADY DEFINED**

an attempt was made to add an existing node to the network.

** IS NOT DEFINED**

an attempt was made to delete a node that did not exist in the network.

** IS THE HOME NODE**

an attempt was made to delete the home node.

** HAS ACTIVE LINES**

an attempt was made to delete a directly-connected BSC node that is connected to the home node by one or more lines.

** NOT A VALID NAME**

an attempt was made to add or delete a nodename that is not valid.

** REF BY SOCKET SNAME**

an attempt was made to delete a directly connected TCPIP node that has one or more sockets referencing it. The socket name "sname" shown in the message text is the first such socket that was found.

** System action:** JES3 ignores the command.

** Operator response:** Verify the name of the node you want to add or delete, and re-enter the command with the correct node name.

IAT8481
Explanation:

The value of the MC= parameter in the *MODIFY,X command is not within the specified allowable range as follows:

(RANGE 0-999999)
The value of the MC= parameter in the *MODIFY,X command is not within the allowable range of 0-999999.

(RANGE 2-999999)
The value of the RC= parameter in the *MODIFY,X command is not within the allowable range of 2-999999.
D=CI was specified and the total of the MC= value combined with current values is not within the allowable combined range of 0-255.

System action: The current values are not changed. JES3 issues message IAT8484, giving the current values.

Operator response: Reissue the command with a valid MC= or RC= parameter.

IAT8482

Explanation:

A *MODIFY,X,M=modname command was issued and rejected for one of the following reasons.

MODULE NOT FOUND
The specified module is not loaded.

NO MODULES REFRESHED
No modules were refreshed as a result of a *MODIFY,X,M=modname,REFRESH command. This could be caused by one of the following:
1. The specified module is not loaded.
2. The specified module was loaded CSECT=YES (CSECT=YES specified on the ALOAD macro).
3. The module is already waiting to be refreshed.
4. The module is in the process of being loaded.

MODULE IATXXXX IS NOT REFRESHABLE
The user exit specified on the refresh command is not refreshable according to the information in the IATYUXL.

MODULE module IS ALREADY LOADED
A *MODIFY,X,M=modname,LOAD command was issued and the module is already loaded.

UNABLE TO LOAD USER EXIT IATXXXX
An error occurred while attempting to load the user exit. Message IAT6308 precedes this message and describes why the load request failed.

UNABLE TO LOAD MODULE module
An error occurred while attempting to load the module. Message IAT6308 precedes this message and describes why the load request failed.

System action: JES3 ignores the command. Processing continues.

IAT8484

Explanation:

As the result of a *MODIFY,X,D=dspname,MC=count command, the maximum number of copies of the specified DSP that may be concurrently active is changed from its previous value (OLDMXCT) to the value specified by the MC parameter (NEWMXCT).

If the dspname given is CI (converter interpreter) or POSTSCAN, the following special meanings apply:

OLDMXCT=(nnnnnn,xxxxxxxx),
NEWMXCT=(mmmmmm,yyyyyy)

The count for batch jobs is represented by nnnnnn and mmmmmm. The counts for TSO logons and started tasks (demand select jobs) are represented by xxxxxx and yyyyyy.

System action: Processing continues.

Operator response: None. This is an informational message.
IAT8485 • IAT8489

Routing Code: Note 18  Descriptor Code: 5,7

IAT8485

Explanation:

➤ MXCT FOR dspname — NOT MODIFIABLE

The maximum count for the specified DSP cannot be modified by a *MODIFY,X command.

System action: JES3 ignores the command.

Programmer response: You may make the DSP eligible for modification by resetting the DSPNMCHG flag in the DSPFLAGS field of the appropriate DSP dictionary entry and linking again to the dictionary.

➤ (MODX) — HOLD RELEASE

The *MODIFY,X,D= command specified a DSP name for which the HOLD or RELEASE function is not supported.

System action: JES3 ignores the command. Processing continues.

Operator response: Reissue the command correctly.

Module:

Containing  Detecting  Issuing
IATMODX  IATMODX  IATMODX

Routing Code: Note 18  Descriptor Code: 5,7

IAT8489

Explanation:

➤ MODULE modname

➤ REFRESH IS PENDING — HAS BEEN REFRESHED

This message is issued in response to an *F,X,M=modname,REFRESH command. If the module is a user exit, a new copy of the module has been loaded into storage and the bit in the IATYUXL indicating the exit is a dummy has been turned off. The original copy has not been deleted from storage. If REFRESH IS PENDING appears in the message, the
module cannot be deleted at this time because it is still in use. When there are no more functions using the module, the module will be deleted and message IAT8489 with the text "HAS BEEN REFRESHED" will be issued. If HAS BEEN REFRESHED appears in the message and the module is not a user exit, the module has been deleted from storage and its load count set to zero; a new copy of the module will be loaded the next time an ALOAD request is issued.

System action:  The module is deleted from storage if it is not a user exit.

Operator response:  None. This is an informational message.

Routing Code: Note 18  Descriptor Code: 5

IAT8493

Explanation:

GROUP MODIFY TO LOCAL OR ANYLOCAL NOT ALLOWED

JES3 issues this message in response to the *MODIFY,T,T=wsname,G=group command. JES3 rejects the modify because the group cannot be changed to LOCAL or ANYLOCAL.

System action:  JES3 rejects the command and JES3 processing continues.

Operator response:  Reissue the command with G= specifying a group name other than LOCAL or ANYLOCAL.

Module:

<table>
<thead>
<tr>

Chapter 24. Inquiry Messages

IAT8500
Explanation:  
INQUIRY ON DEVICES COMPLETE

JES3 issues this message in response to the *INQUIRY,D,D command and indicates that the device inquiry is complete.

System action:  JES3 processing continues. This is an informational message.

System programmer response:  None

Module:
Sending IATIQDS  IATIQDS  IATIQDS

Routing Code:  Note 18  Descriptor Code:  5

IAT8501
Explanation:  
CURRENT SECONDARY EXTENTS IN USE...

This message is issued in response to an *INQUIRY,C,C command. The value printed is the number of current secondary extents in use.

System action:  JES3 processing continues.

Operator response:  None. This is an informational message.

Module:
Sending IATIQAC  IATIQAC  IATIQAC

Routing Code:  Note 18  Descriptor Code:  5

IAT8503
Explanation:  
MAXIMUM SECONDARY EXTENTS USED...

This message is issued in response to an *INQUIRY,C,C command. The value given is the maximum number of secondary extents ever used. The console buffer pool type is identified by header message IAT8514.

System action:  JES3 processing continues.

Operator response:  None. This is an informational message.

Module:
Sending IATIQAC  IATIQAC  IATIQAC

Routing Code:  42  Descriptor Code:  5,7

IAT8504
Explanation:  
xxx IS AN INVALID FIELD

An *I,A command was issued with an incorrect field.

System action:  JES3 rejects the command and continues processing.

Operator response:  Correct the specified field and reissue the command.

Module:
Sending IATIQAC  IATIQAC  IATIQAC

Routing Code:  Note 18  Descriptor Code:  5,7

IAT8506
Explanation:  
JSAM BUFFER USAGE

This message is the first of a series of messages issued in response to an *INQUIRY,C,C command. This message serves as a header only.

Operator response:  None. This is an informational message.

Module:
Sending IATIQAC  IATIQAC  IATIQAC

Routing Code:  42  Descriptor Code:  5,7
IAT8507

Explanation:

One of the following commands was issued:
- *I,A,main,G=group
- *I,A,G=group
- *I,A,main,C=class
- *I,A,C=class
- *I,A,SRCVCLASS=srvclass
- *I,A,mainSRVCLASS=srvclass

No jobs are currently running in the specified service class, group, or class on the main processor displayed.

In response to an *I,A,SRCVCLASS=srvclass command and *I,A,mainSRVCLASS=srvclass, text is the service class name. In response to an *I,A,main,G=group or *I,A,G=group command, text is the group name. In response to an *I,A,main,C=class or *I,A,C=class command, text is the class name.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:  

Routing Code: 42  Descriptor Code: 5,7

IAT8509

Explanation:

An *INQUIRY,Q,SP=spart command was input to request display of the status of spool partition spart.

spart
the name of the spool partition.

mmmmmm
 the total number of logical track groups in the spool partition.

nnnnnn
 the number of logical track groups in the spool partition which are available; the track groups are not currently allocated to any job.

xxx%
the percentage of the total number of logical track groups in the spool partition that are available.

yy%
the minimal condition available logical track group percentage, as defined by the SPLIM parameter on the SPART or BUFFER initialization statement. The minimal percentage value has no meaning for the DRAINED and UNAVAIL spool partitions and will not be displayed.

yy%
the marginal condition available logical track group percentage, as defined by the SPLIM parameter on the SPART or BUFFER initialization statement. The marginal percentage value has no meaning for the DRAINED and UNAVAIL spool partitions and will not be displayed.

DEF
indicates that this partition was defined as the default spool partition (using the DEF=YES parameter on the associated SPART initialization statement) or was selected to be the default partition because no spool partition was explicitly
defined as the default. It is not displayed for the DRAINED or UNAVAIL spool partitions.

**OVFL**
indicates that overflow from this spool partition is allowed; overflow was specified on the OVRFL parameter of the SPART initialization statement or was enabled by the *MODIFY,Q,SP=spart,OVRFL=option command. The *INQUIRY,Q,SP=spart,O command may be entered to display the partition overflow hierarchy for this spool partition. It is not displayed for the DRAINED or UNAVAIL spool partitions.

**OVIN**
indicates that some other spool partition overflows into this partition. It is not displayed for the DRAINED or UNAVAIL spool partitions.

**INIT**
indicates this spool partition contains the data that is required to complete JES3 initialization. It is not displayed for the DRAINED or UNAVAIL spool partitions.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

<td>IATIQCR</td>
<td>IATIQCR</td>
</tr>
</tbody>
</table>

**Routing Code:** 42  
**Descriptor Code:** 5,7
An *INQUIRY,Q,DD=ddn command was input to request display of the status of spool data set ddn.

**spart**
the name of the spool partition that the data set is associated with. If the data set is in a HELD, DRAINED, or UNAVAIL state, this is the partition that the data set will be returned to when the data set is released and available.

**mmmmmm**
the total number of logical track groups in the data set.

**nnnnnn**
the number of logical track groups in the data set that are available; the track groups are not currently allocated to any job.

**ppp%**
the percentage of the total number of logical track groups in the spool data set that are available.

**DRAINED**
indicates that the spool data set is in a drained state; a *MODIFY,Q,DD=ddn,DRAIN command has been entered. Further space allocation from the data set has been suspended.

**UNAVAIL**
indicates the spool data set is not currently available to JES3; the data set was not allocated to JES3 or was found to be unusable during the previous JES3 restart. Further space allocation from the data set has been suspended and jobs that previously allocated logical track groups on the data set have been purged from the complex or were placed into a spool hold state.

**HELD**
indicates that the spool data set is in a held state; a *MODIFY,Q,DD=ddn,HOLD,
*MODIFY,Q,DD=ddn,STOP, or a *MODIFY,Q,DD=ddn,CANCEL command has been entered.

**BT**
indicates that one or more unusable physical tracks within the data set exist; the unusable tracks were either defined using the BADTRACK initialization statement, formatting failed, or an I/O error was encountered. The *INQUIRY,Q,BT command may be entered to display the specific physical tracks within the spool which are unusable.

**STT**
indicates this spool data set contains single track table (STT) expansion segments; a loss of this spool data set results in a loss of JES3 STT data.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

IAT8522

**Explanation:**

**IAT8522**

- JOB—jobname(jobid)—ACTIVE ON—name text—

- text is one of the following:
  - ddin mm.th MINS [FOR nodename]
  - TIME NAVAIL [SCHED FOR {devname/nodename}]

This message is issued in response to an "*INQUIRY,A" command to obtain the status of all active jobs being processed by JES3.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 5,7
**IAT8523 • IAT8524**

(ddn mm.th MINS [FOR nodename])
This text is displayed if the job is active.

**TIME NAVAIL [SCHED FOR (devname|nodename)]**
This text is displayed if the job is not active. If the job is in specialized reschedule status, SCHED FOR devname or nodename is also displayed.

For a 3800 printer, this message displays the job at the transfer station.

**Note:** For an FSS writer DSP, the display contains information for the output sent to the FSS. This may be a job that has completed processing on the output device but is being retained by the FSS. See the FSS application documentation ([z/OS MVS Using the Functional Subsystem Interface](https://www.ibm.com/support/docview.wss?uid=swg21294129)) to determine if there is a better way to monitor job status.

For jobs currently being transmitted to another NJE node, NJESND appears in the message as the dspname, ddn is the name of the logical sender that is currently transmitting the indicated job, and FOR nodename shows the node that is receiving the network stream. For jobs waiting to be transmitted to another node, TIME NAVAIL SCHED FOR nodename indicates the node which will receive the network stream.

jobname The name of the active job.
jobid The id of the active job.
name Either the name of the DSP that is currently processing the job or the name of the converter/interpreter (C/I) functional subsystem (FSS) in which the job is active.

(ddn) Indicates the support device, if any, the function is using.

(mm.th) Indicates how long the job has been active in minutes, tenths of minutes, and hundredths of minutes.

(devname) Indicates the device for which the function is scheduled.

(nodename) Indicates the node of the device for which the function is scheduled.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

</tr>
</tbody>
</table>

This message is issued in response to an "I A D=INTRDR command. It follows message IAT8522 or message IAT8520 for the INTRDR DSP.

**MAX=(n,m)**

n is the current maximum number of DSPs allowed; m is the initialization value.

**ACTIVE=nn**

the current number of active INTRDR jobs. This includes the number of INTRDR FCTs and the INTRDR jobs waiting to be processed.

F=nnn

the current number of INTRDR FCTs attached.

**HWATER=nnnn**

the high water mark value for the INTRDRs.

**Note:** ACTIVE and HWATER are not applicable if there are no IRA control blocks. If there are no IRA control blocks, no INTRDRs have been called.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

This message is issued in response to one of the following commands to provide you with the status of jobs currently active on the designated main processor:

- *INQUIRY,A,main
- *INQUIRY,A,main,G=group
- *INQUIRY,A,main,C=class
- *INQUIRY,A,J=jobid
This message is also issued in response to an *INQUIRY,A,D=JMF command to provide you with the status of the JES3 Monitoring Facility (JMF) dynamic support program (DSP).

In the message text:

- **jobname**: the name of the active job. (For JMF this is always “JMF”).
- **jobid**: the job identifier of the active job.
- **stepname**: for batch jobs only, the current step of the active job.
- **main**: the system on which the job is active.
- **mmmmmm.th**: for batch jobs only, this is the number of minutes, in tenths of minutes and hundredths of minutes, that the job has been active. For jobs that were identified to JES3 using the “request jobid” function, this is the total time that JES3 has been aware of the job. If the job remains active longer than one year, the active time is reset to zero.
- **mmmmmm.th**: for JMF only, this is the number of minutes, in tenths of minutes and hundredths of minutes, that the job has been active. This time cannot exceed 10,080 (7 days); it is the maximum allowable time on the *CALL,JMF command. After a JES3 restart, the active time is reset to zero.

**System action:** JES3 processing continues.

IAT8535
Explanation:
» ERROR PROCESSING EXTENT REQUEST

» REQUEST - CANCELLED

This message is issued when you issue a *MODIFY,Q command to hold or release a specific spool data set or to hold or release all jobs that have data on that data set. An error was detected by macro IATXJBTS. The IATXJBTS macro determines if the job has data on a held data set. For more information about macro IATXJBTS, see [z/OS JES3 Customization].

System action: The command is rejected and JES3 processing continues.

Operator response: Contact your system programmer.

System programmer response:
1. If this problem occurs often, you can issue the "FAIL,MODDRVR,DUMP" command to fail the MODIFY DSP. This will generate a JES3 abend dump of the system. The system continues to process normally.
2. In the dump, locate the RETURN entry for the IATXJBTS macro.

3. Examine register 15 for the return code from macro IATXJBTS. If register 15 contains:
   - **4** An incorrect JCT address was supplied in the JOBTAT search parameter list. Correct the parameter list. Link-edit the DSP and reissue the command.
   - **8** An incorrect address for the JOBTAT search parameter list was supplied on the JTS parameter of the IATXJBTS macro. Correct the address in the parameter list. Link-edit the DSP and reissue the command.
   - **10** An incorrect JBT address or JDS address was specified in the JOBTAT search parameter list. Correct the address in the parameter list. Link-edit the DSP and reissue the command.
   - **14** An error occurred while JES3 was attempting to read the JDS or JBT. Locate the JESREAD entry in the trace table. Use the JESREAD return codes to correct the problem.
   - **18** The required control block is on an unavailable spool data set.
   - **1C** The control block resides at a track group address that is not valid.

Explanation:

- **Badtrack On**

An *INQUIRY,Q,BT command was issued to display the
physical tracks within the JES3 spool which have been flagged as being unusable.

\[ \text{ddn} \]
the ddname of the spool data set within which the bad track lies.

\[ \text{vol} \]
the volume serial of the DASD volume on which spool data set \( \text{ddn} \) was last known to reside.

\[ \text{cyl} \]
the cylinder of the unusable physical track.

\[ \text{trk} \]
the unusable physical track.

\[ \text{cccchhhh} \]
the track address of the unusable physical track.

**AT INITIALIZATION**
will be displayed if the track was defined by a BADTRACK initialization statement.

**DURING FORMATTING**
will be displayed if an error was encountered during formatting of the spool data set.

\[ yyyy/mm/dd hh:mm:ss \]
will be displayed if an error was encountered performing I/O to the track; the date and time that the error was encountered is shown.

**System action:** JES3 processing continues.

parm— the incorrect value specified on the INQUIRY command. For an inquiry on a range of device numbers, this value may be up to 11 characters (for example: /1234-/1236).

System action: JES3 ignores the command.

Operator response: Correct the erroneous field, and resubmit the request.

Problem determination: See Table III, item 4.

Module:

Routing Code: Note 18       Descriptor Code: 5,7

IAT8560

Explanation:

parm— IS INVALID INQUIRY FIELD

This message is issued in response to an "INQUIRY command in which an incorrect or undefined field was specified.
This message is issued in response to the operator command *I,D,D=dev (where dev is a device number). If a device is offline because of path reasons, the characters "OFN" will appear in the message. If a device is allocated somewhere in the complex, but is offline because of path reasons to this processor, the characters "ACN" will appear. It is issued once for each device identified by the command. If the device is an active 3800 printer, the display includes the names of all active jobs that have output scheduled to the device that have not yet been stacked. The names appear in sequence starting with the name of the job whose output is closest to the end of the pipe line. The values in all the fields in the message apply to the job whose data sets were most recently sent to the printer (the last job name in the display).

Also included for SNA devices are the fssname, mode and NPRO values for that device. If ambiguous devices are found, a field stating that the device is ambiguous will also be displayed. If "INTERVENTION REQ" is also displayed, then JES3 has been notified that an "intervention condition" exists on the device. If the device is an active 3800 printer, the display includes the names of all active jobs that have output in the printer's buffer, on the drum, or in the paper line. The names appear in sequence starting with the name of the job whose output is closest to the end of the paper line. The values in all the fields in the message apply to the job whose data sets were most recently sent to the printer (the last job name in the display).

**Note:** The FSS/FSA will notify JES3 about interventions on SNA-attached printers.

In the message text:

- **devname** The device name as defined on the JNAME initialization statement.
- **dev** The device number.
- **AV** Indicates that the device is available (JUNIT status).
- **AC** Indicates that the device is active (JUNIT status).
- **ACO** Indicates that the device is currently active, but has been varied offline (JUNIT status).
OFF Indicates that the device is offline to JES3 (JUNIT status).

OFN Indicates that the device is offline because it has no paths.

ACN Indicates that the device is allocated and is offline because of no paths.

dsppname This field appears if the device is currently in use by a JES3 DSP; if the device is in use by a job, the field is blank.

AMBIGUOUS Indicates that the device is ambiguous.

F= Indicates the name of the forms currently in use on the device. H indicates that JES3 cannot change the forms.

U= Indicates the ID of the train currently in use on the device. H indicates that JES3 cannot change the train.

CH= Specifies the name(s) of the character arrangement table(s) in use for the device. H indicates that JES3 cannot change this characteristic.

DYN= Indicates whether the device can be started by JES3 as a dynamic writer (Y) or not (N).

FL= Specifies the name of the forms overlay frame in use for the device. H indicates that JES3 cannot change this characteristic.

H= Indicates whether header records are to be printed (Y) or not (N).

B= Indicates whether burst records are to be printed (Y) or not (N). M indicates that the edges of the burst page or the three blank pages following a job’s output are to be marked for ease of separation.

M= Indicates whether scheduling is automatic (A) or manual (M).

CB= Indicates whether clear-printer processing is being used for a 3800, 4245, or 4248 printer as follows:

  D Clear-printer processing is being performed after each data set.
  J Clear-printer processing is being performed only at the end of each job.
  N Clear-printer processing is not being performed.

L= Specifies the maximum or minimum

PG= Specifies the maximum or minimum (nnn) number of pages a data set can have to be selected for this device.

CK= Specifies the checkpoint interval (nnn) for an FSS-supported device in pages (P) or seconds (S).

NPRO= Defines the non-process-run-out interval for this device.

MODE= Defines the FSS (functional subsystem) mode or the COMP (compatibility) operating mode for this device.

OPACTLOG= OPACTLOG=Y specifies that operator command actions will be logged in the output of the displayed device using message IAT7066 or IAT7067. This parameter is only displayed when the OPACTLOG parameter is set to YES for an FSS device. OPACTLOG=N specifies that operator command actions will not be logged in the output. This parameter is only displayed when the OPACTLOG parameter is set to NO for an FSS device.

FSS= Defines the fssname for this FSS device.

C= Indicates the name of the carriage tape currently in use on the device. H indicates that JES3 cannot change the carriage tape.

PM= Indicates the process mode(s) defined for this printer or punch device. If the printer is a 3800 model 3 printer, PM indicates the process mode(s) defined for the current device mode.

PDEFAULT= Indicates which JES3 defaults (CHARS, FCB, or NONE (indicating all are applied) ) are not applied to FSS printers.

XLATE= Specifies whether the device translates nondisplay characters to blanks.

PDIR= Specifies at what point(s) a peripheral data set information record is sent with a job.

ALL Specifies that a PDIR precedes every data set in a job.

BDS Specifies that a PDIR is sent at the beginning of a job.
when JES3 sends the begin destination select (BDS) command.

**SS=** Indicates the stacker option in use on a 3800 printer, as follows:

- **S** sheet stacker
- **C** continuous forms stacker
- **H** Indicates that JES3 cannot change the stacker option.

**CGS=** Indicates the amount of character generation storage in the 3800 printer, as follows:

1. There is enough storage for 128 characters (2 WCGMs)
2. There is enough storage for 255 characters (4 WCGMs)

**CM=** Specifies the name of the copy modification module mod and the tape reference character trc in use for the device. H indicates that JES3 cannot change this characteristic.

**J** Specifies the name and number of the job or jobs that are using the device.

**NOTE:** For an FSS device, the display contains job information for the output sent to the FSS. This may be a job that has completed processing on the output device but is being retained by the FSS. See the FSS application documentation for more information.

**NOT RESPONDING TO FSS**

JES3 received an indication from the functional subsystem (FSS) indicating that the device is no longer responding to the FSS. To determine why the device is not responding, check the device and/or communication components (for example, VTAM).

To determine what action you need to take to restore the communication from the FSS to the device, see previous messages issued by the FSS and/or communication software.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATIQDS</td>
<td>IATIQDS</td>
<td>IATIQDS</td>
</tr>
</tbody>
</table>

**DGRPY=**

If DGRPONLY=Y then only output data sets with a destination equal to the device group will be scheduled to that device. If DGRPONLY=N then that device will accept output data sets with destinations equal to ANYLOCAL, as well as data sets with destinations equal to that device group.

**MK** Specifies that copymarking should be done on:

- **C** copies of data sets.
- **J** a job basis.
- **N** none - no change should be made.

**DGRP=** The device group name that is defined on the initialization stream during initialization. DGRP=LOCAL if none is specified.

**INTERVENTION REQ** Indicates an intervention condition on the device which must be corrected before processing on the device continuing.

**SETUPMSG=** Indicates whether or not setup message IAT7030 is suppressed for this device (Y) or not (N).

**IAT8564**

**Explanation:**

```
>>> text
THERE IS NO ADDITIONAL INFORMATION
```

This message is issued in response to an *INQUIRY,J=jobno,X command to display extended information for a job.

- **SCHENV=schenv**
  The scheduling environment associated with the job.

- **SRVCLASS=srvclass**
  The job's service class name.

- **GROUP=group (WLM|JES)**
  The job's group name and whether the group is JES managed or WLM managed.

**RUN COMMAND**

Indicates that a *MODIFY,J=jobno,RUN command was issued for the job.

- **JESLOG=SPIN**
  The job produces a log that can be spun off at any time using the command "*MODIFY,J=job,SPIN".

- **JESLOG=(SPIN,+hh:mm')**
  The job produces a log that is automatically spun off every hh hours and mm minutes; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

- **JESLOG=(SPIN,hh:mm')**
  The job produces a log that is automatically spun off every day at hh:mm; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

- **JESLOG=(SPIN,nnn)***
  The job produces a log that is automatically spun off every nnn lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

- **JESLOG=(SPIN,nnnK)***
  The job produces a log that is automatically spun off every nnn thousand lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

- **JESLOG=(SPIN,nnnM)***
  The job produces a log that is automatically spun off every nnn million lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

**Routing Code:** –  **Descriptor Code:** –

---

**JESLOG=NOSPIN**

The job produces a log but the log cannot be spun off.

**JESLOG=SUPPRESS**

The job does not produce a log.

If there is no extended information to display, THERE IS NO ADDITIONAL INFORMATION is displayed.

**Notes:**

1. If a job did not specify JESLOG and the class is defined to either suppress the log or to make it eligible for spinning, JESLOG text will be displayed according to the class definition.

2. JESLOG=NOSPIN will be displayed only if the job specified JESLOG=NOSPIN on the JOB statement. If JESLOG is not specified and the job's class is not defined to make jobs eligible to spin, no JESLOG text will be displayed for the job.

Explanation:

Chapter 24. Inquiry Messages 593
This message is issued in response to an *INQUIRY,D command. It provides the device name (XTYPE name) and the address of the device identified by the command, the display status for the device, the mount status for the volume, and allocation information. The terms in the message are:

- **AC**: the device is in use by a setup job. (XUNIT status)
- **ACO**: the device is in use but has been varied offline to JES3. (XUNIT status)
- **ACP**: the device is in use but is pending offline
- **RS**: the device is reserved by a setup job above a setup barrier. (XUNIT status)
- **RSO**: the device is reserved but has been varied offline to JES3. (XUNIT status)
- **AV**: the device is online and not in use. (XUNIT status)
- **AVU**: the device is online and not in use, but it is in the process of being unloaded.
- **OFF**: the device is offline to JES3. (XUNIT status)
- **OFN**: the device is offline because there are no paths available
- **JES=**: the volume (if any) is removable by JES3.
- **M**: the volume is JES3 mounted.
- **P**: the volume is permanently resident to JES3.
- **OS=**: the volume (if any) is removable to the operating system.
- **M**: the volume is reserved by the operating system.
- **P**: the volume is permanently resident to the operating system.
- **MS**: the volume is reserved by the operating system and is SMS-managed.
- **PS**: the volume is permanently resident to the operating system and is SMS-managed.

**Note**: The OS= field reflects the last verify for the device inquired on.

- **ALLOC=**: this is indicated only if the inquiry is made of a direct-access device which is allocated. The number of users currently allocated to the device is given.
- **jobname (jobid)**: this is indicated only if the inquiry is made of allocated devices other than direct-access devices. The job name and the job identifier of jobs allocated to that device are given.

### verify status
- **VERIFIED**: the volume has completed MDS verification.
- **MOUNTED**: the volume is mounted on the indicated device.
- **NOT RDY**: the device is not ready.
NO RESP
no response has been received from MDS verify on the local.

I/O ERR
a permanent I/O error has occurred on the indicated device.

VOLID ERR
an error was encountered reading the volume label.

ALLOCATED
the device is allocated.

DUP VOL
the indicated volume serial number is in use on another device.

OFFLINE
the device is offline but contains a permanently resident volume.

INIT COMP
the initial MDS verifies are complete ([that is], restart is complete).

NOT OPR
the device is not operational.

EXPD ERR
the expiration date has not yet been reached.

LOAD CHK
a load check error has occurred.

TIMEOUT
an execute channel program has timed-out.

NO DEVICE
there is no unit control block (UCB) for the indicated device.

GRP
the device is dedicated to a job class group.

NET
the device is dedicated to a DJC job network.

name
the name of the job class group or DJC network ID to which the device is currently dedicated.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

command. Net ID and job information are defined as
follows:

- djnet
  The name of the DJC network.
- jobname
  The job name.
- jobid
  The job number or job identifier.
- nhold
  The current NHOLD count.
- succesr
  The number of successor jobs to this job.
- rel/sch
  The current RELEASE or SCHEDULE count.
- status
  The current DJC status of the specified job. The
  STATUS indicators are defined as follows:
  AC the job completed abnormally
IAT8582 • IAT8586

F the job failed at the reader/interpreter or the converter/interpreter
C the job is complete
OH the job is in DJC operator hold
H the job is in DJC hold
N the job is null
E the job is eligible for scheduling and may be active

System action: Processing continues.
Operator response: None. This is an informational message.

Routing Code: – Descriptor Code: 5,7

IAT8582
Explanation:

NO DJC NETS IN SYSTEM

This message is issued in response to an *INQUIRY,N command. Dependent job control is not active. No jobs in the system have been defined as part of a job net.
System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18 Descriptor Code: 5,7

IAT8583
Explanation:

NET-ID— spart— TOTAL IN USE

BY JOBS— ggg.ggg— TRKGPS
BY JCS—

This message is issued in response to an *INQUIRY,Q,SP={spart|ALL},U,N=nnn command. The messages is issued three times, indicating total track group count, total track group count for JES3 functions, and the total track count usage for active jobs on a partition basis.
Message IAT8527 follows this group of IAT8583 messages to identify the specific jobs or JES3 functions using spool space in the specified partition.
In the message text:

spart The name of the spool partition.

The total track group usage on the specified partition used by JES3, by jobs, or overall. This value will be displayed as ****,**** if the number exceeds 999,999.

System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18 Descriptor Code: 5,7

IAT8584
Explanation:

NET-ID— djnet— NOT FOUND

This message is issued in response to an *INQUIRY,N command. The specified network has not been defined to the system.
System action: JES3 processing continues.
Operator response: Verify the network name, and reissue the command.
Module:

Routing Code: Note 18 Descriptor Code: 5,7

IAT8586
Explanation:

JOB— jobname— FOR NET-ID— djnet

NOT FOUND— dddd— DRAINED

This message is issued in response to an *INQUIRY,N command. The specified job is not defined as a DJC job.
System action: JES3 processing continues.
Operator response: Verify the job name, and reissue the command.
Module:
IAT8587

Explanation:

This is a summary message issued in response to the *INQUIRY,Q,SP= partname|ALL,U,N=nnn command. In the message text:

partname  The name of the spool partition to which this summary message applies.

xxxx  The number of JES3 users found that are using spool space in the indicated spool partition. JES3 users include JES3RJP, JES3INIT, JES3STT, RJP console names, output for JES3 job 0, JES3 dynamic support programs (DSPs), and temporary jobs created during JES3 input service.

jjjjj  The number of jobs that use spool space in the indicated spool partition, including JES3 DSPs. Note that a job may use spool space in more than one partition, and will then be displayed in all applicable partitions.

uuu  The number of users displayed. If you specified N=ALL or N=a value greater than the maximum display value (100), only the maximum (100) is displayed.

System action: JES3 processing continues.

Operator response: None. This is a informational message.

Module:

 CLASS INQUIRY INFORMATION—INFORMATION FOR CLASS—class

System action: JES3 ignores the command.
Operator response: Correct the field, and resubmit the *INQUIRY command.

Module:

Routing Code: Note 18   Descriptor Code: 5,7
This message is issued in response to the *INQUIRY,C=class command.

In the message text:

- **class** - The name of the class for which information is being displayed.
- **group** - The name of the group associated with the class.
- **spart** - The name of the spool partition associated with the class.
- **dsys** - A system in the complex where the class is defined.
- **esys** - A system in the complex where the class is enabled.
- **sdmax** - The maximum SDEPTH for the class.
- **sdcur** - The current SDEPTH for the class.
- **tdmax** - The maximum TDEPTH for the class.
- **tdcur** - The current TDEPTH for the class.
- **mdsys** - The system for which the class being displayed has a maximum depth.
- **mdmax** - The maximum MDEPTH for the class on the given system mdsys.
- **mdcur** - The current MDEPTH for the class on the given system mdsys.
- **tlclass** - The class for which the class being displayed has a maximum total limit.
- **tlmax** - The maximum TLIMIT for the given class tlclass.
- **tlcur** - The current TLIMIT for the given class tlclass.
- **mlsys** - The system for which the class begin displayed has a main limit by class.
- **mlclass** - The class for which the class being displayed as a main limit for the given system mlsys.
- **mlmax** - The maximum MLIMIT for the given main and class mlsys and mlclass.
- **mlcur** - The current MLIMIT for the given main and class mlsys and mlclass.
- **hh** - The hour or hour interval at which automatic spinoff for jobs in the class occurs.
- **mm** - The minute or minute interval at which automatic spinoff for jobs in the class occurs.
- **nnn** - The line interval at which automatic spinoff for jobs in the class occurs.

Module:

Routing Code: Note 18   Descriptor Code: 5,7

IAT8618
Explanation:

This message is issued in response to an *INQUIRY command which requested the status of a BSC RJP line or workstation or a SNA RJP workstation. The designated line or workstation is not signed on. If SNA RJP is included in the message text, the specified workstation is a SNA RJP workstation; otherwise, the workstation or line is BSC RJP.

System action: None. The state of DLOG is displayed.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18   Descriptor Code: 5,7

IAT8617
Explanation:

This message is issued in response to an *INQUIRY O,DLOG command which requested that the status of the JES3 hardcopy log (DLOG) be displayed. The status is one of the following:

DISABLED
DLOG is disabled

ENABLED BUT INACTIVE
DLOG is enabled (i.e. the DLOG option is turned on) but the JES3DLOG address space is not active.

ACTIVATE IN PROGRESS
DLOG is in the process of being activated. That is, the JES3DLOG address space is started and JES3 is waiting for it to initialize.

ACTIVE
DLOG is active and is ready to process messages.

ACTIVE AND SUSPENDED
DLOG is active but is suspended temporarily because of a WTL buffer shortage or because SYSLOG is not active.

DEACTIVATE IN PROGRESS
DLOG is in the process of being deactivated. That is, the JES3DLOG address space has been posted for termination processing, and JES3 is waiting for it to terminate.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

SRVCLASS MODE EXECUTING SCHEDULED NOT

This message is issued in response to the *INQUIRY,B,Srvclass= command to display a summary of all jobs in main service that use the specified service class. The message contains the

- service class name
- job class group’s mode for jobs that are using the service class
- number of jobs executing
- number of jobs that were scheduled for main service and not executing
- number of jobs that are waiting to be scheduled for main service

This message appears in two forms:
IAT8621 Srvclass mode nnn nnn nnn
IAT8621 srvclass mode nnn nnn nnn

System action: JES3 continues processing.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATIQBCT  IATIQBCT  IATIQBCT

Routing Code: Note 18  Descriptor Code: 5,7

IAT8622

Explanation:

TRACE ON

This message is issued in response to an *INQUIRY command that requested the status of a BSC RJP line or workstation or a SNA RJP workstation. The designated line or workstation is signed on.

RDRS HELD indicates that jobs submitted from the workstation will enter the system in hold status. This setting is controlled using the H (hold) or R (release) parameter of the *MODIFY,T command.

TRACE ON or TRACE OFF indicates the status of the SNA RJP trace facility. Tracing can be specified even if the workstation is not signed on. Use the TRACE=ON parameter of the RJPWS initialization statement or the *MODIFY,T command to enable the TRACE facility.

CHAINED MSG= indicates the number of message lines queued in JES3 storage for this workstation.
PL=n indicates the number of times an incorrect password will be allowed on a SNA RJP workstation before logons from that workstation are rejected. Use the PL=n parameter of the RJPWS initialization statement or the *MODIFY,T command to specify the password limit.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

---

**Explanation:**

This message is issued in response to the *INQUIRY,D:T=tname command and displays the status of devices at the indicated workstation, as follows:

- **AL** allocated, not active
- **AV** available, not active
- **OFF** offline, not active
- **AC** active
- **ACO** active with a pending offline request; the DSP requesting the device is given
- **UA** indicates that the device is unavailable. This indicator is displayed only after the terminal has signed on
- **jobno** is the job number associated with the device or DSP
- **jobid** is the job identifier associated with the device or DSP

If the inquiry is of a SNA RJP workstation, the logical unit being used by the device is given as `luname`.

- **REAL** indicates that the terminal has a real console
- **SIMU** indicates that the terminal has a simulated console

**System action:** JES3 processing continues.

**Operator response:** If the workstation is functioning normally, no response is needed. Otherwise, make sure the devices specified as being active are ready.

---

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 5,7
IAT8625

Explanation:

- **luname** - name of the workstation logical unit (LU) that has a session with JES3.
- **CID** - communication identifier (network address) for the session.
- **AL**(ddn) - the session is allocated for communication with the device ddn.
- **UA** - session is not allocated to any device.
- **UP** - session is running.
- **Q** - device is quiescing.
- **QI** - device is immediately quiescing.
- **PC** - the session is pending closing. JES3 has not issued a VTAM CLSDST request to close down the session.
- **CR** - JES3 issued a VTAM CLSDST request to close down the session. The CLSDST request has not yet completed.
- **CC** - CLSDST completed for the session. All session activity has stopped.
- **FB** - the session is pending free block processing which will remove it from the JES3 SNARJP control structure.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Extended Information:

- PLEVEL=pl
- SLEVEL=sl
- ID=id
- MDEST=mdest
- SELECT=select
- spart=
- TRKGRPS=(pri,sec)
- JESMSGLMT=(limit,intvl)
- FIXPAGE=fixpage
- PRTPAGE=(csa,aux)
- USRPAGE=usrpage

This message is issued in response to an *INQUIRY,MAIN=command. For an *INQUIRY,MAIN=name, information about the requested main processor is returned. For an *INQUIRY,MAIN=ALL, information about all main processors is returned.

The status indicators are:

- Online status, in which the following text can appear:
  - **ONLINE**
  - The processor has been varied on line to the global, or was defined (explicitly or by default) as being initially on line to the global at initialization time.

  **OFFLINE**
  - The processor has been varied off line to the global, or was defined explicitly as being initially on line to the global at initialization time. The status OFFLINE is also displayed if the processor has been flushed.

- Connect status, in which the following text can appear:
  - **CONNECTED**
  - The processor has connected to the global and is capable of receiving jobs.

  **NOT-CONNECTED**
  - The processor has not connected to the global.

- JES3 status as viewed by JESXCF, in which the following text can appear:
  - **DOWN**
  - Either the processor is completely down, or JES3 has never attached to JESXCF since the processor was IPLed.

  **ATTACHED**
  - JES3 has initialized and attached to JESXCF.

  **NOT-ATTACHED**
  - JES3 was previously attached to JESXCF, but has been brought down.

  **JESXCF-ERROR**
  - The attach status of JES3 could not be obtained because of an error.

- Global status, in which the following text can appear:
  - **GLOBAL**
  - The processor is the JES3 global.

  **LOCAL**
  - The processor is a JES3 local.

If the X parameter is specified (*INQUIRY,MAIN=name,X or *INQUIRY,MAIN=ALL,X) then short and extended information are returned; otherwise only short information is returned.

In the message text:

- **name**
  - The name of the main processor for which information is being returned.

- **fmid**
  - The JES3 FMID level of the main processor.

- **pl**
  - The JES3 product level of the main processor.

- **sl**
  - The JES3 service level of the main processor.

- **id**
  - The message prefix id of the main processor, as defined by the ID= parameter on the MAINPROC initialization statement.
MDEST
The message destination class of the main processor, as defined by the MDEST= parameter on the MAINPROC initialization statement.

SELECT
The select mode of the main processor, as defined by the SELECT= parameter on the MAINPROC initialization statement.

SPART
The default spool partition for jobs that run on this main processor, as defined by the SPART= parameter on the MAINPROC initialization statement. If no partition is defined, the text NONE is displayed.

pri
The default primary track group allocation for jobs that run on this main processor, as defined by the TRKGRPS= parameter on the MAINPROC initialization statement.

sec
The default secondary track group allocation for jobs that run on this main processor, as defined by the TRKGRPS= parameter on the MAINPROC initialization statement.

limit
The maximum number of messages that a job can issue within a given time interval before a warning message is issued, as defined by the JESMSGLMT= parameter on the MAINPROC initialization statement.

intvl
The time interval for the above message limit, as defined by the JESMSGLMT= parameter on the MAINPROC initialization statement.

fixpage
The number of pages that are fixed at initialization time for this main processor, as defined by the FIXPAGE= parameter on the MAINPROC initialization statement.

csa
The number of pages that are allocated in the Common Storage Area for this main processor, as defined by the PRTPAGE= parameter on the MAINPROC initialization statement.

aux
The number of pages that are allocated in the JES3 Auxiliary address space (JES3AUX) for this main processor, as defined by the PRTPAGE= parameter on the MAINPROC initialization statement.

usrpage
The number of pages that JES3 uses for each open SYSOUT data set, as defined by the USRPAGE= parameter on the MAINPROC initialization statement.

System action: JES3 processing continues. This is an informational message.

Operator response: None. However, if the text JESXCF-ERROR appears in either the FMID or the status, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

System programmer response: If the text JESXCF-ERROR appears in either the FMID or the status, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Routing Code: Note 18 Descriptor Code: 5, 7
IAT8649
Explanation:

This message is issued in response to an *I,NJE or *I,NJE,N=nodename,LINE command. A remote node is in the process of sending a job or a SYSOUT data stream to the local node and the local node has initiated a security request to the security product. Until the security request completes, the local node is indicating to the remote node that no more data for the stream should be sent.

System action: JES3 processing continues.

Operator response: No action is necessary unless a line remains in quiesce mode for an inordinate amount of time. This may indicate that the security product is unable to complete the request. This may result from the security product data base or that the security request is hung. To recover from this condition, cancel the line by using the *C,linename,I command. After the security product or the security product data base have been cleared up, restart the line by using the *X,NJE,N=nodename command.

Routing Code: Note 18  Descriptor Code: 5,7
Print/Punch Class:
- PRTDEF—prtclass—PRTTSO—tsoclass
- PRTXWRTR—xwrclass—PUNDEF—punclass

This message is issued in response to an *INQUIRY,NJE,NAME=nodename command. Various information about the requested node name is included in this message. DEFINED LINE NAME is displayed if the node is a directly connected binary synchronous (BSC) node; SNA PROTOCOL is displayed if the specified node is allowed to receive and send a network job using SNA protocols. The default print, external writer, TSO, and punch classes are displayed if the node is the home node or an alias.

In the message text:

nodetype
  The type of the node being displayed.
  HOME
    The node being displayed is the home node.
  ALIAS
    The node being displayed is an alias of the home node.
  NODE
    The node being displayed is a directly or indirectly connected BSC or SNA node.

nodename
  The name of the node for which information is being displayed.

hold
  A hold status of either HOLD or NOHOLD.

pathname
  The path of the node if the requested node is directly or indirectly connected. If the node is directly connected and the path has not been modified through the *MODIFY,NJE,NAME=node,PATH=path command, the node’s path is itself.

lname
  The name of the line, if the requested node is directly connected.

prtclass
  The default print class as defined by the PRTDEF keyword on the home node or alias definition.

tsoclass
  The default TSO class as defined by the PRTTSO keyword on the home node or alias definition.

xwrclass
  The default external writer as defined by the PRTXWRTR keyword on the home node or alias definition.

punclass
  The default punch as defined by the PUNDEF keyword on the home node or alias definition.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT8660

Explanation:

This message is issued in response to an *INQUIRY,NJE,NAME=nodename,LINE command. In addition to the line status messages for the specified node nodename and linename, RCV|NORCV status for active lines for the specified node are given. RCV indicates node is receiving. NORCV indicates node is not receiving.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18 descriptor Code: 5,7

IAT8661

Explanation:

This message is issued in response to an *INQUIRY,NJE,NAME=nodename,SNDR command. The nodename and NJE logical sender device names for the specified node are given.

System action: JES3 processing continues.
**IAT8662**

**Operator response:** None. This is an informational message.

**Explanation:**

- **SNDR**
- **LINE**
- **RETRYCT**

This message is issued in response to a *I NJE, NAME=nodename, (SNDR | LINE | RETRYCT) command. The SNDR, LINE, or RETRYCT parameter is not correct for a node that does not use BSC protocols.

**System action:** JES3 ignores the command.

**Operator response:** Resubmit the command using the valid parameters for a BSC node.

**Module:**

**Routing Code:** Note 18 **Descriptor Code:** 5,7

---

**IAT8663**

**Explanation:**

- **SNDR**
- **RETRYCT**

This message is issued in response to a *INQUIRY NJE,NAME=nodename,RETRYCT=nnn command. The nodename and RETRYCT values for the specified node are given.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18 **Descriptor Code:** 5,7

---

**IAT8664**

**Explanation:**

- **PARAMETER**
- **SNDR**
- **LINE**
- **RETRYCT**

This message is issued in response to an *I NJE, NAME=nodename,PENCYP command. It specifies whether the passwords will be sent to the specified node encrypted or in clear text.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18 **Descriptor Code:** 5,7

---

**IAT8665**

**Explanation:**

- **SNDR**
- **RETRYCT**

An *F,J=nnnn,M=mains command was issued to change the job's main eligibility.

**System action:** The specified job is restarted through JES3 C/I processing and will continue using the new list of main processors.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18 **Descriptor Code:** 5,7

---

**IAT8666**

**Explanation:**

- **PARAMETER**
- **SNDR**
- **RETRYCT**

An *F,J=nnnn, M=mains command was issued to change the job's main eligibility but the command was rejected for one of the following reasons (reasontext):

**JOB IS INELIGIBLE**
The job is a procib update job.
The job is a demand select job.
The job is already in execution.
The job is has completed execution.
The job is in MDS restart.
The job is active in some other function except main service.
The job does not require main service.

**MAINS ARE INCONSISTENT WITH JOB CLASS**
The main processors specified are not eligible to run with the job's job class.

**mmmmmm IS AN INVALID MAIN NAME**
An incorrect main name was specified on the "F,J=nmnn,M=mmmm" command.

**System action:** The command is rejected.

**Operator response:** If **MAINS ARE INCONSISTENT WITH JOB CLASS** is displayed, correct the command so that the mains specified are eligible to run with the job's job class. You can issue an "F,J=nmnn,CL=class" command to change the job's job class.

IAT8670 Explanation: AN ERROR OCCURRED WHILE ATTEMPTING TO ACCESS THE JCT DATA SPACE

An error occurred while attempting to access the JCT data space. Message IAT4085 follows describing the action taken by JES3.

System action: The data space function is disabled. JES3 continues processing.

Operator response: Notify the system programmer. Once the problem is fixed, hotstart JES3 to create the data space.

Programmer response: Examine the system dump to determine the cause of the failure.

Module: IATGRJX, IATGRJX, IATGRJX

Routing Code: 10  Descriptor Code: –

IAT8671 Explanation: **********(GRJX) JOB_jobname (jobid)**********

CATASTROPHIC ERROR QUIESCED **********

Note: This message is repeated eight times.

An unrecoverable error has occurred while processing an IATXJQE or IATXJCT macro instruction. Possible causes of the error are:
- Unrecoverable read/write error on JCT record
- Incorrect control block structure for this job
- Damage to JQE/JCT service control blocks
- Program interrupt
- Machine error

System action: The error condition is flagged in the IATYJQE control block, and all further access to the job is inhibited. All control blocks remain in storage for diagnostic purposes. The DSP issuing the macro instruction may issue a DM abend.

Operator response: Notify the system programmer and/or the submitter of the job about the error for each unique job. Each of the jobs may need to be rerun.

System programmer response: Dump JES3 address space and capture dump.

Problem determination: See Table I, items 2 and 16; Table III, items 2, 3, 4, and 7.

Module: IATGRJX, IATGRJX, IATGRJX

Routing Code: 10  Descriptor Code: 5,7,11

IAT8672 Explanation: JOB_jobname_jobno NOT FOUND

This message is issued in response to an *INQUIRY command in which the specified job could not be found.

System action: JES3 processing continues.

Operator response: Verify the correct job ID, and resubmit the command.

Module: IATGRWJ, IATGRWJ, IATGRWJ

Routing Code: Note 18  Descriptor Code: 5,7

IAT8673 Explanation: JOB_jobname (jobid) OF NET_net id

IS IN SETUP— OR ON MAIN

The specified job of network net id was in setup processing, or executing on a processor, when a *MODIFY,N,ID=net id,F command was issued. The job might remain active, and even though the network has completed processing, data sets will continue to be updated.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module: IATGRWM, IATGRWM, IATGRWM

Routing Code: Note 18  Descriptor Code: 5,7
JES3 issues this message in response to an *INQUIRY,J, an *INQUIRY,P, or an *INQUIRY,Q command. This is the job or queue status report. In the message, text is one of the following:

**P=** prty identifies the job priority. (This field appears only if the request is job-specific.)

**CL=** cls identifies the job class as specified in the CLASS= parameter of the JOB statement for this job.

**NET=** djnet identifies the dependent network name.

**HOLD=** holdtype identifies the hold status. **holdtype** is one of the following:
- **OP** Operator hold status.
- **DJ** DJC operator hold status.
- **N** DJC network hold status.
- **ER** Operator hold status because of an error in the job.
- **PR** Priority hold status.
- **SP** Spool hold status.
- **ARM** Automatic restart management hold status.

**Note:** In response to an *INQUIRY,Q,H command, a job in priority hold only displays HOLD=PR if other hold types also apply. If PR is the only hold type that applies, IAT8674 is not issued for that job. If you need to see which jobs are in priority hold, use the *INQUIRY,Q,H,PR command.

The status of the job appears in terms of the JES3 function (scheduler element) being processed for the job, as follows:

**dspname [status]**

The name of the DSP that is associated with the scheduler element being processed is waiting for output service to complete processing data sets that were spun off by the previous DSP. This DSP will be scheduled when all spinoff data sets have completed output service processing.

**status** is one of the following:
- **ACTIVE** Active.
- **COMPLETE** Complete.

**RESCHEDULED**

This DSP was rescheduled.

**SPEC RESCHED**

This DSP has specialized rescheduling and is waiting for devices.

If the dspname is NJESND, the job is waiting for a connection to the destination node. Use the *INQUIRY A,D=NJESND and the *INQUIRY NJE,NAME=node commands to determine whether the job is formatted with the same protocol with which the destination node is defined.

If the dspname is not NJESND, the job needs to be rerouted using NJEROUT DSP before it can be sent.

**PENDING WTR** The job's data set is waiting for a writer if DSP=OUTSERV.

**ACTIVE ON WTR** The job's data set is active on a writer if DSP=OUTSERV.

**DSP ABEND** JES3 failsoft processing this DSP.

**PENDING SPIN** The job is waiting for output service to complete processing data sets that were spun off by a previous DSP. For example, spinoff output was created by the job during execution (MAIN DSP) as a result of specifying FREE=CLOSE on a DD statement. The DSP specified in this message will be scheduled when all spinoff data sets have completed output service processing.

**MAIN status1**

the MAIN scheduler element is ready to be processed or is being processed for the job. If no DSP is running yet, only MAIN appears in the message. Otherwise, status1 indicates where the job is in relationship to the functions of main service processing.

**status1** is one of the following:
- **FETCH** The job is waiting for volume fetch processing.
- **WAITVOL** The job is waiting for *S setup processing.
- **SYSTEM SELECT** The job is on the system select queue.
IAT8674

**ALLOCATE** The job is waiting for resources to be allocated.

**VOL UNAVAIL** The job is waiting for an unavailable volume.

**VERIFY** The job is waiting for volumes to be mounted.

**SYSTEM VERIFY** The job is on the system verify queue.

**MDS ERROR** The job is waiting for an operator decision. (MDS error queue)

**GMS SELECT** The job is waiting to be selected for processing on the main.

**EXECUTING** The job is in execution.

**BREAKDOWN** The job is waiting for its resources to be deallocated (MDS breakdown).

**MDS RESTART** The job is waiting for MDS restart processing.

**MAIN COMPLETE** The job is complete on main.

**OUTSERV WAIT** The job is in the process of being rescheduled.

**DEMAND SELECT** The job is a demand-select job that is waiting to be selected for processing on the main.

**I/O WAIT** The ending function RESQUEUE is waiting for I/O to complete.

**ENDFUNC ERROR** Error - the ending function RESQUEUE was not processed.

**DSP ABEND** The main service scheduler element was ended by JES3 failsoft processing.

**DELETE ONLY** Restart processing with analysis found that the job's control blocks contain incorrect data.

**CI**

- **status**

  - **CATALOG SETUP** The job is in catalog setup (JOBCAT or STEPCAT DDs).
  - **CI IN FSS** The job is active in C/I and PRESCAN processing in a functional subsystem (FSS) address space. In this case, the FSS name of the CI FSS that is processing the job is also displayed.
  - **ACTIVE** The job is active in C/I and PRESCAN processing in the JES3 address space.
  - **LOCATE** LOCATE processing is being performed for the job.
  - **POSTSCAN** The job is active in POSTSCAN processing in the JES3 address space.
  - **RESCHEDULED** The CI DSP had specified rescheduling because a main was not available to do LOCATE processing, or the job is in DJC hold status.
  - **WAIT POSTSCAN** The job is waiting to be scheduled for POSTSCAN processing. The name of the FSS that the job is associated with is also displayed.
  - **DSP ABEND** The C/I scheduler element was ended by JES3 failsoft processing.

**FSS=fssname**

- *fssname* identifies functional subsystem (FSS) name.

**MPNAME=mpname**

- *mpname* identifies the main processor name.

**System action:** JES3 continues processing.

**Operator response:** No specific action is required if this message is issued in response to a command. If it is issued during restart processing, cancel the indicated job when restart processing is complete. (The only commands that JES3 can accept for the job are *INQUIRY and *MODIFY,jobno,C.)

IAT8677
Explanation:

This message is issued in response to the *INQUIRY,J=jobname:jobno,SD command was issued to display the names of the spool data sets that contain data for the indicated job.

In the message text:

- **jobid**: The job identifier.
- **jobname**: The job name.
- **ddn**: The *ddn* of the spool data set which contains data for the job in question.

**System action**: JES3 processing continues.

**Operator response**: None. This is an informational message.

**Module**: IATGRWJ

**Routing Code**: Note 18  **Descriptor Code**: 5,7

---

IAT8678
Explanation:

This message is issued in response to an *INQUIRY,P=pri command. No jobs exist in the specified priority queue.

**System action**: JES3 processing continues.

**Operator response**: None. This is an informational message.

**Module**: IATGRWJ

**Routing Code**: Note 18  **Descriptor Code**: 5,7

---

IAT8679
Explanation:

This message is issued in response to an *INQUIRY,Q command. No jobs exist in the JES3 job queue.

**System action**: Processing continues.

**Operator response**: None. This is an informational message.

**Module**: IATGRWJ

**Routing Code**: Note 18  **Descriptor Code**: 5,7
This message is issued in response to an "I,Q" command with the W operand. It is displayed when the particular job is waiting to be scheduled:

SCHEDULING/ENDING FUNCTION
The job has just become ready and is waiting for the Job Segment Scheduler (JSS) to schedule the job. Or the job has just completed a JES3 function (such as C/I) and is waiting for JSS to mark the function complete and schedule the next function.

Nothing needs to be done for this condition unless it persists for a long time.

A DSP TO BECOME AVAILABLE
The job is waiting for a DSP to become available.

To determine which DSP the job is waiting for, find the DSP name in message IAT8674, and issue the "I,X,D=dspname command to determine whether there are enough DSPs defined or whether the DSP is in hold.

A RQ TO BECOME AVAILABLE
JSS was unable to create a RQ to schedule the job because there are no RQs in the RQ cell pool, and storage for another cell pool extent could not be obtained. Nothing needs to be done for this condition unless it persists for a long time.

A PROCLIB TO BECOME AVAILABLE
The job is waiting for the procedure library to become available. This means that either the procedure library could not be allocated, or another job is updating the PROCLIB. To determine which procedure library the job is waiting for, issue a "X,DISPLAY command and find the procedure library identified by "PROCLIB=IATPLBnn". To determine the status of the procedure library, issue a "I,PROCLIB,ID=nnn command, where "nnn" is the last two characters of the procedure library name. If a job is updating the procedure library, the job number will appear in the output from the "I,PROCLIB,ID=nnn command.

A MAIN/CLASS/GROUP
The job is waiting for a main processor, a job class, or a job class group to become available. This means that either the main processor is not connected, the main processor is offline, the job class is disabled on all main processors, or the group is disabled on all main processors.

If the job is waiting to be scheduled for C/I, the job can only be waiting for a main processor since the status of the job's class and group does not affect C/I scheduling. To determine which main processors the job is eligible for, issue a "I,J=nnn,M command. To determine the status of those main processors, issue an "I,S command (provided you are using JES3 setup), and examine the status of those main processors that appeared in the "I,J=nnn,M command. At least one of these main processors must be connected and online in order for the job to be scheduled for C/I.

If the job is waiting to be scheduled for MAIN, then the job can be waiting for a main processor, a job class, and/or a job class group. To determine which main processors the job is eligible for, issue a "I,J=nnn,M command. To determine the status of those main processors, issue an "I,S command (provided you are using JES3 setup), and examine the status of those main processors that appeared when you issued the "I,J=nnn,M command. At least one of these main processors must be connected and online in order for the job to be scheduled for MAIN.

To determine the status of the job's class, issue a "I,G,ALL,C,classname command, where "classname" is the name of the class that appears in message IAT8674. The class must be enabled on at least one main processor that is eligible to run the job.

To determine which group the job is associated with, issue a "I,G,ALL,C,classname command, where "classname" is the job class name that appears in message IAT8674. The name of the group will appear in the output from the "I,G,ALL,C,classname command. Then issue a "I,G,mainname,G,groupname command to determine the status of the group. The group must be enabled on at least one main processor that is eligible to run the job.

COMPLETION OF QUEUE PROCESSING
The job is waiting for JSS to complete processing of its queues so that it can later be put back on the DSP wait queue. Nothing needs to be done for this condition unless it persists for a long time.

SMS RESOURCES TO BECOME AVAILABLE
The job requires SMS-managed user catalogs to become available. This condition occurs when the volume or storage group, where the SMS-managed user catalog resides is quiesced or disabled. There is no method by which you can list the specific storage groups and volumes that are required by this job. However, you can issue the "D SMS,SG(ALL),LISTVOL" command to list all of the storage groups and volumes defined in your installation.

A LOCATE MAIN TO BECOME AVAILABLE
The job is waiting for a main processor to become available for locate processing. This condition occurs when a job, that needs catalog locate processing, is scheduled for C/I and the main becomes unavailable before the job begins catalog locate processing. To determine which main processors the job is eligible for, issue a "I,J=nnn,M command. To determine the status of those main processors, issue an "I,S command (provided you are using JES3 setup), and examine
the status of those main processors that appeared when you issued the \*I,J=nnnn,M command. At least one of these main processors must be available in order for the job to be scheduled for C/I processing.

**SOME UNKNOWN REASON**

JES3 was unable to identify the reason that the job is waiting. This is probably due to some system error; the system programmer should be contacted.

**JOB WITH SAME NAME TO END**

A job with the same name has been scheduled for main service processing. To determine which job has been scheduled for main service, issue an \*I,J=jobname command.

**JOB PRIORITY IS IN HOLD**

The job's priority was put into hold through a \*F,Q,H command or a \*F,Q,P=prty,H command. The job's priority appears in message IAT874.

**JSAM BUFFERS TO BECOME AVAILABLE**

The job requires POSTSCAN processing, and POSTSCAN cannot proceed until system-wide JSAM buffer usage by C/I decreases below the allowable threshold.

System action: JES3 processing continues.

Programmer response: The action to be taken depends on the reason why the job is waiting.

**IAT8681**

Explanation:

- **JOB jobname (jobid) SP=spart CL=class**

An \*INQUIRY,J=jobno or jobname,SP command was issued to display the name of the spool partition assigned to a job.

- **jobid**
  - job identifier

- **jobname**
  - job name

- **spart**
  - Indicates that spool partition spart has been assigned to the job. If CL=class is not present, the spool partition was specified on the //MAIN statement for the job. If CL=class is present, the job requested job class class and spool partition spart has been assigned to that job class.

- **SP=UNASSIGNED**
  - Indicates that no spool partition has been assigned to the job; the JCL for the job did not specify a specific spool partition and there was no spool partition assigned to the job class that was specified by the job.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Explanation:

>>> JOB— jobname (jobid) text

This message is issued in response to an *INQUIRY,J=jobno or jobname,M command.

ELIGIBLE ON main, [main] [GLOBAL]
Indicates the name(s) of the main(s) on which the job is eligible for execution.

NOT ELIGIBLE FOR MAIN
The job does not have a main scheduler element or the job has completed main processing.

jobid
The job identifier.

jobname
The job name.

main
The name of a JES3 main (as defined by a MAINPROC initialization statement). Up to eight main names may be displayed.

GLOBAL
The job is a called DSP and runs only on the global processor.

System action: JES3 continues processing.

Operator response: None. This is an informational message.

IAT8685

Explanation:

>>> main - reason text

This message is issued in response to the *INQUIRY,Q,*INQUIRY,P, and *INQUIRY,J commands when the W operand is specified. It is displayed when the reasons why the job is waiting may vary from main processor to main processor. The message indicates which main processor the delay is associated with and why the job is waiting on that main and cannot be scheduled on that main. Most of the reasons are similar to the ones displayed when you issue a *CALL,DISPLAY command. They are as follows:

- [RQJSTAT=(mpname,selection status/bypass reason,...)] - The selection status or bypass reason is given for each main for which this job is eligible (if present) (MPNAME/RQJSTAT). Selection status is one of:
  - VALUE NOT DEFINED - means that RQJSTAT has not yet been filled in (RQJXZERO); either the job has:
    - not yet reached MDS or GMS processing
    - reached MDS or GMS processing but has not yet been selected for a main, and there are not yet any reasons why the job cannot be allocated or selected.
  - ON MAIN - job selected for a main (RQJXONMN)

The bypass reasons are divided into GMS reasons and MDS reasons. Through various initialization statements (MAINPROC, SELECT, CLASS, GROUP), the installation defines throughput objectives to be used as GMS balances the workload. If RQJSTAT is one of the GMS reasons, it may mean that the job was not selected on the main specified because of a
conflict with one of the installation defined criteria and the current workload of the JES3 complex. The GMS bypass reasons are:

INSUFFICIENT STORAGE - from the LSTOR parameter (RQJXSTOR)
TLIMIT EXCEEDED - (RQJXTLIM)
NO MATCH ON IORATE - (RQJXIORT)
NO MATCH ON RQMAINS - the job is not eligible to run on this processor (RQJXMAIN)
JOB CLASS DISABLED - (RQJXCLAS)
LSTOR UPDATE PENDING - (RQJXLSPN)
JOB IN HOLD OR ACTIVE - (RQJXHOLD)
RQINDEX NO SELECT - RQINDEX is not select (RQJXINDEX)
JOB IN DJC HOLD - (RQJXDJCH)
GROUP OFF THIS MAIN - group disabled on this main (RQJXMGMN)
MAIN OFFLINE - (RQJXMNOF)
TDEPTH EXCEEDED - (RQJXTDPT)
CANCL/RSTRT SETUP ISSUED - a cancel/restart setup command was issued (RQJXRCSN)
WAITING FOR REQ MVS LVL - waiting for a system at a particular release level or higher to become available (RQJXW522)
SCHENV UNDEFINED - the scheduling environment is undefined in the current WLM policy (RQJXSEUD)
SCHENV NAVAIL - the scheduling environment is not available (RQJXSEUN)
WAITING FOR SPOOL SPACE - (RQJXW5PL)
MAX JES MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in JES managed initiators (65535) is active and no new job can run on this main in a JES managed initiator until one of these active jobs ends or is canceled.
MAX WLM MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in WLM managed initiators (65535) is active and no new job can run on this main in a WLM managed initiator until one of these active jobs ends or is canceled.
JESLOG VALUE NOT SUPPORTED ON MAIN - The job specified (on the JOB statement or the START command) or inherited (from the class definition) a JESLOG attribute of SUPPRESS or SPIN. The main processor for which this text is displayed for the job is not at a sufficient JES3 level to allow the job to run on that processor.

GROUP NOT SUPPORTED IN WLM MODE - (RQJXGWL)
MDEPTH EXCEEDED - (RQJXMDEP)
MLIMIT EXCEEDED - (RQJXMLMT)
SRVCLASS MODIFY IN PROGRESS - (RQJXSRVM)
WLM RECLASSIFICATION IS IN PROGRESS - (RQJXW5LC)

The MDS bypass reasons explain why MDS could not perform allocation for the job. The MDS bypass reasons are the following:

RESOURCE UPDATE ONLY - resource update scan is in progress (RQJMDRSU)
JOB HOLD STATUS - job is held (RQJMDHL)
MAX REGION SIZE EXCEEDED - job exceeds maximum region size (RQJMDRG)
RESTART JOB PASS ONLY - following a warmstart, JES3 allocation first processes jobs that had been allocated before the warmstart (RQJMDRST)
MAIN OFFLINE OR NOIPL - main offline/not connected (RQJMDOFF)
RESTART MAIN NOT IPLD - restart main not connected (RQJMDROI)
GROUP/CLASS DISABLED - group/class disabled (RQJMDGMS)
REQ RESOURCE NAVAIL - required resource not available (RQJMDRSC)
DEVPOOL FENCE PENDING - device pool fence is pending, not available, and/or not built (RQJMDFNC)
MAIN SDEPTH EXCEEDED - main setup depth exceeded (RQJMDMDP)
CLASS SDEPTH EXCEEDED - class setup depth exceeded (RQJMDCDP)
FAILED PRE-ALLOC SCAN - pre-allocation scan failed (RQJMDSCN)
SYS MNGD RESOURCES UNAVL - SMS managed resources not available (RQJMDSMS)
SCHENV UNDEFINED - the scheduling environment is undefined in the current WLM policy (RQJMSEUD)
SCHENV NAVAIL - the scheduling environment is not available (RQJMSEUN)
GROUP NOT SUPPORTED IN WLM MODE - WLM groups are not supported by this system (RQJMGW)
JESLOG VALUE NOT SUPPORTED ON MAIN - The job specified (on the JOB statement or the START command) or inherited (from the class definition) a JESLOG attribute of SUPPRESS or SPIN. The main
processor for which this text is displayed for the job is not at a sufficient JES3 level to allow the job to run on that processor (RQJMJLNS).

The following additional reasons can be displayed:

- **MAIN OFFLINE/NOT CONNECTED**
- **GROUP DISABLED**
- **JOB CLASS DISABLED**
- **NO GROUP INITIATORS STARTED**
  - There are no initiators associated with the job’s job class group that are started, or there are initiators that are in the process of being started. To determine which group the job is associated with, issue an *INQUIRY,G,main name,C,classname, where main name is the name of the main processor that appears in message IAT8685, and classname is the job class name that appears in message IAT8674. Then issue an *INQUIRY,G,main name,G,groupname command for that group. The output from the command should show the status of the initiators for that group including the number of initiators that have been allocated (started). If the number of allocated (started) initiators is non-zero, then there are probably some initiators that are in the process of being started and are held up for some reason. To determine the status of the JES3 initiators, issue an *INQUIRY,J=INITJES3,W command.

- **ALL GROUP INITIATORS IN USE**
  - All initiators associated with the job’s job class group are in use by jobs in execution. To determine the status of the job’s group, use the same steps as when there are no started initiators.

- **NO INITIATORS STARTED IN SRVCLASS** (RQJNSIST)
  - No initiators are associated with the service class. To determine the resource group associated with a service class or the WLM initiator information, use the MVS "LIST ALL" command; *I,G,ALL,G,group gives the status of the group on all the systems.

- **ALL INITIATORS IN SRVCLASS IN USE** (RQJASIUS)
  - All the initiators associated with a service class are in use by jobs in execution. To determine the job group’s status, use the same steps as when no initiators started in SRVCLASS.

**System action:** JES3 processing continues.

**Operator response:** The action to be taken depends on the reason why the job is waiting.

**Module:**

- **IAT8686**
  - **Explanation:**
    - **JOB** (jobname) (jobid)
      - ESTIMATES
        - ACTUAL
      - xxxx LINES, xxxx PAGES, xxxx BYTES,
      - xxxx CARDS
    
    This message is issued in response to an *INQUIRY,J=jobname or jobno, E command. The message includes estimates of the number of lines, pages, or bytes to be printed and the number of cards to be punched for the specified job. If the job has completed processing, the display contains the actual counts. The actual counts for the job will not contain the counts for the JESYSMSG, JESMSGLG, and JESJCL system data sets. The actual byte count will specify the spool space used by the job. Because of the manner in which the statistics are saved in the JES3 job queue, up to 7 lines or cards may not have been counted.

  - **System action:** JES3 processing continues.
  - **Operator response:** None. This is an informational message.

- **IAT8687**
  - **Explanation:**
    - **JOB** WAITING
      - ACTIVE
      - hhhhh HOURS, mm MINUTES
      - ss SECONDS
    
    This message is issued in response to an *INQUIRY,Q, an *INQUIRY,P, or an *INQUIRY,J= command with the W operand. It indicates how long a particular job has been waiting.

  - **Note:** This time is relative to the last JES3 restart.
  - **System action:** JES3 does not accumulate the job wait time across restarts.

  - **Operator response:** None. This is an informational message.

  **Module:**

- **IAT8686**
  - **Explanation:**

This message is issued in response to an *INQUIRY,B command when there are no jobs found for the specified selection criteria.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18  **Descriptor Code:** 5,7

---

More than one job was found based on the selection criteria specified on the *MODIFY,J=jobname command. JES3 will only process the request if the specified criteria applies to a single job.

**System action:** JES3 rejects the command.

**Operator response:** To see all the jobs that match the selection criteria, issue an *INQUIRY J=jobname command specifying the same set of parameters that were used on the *MODIFY,J command. To change one job, use that job number on the *MODIFY,J=jobnum command.

To modify more than one job with the same name, or to modify all jobs whose name begins with the same character string, specify additional parameters on the *MODIFY,J=jobname command to define the selection.

If the additional parameters do not make the name unique, use the N=ALL parameter on the *MODIFY,J command. Use caution when using N=ALL, especially when canceling jobs. For more information on how to use the parameters, See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/en/SSD8KV_4.2.1/COM.ibm-jes-42.pdf).

An *I,M command was issued to display JES3 routing information for all MVS messages that are assigned to a specific MCS routing code. The following list defines the information specified in the message.

**RC**
- the routing code

**CONS**
- the name of the console where the messages will be displayed. If (NONE) appears, a specific console is not defined to receive messages with the specified routing code.

**constatus**
- The status of the console assigned to receive messages with the specified routing code.
  - (ACTIVE) - the indicated console is active in the sysplex
  - (INACTIVE) - the indicated console is defined in the sysplex but is not currently active
  - (UNDEFINED) - the indicated console is not defined in the sysplex
  - (ERROR) - an error occurred determining the status of the indicated console

**CLASS**
- The JES3 destination class that is used to route the message. The MVS routing code equivalent of the destination class is also displayed.

Destination class **ALL** and destination class **MLG** do not map to a specific MVS routing code. For these classes, **BROADCAST** (for dest class **ALL**) or **HARDCOPY** (for dest class **MLG**) is displayed. If (NONE) appears, a specific destination class has not been defined for messages with the specified routing code. If ? appears, an error occurred while determining the destination class.

**J**
- This option indicates that the routing code equivalent of the JES3 destination class is used for the message in place of the message's original routing code(s). The absence of 'J' indicates the routing code equivalent of the JES3 destination class is merged with the message's original routing codes.

**System action:** JES3 processing continues.

FSSNAME  TYP  SYSTEM  PROCNAME  JOBID

STAT  T  S  MD  RC  DSP/DEV  MAXASST

This message is issued in response to an *INQUIRY,F command. One IAT8702 message is written for each FSS to be displayed; in addition, one message is written for each FSA assigned to an output writer FSS. The values that may be displayed are as follows:

FSSNAME  Functional subsystem (FSS) name.
TYP  Type of FSS function (WTR or C/I).
SYSTEM  Main where the FSS is currently active or where it is assigned to run in conjunction with the current global.
PROCNAME  Name of the procedure library member.
JOBID  Job number of the job that is executing as the FSS address space.
STAT  Current status of the FSS.
T  Specifies whether the FSS ends.
S  Specifies whether this CI FSS is to be started automatically.
MD  Message Destination class.

RC  MVS routing code.

DSP/DEV  Number of C/I subtasks to be started in the CI FSS address space or the name of a device assigned to an output writer FSS.

MAXASST  Maximum number of JCL statements.

System action:  JES3 formats and issues message IAT8702.

Operator response:  None. This is an informational message.

IAT8701

Explanation:

FSSNAME  TYP  SYSTEM  PROCNAME  JOBID

STAT  T  S  MD  RC  DSP/DEV  MAXASST

This message is issued in response to an *INQUIRY,F command. It provides the column headings for message IAT8702. Entries appear under each head are:

FSSNAME  Functional subsystem (FSS) name.
TYP  Type of FSS function (WTR or C/I).
SYSTEM  Main where the FSS is currently active or where it is assigned to run in conjunction with the current global.
PROCNAME  Name of the procedure library member.
JOBID  Job number of the job that is executing as the FSS address space.
STAT  Current status of the FSS.
T  Specifies whether the FSS ends.
S  Specifies whether this CI FSS is to be started automatically.
MD  Message Destination class.

RC  MVS routing code.

DSP/DEV  Number of C/I subtasks to be started in the CI FSS address space or the name of a device assigned to an output writer FSS.

MAXASST  Maximum number of JCL statements.

System action:  JES3 formats and issues message IAT8701.

Operator response:  Correct and resubmit the command.

Module:

Containing  Detecting  Issuing
IATIQDV  IATIQDV  IATIQDV

632  z/OS V1R12.0 JES3 Messages
jobid
The job number of the job that is executing as the
FSS address space. This field is blank for an output
writer FSA.

status
The current status of the FSS is one of the
following:
- UNUS: The FSS is unusable.
- INAC: The FSS is inactive.
- FAIL: The FSS START command or the FSS address
  space has failed.
- RSTR: Processing for this FSS in the JES3 global has
  not yet resumed following a hot start.
- STRT: The MVS START command for the FSS
  address space has been sent.
- FSSC: The FSS has connected.
- PLIC: For a C/I FSS only, the FSS has connected,
  and procedure library initialization is complete.
- ACTV: For a C/I FSS or an FSA. For a C/I FSS,
  subtask initialization is complete and the FSS
  address space is fully active. For an FSA, the
  device shown for the FSA is active.
- STOP: For an FSA only. The STOP DEVICE order has
  been sent.
- DSTP: For an FSA only. The FSA device has been
  stopped.
- FSAD: For an FSA only. The FSA has been
  disconnected.

term
Specifies whether the FSS ends when the JES3
global address space ends by a "RETURN
command. The possible value is Y or N. This field
is blank for an output writer FSA.

start
Specifies whether this CI FSS is to be started
automatically when the main where it is assigned to
run connects to the JES3 global; the possible
values are Y or N. This field is blank for both an
output writer FSS and an output writer FSA.

dest-class rc
Specifies the routing information for messages
concerning this FSS. This routing information is
displayed in JES3 destination class format and
MVS routing code format. If current routing
information does not correspond to a JES3
destination class, for example, 1,2,4,5,6, and 11
through 40 then "n/a" is displayed for the JES3
destination class. This field is blank for both a C/I
FSS and an output writer FSA.

dspcount
The number of C/I subtasks to be started in this CI
FSS address space. Two numbers are given. The
first one indicates the maximum number of batch
jobs that may be processed concurrently. The
second one indicates the maximum number of TSO
logons and started tasks (demand select jobs) that
may be processed concurrently. This field is
normally blank for an output writer FSS and
contains the device name for an output writer FSA.

deviden
The name of a device assigned to an output writer
FSS. If there are multiple devices, subsequent
IAT8702 messages are written; one for each such
device, with all other fields blank.

maxasst
The maximum number of JCL statements that can
be processed concurrently by all CI DSPs in the C/I
FSS Address Space. This field is blank for both an
output writer FSS and an output writer FSA.

System action: Processing continues.

Operator response: None. This is an informational
message.

Module:

IAT8703

Explanation:

This message is issued in response to an "INQUIRY,F
command. No FSS was found that satisfied the
requirements specified on the command.

System action: JES3 processing continues.

Operator response: None. This is an informational
message.

Module:
**Note 18**

**IAT8704**

**Explanation:**

- **FSSNAME** GLOBAL ASSIGNED FSS MAIN
- **PENDING MAIN**

This message is issued in response to an *INQUIRY,F,...,S command. It is the header message for message IAT8705.

**System action:** JES3 formats and issues message IAT8705.

**Operator response:** None. This is an informational message.

**Module:**

**IAT8705**

**Explanation:**

- **fssname** sysnamei sysnamej msysnamej

This message is issued in response to an *INQUIRY,F,...,S command. For each FSS displayed, one line of output is displayed for each main in the complex, starting with the current global.

- **fssname**
  The name of the functional subsystem (FSS). This field is blank on all lines after the first line for a single FSS.

- **sysnamei**
  The name of a main that is a potential global.

- **sysnamej**
  The name of the main on which FSS fssname runs if sysnamei is the global. If the FSS cannot run on any main when sysnamei is the global, the word NONE appears in the message.

- **msysnamej**
  The name of the main on which FSS fssname will run if sysnamei is the global after a pending *MODIFY command has been processed. If there is no such modify pending, the word NONE appears in the message.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**IAT8707**

**Explanation:**

- **NETSERV INQUIRY RESPONSE**

**INFORMATION FOR NETSERV:**

- **NAME=**
- **HOST=**
- **PORT=**
- **STACK=**
- **ITRACE=**
- **VTRACE=**
- **TLS=**
- **ACTIVE=**
- **SOCKETS DEFINED IN THIS NETSERV**
This message is issued in response to an *I,NETSERV= command to display information about a given Netserv definition, or all Netserv definitions.

In the message text:

**system**
The system on which the Netserv runs, or blank if none is defined.

**host**
The name of the IP host that the Netserv uses to listen to TCP/IP, or blank if none is defined.

**port**
The name of the IP port for the Netserv, or blank if none is defined.

**stack**
The TCP/IP stack name containing the TCP/IP definition for the host, or blank if the default stack is used.

**sname_n**
A socket name within a list of socket lines, each representing a socket that is defined for the given Netserv, and an active status.

**nname_n**
The node name with which the home node uses the socket named sname_n to communicate.

**nsvname**
The name of the Netserv on which this socket is defined, or blank if none is defined.

This message is issued in response to an *I,SOCKET= command to display information about a given socket definition, or all socket definitions.

In the message text:

**nserv**
The name of the requested Netserv. If this name is blank, an *I,NETSERV=ALL command was issued and there are no Netservs.
The name of the IP host that the socket uses to communicate with TCP/IP, or blank if none is defined.

The name of the IP port for the socket or zero. Zero is displayed in one of the following cases:
- Inactive port that was not specifically defined.
- Inactive port that was defined as zero, PORT=0.
In all other cases, port displays the actual port defined or assigned to it.

The node that uses this socket, or blank if none is defined.

System action: Processing continues.
Operator response: None.
System programmer response: None.

Module:

Routing Code: Hardcopy  Descriptor Code: 5

Explanation:

This message is issued in response to an *I,SOCKET= command. The specified socket could not be displayed because it does not exist.

In the message text:

The name of the requested socket. If this name is blank, an *I,SOCKET=ALL command was issued and there are no sockets.

System action: Processing continues.
Operator response: Correct and reissue the command.
System programmer response: None.

Module:

Routing Code: Hardcopy  Descriptor Code: 5

Explanation:

This message is issued in response to an *I,NJE,NAME=nname command to display information about a node that uses TCP/IP protocols. If the requested node has BSC or SNA protocol, this message is not issued; message IAT8659 is displayed instead.

In the message text:

The name of the node.

The number of job transmitters for this node.

The number of job receivers for this node.

The number of output transmitters for this node.

The number of output receivers for this node.

A socket name within a list of socket lines, each
representing a socket that is defined for the given Netserv, and an active status, a server indicator, a Netserv, and system name.

\[ nname_n \]
The Netserv on which sname_n is defined.

\[ sysn_n \]
The name of the system on which Netserv nname_n runs.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Descriptor Code:** 5,7

---

**IAT8722**

**Explanation:**

\[ \text{PRIMARY EXTENT SIZE} \quad nnnn \]

This message is issued in response to an *INQUIRY,C command. nnnn represents the number of buffers in the primary extent of the JSAM Buffer Pool.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18

**Descriptor Code:** 5,7

---

**IAT8723**

**Explanation:**

\[ \text{SECONDARY EXTENT SIZE} \quad nnnn \]

This message is issued in response to an *INQUIRY,C command. nnnn represents the number of buffers in a secondary extent of the JSAM Buffer Pool.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18

**Descriptor Code:** 5,7
IAT8724

Explanation:

Secondary extents allowed

This message is issued in response to an *INQUIRY,C command. nnnn represents the maximum number of secondary extents of the JSAM Buffer Pool that is allowed.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 5,7

IAT8725

Explanation:

Total number of JSAM buffers

This message is issued in response to an *INQUIRY,C command. nnnn represents the total number of buffers in the primary extent and all secondary extents currently in use.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 5,7

IAT8742

Explanation:

Keyword interval limit

May not be specified with WANDUMP set to ASK

Command ignored

This message is issued in response to the *MODIFY WANTDUMP operator command. Either the current setting for WANTDUMP was what the message indicates, ASK or NO, or the command tried to change it to that value.

System action: None. The command is ignored.

Operator response: Reissue the command with the correct keyword combination.

Module:

Routing Code: Note 18,10  Descriptor Code: 5,7

IAT8800

Explanation:

JMF is not active on main

This message is issued when the operator enters an *I,A,D=JMF command and JMF is not active on an IPLed processor.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 5,7

IAT8930

Explanation:

Select option-value-main

For processor main, the current value of the select mode item option is the value specified. JES3 select mode options are determined by the SELECT initialization statement, which is discussed in z/OS JES3 Initialization and Tuning Reference.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 5,7
IAT8932

Explanation:

```
GROUP  grp  STATUS  ON
```

- **DI** = number of dedicated initiators for this group for this main (JES-managed groups only)
- **AI** = number of allocated initiators (JES-managed groups only)
- **UI** = number of initiators in use (JES-managed groups only)
- **ALLOC** = group execution resource allocation option (JES-managed groups only)
- **UNAL** = group execution resource unallocation option (JES-managed groups only)
- **BAR** = current group scheduling barrier (JES-managed groups only)
- **JSPAN** = number of jobs in this group to be examined in selecting a job to be scheduled (JES-managed groups only)
- **MODE** = whether the group is JES3 managed (JES) or WLM managed (WLM)
- **STATUS** = status of the WLM-managed group
- **main** = the main processor

Under the current select mode for the main, the current status of group *grp* is **STATUS=ON**, whether the group is online or offline to this main. For JES-managed groups, all values are displayed except the part indicated as "NOT SUPPORTED". For WLM-managed groups, only **STATUS=ON**, **MODE=main**, and "NOT SUPPORTED" are displayed. Other terms in the message are:

- **class** = the main processor
- **jobid** = job identifier
- **jobname** = job name
- **spart** = spool partition

:\n```
```

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT8968

Explanation:

IN dsnname

This is a secondary message in response to a TSO/E status command. This message is only issued if

IATUX30 is used for authority checking.

IN dspname

The job is currently associated with the names Dynamic Support Program.

ACTIVE IN AN FSS CI

The job is currently undergoing C/I processing in a JES3 FSS C/I address space.

AWAITING POSTSCAN (BATCH)

The batch job is waiting for JES3 C/I processing in the JES3 global address space.

AWAITING POSTSCAN (DEMSSEL)

The demand select job is waiting for JES3 C/I processing in the JES3 global address space.

AWAITING VOLUME FETCH

The job is waiting volume fetch processing.

AWAITING START SETUP

The job is waiting for the system operator to issue a *START SETUP JES3 command.

AWAITING RESOURCE ALLOCATION

The job is currently waiting for resources to be allocated.

AWAITING UNAVAILABLE VOL(S)

The job is currently waiting for one or more unavailable volumes.

VERIFY - nnn VOL MOUNTS PENDING

The job is currently undergoing verify processing with nnn mounts pending.

AWAITING OPERATOR ACTION

The job is currently waiting action to be taken on its behalf by the system operator (Main Device Scheduler error queue).

AWAITING SELECTION ON MAIN

The job is awaiting selection for MVS processing on a JES3 MAIN processor.

AWAITING BREAKDOWN

The job has finished processing and is waiting for deallocation of resources.

AWAITING MDS RESTART PROC

The job is waiting for restart processing through JES3 Main Device Scheduler functions.

MAIN AND MDS PROC COMPLETE

The job has completed MVS processing on a JES3 MAIN processor and all resources have been deallocated.

AWAITING OUTPUT SERVICE

The job is waiting for output service processing.

AWAITING OUTPUT SERVICE WRITER

The job is waiting for the availability of a JES3 output service writer.

AWAITING RESERVED SERVICE

The job is unable to be scheduled for output service processing.
OUTPUT SERVICE COMPLETE
The job has completed output service and will be transitioning to the next JES3 scheduler element, most likely PURGE.

MAIN SERVICE IS FOR DEMAND SELECT
The job is a demand select job that is waiting to be selected for processing on a JES3 MAIN processor.

stepname ON sysname TIME(MM:SS)
The job is currently processing on a JES3 MAIN processor and is in step sysname. The amount of processing time completed is MM:SS.

RESALLOC ww DASD xx TAPE yy OTHER
The job is currently waiting for ww DASD to be allocated, xx tapes to be allocated, and/or yy other devices (for example: unit record devices) to be allocated.

DJC NET netid -- OPERATOR HOLD
The job is in a Dependent Job Control (DJC) NET netid. The job has been held by a system operator.

DJC NET netid -- DJC HOLD
The job is in a DJC NET netid. The job is in DJC network hold status.

WAITING FOR THE NEXT JOB PHASE
The job is waiting for processing by JES3 for its next processing phase.

UNKNOWN RESQUEUE INDEX
The job has an unknown status state (error condition).

ENDING FUNCTION I/O WAIT
The function is in JES3 ending function processing and is waiting for I/O operations to complete.

ENDING FUNCTION IN ERROR
The job is in JES3 ending function and is in error (error condition).

SYSTEM SELECT PROCESSING
The job is on the system select queue (waiting for SMS-managed resources or is active in system select processing).

SYSTEM VERIFY PROCESSING
The job is waiting for system verify processing.

AWAITING ARM RESTART
The job is waiting for automatic restart management to restart it. This message appears after the job ends and before automatic restart management tells JES3 whether or not to restart it.

***WARNING*** ADDITIONAL JOB INFORMATION NOT AVAILABLE
Additional information about the job is not available.

Note: JES3 will send an OK return code to TSO with the STATUS of all the JES3 jobs that it was able to provide before the maximum staging area size was exceeded.
IAT8980

Explanation:

An *INQUIRY,Q=spart,U,N=nnn or an *INQUIRY,Q,SP=spart,DD command was issued to display the status of spool partition spart and there are no spool data sets defined in the partition at this time.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 2

IAT8990

Explanation:

The maximum number of partition inquiries on track groups requests (*INQUIRY,Q,SP=spart,U command) are already active.

System action: JES3 ignores the request.

Operator response: Wait for preceding requests to complete.

Module:

Routing Code: 2

IAT8991

Explanation:

An *F,X,ABEND=DMxxx,RESET command was issued to resume generating dumps for all JES3 failsoft completion codes. The *F,X,ABEND=DMxxx,SET command was never issued to select the JES3 failsoft completion codes that do not need a JES3 dump.

System action: JES3 ignores the command and continues processing.

Operator response: None. This is an informational message.

System programmer response: Examine your installation's procedures to identify if your installation has selected JES3 failsoft completion codes that do not require a JES3 dump. If your installation has not compiled a list of codes, you may want to create a list.

Module:

Routing Code: Note 18
An incorrect DM completion code was on the *F,X,ABEND=DMxxx,SET or
*F,X,ABEND=DMxxx,RESET command. Specify a valid JES3 failsoft completion code listed in z/OS JES3 Diagnosis Reference or ALL.

**System action:** JES3 ignores the request and continues processing.

**Operator response:** Ensure you have issued the requested JES3 failsoft completion code on the command. If you have not specified the requested number, reissue the command with the requested number. Otherwise, notify your system programmer of the incorrect DM code.

**System programmer response:** Determine the correct JES3 failsoft completion code by examining either:
- z/OS JES3 Diagnosis
- IATYDUM

**IAT8997**

**Explanation:**

A *I,X,ABEND=DM ALL command was issued to determine if JES3 generates a dump for all JES3 failsoft completion code except DM008. If JES3 does not generate a dump for all JES3 completion codes except DM008, JES3 displays SUPPRESSED. If JES3 generates a dump for a JES3 failsoft completion code in addition to DM008, JES3 displays NOT SUPPRESSED.

**System action:**  JES3 processing continues.

**Operator response:**  None. This is an informational message.

**Routing Code:**  Note 18  **Descriptor Code:**  5,7

---

**IAT8998**

**Explanation:**

An *I,X,DM=xxx command was issued to display all the DM codes for which JES3 suppresses dumps.

**System action:**  JES3 processing continues.

**Operator response:**  None. This is an informational message.

**Routing Code:**  Note 18  **Descriptor Code:**  5,7
Chapter 25. JES3 Networking Messages

IAT9101
Explanation:

The *CALL,NJE command was issued but there were no parameters specified. The NAME= parameter is required.

System action: JES3 does not initialize networking.

Operator response: Reissue the *CALL,NJE command with at least the NAME= parameter specified.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9102
Explanation:

The *CALL,NJE command contained a NAME= or LINE= parameter that exceeded eight characters.

System action: JES3 does not initialize networking.

Operator response: Reissue the *CALL,NJE command with the correct parameters.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9103
Explanation:

JES3 determined an incorrect node name was specified on a networking command. The node name was incorrect because of one of the following reasons:

- the NAME= parameter on the *CALL,NJE command contained a node name that has not been defined to JES3 using a NJERMT initialization statement.
- the node name specified on the command is the home node.
- the node name specified on the command specified a remote node that uses SNA protocols to receive network jobs.

System action: JES3 does not initialize networking.

Operator response: Reissue the *CALL,NJE command with a valid node name specified.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9104
Explanation:

The node name specified on the *CALL,NJE command is not directly connected to the node from which the command was entered.

System action: JES3 does not initialize networking.

Operator response: The *CALL,NJE command cannot be used to initialize the networking capability between two indirectly-connected nodes. Issue the *CALL,NJE command for directly-connected nodes. If a line exists between these two nodes, but the direct path has not been defined, use the *MODIFY,NJE,N=node name... command to define the path.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9105
Explanation:

The line specified (or defaulted to) on the *CALL,NJE command could not be allocated. Either an error
occurred while trying to allocate the line or the LINE= parameter was not specified on the *CALL,NJE command nor the LINE= parameter on the NJERMT initialization statement.

**System action:** JES3 does not initialize networking.

**Operator response:** If you did not specify the LINE= parameter, reissue the *CALL command and specify a line. If you specified the LINE= parameter, reissue the command. If the message persists, contact your system programmer.

**Explanation:**

➤➤—LOGGING STARTED FOR lname—➤

JES3 has received the *CALL,NJE or *START, lname command with the LOG parameter specified. The line trace facility is initialized.
IAT9111
Explanation:

The *CANCEL, lname, I command was issued.

System action: JES3 ends all processing for the specified line. No additional I/O operations will be performed on this line.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9112
Explanation:

The *CANCEL command was issued for this line.

System action: Current line activity continues. No new line activity is started. After all active functions are complete, JES3 ends the line.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9113
Explanation:

The specified line is ending either because the *CANCEL command was issued or an I/O error has occurred.

System action: JES3 purges any outstanding I/O operations.

Operator response: Consult your system programmer.

Module:

Routing Code: Note 17  Descriptor Code: 7

IAT9114
Explanation:

A line error has occurred. Intervention is required to correct the problem.

System action: JES3 ends the line.

Operator response: Correct the condition requiring intervention. Then restart the line.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9115
Explanation:

JES3 could not start an I/O operation on the line. The device is not operational. The condition is probably due to a hardware problem.

System action: JES3 ignores the request.

Operator response: Ensure that the device is on.

Routing Code: Note 17  Descriptor Code: 7

IAT9122

Explanation:

invalid record received on line __lname.__

- error in job stream rc= __rc__

As the home node received a network job or SYSOUT stream using BSC protocols, an error was found. For example:

- Incorrect record length was found
- Incorrect record identifier (RID) was found

System action: JES3 cancels the job stream for reason codes:

- 004 - 400
- 504 - 600

Operator response: Notify the system programmer.

Programmer response: Analyze the reason code to determine the reason for the error.

RC in decimal Meaning

004 While breaking a record out of the transmission buffer, mixed record control bytes (RCBs) were detected.

008 An error was detected while validating the next record within the transmission buffer. The record control byte (RCB) of the next record did not contain a valid stream identifier (1 - 7).

012 An error was detected while validating the next record within the transmission buffer. Module IATNTJS was invoked to process a transmission buffer from a SYSOUT stream and the next record in the transmission buffer was not from a SYSOUT stream.

016 An error was detected while validating the next record within the transmission buffer. Module IATNTJS was invoked to process a transmission buffer from a job stream and the next record in the transmission buffer was not from a job stream.

044 While processing a job stream, a job header was expected. A record other than the job header was received before receiving a job header record.

048 While processing the job stream, a job header segment was expected. A record other than a job header segment was received before receiving the entire job header.

056 While processing a job stream from a BSC node, a record was received after the job trailer that was not valid. The only valid record after the job trailer is an end of file (EOF).

060 A subsequent job header record was received after a data record had been received.

064 A record was removed from the transmission buffer. The length of the record is zero.

068 A job header segment was received for a job stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

072 A record was received that contained a zero length job header segment.

076 The job stream contains a zero length job trailer record.

080 A job trailer segment was received for a job stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

088 The first segment of a job trailer has been received. An additional record was found in a job trailer buffer while processing a job stream from a BSC node. The additional record was not a job header, job trailer, or an end of file record.

092 The first segments of the job header and the job trailer have not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was not a job header or a job trailer record.

096 The first segment of the job trailer has not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was...
not a job header, job trailer, or a data record. The first segment of the job header has been received.

100 While processing a SYSOUT stream, a job header was expected. A record other than the job header was received before receiving a job header record.

104 While processing a SYSOUT stream, a job header segment was expected. A record other than a job header segment was received before receiving the entire job header.

112 While processing a SYSOUT stream from a BSC node, a record was received after the job trailer that was not valid. The only valid record after a job trailer is an end of file (EOF).

116 While processing a SYSOUT stream, a data record was received before receiving a data set header.

120 While processing a SYSOUT stream, a data record's carriage control type was not recognized from the subrecord control byte (SRCB).

124 While processing a SYSOUT stream, a data record's spanned record indication was not recognized from the subrecord control byte (SRCB).

128 While processing a SYSOUT stream, a data record's spanned record indication was not recognized from the subrecord control byte (SRCB).

132 While processing a SYSOUT stream, a data record's length exceeded the maximum allowed for a spool data management spanned record.

136 While processing a SYSOUT stream, a network spanned data record's length exceeded the maximum logical record length defined for this data set. The maximum logical record length is indicated in the field NDHGLREC of the associated data set header.

140 While processing a SYSOUT stream data record, a “first” segment of a network spanned data record was received when an outstanding “first” segment had already been received.

144 While reconstructing a SYSOUT stream network spanned data record, a segment was detected when no outstanding “first” segment was received.

148 While processing a SYSOUT stream network spanned data record, a problem was detected with a work area.

152 While processing a SYSOUT stream non-spanned data record, a “first” segment of a spanned data record was detected.

156 While processing a SYSOUT stream, a job header record was detected after receiving data or data set header records.

160 While processing a SYSOUT stream job header record, a zero length record was detected.

164 A job header segment was received for a SYSOUT stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

168 While reconstructing a SYSOUT stream job header, a segment with a zero length was detected.

172 While processing a job trailer buffer, a zero length job trailer record was detected.

176 A job trailer segment was received for a SYSOUT stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

180 While processing a data set header buffer, a zero length data set header record was detected.

184 While reconstructing a SYSOUT stream data set header, a zero length segment was detected.

188 A data set header segment was received for a SYSOUT stream. While rebuilding the data set header, the length of the data set header exceeded the maximum size allowed.

200 The first segment of the job header has not been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record.

204 The first segment of the job header has been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record.

208 A job trailer segment was received for a SYSOUT stream. While processing the job trailer, the length of the job trailer exceeded the maximum size allowed.

212 A data set header segment was received for a SYSOUT stream. While processing the data set header, the length of the data set header exceeded the maximum size allowed.
header, data set header, or job trailer record. A data set header was currently being constructed.

208 An incorrect specification of the job header password encryption bits was detected.

212 The length of a job header section is not positive.

216 The total length of all of the job header sections is not equal to the length of the entire job header minus the job header prefix.

220 The length of a data set header section is not positive.

224 The total length of all of the data set header sections is not equal to the length of the entire data set header minus the data set header prefix.

228 A stream was either rejected by the security product or an error occurred during the processing of the security request.

232 An error was detected while decompressing a BSC record from the transmission buffer.

236 An error was detected while validating the next record within the transmission buffer. The next record was beyond the end of the transmission buffer.

240 While processing a SYSOUT stream record, a “first” segment of a sdm spanned record was received when an outstanding “first” segment of a sdm spanned record has already been received.

244 While processing a SYSOUT stream record, a “first” segment of a sdm spanned record was received when an outstanding “first” segment of a spanned record has already been received.

248 While processing a SYSOUT stream record, an “nth” segment of a sdm spanned record was received when no “first” segment was received.

252 While processing a SYSOUT stream record, a last segment of a sdm spanned record was received when no “first” and/or “nth” segment was received.

256 While processing a SYSOUT spanned record, a “first” segment of a spanned record was detected when an outstanding “first” segment of a sdm spanned record has been received.

260 While processing a SYSOUT non-spanned record, an outstanding “first” segment of a sdm spanned record was detected.

264 A job trailer has been received and the prior SYSOUT stream contained a sdm spanned record and the last segment of the sdm spanned record has not been received.

268 A job trailer has been received and the prior SYSOUT stream contained a spanned record and the last segment of the spanned record has not been received.

272 A data set header has been received and the prior SYSOUT stream contained a sdm spanned record and the last segment of the sdm spanned record has not been received.

276 A data set header has been received and the prior SYSOUT stream contained a spanned record and the last segment of the spanned record has not been received.

280 While processing a SYSOUT stream record, the length of the record exceeded the logical record length.

288 While processing a SYSOUT stream, the segments of a spanned record exceeded the spanned record length that was contained in the first segment.

999 Unknown error (the reason code returned by the common receiver was not recognized).

IAT9125
Explanation:
>>> UNABLE TO ADD JCT TO QUEUE

An error occurred while JES3 was trying to add a job to the job queue.

System action: JES3 ends the line.

Operator response: Notify the system programmer.

Programmer response: You may want to ease the current situation by canceling some jobs; or you may be able to find a bottleneck (output service, for example) in your installation.

To prevent this situation from recurring in the future, check the JOBNO parameter on the OPTIONS initialization statement. Allocate enough direct-access space to accommodate your installation's working data set for JCT records. (See z/OS JES3 Initialization and Tuning Reference for more information on the OPTIONS statement.)

Routing Code: Note 17   Descriptor Code: 7

IAT9134

Explanation:

Each node in the network is defined to the home node by a NJERMT statement. For each statement an entry is created and added to the networking node table. When a network job is received by a node, the networking node table is checked to ensure that the
node that sent the data is defined to the home node. This message is issued if the node that sent the data is not defined to the home node.

**System action:** JES3 places the received job in operator hold for inspection by the system programmer. Networking and JES3 processing continues.

**Operator response:** Because the network job is placed in operator hold, JES3 will not transmit the network job. Give the job number, line name and node name issued in the message to the system programmer. JES3 processing continues. Other network streams can be transmitted.

**Programmer response:** Investigate the source of the job.

**Routing Code:** Note 17  **Descriptor Code:** 7

---

**IAT9136**

**Explanation:**

\[\text{LINE} \rightarrow \text{name} \rightarrow \text{TERMINATED BY NAK LOOP} \rightarrow \]  

A NAK loop has developed between nodes: each time a record is transmitted, the receiver sends a negative acknowledgment (NAK) indicating that the record is incorrect and should be retransmitted.

**System action:** JES3 has ended line \text{name}. The line will restart if it is not automatically restarting line.
IAT9139

Explanation:

A sign-off record has been received from a node connected by a TP line.

System action: The line is canceled and then restarted if automatic sign-on was requested.

Operator response: None. This is an informational message.

Module: 

Routing Code: Note 17  Descriptor Code: 7

IAT9143

Explanation:

A network stream was received using SNA protocols by the NJE Reader DSP. The NJE Reader DSP added the job to the job queue so that JES3 will process the network stream. The NJE Reader DSP created data sets for the:

- job header
- data set header
- data
- job trailer

but could not delete the data set containing the network stream because of an error from the IATXOSPC TYPE=PUT macro.

System action: JES3 successfully processed the network stream. The NJERDR DSP ends and JES3 processing continues.

Operator response: JES3 processing continues. Issue a *I,J=NJERDR to determine the number of NJERDR DSPs that are active. If a NJERDR DSP is active, JES3 will continue to transmit network streams. If there are not any active NJERDR DSPs, JES3 cannot transmit any network streams using SNA protocols until a *CALL NJERDR command is issued.

System programmer response: To indicate the data set can be deleted, the NJERDR DSP issues an IATXOSPC TYPE=PUT request to update the output service element (OSE) that represents the network stream. Use a slip trap for module IATNTNR and IATOSPC to isolate the errors. Because the data set containing the network stream has not been deleted, JES3 may process the network stream again.

Module:

Routing Code: Note 17  Descriptor Code: 7

IAT9141

Explanation:

A SYSOUT stream received by JES3 networking has been added to the JES3 output queue.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 17  Descriptor Code: 7
**IAT9144 • IAT9145**

---

**IAT9144**

**Explanation:**

- **PARTIAL STREAM FLUSHED - JOB SYSOUT**
- **STREAM FROM ORIGIN NODE — node**
- **USER — userid — JOB — jobname**

While MVS/BDT was receiving a network stream, an error occurred that caused MVS/BDT to end processing. Due to the error, the partial stream was sent to JES3 for processing. JES3 flushes the partial network stream.

**System action:** JES3 processing and networking continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATYNDN</td>
<td>IATNTNR</td>
<td>IATNTNR</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 17  
**Descriptor Code:** 7

---

**IAT9145**

**Explanation:**

- **ERROR IN JOB SYSOUT**
- **STREAM FROM ORIGIN NODE — nodename**
- **USER — userid — JOB — jobname — RC — rc**

As the home node received a network job or SYSOUT stream using SNA protocols, an error was found. For example:

- Incorrect record length was found
- Incorrect record identifier (RID) was found

**System action:** The network job stream or network SYSOUT stream is not processed. The NJERDR ends with an abend code of DM530. Network streams cannot be received at this node until a *CALL NJERDR is reissued. JES3 processing continues.

**Operator response:** Request a dump. Notify the system programmer. Reissue a *CALL NJERDR command to initialize another NJERDR DSP. Another NJERDR DSP enables your node to receive a network stream that require SNA networking protocols. Other JES3 processing continues.

**System programmer response:** Analyze the dump provided by the operator. For additional information on DM530, see [z/OS JES3 Diagnosis] and use the appropriate return code listed below.
trailer, the length of the job trailer exceeded the maximum size allowed.

084 The first segment of a job trailer has been received. An additional record was found in a job trailer buffer while processing a job stream from a SNA node. The additional record was not a job header, job trailer, or an end of file record.

092 The first segments of the job header and the job trailer have not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was not a job header or a job trailer record.

096 The first segment of the job trailer has not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was not a job header or a data record. The first segment of the job header has been received.

100 While processing a SYSOUT stream, a job header was expected. A record other than the job header was received before receiving a job header record.

104 While processing a SYSOUT stream, a job header segment was expected. A record other than a job header segment was received before receiving the entire job header.

108 While processing a SYSOUT stream from a SNA node, a record was received after the job trailer that was not valid. The only valid record after a job trailer is an end of file (EOF).

116 While processing a SYSOUT stream, a data record was received before receiving a data set header.

120 While processing a SYSOUT stream, a data record's carriage control type was not recognized from the subrecord control byte (SRCB).

124 While processing a SYSOUT stream, a data record's spanned record indication was not recognized from the subrecord control byte (SRCB).

128 While processing a SYSOUT stream, a data record's spanned record indication was not recognized from the subrecord control byte (SRCB).

132 While processing a SYSOUT stream, a data record's length exceeded the maximum allowed for a spool data management spanned record.

136 While processing a SYSOUT stream, a network spanned data record's length exceeded the maximum logical record length defined for this data set. The maximum logical record length is indicated in the field NDHGLREC of the associated data set header.

140 While processing a SYSOUT stream data record, a "first" segment of a network spanned data record was received when an outstanding "first" segment had already been received.

144 While reconstructing a SYSOUT stream network spanned data record, a segment was detected when no outstanding "first" segment was received.

148 While processing a SYSOUT stream network spanned data record, a problem was detected with a work area.

152 While processing a SYSOUT stream non-spanned data record, a "first" segment of a spanned data record was detected.

156 While processing a SYSOUT stream, a job header record was detected after receiving data or data set header records.

160 While processing a SYSOUT stream job header record, a zero length record was detected.

164 A job header segment was received for a SYSOUT stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

168 While reconstructing a SYSOUT stream job header, a segment with a zero length was detected.

172 While processing a job trailer buffer, a zero length job trailer record was detected.

176 A job trailer segment was received for a SYSOUT stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

180 While processing a data set header buffer, a zero length data set header record was detected.
While reconstructing a SYSOUT stream data set header, a zero length segment was detected.

A data set header segment was received for a SYSOUT stream. While rebuilding the data set header, the length of the data set header exceeded the maximum size allowed.

The first segment of a job trailer has already been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream from a SNA node. The additional record was not a job header, data set header, job trailer, or an end of file record.

The first segment of a job trailer has already been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream from a BSC node. The additional record was not a job header, data set header, job trailer, or an end of file record.

The first segment of a job header has not been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record.

The first segment of the job header has been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record. A data set header was currently being constructed.

An incorrect specification of the job header password encryption bits was detected.

The length of a job header section is not positive.

The total length of all of the job header sections is not equal to the length of the entire job header minus the job header prefix.

The length of a data set header section is not positive.

The total length of all of the data set header sections is not equal to the length of the entire data set header minus the data set header prefix.

A stream was either rejected by the security product or an error occurred during the processing of the security request.

An error was detected while decompressing a BSC record from the transmission buffer.

An error was detected while validating the next record within the transmission buffer. The next record was beyond the end of the transmission buffer.

The end of file record was passed to the common receiver in the last transmission buffer, but the common receiver did not detect the end of file record.

The end of file record was not passed to the common receiver in the last transmission buffer, but the common receiver detected an end of file record.

While processing a job stream, the common receiver has detected a transmitter abort record within the transmission buffer.

While processing a SYSOUT stream, the common receiver has detected a transmitter abort record within the transmission buffer.

While processing a stream, the common receiver detected a job header, data set header, or job trailer that exceeded the allowable size.

The records within the stream are not in the proper order. Either a job header record was expected and not found, a job trailer record was expected and not found, or an end of file record was expected and not found.

A transmitter abort or an end of file record was received for a job stream that is not active.

A transmitter abort or an end of file record was received for a SYSOUT stream that is not active.

A decompression error occurred while processing a nodal message record (NMR).

Unknown error (the reason code returned by the common receiver was not recognized).
IAT9146

Explanation:

INVALID RECORD FOUND IN INBOUND STREAM

While using SNA protocols to receive a network job or SYSOUT stream, an incorrect record was found in the inbound stream. JES3 cannot identify the type of data that was received from the remote node that used SNA protocols to transmit the network stream.

System action: The NJERDR DSP fails with an abend code of DM530. The NJERDR DSP ends and additional work sent by a SNA node cannot be processed until the DSP is called again.

Operator response: Request a dump and notify the system programmer. JES3 processing other than SNA networking continues.

Programmer response: Analyze the dump to determine why the records in the transmitted data set are incorrect. See z/OS JES3 Diagnosis for assistance in determining the error.

Module:

IAT9146  IAT9147  IAT9149

IAT9147

Explanation:

NJERDR UNABLE TO ADD JOB TO QUEUE

While the NJERDR DSP was attempting to add a network job to the job queue, an error occurred.

System action: The NJERDR DSP ends and the network stream is released so that it can be processed when the job can be added. SNA networking ends and other JES3 processing continues.

Operator response: Request a dump and notify the system programmer.

Programmer response: Analyze the dump to determine why the job could not be added to the job queue. See z/OS JES3 Customization for a list of the reason codes for the IATXJCT macros.
IAT9150

**Explanation:**

MISSING JDS ENTRY FOR jobname

A required JDS entry for a job that was received from another node could not be found.

**System action:** JES3 purges the job.

**Operator response:** Notify the operator at the other node that submitted the job that JES3 has purged the job.

**Module:**

Explanation:

NO WORK AVAILABLE FOR JOB—(jobid)

The reroute command specified a job number and groupid that either did not exist or is being currently transmitted by MVS/BDT.

System action:  Processing continues.

Operator response:  Check the job number and groupid and reissue the reroute command.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9205

Explanation:

JOB—(jobid)

An attempt was made to reroute a network stream that is formatted to be transmitted over BSC protocols, but the network job was not in specialized reschedule status, or an attempt was made to reroute a job that was not supposed to be transmitted to another node.

System action:  The NJEROUT DSP does not reroute the job and processing continues.

Operator response:  Verify the job number and the status of the job.

Module:

Routing Code: Note 18  Descriptor Code: 7

RC in decimal  Meaning
1  end-of-data was reached for a JDSGET request for the job header.
2  a data set containing the network stream (*NJEDATA) was not found.
3  end-of-data was reached for a JDSGET request for the job trailer.
4  a data set that did not contain a job header, data set header, data, or job trailer was obtained by the IATXOSPC TYPE=GET request.
5  an error occurred during a IATXOSPC TYPE=PUT request.
6 a data set containing the job trailer was not found.
7 an error occurred while trying to obtain the job's JQE.
8 a RESQUEUE could not be found for the network job.
9 an error occurred while trying to access a job's JCT element.
10 an error occurred while trying to obtain a new job number.
11 an error occurred while trying to add the job to the job queue.
12 An IATXJCT error occurred (BSC).
13 An IATXJCT error occurred (SNA) or TCP/IP. Queue (SNA) or TCP/IP.
14 An error occurred while trying to delete the origin job (SNA) or TCP/IP.
15 the first data set of a network stream did not contain a job header.
16 the authorization failed by SAF.
17 protocol error occurred.
18 a current OSE FDB was not found.
19 the job being processed no longer exists.
20 data set header contained an incorrect length while trying to AOPEN syout stream data.

**System action:** JES3 does not reroute the network stream. The network job is left on the job queue in operator hold. JES3 processing continues.

**Operator response:** Your response is dependant on the return code in the message.

If the return code is a 7, verify the job number that was issued on the reroute command. If the return code is valid, there may be a system error and the system programmer should be contacted. Otherwise, reissue the reroute command with the correct job number. If the return code is a 9 or 10, there may be a system error and the system programmer should be contacted.

For the other return codes, the message was issued because of an error in the job. Issue a \*S DC (OPTION=SNP),J=jobno for a snap dump of the job's control blocks dump and contact the system programmer. Other, JES3 processing continues.

**Programmer response:** Determine the error by using the return code supplied in the message and the accompanying snap dump.

**IAT9207**

**Explanation:**

>`ERROR DELETING ORIGINAL JOB— (jobid) RC=— rc`

JES3 successfully rerouted a network stream but an error occurred during cleanup processing for the network job. See the list specified below for the possible return codes and their meanings.

**RC in decimal | Meaning**

| 12 | an error occurred while trying to release the JCT for a BSC formatted job. |
| 13 | an error occurred while trying to release the JCT for a SNA or TCP/IP formatted job. |
| 14 | an error occurred while deleting the original network job by the IATXOSPC TYPE=PUT request. |

**System action:** JES3 rerouted the network stream but the network job at your node cannot be deleted from the job queue.

**Operator response:** The error was issued because of a problem with the network job. Issue a \*S DC (OPTION=SNP),J=jobno for a snap dump of the job's control blocks dump and contact the system programmer. Other, JES3 processing continues.

**Programmer response:** Determine the error from the return code and the accompanying snap dump.

**Module:**

**Routing Code:** Note 17  **Descriptor Code:** 7

---

**IAT9208**

**Explanation:**

>`NODE NAME— (nodename) — NOT DEFINED`

Each node in the network is defined to JES3 by a NJERMT initialization statement. From the NJERMT statements, a networking node table is created that identifies the nodes and the type of networking protocols used to transmit data. The reroute command
specified a networking node that was not defined to the home node by a NJERMT statement.

**System action:** JES3 rejects the command and the NJEROUT DSP continues.

**Operator response:** Verify the name of the node. If the remote node is defined to your node, the home node, reissue the command with the corrected node name. If the remote node is not defined to the home node, contact the system programmer.

**System programmer response:** Include a NJERMT initialization statement in the network stream to define the remote node to your node. Restart JES3 using a warm start, cold start or hot start with refresh.

---

**IAT9209**  
**Explanation:**

- NO PARAMETER FOR KEYWORD— *(text)*
- SPECIFIED—*(text)*

A keyword on the reroute command did not include a value. The text specifies the keyword that did not have a value assigned to it.

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Correct the reroute command to include only one of these parameters. Reissue the command.

---

**IAT9210**  
**Explanation:**

- DUPLICATE PARAMETER— *(text)*
- SPECIFIED—*(text)*

The reroute command included more than one of these keywords:

- TO=
- ID=

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Correct the reroute command to include only one of these parameters. Reissue the command.

---

**IAT9211**  
**Explanation:**

- NO PARAMETER FOR KEYWORD— *(text)*
- SPECIFIED—*(text)*

A keyword on the reroute command did not include a value. The text specifies the keyword that did not have a value assigned to it.

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Correct the reroute command to include a value for the keyword.

---

**IAT9212**  
**Explanation:**

- BAD PARAMETER— *(text)*— SPECIFIED—*(text)*

A keyword other than:

- J=
- JG=
- JOB=
- JOBGROUP=
- TO=
- T
- ID=

was specified on the reroute command. The text specifies the incorrect keyword.
System action: JES3 rejects the command and continues the NJEROUT DSP.

Operator response: Correct the keyword on the reroute command and reissue the command.

Module:

IATNTRD IATNTRS IATNTRS

IAT9213

Explanation:

- FDEST=/J=/JG=/PATH= AND

- TO= ARE REQUIRED KEYWORDS

The reroute command is missing a required keyword.

System action: JES3 rejects the command and continues the NJEROUT DSP.

Operator response: Correct the reroute command to include the TO= keyword and the J= keyword if rerouting a network job using BSC protocols or the JG= keyword if rerouting a network job using SNA protocols.

Module:

IATNTRD IATNTRS IATNTRS

Routing Code: Note 18 Descriptor Code: 7

IAT9214

Explanation:

- INVALID COMBINATION OF FDEST=––––

- /J=/JG=/PATH=S––––

The J= and JG= keyword cannot be specified together on the reroute command. Use the J= parameter, if rerouting a network job using BSC protocols. Use the JG= parameter, if rerouting a network job using SNA protocols.

System action: JES3 rejects the command and continues the NJEROUT DSP.

Operator response: Determine the type of networking protocol that the networking stream is currently formatted for. To determine the format of the network stream, use the *I,U,Q=BDT,J=jobno or the *I,A,D=NJESND command. Message IAT8522 or IAT8524 is issued in response to the *I,A,D=NJESND command. Either message displays all the network jobs that will be transmitted using BSC protocols. If the job number for the network job is displayed by one of these messages, the network stream will be transmitted by using BSC protocols. Message IAT8131 is issued in response to the inquiry, the network stream will be transmitted using SNA protocols. Correct and reissue the reroute command.

Module:

IATNTRD IATNTRS IATNTRS

Routing Code: Note 18 Descriptor Code: 7

IAT9216

Explanation:

- TOO MANY JOB NUMBERS

- AND GROUPIDS SPECIFIED

The command contained too many job numbers and/or groupids.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Reduce the number of job number(s) or groupid(s) in the command.

Module:
IAT9217 • IAT9220

Routing Code: Note 18  Descriptor Code: 7

IAT9217

Explanation:

An incorrect keyword, J= or JG=, was specified on the reroute command.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9218

Explanation:

A syntax error occurred while processing the reroute command. The text in the message indicates the portion of the command where the error was located.

System action: The NJEROUT DSP continues and the command is ignored.

Operator response: Correct and reissue the reroute command.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9219

Explanation:

The specified NJEROUT DSP has completed processing all requests. This message is issued when:

- The specified NJEROUT DSP is waiting for network jobs to reroute to another destination.
- A *START, *RESTART, or *CANCEL command was issued without parameters.

Rjobno is used whenever jobno is greater than 99999.

System action: JES3 processing continues. The NJEROUT DSP will wait until the operator issues a *START NJEROUT, *CANCEL NJEROUT or *RESTART NJEROUT command.

Operator response: Issue a *START NJEROUT or *RESTART NJEROUT command to send a network stream to another node. Issue a *CANCEL NJEROUT command to end NJEROUT DSP.

Module:

Routing Code: Note 18  Descriptor Code: 7

IAT9220

Explanation:

On an *CALL,NJEROUT or *START,NJEROUT command, the PATH= or FDEST= (final destination) parameter was specified. There were no jobs found matching the specified parameter.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Correct and reissue the reroute command.

Module:
IAT9221

Explanation:  
Invalid combination of Q= and J=/JG=.

On a *CALL,NJEROUT or *START,NJEROUT command, the J= (job) or JG= (job group) keyword was specified. The Q= (queue) keyword was also specified. This combination of keywords is not allowed.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Correct and reissue the reroute command.

Module:

Routing Code: Note 18  Descriptor Code: 2,7

IAT9222

Explanation:  
Premature EOF found for job jobname (jobno) (groupid), processing continues.

The NJEROUT DSP could not find more data or an end-of-file marker for the data set while processing the job. This can occur if there was a system failure while a job was writing an output data set or an IPL caused the job to cancel.

System action: The data set is ended and the reroute is completed. Processing continues.

Operator response: None. This is an informational message.

Module:

IAT9225

Explanation:  
NJERDR is active.

This message is issued to inform the operator that the NJERDR DSP is active and is ready to process a job or SYSOUT network stream from a node that used SNA protocols to transmit the data.

IAT9221 • IAT9231

IAT9230

Explanation:  
Job jobname (jobno) has been put in operator hold.

An error occurred while JES3 was attempting to send a network stream to a remote node. While recovering from the error networking released the resources allocated to the job and placed the job in operator hold.

System action: JES3 places the network job used to transmit the network stream into operator hold. JES3 continues processing.

Operator response: Notify the system programmer.

System programmer response: Use the DM code and z/OS JES3 Diagnosis to determine the error.

Module:

Routing Code: Note 17  Descriptor Code: 7

IAT9231

Explanation:  
The last logical sender for node node name has been varied offline.

The NJESND DSP has varied the last sender offline because of an error detected by the BSC NJE line driver (NJE DSP).

System action: All networking traffic to the specified node stops.

Operator response: Use the "I
NJE=nodename;SDND command described in z/OS JES3 Commands to determine the names of the senders and vary them back online. If the message persists, notify the system programmer.

Programmer response: Start the networking logging
IAT9300

facility for the line(s) to the specified node and
determine why the line driver is requesting the sender to
be varied offline.

IAT9300

Explanation:

command — FOR — object — name
FAILED - reasontext

A command for the TCP DSP failed.
In the message text:

command
The command that failed. It is one of the following:
- CALL
- START
- RESTART

object
The type of object on which the command was intended to be performed. It is one of the following:
- NETSERV
- SOCKET

name
The name of the object on which the command was intended to be performed, or UNKNOWN if the name cannot be determined.

reasontext
The reason that the command failed. It is one of the following:

ERROR RETRIEVING CONSOLE INPUT
An internal error occurred when retrieving the input console command.

EXTRANEOUS *CALL,TCP PARAMETERS
The only allowable parameter on the *CALL,TCP command is NETSERV=ntsvname. This parameter was found, but extraneous parameters were also found.

INCORRECT *CALL,TCP PARAMETERS
The only allowable parameter on the *CALL,TCP command is NETSERV=ntsvname. Some other parameter was found instead.

NETSERV NAME TOO LONG
The name on the NETSERV= parameter cannot exceed eight characters.

NETSERV IS NOT DEFINED
The name on the NETSERV= parameter is not defined.

NETSERV SYSTEM NAME sysname NOT DEFINED
The NETSERV definition does not specify a system name. A system name must be defined before the NETSERV can be started.

NETSERV SYSTEM NAME sysname DOWNLEVEL
The NETSERV definition specifies a system name, but the system name is not at the required JES3 release.

NETSERV SYSTEM NAME sysname IS DOWN
The NETSERV definition specifies a system name, but the processor is down.

NETSERV ALREADY STARTED
The NETSERV cannot be started because there is already a TCP DSP active using that NETSERV.

NETSERV GETUNIT ERROR
The NETSERV cannot be started because an internal error issued a GETUNIT for the NETSERV device in question. This text should not normally be issued; NETSERV IS UNAVAILABLE is the only expected error from the GETUNIT.

SOCKET IS ALREADY ACTIVE
The specified socket cannot be started because it is already active.

SOCKET IS PENDING START
The command is not allowed for the socket at this time because a start command (either *S,TCP,SOCKET=socket or *S,TCP,NODE=node) was previously issued and the socket is in a pending state while waiting for the connection to be made.

TIMEOUT DURING SIGNON
During a *S,TCP,SOCKET= command to start a socket, 30 seconds elapsed before the socket was successfully started. The start of the socket is considered unsuccessful and the socket is returned from the pending to inactive state.

CANCEL OR FAIL BY OPERATOR
The NETSERV address space failed to start. Message IAT9308 was issued one or more times if at least 60 seconds have elapsed without the NETSERV starting successfully. While JES3 was waiting for the NETSERV to start, the operator
entered the *CANCEL or *FAIL command to abandon all attempts to start this NETSERV.

**System action:** The command is rejected.

**Operator response:** If the reason text indicates a parameter error, correct and reissue the command. Otherwise, if the probable cause of the error cannot be determined, notify the system programmer.

**System programmer response:** If the error is caused by an incorrect NETSERV definition, correct the definition and reissue the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

---

**IAT9303**

**Explanation:**

\[\text{TCP START FAILED FOR SERVER--netserv}\]

\[\text{TCP DSP--RC--RSN--rsn--UNABLE TO CREATE NMSC}\]

A Netserv failed to start either because of an address space creation error or because of an error obtaining storage. If the reason for the failure is an address space creation error, the return code from ASCRE is included in the message.

In the message text:

*netserv*  
The name of the Netserv that failed to start. Typically this occurs because of an address space or storage limit preventing the creation of the address space or data areas. Other...
messages at the time of issuing the "CALL,TCP command should also be present to further clarify the error.

rc The return code from the ASCRE service.

System action: The server address space fails to start.
Operator response: Notify the system programmer.

System programmer response: If the probable cause of the error cannot be determined, retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:

**IAT9304**

Explanation:

- **INCORRECT ID IN ASCRE PARAMETER**
  The Address Space Create service was called with an incorrect identifier in the parameter string.

- **UNABLE TO CREATE TCT or MEM**
  The Netserv address space was unable to create the indicated data area.

- **IEANTCR RC=**
  The Name Token create service (IEANTCR) failed with the indicated return code.

- **DUPLICATE NAME TOKEN, IEANTDL RC=**
  The Name Token create service (IEANTCR) failed because a name token with the same name already exists, and an attempt to call the Name Token Delete service (IEANTDL) to delete the duplicate failed with the indicated return code.

In the message text:

- **crrc** The return code from the IEANTCR service.
- **dlrc** The return code from the IEANTDL service for the duplicate name token that was found.

**IAT9305**

Explanation:

- **NETSERV-netserv-SIGNED ON/OFF**

  A remote node has signed on or off by using TCP/IP protocol.
  In the message text:

- **node** The name of the remote node.
- **netserv** The name of the Netserv on which the sign on/off is occurring.
- **socket** The name of the socket on which the sign on/off is occurring.

If the text (SECURE) appears, this indicates that secure signon has taken place. Secure signon is an optional NJE definition parameter that requires nodes to confirm their identities to each other.

System action: Processing continues.
Operator response: None.
System programmer response: None.

Module:

**IAT9305**

System action: Netser address space started, but stopped because of an internal error.
Operator response: Notify the system programmer.
System programmer response: Retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:
IAT9306

Explanation:

- *CANCEL SOCKET REJECTED*—socket
- *NOT ACTIVE*

A *CANCEL,TCP,SOCKET=sOCKET* command was entered. The command cannot be completed because the socket is not active.

In the message text:

- **socket** The name of the socket that was requested in the command.

System action: The command is rejected. Processing continues.

Operator response: None.

System programmer response: None.

log

IAT9307

Explanation:

- **TCP/IP SIGNON FOR NODE=node**—FAILED—rsntext

An NJE signon was attempted by using TCP/IP protocol but the signon failed for the indicated reason.

In the message text:

- **node** The name of the remote node.
- **rsntext** The reason that the signon failed. The reason text is one of the following:

  **NO SESSION KEY DEFINED**
  
  The session key for the remote node is not defined in the security product APPCLU security class.

  **INCONSISTENT SECSIGNON DEFINITIONS**
  
  The two nodes involved in the signon do not both specify the same SECSIGNON settings in the NJERMT definition. (In JES2, SIGNON=COMPAT is equivalent to SECSIGNON=NO in JES3, and SIGNON=SECURE is equivalent to SECSIGNON=YES in JES3.)

  **encrypt of local key failed**
  
  The security call to encrypt the remote node's session key has failed.

  **encryption keys do not match**
  
  The nodes do not consistently define the session keys in the security product APPCLU security class.

  **APPCLU security class not active**
  
  The APPCLU security class has not been activated in the security product.

  **INCONSISTENT TLS DEFINITIONS**
  
  The two nodes involved in the signon do not both specify the same TLS settings in the NJERMT definition. (In JES2, the TLS setting is on the socket definition.)

  **Undefined node**
  
  The remote node is not defined.

  **NODE IS NOT TCP/IP**
  
  The remote node is defined but does not specify TYPE=TCPIP.

System action: The signon of the nodes will not complete.

Operator response: Notify the system programmer.

System programmer response: If the reason text says *ENCRIPT OF LOCAL KEY FAILED* or *ENCRIPT OF REMOTE KEY FAILED*, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

If the reason text says *UNDEFINED NODE*, add the remote node with the command '*MODIFY,NJE,ADD=nodename,TYPE=TCPIP'. If you need this node permanently added, include an NJERMT statement to define it during the next hot start with refresh or warm start.

If the reason text says *INCONSISTENT SECSIGNON DEFINITIONS* or *INCONSISTENT TLS DEFINITIONS*, correct the NJE definitions. If the change is required on the home node, stop and restart the TCP DSP for the affected Netserv.

If the reason text says *NO SESSION KEY DEFINED*, *APPCLU SECURITY CLASS NOT ACTIVE*, or *ENCRYPTION KEYS DO NOT MATCH*, correct the security product definitions and retry the *S,TCP* command.

Routing Code: 10  Descriptor Code: 4, 7
IAT9308  •  IAT9351

IAT9308
Explanation:

A time interval of 60 seconds has elapsed during which a NETSERV that was requested to start as a result of a ‘CALL,TCP’ command has not proceeded far enough for JES3 to recognize a successful start request. Typically this occurs because of an address space or storage limit preventing the creation of the address space. It can also occur because of DASD contention delaying the address space start. One or more other messages at the time of the ‘CALL,TCP’ command should also be present to further clarify the error. If the problem is with the address space create service, message IAT9303 will also be issued.

In the message text:

NSVNAME
The name of the NETSERV that has not yet initialized.

System action: JES3 repeats this message at 60 second intervals until the operator takes an action or the NETSERV successfully starts.

Operator response: If you want to give the NETSERV more time to start, do nothing. If you believe that the NETSERV has a problem coming up and want to stop JES3 from waiting, enter either the ‘CANCEL,nsvname’ or ‘FAIL,nsvname’ command. If the NETSERV comes up after one of these commands is entered, you must then cancel the address space by entering the MVS command ‘C nsvname’.

System programmer response: Look for messages or other conditions that might prevent the NETSERV from starting, and correct these conditions.

Module:

Routing Code: Hardcopy  Descriptor Code: 5

IAT9351
Explanation:

A job or SYSOUT stream has requested a destination of a node that is defined as TYPE=TCPIP, but no Netserv is available to transmit the work to the destination node for one of the following reasons:

- No Netserv statement is defined in the JES3 initialization deck.
- No Netserv is started on that JES3 node.

System action: Any network job to be transmitted by a Netserv using TCP/IP protocol, is placed on the JES3 TCP job queue. The network job remains on the queue until the Netserv is defined to JES3 and gets started by using the ‘CALL,TCP,NETSERV=netserv’ command.

Note: JES3 spool might reach maximum capacity if there is an abnormal number of networking jobs waiting for the Netserv.

Operator response: If the Netserv is defined, start the Netserv by using the ‘CALL,TCP,NETSERV=netserv’ command, followed by a ‘START,TCP,SOCKET=socket’ command to establish the TCP/IP NJE connection with
System programmer response: Define a Netserv either by adding a NETSERV statement and performing a hot start with refresh, or by using the *MODIFY,NETSERV,ADD= command.

Module:

Routing Code: Hardcopy  Descriptor Code: 2, 7 log

IAT9352

Explanation:

A job or SYSOUT stream has requested a destination of a node that is defined as TYPE=TCPIP, but no socket is available to transmit the work to the destination node for one of the following reasons:

- No socket statement is defined in the JES3 initialization deck for that destination node.
- No socket is started to that destination node.

System action: Any network job to be transmitted by a Netserv using TCP/IP protocol, is placed on the JES3 TCP job queue. The network job remains on the queue until a socket is defined to JES3 and gets started by using the *START,TCP,SOCKET=socket command.

Note: JES3 spool might reach maximum capacity if there is an abnormal number of networking jobs waiting for the Netserv.

Operator response: If the socket is defined, start the socket by using the *START,TCP,SOCKET=socket command to establish the TCP/IP NJE connection with the destination node. Otherwise, notify the system programmer.

System programmer response: Define a socket either by adding a SOCKET statement and performing a hot start with refresh, or by using the *MODIFY,SOCKET,ADD= command.

Module:

Routing Code: Hardcopy  Descriptor Code: 2, 7 log

IAT9370

Explanation:

A specified job or SYSOUT stream has been successfully transmitted to the specified node.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Hardcopy  Descriptor Code: 7 log

IAT9371

Explanation:

A specified job or SYSOUT stream has been transmitted to the specified node. An error occurred before the transmission was completed. The transmitter detected this error and put the job in hold.

System action: JES3 puts the job in system hold.

Operator response: Notify the system programmer.

System programmer response: Report the problem to the IBM Support Center.

Module:

Routing Code: 2  Descriptor Code: 4

IAT9372

Explanation:

A specified job or SYSOUT stream has been transmitted to the specified node.
IAT9373 • IAT9376

The job transmission is canceled by the receiver.

System action: JES3 puts the job in system hold.

Operator response: Notify the system programmer.

System programmer response: Check with the receiver node to analyze the reason for the receiver cancel. When the receiver node is ready to accept the job again, release the job using *F U,J=XX,H=y,NH=n command.

IAT9373

Explanation:

-INCORRECT DATA SET TYPE IN
-JOB_jobname-(jobid-)
-GROUPID-(groupid-) JOB PUT IN HOLD

The Netserv got an incorrect data set type while reading the spool data sets of a network job. Job header, Data set header, SYSIN/SYSYOUT data sets, and Job trailer are valid data set types for network jobs.

System action: JES3 puts the job in system hold.

Operator response: Notify the system programmer.

System programmer response: Report the problem to the IBM Support Center.

IAT9375

Explanation:

-ERROR FROM BLOCK SPOOLER WITH RC=returncode FOR
-JOB_jobname-(jobid-) GROUPID-(groupid-) JOB PUT IN HOLD

While Netserv transmitter read the spool buffer using the block spooler, the application took an error return.

System action: JES3 puts the job in system hold.

Operator response: Notify the system programmer.

System programmer response: See descriptions of the block spooler related JES3 (IAT) messages immediately preceding IAT9375 for more information. If the problem could not be diagnosed with this information, report the problem to the IBM Support Center.

IAT9376

Explanation:

-ALL REQUIRED DATA SETS WERE NOT SENT FOR
-JOB_jobname-(jobid-) GROUPID-(groupid-) JOB PUT IN HOLD

All needed data sets for a network job are not available in the spool. This might happen because program error or storage overlay.

System action: The X'EC8' abend with RC=10 is
issued after the message and the corresponding socket connection is terminated. JES3 puts the job in system hold.

Operator response: Notify the system programmer.

System programmer response: Report the problem to the IBM Support Center.

```

**Routing Code:** 2  **Descriptor Code:** 4

**IAT9500**

**Explanation:**
```
INVALID  BDT SYSTEM ID:  sys-id
```
```
DUPLICATE
```

If INVALID BDT SYSTEM ID was issued a JES3
operator entered a MVS/BDT command or transaction that could not be processed because the sys-id specified on the transaction or command is not valid. JES3 could not locate a SSCVT that exists for the MVS/BDT subsystem.

If DUPLICATE BDT SYSTEM ID was issued two or more MVS/BDT subsystems exist with the same sys-id. While processing a shuttle BSID, JES3 encountered more than one BSID that contained the same sys-id.

System action: JES3 rejects the command or transaction; other JES3 processing continues.

Operator response: If an incorrect sys-id was entered for the MVS/BDT subsystem:
- correct the sys-id, if possible
- reissue the command or transaction

If you cannot correct the sys-id, contact your system programmer.

If a duplicate sys-id was entered, note the duplicate sys-id of the MVS/BDT subsystem and contact the system programmer so that the initialization stream may be changed for the next restart. Issue a dump for the system programmer.

Programmer response: If an incorrect sys-id was specified, provide a valid sys-id for the operator to specify. If a duplicate sys-id was specified, two or more MVS/BDT subsystems communications tables (BSCTs) contained the same sys-id. Each MVS/BDT subsystem in a JES3 complex must have a unique sys-id.
- determine the duplicate sys-id of the MVS/BDT subsystem from the dump and the message.
- correct the BDTNODE statement in the MVS/BDT initialization stream so that the error will be corrected during the next restart.

Module:

Module: IATBDCI IATBDCI IATBDCI
Routing Code: 42 Descriptor Code: 7

IAT9501
Explanation:
>>> ERROR ACCESSING JOB— jobname (jobid)

If communications were rejected, the request failed because of one of the following:
- JES3 encountered a duplicate or incorrect sys-id for a MVS/BDT subsystem. (Message IAT9500 was issued to indicate the error)
JES3 cannot access the job related control blocks associated with the MVS/BDT subsystem. Message IAT9501 was issued to indicate the job could not be accessed.

If communications were established, transactions can be sent to either subsystem.

**System action:** JES3 processing continues. If communications were rejected, future processing for the MVS/BDT subsystem is rejected until communications are established between the two subsystems.

**Operator response:** If communications are not established, inform the system programmer of the *sys-id* so that the problem can be corrected over the next restart.

**Programmer response:** If message IAT9500 was issued to indicate duplicate or incorrect *sys-ids* were specified, provide a valid subsystem ID for the MVS/BDT subsystem. If the message IAT9501 was issued to indicate the job's control blocks could not be accessed, determine the error from the reason code given in message IAT9501.

While processing a subsystem interface (SSI) request, the BDT subsystem interface data area (BSID) contained one of the following errors:

- the BSID ID field *curname* did not contain the characters, BSID.
- a staging area that does not contain a shuttle BSID was placed on the shuttle destination queue.
- the BSID modifier code (code) was not in the range defined for use by the user. The range defined for the user is 128-255.
- the BSID modifier code (code) was in the user range. However, installation exit, IATUX50, was not modified by the installation.
- installation exit, IATUX50, rejected the modifier code in the BSID.
- installation exit, IATUX50, set a return code other than X'00', X'04', or X'08' before returning to the MVS/BDT communications interface FCT.

**System action:** JES3 ignores the SSI request; other JES3 processing continues.

**Operator response:** Request a dump and notify your system programmer.

**Programmer response:** Examine the BSID in the staging area to determine the cause of the problem. Check installation exit IATUX50 for the possible error.

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT9508**

**Explanation:**
JES3 ends communications or disconnects with MVS/BDT subsystem sys-id in response to an MVS/BDT VARY JES3 OFFLINE command or a MVS/BDT subsystem failure. If your installation has MVS/BDT Version 1, communications between JES3 and MVS/BDT are in an ended state. If your installation has MVS/BDT Version 2, communications between JES3 and MVS/BDT are in a disconnected state. When communications are in a disconnected state, JES3 and MVS/BDT are unable to send requests to each other.

**System action:** JES3 processing continues. The message is issued to inform the operator of the state of the communications between JES3 and MVS/BDT. If your installation has installed Version 2 of MVS/BDT, JES3 will not send any networking work to MVS/BDT for processing. Therefore, JES3 can not indicate to MVS/BDT that network streams, commands, or messages are ready to be transmitted using SNA protocols.

**Note:** The only command that can be issued when communications between MVS/BDT and JES3 are in a disconnect state is the `START BDT` command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEK53_5.3.0/com.ibm.zos.v5r3.jes3/zosjes3com.html) for a description of this command.

**Operator response:** Notify the system programmer.

System action: JES3 rejects the command or transaction; other JES3 processing continues.
Operator response: Notify the system programmer.
Programmer response: Field SSObRETN in the SSOb contains the reason code.

Module:

Routing Code: Note 18    Descriptor Code: 7

IAT9514

Explanation:

COMMAND/TRANSACTION ACCEPTED, TQI

A command or transaction was sent to MVS/BDT using an IEFSSREQ and was accepted. MVS/BDT TQI is enabled or disabled.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

Module:

Routing Code: Note 18    Descriptor Code: 7

IAT9515

Explanation:

INVALID BSID RECEIVED, BDT SUBSYSTEM sys-id

The MVS/BDT subsystem requests a service from JES3 by sending a MVS/BDT subsystem interface data area (BSID) to JES3. This message is issued if:

- JES3 receives a BSID from the MVS/BDT subsystem for a request other than connect before communications between the two subsystems enters a connect state. This will only occur if your installation has installed MVS/BDT Version 2.
- the MVS/BDT subsystem identified by the sys-id is not defined to JES3.
- a Version 1 MVS/BDT subsystem sent a Version 2 BSID to JES3. (that is, a BSID that contains a suspend, resume, or connect request)

System action: JES3 ignores the request. The staging area is purged or returned to the MVS/BDT subsystem. Unless message IAT9508 was issued to indicate JES3 and MVS/BDT could not issue any requests, future processing between JES3 and MVS/BDT can still be performed. JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 42    Descriptor Code: 7
IAT9516

Explanation:

- **JOB**— jobname (jobid)
- **BDTJOB=BDT**— jobno
- **GROUPID=**— groupid
- **IN OPERATOR HOLD**

While MVS/BDT was trying to process a transaction or network job a permanent error occurred. Either jobname or jobid identifies the job number that JES3 assigns to the network job. The BDT jobno identifies the job number that the MVS/BDT subsystem assigns to the job. The groupid is a unique JES3 identifier assigned to a job or to each SYSOUT data set that is being transmitted by the MVS/BDT using SNA protocols.

**System action:** JES3 places the job in operator hold.

**Operator response:** See the MVS/BDT messages that are issued, these will direct your response.

**Module:**

- **Containing** IATYBDD
- **Detecting** IATBDCI
- **Issuing** IATBDCI

**Routing Code:** 42  **Descriptor Code:** 7

IAT9518

Explanation:

- **JOB**— jobname (jobid)
- **GROUPID=**— groupid
- **HELD, PATH NODE UNDEFINED TO BDT**

MVS/BDT is trying to send a network stream to a remote node using SNA protocols. The nodes are indirectly connected and the stream must be sent to a path node. However, the path node is defined to JES3 as a node that can receive a network stream using SNA protocols but the node is not defined to the MVS/BDT subsystem. Either jobname or jobid indicates the job number assigned to the job by JES3. groupid is a unique JES3 identifier assigned to the network job or to each SYSOUT data set that is being transmitted by the MVS/BDT subsystem using SNA protocols.

**System action:** The indicated job is placed in operator hold.

**Operator response:** Notify the system programmer. Issue a "CALL NJEROUT command to reroute the job to a different execution node.

**Programmer response:** Include a BDTNODE initialization statement in the MVS/BDT initialization stream to define the node to MVS/BDT.

**Module:**

- **Containing** IATYBDD
- **Detecting** IATBDCI
- **Issuing** IATBDCI

**Routing Code:** 42  **Descriptor Code:** 7

IAT9519

Explanation:

- **JOB**— jobname (jobid)
- **GROUPID=**— groupid
- **REMOVED FROM BDT JOB QUEUE,**
- **PATH NODE UNDEFINED TO BDT**

MVS/BDT is trying to send a network stream to a remote node using SNA protocols. The nodes are indirectly connected and the stream must be sent to a path node. The path node is defined to JES3 as a node that can receive a network stream using SNA protocols. However, the MVS/BDT subsystem at the home node ended. When the MVS/BDT subsystem was restarted, the path node was not defined to the MVS/BDT subsystem. Either jobname or jobid indicates the job number assigned to the job by JES3. groupid is a unique identifier assigned to a job or to each SYSOUT data set.
that is being transmitted by the MVS/BDT subsystem using SNA protocols.

**System action:** The job is placed in operator hold.

**Operator response:** Notify the system programmer. Issue a *CALL NJEROUT command to reroute the job to a different execution node.

**Programmer response:** Either include a BDTNODE initialization statement in the MVS/BDT initialization stream or remove the NJERMT statement from the JES3 initialization stream that defines the node to JES3.

**Routing Code:** 42  **Descriptor Code:** 7

---

IAT9522

**Explanation:**

- CHECKPOINT DATA LOST, —
- BDT COMMUNICATIONS—
- INTERFACE FCT PERMANENTLY DISABLED—

A permanent error occurred while updating the checkpoint data set. This error caused all the JES3 MVS/BDT checkpoint data to become inaccessible.

**System action:** JES3 removes the MVS/BDT communications interface FCT from the FCT chain. All communication between JES3 and all the MVS/BDT subsystems are disabled. JES3 processing can continue, however, JES3 cannot communicate with the MVS/BDT subsystem.

**Operator response:** Notify the system programmer.

**Programmer response:** A return code of 20 was returned in register 15 from the WRITCHAIN macro. The MVS/BDT communications interface FCT ends with an abend code of 703. Determine the reason for the permanent error. See [z/OS JES3 Diagnosis](http://www.ibm.com) and [z/OS JES3 Customization](http://www.ibm.com) to help diagnosis the error. To establish communications between JES3 and the MVS/BDT subsystems, JES3 must be restarted by performing a warm or hot start.

**Module:**

<table>
<thead>

</tbody>
</table>

**Routing Code:** 42  **Descriptor Code:** 7

---

IAT9523

**Explanation:**

- UNABLE TO SEND AVAILABLE SNA NJE—
- TRANSACTION, NO SNA NJE BDT—

An MVS/BDT subsystem is not yet defined to JES3 for one of the following reasons:

- a Version 2 MVS/BDT subsystem was not defined to JES3 by a SYSID or NJERMT initialization statement.
- the MVS/BDT subsystem has not sent a CONNECT request to JES3.

**System action:** Any network job to be transmitted by MVS/BDT using SNA protocols, is placed on the JES3 job queue. The network job remains on the queue until MVS/BDT is defined to JES3 and communication is in the connected state.

**Note:** JES3 spool may reach maximum capacity if there is an abnormal number of networking jobs waiting for MVS/BDT.

**Operator response:** Notify the system programmer about the BDT subsystem condition.

**Programmer response:** Check the initialization stream to ensure a Version 2 MVS/BDT subsystem is defined to JES3. The initialization stream should include a BDTID parameter on the NJERMT statement or a SYSID initialization statement. If a Version 2 MVS/BDT subsystem is defined to JES3, initialize the MVS/BDT subsystem. If the MVS/BDT subsystem is not defined and the node will be receiving jobs sent to the node over a SNA connection, correct the initialization stream...
and restart JES3 by performing a warm start, cold start, or hot start with refresh.

</tr>
</tbody>
</table>

**Routing Code:** 10  **Descriptor Code:** 7

---

**IAT9526**

**Explanation:**
- JESREAD ERROR, MVS/BDT
- CHECKPOINT DATA, RC= rc

An error occurred during a JES3 hot start. During a hot start, initialization information is kept in checkpoint data sets. While reading records from the JES3 checkpoint data set, an error occurred. The JESREAD macro, that was issued to read the information from spool, supplies these return codes rc when an error occurs.

**Return Code**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'04' Incorrect FDB address in the file directory</td>
</tr>
<tr>
<td>X'08' Incorrect spool address</td>
</tr>
<tr>
<td>X'0C' Unrecoverable I/O error</td>
</tr>
<tr>
<td>X'10' Zero FDB</td>
</tr>
<tr>
<td>X'14' IDs did not match</td>
</tr>
<tr>
<td>X'18' File unavailable during initialization</td>
</tr>
</tbody>
</table>

**System action:** JES3 saves the checkpoint data set. However, the data in the data set is considered as lost. Message IAT9528 is issued following this message.

**Operator response:** See message IAT9528.

**Module:**

<table>

</table>

**Routing Code:** 42  **Descriptor Code:** 7

---

**IAT9528**

**Explanation:**
- MVS/BDT CHECKPOINT
- DATA READ ERROR MAY

A IATXOSBM macro was issued to obtain a job from the MVS/BDT subsystem. While attempting to get a job, an error occurred. JES3 entered the JESTAE recovery routine in IATBDCI to recover from the error.

**System action:** Processing continues.

**Operator response:** Request a dump and notify the system programmer.
An error occurred while reading information from the JES3 checkpoint data set.

**System action:** Processing continues.

**Operator response:** Because information in the checkpoint data set is lost, the states of any MVS/BDT subsystems defined to JES3 are also lost. To establish communication between JES3 and the MVS/BDT subsystems, issue an MVS/BDT VARY JES3 ONLINE command. See the MVS/BDT Commands document for the correct syntax of the command. Notify the system programmer.

**Programmer response:** Use the return code specified in message IAT9526 to help determine the error.

**Module:**

<table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

IAT9610

**Explanation:**

No options were specified that allowed JMF to produce output either by SMF records or JMF reports. A *CALL JMF command was entered with SMF=N specified. Either a value for SMF (either Y or a module name) or a value for WTR (either Y or a module name) must be specified when JMF is called on a global main. A value for SMF (either Y or a module name) must be specified when JMF is called on a local main. JMF defaults to SMF=Y and WTR=N on both the global and local mains.

**System action:** JMF issues message IAT9602 and ends processing. JES3 continues processing.

**Operator response:** To call JMF on a global main, re-issue the *CALL JMF command, specifying SMF=Y or SMF=module-name and/or WTR=Y or WTR=module name. To call JMF on a local main, re-issue the *CALL JMF command with SMF=Y or SMF=module-name specified.

**Module:**

<table>
<thead>
<tr>

<td>IATMFDR</td>
<td>IATMFRN</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

IAT9612

**Explanation:**

This message is issued when JMF has finished processing the current *CALL JMF command, and indicates the number of SMF Type 84 records that were successfully generated for that session. See z/OS JES3 Diagnosis for more information about SMF Type 84 records.

**System action:** JMF issues message IAT9602 and ends processing. JES3 continues processing.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

IAT9613

**Explanation:**

This message is issued when SMF=Y or SMF=module-name was specified on the *CALL JMF command and SMF was not active.
**IAT9614 • IAT9617**

**System action:** When the "CALL JMF" command was issued on a local processor, JMF issues message IAT9602 and ends. JES3 continues processing.

When the "CALL JMF" command was issued on a global processor:
- If WTR=N was specified, JMF issues messages IAT9610 and IAT9602, and ends. JES3 continues processing.
- If either WTR=Y or WTR=module-name was specified, JMF continues processing on the global.

**Operator response:** Correct and reissue the "CALL JMF" command.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMFDT</td>
<td>IATMFDR</td>
<td>IATMFDR</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18  **Descriptor Code:** 7

---

**IAT9614**

**Explanation:**

The SMF Type 84 record was not written. The return code from the SMF record output routine is displayed. See [z/OS MVS System Management Facilities (SMF)](https://www.ibm.com/support/knowledgecenter/en/SSLTBW_2.2.0/com.ibm.zos.mvs/SMF_020000_z01.html) for an explanation of the return code.

**System action:** When the "CALL JMF" command was issued on a local processor, JMF issues message IAT9602 and ends. JES3 continues processing.

When the "CALL JMF" command was issued on a global processor:
- If WTR=N was specified, JMF issues message IAT9602, and ends. JES3 continues processing.
- If either WTR=Y or WTR=module-name was specified, JMF continues processing on the global.

**Operator response:** If JMF issues message IAT9602 and ends, contact your system programmer.

**Module:**

Chapter 27. Assignable Device Recovery Messages

IAT9652
Explanation:

*VARYL - VERIFY GLOBAL IS DISABLED*

The *CALL VARYL command is executing on a local main and VARYL processing is about to begin. The operator needs to make sure that the global main is disabled.

System action: VARYL processing continues.

Operator response: Determine the status of the global. If the global has failed, but it is not disabled, press SYSTEM RESET on the global.

See [z/OS JES3 Commands](#) for more information on disabling the global.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATMOVL</td>
<td>IATMOVL</td>
</tr>
</tbody>
</table>

Routing Code: 10  Descriptor Code: 7

IAT9655
Explanation:

*VARYL - RUNS ONLY ON A LOCAL*

The *CALL VARYL command was executing on a global JES3 main. You need to invoke VARYL on the local main to vary a multi-system assigned device (such as, IBM 3480) offline from the global.

System action: VARYL processing ends. JES3 processing continues.

Operator response: Issue the *CALL VARYL command from a local main. See [z/OS JES3 Commands](#) for more information.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATMOVL</td>
<td>IATMOVL</td>
</tr>
</tbody>
</table>

Routing Code: 10  Descriptor Code: 7

IAT9656
Explanation:

*VARYL - JES3 IS TERMINATING*

The *CALL VARYL command is executing on the local main. The VARYL DSP has determined that JES3 is abending on the local main.

System action: VARYL and JES3 processing ends.

Operator response: Contact your system programmer.

System programmer response: JES3 is ending because of a problem in a functional area other than VARYL. Use the DM code and the failsoft logout in the messages contained in the hardcopy message log to determine where the problem exists.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATABIP</td>
<td>IATSIEM</td>
</tr>
</tbody>
</table>

Routing Code: 10  Descriptor Code: 7

IAT9657
Explanation:

*VARYL - SETUNITS TABLE NOT FOUND*

An incorrect device address was specified on the *START VARYL command entered on the local main. No SETUNITS table for the device attached to the local main was found. The main processor control table (MPC) doesn't contain the address of the SETUNITS table.

System action: VARYL processing ends. JES3 processing continues.

Operator response: Determine if the device specified in the *START command is valid. Contact your system programmer.

System programmer response: The main processor control table (MPC) does not contain a valid address of the SETUNITS table. Follow the procedure described below to correct the incorrect address:

1. Locate the incorrect SETUNITS address by:
   a. using IPCS or the JES3 nucleus section of the formatted dump to locate the transfer vector table (TVT). Locate the TVT in storage to obtain the address of the MPC.
   b. Locate the MPC in storage. The MPC contains the incorrect address of the SETUNITS table.
2. Locate the SSVT to obtain the valid SETUNITS address
3. Use dump core to correct the address of the incorrect SETUNITS table in the MPC.
### IAT9658  •  IAT9661

**Problem determination:** See Table I, items 4,5,7 and 16; Table III, item 7.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATMOVL</td>
<td>IATMOVL</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  
**Descriptor Code:** 7

---

#### IAT9658

**Explanation:**

1. **VARYL** --- *devname(dev)*
2. **NOT IN SETUNITS TABLE**

This message is issued in response to a *START VARYL command. An incorrect device number has been specified for the *dev parameter when entering the command.

**System action:** JES3 ignores the command and reissues message IAT9665 asking you to enter a *START or *CANCEL command.

**Operator response:** Reissue the *START command with the correct device number. If you do not know the number of the device you want to unassign from the local main, ask your system programmer.

---

#### IAT9660

**Explanation:**

1. **VARYL** --- NO PARMS ENTERED ON
2. ***START COMMAND**

This message is issued because no parameters were specified on the *START VARYL command. The *dev parameter, used to specify the device number, is required on the *START command.

**System action:** The VARYL DSP issues message IAT9665 requesting a *START command or *CANCEL command, and then waits for a command to be entered. JES3 processing continues.

**Operator response:** Determine the correct device number and enter the *START command again with the valid number. See [z/OS JES3 Commands](#) for the correct parameters.

---

#### IAT9659

**Explanation:**

1. **VARYL** --- ERROR WHILE SCANNING
2. ***START COMMAND**

An incorrect parameter was entered on the *START VARYL command.

**System action:** VARYL issues message IAT9659 requesting a new *START or *CANCEL command, and then waits for a command to be entered. JES3 processing continues.

**Operator response:** Reissue the *START VARYL command with valid parameters. See [z/OS JES3 Commands](#) for the correct command syntax.

---

#### IAT9661

**Explanation:**

1. **VARYL** --- PARM AFTER-*dev* IS INVALID

A keyword other than OFF or OFFLINE was entered after the *dev parameter on the *START VARYL command.

**System action:** The VARYL DSP issues message IAT9665 requesting a *START command or *CANCEL command, and then waits for a command to be entered. JES3 processing continues.

**Operator response:** Reissue the *START VARYL command with the correct parameters. See [z/OS JES3 Commands](#) for the correct command syntax.
IAT9662

Explanation:

\[\text{\textasciitilde VARYL} \text{--dev} \text{\rightarrow IS NOT AN ASSIGNABLE DEVICE} \text{\rightarrow} \]

The dev parameter specified on the *START VARYL command was not an address of a device that can be multi-system assigned.

System action: The VARYL DSP issues message IAT9665 requesting a *START command or *CANCEL command, and then waits for a command to be entered.

Operator response: Reissue the *START VARYL command with the correct device number. If you do not know which devices in your complex can be multi-system assigned, ask your system programmer. See z/OS JES3 Commands for an explanation of assignable devices.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATMOVL</td>
<td>IATMOVL</td>
</tr>
</tbody>
</table>

Routing Code: 10     Descriptor Code: 7

IAT9663

Explanation:

\[\text{\textasciitilde VARYL} \text{--dev} \text{\rightarrow IS NOT MULTI-SYSTEM ASSIGNED} \text{\rightarrow} \]

The device specified by the dev parameter of the *START VARYL command is not currently multi-system assigned.

System action: The VARYL DSP issues message IAT9665 requesting a *START command or *CANCEL command, and then waits for a command to be entered.

Operator response: Reissue the *START VARYL command with the correct device number. If you do not know which devices in your complex are currently multi-system assigned, ask your system programmer.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

Chapter 28. JES3 Macro Messages

IATDV100

Explanation:

- **SYNTAX ERROR:**
  - No model DEVICE statement specified
  - Incorrect range specified
  - No range specified
  - Devices must be of the form x
  - Incorrect device specified
  - Only one model DEVICE statement allowed
  - No device(s) specified

‘MOD’ must be specified at the beginning of a DEVICE statement.
An IATDEVC or IATDEVA edit macro was invoked using incorrect syntax.

No model DEVICE statement specified.
An existing DEVICE statement needs to be marked with ‘MOD’ on the line command to be used as a model.

Incorrect range specified.
The last number specified in the device range must be greater than the first.

No range specified.
‘CC’ must be specified to identify the DEVICE range to be changed; or, a DEVICE range or DEVICE list must be specified on the command.

Devices must be of the form (x)xxx.
Device numbers need to be 3 or 4 digits.

Incorrect device specified.
The device statement specified must be a valid hexadecimal number.

Only one model DEVICE statement allowed.
More than one model DEVICE statement was specified.

‘MOD’ must be specified at the beginning of a DEVICE statement.
A model was specified, however, it was not found on the first line of a DEVICE statement.

No device(s) specified.
No devices were marked or specified.

System action: The system ends processing.
System programmer response: Fix the command syntax and try the command again.

Module:

**IATDV900**

**Explanation:**

- Command completed successfully.

**Updated:**

- Device # used JNAME repeated as necessary
- Last defined DESTCODE repeated as necessary
- Updated

The command completed successfully; however, detailed processing conditions may be displayed.

**no text**

The IATDEVA or IATDEVC edit macro completed successfully.

**Device number was used for JNAME. Update as appropriate.**

An IATDEVA edit macro was successfully completed. The device numbers were used as the JNAMEs on the new DEVICE statements. This is an informational message for the system programmer.
Last defined DESTCODE was repeated as necessary. Update as appropriate.
   An IATDEVC edit macro was successfully completed. Either a sequential DESTCODE pattern (i.e., S1, S2, S3) was not recognized; or the DESTCODES were sequential, but not enough valid sequential DESTCODES existed to complete the DEVICE statement. In either case the last valid DESTCODE defined or generated on the DEVICE statement was propagated as the DESTCODE for the added processor(s).

System action: Processing continues.

System programmer response: One of the following:

- no text
  None.

Device number was used for JNAME. Update as appropriate.
   If this is not acceptable, the JNAME may need to be changed.

Last defined DESTCODE was repeated as necessary. Update as appropriate.
   If this is not acceptable, the DESTCODEs may need to be changed.

Chapter 29. JES3 IPCS Messages

The ISPF dialog messages consist of a short message followed by an optional long message.

IATKM720
Explanation:

GROUP—group—is empty

NO CONTROL BLOCK IN GROUP—group

JES3 could not display any installation-defined control blocks for the specified group because they were previously deleted from the group.

System action: Processing continues. The IPCS session remains active.

User response: Make another selection or press the PF3 key to exit.

Module:

Containing
ISPMLIB

Detecting
IATJIPCS

Issuing
IATJIPCS

IATKM721
Explanation:

SELECT ONLY ONE OPTION

NO MORE THAN ONE SELECTION CAN BE MADE

On one of the selection panels for the JES3 component of IPCS, more than one option was specified.

System action: The panel reappears, allowing you to select only one option.

User response: Enter ‘S’ next to one option only.

Module:

Containing
ISPMLIB

Detecting
IATJIPCS

Issuing
IATJIPCS

IATKM722
Explanation:

ENTER REQUIRED FIELD

PLEASE ENTER THE REQUIRED FIELD

On one of the input panels for the JES3 component of IPCS, a required field was not completed.

System action: The panel reappears with the cursor at the required field, allowing you to fill in the required information.

Module:

Containing
ISPMLIB

Detecting
IATJIPCS

IATJIPCS

IATKM723
Explanation:

NO MORE SPACE IN DATA SET—dataset

REALLOCATE THE DATA SET WITH MORE SPACE

IPCS could not add the group or control block specified when you were using one of the following panels:

• ADD AN INSTALLATION DEFINED CONTROL BLOCK
• ADD AN INSTALLATION DEFINED CONTROL BLOCK GROUP

IPCS attempted to add the control block or group to the preallocated data set ‘userid.ISPTABLE’, but IPCS failed to add because of insufficient space in the data set.

System action: JES3 processing continues. The IPCS session remains active.

User response: Exit JES3 IPCS and reallocate data set ‘userid.ISPTABLE’ with more space. After reallocating the data set, return to the IPCS session to add the control block or the control block group.

Module:

Containing
ISPMLIB

Detecting
IATJIPCS

Issuing
IATJIPCS

IATKM724
Explanation:

NOTHING TO DELETE

THERE ARE NO INSTALLATION-DEFINED TO DELETE

The DELETE A USER DEFINED CONTROL BLOCK GROUP option was selected, but JES3 determined that there are no installation-defined control blocks.

System action: The system waits for you to select another option.
**IATKM725**  
**User response:** Make another selection or press the PF3 key to exit.

**Explanation:**
- NOTHING TO DELETE
- THERE ARE NO INSTALLATION-DEFINED
- CONTROL BLOCK GROUPS TO DELETE

The DELETE A USER DEFINED CONTROL BLOCK GROUP or the DELETE A USER DEFINED CONTROL BLOCK FROM A GROUP option was selected, but JES3 determined that no user-defined control blocks exist.

**System action:** The system waits for you to enter select another option.

**User response:** Make another selection or press the PF3 key to exit.

**Module:**
- Containing ISPMLIB
- Detecting IATJIPCS
- Issuing IATJIPCS

---

**IATKM728**

**Explanation:**
- control block IS ADDED
- CONTROL BLOCK control block
- HAS BEEN ADDED TO TABLE

You have successfully defined a control block to the IPCS session.

**System action:** Processing continues.

**User response:** None. This is an informational message.

**Module:**
- Containing ISPMLIB
- Detecting IATJIPCS
- Issuing IATJIPCS

---

**IATKM729**

**Explanation:**
- NOTHING TO DELETE
- NO INSTALLATION-DEFINED CONTROL BLOCKS
- GROUP group

JES3 could not delete any installation-defined control blocks from the specified group because you did not define any control blocks to the group previously.

**System action:** Processing continues. The IPCS session remains active.

**User response:** Make another selection or press the PF3 key to exit.

**Module:**
- Containing ISPMLIB
- Detecting IATJIPCS
- Issuing IATJIPCS

---

**IATKM730**

**Explanation:**
- DISPLAY CHAIN INVALID
- DISPLAY CHAIN CANNOT BE
- 'Y' IF POSITION FIELD IS FILLED IN

After you selected a chain control block without a find routine, you completed the position field with the 3-digit extension and specified ‘Y’ for the display chain group. The 3-digit extension and ‘Y’ for the display chain group cannot be specified together.
The system will wait for the user to blank out the position field and enter a ‘Y’ or an ‘N’ for the display chain option. The user could also enter the 3-digit extension in the position field and enter an ‘N’ for the display chain option.

User response: Select the appropriate action or press the PF3 key to exit.

**Explanation:**

```
▏— TABLE IN USE —▏
```

```
▏— CONTROL BLOCK DEFINITIONS CANNOT —▏
```

```
▏— BE MODIFIED IN SPLIT SCREEN MODE —▏
```

An attempt was made to modify a control block definition while in split screen mode. A control block definition cannot be modified within split screen mode.

**System action:** The system rejects the command.

**User response:** Get out of split screen mode and reissue the command(s) to modify the control block definition.

**Module:**

Chapter 30. Problem Determination

Problem determination is the activity required to identify a failing hardware unit or program and determine who is responsible for support.

Problem determination is accomplished by using procedures specified by IBM. In some cases, these procedures may be initiated by a message or code which requires operator or programmer response. The response may include the requirement for additional problem-related data to be collected and will attempt, where possible, to indicate “probable” failure responsibility.

Problem determination information is included for applicable messages and codes under the heading “Problem Determination.”

For z/OS problem determination procedures, see [z/OS Problem Management] and for further JES3 problem determination procedures, see [z/OS JES3 Diagnosis]. In any case, it is intended you take the specified actions and collect any requested documentation before calling IBM for support.

<table>
<thead>
<tr>
<th>TABLE I</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Standard Problem Determination</strong></td>
</tr>
<tr>
<td>If the problem recurs, follow the problem determination aids specified by the associated message or code before calling IBM for support.</td>
</tr>
<tr>
<td>1. If MSGLEVEL=(1,1) was not specified in the JOB statement, specify it and rerun the job.</td>
</tr>
<tr>
<td>2. Save the console sheet from the primary console. For systems with remote consoles, save the remote console sheet. In systems with Multiple Console Support (MCS), save a copy of the hard copy log.</td>
</tr>
<tr>
<td>3. Save the job stream associated with the job.</td>
</tr>
<tr>
<td>4. Save the system output (SYSOUT) associated with the job.</td>
</tr>
<tr>
<td>5. Make sure that the failing job step includes a:</td>
</tr>
<tr>
<td>a. SYSABEND DD statement.</td>
</tr>
<tr>
<td>b. SYSUDUMP DD statement.</td>
</tr>
<tr>
<td>c. PL1DUMP DD statement.</td>
</tr>
<tr>
<td>d. SYSMDUMP DD statement.</td>
</tr>
<tr>
<td>6. Make sure that the PARM parameter of the EXEC statement specifies the following:</td>
</tr>
<tr>
<td>a. MAP</td>
</tr>
<tr>
<td>b. LIST</td>
</tr>
<tr>
<td>c. DIAG</td>
</tr>
<tr>
<td>d. MSG=AP</td>
</tr>
<tr>
<td>e. CORE, if applicable</td>
</tr>
<tr>
<td>f. XREF</td>
</tr>
<tr>
<td>g. DUMP</td>
</tr>
<tr>
<td>7. If SMP is used to make all changes to the system, run the LIST CDS and LIST PTFBY functions of SMP to obtain a list of the current maintenance from the SMP control data set (CDS). If any changes are made to the system without using SMP, run the LISTIDR function of the AMBLIST service aid program to obtain a list of all members with a PTF or local fix, and save the output. Run the program against the:</td>
</tr>
<tr>
<td>a. SYS1.LINKLIB data set.</td>
</tr>
<tr>
<td>b. SYS1.SVCLIB data set.</td>
</tr>
</tbody>
</table>
c. Library containing the program that issued the message.

d. SYS1.LPALIB data set.

8. Run the IMCJOBQD (stand-alone) or IMCOSJQD (system-assisted) service aid program to obtain a formatted copy of the contents of the SYS1.SYSJOBQE or SYS1.SYSWADS data sets, SWADS or the resident job list.

9. Run the AMBLIST service aid program to obtain:
   a. An object module listing, specifying the LISTOBJ function.
   b. A load module map and cross-reference listing, specifying the OUTPUT=BOTH option of the LISTLOAD function.

10. Have a copy of the Message Control Program (MCP) available.

11. Run the AMDSADMP service aid program to dump the contents of real storage and page data sets on magnetic tape.

    After restarting the system, use IPCS to print the required portion of the dump tape produced by AMDSADMP.

    Save both the tape from AMDSADMP (should further information from the tape be required) and the listing from IPCS.

12. Run the SEREP program, and save the resulting output.

    (Note: The SEREP program is not supported on processors in the 4300 series.)

13. Save all the associated output.

14. The normal response to this message requests the programmer/operator to run a specific program.

    Save all output from that program.

15. Save the program listing associated with the job.

16. Save the dump.

17. Run the EREP service aid, to dump the SYS1.LOGREC data set and save the resulting output.

18. Save the assembly listing associated with the job.

19. Save the control cards associated with the job.

20. Save the compiler output associated with the job.

21. Save the source input associated with the job.

22. Save the source program listing associated with the job.

23. Run OLTEP diagnostics for the problem device and save the output.

24. Run the IEHLIST system utility program to obtain a list of the:
   a. Volume table of contents of the associated volume, specifying the FORMAT option.
   b. Volume table of contents of the associated volume, specifying the DUMP option.
   c. Directory of the associated data set

25. Run the IEBPTPCH data set utility to print the:
   a. Directory of the applicable data set.
   b. Applicable data set.
   c. Applicable member.
   d. Applicable procedure.

26. Have the linkage editor/loader map available.

27. Save the associated volume.

28. Contact your programming support personnel.

29. Contact your hardware support personnel.

30. Save the trace output data set.

31. Print the GTF trace data set using IPCS.

32. Print the associated SVC Dump data set using IPCS.
33. Run the access method services LISTCAT command to:
   a. List the contents of the applicable catalog.
   b. List the catalog entries for the applicable objects and any related objects.

34. Run the following access method services command:
   a. The PRINT command to list the contents of the mass storage volume control inventory data set.
   b. The LISTMSVI command.
   c. The LISTMSF command with the ALL parameter.

35. Run the access method services PRINT command to print the repair work file.

36. Run the AMASPZAP service aid program using the ABSDUMP statement to print the contents of the applicable:
   a. Data set.
   b. Track.

37. Run the access method services COMPARET command.

38. Display units for units associated with the problem area. If specific unit(s) is not known, display range of all virtual units. See your configuration path chart for address ranges.

39. Obtain the RACF profile of the associated data set, where applicable.

40. Stop the processor and use the hardware ALTER/DISPLAY facility to display:
   a. All general purpose registers.
   b. The PSW.
   c. Main storage locations 0 through 200 (hexadecimal) and 7000 through 7080 (hexadecimal).

41. If the AMDSADMP program resides on tape, save the tape. If the AMDSADMP program resides on disk, use the DUMP feature of IEHDASDR to print the SYS1.PAGEDUMP data set and cylinder 0 track 0 of this residence disk.

42. Save the output (listings) of the stage 1 and stage 2 AMDSADMP initialization jobs.

43. Follow the procedures for item 9b of this table for load modules AMDSAPGE, AMDSAPRO and AMDSALDR of SYS1.LINKLIB. Use IEBUPDTE or IEBPTCH to print the AMDSADMP and AMDSADM2 macros from SYS1.MACLIB.

44. Save the AMDSADMP dump output (tape or listing).

45. If the program seems to be looping, use the display PSW feature of the hardware ALTER/DISPLAY facility along with the hardware instruction Step facility to trace the loop, instruction by instruction.

46. If there is an error in the contents of a page data set dump, restart the system using a different page data set, then dump the original page data set.

47. Use IEBCOPY to unload SYS1.IMAGELIB to tape.

48. Have a list of RACF-defined entities available.

49. Contact your IBM system engineer.

50. Save the log from all active global resource serialization systems, and from any systems that are restarting or joining the global resource serialization complex.

51. Use the following instructions to find the IPL WTO buffer and locate a message in that buffer.
   Before a stand-alone dump is taken:
   a. Using the hardware ALTER/DISPLAY facility, read the address in storage location X’14’; this address points to the IPL diagnostic area.
   b. Add X’28’ to the address in location X’14’; the result is a 31-bit pointer to the virtual address of the IPL vector table (IVT).
   c. Add X’E0’ to the IVT address; the result is a 31-bit pointer to the IVTMQHP field of the IVT. IVTMQHP contains the address of the message queue header (MQH).
   d. Add X’8’ to the address of the MQH; the result is a 31-bit pointer to the youngest message queue element (MQE), which is the message you want to see.
e. Add X'A' to the address of the MQE; the result points to the MQETEXT field of the MQE.
   MQETEXT contains the text of the most recent message.

After a stand-alone dump has been taken and copied to DASD, you may use either ISPF browse or IPCS to find the buffer and locate a message:
   • Using ISPF browse
     a. Search the dump for the message string you want to locate. For example, if your system is in a
        wait state, code 055, you want to locate message IEA086W; so enter Find 'IEA086W'.
     b. Repeat Find ‘message ID’ until you have located all occurrences of that message.
   • Using IPCS
     a. Enter the VERBX CPUDATA command to get the value in control register 1; this value points to
        the segment table.
     b. Enter the EQUATE command to equate the segment table (SGT1) to the value in control
        register 1. Ignore the low-order byte; the segment table will always be on a page boundary. An
        example of this EQUATE command follows:

        EQU SGT1 FFE000. ABSOLUTE STR(SGT)

     c. Enter EQU PSA0 0. ABSOLUTE to equate PSA0 to absolute location 0.
     d. Enter DROPD RECORDS(TRANSLATION) to reinitialize the dump so that IPCS can process
        virtual addresses in the dump.
     e. The IPL vector table (IVT) will always be at virtual storage address X'2000 1000'. Add X'E0' to
        the IVT address; the result is a 31-bit pointer to the IVTMQHP field of the IVT. IVTMQHP
        contains the address of the message queue header (MQH).
     f. Add X'8' to the address of the MQH; the result is a 31-bit pointer to the youngest message
        queue element (MQE), which is the message you want to see.
     g. Add X'A' to the address of the MQE; the result points to the MQETEXT field of the MQE.
        MQETEXT contains the text of the most recent message.

---

**TABLE II**

**GTF Problem Determination**

**Format 1: Tracing Without Prompting for Event Keywords**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type TRACE=opt, where opt is the trace option indicated for the particular message or code, within the text of his reply.

When data for the problem has been recorded, use IPCS to format the trace output, specifying DDNAME=(ddname of the trace data set).

**Format 2: Tracing With Prompting for Event Keywords**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to the message AHL100A, the operator should specify the trace options indicated for the associated message or code within the text of his reply. Then, in response to the message AHL101A, the operator should specify the event keywords also indicated with the associated message or code.

When data for the problem has been recorded, use IPCS to format the trace output, specifying DDNAME=(ddname of the trace data set).

**Format 3: Specialized Tracing Action**
Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type ‘TRACE=SYS,USR,SLIP’. The DD statement for a data set in error should specify DCB=DIAGNS=TRACE.

When data for the problem has been recorded, use IPCS to format a dump.

**Format 4: Specialized Tracing Action for VSAM**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type ‘TRACE=SYS,USR’. The DD statement for a data set in error should specify AMP=TRACE.

When data for the problem has been recorded, use IPCS to format a dump.

### TABLE III

**JES3 Problem Determination**

If a problem occurs in JES3, one or more of the following steps may be taken to assist in determining the cause:

1. Take a stand-alone dump of the system by specifying DUMP=PRDMP on the OPTIONS card in the initialization deck and save the output (SYS1.DUMPnn).
2. Take a standard dump of the system by specifying DUMP=JES on the OPTIONS card in the initialization deck and save the output (JESABEND).
3. Take an operating system dump including the nucleus and SQA by specifying DUMP=MVS on the OPTIONS card in the initialization deck and save output (SYSABEND).
4. Save the MLOG listing or get a print of DLOG.
5. Provide listing of initialization deck (JES3OUT).
6. Provide console log from initialization.
7. Determine z/OS level and JES3 PTF level.
8. Provide z/OS nucleus LOADMOD map.
9. Issue */F T,L=linename, SNAPON and */X RJPNSPS.
10. Issue */F T,L=linename, TRCEON. This will give an RJP event trace on the MLOG console. Save MLOG output.
11. Take a system dump by placing an INTDEBUG,n, message-text$$ card in the initialization deck. The message-text field is compared for occurrences of the chosen message. The n field specifies the number of message occurrences before the system is dumped.
12. Issue */X DISPLAY and save output.
13. Issue */X DISPLAY, SNAPS and save the output.
   a. After Interpreter DSP
   b. After Main Service
   c. After Input Service
15. Rerun job with EXEC PGM=JCLTEST and save output.
16. Rerun job with EXEC PGM=JSTTEST and save output.
17. Rerun job with TYPRUN=SCAN specified on JOB card and save output.
18. Issue */X DISPDJC when problem occurs and save output.
19. Restart system with specifying a start type of WA (Warm start with queue analysis) and save output (JES3SNAP).
20. Check JESYMSMG data set for error indications.
21. Provide a listing of the JES3 start up procedure, containing all JCL used to start the subsystem.
22. Save the IOERR trace that will be printed.
23. Rerun job with DEBUG=All immediately following PROCESS CI or PROCESS RI card.

Accessibility

Publications for this product are offered in Adobe Portable Document Format (PDF) and should be compliant with accessibility standards. If you experience difficulties when using PDF files, you may view the information through the z/OS Internet Library Web site or the z/OS Information Center. If you continue to experience problems, send an e-mail to mhvrcfs@us.ibm.com or write to:

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
U.S.A.

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to [z/OS TSO/E Primer](#) and [z/OS TSO/E User's Guide](#) for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer or Library Server versions of z/OS books in the Internet library at:

Programming Interface Information

This publication documents information that is NOT intended to be used as Programming Interfaces of JES3.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks
