JES3 Messages

Version 2 Release 1
Before using this information and the product it supports, read the information in "Notices" on page 1149.

This edition applies to version 2, release 1, modification 0 of IBM z/OS (product number 5650-ZOS) and to all subsequent releases and modifications until otherwise indicated in new editions.

About this document

This document supports z/OS® (5650-ZOS). This document is intended for any JES3 complex that runs z/OS MVS.

Who Should Use This document

This document is intended for JES3 operations staff, applications or system programmers, or by anyone who is responsible for controlling JES3 or diagnosing problems in JES3.

How To Use This document

The first section of this document provides information to customize the message library for your installation, including corequisite and related documents. It also provides information for the use of this document, as well as a message directory showing where different messages are documented.

Later sections are organized by sequential message number with each section containing those messages which relate to a specific function. All sections list the messages produced by the IBM-supplied JES3 component of the operating system. The causes of the messages are explained, the accompanying actions by the operating system are described and appropriate responses are suggested. The module that issues the message is also listed. Where applicable, problem determination information is included.

JES3 completion codes can be found in z/OS JES3 Diagnosis Reference.

Where To Find More Information

This document references the following documents using the shortened version of the document title. The following table lists the shortened titles, complete titles, and order numbers of the documents that are not listed in z/OS Information Roadmap. See that document for all z/OS documents.

Most licensed documents were declassified in OS/390® V2R4 and are now included on the OS/390 Online Library Collection, SK2T-6700. The remaining licensed documents appear in unencrypted BookManager® softcopy and PDF form on the OS/390 Licensed Product Library, LK2T-2499.

How Messages are Explained in this Book

The following describes the different parts of message explanations in this book:

Explanation
   The meaning of the message, including why the system issued the message.

System Action
   • What the system did as a result of the system condition reported by the message. A system condition could include running out of storage, a hardware or software failure, an abend, a wait state.
   • What the system did as a result of user input. User input can include a system command, a job running on the system, a transaction, a query, or another user-system interaction.

Operator Response
   Instructions for the system operator, including, as appropriate, decisions to make and actions to take.
   Only provided for messages that could appear at the operator console.

User Response
   Instructions for the end user.
   Only provided for messages that could appear at an interactive interface such as a TSO/E terminal or ISPF application.

Note: Most user messages are explained in other message books, such as z/OS TSO/E Messages.

Application Programmer Response
   Instructions for an application programmer.
   Only provided for messages that could appear in SYSOUT produced by a job, for example SPZAP.

System Programmer Response
   Instructions for the system programmer.
   Only provided for messages that require additional action beyond the operator response, user response, or application programmer response.

Storage Administrator Response
   Instructions for the DFSMSdfp storage administrator.

Security Administrator Response
   Instructions for the security administrator.
   Only provided for security-related messages.

Problem Determination
   Additional instructions for determining the cause of the problem, searching problem databases, and, if necessary, reporting the problem to the IBM support center. These instructions are for a customer support person who
can troubleshoot problems, such as the system programmer or system administrator, an experienced security administrator, or an experienced storage administrator.

For additional information on performing problem determination procedures, see [z/OS Problem Management](#) and the appropriate diagnosis guide for the product or element issuing the message, such as:

- DFSMS/MVS diagnosis guides and references
- z/OS JES2 Diagnosis
- z/OS JES3 Diagnosis

**Source**
Element, product, or component that issued the message.

**Detecting Module**
Name of the module or modules that detected the condition that caused the message to be issued.

**Routing Code**
For WTO or WTOR messages, the routing code of the message.

**Descriptor Code**
For WTO or WTOR messages, the descriptor code of the message.
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or provide any other feedback that you have.

Use one of the following methods to send your comments:
1. Send an email to mhvrcfs@us.ibm.com.
2. Send an email from the "Contact us" web page for z/OS (http://www.ibm.com/systems/z/os/zos/webqs.html).
3. Mail the comments to the following address:
   IBM Corporation
   Attention: MHVRCFS Reader Comments
   Department H6MA, Building 707
   2455 South Road
   Poughkeepsie, NY 12601-5400
   US
4. Fax the comments to us, as follows:
   From the United States and Canada: 1+845+432-9405
   From all other countries: Your international access code +1+845+432-9405

Include the following information:
• Your name and address.
• Your email address.
• Your telephone or fax number.
• The publication title and order number:
  z/OS V2R1.0 JES3 Messages
  SA32-1007-00
• The topic and page number that is related to your comment.
• The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

If you have a technical problem

Do not use the feedback methods that are listed for sending comments. Instead, take one of the following actions:
• Contact your IBM service representative.
• Call IBM technical support.
• Visit the IBM Support Portal at z/OS support page (http://www.ibm.com/systems/z/support/).
z/OS Version 2 Release 1 summary of changes

See the following publications for all enhancements to z/OS Version 2 Release 1 (V2R1):

- z/OS Migration
- z/OS Planning for Installation
- z/OS Summary of Message and Interface Changes
- z/OS Introduction and Release Guide
Chapter 1. Introduction

The MVS/Enterprise Systems Architecture Message Library is designed so that you can have the messages and codes documentation that fits your specific needs. Figure 1 on page 4 illustrates the way that you can customize your z/OS Message Library.

Message Prefix Identification

The message prefix identifies the component of the operating system that issues that message. The prefix IAT identifies messages supplied by the JES3 component.

Message format

JES3 messages appearing on a display console have the following format:

```
hhmsstp*IATnnnn text
```

The time stamp (hhmsst) shows the time, by hour, minute, second, and tenth of second, that the message was issued.

The prefix character (p) is used to alert you to unusual system conditions. Your system programmer may define these characters on an initialization statement; they appear in messages issued after initialization is complete. The message prefix characters and their IBM-supplied defaults are described below.

- **Blank**: This is a normal output message.
- **Switch character**: This is used to flag messages initially routed to one RJP console but switched to another because of operator intervention. The switch character is a number sign (#).

An asterisk (*) appearing in the next position indicates an action message; operator action is required. The message serial number (IATnnnn) consists of a component prefix, which is IAT for JES3; and the message number.

The message itself (text) follows the serial number. Very long message texts are often issued as a series of messages, with each part having its own serial number. When an 8 character jobid (JOBxxxxx) appears in a message and you need to issue a command, use the numerical characters in the jobid (xxxxx) when the command operand is `jobno`.

Variable data within the text of messages in this document is indicated by a lowercase representation of the item, listed in Table 1 on page 4.

Symbols preceding JES3 message numbers convey information to the operator or system programmer (see Table 2 on page 7). Messages displayed at the console for the operator are preceded by an asterisk (*) when operator action is required. Other symbols preceding messages directed to the operator are installation-dependent and may be changed by the JES3 initialization stream.

Messages IAT0000 through IAT0899 are reserved for the JES3 user. If a message in this range appears, consult the system programmer.

Message numbers are grouped by functional area, as follows:
<table>

Chapter 1. Introduction
Select the z/OS publications that are compatible with your system.

2 Select the supplementary messages publications that fit the needs of your installation.

3 If your installation uses a particular compiler or application program, you may want to append the program's messages to your message library. These messages are located in the associated programmer's guides, user's guides, installation reference manuals, or messages books.

---

**JES3 hardcopy log (DLOG)**

On a hardcopy console, the message format consists of the date stamp, time stamp, serial number and message text; there are no prefix characters.

The JES3 hardcopy log (DLOG) records all communication in the complex, both commands and messages. The DLOG format includes the console destination class for messages, the name of the receiving or issuing console, a date stamp, a time stamp, a prefix symbol (blank for normal messages, * for action messages, + for JES3 input commands, and - for MVS™ input commands), and the message or command text. The message text is also prefixed by the suppression character if display of the message was suppressed through MPF or by a subsystem routine. The suppression character is defined by the MPFHCF parameter in the MPFLSTxx parmlib member.

Messages recorded by DLOG include both write-to-operator (WTO) messages that appear on the operators’ consoles and write-to-log (WTL) messages that are sent to DLOG only.

How to Read a Syntax Diagram

Syntax is described using the structure defined below.

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line.
  - The ➩ symbol indicates the beginning of a message syntax.
  - The ➩ symbol indicates that the message syntax is continued on the next line.
  - The ➩ symbol indicates that the message syntax is continued from the previous line.
  - The ➩ indicates the end of the message syntax.
  - A lower-case word indicates a variable.
- Strings of fixed text, keywords (and their value), and positional items that always appear in the message are shown on the horizontal line (the main path).
  ➩ positional_item, required_item, KEYWORD= required_value ➩
- Strings of fixed text, keywords (and their value), and positional items that might not appear in the message are shown below the main path.
  ➩
  ➩ optional_item, KEYWORD= optional_item
- If one of several items might appear in a message, they appear vertically, in a stack. If some item always appears in the message, an item is shown on the main path.
  ➩ positional_choice1, KEYWORD= required_choice1
  ➩ positional_choice2, KEYWORD= required_choice2
- If there is a possibility that none of the items will appear in the message, the entire stack is shown below the main path.
  ➩ positional_item
  ➩ optional_choice1
  ➩ optional_choice2
- If one of the items has a default, it appears above the main line (for that item) and the overriding choices will be shown on and/or below the main line. For POSITIONAL items the syntax is as follows:
  ➩
  ➩ (1)
  ➩ positional_default
  ➩ positional_option1
  ➩ positional_option2
  ➩ (2)

Notes:
1. If a positional parameter is not specified, the positional default is used.
2. If a positional parameter is coded, then any one of the 3 positional parameters can be specified.
Note: This does not apply to messages.
For KEYWORD items the syntax is as follows:

```
/SM590000/SM590000

| KEYWORD= | keyword_default
|         | keyword_value1
|         | keyword_value2
|         | (2)
```

Notes:
1. If KEYWORD is not coded, the keyword_default is used.
2. If the KEYWORD is coded, then the keyword_default or the keyword value override MUST be coded.

Note: This does not apply to messages.
- An arrow returning to the left above the main line indicates an item that can be repeated indefinitely.

```
/SM590000/SM590000

| KEYWORD= | repeatable_item
```

- A repeat arrow with a syntax note indicates how many times this can be repeated.

```
/SM590000/SM590000

| KEYWORD= | repeatable_item (1)
```

Notes:
1. (1) Specify the `<repeatable_item>` 1 to n times.
- Syntax is occasionally broken into fragments if the inclusion of the fragment would overly complicate the main syntax diagram.

```
/SM590000/SM590000

| KEYWORD= | fragment
```

**fragment:**

```

```

**Routing Codes**

Routing codes send system messages to the consoles where they are to be displayed. More than one routing code can be assigned to a message to send it to more than one console. For more information on message routing, see the following documents:
Routing Code Meaning

<table>
<thead>

Chapter 1. Introduction 11
The message gives problem information for the system programmer, such as a system error, an uncorrectable I/O error, or information about system maintenance.

11 **Programmer Information**

The message is intended for the problem programmer. This routing code is used when the program issuing the message cannot route the message to the programmer through a system output (SYSOUT) data set. The message appears in the job log.

12 **Emulation**

The message gives information about emulation. (These message identifiers are not included in this document.)

13-20 For customer use only.

21-28 For subsystem use only.

29 The message gives information about Disaster Recovery.

30-40 For IBM® use only.

41 The message gives information about JES3 job status.

42 The message gives general information about JES2 or JES3.

43-64 For JES use only.

65-96 Messages associated with particular processors.

97-128 Messages associated with particular devices.

**Routing Codes in This Document**

Routing codes appear to the right of the message identifiers in the **Routing Code** column. The column can also contain the following special characters or notes:

* The message will be routed back to the consoles that initiated the associated requests.

/ The message will be routed to different locations according to the task issuing it. For example, */2/3 means the message is routed back to the console that initiated the request, to the console with master authority, or to the tape pool.

# The message will be routed in one of the following ways:

• According to the routing indicators specified by the operator

• According to the default routing instructions previously specified by the operator

• Back to the console that initiated the associated request

— The message has no routing code.

**Note 2**

The message is issued by a WTO or WTOR macro, but has no routing or descriptor codes (old format WTO or WTOR macro).

**Note 3**

The message has a routing code of 1, which sends it to the console with master authority, and is also routed to the console that the message describes.

**Note 4**

The message is sent to all active consoles; this is a broadcast message.
Note 5
The message has a routing code of 2, which sends it to the console with master authority, and is also routed to the consoles that are assuming the duties of the failing console. (This message indicates that console switching has occurred.)

Note 6
The message is routed only to non-printer consoles. This message is not issued by a WTO or WTOR macro.

Note 7
The message is routed to consoles where one or more of the following are active:
- MONITOR JOBNAME
- MONITOR SESSIONS
- MONITOR STATUS

Note 8
The message is also routed to the MSS space manager's console specified by an alternate console routing code on the MSFMSG parameter in the MVIKEY00 parmlib member.

Note 9
The message is issued during the nucleus initialization program (NIP) processing.

Note 10
The message is issued by the WTL macro.

Note 11
The message is routed to a SYSPRINT data set by data management.

Note 12
The message is issued by a WTO or WTOR macro with SYNCH=YES. See z/OS MVS Initialization and Tuning Reference for more information.

Note 13
The message is routed only to receivers of the hardcopy message set.

Note 14
The message is routed back to the console that initiated the request and to all associated consoles.

Note 16
The message is routed to the IPCS print file IPCSPRNT.

Note 17
The message is issued by JES3. A JES3 destination class is specified either by the initialization stream or by operator commands.

Note 18
The message is sent in response to a command to the console where the command was entered.

Note 19
The message is written to a data set. If routing and descriptor codes are also included for the message, the message might also be displayed according to the specified routing and descriptor codes. (The descriptor code does not apply to writing the message to the data set.)
Note 20
JES3 does not issue the message. JES3 sends the message to another subsystem for processing.

Note 21
This message is a trailer attached to multiple messages previously issued. It has the same routing and descriptor codes as the first line of the conglomerate.

Note 22
This message is routed to the transaction program (TP) message log.

Note 23
This message is issued by the device controller. The routing code will vary according to the device controller's task.

Note 24
This message is routed to the assembly listing.

Note 25
When this message is issued during IPL, the routing codes are 2 and 10 and the descriptor code is 12. When it is issued after IPL, it has no routing code and the descriptor code is 5.

Note 26
When this message is issued during NIP processing, the descriptor code is 12. When it is issued after NIP processing, the descriptor code is 4.

Note 27
The indicated route codes are used only if this message is issued in response to a reply of CKPTDEF during a JES2 checkpoint reconfiguration. This message might be issued to a specific console ID rather than directed by route code. For further information concerning the routing of JES2 messages issued during a reconfiguration, see "z/OS JES2 Initialization and Tuning Guide."

Note 28
These routing and descriptor codes apply only when SMS issues the message. If SMS returns the message to its caller and the caller issues the message, the codes do not apply.

Note 29
This message is written to the JES3OUT data set.

Note 30
This message is issued by JES3. The message is written to the *MODIFY,CONFIG (*F MODIFY) log and/or the issuer of the *MODIFY,CONFIG command.

Descriptor Codes
Descriptor codes describe the significance of messages. They indicate whether the system or a task stops processing, waits until some action is completed, or continues. This code also determines how the system will display and delete the message.

Descriptor Code Meaning

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>System Failure</td>
</tr>
</tbody>
</table>
The message indicates an error that disrupts system operations. To continue, the operator must reinstall the system or restart a major subsystem. This causes the audible alarm to be issued.

2 Immediate Action Required
The message indicates that the operator must perform an action immediately. The message issuer could be in a wait state until the action is performed or the system needs the action as soon as possible to improve performance. The task waits for the operator to complete the action. This causes the audible alarm to be issued.

Note: When an authorized program issues a message with descriptor code 2, a DOM macro must be issued to delete the message after the requested action is performed.

3 Eventual Action Required
The message indicates that the operator must perform an action eventually. The task does not wait for the operator to complete the action.

If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.

4 System Status
The message indicates the status of a system task or of a hardware unit.

5 Immediate Command Response
The message is issued as an immediate response to a system command. The response does not depend on another system action or task.

6 Job Status
The message indicates the status of a job or job step.

7 Task-Related
The message is issued by an application or system program. Messages with this descriptor code are deleted when the job step that issued them ends.

8 Out-of-Line
The message, which is one line of a group of one or more lines, is to be displayed out-of-line. If a message cannot be printed out-of-line because of the device being used, descriptor code 8 is ignored, and the message is printed in-line with the other messages.

9 Operator's Request
The message is written in response to an operator's request for information by a DEVSERV, DISPLAY, TRACK, or MONITOR command.

10 TRACK Command Response
The message is issued in response to a TRACK command.

11 Critical Eventual Action Required
The message indicates that the operator must perform an action eventually, and the action is important enough for the message to remain on the display screen until the action is completed. The task does not wait for the operator to complete the action. This causes the audible alarm to be issued.
Avoid using this descriptor code for non-critical messages because the display screen could become filled.

If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.

12 Important Information
The message contains important information that must be displayed at a console, but does not require any action in response.

13 Automation Information
Indicates that this message was previously automated.

14-16 Reserved for future use.

Descriptor Codes in This Document
The descriptor codes appear in the Descriptor Code column. The column can also contain the following special characters.

/ The message will have different descriptor codes according to the task issuing it. For example, 4/6 means the message can describe system status or job status.
— The message has no descriptor code.
Chapter 2. Dynamic System Interchange Messages

IAT0900
Explanation:

muş DSI - SWITCH GLOBAL DEVICES

DSI has been called, and the operator is requested to switch global devices.

System action: DSI waits for operator response.

Operator response: Set the switching devices to enable channel paths from the new global to all JES3 devices and mains as required. When this function is complete, enter the *S,DSI command to continue, or the *C,DSI command to end DSI.

Module:

Containing       Detecting       Issuing
IATDSI1           IATDSI1         IATDSI1

Routing Code: 2          Descriptor Code: 7

IAT0905
Explanation:

muş DSI - STARTED FOR main

DSI is active.

System action: The active local JES3 system main was ended. JES3 was reinitialized in global hot start mode.

Operator response: Proceed with a JES3 global hot start. Continue normal operation on the new global. If the old global was disabled by pressing SYSTEM RESET, JES3 on the old global can be initialized by performing a local start after an MVS IPL.

If the old global was disabled by entering *X,DSI and then *START,DSI, the old global can be initialized as a local without an intervening MVS IPL.

Module:

Containing       Detecting       Issuing
IATDSI1           IATDSI1         IATDSI1

Routing Code: 10          Descriptor Code: 7

IAT0910
Explanation:

muş DSI - DISABLE OLD GLOBAL PROCESSOR

This message informs the operator DSI processing has started on the local. After this message is issued the operator is requested to disable the old global.
IAT0911 • IAT0912

Note: This message may be issued more than once during a DSI. First, it is issued for the current global. If a previous DSI never completed, this message is issued for the global before the previous, incomplete, DSI.

System action: DSI waits for operator response.

Operator response:
- If you do not want DSI processing to continue, enter the *C,DSI command. DSI processing ends and JES3 processing continues.
- If you want DSI processing to continue, and the old global has failed: press SYSTEM RESET on the old global. DSI processing will automatically continue on the new global.
- If you want DSI processing to continue, and the old global is still active: enter the *X,DSI command on the old global and wait for message IAT0920. Then review the global DSI procedure. After you issue the *S,DSI command on the old global to bring JES3 down, DSI processing will automatically continue on the new global.

Routing Code: 2     Descriptor Code: 7

IAT0921

Explanation:

➤— DSI — WARNING: SYSTEM— nnnnnnnnn— HAS— nnnnn— ACTIVE NETSERV— S—

This message is issued during a DSI when both of the following conditions hold:

• At least one system in the complex (not necessarily the new global) is at a level lower than HJS7730.
• At least one Netserv is active. This message is issued once for every system that has an active Netserv.

In the message text:
IAT0925 • IAT0927

The system name containing active Netservs.

The number of Netservs on the indicated system.

**System action:** This message is highlighted along with message IAT0920, and the highlighting is removed when the *S,DSI command is entered in response to IAT0920.

**Operator response:** If the new global is running at the HJS7730 level or higher, no action is necessary. If the new global is at a level below HJS730, you must stop all of the Netservs before continuing the DSI. If necessary, enter a *C,DSI command and begin the DSI procedure later after canceling these Netservs.

**Module:**

<table>
<thead>

Chapter 3. Data Management Messages

IAT1005
Explanation:

>>> SPOOL PARTITION— spart1—is FULL AND — OVERFLOWED INTO— spart2 ————->

JES3 has allocated all track groups in spool partition spart1; space is not available in any spool data set in that partition.

System action: All subsequent spool space allocation requests that specify spool partition spart1 will be satisfied from partition spart2 as long as space is available in spart2 or until space is released in spart1.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMGB</td>
<td>IATDMTK</td>
<td>IATDMGB</td>
</tr>
</tbody>
</table>

Routing Code: 10  Descriptor Code: 7

IAT1016
Explanation:

>>> SPOOL PARTITION— spart— HAS LESS THAN — pp— % SPACE REMAINING. SYSOUT BUFFER ————->

PROCESSING SUSPENDED. ————->

JES3 has allocated space down to the minimal spool space threshold for spool partition spart. Less than pp% of the total number of track groups in the partition is currently available.

System action: Spool partition spart does not allow overflow; therefore, JES3 suspends SYSOUT buffer processing for jobs requiring this partition or jobs that overflow into this partition until more space is available. If partition spart is the default partition, JES3 will not accept any new jobs (including an operator *CALL command) until the condition is corrected.

Operator response: Inform your system programmer that spool partition spart has reached the minimal condition and that SYSOUT buffer processing is suspended.

Programmer response: To recover from this condition, several alternatives are available:

- Move a spool data set from another spool partition into the partition with the shortage condition. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/en/SDDW57_1.12.0/com.ibm.zos.zos.jes3/commands/comm_division.html) (the *MODIFY,Q command) for more information on this alternative.
- Add a spool data set to the initialization stream and perform a warm start. See [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com/support/knowledgecenter/en/SDDW57_1.12.0/com.ibm.zos.zos.jes3/initialization/guide/iq3iag.htm) for more information on this alternative.
- Modify the partition to allow overflow from the partition into another partition which has available track groups. See the MODIFY command in [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/en/SDDW57_1.12.0/com.ibm.zos.zos.jes3/commands/comm_division.html) for more information on this alternative.
- Purge jobs which are using space within the partition, selectively or by using the *MODIFY,U command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/en/SDDW57_1.12.0/com.ibm.zos.zos.jes3/commands/comm_division.html) for more information.
- Modify the partition assignments for jobs (through main affinity), jobs classes, or mains. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/en/SDDW57_1.12.0/com.ibm.zos.zos.jes3/commands/comm_division.html) for more information.
- If the condition was caused by a runaway job, first cancel the job. To determine what jobs use the most spool space in a partition, issue the *I Q,SP=spart1,U command. Then display the partition using the *I Q,SP=spart command.
You can then temporarily lower the MIN value using the *F Q,SP=spart,MIN=nn command. After the job is moved to Output Service or Purge, reenter the *F Q,SP=spart,MIN=nn command specifying the original MIN value.

**Note:** Leaving the MIN value too low could impede your ability to restart the JES3 system, requiring a coldstart to recover.

**Module:**
<table>

<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMGB</td>
<td>IATDMTK</td>
<td>IATDMGB</td>
</tr>
</tbody>
</table>

**Routing Code:** 10  
**Descriptor Code:** 7

---

**IAT1017**

**Explanation:**

SPOOL PARTITION spart HAS LESS THAN pp% SPACE REMAINING. JOB SELECTION HAS BEEN SUSPENDED.

JES3 has allocated space down to the marginal spool space threshold for spool partition spart. Less than pp% of the total number of track groups in the partition is currently available.

**System action:** JES3 processing of work currently in progress continues; however, jobs which require space from this partition will not be initiated because spool partition spart does not allow overflow. When more than pp% of the space on this partition becomes available, JES3 will start to initiate job selection again.

**Operator response:** Inform your system programmer that this partition has reached the marginal threshold and that JES3 has suspended job selection.

**Programmer response:** To recover from this condition, several alternatives are available:

- Move a spool data set from another spool partition into the partition with the shortage condition. See z/OS JES3 Commands for more information on this alternative.
- Add a spool data set to the initialization stream and perform a warm start. See z/OS JES3 Initialization and Tuning Guide for more information on this alternative.
- Modify the partition to allow overflow from the partition into another partition which has available track groups. See the MODIFY command in z/OS JES3 Commands for more information on this alternative.
- Purge jobs which are using space within the partition, selectively or by using the *MODIFY,U command. See z/OS JES3 Commands for more information.
- Modify the partition assignments for jobs (through main affinity), jobs classes, or mains. See z/OS JES3 Commands for more information.

**Routing Code:** 10

**Descriptor Code:** 7

---

### IAT1050

**Explanation:**

>>>**SPOOL PARTITION**_spart_**IS FULL AND IS NOT PERMITTED TO OVERFLOW**<<<

JES3 has allocated all track groups in the indicated spool partition. Overflow from the partition is not allowed.

**System action:** All subsequent spool space allocation requests that specify the indicated partition will wait for track groups within the partition to become available. JES3 will not schedule any jobs that are waiting for execution using this partition. If space within this partition becomes available, this message is deleted from the JES3 action message queue.

**Operator response:** Inform your system programmer that partition _spart_ is not allowed to overflow and that jobs requesting that partition will be forced to wait until space becomes available.

**Programmer response:** If you cannot afford to wait for space to become available, the following alternatives can be considered:

- Move a data set from another spool partition into the partition with the shortage condition. See _z/OS JES3 Commands_ for more information on this alternative.
- Add a spool data set to the initialization stream and perform a warm start. See _z/OS JES3 Initialization and Tuning Guide_ for more information on this alternative.
- Modify the partition to allow overflow from the partition into another partition which has available track groups. See the MODIFY command in _z/OS JES3 Commands_ for more information on this alternative.
- Purge jobs which are using space within the partition. See _z/OS JES3 Commands_ for more information.
- Use the *MODIFY command to route jobs submitted on a main to another spool partition. See _z/OS JES3 Commands_ for more information.

<td>IOS</td>
<td>IATDMER</td>
</tr>
</tbody>
</table>

Routing Code: 42
Descriptor Code: 7,11

IAT1101
Explanation:

```plaintext
>>> MINIMAL JSAM BUFFER CONDITION FOR FSS—name—ASID=—nnnn—
```

A minimal buffer condition for the specified CI FSS address space has been reached. *name* specifies the name of the CI FSS and *nnnn* specifies the address space id.

System action: If all JSAM buffers are used, JES3 could stop processing, otherwise JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Record the name of the CI FSS address space and notify the system programmer.

Programmer response: If a minimal JSAM buffer condition recurs, the JSAM buffer pool may need to be enlarged and the minimal threshold may need to be changed. Use the MINBUF parameter on the BUFFER statement to change the value JES3 uses to calculate the minimum number of free JSAM buffers. Use the PAGES parameter on the BUFFER statement to change the size of the JES3 buffer pool in the specified CI FSS address space. For additional information on the BUFFER statement see [z/OS JES3 Initialization and Tuning Reference](#). See message IAT1103 for more information.

Module:

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>IATDMNC</td>
<td>IATDMNC</td>
<td>IATDMNC</td>
</tr>
</tbody>
</table>

Routing Code: 2
Descriptor Code: 2

IAT1102
Explanation:

```plaintext
>>> NO AVAILABLE JSAM BUFFERS FOR—variable text—
```

A request was made for a JSAM buffer and failed because all buffers are currently in use. Depending on where the shortage occurred, *variable text* is one of the following:

- JES3 GLOBAL ADDRESS SPACE
- JES3 LOCAL ADDRESS SPACE
- FSS *name*, ASID=*nnnn*

System action: Processing continues. If a buffer becomes available, the message is deleted. If the condition is not relieved, the message is not deleted.

Operator response: Notify the system programmer about the shortage and where it occurred.

Programmer response: If the condition is not relieved, a JES3 hotstart or a hotstart with analysis might be required to rebuild the JSAM buffer pool. Check for a previous IAT1104 action message to obtain the names of the jobs that are using the most buffers. If the condition recurs, the buffer pool size might need to be increased. Enlarging the pool requires an initialization stream change and a hotstart with refresh or a warmstart. The PAGES= parameter on the buffer initialization statement controls the size of the pool.
IAT1103

Explanation:

Mininal buffer condition for the JES3 global address space or a JES3 local address space has been reached.

System action: If all JSAM buffers are used, JES3 could stop processing, otherwise JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Notify the system programmer. If this condition does not resolve itself and is allowed to continue, it is possible JES3 will exhaust all available JSAM buffers and issue message IAT1102. Therefore, try to quiesce certain JES3 functions (for example, shut down initiators) until the condition is relieved.

System programmer response: Use OPTION=JIO of dump core or take a system dump and use the IPCS command VERBX JES3 ‘OPTION=JIO’ to determine which FCT is using JSAM buffers. If a minimal JSAM buffer condition reoccurs, the JSAM buffer pool may need to be enlarged and the minimal threshold may need to be changed. Use the MINBUF parameter on the BUFFER initialization statement to change the minimum number of free JSAM buffers. Use the PAGES parameter on the BUFFER initialization statement to change the size of the JES3 buffer pool in the specified address space. For additional information about the BUFFER initialization statement, see z/OS JES3 Initialization and Tuning Reference. Restart FSS.

Module:

IAT1104

Explanation:

This message is issued along with message IAT1103 when a minimal buffer condition for the JES3 global address space has been reached. It identifies the three jobs that account for the most JSAM buffers. This is an action message. If fewer than three jobs are found, the message displays fewer jobs. If a job owns more than 9999 buffers, JES3 displays 9999.

Note: If UNKNOWN is listed instead of a job identifier, this indicates that some buffers could not be associated with a particular job.

System action: JES3 processing continues. The message is deleted after enough JSAM buffers have been released to free a secondary buffer extent.

Operator response: Notify the system programmer. If this condition does not get relieved by itself and is allowed to continue, it is possible JES3 will exhaust all available JSAM buffers and issue message IAT1102. If appropriate, cancel jobs that are responsible for the buffer shortage.
IAT1105 • IAT1106

System programmer response: Determine if any of the jobs listed in the message text should be canceled.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDMNC</td>
<td>IATDMNC</td>
<td>IATDMNC</td>
</tr>
</tbody>
</table>

Routing Code: 2,10
Descriptor Code: 2,7

IAT1105

Explanation:

" nowrap="nn%— OF FILE DIRECTORY ENTRIES IN USE" ->

JES3 detected that nn% (80%, 85%, 90%, 95% or ALL) of the File Directory entries are in use. JES3 uses File Directory entries to keep track of opened multi-record files and access to some single record files.

System action: JES3 continues. This message is accompanied by non-action message IAT1106, which lists the three FCTs using the most File Directory entries.

Operator response: Determines if this is a problem and if necessary, take action to remove the source of the problem. For example, if a DSP is using the majority of FD entries, consider canceling it.

System programmer response: If a user DSP is the source of the problem, correct it. If the DSP is an IBM DSP, call IBM for support.

Module:

<table>
<thead>
<tr>
<th>Containing</th>

Routing Code: 2,10
Descriptor Code: 2,7

IAT1106

Explanation:

" nowrap="FILE DIRECTORY USAGE: — dspname1 addinfo nnnn — " ->

" nowrap="dspname2 addinfo nnnn — dspname3 addinfo nnnn — " ->

JES3 issues this message to accompany message IAT1105. It indicates the three FCTs that use the most File Directory entries and the number of them (nnnn). If fewer than three FCTs use File Directory entries, the message displays fewer FCTs. Each FCT is identified by a DSP name, and optionally, a GETUNIT DD name. If an FCT uses more than 9999 entries, JES3 displays the number 9999

In the message text:

dspnamen
  The DSP name of the FCT using the File Directory.
addinfo  One of the following:
(jname)
  A JNAME from the associated device.
@aaaaaaa
  The address of the associated FCT.

System action: JES3 continues.
Operator response: Determine if this is a problem and, if necessary, take action to remove the source of the problem. For example, if a DSP is using the majority of FD entries, consider canceling it.

System programmer response: If a user DSP is the source of the problem, correct it. If the DSP is an IBM DSP, call IBM for support.

---

IAT1110

Explanation:

Program check or machine check occurred—in IOS for a JES3 spool device.

JES3 spool I/O has ended because of a program or machine check. Part of the I/O for the request may be lost. Some JES3 and USAM functions may have issued an AWAIT macro to wait for a resource that is permanently unavailable.

System action: The JES3 I/O error recovery DSP forces a dump with a failsoft DM code of DM750. After the dump, JES3 tries to validate the I/O associated with the request. I/O is restarted if it is still valid.

Operator response: Submit the dump and the hard-copy message log to the system programmer for analysis. You may have to restart some JES3 functions and jobs.

Programmer response: Check the dump to determine the reason for the failure. See z/OS JES3 Diagnosis Reference for a description of DM750.

Routing Code: 42
Descriptor Code: 7,11

---

IAT1130

Explanation:

JES3 spool I/O error output generated—DSP=dspname (jobid)

An error occurred while JES3 was trying to read or write a record on a spool device. The I/O is associated with the specified job or with DSP dspname. When listed with DSP jobid is the job identifier (JOBnmmm) of the DSP or of the job that the DSP was working with at the time of the error. N/A appears in the message text when information is not available at the time of the error. The IOERR DSP has generated output and JES3 will print that output when error recovery is complete.

System action: Spool I/O error recovery continues.

Operator response: Submit the IOERR output to the system programmer for analysis.

Programmer response: Check the IOERR output to determine the reason for the spool I/O error.

IAT1140
Explanation:

JES3 SPOOL I/O ERROR ON DDNAME=ddn, CYL=cyl, TRK=trk, DSP=dspname (jobid)

N/A

JES3 attempted to access a record on a spool volume, but could not find the record. Possibly, the spool volume was

IAT1141
Explanation:

NO RECORD FOUND ON DDNAME=ddn, CYL=cyl, TRK=trk, REC=rec

JES3 attempted to access a record on a spool volume, but could not find the record. Possibly, the spool volume was
not formatted correctly or was not formatted at all. The cylinder, track, and record identify the physical location of the record.

This message is always preceded by message IAT1140.

In the message text:

*ddn* Indicates the ddname with which the spool data set is associated.

*cyt* The cylinder on which the record is located.

*trk* The track on which the record is located.

*rec* The record.

**System action:** Spool input/output (I/O) recovery continues.

**Operator response:** Record the ddname, cylinder, track, and record information and give this information to the system programmer.

**System programmer response:** If this message is issued for several records on the same spool volume, inspect the data on the track. If the records do not appear, this could indicate that the track has been erased. Drain the spool volume and reformat the extent.

By issuing the *INQUIRY,Q,BT command, determine if JES3 automatically added a BADTRACK statement. If a BADTRACK statement was not added, add one to the initialization deck on the next warm or cold start.

**Module:**

**Containing** IATDMER  
**Detecting** IATDMER  
**Issuing** IATDMER

**Routing Code:** 10

**Descriptor Code:** 7

---

**IAT1145**

**Explanation:**

An I/O error occurred while JES3 was trying to write to the indicated track address on the spool device. The BADTRACK *MODIFY command (*F Q,DD=ddn, CYL=cyl, TRK=trk) was entered.

In the message text, *ddn* indicates the ddname with which the spool data set is associated.

**System action:** JES3 dynamically adds an entry to the BADTRACK checkpoint record that describes the identified track. JES3 will not allocate space on that track until the next warm or cold start is performed. This message is preceded by IAT1140, which provides more information about the write error.

**Operator response:** Record the ddname, cylinder and track information from the message and give this information to the system programmer.

**Programmer response:** Add a BADTRACK statement to the JES3 initialization stream before the next warm or cold start. If you do not update your initialization stream, you may lose jobs and data because of intermittent spool I/O errors. If you want to know more about the error, enter the *INQUIRY,Q,BT operator command.

**Module:**

**Containing** IATDMTK  
**Detecting** IATDMER  
**Issuing** IATDMTK

**Routing Code:** 10

**Descriptor Code:** 7
IAT1146

Explanation:

![BADTRACK ENTRY LOST:](rc)

- **DDNAME** = *ddn*, **CYL** = *cyl*, **TRK** = *trk*

An error occurred while JES3 was trying to checkpoint the JES3 BADTRACK table. READ indicates that JES3 was unable to read the BADTRACK checkpoint record. WRITE indicates that JES3 successfully read and updated the record but could not write the updated record back to the spool.

This message is always preceded by message IAT1140.

In the message text:

- **rc**  The return code from the IATXCKPT macro.
- **ddn**  Indicates the ddname with which the spool data set is associated.
- **cyl**  The cylinder on which the record is located.
- **trk**  The track on which the record is located.

**System action:** For a WRITE error, JES3 updates the resident BADTRACK table to describe the indicated spool track. However, the BADTRACK table on the spool does not reflect the bad spool track.

For a READ error, JES3 continues processing.

**Operator response:** Inform your system programmer and provide the return code, ddname, and physical address of the track.

**Programmer response:** The return codes from the IATXCKPT TYPE=READ macro are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>The request could not be performed because another JES3 function is currently using the checkpoint capability.</td>
</tr>
<tr>
<td>8</td>
<td>The checkpoint record name is incorrect.</td>
</tr>
<tr>
<td>12</td>
<td>JES3 could not find the checkpoint record.</td>
</tr>
<tr>
<td>16</td>
<td>The record exists, but JES3 could not read it in because there is insufficient virtual storage.</td>
</tr>
<tr>
<td>20</td>
<td>JES3 could not read the record because it contained a bad segment.</td>
</tr>
<tr>
<td>24</td>
<td>JES3 could not read the record because a permanent I/O error occurred.</td>
</tr>
<tr>
<td>28</td>
<td>JES3 read in a down-level copy of the requested checkpoint record. A current copy exists but it is incorrect or an I/O error occurred while trying to read it.</td>
</tr>
</tbody>
</table>

The return codes from the IATXCKPT TYPE=WRITE macro are:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>The request could not be performed because another JES3 function is currently using the checkpoint function.</td>
</tr>
<tr>
<td>8</td>
<td>The checkpoint record name is incorrect.</td>
</tr>
<tr>
<td>12</td>
<td>JES3 could not write the record because of insufficient space in the data set. A previous level of the record does not exist in the data set.</td>
</tr>
<tr>
<td>16</td>
<td>JES3 could not write the record because of insufficient space in the data set. A previous level of the record exist in the data set but was not altered.</td>
</tr>
<tr>
<td>20</td>
<td>JES3 could not write the record because of insufficient space in the data set. A previous level of the record was destroyed in the process.</td>
</tr>
</tbody>
</table>
JES3 was unable to write the record because of a permanent I/O error. JES3 was unable to write the record because of an error that occurred in updating the track maps in the checkpoint data set.

The return codes provide an explanation of what happened. In order to avoid any problems as a result of the mismatch of BADTRACK tables, you should add a BADTRACK statement to the JES3 initialization stream and perform a warm start as soon as possible.

</tr>
</tbody>
</table>

Routing Code: 2,11
Descriptor Code: 7
IAT1611
Explanation:

A USAM request could not be completed because the JES3 SSVT was incorrect or could not be found.

System action: IATDMEBS, IATDMEB2 or IATDMEB3 ends the request with a system completion code of X'1FB'.

Operator response: Notify the system programmer.

Programmer response: See z/OS MVS System Codes for an explanation of the X'1FB' system completion code.

Module:

IAT1612
Explanation:

JES3 received a request to allocate a SYSOUT class that is not alphabetic (A-Z) or numeric (0-9). The requested class is displayed in hexadecimal within the message.

System action: The job ends with a system completion code of X'1FB'. The system dumps.

Operator response: Notify the system programmer.

System programmer response: Examine the IEFISSOB and IEFSSAL data areas in the dump to determine the source of the incorrect SYSOUT class. See z/OS MVS System Codes for an explanation of the X'1FB' system completion code.

Module:

IAT1613
Explanation:

The number of lines that the job has written to the system message data set either explicitly (through the use of the WTO macro with routing code 11) or implicitly (through system action) has exceeded the SYSLINES limit specified on the STANDARDS initialization statement.

In the message text:

jobname The job name.
jobid The job identifier.
n,nnn,nnn

Specifies the current number of lines written to the system message data set. If “>10M” is displayed, the number is larger than 9,999,999.

**System action:** JES3 processing continues. This message will be repeated when the number of lines written to the system message data set exceeds a certain percentage of the original number of lines. This percentage is defined on the SYSLINES parameter of the STANDARDS statement.

**Operator response:** If the message appears infrequently for a job, this may be a normal condition (for example, a long running started task that issues messages at a reasonable pace).

If the message appears frequently, the job or started task might be producing system messages in a loop. A loop can lead to loss of available spool space and/or staging areas if left uncorrected for an extended period of time.

Determine whether the job indicated in the message should be canceled.

**System programmer response:** If the message appears frequently for a normal condition, examine the SYSLINES parameter on the STANDARDS initialization statement. It may be necessary to increase the limit and/or percentage interval during the next warm start, cold start, or hot start with refresh.

IAT2003

Explanation:

MPAINIT=nnn— DI=nnn— AI=nnn— PI=nnn— UI=nnn— GRP=group— main

Initiator availability changes dynamically as initiators are started and ended. This message provides the current status. MPAINIT is the total count of initiators allocated to main. Of these, DI is the current number of dedicated initiators; AI is the current number of initiators started; PI is the current number of pending initiators; and UI is the current number of initiators with jobs in execution.

System action: Processing continues.

Operator response: None. This is an informational message.

IAT2004

Explanation:

GMS ERROR—text—RECOVERABLE—text—NON RECOVERABLE—text—JOB CANCELED

A significant error has been detected by GMS validity checking routines. Possible message texts and explanations are:

INVALID S.A. ID
the staging area ID field is incorrect

INVALID JSQ ID
the job select queue ID field is incorrect

INVALID JSQ POST
the bit configuration of JSQ post is incorrect

JOBSEL GROUP=group NOT FOUND
a normal job selection contains an incorrect name

GROUP HAS NO EXRESC
no execution resource entry exists for group

COUNTER LT ZERO
GMS attempted to decrement a counter below zero

MPC NOT IN MLBCB
the MLBCB has no entry for the specified main

BAD MAIN FCT CHAIN
the main FCT chain has been incorrectly modified by GMS
EOJ NOT ON MPRQONMN
  an EOJ JSQ was received for a job not on the MPRQONMN chain

INVALID RGQRPSEQ
  the group sequence number in the RESQ entry is incorrect

JOB jobname (jobid) - RAB DESTROY
  an error return code was received from RAB DESTROY

JOB jobname (jobid) - RAB CREATE
  an error return code was received from RAB CREATE

EXREC HAS NO GROUP
  the execution resource entry has no group

INVALID LSTOR MOD
  GMS attempted to decrement the allocated LSTOR below zero

JOB jobname (jobid) - JMR READ
  an error return was taken on a JESREAD macro while JES3 was reading a JMR

JOB jobname (jobid) - JDAB READ
  an error return was taken on a JESREAD macro while JES3 was reading a JDAB

JOB jobname (jobid) - JESMSG ERR
  an error return called was received from the JESMSGGLG macro.

JOB jobname (jobid) - NO FSS TAB
  the specified job has just ended. The job is marked as a functional subsystem (FSS) job (the demand-select job
  created to run an FSS address space), but there is no matching FSS table entry.

System action: If the error is described as RECOVERABLE, GMS has attempted to purge or reconfigure incorrect
  data areas and will attempt to continue normal operation. If the error is described as NON-RECOVERABLE, the error
  disrupts operations and cannot be corrected. JES3 job selection for the main is ended (GMS enters a permanent
  AWAIT). If the error is described as JOB CANCELED, JES3 cancels the job and allows GMS to continue job selection
  for this main.

Operator response: On an unrecoverable error, restart the JES3 system as soon as possible to allow scheduling of
  jobs to the specified main. If the job has been canceled, resubmit at a later time.

Problem determination: See Table III, items 2 and 12.

IAT2006

Explanation:

PREMATURE JOB TERM - JOB—jobname (jobid) — main — RESTARTED — CANCELED — HELD — PRINTED

During connect processing for the specified main, one of the following occurred:

- An IPL was performed on the specified main and the specified job is a demand-select job for that main.
- A RESQUEUE entry with the status of ON MAIN was found for the specified job, but the job was not shown in
  the restart connect record. This is normal processing for jobs that were active on a main when the main was
  undergoing an IPL.
IAT2007 • IAT2008

• The specified job was selected by an initiator. The initiator ended, possibly in the job-select-subsystem-interface routine.

System action: The job is processed using its specified JES3 failure option as indicated by the STANDARDS initialization statement and FAILURE= keyword.

Operator response: None. This is an informational message.

IAT2008

Explanation:

▶▶START CMD FAILURE - MAX INITS—nnn— main— ▶▶

A START command failed on the specified main. JES3 was notified of this using the subsystem interface by message IEA890I. Possible reasons for the failure are insufficient storage defined to MVS or insufficient paging space. It is possible that one or more groups may lose initiators because of the command failure. It is necessary to reconnect or to repeat the IPL of the main to reuse these initiators.

System action: The maximum number of initiators JES3 will start on the main is set to nnn.

Operator response: Determine or modify the maximum initiator value with an *INQUIRY,G,main,S,MAXI or *MODIFY,G,main,S,MAXI,nnn command. These commands are not valid until the maximum initiator value has been set. See z/OS JES3 Commands for more information. Reconnect the main by issuing an *S,main,connect command to validate GMS counters.

Module:
IAT2009

Explanation:

The specified job was selected by an initiator whose address space has ended.

System action: The job is canceled.

Operator response: Notify the system programmer.

Programmer response: Resubmit the job.

Module:

IAT2010

Explanation:

The JES3 WLM subtask has unexpectedly terminated.

System action: JES3 continues processing but without the WLM subtask. The WLM subtask provides information to WLM so that it can adjust the number of WLM initiators selecting work for a service class. Without the WLM subtask, this information is no longer provided to WLM. As a result, the system may show service classes with too many initiators being started, other service classes with no initiators being started, or not enough initiators being started.

Operator response: Contact the system programmer.

Programmer response: Examine the dump that was taken. Try to determine the cause of the subtask failure. Contact the IBM Support Center. If the message was issued on a local processor, the WLM subtask function can be reactivated by performing a JES3 local start.

If the message was issued on the global processor, the WLM subtask function can be reactivated by performing a JES3 hot start.

Module:
IAT2011 • IAT2013

IAT2011
Explanation:

WLM RECLASSIFICATION IS IN PROGRESS

JES3 detected a new WLM service definition that has been installed and a new WLM policy that has been activated. Since the WLM classification rules and service classes may have changed, JES3 must reclassify all jobs that have completed C/I processing but have not as yet completed main service. While JES3 is reclassifying jobs, job selection is suspended. That is, no additional jobs will be selected for execution until reclassification has completed. Message IAT2016 is issued when reclassification is complete.

System action: Job selection is suspended until the jobs are reclassified.
Operator response: None
Module:

Containing Detecting Issuing

IAT2012
Explanation:

REGISTRATION SUCCESSFUL FOR SRVCLASS=srvclass - main

JES3 successfully registered or deregistered a service class with WLM.

System action: Processing continues.
Operator response: None. This is an information message.
Module:

Containing Detecting Issuing
IATWLSRV IATWLSRV IATWLSRV

Routing Code: 
Descriptor Code: 

IAT2013
Explanation:

WLM REGISTRATION FAILED FOR SRVCLASS=srvclass, RETURN CODE=retcode, REASON CODE=rsncode

An error occurred while JES3 was attempting to register a service class using the IWMBREG macro, or deregister a service class using the IWMDREG macro. The return and reason codes from the IWMBREG or IWMDREG macros are displayed in the message.

System action: If the error occurred while attempting to register a service class, no WLM-managed initiators are started for that service class on the system where the error occurred. If the error occurred while attempting to
deregister a service class, system operations are still sound, but take note of the error and diagnose the reason for the error.

**Operator response:** Contact system programmer.

**Programmer response:** Contact the IBM Support Center.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATWLSRV</td>
<td>IATWLSRV</td>
<td>IATWLSRV</td>
</tr>
</tbody>

**Routing Code:** 42

**Descriptor Code:**

```
IAT2014
```

**Explanation:**

```
>>>WLM POLICY QUERY REQUEST FAILED, RETURN CODE = -retcode, REASON CODE = -rsncode
```

An error occurred while JES3 was attempting to extract the active WLM policy information using the IWMPQRY macro. The return and reason codes from IWMCLSFY macro are displayed in the message.

**System action:** If the error occurred during JES3 initialization, message IAT3115 is issued to indicate that WLM initialization failed.

If the error occurred on the global processor after JES3 initialization has completed, then JES3 is reacting to a WLM policy change. If a new WLM service definition was installed and is active, the WLM classification rules may have changed and JES3 needs to reclassify all jobs. Because JES3 was unable to extract the active WLM policy information, reclassification has not take place. If the installation is using WLM-managed job class groups, then no new WLM-managed initiators are started. Jobs may or may not be selected for execution depending on whether there are already WLM initiators started.

If the error occurred on a JES3 local processor, then no new WLM-managed initiators will be started on that system. Jobs may or may not be selected for execution on that system depending on whether there are already WLM initiators started.

**Operator response:** Contact the system programmer.

**Programmer response:** Use the return codes and reason codes from the IWMPQRY macro, which is described in z/OS MVS Programming: Workload Management Services, to determine the cause of the failure.

</thead>
<tbody>
<tr>
<td>IATMSR2</td>
<td>IATMSR2</td>
<td>IATMSR2</td>
</tr>
</tbody>
</table>
When processing job termination, the JES3 global found the job `jobname` ARM-registered. Normally, the job is deregistered with ARM (Automatic Restart Manager) in the execution address space during job termination. Then a job termination request is sent to the JES3 global. Either the system where the job was executing failed or the job was canceled using an `*F J=nn,C,ARMR` command which caused the deregistration to be bypassed on the execution address space.

**System action:** The job is deregistered with ARM and JES3 continues its processing.

**Operator response:** None. This is an informational message.

**System programmer response:** None.

---

An error occurred while JES3 was attempting to access the JCT or JMR to classify a job (to assign a service class and optionally a report class). The control block was in use by some other DSP in JES3.

**System action:** The job is not classified. If the job is in a JES managed group, it will be classified when it begins execution. If the job is in a WLM managed group, the job may not be selected for execution or it may be selected when it shouldn’t, based on the new service class. You can later try to issue `*MODIFY,J=jobno,SERVCLASS=srvclass` to change the service class directly or modify the job’s class or priority to force the job’s reclassification. Or you can wait for some other event that causes the job to be classified, for example a new WLM service definition is installed and activated.

**Operator response:** Contact the system programmer.

**System programmer response:** Issue an `*INQUIRY J=jobno` command to determine what DSP is currently active for the job and take the appropriate action for the DSP.

---

Chapter 4. Main Service Messages
IAT2061
Explanation:

A processor (system) in the JESplex is still running. For certain JES3 functions, further processing of the requested JES3 function requires that the processor be disabled, in which case this message is highlighted until you either disable the system shown or cancel the function by replying CANCEL to message IAT2064. For other JES3 functions, this message is informational and requires you to confirm the state of the JES3 complex with respect to the specific environment of the JES3 function that caused this condition to be detected.

It is possible that more than one processor will be affected in this manner. If this is the case, a separate IAT2061 message is issued for each processor.

In the message text:

**system** The name of the system that was found to be active.

**group** The name of the JESXCF group in which the processor is active.

**System action:** If the message is highlighted, JES3 also issues message IAT2064 and waits for you to respond.

**Operator response:** If the message is highlighted, disable the processor in question by resetting it and replying to the resulting XCF messages, or by using the MVS command VARY XCF,system,OFF and replying to the resulting XCF messages. If you do this, no further reply to message IAT2064 is required. If you prefer that the requested JES3 function not continue, reply CANCEL to message IAT2064.

If the message is not highlighted, see other messages issued by the particular JES3 function informing you of your options.

If the group name shown is incorrect or "<NAVAIL>" , notify the system programmer.

**System programmer response:** If the group name is incorrect, this is an indication that the JES3 procedure is pointing to the wrong checkpoint data set. A particularly dangerous example of this is that JES3 procedures on processors residing in different JES3 complexes could be using a common checkpoint data set. This is an incorrect configuration which, if left undetected, would have caused data integrity problems possibly requiring a cold start to recover.

If this message (with an incorrect group name) is highlighted, reply CANCEL to message IAT2064, otherwise cancel the JES3 function in question using its prescribed method. Identify the erroneous procedure, and correct it.

If the group name is "<NAVAIL>" , then message IAT2063 will also be issued. See message IAT2063 for instructions on how to proceed in this case.

**Module:**

Detecting
IATMSSTA

Issuing
IATMSSTA

Routing Code: 1
Descriptor Code: 4, 7

IAT2062
Explanation:

The JES3 address space on a processor (system) in the JES3 complex is still running. For certain JES3 functions, further processing of the requested JES3 function requires that the JES3 address space be brought down, in which case this message is highlighted until you either end JES3 on the system shown or reply CANCEL to message IAT2065. For other JES3 functions, this message is informational and requires you to confirm the state of the JES3 complex with respect to the specific environment of the JES3 function that caused this condition to be detected.

It is possible that more than one processor will be affected in this manner. If this is the case, a separate IAT2062 message is issued for each processor.
In the message text:

**system** The name of the system that was found to be active.

**group** The name of the JESXCF group in which the processor is active (as determined by the OPTIONS,XCFGRPNM= parameter on the most recent warm or cold start).

**System action:** IF the message is highlighted, JES3 also issues message IAT2065.

**Operator response:** If the message is highlighted, bring the JES3 address space on the processor in question down by issuing the *RETURN command. If you prefer, you can disable the processor completely as described in the operator response for message IAT2061. If you perform either of these actions, no further reply to message IAT2065 is required. If you prefer that the requested JES3 function not continue, reply CANCEL to message IAT2065.

If the message is not highlighted, see other messages issued by the particular JES3 function informing you of your options.

If the group name shown is incorrect or "<NAVAIL>", notify the system programmer.

**System programmer response:** If the group name is incorrect, this is an indication that the JES3 or IATUTJCT procedure is pointing to the wrong checkpoint data set. A particularly dangerous example of this is that JES3 or IATUTJCT procedures on processors residing in different JES3 complexes could be using a common checkpoint data set. This is an incorrect configuration which, if left undetected, would have caused data integrity problems possibly requiring a cold start to recover.

If this message (with an incorrect group name) is highlighted, reply CANCEL to message IAT2065, otherwise cancel the JES3 function in question using its prescribed method. Identify the erroneous procedure, and correct it.

If the group name is "<NAVAIL>", then message IAT2063 will also be issued. See message IAT2063 for instructions on how to proceed in this case.

### IAT2063

**Explanation:**

```
<<<<main----------UNABLE TO DETERMINE THE STATUS OF—JESXCF GROUP—group — rsn<<<<
```

A JES3 function needs to inquire on the system status of all members in the JESXCF group or requires one or more of these members to be disabled or to have the JES3 address space brought down in order to ensure system data integrity. However, an error occurred when the service that is responsible for performing this task attempted to do so. The nature of the error is described in the reason text.

In the message text:

**main** The processor name on which the failure occurred.

**group** The name of the group for which the failure occurred.

**rsn** The reason text identifying the cause of the failure.

**STORAGE OBTAIN RC=storretn**

An error occurred when attempting to obtain working storage. The return code from the STORAGE macro (storretn) is shown as part of this error text.

**IXZXIXIF RC=ixifresn**

An error occurred when attempting to issue the IXZXIXIF service. The return code (IXIFRETN) and reason code (IXIFRSEN) from the IXZXIXIF macro are shown as part of this error text. (The below text was originally NOT PRESENT IN PREVIOUS JES3 RELEASE. The new text is more general and the reason for the change can be found in the description of the text.)
NOT PRESENT IN COMPLEX STATUS RECORD

The JESXCF group name is not present in the Complex Status Record. This will happen if you have just migrated to z/OS 1.4.0 JES3 and you did not have required migration maintenance on the previous JES3 release. Normally, you will get this text only if you are trying to do a warm or cold start at the same time that you are migrating, or if you have IPLed this processor with z/OS 1.4.0 JES3 but have not yet started JES3, and you are attempting to run IATUTJCT.

This text will also appear when JES3 is started after a previous warm or cold start that failed, or was interrupted, before a valid complex status record could be written.

This text can also appear if JES3 was started with an incorrect checkpoint data set, which could contain either an incorrect group name or no group name. If the group name shown is incorrect, or contains the text "<NAVAIL>" and there was no previous failed or interrupted warm or cold start, notify the system programmer.

System action: If the function that called the system status service requiring one or more processors to be brought down has a contingency procedure that lets you manually confirm the status of processors in the complex and continue, you can use that procedure. Otherwise, the function is automatically canceled.

Operator response: If there is a contingency procedure to manually confirm the status of processors in the complex, follow it. Otherwise, notify the system programmer.

System programmer response: If the group name is incorrect or the text "<NAVAIL>" , confirm that required migration maintenance is installed and that the JES3 procedure points to the correct checkpoint data set.

If the cause of the error cannot be determined from the reason text, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Routing Code:** Note 18

**Descriptor Code:** 7
An attempt to connect the global JES3 to a local JES3 has failed for one of the following reasons:

**WRONG INISHID**
The spooled records used for local initialization were not from the last warm or cold start performed on the global.

**WRONG SYSTEM NAME**
The JES3 system name does not match the MVS system name (in other words, the name of the processor on the MAINPROC statement is not the same system name specified by SYSNAME= in the IEASYSxx parmlib member).

**WRONG SPOOLID**
The status of the spool data set has changed.

**JSS NOT STARTED**
An *START,main,CONNECT command has been issued before starting JSS. The connect processing cannot be done until JSS is started. This is a warning message only.

**JES3 INCOMPATIBLE**
The service and release level of the local JES3 system is incompatible with level of the global JES3 system.

**SMS NOT ON GLOBAL**
A local processor with SMS active is attempting to connect to the global processor, which does not have SMS active.

**JOB NUMBERS INCOMPATIBLE**
The OPTIONS statement has defined a maximum job number greater than 65534, but the connecting system is not at a high enough JES3 release to support the global's job number range.

**System action:** The connection is ended.

**Operator response:** Respond to the specific message as indicated:

**WRONG INISHID**
Restart JES3 on the local.

**WRONG SYSTEM NAME**
After the main name and/or system name has been corrected, re-IPL the local processor.

**WRONG SPOOLID**
Restart JES3 on the local.

**JSS NOT STARTED**
If the main is online, connect processing will start when the *START,JSS command is issued.

**JES3 INCOMPATIBLE**
Verify that the level of JES3 on the local is one that is capable of coexisting with the level on the global.

**SMS NOT ON GLOBAL**
Re-IPL the local processor without SMS active or re-IPL the global with SMS active for the specified main.

**JOB NUMBERS INCOMPATIBLE**
Notify the system programmer.

**System programmer response:** For **WRONG SYSTEM NAME**, check whether the initialization MAINPROC
IAT2641

statement correctly specifies the main name. Also check whether the IEASYSxx parmlib member correctly specifies the system name.

For SMS NOT ON GLOBAL, correct the appropriate SYS1.PARMLIB members so that the local processor can be brought up without SMS active or the global processor can be brought up with SMS active.

For JOB NUMBERS INCOMPATIBLE, either bring up the local at a JES3 release that supports job numbers greater than 65534, or reduce the maximum job number on the OPTIONS statement and perform a warm start or hot start with refresh on the global. If you reduce the range, keep in mind that jobs in the range of deleted numbers will be removed from the JES3 queue, and that, if any jobs in this range are active, you must wait for them to end, cancel them, or IPL the system on which they are active. You can preserve jobs that are to be deleted by calling the Dump Job (DJ) DSP and dumping jobs using the RANGE parameter, before reducing the job number range. You can reload dumped jobs on a JES3 system that has a smaller job number range defined, in which case, reloaded jobs will be reassigned job numbers in the defined range.

During connect processing with the specified main, JES3 has waited a specified time for the completion of one of the following actions:

**VERIFIES**
Initial verifies (by IATMDDR and IATLVVR) for the specified main have not been completed.

**GMS**
Generalized main scheduling (IATMSMC) has not completed processing of the restart records for the specified main.

**WTDDRVR**
JCT Scan (IATGRWM) for the specified main has not completed.

**LOCATE**
Locate Restart (IATLVIN) for the specified main has not completed.

**System action:** JES3 waits for the completion of the specific function.

**Operator response:** If the wait seems abnormal for the current workload, issue the *START,main,CONNECT command to restart the connect sequence. Notify the system programmer.

**Programmer response:** Determine why the indicated action has not completed.

**Problem determination:** See Table III, items 1 and 2.
IAT2642  •  IAT2644

Descriptor Code: 7

IAT2642
Explanation:

FSS TABLE NOT FOUND FOR FSS JOB—jobname (jobid)— ON PROCESSOR—main— FSS STATUS REMOVED

The specified job is active on a connecting main. The job is marked as a functional subsystem (FSS) job (the demand select job created to run an FSS address space), but there is no matching FSS entry.

System action: JES3 clears the fields in the RESQUEUE entry that identify the job as an FSS job and allows the job to continue in execution.

Operator response: Cancel the job as soon as possible.

Module:

Chapter 5. SNA RJP Messages

IAT2801
Explanation:

SNARJP IS ACTIVE

This message, issued in response to a *CALL,SNARJP command, indicates that the JES3/VTAM interface is active and JES3 will accept logons of logical units from SNA RJP workstations.

System action: The SNARJP DSP automatically logs on to the logical units for which AUTO=Y is specified in the RJPWS initialization statement. At this time any manual logons of logical units from workstations will also be processed.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATSNL  IATSNLD  IATSNLD

Routing Code: 8
Descriptor Code: 7

IAT2802
Explanation:

WS=wsname  LOGON REJECT -- DEACTIVATION IN PROGRESS

A logon from workstation wsname has been rejected because a workstation cancel (either internally generated or with operator command) is in progress.

System action: Processing continues.

Operator response: When the cancel is completed, logons will be allowed.

Module:

Containing  Detecting  Issuing
IATSNL  IATSNLB  IATSNLB

Routing Code: 8
Descriptor Code: 7

IAT2803
Explanation:

SNARJP IS INACTIVE

The SNARJP DSP is not active. Logons cannot be accepted by JES3 because the *CANCEL,SNARJP command has been issued, or the SNARJP DSP is ended.

System action: All SNA RJP modules are deleted and control returns to JES3 job segment scheduler (JSS) routine. The SNARJP DSP is ended.
IAT2804 • IAT2806

Operator response: Issue a *CALL,SNARJP command to activate the SNARJP DSP. See previous messages when an abend occurs.

Module:

<table>

>>LOGON FROM—WS—wsname—REJECTED DUE TO LACK OF CONSOLE SUPPORT

A remote workstation has been defined but a CONSOLE statement for the remote workstation has not been defined in the initialization stream.

System action: The workstation is marked inactive.

Operator response: Contact your system programmer.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATSNLB</td>
<td>IATSNLB</td>
<td>IATSNLB</td>
</tr>
</tbody>
</table>

Routing Code: –
Descriptor Code: 10

IAT2814

Explanation:

>>LOGON FROM—WS—wsname—REJECTED, SESSION LIMIT REACHED

A logon from workstation wsname has been rejected because the maximum number of logons allowed has been reached. This number is specified at initialization time in the LU=parameter of the COMMDEFN initialization statement.

System action: The logon is rejected.

Operator response: None for the system operator. The workstation operator should attempt to log on later.
IAT2815

Explanation:

>WS=wsname—IS NOT DEFINED TO JES3

A logon has occurred or a command has been entered for a workstation that is not defined by the N= parameter on a RJPWS initialization statement.

System action: The logon is not accepted or the command is ignored.

Operator response: Verify that the workstation name is defined. If the workstation is defined, attempt the logon again or reissue the command. If the workstation is not defined, define it.

IAT2816

Explanation:

>WS=wsname—INACTIVE—n—PASSWORD ERRORS

Workstation wsname has become inactive because the maximum number of attempts allowed to log on with the password incorrectly specified has been reached. This number is represented by n and is specified in the PL=parameter of the RJPWS initialization statement.

System action: No logons from this workstation are allowed.

Operator response: An attempt may be under way to break password security. Notify the system programmer or system security personnel. When this problem is solved and the workstation is to be used, issue the *START,SNARJP,T=wsname command to activate the workstation. Then the workstation operator should log on using the valid password.
An attempt to log on to workstation *wsname* has been rejected because the logical unit name specified during logon did not match any of the logical unit names specified on the RJPWS initialization statement.

**System action:** The logon is rejected.

**Operator response:** Notify the system programmer.

**Programmer response:** Verify that the logical unit name specified for this workstation to VTAM matches the logical unit name defined to JES3 in the LU=parameter of the RJPWS initialization statement.

**Module:**

<table>
<thead>

Descriptor Code:

IAT2845
Explanation:

getSession Term Entered, Workstation=wsname, LU=luname, Reason Code=rc

VTAM scheduled the SNA LOSTERM exit routine for workstation wsname. For information about the reason code rc, see VTAM Programming. Some of the more common reason codes are listed below.

Reason Code
Reason
X'0C'  Network operation deactivated LU
X'14'  Unconditional logoff
X'20'  Conditional logoff
X'24'  Buffer limit exceeded

System action: For the indicated reason code the following occurs:

Reason Code
System Action
X'0C' or X'14' The session is ended immediately.
X'20'  The session is ended when all I/O operations scheduled for this session have completed.
X'24'  The session is reset (using CLEAR and start data traffic) unless e the maximum buffer limit exceeded is reached. In that case, the session is ended.

Operator response: None. This is an informational message.

Module:

Routing Code: 10

Descriptor Code: 7
IAT2846

Explanation:

SESSION CANCELLED/RESTARTED.

This informational message indicates that JES3 either started or canceled the session with the specified logical unit (LU) at the specified workstation (wsname). xxxx identifies the module and the point within the module where the call was made to module IATSNDE or module IATSNLO.

System action: The system cancels or restarts the session.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>

IAT2847

Explanation:

ATTEMPT TO LOGON—LU=—REJECTED,—LOGON COMMAND TOO LONG.

A SNARJP workstation attempted to log on using LU=luname. The logon command passed to SNARJP exceeded the maximum logon command buffer size.

System action: The LU is ended. JES3 and SNARJP continue processing.

Operator response:

- Local operator: This message is not displayed at the remote workstation (it is not logged on yet). This message can be used to determine why the remote operator can not log on.
- Remote operator: If possible re-enter the logon command correctly and reduce the size of the comment field. If the remote operator does not enter the logon command directly, investigate whether there is an error in the workstation software/hardware.

Module:

Routing Code: 10
Descriptor Code: 7

IAT2848

Explanation:

SNARJP ESTAE PROCESSING HAS DETECTED—AN INCORRECT WORK WORD,—SNARJP WILL BE ENDED.

The work word used by the SNARJP ESTAE exit was found to be incorrect. The work word is used to determine which retry routine should get control. Since the work word was incorrect, retry is impossible and the SNARJP DSP is posted to end.

System action: The SNARJP DSP and subtask are ended.

Operator response: Restart SNARJP by issuing a *X SNARJP command.
Problem determination: See table III, items 1 and 4.

Module:

<table>
<thead>
<tr>

</tr>
<tr>
<td>5C</td>
<td>VTAM inactive</td>
<td>Initialize VTAM</td>
</tr>
</tbody>
</table>

Module:
While JES3 was using the specified Virtual Telecommunications Access Method (VTAM) function, an error occurred for the logical unit (LU) specified by `luname`. Generally, this message will be issued only for failure conditions. In the message text, the VTAM function, specified by `xxxxxx`, is one of the following:

**Function**

- **CLOSE**: Close access method control block (ACB)
- **CLSDST**: Close destination
- **OPEN**: Open ACB
- **OPNDST**: Open destination
- **SETLOGON**: Set logon processing
- **SIMLOGON**: Simulated logon (AUTO=Y)
- **SEND**: Send data
- **INQUIRE**: Session inquiry
- **RECEIVE**: Receive data
- **RESETSR**: Session direction reset

**Note:** If UNKWN is indicated on the WS= parameter, then the workstation name is unknown.

**System action:** The system ends the specified LU immediately. If no logical unit is specified in the message text, the error may cause SNARJP to end.

**Operator response:** Notify the system programmer.

**System programmer response:** See *VTAM Programming* for information about the RC, RTCD, FDBK2, and SENSE CODE.
IAT2853 • IAT2855

Routing Code: 10
Descriptor Code: 7

IAT2853

Explanation:

>>>INVALID EXPEDITED REQUEST—WS=wsname—LU=luname

An expedited request other than request shut down (RQSHUTD) or SIGNAL was sent from workstation wsname for logical unit luname.

System action: Workstation wsname is immediately ended.

Operator response: The workstation operator must log on at his workstation.

Module:

<table>
<thead>
<tr>
<th>Containing</th>

</table>

Routing Code: 10
Descriptor Code: 7

IAT2855

Explanation:

>>>JES3/VTAM OPEN ACB FAILURE,—SPECIFY—"RETRY"—TO ATTEMPT OPEN AGAIN OR—"TERM"

SNA/RJP did not initialize because the JES3/VTAM interface was not established.

System action: SNA/RJP waits until a valid response, either “TERM” or “RETRY”, is entered.

Operator response: First, determine if VTAM has initialized by entering this command:

DISPLAY A LIST

78 z/OS V2R1.0 JES3 Messages
If VTAM has initialized, enter “TERM” and contact your system programmer.
If VTAM has not initialized, wait until VTAM has initialized and then enter “RETRY”.

System programmer response: Message IAT2851 is issued after “TERM” is entered. Use this message to determine the cause of the failure.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATSNLS</td>

This message, issued in response to a *START,SNARJP,T=wsname, TRACEON command indicates that the SNA RJP trace facility has been started.

System action: Processing continues.
Operator response: None. This is an informational message.

Module:

Routing Code: 8,Note 18
Descriptor Code: 7

-------------------------------------------------------------

IAT2886
Explanation:

>>>DISCONNECT FORCED-REASON=xx WS=wsname LU=luname <<<

An *CANCEL SNARJP,T=WSNAME,I command to immediately end all JES3 activity was entered, but the normal end hung.
In the message text, reason xx is one of the following:

Reason Explanation
01 The Virtual Telecommunications Access Method (VTAM) CLSDST request issued by JES3 did not complete
02 A synchronization problem occurred in JES3 close down processing.

System action: JES3 forces the session to end before completing SNARJP processing. Once the workstation is gone, the LU should be able to log on to JES3 again.
Operator response: Notify the system programmer.

System programmer response: If the reason for the forced disconnection is because the VTAM CLSDST did not complete, the session may still be in VTAM. If so, have the operator enter an V NET,TERM,SLU=luname command to clear the session; then the remote operator might log on again.

If the reason for the forced disconnection is due to JES3 close down synchronization problem and this problem repeatedly occurs for the workstation, run the workstation with the SNARJP trace active for the workstation. When the problem occurs again, save the system log and SNARJP trace output for the workstation. Also, invoke the dump core facility and have the operator enter an *S DC,OPTION=WSB command to dump the SNARJP workstation blocks. The disconnected workstation may still be in the DC output with an indication that it is 'pending free' processing. Once this output is collected, contact the IBM Support Center.

Module:
Routing Code: 8
Descriptor Code: 7
Chapter 6. Initialization Messages

IAT3000
Explanation:

The job step task, IATINTK, was not able to attach IATNUC or IATNUCF, the resident JES3 or functional subsystem (FSS) nucleus.

System action: JES3 or FSS initialization ends.

Operator response: Notify the system programmer.

Programmer response: Verify that module IATNUC or IATNUCF is present in one of the following:
- The STEPLIB concatenation defined in the procedure used to start the JES3 or CI FSS address space.
- The linklist specified in response to message IEA101A, SPECIFY SYSTEM PARAMETERS FOR RELEASE xxx.yy.zzz.

Problem determination: See Table I, items 2, 5a, 7c, 13, and 16; Table III, items 6 and 21.

Module:

<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINTK</td>
<td>IATINTK</td>
<td>IATINTK</td>
</tr>
</tbody>
</table>

Routing Code: 2,10
Descriptor Code: 4

IAT3001
Explanation:

JES3 read the complex status record (CSR) from the checkpoint data set to update the status of the processor on which JES3 was ending. In reading the CSR, JES3 detected that the initialization time stamp in the CSR on the spool did not match the time stamp in the resident CSR.

System action: JES3 continues to end processing; however, status information for this processor in the checkpointed CSR is either incorrect or absent. If this message is issued while you are performing a DSI, then the DSI ends.

Operator response: Perform a warm start and if that fails, notify the system programmer.

Programmer response: If the warm start failed, perform a cold start.

Problem determination: See Table III, items 4 and 6.

Module:

<table>
<thead>
<tr>

Descriptor Code: 4
IAT3002 • IAT3004

IAT3002
Explanation:

>>> ERROR ON FSS—START COMMAND FOR FSS—fssname,—ASID=—asid

JES3 issued a START command for a functional subsystem (FSS) address space. The command contained syntax errors. The FSS name fssname indicates the name of the requested FSS and the ASID asid indicates the requested address space ID.

System action: FSS initialization ends with a system completion code of 2FB and a dump is taken.

Operator response: Notify the system programmer.

Programmer response: Look at the ABEND dump generated by module IATINTK to determine what was wrong with the START command. Verify that the parameters on the START command are correct.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINTK</td>
<td>IATINTK</td>
<td>IATINTK</td>
</tr>
</tbody>
</table>

Routing Code: 2,10
Descriptor Code: 4

IAT3003
Explanation:

>>> INVALID FSS START FOR FSS—fssname,—ASID=—asid

An incorrect START command was issued for a functional subsystem (FSS) address space. The START command can only be issued internally by JES3. The START command cannot be issued from the operator console. The FSS fssname indicates the name of the requested FSS and the ASID asid indicates the requested address space ID.

System action: FSS initialization ends with a system completion code of 2FB and a dump is taken.

Operator response: Starting an FSS with an operator START command is not allowed and will always fail. If you did not issue a START command to bring up the FSS address space, then notify the system programmer.

Programmer response: Verify that the START was issued internally by JES3 as opposed to by a START command from the console. This can be checked by looking for the existence of a token in the command input buffer (CIB). There will be no token if a START command was issued by the operator.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

Routing Code: 2,10
Descriptor Code: 4

IAT3007

Explanation:

An error was encountered while processing a prefix specified on the SYN= or PLEXYN= keyword on the CONSTD initialization statement. The message text can be one of the following:

**PREFIX prefix IGNORED - CONTAINS ALL NUMERIC**
  - Prefix consists of all numeric characters.

**PREFIX prefix IGNORED - CONTAINS GREATER THAN EIGHT CHARACTERS**
  - Prefix consists of greater than eight characters.
PREFIX prefix IGNORED - CONTAINS INVALID CHARACTERS
Prefix consists of one or more characters that are not in the range of X’41’ to X’FE’

PREFIX prefix IGNORED AS A SYSPLEX PREFIX, ALREADY DEFINED WITH SYSTEM SCOPE
The same prefix was specified on both the SYN= and PLEXSYN= keywords of the CONSTD initialization statement. The PLEXSYN definition is ignored.

PREFIX prefix HAS BEEN ADDED AS A SYSPLEX SCOPED PREFIX
The prefix “*” was not specified on either the SYN= or PLEXSYN= keywords of the CONSTD initialization statement. JES3 adds “*” to its sysplex scoped prefix table.

NO ALLOWABLE SYSTEM Scoped PREFIX FOUND, DEFAULT PREFIX “8” WILL BE USED
All prefixes specified on the SYN= keyword on the CONSTD initialization statement were in error. The default SYSTEM scoped prefix, “8” will be used.

“*” IS NOT A SYSPLEX SCOPED PREFIX, USE IT AS A SYSTEM Scoped PREFIX
The prefix “*” was specified on the PLEXSYN= keyword of the CONSTD initialization statement however, JES3 was unable to register the “*” with the COMMAND PREFIX FACILITY (CPF) as a sysplex scoped prefix. The “*” prefix should be used as a JES3 system-scoped prefix.

DEFAULT SYSPLEX PREFIX “*” CANNOT BE DEFINED TO CPF, USE IT AS A SYSTEM PREFIX
The prefix “*” was specified on the PLEXSYN= keyword of the CONSTD initialization statement however, JES3 was unable to register the “*” with the COMMAND PREFIX FACILITY (CPF) as a sysplex scoped prefix. The “*” prefix should be used as a JES3 system-scoped prefix.

NO ALLOWABLE SYSPLEX SCOPED PREFIX FOUND, NO SYSPLEX SCOPED PREFIX IN EFFECT
JES3 was unable to successfully define any sysplex scoped prefixes to the COMMAND PREFIX FACILITY (CPF). Therefore, only the system scoped prefixes may be used to communicate with JES3.

PREFIX prefix IGNORED - ALREADY DEFINED FOR [SYSPLEX] [sysname]
JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received a return code indicating that another subsystem has this prefix in use. If SYSPLEX is specified, the conflicting prefix is already defined as a sysplex-scoped prefix. If sysname is specified, the conflicting prefix is already defined as a system-scoped prefix on the indicated system.

PREFIX prefix IGNORED - SUBSET OF PREFIX ALREADY DEFINED FOR [SYSPLEX] [sysname]
JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received a return code indicating that the prefix is a subset of a prefix that has already been defined to CPF. If SYSPLEX is specified, the conflicting prefix is already defined as a sysplex-scoped prefix. If sysname is specified, the conflicting prefix is already defined as a system-scoped prefix on the indicated system.

PREFIX prefix IGNORED - SUPERSET OF PREFIX ALREADY DEFINED FOR [SYSPLEX] [sysname]
JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received a return code indicating that the prefix is a superset of a prefix that has already been defined to CPF. If SYSPLEX is specified, the conflicting prefix is already defined as a sysplex-scoped prefix. If sysname is specified, the conflicting prefix is already defined as a system-scoped prefix on the indicated system.

PREFIX prefix IGNORED - CPF REQUEST=DEFINE ERROR ENCOUNTERED, RC=rc, RSN=rsn, FOR [SYSPLEX] [sysname] }
JES3 attempted to define the prefix to the COMMAND PREFIX FACILITY (CPF) and received the specified return and reason code. If SYSPLEX is specified, the error occurred attempting to define a sysplex-scoped prefix. If sysname is specified, the error occurred attempting to define a system-scoped prefix on the indicated system.

SYSTEM IS RUNNING IN AN XCF-LOCAL ENVIRONMENT, NO SYSPLEX SCOPED PREFIX IN EFFECT.
Due to an environmental error, JES3 could not define any prefix(es) specified on the PLEXSYN= parameter of the CONSTD initialization statement to the command prefix facility (CPF). Upon return, CPF indicated that the system is running in XCF-local mode. This could occur if you specified either PLEXCFG=MONOPLEX or PLEXCFG=XCFLOCAL in the IEASY$xx member of SYS1.PARMLIB. Therefore, only system-scoped prefixes can be used to communicate with JES3.

System action: Either the specified prefix has not been defined to the COMMAND PREFIX FACILITY (CPF) as a SYSTEM or SYSPLEX scoped prefix or, a default SYSTEM or SYSPLEX scoped prefix has been defined as specified. Initialization continues.

Operator response: The system programmer can use the D OPDATA,PREFIX command to see which prefixes are already in use in the sysplex. On the next JES3 warm or cold start, replace the prefix in error with a valid prefix.
If the error reason is “NO ALLOWABLE SYSPLEX SCOPED PREFIX FOUND, NO SYSPLEX SCOPED PREFIX IN EFFECT”, currently the system is running without a SYSPLEX scoped prefix defined to the COMMAND PREFIX FACILITY (CPF).

If the failure to define the sysplex scoped prefixes to CPF was due to another subsystem having already defined the prefixes with SYSPLEX scope, using these prefixes could result in the command being routed to another processor (i.e. if that subsystem registered its SYSPLEX scoped prefix on another processor). In this case, use the remaining SYSTEM scoped prefixes to communicate with JES3, or precede the command with another sysplex scoped prefix which directs the command to the appropriate processor (e.g. a prefix defined by the IEECMDPF sample program).

However, if the message was issued in a multiple global sysplex configuration, as a result of the SYN=(*,8) specification on the CONSTD statement, ignore the message. Use the asterisk character (*) only on the global system, or use the sysplex synonym defined via PLEXSYN keyword, or use the MVS ROUTE command to direct JES3 commands to the correct global.

See z/OS JES3 Initialization and Tuning Reference for information on defining prefixes. Some forms of this message are written to JES3OUT and an operator’s console. Others are written exclusively to JES3OUT.

Routing Code: 1, Note 17, Note 18

Descriptor Code: 4

**IAT3008**

Explanation:

>>> COLD, WARM, OR HOT/REFRESH START REQUIRED, - reason text

JES3 encountered an error during initialization processing of records within the checkpoint data set(s). reason text can be the following:

**ERROR READING DYNALLOC CKPT RECORD**

An error was encountered while reading the DYNALLOC record (S99) from the checkpoint data set(s), or the S99 record was not found.

**DYNALLOC CKPT RECORD NOT VALID**

The DYNALLOC record (S99) was successfully read but is not usable or contains incorrect status.

System action: JES3 issues message IAT3011 and restricts the current restart to cold, warm, or hot start with refresh.

Operator response: Notify the system programmer. Respond to message IAT3011. The only acceptable replies are C (cold start), W (warm start), HR (hot start with refresh), or CANCEL (to end JES3 initialization).

System programmer response: Obtain the information listed in Chapter 30, “Problem Determination,” on page 1135 and use the data to determine the error. See z/OS JES3 Initialization and Tuning Guide for more information on restarting JES3.

</tbody>
</table>

Routing Code: 2,10
Descriptor Code: 4

IAT3011
Explanation:

▶—SPECIFY JES3 START TYPE—(C, L, H, HA, HR, HAR, W, WA, WR, WAR, OR CANCEL)—▶

JES3 requests that the operator specify a start type before resuming initialization processing.

System action: JES3 initialization waits for an operator response.

Operator response: Enter one of the following:

C  cold start as the global
L  local start (note 2 below)
H  hot start as the global (note 2 below)
HA hot start as the global and perform spool control block validity analysis on all jobs in the queue (note 2 below)
HR hot start as the global, read the initialization stream, and process some of the initialization parameters (note 2 below)
HAR hot start as the global, read the initialization stream, and process some of the initialization parameters, and perform spool control block validity analysis on all jobs in the queue (note 2 below)
W  warm start as the global
WA warm start as the global and perform spool control block validity analysis on all jobs in the queue
WR warm start as the global processor and allow replacement of spool data sets
WAR warm start as the global processor, perform spool control block validity analysis for all jobs in the queue, and allow replacement of spool data sets
CANCEL immediately end JES3 initialization

Note:
1. A reply of W, WA, WR, WAR, or C also requires the IPL of all processors in the complex.
2. Valid on a processor that was global at the last JES3 start; the processor remains global.

System programmer response: None
IAT3012

Explanation:

**SELECT JES3 INISH ORIGIN—(N OR M=), AND OPTIONAL EXIT PARM—(,P=)—OR CANCEL—**

The operator replied HR, HAR, W, WA, WAR, WR, or C to message IAT3011. The location of the JES3 initialization statements must now be supplied. As distributed by IBM, the JES3 procedure specifies member JES3IN00 in SYS1.IATSAMP as the default source of initialization statements. Ignore the P= parameter unless directed to do otherwise by your system programmer.

**System action:** JES3 initialization waits for an operator response.

**Operator response:**

- **N**
  - no change. Use the data set member specified in the JES3 procedure.
- **M=nn**
  - use the member whose name is JES3INnn.
- **,P=xxxxxxxx**
  - use the 1-8 character sequence that is to be made available to installation exit 15 described in [z/OS JES3 Customization](#). Special characters may be included, but are not advised. Do not use an equal sign, a comma, or a blank in the string.
- **CANCEL**
  - end JES3 initialization immediately.

If your reply is incorrect, JES3 reissues the message.

IAT3013

Explanation:

**INVALID REPLY**

The reply to a preceding JES3 initialization or configuration services write to operator (WTOR) was incorrect or did not specify a valid option.

**System action:** JES3 reissues the original message and waits for an operator response.

**Operator response:** Select the desired response.

**Problem determination:** See Table III, items 6 and 21.

Routing Code: 2,10
Descriptor Code: 1,7

IAT3015
Explanation:

„„JES3IN BLKSIZE NOT MULTIPLE OF 80,—INIT TERMINATED„„

The data set represented by the DD statement JES3IN in the JES3 procedure is not in blocked 80-character card image format. Only 80-character multiple blocks are acceptable for use as JES3IN.

System action: JES3 initialization ends.

Operator response: Reinitialize JES3 and specify an alternate JES3 procedure if you did not change the JES3IN data set in the original procedure.

Programmer response: Recreate the data set that contains the JES3 initialization statements, specifying a block size that is an integer multiple of 80. Or correct the DD statement in the JES3 procedure to specify the proper data set.

Problem determination: See Table III, items 6, 20, and 21.

z/OS V2R1.0 JES3 Messages
IAT3016 • IAT3020

Routing Code: 2,10
Descriptor Code: 1,7

IAT3016
Explanation:

An attempt to dynamically deallocate the JES3IN data set has failed.

System action: JES3 initialization continues.
Operator response: None. This is an informational message.

Module:

Routing Code: 10
Descriptor Code: 4,7

IAT3020
Explanation:

JES3 was unable to load the MVS or JES3 module. If JES3 attempts to load the specified module while executing in a functional subsystem (FSS), the functional subsystem name fssname and address space id appear in the message. If the message does not identify the name and ASID of an FSS, the error occurred while attempting to load the specified module in a JES3 address space.
JES3 displays the abend code and return code when the LOAD macro is used to place the specified module in storage. The dump code is displayed when an ALOAD macro was used to place the module in storage.

System action: The action depends on the module being loaded and the module that requested the load. The following conditions cause JES3 or FSS initialization to end with a system completion code of 2FB:

- The module is needed for JES3 or FSS initialization.
- The module is needed during normal JES3 operation.

If the module is not critical to JES3 operation, or if the module name starts with IATUX, initialization continues, but message IAT3102 indicating, probable failure, is issued at the end of initialization.

Operator response: Notify the system programmer.

Programmer response: Verify that the module is present in one of the following:

- The STEPLIB concatenation defined in the JES3 or FSS procedure
- The linklist specified in response to message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zzz

If the module in error is required in LPA, you must make sure it is not in a STEPLIB or JOBLIB data set.

Problem determination: See Table I, items 2, 7d, and 13; Table III, items 4, 5, 6, 20, and 21.

Module:
IAT3021 • IAT3022

Routing Code: 2,10,Note 19
Descriptor Code: 1,2,3,4,7,10

IAT3021
Explanation:

>>>—JES3 ALREADY ACTIVE

JES3 has already been started as the primary subsystem. Only one JES3 subsystem can be active at a time.

System action: The last JES3 subsystem that was started ends.

Operator response: The active JES3 subsystem must be ended before a second START JES3 is issued.

Module:

Routing Code: 2,10
Descriptor Code: 4

IAT3022
Explanation:

>>>—MEMBER NAME ON JES3IN—DD IS ABSENT.—DEFAULT SET TO JES3IN00

The operator replied N or M=n to message IAT3012, but the DD statement JES3IN in the JES3 procedure does not specify a specific member of the data set to be used for JES3 initialization.

System action: The member name JES3IN00 has been internally set as the default. JES3 initialization continues with a member JES3IN00, if N was specified, or a member JES3INm, if M=m was specified.

Operator response: If another member is desired, reinitialize and select it by specifying M=m in response to message IAT3012.

Programmer response: Specify the desired default member name in the JES3 procedure.

Problem determination: See Table III, items 6 and 21.

Module:

Routing Code: 2
Descriptor Code: 4,7
IAT3023
Explanation:

--mem-- IS A NONSTANDARD MEMBER NAME-- FOR JES3 INIT DECK, --DEFAULTING TO JES3N--xx

The operator replied N or M=nn to message IAT3012, but the DD statement JES3IN in the JES3 procedure specifies a member whose name mem starts with characters other than JES3IN. The xx is set to 00 if the reply to message IAT3012 was not M=nn; if the reply was M=nn, then xx is set to nn.

System action: The member name JES3IN00 has been internally set as the default. JES3 initialization continues.

Programmer response: Change the JES3 procedure to specify a member whose name starts with JES3IN for the DD statement JES3IN.

Problem determination: See Table III, item 21.

Module:

<td>IATINGS</td>
<td>IATINGS</td>
</tr>
</tbody>
</table>

Routing Code: 2,10

Descriptor Code: 1,7

IAT3027

Explanation:

>>> IPL REQUIRED FOR WARM OR COLD START

In reply to message IAT3011, the operator selected a warm start or a cold start, but the IPL of the processor has not been repeated since JES3 was last initialized on this processor. An IPL is required to ensure that JES3 control blocks residing in the common service area (CSA) are rebuilt according to the current initialization statements. Conversely, when CSA is intact (no IPL) during a hot (or local) start, it is not necessary to perform the initialization routines that build those control blocks.

System action: JES3 reissues message IAT3011.

Operator response: If a warm start or a cold start must be performed, first repeat the IPL. Otherwise, perform a hot start or local start, as appropriate.

Problem determination: See Table III, item 6.

Module:
IAT3028 • IAT3029

**IAT3028**

**Explanation:**

UNABLE TO OBTAIN JES3IN DSNAME

JES3 was unable to extract the name of the data set specified on the JES3IN DD statement. As a result, *MODIFY,CONFIG commands will not work after JES3 has completed initialization.

**System action:** JES3 initialization continues.

**Operator response:** None. This is an informational message.

**IAT3029**

**Explanation:**

UNABLE TO ALLOCATE \textit{ddn dsn} UNIT= \textit{unitname}

A dynamic allocation attempted has not been successful.

In the message text:

\textit{ddn dsn} the ddname/dsname combination for which the dynamic allocation attempt was unsuccessful.

\textit{unitname} the unitname for which the dynamic allocation attempt was unsuccessful.

**System action:** JES3 issues message IAT3030 to detail the reason for the failure. The rest of the DYNALLOC statements in the initialization stream are checked for validity.

**Operator response:** None. This is an informational message.

**Programmer response:** Correct the conditions that caused the allocation to fail. You may have to change only the initialization statement, or you may have to make available a data set or unit that was previously not found. Other MVS messages may have been issued that will help to determine the cause of failure.

**Problem determination:** See Table III, items 5, 6, and 21.
IAT3030 • IAT3032

IAT3030
Explanation:

RETURN CODE IS—rc, REASON CODE IS—xxx

This message details the reason for the failure of the dynamic allocation specified in messages IAT3029, IAT3031, and IAT3053 one of which preceded this message. See z/OS MVS Programming: Authorized Assembler Services Guide for an explanation of the dynamic allocation return codes and the error reason codes in this message.

System action: JES3 initialization continues as specified for message IAT3029, IAT3031, or IAT3053 whichever preceded this message.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>

Routing Code: 2,10
Descriptor Code: 4,7

IAT3032
Explanation:

ILLEGAL DYNALLOC CARD

A DYNALLOC statement contains an incorrect keyword. The statement containing the error is duplicated on the operator’s console immediately preceding this message.

System action: The rest of the DYNALLOC statements in the initialization stream are checked for validity. JES3 initialization ends.

Programmer response: Correct the statement in error.

Problem determination: See Table III, items 5 and 6.
IAT3033
Explanation:

➤➤ CONFIRM JES3 COLD START REQUEST (U) — OR CANCEL —

The operator replied C to message IAT3011. Confirmation of the cold start request is required before continuing with initialization. This is required since all existing jobs in the queue will be lost if a cold start is performed.

System action: JES3 waits for an operator response.

Operator response: Reply U to continue with the cold start. Reply CANCEL to end JES3 initialization. In this case, the job queue is left intact. Any other reply will cause message IAT3011 to be reissued.

IAT3035
Explanation:

➤➤ DYNALLOC CONCATENATION — LIMIT EXCEEDED —

JES3 attempted to dynamically concatenate more than 16 DD statements with the same ddname. The statement that exceeded the limit is duplicated on the operator’s console immediately preceding this message.

System action: JES3 checks the remaining DYNALLOC statements in the initialization stream for validity. JES3 initialization ends.

Programmer response: Remove the excess statement.

Problem determination: See Table III, items 5 and 6.

IAT3036
Explanation:

➤➤ DEVICE — dev_name — CANNOT BE ADDED, — WORKSTATION — workstation_name — IS LOGGED ON —

Chapter 6. Initialization Messages  101
During *MODIFY,CONFIG command processing, the SNA RJP device `dev_name` can not be added because the workstation `workstation_name` is logged on.

In the message text:

`dev_name`
   The name of the SNA RJP device to be added

`workstation_name`
   The name of the workstation to which the device is to be added

**System action:** JES3 ignores the DEVICE statement and processing continues.

**Operator response:** Re-issue the *MODIFY,CONFIG command to add the DEVICE statement after you log off the workstation.

**Module:**

---

**IAT3038**

**Explanation:**

`ERROR WRITING THE COMPLEX STATUS CKPT RECORD`

An error occurred while JES3 was writing the complex status record or the dynamic allocation record (IATYS99) to the checkpoint data set during JES3 initialization.

If checkpoint duplexing was being used (for example, both CHKPNT and CHKPNT2 defined), this message is issued only if the write operation failed on both checkpoint data sets.

**System action:** JES3 initialization processing continues, however, subsequent global processor hot or warm starts may not be possible.

**Operator response:** Notify the system programmer.

If initialization completes, reduce the queue backlog, especially if there are JES3 local processors still active.
Programmer response: If there are indications of permanent errors, allocate the checkpoint data sets again and perform a cold start.

Problem determination: See Table I, items 18 and 37; Table III, items 4 and 6.

Descriptor Code: –

IAT3040
Explanation:

" STATUS OF PROCESSORS IN JESXCF GROUP—group— main1 (status1), mainn (statusn) "

The status of the processors (main1[mainn...]) in this complex as last recorded in the complex status record (CSR) is provided for operator information. The parentheses enclosing the status information are set as follows:

Current system is a global: +status+
Global on another system: *status*
Current system is a local: <status>
Local on another system: (status)
IAT3041

The status field can be as follows:

**UP** the main has completed initialization

*Note:* If this value appears for the *main* now being initialized, that processor has abended, or was not brought down cleanly, since the status was recorded.

**IN** the *main* has not completed initialization

**DS** the *main* has not completed dynamic system interchange

**blank**
the *main* has either ended normally or has never been initialized by JES3

The status is updated at the beginning and end of JES3 initialization and cleared as JES3 ended. The status may be incorrect if a normal end has not been possible (for example, main failure) or if an I/O error has precluded complex status record (CSR) update.

*Note:* Up to 32 *mains* can be displayed in this message.

In the message text:

*group* The name of the JESXCF group containing the processors listed in this message.

*main*n The name of a processor within the complex.

*status*n The status of the associated processor.

**System action:** JES3 initialization continues.

**Operator response:** None. This is an informational message. However, if the group shown is incorrect, or the text "<NAVAIL>", notify the system programmer.

**System programmer response:** If the group name is incorrect, it means that the JES3 procedure is pointing to an incorrect set of checkpoint data sets. Do not allow JES3 to initialize further. When message IAT3041 appears for the start type, reply CANCEL to end JES3, and correct the JES3 procedure before restarting JES3.

If the group is "<NAVAIL>", see message IAT2063.

**Module:**

<table>

**Descriptor Code:** 4,7

---

IAT3041

**Explanation:**

```
>>> COLD START REQUIRED
---PREVIOUS GLOBAL COLD START INCOMPLETE
ERROR READING COMPLEX STATUS RECORD
COMPLEX STATUS RECORD NOT VALID
ERROR READING JESCKPNT RECORD
ERROR READING SPOOL DATASET CKPT RECORD
ERROR READING SPOOL PARTITION CKPT RECORD
```

An error was encountered during JES3 initialization processing of records within the checkpoint data set(s), requiring a cold start of JES3:

**PREVIOUS GLOBAL COLD START INCOMPLETE**
The previous JES3 start type was a cold start and that restart failed to complete.

**ERROR READING COMPLEX STATUS RECORD**
An error was encountered while reading the complex status record (CSR) from the checkpoint data set(s), or the CSR record was not found.
COMPLEX STATUS RECORD NOT VALID
   The complex status record (CSR) was successfully read but failed validity checking.

ERROR READING JESCKPNT RECORD
   An error was encountered while reading the JESCKPNT (CKP) record from the checkpoint data set(s), or the
   CKP record was not found.

ERROR READING SPOOL DATASET CKPT
   An error was encountered while reading the spool data set CKPT record (VOL) from the checkpoint data set(s),
   or the VOL record was not found.

ERROR READING SPOOL PARTITION CKPT
   An error was encountered while reading the spool partition CKPT record (SPR) from the checkpoint data set(s),
   or the SPR record was not found.

This message will always appear the first time that JES3 is initialized with newly allocated checkpoint data set(s)
because the contents of new checkpoint data set(s) is unpredictable.

System action:  JES3 issues message IAT3011 and restricts the current restart to a cold start.

Operator response:  The only acceptable replies to message IAT3011 are C (cold start) or CANCEL (to end JES3
   initialization).

Programmer response:  Obtain the data listed in Chapter 30, “Problem Determination,” on page 1135 and use the
   information to determine the error.

Problem determination:  See Chapter 30, “Problem Determination,” on page 1135 Table III, items 6, 20, and 21.

IAT3042

Explanation:

>>> COLD OR WARM START REQUIRED, — reasontext ————

JES3 encountered an error during initialization processing of records within the checkpoint data set(s). The reason
is one of the following:

PREVIOUS GLOBAL WARM START INCOMPLETE
   The previous JES3 start type was a warm start that failed to complete.

ERROR READING COMPLEX STATUS RECORD
   JES3 encountered an error during reading the complex status record (CSR).

COMPLEX STATUS RECORD NOT VALID
   The complex status record (CSR) was successfully read but is not usable or contains incorrect status.

THIS CPU NOT DEFINED
   This processor was not defined by its sysname on a MAINPROC statement the last time a warm or cold start
   was performed for the global processor.

ERROR READING INITIALIZATION CKPT RECORD
   JES3 encountered an error while reading the initialization CKPT record (ICP).

INITIALIZATION CKPT RECORD NOT VALID
   The initialization CKPT record (ICP) was successfully read but is not usable or contains incorrect status.
IAT3043

JESCKPT RECORD NOT VALID
The JESCKPT record (CKP) was successfully read but is not usable or contains incorrect status.

ERROR READING BADTRACK CKPT RECORD
JES3 encountered an error while reading the badtrack CKPT record (BTR) from the checkpoint data set(s), or
JES3 could not find the BTR record.

BADTRACK CKPT RECORD NOT VALID
The badtrack CKPT record (BTR) was successfully read but is not usable or contains incorrect status.

SPOOL DATASET CKPT RECORD NOT VALID
The spool data set CKPT record (VOL) was successfully read but is not usable or contains incorrect status.

SPOOL PARTITION CKPT RECORD NOT VALID
The spool partition CKPT record (SPR) was successfully read but is not usable or contains incorrect status.

System action: JES3 issues message IAT3011 and restricts the current restart to a cold or warm start.

Operator response: The only acceptable replies to message IAT3011 are C (cold start), W (warm start), or CANCEL
(to end JES3 initialization).

System programmer response: Obtain the information listed in Chapter 30, “Problem Determination,” on page 1135
and use that data to determine the error.

Problem determination: See “TABLE V” on page 1142 items 6, 20, and 21.

IAT3043
Explanation:

>>>—COLD OR WARM START ON globproc—HAS NOT COMPLETED.

>>>— DO YOU NEED TO TAKE CONTROL? (YES, NO, OR RETRY)

JES3 initialization has determined that a local processor is being started. This processor cannot be initialized until
global initialization has successfully completed. Initialization data for local and hot starts is not available until the
end of a successful initialization performed from initialization statements.

In the message text:

globproc The name of the processor on which a cold or warm start was most recently attempted.

System action: JES3 waits for an operator reply.

Operator response: Reply NO or CANCEL to end JES3. Reply YES to ignore any other global initialization in
process; message IAT3011 is then issued. The only valid replies to message IAT3011 (issued next) are W, WA, WR,
WAR, or C.

To continue, reply RETRY after the global has successfully completed JES3 initialization. A reply of YES is needed
only if JES3 had started a warm or cold initialization and had not successfully completed it. This might be due to
hardware or software failure, incorrect initialization stream, or operator intervention.

Problem determination: See Table III, items 5 and 6.

IAT3045

Explanation:

THIS PROCESSOR IS THE GLOBAL; START TYPE MUST BE COLD OR WARM OR HOT/REFRESH

JES3 previously issued message IAT3041, IAT3042, or IAT3008 to display the acceptable responses to message IAT3011. The operator reply was not one of the acceptable responses.

If COLD only appears in the message, then a reply of C for a cold start is acceptable.

If COLD OR WARM appears in the message, then a reply of W, WA, WR, or WAR for a warm start, or C for a cold start is acceptable.

If COLD OR WARM OR HOT/REFRESH appears in the message, then a reply of HR or HAR for a hot start with refresh; or W, WA, WR, or WAR for a warm start; or C for a cold start is acceptable.

System action: JES3 reissues message IAT3011.

Operator response: If this processor is to be initialized as the global, reply HR, HAR, W, WA, WR, WAR, or C to message IAT3011. Otherwise, reply CANCEL to end JES3 initialization.

System programmer response: None

---

IAT3046

Explanation:
DISABLE ANY OTHER RUNNING JES3 PROCESSOR-- IN COMPLEX (DONE) OR CANCEL--

JES3 has attempted to automatically enforce the state of the active processor, but a system error occurred during this process. Message IAT2063 is also issued describing the nature of the error. This message should not normally appear; messages IAT2061 and IAT2064 should appear instead.

JES3 initialization has determined that there is at least one other JES3 processor in the complex that is either running or in hot or local initialization. The operator has specified a warm start or cold start in reply to message IAT3011. Message IAT3046 is issued to remind the operator that no other JES3 processor may be operating while a global cold start or warm start is in progress. Otherwise, any resulting queue destruction may require a cold start.

This message may be issued when other processors are not in operation if the status information for the processor was not updated when it ended processing.

**System action:** JES3 initialization waits for an operator response.

**Operator response:** Reply DONE to confirm that no other JES3 processor is active in the complex. Reply CANCEL to end JES3. Any other reply will cause message IAT3011 to be reissued.

**System programmer response:** See message IAT3063.

**Problem determination:** See Table III, item 6.

**IAT3050**

**Explanation:**

>>> nnn—DYNAMIC ALLOCATIONS FAILED. ENTER— CONTINUE OR CANCEL.-----------------------------

JES3 failed when it tried to dynamically allocate one or more data sets. The value nnn specifies the number of dynamic allocation tries that failed. Messages IAT3029, IAT3030, and IAT3053 provide more information about the failures.

**System action:** JES3 waits for an operator response.

**Operator response:** Contact the system programmer to determine whether to reply CONTINUE or CANCEL. Enter one of the following replies:

**CONTINUE**

JES3 processing continues without the affected data sets.

**CANCEL**

JES3 ends processing.
**IAT3051 • IAT3052**

**Programmer response:** See messages IAT3029, IAT3030, and IAT3053. If JES3 can continue without the affected data sets, have the operator reply CONTINUE. Otherwise, have the operator reply CANCEL.

**Problem determination:** See Table III, items 5 and 6.

---

**IAT3052**

**Explanation:**

>>>— UNABLE TO OPEN PROCLIB— ddn dsn—

An open error has occurred while attempting to open the indicated procedure library data set.

**System action:** JES3 attempts to recover from the open error. If the recovery is unsuccessful, message IAT3051 is issued. Regardless of the result of the recovery attempt, JES3 validity checks the rest of the DYNALLOC statements in the initialization stream.

**Operator response:** Notify the system programmer.

**Programmer response:** Correct the conditions that caused the open attempt to fail. You may have to change only the initialization statement, or you may have to make a data set or unit available that was not found. Other MVS messages may have been issued that will help to determine the cause of the failure.

**Problem determination:** See Table III, items 5, 6, and 21.

**Module:**
IAT3053

Explanation:

A dynamic unallocation for the indicated procedure library data set has failed. This attempted unallocation was preceded by JES3 issuing messages IAT3051 and/or IAT3052.

System action: JES3 issues message IAT3030 stating the reasons for the failure. The rest of the DYNALLOC statements in the initialization stream are checked for validity.

Operator response: Notify the system programmer.

Programmer response: Correct the conditions that caused the unallocation to fail. You may have to change only the initialization statement, or you may have to make a data set or unit available that was previously not found. Other MVS messages may have been issued that will help to determine the cause of the failure.

Problem determination: See Table III, items 5, 6, and 21.

Module:

IAT3054

Explanation:

You were trying to add a DEVICE statement for a device that is not allowed to be added during *MODIFY,CONFIG processing.

In the message text:

dev_type

The type of device that you want to add using the *MODIFY,CONFIG command.

System action: JES3 ignores the initialization statement. Processing continues.

Operator response: Contact your system programmer.

System programmer response: In the initialization deck, fix this initialization statement for the device you want to add dynamically using the *MODIFY,CONFIG command.

Module:
IAT3055 • IAT3060

IAT3055
Explanation:

>>> TYPE=CI FSSDEF STATEMENT CANNOT BE ADDED DYNAMICALLY

During *MODIFY,CONFIG processing, an FSSDEF statement for a C/I FSS (TYPE=CI) was detected. JES3 does not allow C/I FSSs to be added using the *MODIFY,CONFIG command.

System action: JES3 ignores the initialization statement. Processing continues.

Operator response: Contact your system programmer.

System programmer response: Do not specify TYPE=CI on any FSSDEF statements that are used with the *MODIFY,CONFIG command.

IAT3060
Explanation:

>>> JCT DOWN LEVEL, RUN IATUTJCT —OR PERFORM A COLD START

JES3 is down-level, run IATUTJCT or perform a cold start.
During JES3 initialization, JES3 has determined that the JCT data set was not migrated for this JES3 release. Unless this migration is performed, a cold start of JES3 is required on the current JES3 release.

**System action:** JES3 continues and issues message IAT3011 prompting the operator for the start type, but will not accept any reply other than C (cold start) or CANCEL.

**Operator response:** Notify your system programmer.

**System programmer response:** If you have determined that a cold start is acceptable, reply C to message IAT3011.

If you want to avoid the cold start, reply CANCEL to message IAT3011 and then bring up a procedure to run IATUTJCT under the master subsystem (SUB=MSTR) with the MIGRATE parameter. After the migration is complete, restart JES3 pointing to the new JCT data set and new checkpoint data set(s). See [z/OS JES3 Initialization and Tuning Guide](https://www.ibm.com) for more information about the IATUTJCT utility.

**Module:**

<td>IATINGL</td>
<td>IATINGL</td>
<td>IATINGL</td>
</tr>
</tbody>
</table>

**Routing Code:** 2

**Descriptor Code:** 2,7

---

IAT3061

**Explanation:**

JES3 encountered an error while writing the initialization checkpoint record or the complex status record on the checkpoint data set(s). JES3 can issue this message during JES3 initialization or at JES3 termination. If checkpoint duplexing was being used, the message occurs only if the read or write failed on both checkpoint data sets.

In the message text:

**recordtype**

The type of record that was being read or written. It can be one of the following:

- INITIALIZATION CHECKPOINT RECORD
- COMPLEX STATUS RECORD
- CHECKPOINT DATA AREA
- DYNALLOC CHECKPOINT RECORD
- SPOOL PARTITION CHECKPOINT
- BADTRACK CHECKPOINT

**System action:** If this message occurs during initialization, JES3 continues processing. Global hot starts and local starts in the complex might not be possible because initialization data might not be valid or might be unavailable.

If this message is issued during JES3 termination, the CSR is not updated and contains obsolete processor status. Future warm starts should be possible unless there is physical damage to the recording medium.

**Operator response:** Before ending JES3, reduce the queue backlog as much as possible, particularly if JES3 local processors are in use.

**Programmer response:** If there are indications of permanent errors, reallocate theCHKPNT data set and cold start the complex.

**Problem determination:** See "TABLE III" on page 1139, item 18; "TABLE V" on page 1142, items 5, 6, and 11.

**Module:**

</table>
IAT3062

Explanation:

>>>-RESET—sysname—AND REPLY CONTINUE,—OR REPLY CANCEL—>

JES3 has attempted to automatically enforce the state of the active processor, but a system error occurred during this process. Message IAT2063 is also issued describing the nature of the error. This message should not normally appear; messages IAT2061 and IAT2064 should appear instead.

Message IAT3101 was previously issued because a job was found active on a local system. The global was deleting its job number, during a hot start with refresh, during which the OPTIONS,JOBNO range is being changed. This must not be done unless the system on which the job was active is reset.

In the message text:

sysname
The system name on which the job was active.

System action: JES3 waits for a reply. If you reply CONTINUE, it is assumed that the system sysname has been reset and no further IAT3101 or IAT3062 messages will be issued for that system if additional active jobs are detected. Any subsequent jobs that are found active on that system are eligible to be deleted. You must reset the system otherwise the active jobs can cause damage to the JES3 spool.

JES3 does not delete the jobs until messages IAT4174 and IAT4133 are issued, so you can still stop the jobs from being deleted by replying TERMINATE to message IAT4174.

Operator response: Notify the system programmer.

System programmer response: If you want to delete the active jobs, reset the system indicated and reply CONTINUE. If you do not want to delete the jobs, reply CANCEL, which will end JES3 initialization. Perform another hot start with refresh using an initialization stream that restores the original job number range.

Refer also to message IAT3063.

Explanation:

-- unittype- main-- SPECIFIED ON DEVICE-- name-- HAS NO MAINPROC - IGNORED--

A JUNIT parameter on a DEVICE statement specifies an undefined MAINPROC.

In the message text:

unittype The type of unit being defined, either XUNIT or JUNIT.
main The name of the undefined system specified on the XUNIT or JUNIT.
name If unittype is JUNIT, the JNAME of the DEVICE statement.
unit If unittype is XUNIT, the device number associated with the undefined main.

System action: If unittype is JUNIT, the entire DEVICE statement is ignored. Otherwise the device is ignored for the specified main. JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: Change the JUNIT or XUNIT to specify an existing processor or *ALL to indicate all processors.

Module:
IAT3072 • IAT3073

Routing Code: Note 19
Descriptor Code: N/A

IAT3072
Explanation:

The JES3 address space on main processor main or the FSS address space fssname is waiting to access the configuration. During a hot start with refresh or when you issue a *MODIFY,CONFIG command, the global processor requests exclusive access to the configuration. For all other starts (cold, warm, hot, local, or FSS), JES3 requires shared access.

In the message text:

main The main processor name if this is the JES3 global or a JES3 local address space.
fssname The FSS name if this is an FSS address space.
asid The address space id if this is an FSS address space.

System action: JES3 waits for the configuration to become available. If this is the JES3 global address space, and either a hot start with refresh is being performed, or a *MODIFY,CONFIG is being processed, and JES3 issues message IAT3073 to allow the operator to cancel the request.

Operator response: To determine who has control of the JES3 configuration, issue one of the following commands:

• D GRS,RES=(SYSZIAT,*)
• D GRS,RES=(SYSZIAT,CONFIG.CHANGE*)
• D GRS,RES=(SYSZIAT,CONFIG.CHANGE.volser.dname)

System programmer response: None

Module:

IAT3073
Explanation:

JES3 issues this message in conjunction with IAT3072 to allow the operator to cancel the wait for the configuration to become available.

There are a few reasons why the configuration might not be available:

• A local processor is in the process of starting and waiting for the operator to respond to message IAT3011. This will prevent a global from performing a hot start with refresh because the local needs only shared access to the configuration while the global requires exclusive access. Before you perform a hot start with refresh, make sure that there are no outstanding IAT3011 messages for local processors.
• An FSS address space is in the process of starting and has requested services from the JES3 global. For example, the FSS address space can be in the process of dynamically allocating a data set, and a request has been sent to the
JES3 global to determine if the data set is available to be allocated. This prevents a global from performing a hot start with refresh because the FSS address space needs only shared access to the configuration while the global requires exclusive access.

The FSS address space will not release the configuration until the JES3 global has responded to the request. But the JES3 global can’t respond to the request until it completes initialization. In this case, either cancel the FSS address space to allow JES3 to continue, or respond CANCEL to IAT3073 to cancel the hot start with refresh, and then perform a hot start.

In the message text:

main  The main processor name if this is the JES3 global or a JES3 local address space.

fssname  The FSS name if this is an FSS address space.

asid  The address space id if this is an FSS address space.

System action: JES3 waits for the configuration to become available or for the operator to cancel the request.

Operator response: Respond "CANCEL" if you want to cancel the request. For example, during a hot start with refresh of the global processor, if the configuration is not immediately available, instead of waiting you may want to cancel the request and perform a hot start in order to get the global processor up as soon as possible.

fssname  The FSS name if this is an FSS address space.

asid  The address space id if this is an FSS address space.

rc  The return code from the ENQ macro.

System action: If JES3 issues this message as a result of a "MODIFY,CONFIG command, the requested changes have been made in storage, but the configuration was not updated to reflect those changes. The changes are lost if you restart the JES3 global. If you need to restart the JES3 global, add the changes to your initialization stream and perform a hot start with refresh.

If JES3 issues this message as a result of a JES3 global, local, or FSS address space initialization, initialization ends.

Operator response: Provide the ENQ return code to the system programmer.

System programmer response: Contact the IBM support center.

Module:
IAT3075 • IAT3076

Routing Code: 1
Descriptor Code: 12

IAT3075
Explanation:

>>> FSS—fssname—CANNOT BE DELETED—DURING A HOT START WITH REFRESH <<<

JES3 determined that FSS fssname is active, but the FSSDEF and/or DEVICE statements were removed from the initialization stream during a hot start with refresh. You cannot delete an FSS that is active during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

System action: JES3 initialization fails.
Operator response: Restart JES3 after the system programmer adds the FSSDEF and/or DEVICE statements to the initialization stream.
System programmer response: Add the FSSDEF and/or DEVICE statements to the initialization stream.

Module:

Routing Code: 1
Descriptor Code: 4

IAT3076
Explanation:

>>> DEVICE—devname—CANNOT BE ADDED TO ACTIVE FSS—fssname—DURING A HOT START WITH REFRESH <<<

One of the following changes were made to the initialization stream used to perform a hot start with refresh:

• A DEVICE statement was added to the initialization stream, and the FSSNAME parameter on the DEVICE statement refers to an FSS that is active.
• The FSSNAME parameter on an existing DEVICE statement in the initialization stream was changed so that it refers to an FSS that is active.

Devices cannot be added to an active FSS during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

In the message text:

devname 
The device name on the JNAME parameter of the DEVICE statement.
fssname 
The FSS name on the FSSNAME parameter of the DEVICE statement.

System action: JES3 initialization fails.
Operator response: Restart JES3 after the system programmer corrects the initialization stream.
System programmer response: Delete the DEVICE statement from the initialization stream, or change the reference to an active FSS, and reinitialize JES3.

Module:
IAT3077

Explanation:

➤ DEVICE— devname— CANNOT BE DELETED FROM ACTIVE FSS
➤ fssname— DURING A HOT START WITH REFRESH

One of the following changes were made to the initialization stream used to perform a hot start with refresh:

• A DEVICE statement was deleted from the initialization stream and the FSSNAME parameter on the original DEVICE statement referred to an FSS that is active.
• The FSSNAME parameter on an existing DEVICE statement in the initialization stream was changed. The FSSNAME on the original DEVICE statement referred to an FSS that is active.

Devices cannot be deleted from an active FSS during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

In the message text:

devname
The device name on the JUNIT parameter of the DEVICE statement.

fssname
The FSS name on the FSSNAME parameter of the DEVICE statement.

System action: JES3 initialization fails.

Operator response: If an FSA device was deleted dynamically from the MVS configuration through the HCD facility since the last JES3 restart, perform steps 1 through 5. If this is not the case, skip to step 6.
1. Use the MVS HCD facility to activate the previous IODF configuration (before the devices identified in this message was deleted).
2. Use a hot start to start JES3.
3. Use HCD to activate the required IODF configuration with the devices deleted.
4. Deactivate the FSS.
5. Perform a hot start with Refresh using the initialization stream with the appropriate DEVICE statements deleted.
6. Restart JES3 after the system programmer corrects the initialization stream.

System programmer response: Return the DEVICE statement to the initialization stream, or change the FSSNAME parameter to refer to the original FSS.
IAT3078
Explanation:

▶️ DEVICE NUMBER FOR — devname — CANNOT BE CHANGED FOR

▶️ ACTIVE FSS — fssname — DURING A HOT START WITH REFRESH

During a hot start with refresh, the device number in the JUNIT parameter of the DEVICE statement for an active FSS was changed.

In the message text:

device
The device name on the JUNIT parameter of the DEVICE statement.

fssname
The FSS name on the FSSNAME parameter of the DEVICE statement.

System action: Message IAT3079 is issued to display the old and new device numbers. JES3 initialization fails.

Operator response: Restart JES3 after the system programmer corrects the initialization stream.

System programmer response: Change the device number to what it was in the initialization stream when the FSS was started.

IAT3079
Explanation:

▶️ OLD DEVICE NUMBER = — olddevno — NEW DEVICE NUMBER = — newdevno

JES3 issues this message in conjunction with message IAT3078 when the device numbers are changed for a device associated with an active FSS.

In the message text:

olddevno
The device number that was in the JUNIT parameter of the DEVICE statement when the FSS was started. If the device is not channel attached, this field is blank.

newdevno
The device number that is in the JUNIT parameter of the DEVICE statement in the initialization stream used to perform the hot start with refresh. If the device is not channel attached, this field is blank.

System action: JES3 initialization fails.

Operator response: Restart JES3 after the system programmer corrects the initialization stream.

System programmer response: Change the device number to its original (olddevno) value.

IAT3081
Explanation:

>>> FSS/FSA CHECKPOINT IS DOWN-LEVEL AND CANNOT — BE USED DURING A — HOT START WITH REFRESH

A hot start with refresh was performed and JES3 determined that the FSS/FSA checkpoint is down-level. This can occur if you attempt to perform a hot start with refresh after you first migrated to OS/390 Version 2 Release 4 (HJS6604). Before attempting to perform a hot start with refresh, you should first perform a cold, warm, or hot start to reformat the FSS/FSA checkpoint; only thereafter, can you perform a hot start with refresh.

System action:  JES3 initialization fails.

Operator response:  Restart JES3 and perform a cold, warm, or hot start.

System programmer response:  None

Module:

Containing  Detecting  Issuing
IATINFS     IATINFS     IATINFS

Routing Code: 1
Descriptor Code: 4

IAT3082
Explanation:

>>> DEVICE — devname — IS NO LONGER DEFINED TO — mainname — FOR ACTIVE FSS — fssname

During a hot start with refresh, one or more main processor names were removed from the JUNIT parameter of the DEVICE statement for an active FSS. One of the main processor names that was removed is the main processor where the FSS is active. This is not allowed during a hot start with refresh unless the FSS was active on the global and the global was IPLed before the hot start with refresh.

In the message text:

devname  The device name on the JUNIT parameter of the DEVICE statement.
main     The main processor name where the FSS is active.
**fsname**  The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:**  JES3 initialization fails.

**Operator response:**  Restart JES after the system programmer corrects the initialization stream.

**System programmer response:**  Return the main processor name and its associated device number information to the DEVICE statement.

**Module:**

<td>IATINCF</td>
</tr>
</tbody>
</table>

Routing Code: 2
Descriptor Code: 10

IAT3088
Explanation:

stmttype name onmain1 IGNORED, PREVIOUSLY DEFINED onmain2

An instance of a statement definition has already been defined in the initialization stream. For the purposes of determining statement uniqueness, the following attributes uniquely identify a statement:

- The JNAME on a DEVICE statement.
- The NAME= parameter on an NJERMT statement.
- The NAME= parameter on the NETSERV statement.
- The NAME= parameter on the SOCKET statement.
- When compared with XUNIT and main name, a JUNIT and main name that appear on a different statement from the compared XUNIT and main name.

The following attributes of a DEVICE statement can also cause a duplicate statement even if the duplication was not literally coded:

- Duplicate device numbers can result from a range of devices that are created by using the NUMDEV parameter.
- The same XUNIT and system name were defined on multiple DEVICE statements.
- The same JUNIT and system name were defined on multiple DEVICE statements.
- A JUNIT and system name pair was defined after previously being defined on another statement as an XUNIT and system name pair.
- An XUNIT and system name pair was defined after previously being defined on another statement as a JUNIT and system name pair.
- The XUNIT or JUNIT parameter of one DEVICE statement defines a device or device number with a specific system name and the XUNIT or JUNIT parameter of another DEVICE statement defines the same device number with a system name of *ALL.

In the message text:
**IAT3089 • IAT3090**

**stmttype**
Indicates the type of statement that is duplicated.

**onmain1**
If the duplication is a unique statement name, the text is ON MAIN main1 where main1 is the main for which the current definition is being reported in error. If the duplication is a unique statement name, this text is omitted from the message.

**onmain2**
If the duplication is a unique statement name, the text is ON MAIN main2 where main2 is the main on which the previous occurrence of the device was found. If the duplication is a unique statement name, this text is omitted from the message.

The values main1 and main2 are the same unless one of them is *ALL and the other is a specific name.

**System action:** If the NUMDEV parameter is specified, the duplicate device is ignored, but the rest of the range is processed and all other devices in the range that are not duplicates and have no other errors are defined. In all cases where a duplicate is detected, the first definition prevails. JES3 initialization continues.

**System programmer response:** Correct or remove the duplicate statement.

**Module:**

Routing Code: 2,10
Descriptor Code: 1,7

IAT3091

Explanation:

An AGETMAIN macro instruction has been rejected because there is not enough main storage to satisfy the request. If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name fssname and address space ID asid appear with the message. The absence of this text indicates the failure occurred during JES3 initialization.

System action: JES3 or FSS initialization ends with a DM002 and message IAT3713 is issued. See z/OS JES3 Diagnosis for information on the abend code that is issued with this message. The registers contain the following information.
Register 14 contains the return address to the requesting module. Register 15 contains the following information:

Byte 0
- XX'02' is on when the BUSY= parameter was specified on the GETMAIN macro.
- XX'01' is on when the BNDRY=PAGE parameter was specified on the GETMAIN macro.

Byte 1
- XX'00' LOC=RES. JES3 tried to obtain storage from the same area as the calling program.
- XX'01' LOC=BELOW. JES3 tried to obtain storage from below 16M virtual.
- XX'04' LOC=(RES,ANY). JES3 tried to obtain storage from the same area as the calling program
- XX'05' LOC=(BELOW,ANY). JES3 tried to obtain storage from below the 16m virtual.
- XX'07' LOC=(ANY,ANY) or LOC=ANY. JES3 tried to obtain storage, but there was an inadequate amount.

Byte 3 contains the subpool number

Operator response: Consult the system programmer. This is probably a system error. However, if it results from an inadequate allocation of CSA, repeat the IPL of the processor. Then message IEA101A SPECIFY SYSTEM PARAMETERS FOR RELEASE xx.yy.zz will be displayed. (See z/OS MVS System Messages, Vol 6 (GOS-JEA).) Next, specify a CSA = quantity that is 200K greater than the default amount (the amount specified in SYSPARMLIB, IEASYSYS00), or 600K, whichever is larger. Then reinitialize JES3.

Problem determination: See Table III, items 2, 5, 6, and 21.

IAT3099
Explanation:

JES3 has been started on a processor that was not previously defined. An undefined processor requires a cold or
warm start to define itself and become a global. An undefined processor can be defined and become a local by a hot
start with refresh on the current global.

In the message text:

newproc The processor that is initializing, and that is currently not known to JES3.
globproc The name of the currently active global.

System action: JES3 issues message IAT2061 and IAT2064 requiring you to reset the current global.
Operator response: If you want the new processor to become the global, reset the current global and any other
processors in the complex and perform a cold or warm start. If you want to avoid re-IPLing these processors, reply
CANCEL. JES3 will end on the initializing processor.
System programmer response: To define the new processor, create an initialization stream containing a MAINPROC initialization statement for the new processors and reference this MAINPROC on any other required statements. Then perform a hot start with refresh on the global using the new initialization stream.

Module:

JES3 has detected that a job whose job number is not defined in the initializing configuration's OPTIONS,JOBNO range is active and cannot be deleted unless the system on which the job is active is IPLed. In the message text:

djobname
    The name of the job that would be deleted by the change in the job number range.

djobid
    The job identifier of the job that would be deleted by the change in the job number range.
sysname
    The system name on which the job was active.

System action: If sysname is the global, JES3 initialization ends immediately with a DM025. Otherwise JES3 also issues IAT2061 and IAT2064 and waits for a reply.

If the operator replies CANCEL to IAT2064, JES3 initialization ends with a DM025.
**IAT3102 • IAT3103**

**Operator response:** Notify the system programmer, and reply to message IAT2061 and IAT2064 as instructed.

**System programmer response:** See message IAT2061 and IAT2064.

---

**IAT3102**  
**Explanation:**

Possible impact of function error(s) likely to fail JES3 catastrophic errors were detected during initialization, see JES3OUT.

Errors were detected before JES3 initialization was complete. The JES3OUT data set contains the message describing the errors.

**System action:** If the errors will not disrupt a JES3 function, this warning is issued and JES3 continues initialization processing. If the errors make further execution impossible, JES3 ends with a dump. If JES3 continues initialization processing, message IAT3100 is issued next.

**Operator response:** Notify the system programmer.

**System programmer response:** Review the JES3OUT listing. Change the initialization stream to eliminate the errors listed during JES3 initialization. Restart JES3 to ensure that the changes in the initialization stream take effect.

**Problem determination:** See Table III, items 5, 6, and 21.

**Descriptor Code:** 7

---

**IAT3103**  
**Explanation:**

Incompatible function used on higher JES3 release.

JES3 has detected that a function used in a higher JES3 release is not supported at the current JES3 release. For example, a large job number range was defined and an attempt was made to fall back using a hot start without refresh to a release that does not support that range.

**System action:** JES3 fails with a DM025.

**Operator response:** Notify the system programmer.

**System programmer response:** If the initialization stream used by the higher JES3 release contains a definition that would not be supported in the current JES3 release, correct the parameter to specify a value that is supported in the current JES3 release and perform a hot start with refresh or a warm start, depending on the individual parameter’s restart requirement. Or, bring up the higher JES3 release again to continue using the function.

You can determine whether the current release would allow the function by performing a hot start with refresh with...
the initialization stream containing the parameter definition in question, or by running IATUTIS. In either case a syntax error message will be written to JES3OUT if the parameter is not supported.

IAT3105

Explanation:

| INSTALLATION STRING NOT VALID | LENGTH NOT VALID |

During JES3 initialization or connect processing, JES3 was attempting to build an information string for the subsystem version information SSI call (SSI function code 54). The string could not be built because the length supplied by IATUX63 in field YUX63LNR was not valid. It was either zero or a value greater than the maximum length allowed (2048 bytes in size).

System action: JES3 initialization continues. The SSI routine will operate without the information string.

Operator response: Notify the system programmer. If the reason text indicates that the installation string length is not valid, then installation exit IATUX63 should be examined to ensure that the string is built correctly.

IAT3113
Explanation:

WLM Connect Request Failed, Return Code=retcode, Reason Code=rsncode

An error occurred while JES3 was attempting to connect to WLM through the IWMCONN macro. The return and reason codes from the IWMCOMM macro are displayed in the message.

Operator response: Contact the system programmer.

Programmer response: Use the return and reason codes from the IWMCONN macro, which is described in "z/OS MVS Programming: Workload Management Services", to determine the cause of the error.

Module:
Containing  Detecting  Issuing
IATINWLM    IATINWLM    IATINWLM

Routing Code: 1
Descriptor Code: 4

IAT3114
Explanation:
An error occurred while JES3 was attempting to establish an Event Notification Facility (ENF) listen exit through the ENFREQ macro for the specified event. The return code from the ENFREQ macro is displayed in the message.

**System action:** JES3 initialization continues but JES3 will not be notified for the specified event. The following list of events describe what happens if JES3 is not notified:

- **SCHENV CHANGES** - The state of a scheduling environment changed. If JES3 is not notified when this event occurs, jobs may wait in JES3 for the scheduling environment to become available or be scheduled for execution to systems where the scheduling environment is not available, even though a MODIFY WLM command was issued to change the state of the resources associated with a scheduling environment.

- **WLM POLICY CHANGES** - A new WLM policy was activated, for example, through the V WLM,POLICY= command. If the WLM classification rules were changed, and a new WLM service service definition was installed before activating the new policy, jobs will be reclassified (i.e. assigned a service class) to advantage of the new classification rules. If JES3 is not notified when this event occurs, jobs will not be reclassified until they are selected for execution.

- **SWITCH TO WLM GOAL MODE** - WLM was switched to goal mode on a system through the MODIFY WLM,MODE=GOAL command. When WLM is switched to goal mode on a system, all jobs in execution are reclassified based on the current WLM policy. If JES3 is not notified when this event occurs, JES3 will not update its own control blocks to reflect the service class that was assigned to each job. As a result, JES3 inquiry commands (e.g. *LJ=jobno,X) will not show the same service class that is assigned to a particular job as the MVS D A,jobname command.

- **RESET JOB COMMAND** - The MVS RESET command can be used to change a job's service class while it is in execution. If JES3 is not notified when this event occurs, JES3 will not update its own control blocks to reflect the new service class that was assigned to the job. As a result, JES3 inquiry commands (e.g. *LJ=jobno,X) will not show the same service class that is assigned to the job as the MVS D A,jobname command.

**Operator response:** Contact the system programmer.

**Programmer response:** Use the return code from the ENFREQ macro, which is described in [z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG](http://www.ibm.com) to determine the cause of the error.

IAT3117
Explanation:

An EXRESC parameter on the GROUP statement specified a system name. A subsequent EXRESC parameter specified *ALL as the system name. This is not allowed when specific system names are used.

System action: The EXRESC parameter with *ALL is ignored.

Operator response: None

Module:

Routing Code: 19
Descriptor Code: –

IAT3118
Explanation:

More than EXRESC parameter with a system name of *ALL was specified on the GROUP statement.

System action: The extraneous EXRESC parameters are ignored. Only the first one is used.

Operator response: None
IAT3119

Explanation:

This message is issued when JES3 detects that a GROUP statement specified a JSPAN value that is higher than the maximum value allowed, which is 65534.
In the message text:

`jspan` The JSPAN that was specified on the GROUP statement.

System action: JES3 treats the group as if JSPAN=ALL has been specified. JES3 initialization continues.
Operator response: None.
System programmer response: Correct the GROUP statement during the next warm start, cold start, or hot start with refresh.

IAT3120

Explanation:

The operator requested a hot start on a processor that used to be the global before a failed DSI.

System action: JES3 waits for a response.
Operator response: Reply YES if you want to continue JES3 hot start back to the old global; otherwise, reply CANCEL.
System programmer response: None.
IAT3121 • IAT3123

IAT3121
Explanation:

TRACK/FORMAT CARD NOT FOUND IN INISH DECK

At least one TRACK or FORMAT statement is required for JES3 initialization, and none was found.

System action: JES3 initialization ends after all JES3 spool data management statements have been checked.

Programmer response: Insert the TRACK or FORMAT statement and reinitialize JES3. See z/OS JES3 Initialization and Tuning Reference for a description of the statements.

Problem determination: See Table III, item 5.

IAT3126
Explanation:

PARAMETER ALREADY SPECIFIED

The specified parameter, DEF=YES or INIT=YES, is specified on two SPART statements.

System action: JES3 ignores the specified parameters on all SPART statements beyond the first statement on which the parameter was found.

Programmer response: Correct the SPART statement that is in error. The SPART statement in error appears immediately before this message.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: 19
Descriptor Code: –

IAT3127
Explanation:

INCORRECTLY SPECIFIED—SPOOL PARTITION NAME

A SPART statement specified an incorrect name as a subparameter of the NAME parameter. The names DELETED, DRAINED, UNAVAIL, YES, or NO are not allowed. If the name is more than 8 characters long or the first character is numeric, the name is incorrect.

System action: JES3 initialization ends.

Programmer response: Correct the SPART statement that is in error (it appears immediately before this message) and then restart JES3.

Problem determination: See Table III, items 5 and 6.

Module:
IAT3128
Explanation:

Two SPART statements specify the same spool partition name.

System action: JES3 initialization ends.

Programmer response: Change the spool partition name on one of the two SPART statements, and then restart JES3.

Problem determination: See Table III, items 5 and 6.

Module:

Routing Code: 2
Descriptor Code: 7

IAT3129
Explanation:

The value specified for the GRPSZ= parameter on the SPART or BUFFER initialization statement is outside of the acceptable range of 1 to 999.

System action: JES3 initialization ends.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the GRPSZ parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:

Routing Code: 2
Descriptor Code: 7

IAT3130
Explanation:

Either the minimum or marginal value of the SPLIM= parameter is outside of the acceptable range of 0 to 99.

System action: If the error was on the BUFFER initialization statement, the system default values of SPLIM=(10,25) are used; if the error was on an SPART initialization statement, the SPLIM values associated with the BUFFER statement are assigned to the partition.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the SPLIM parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:
IAT3131 • IAT3132

IAT3131
Explanation:

ＭＭ ＳＰＬＩＭ ＭＩＮ ＶＡＬＵＥ ＭＵＳＴ ＢＥ ＬＥＳＳ － ＴＨＡＮ ＭＡＲＧ ＶＡＬＵＥ—

The minimum value specified for the SPLIM parameter on the SPART or BUFFER initialization statement is larger than the marginal value specified.

System action: If the error was on the BUFFER initialization statement, the system default values of SPLIM=(10,25) are used; if the error was on an SPART initialization statement, the SPLIM values associated with the BUFFER statement are assigned to the partition.

Programmer response: Correct the initialization stream before the next JES3 warm start, cold start, or hot start with refresh. Note that during a hot start with refresh, the SPLIM parameter is syntax checked only. To actually change the value requires a warm or cold start.

Module:

IAT3132
Explanation:

ＭＭ ＸＳＴＭＴ—ＸＮＡＭＥ—ＳＰＥＣＩＦＩＥＤ ＦＯＲ—ＳＴＭＴ—ＮＡＭＥ—ＥＲＲＴＥＸＴ—ＰＡＲＡＭＥＴＥＲ ＩＧＮＯＲＥＤ—

One type of JES3 initialization statement is intended to make cross-reference to another type of JES3 initialization statement. However, the statement that is made cross-reference to is either not found or is defined in such a way that the cross-reference is disallowed. For example, a SOCKET statement specifies a NODE= parameter but the specified node was not defined with TYPE=TCPIP; then the cross-reference is disallowed.

In the message text:

xstmt  The statement type that is made cross-reference to.
xname  The statement name that is made cross-reference to.
stmt   The current statement type.
name   The current statement name.
errtext  Reason text identifying the error.

System action: The statement that makes the cross-reference is allowed and JES3 initialization continues; however, the statement that is made cross-reference to is ignored.

Operator response: Notify the system programmer.

System programmer response: Correct the statement during the next hot start with refresh, warm start, or cold start. If the structure defined by the statement that is made cross-reference to is modifiable, you can use the *MODIFY command to supply the correct parameter in the meantime.

Module:
IAT3133

Explanation:

One of the following conditions occurred:

1. During a cold start, warm start, or hot start with refresh, a NETSERV statement was defined with a name that is the same as either a DEVICE or MAINPROC statement or a system generated device (for example, a BSC NJE printer or sender). Because a NETSERV definition also results in a system generated device, the two devices cannot exist with the same name. JES3 therefore must reject the NETSERV definition because the device is more critical to JES3 function.

2. During *MODIFY,CONFIG processing, a dynamically added printer has the same name as a previously existing NETSERV definition. Because a NETSERV definition is internally represented as a system generated device, the dynamically defined printer is rejected because the NETSERV already exists. Unlike the previous condition, a system generated device is never created during *MODIFY,CONFIG processing.

In the message text:

name The name that is defined as both a DEVICE and NETSERV.

stmttype The type of statement that is ignored (DEVICE or NETSERV).

System action: During a cold start, warm start, or hot start with refresh, the NETSERV statement is ignored, even if it appears before the current statement. JES3 initialization continues.

During *MODIFY,CONFIG processing, the device is ignored.

Operator response: Notify the system programmer.

System programmer response: If this is a JES3 restart, correct either the NETSERV or DEVICE statement during the next cold start, warm start, or hot start with refresh. If this is *MODIFY,CONFIG, correct the DEVICE statement.

Module:

IAT3134

Explanation:

The JES3 spool buffer size specified was different from that used during the previous JES3 cold start. The current JES3 start type is warm or hot start with refresh; the buffer size may be modified only during a cold start.

System action: JES3 initialization continues, using buffer size nnnn.

Programmer response: Change the BUFSZ parameter of the BUFFER initialization statement to the value nnnn before the next JES3 cold start.

Explanation:

➤➤—DSI HAS NOT COMPLETED —FIRST START GLOBAL ON—glbiname—

146 z/OS V2R1.0 JES3 Messages
The operator either requested a local start after a DSI before the global came up, or requested a hot start on a processor that was intended as the new global during a preceding DSI. glblname is the name of the global.

**System action:** JES3 terminates.

**Operator response:** If this was a local start, start the global JES3 on the specified system. If DSI failed before the local start, start JES3 on the old global and specify hot start for the start type in response to message IAT3011. Then respond YES to message IAT3120 after all global devices are switched back to the previous global.

**Programmer response:** None.

**Module:**

### IAT3138

**Explanation:**

```
>>> keyword--- KEYWORD ALREADY SPECIFIED
```

This is a warning message. It indicates a keyword has been specified more than once on the same initialization statement. This message is issued for the keyword XCFGRPNM= on the OPTIONS initialization statement. This message is also issued when the LIMIT or INTERVAL parameters are specified more than once.

**System action:** JES3 initialization continues. JES3 will use the value specified on the last instance of the keyword on the initialization statement.

**Programmer response:** None required, however, the system programmer should determine which instance of the keyword is correct and delete any duplicate instances of the keyword on the initialization statement.

**Module:**

### IAT3139

**Explanation:**

```
>>> DUPLICATE PARAMETER SPECIFIED ---- parm
```

The operator’s reply to message IAT3146 specified an incorrect or duplicate job number or job name. An incorrect job number or job name may have contained more than eight characters. In the message text, parm identifies the job number or job name in error.

**System action:** JES3 finishes processing the job numbers or job names that were correctly entered in reply to IAT3146 and then reissues message IAT3146.

**Operator response:** None. The following message (IAT3146) will direct operator action. The operator can enter the correct job number or job name or END.

IAT3151

Explanation:

DATA LOST AND/OR JOB(S) DELETED— DURING ANALYSIS PROCESSING. DO YOU
WISH TO PROCEED? (CONTINUE OR CANCEL)

An error was detected during analysis processing which resulted in the loss of JES3 checkpointed data or the loss of one or more jobs which were in the JES3 job queue. Previous warning messages were written to the JES3OUT data set and to the operator console which describes the data and/or jobs for which errors were encountered.

System action: JES3 initialization waits for an operator reply.

Operator response: Examine the preceding messages to determine the exact impact of the data and/or jobs being lost and reply either:

CONTINUE
JES3 initialization continues without the affected data and/or jobs.

CANCEL
JES3 initialization ends.

IAT3152

Explanation:

keyword— PARAMETER TOO LONG

This is a warning message. It indicates a keyword has been specified which exceeds the length restriction for the specified keyword in the message. This message is issued for the keyword XCFGRPNM= on the OPTIONS initialization statement.

System action: JES3 initialization continues. JES3 will use the default value for the keyword specified.

Programmer response: None required, however, the system programmer should correct the parameter specified on the indicated keyword so that it conforms to the parameter length restriction as well as any other fields.

Module:

Containing  Detecting  Issuing
IATINIC     IATINIC     IATINIC

IAT3154

Explanation:

keyword=parm— INCORRECT CHARACTER FOUND

This is a warning message. It indicates an incorrect character was specified in the parameter for the indicated
keyword. The naming conventions support alphabetic, numeric and standard symbols (@,#,$). A character other than
those supported was specified in the parameter. This message is issued for the keyword XCFGRPNM= on the
OPTIONS initialization statement.

System action: JES3 initialization continues. JES3 will use the default value for the keyword specified.

Programmer response: None required, however, the system programmer should correct the parameter specified on
the indicated keyword so that it conforms to the naming convention as well as any other restrictions.

IAT3156

Explanation:

>>> SPOOL OR JCT ALLOCATION FAILED. ENTER— RETRY OR CANCEL

A dynamic allocation for a JCT data or a dynamic allocation of a SPOOL data set has failed on a local processor. This
message was preceded by messages IAT3029 and IAT3030, which identify the data set and the reasons for the failure.

System action: JES3 waits for an operator response.

Operator response: Contact the system programmer to determine whether to attempt to correct the problem and
reply RETRY, or to reply CANCEL. Enter one of the following replies:

RETRY

JES3 attempts the allocation again.

CANCEL

JES3 ends processing.

System programmer response: See messages IAT3029 and IAT3030. Perform either of the following tasks:
• If the problem can be corrected immediately, have the operator correct the problem and reply RETRY. For example,
you are able to correct the problem by only varying a device online period.
• If the problem cannot be corrected immediately, have the operator reply CANCEL, and correct the condition that
caused the allocation to fail. For example, you have to make changes to the JES3 initialization stream.
Module: IAT3157 • IAT3158

Explanation:

An FSA device entry was found in the FSA checkpoint but not in the FSA tables while the tables were being rebuilt. The FSA device might have been dynamically deleted from the MVS configuration through the HCD facility. Devices should not be deleted from an FSS during a hot start; however JES3 will tolerate this condition until a hot start with refresh can be scheduled to delete the device from JES3.

In the message text:

```
/devname/ FOR /fssname/ IS NO LONGER VALID
```

- **devname** The device name on the JNAME parameter of the DEVICE statement.
- **fssname** The FSS name on the FSSNAME parameter of the DEVICE statement.

**System action:** JES3 initialization continues.

**Operator response:** If the FSS is not active, perform a hot start with refresh after the system programmer corrects the initialization stream.

If the FSS is active, JES3 does not allow a configuration to be activated if that configuration deletes the device or changes it from static to dynamic, so this message should not appear.

**System programmer response:** Remove the DEVICE statements for the deleted devices from the JES3 initialization stream.

Module: IAT3158

Explanation:

```
TCP INTERNAL MODIFY ERROR(S) WERE DETECTED—errtotal ERROR(S) WERE LOGGED
```

During a restart of JES3, JES3 attempted to restore various pieces of the checkpoint information about TCP/IP NJE definitions to the configuration made by the initialization statements. Some of the restore attempts were not successful. These errors resulted in additional messages being written to SYSLOG. This is a summary message to indicate to the operator the presence of the other messages, and the number of errors that were detected.

In the message text:

- **errtotal** The number of errors that were detected.

**System action:** JES3 initialization continues; however, some of the changes made by modify commands prior to the restart have been lost. JES3 uses the definitions made by the initialization statements.

**Operator response:** Examine the SYSLOG for messages IAT8161, IAT8163, IAT8164, IAT8165, IAT8166, and IAT8464 to determine the exact error(s) that occurred. Report these to the system programmer.
System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Descriptor Code: N/A

IAT3159

Explanation:

>>> NO DEFAULT BDT SYSID—SPECIFIED IN INITIALIZATION STREAM

A network job can be sent to other nodes with BSC or SNA networking protocols. To send a network job to a remote node using SNA protocols, a NJERMT or SYSID initialization statement must be used to define an MVS/BDT subsystem in the JES3 complex to be used to transmit network jobs.

System action: JES3 continues initializing. Because an MVS/BDT subsystem that will transmit network jobs was not defined to JES3, your node will not transmit network jobs using SNA protocols.

Operator response: If your node is part of a network, notify the system programmer. Otherwise, the message is informational.

Programmer response: Correct the NJERMT or SYSID initialization statement to identify a MVS/BDT Version 2 subsystem that will transmit network jobs. If BDT is not installed, you can specify a dummy SYSID initialization statement to suppress message IAT3159.

Programmer response: Correct the FSSDEF initialization statement.
IAT3170

Explanation:

>>>–fsstype1— FSS KEYWORD(S) USED FOR–fsstype2— FSS ARE IGNORED

At least one keyword for a fsstype1 has been encountered on an FSSDEF statement for an fsstype2 functional subsystem (FSS). The possible values for fsstype1 and fsstype2 are C/I and WRITER.

**System action:** The keywords for fsstype1 are ignored and initialization processing continues.

**Programmer response:** Correct the FSSDEF initialization statement.

---

IAT3171

Explanation:

>>> DEVICE— devname— SET OFFLINE TO GLOBAL —reasontext

The definition of the specified device is incompatible with the definition of the corresponding output writer FSS. The reason for the incompatibility is one of the following:

**COMP MODE REQUIRES GLOBAL ATTACHMENT**
Compatibility mode requires that the device be attached to the global processor; this device has no such attachment.

**FSS MODE REQUIRES ATTACHMENT TO main**
FSS mode requires that the device be attached to the processor where the FSS is assigned to run, specified by main; this device has no attachment to processor main.

**FSS fsname HAS NO ASSIGNED SYSTEM**
FSS mode has been specified for the device, but the assigned FSS fsname is unusable or has not been assigned a processor on which to run in conjunction with the current global processor.

**System action:** The device is marked offline.

**Operator response:** Use the *MODIFY,F command to correct the device mode specification or the FSS processor assignments. Use the *MODIFY,V command to vary the device online.

**Programmer response:** Change either the DEVICE statement or the FSSDEF statement to remove the incompatibility and recall the writer.
IAT3172 • IAT3174

Routing Code: 2

IAT3173

Explanation:

>>> INVALID NUMBER OF SYSTEM NAMES—SUPPLIED - DEFAULT USED

An odd number of names (3 or more) has been supplied on the SYSTEM= keyword of the FSSDEF initialization statement.

System action: JES3 ignores all values specified on the SYSTEM= keyword and substitutes system assigned defaults based on the type of FSS (C/I or writer).

Programmer response: Correct the FSSDEF statement.

Module:

        Containing                   Detecting                  Issuing
        IATINFS                     IATINFS                     IATINFS

Routing Code: 19
Descriptor Code: –

IAT3174

Explanation:

>>> SYSTEM—main—SPECIFIED AS GLOBAL—SYSTEM FOR FSS—fssname—MORE THAN ONCE

System main appears more than once as a potential global processor in the SYSTEM= operand on the FSSDEF statement for FSS fssname.

System action: The last system assignment overrides the previous one.

Programmer response: Correct the FSSDEF statement.

Module:
IAT3175

Explanation:

During a JES3 hot start or hot start with refresh, an error occurred in FSS/FSA checkpoint (FCK) processing. Either the format of the existing checkpoint is incorrect, or a permanent I/O error occurred during the reading of the existing checkpoint.

If the format of the existing checkpoint is incorrect, JES3 also provides an error reason code (in hex) as follows:

- 01 The FCK low value in the first buffer is incorrect.
- 02 The FCK low value is less than the FCK high value from the previous FCK buffer.
- 03 The FCK high value is less than the FCK low value in the current buffer.
- 04 The FCK variable length is incorrect in an FCK entry.
- 05 End-of-data occurred while processing the FSA FCK entries associated with an FSS FCK entry.
- 06 The middle or end of split record flags are not on in an FCK continuation buffer.
- 07 Both the middle and end of split record flags are on in an FCK continuation buffer.
- 08 The FCK low value in an FCK continuation buffer is incorrect.
- 09 The middle and end of split record flags are not off in an FCK buffer that is supposed to start with an FSS FCK entry.
- 0A The FCK low value is incorrect in an FCK buffer that is supposed to start with an FSS FCK entry.
- 0B During a hot start, the FCK high value in the last buffer was not equal to the number of FSSs defined.
- 0C The FCK fixed length is incorrect in an FCK buffer.
- 0D The FCK total length points past the end of the FCK buffer.
- 0E When you add the FCK total length to the address of the beginning of the FCK buffer, that location is not an FCK buffer terminator.

System action: JES3 builds a new FSS/FSA checkpoint and cancels each active FSS address space when the system where it is running connects to the JES3 global.

Operator response: After each FSS address space ends, restart the FSS.

Module:
IAT3176

Explanation:

 DEVICE NUMBER— dev— ASSIGNED to DEVICE— devname— FOR FSS— fssname— ON SYSTEM— main—

The specified device devname has been defined in FSS mode. The functional subsystem (FSS) is assigned to run on system main, where the device is attached with device number dev. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

System action: The device number is stored in the JES3 global device table entry for this device. The online/offline status and the console class for messages are set from the DEVICE statement parameters for processor main.

Operator response: Any command that uses this device can use the device name. The device number can also be used, unless this message is followed by message IAT3177.

Descriptor Code: 7

IAT3178

Explanation:

 IPL REQUIRED ON SYSTEM— system— - - - INITIALIZATION STREAM MISMATCH DETECTED—

SYSTEM system is initialized using an initialization stream that does not match that currently in use by the global. Likely, you either started the local before the global completed initialization processing or you performed a cold- or warmstart without IPLing the local. JES3 requires that you IPL all processors in the JES3 complex for either a cold- or warmstart.

System action: JES3 initialization ends.

Operator response: IPL system system and restart JES3 on that system.

Programmer response: None.
JES3 has detected the use of a statement or a keyword within a statement that is going to be removed in a future JES3 release.

In the message text:

STMT  The name of the statement

KEYWORD  The name of the keyword

System action:  JES3 initialization continues. The statement, the keyword, or both continue to be honored in this JES3 release.

Operator response: Notify the system programmer.

Programmer response: Remove the keyword or statement from the initialization stream at your earliest convenience and restart JES3 to pick up the change (hot start with refresh or warm start, as required by the keyword or statement in question).

This message is issued after a hot start or warm start is performed on the JES3 global. Initialization is complete, and restart processing is being performed to setup the environment that existed before JES3 ends (for example, jobs that are active in the MAIN scheduler element). If an error occurs, restart processing is bypassed for the job:

CLASS=class NOT DEFINED
  The job is active in the MAIN scheduler element. The job class indicated is not in the job class table. Restart of the job is bypassed because MDS and GMS require class information to schedule jobs.

FSID=fsid NOT DEFINED
  When a job is scheduled for converter/interpreter (C/I) processing to a functional subsystem (FSS) address
space, the FSS's FSID is put into the JCT. If the FSID is incorrect, JES3 cannot determine where the job is currently. The CI scheduler element for the job is marked active so that it cannot be rescheduled for C/I until the system is warm started. If the job was allowed to be rescheduled, it is possible to have it active in C/I in two address spaces.

**main NOT DEFINED**
Before restart, the initialization statement, specifying the name of the main, was changed.

**CI DRIVER NOT INITIALIZED**
The CI driver FCT was not setup by JES3 initialization (messages IAT3120, IAT3527, and/or IAT3528 indicate the reason) and there are jobs active in C/I in FSS address spaces. The CI driver controls all work returning from the C/I FSS address spaces, including jobs which have completed MVS C/I and prescan. The CI scheduler element is marked active and the job waits until the CI driver is initialized, or the system is warm started.

**PROCLIB RESTART UNSUCCESSFUL**
An error has occurred during proclib restart processing. A proclib restart is required for a proclib update job, if it had completed the DISABLE scheduler element, but not the ENABLE scheduler element before JES3 was restarted. The proclibs that the job updates are held for update and unallocated in the JES3 address space. This is done to prevent jobs that use these proclibs, from being scheduled for C/I while they are being updated. Proclib restart is unsuccessful if module IATIIPC encounters an error.

**EXRESC group ON main NOT DEFINED**
The job is active in the main scheduler element. The EXRESC definition for the group and main is not defined. Restart of the job is bypassed because GMS requires EXRESC information to schedule jobs.

**System action:** JES3 puts the job in hold and processes the next job.

**Operator response:** Notify the system programmer.

**Programmer response:** The type of response depends on the type of error, and the status of the job:

**CLASS=class NOT DEFINED**
When this occurs, all MDS restart is also bypassed. If the job is currently executing on main (hot start only), it may be using JES3 managed devices, etc. The job should be canceled or the system should be restarted so that the devices are not re-allocated to another job. This is not a problem if the job is not executing, or if JES3 has been warm started. However, the job remains in operator hold until the system is restarted, and the class is defined.

**main NOT DEFINED**
The job remains in operator hold until the system is restarted and the main is defined in the initialization stream.

**FSID=fsid IS INVALID**
In order to have the job rescheduled for C/I, JES3 must be warm started. Since a warm start requires an IPL of all the processors, no CI FSSs can be active and processing jobs. JES3 initialization clears the FSS ID in the JCT during a warm start.

**CI DRIVER NOT INITIALIZED**
To prevent jobs hanging in C/I, the system should be restarted and the CI driver initialized before main connect processing has occurred. The reason is that during main connect processing, a STOP FSS ORDER is sent to each FSS that is active, and is not being controlled by an FCT. When the FSS ends, all status indicators for the FSS are reset. If the system is restarted again, jobs being processed by the FSS address space will look as if they are still active in C/I, even though the FSS has ended.

**PROCLIB RESTART UNSUCCESSFUL**
Since restart was unsuccessful, jobs may be scheduled for C/I which use the proclib that the job is updating. If the job is active in the MAIN scheduler element, it should be canceled. This is not a problem if the MAIN scheduler element is complete, since the job is no longer updating the proclibs.

**EXRESC group ON main NOT DEFINED**
When this occurs, all MDS restart is also bypassed. If the job is currently executing on main (hot start only), it may be using JES3 managed devices, etc. The job should be canceled or the system should be restarted so that the devices are not re-allocated to another job. This is not a problem if the job is not executing, or if JES3 has been warm started. However, the job remains in operator hold until the system is restarted, and the indicated main (or *ALL) is defined to the group as an EXRESC.

Module:
IAT3182

Explanation:

COPYMARK IS AN INCORRECT KEYWORD—WHEN reason_text IS BEING USED

During JES3 initialization, JES3 found an incorrect keyword for the reason indicated by reason_text. The reason_text is one of the following:
**DEVICE IS NON-FSS, NO COPYMARKING**

the device defined in the initialization stream with the keyword COPYMARK is a non-FSS device. A COPYMARK specification is not valid for a non-FSS device.

**DGROUP=LOCAL IS IN EFFECT, DEFAULT DGRPONLY=NO**

the DGRPONLY=YES specification for the device is not valid because no DGROUP has been defined for the device.

**System action:** JES3 initialization continues using the default.

**Operator response:** Notify the system programmer.

**Programmer response:** JES3 might be initialized with an undesirable value for the keyword. If so, correct the initialization statement that has been flagged. See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com) for statement requirements. Perform a warm start or hot start with refresh to implement the correct value.

**Problem determination:** See Table III, item 5.

IAT3185

Explanation:

►► LINE ADAPTER—adr— FOR LINE lname— NOT DEFINED TO MVS - LINE DEFINITION BYPASSED◄◄

JES3 attempted to obtain a device that was not defined to MVS.

System action: JES3 continues to process the statements in the initialization stream.

Operator response: Notify the system programmer.

System programmer response: JES3 could not obtain a unit control block (UCB) for the requested device. Ensure that the requested device is defined to MVS. If the device is defined to MVS, issue the MVS DISPLAY command with the M=CONFIG option to display the device defined to MVS in your installation. If the device is not defined, include the device in the CONFIGXX member in SYS1.PARMLIB.

IAT3186

Explanation:

►► LINE ADAPTER—adr— FOR LINE lname— IS NOT A COMMUNICATION DEVICE◄◄

►► LINE DEFINITION BYPASSED◄◄

JES3 obtained a device that cannot be used for communications. A communication device allows telecommunication lines to be attached to the device. An example of a communication device is a line.

System action: JES3 continues to process the statements in the initialization stream.

Operator response: Notify the system programmer.

System programmer response: The device specified was not defined in the JES3 initialization stream as a communication device. If the communication device is used by:

- networking
  check each NJERMT the corresponding DEVICE statement

- BSC remote job processing (RJP)
  check each RJPLINE and RJPTERM statement

- SNA remote job processing (RJP)
  check the CONSOLE and DEVICE statement

IAT3225
Explanation:

REAL DEVICE CHECKPOINT DATA SET

During the current hot start, JES3 was unable to read the real device checkpoint status record, or during a local start, JES3 was unable to read the checkpoint data set.

System action: JES3 initialization continues. For REAL DEVICE CHECKPOINT or CHECKPOINT DATA SET, all real devices are initialized as defined in the initialization stream.

Operator response: Before issuing the *START,JSS command, vary on/offline any real devices after you issue the *START,JSS command. Notify the system programmer.

Programmer response: Take a dump by placing an INTDEBUG,n,message-text$$ statement in the initialization stream.
IAT326

Explanation:

NO PATHS AVAILABLE TO DEVICE—dev—FORCED OFFLINE TO JES3—

The initialization stream specifies that global device dev (supunit(support unit)) is online, but device dev has no available physical paths.

System action: JES3 initialization continues. JES3 forces device dev offline. MVS online/offline status of the device is not affected.

Operator response: If you want the device online, do any hardware switching required to ensure that a complete physical path exists between the global processor and device dev. Then vary device dev online to JES3.

IAT3227

Explanation:

MORE THAN 8 PM ALTPM DEFINED FOR DEVICE COMPLEX OVERFLOW IGNORED

The DEVICE statement defines an I/O device to JES3. This message is issued because one of these conditions occurred:

• more than eight values were specified on the PM or ALTPM parameter of the DEVICE statement.
• more than 255 unique values were specified on the PM and ALTPM parameters for all the DEVICE statements in the JES3 initialization stream.

JES3 accepts only the first eight values specified on the indicated parameter, the remaining values are ignored. The first 255 values specified on the PM or ALTPM parameters are accepted, the remaining values are also ignored.

System action: JES3 continues processing the initialization stream until it completes processing all the statements.

Operator response: Notify the system programmer.

Programmer response: Change the DEVICE statement so that no more than eight values are specified on the PM or ALTPM parameter. If more than 255 values were specified for the complex, reduce the number of values specified on the PM and ALTPM parameter on the appropriate DEVICE statements.

---

**IAT3232**

**Explanation:**

**UNRECOVERABLE ERROR WHILE ASSIGNING NON-JES3 DEVICES**

During JES3 initialization, an unrecoverable error occurred in the MVS assign service. JES3 invokes the MVS assign service to assign all the online devices that JES3 does not manage.

**System action:** JES3 initialization fails.

**Operator response:** Notify the system programmer.

**Programmer response:** Gather the system log and the dump associated with the MVS Assign failure. Perform initial diagnosis using the error recovery information saved by the MVS Assign Service during its recovery processing. If the problem persists, contact the IBM Support Center.

**Module:**

<table>
<thead>

**Routing Code:** 2

**Descriptor Code:** 7

---

**IAT3233**

**Explanation:**

**MODULE IATINVR IS INITIALIZING ASSIGNABLE DEVICES - CURRENT DEVICE dddd**

During JES3 initialization, verification of assignable devices exceeded 30 seconds. The current device being verified is dddd. This message is issued every 30 seconds while assignable devices are being verified.

**System action:** JES3 initialization continues.

**Operator response:** Observe the rate of change for the displayed device dddd. If the message is displayed repeatedly, notify the system programmer.

**Programmer response:** Check the configuration definition against the actual installed hardware. A long delay could be indicative of definitions for nonexistent devices. If the device definitions match the hardware, contact the device manufacturer.

**Module:**
IAT3234

Explanation:

During JES3 initialization, processing of the MVS VARY command or the path verification service IOSPTHV exceeded 30 seconds. In the message text, \textit{nnnn} is the first device in the range and \textit{mmmm} is the last device. This message is issued every 30 seconds during MVS VARY command processing.

\textbf{System action:} JES3 initialization continues.

\textbf{Operator response:} Observe the rate of change for the displayed device range. If the message is displayed repeatedly, notify the system programmer.

\textbf{Programmer response:} Check the configuration definition against the actual installed hardware. A long delay could be indicative of mismatched definitions between JES3 and MVS. If the device definitions match the hardware, contact the device manufacturer.

IAT3236

Explanation:

JES3 initialization was unable to create the specified cell pool. In the message text, the return code, \textit{rc}, is the return code from the IATXBPL (build cell pool) service routine.

\textbf{System action:} The system ends JES3 initialization.

\textbf{Note:} If there is not enough storage to build the cell pools, the system ends JES3 initialization with a DM002 abend.

\textbf{Operator response:} Notify the system programmer.

\textbf{System programmer response:} Check the return code to determine the type of error. See z/OS JES3 Customization for more information.
FSS initialization was unable to create either the CI, MAIN, OUTSERV, or COMMON RQ cellpool. The CI RQ cellpool is the only RQ cellpool that is created for a CI FSS address space.

**System action:** The return code from the IATXBPL (Build Cellpool) Service routine is put into register two, and a FAILDSP (DM101) is issued to end FSS initialization. See [z/OS JES3 Customization](https://www.ibm.com/support/docview.wss?uid=ssg1S00000000000000) for a description of the return codes.

**Operator response:** Notify the system programmer.

**Programmer response:** Check the return code to determine the type of error that occurred.

The use of the specified keyword is incorrect. It has been used more than once in the same initialization statement.

**System action:** The syntax and interdependencies of initialization statements are checked as far as possible.

**Programmer response:** Correct the initialization statements that have been flagged. See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com/support/docview.wss?uid=swg21277000) for statement requirements.

**Problem determination:** See Table III, item 5.

<td>IATINDT</td>
</tr>
</tbody>
</table>

Routing Code: –
Descriptor Code: –

IAT3254
Explanation:

I/O ERROR DURING BUILD OF— tab— TABLE FUNCTION IS — INCOMPLETE

During construction of the JES3 internal table or control block tab, an I/O error occurred on the JES3 queue used for intermediate work files during initialization.

System action: A noncritical system function may be left partially operable, INCOMPLETE; or be blocked out completely, DISABLED. (An I/O failure during initialization of a vital system function always results in JES3 ending. Such an error will not produce this message.)

Operator response: If the named function is necessary to continued operation, attempt a hot or local restart of JES3. If this fails, attempt a global warm start with analysis (WA). If this fails, cold start and reformat the queue extents.

Problem determination: See Table III, items 5, 6, 20, and 21.

Module:
The JES3 initialization stream contains an incorrect value xxx for the indicated keyword on the flagged initialization statement.

**System action:** JES3 assumes the default value for the respective keyword and JES3 initialization continues.

The following describes the keywords and their defaults:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPYMARK</td>
<td>C</td>
</tr>
<tr>
<td>DGRPONLY</td>
<td>NO</td>
</tr>
<tr>
<td>PDEFAULT</td>
<td>NONE</td>
</tr>
<tr>
<td>SETUPMSG</td>
<td>YES</td>
</tr>
</tbody>
</table>

**Programmer response:** JES3 might be initialized with an undesirable value for the keyword. If so, correct the initialization statement that has been flagged. See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com) for statement requirements. Perform a warm start or hot start with refresh to implement the corrected value.

**Problem determination:** See Table III, item 5.
IAT3256

Explanation:

The initialization stream contains an obsolete keyword keyword.

System action: The keyword is ignored. JES3 initialization continues.

Operator response: Remove the keyword to avoid receiving this message on future cold starts, warm starts, or hot starts with refresh.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>

<td>IATINRB</td>
<td>IATINDT</td>
</tr>
<tr>
<td>IATINDT</td>
<td>IATINSC</td>
<td>IATINDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 19

Descriptor Code: –

IAT3259

Explanation:

The specified parameter parm1 on keywd1 is not valid when used in combination with the second parameter parm2 on keywd2. For example, JES3 issues this message if a user codes JUNIT=DDD on a DEVICE initialization statement that also contains DTYPE=3820.
System action: JES3 checks the syntax and interdependencies of initialization statements. Based on the severity of the parameter mismatch, JES3 will either use a default specification (and issue other related warning messages) or terminate.

Operator response: None.

Programmer response: Change the particular initialization statement to specify a combination of values that are compatible. See z/OS JES3 Initialization and Tuning Reference for the initialization statement and its parameter relationships. Then, if necessary, restart JES3.

Module:

IATINCF  IATINCF  IATINDT

IAT3260

Explanation:

\[parm\]-- PARAMETER NO LONGER SUPPORTED--

The specified parameter is no longer supported on the JES3 initialization statement.

System action: JES3 ignores the parameter and continues processing the remaining parameters on the JES3 initialization statement. The system continues JES3 initialization.

Operator response: Inform the system programmer that the JES3 initialization statement contains an obsolete parameter. The statement should be corrected for the next restart.

System programmer response: Remove the parameter from the JES3 initialization statement.

Module:

IATINDT  IATINSL  IATINDT
IATINDT  IATINII  IATINII
IATINDT  IATINCH  IATINCH

Routing Code: Note 19        Descriptor Code: –

IAT3261

Explanation:

\[xxxxx\]-- HOME NODE NAME CHANGED TO \[yyyyyyyy\] VIA HR RESTART--

\[yyyyyyyy\]-- WILL BE USED AS THE XCF GROUP NAME--

The NJERMT HOME=YES initialization statement NAME= parameter has been changed over a hot start with refresh of JES3, and the OPTIONS initialization statement, XCFGRPNM= parameter has not been specified. This allows the XCF group name used for the JESXCF ATTACH to default to the home node for NAME=. Because the XCF group name cannot be changed over a hot start with refresh, the home node NAME= value from the last cold or warm start has been used to connect to JESXCF.

System action: The connect to JESXCF proceeds using the JESXCF group name indicated in the message.

Operator response: None. This is an informational message.

System programmer response: None. This is only an informational message.

Module:
IAT3263 • IAT3264

Explanation:

The initialization statement specified by stmt is no longer supported, but will be ignored in the initialization stream.

System action: None. JES3 ignores the initialization statement.

Operator response: None. This is an informational message.

System programmer response: When you are sure that you will not need to migrate back to a level of JES3 where this statement is supported, you should remove the statement from the initialization stream.

This is only an informational message.

Module:

IAT3264

Explanation:

An error occurred while attempting to initialize an event listen routine for the Event Notification Facility (ENF). This occurs for one of the following reasons:

- The event listen module was not found in LPA or ELPA.
- The ENFREQ request to establish the listen routine failed.

System action: JES3 initialization continues.

If the text specifies IATMDEN, jobs which require unavailable SMS resources will not continue using JES3 setup when their resources become available. To continue, these jobs must be restarted using the *RESTART,SETUP command.

If the text specifies IATCNNF, JES3 will not be able to handle console buffer constraint situations.

If the text specifies IATMSEWL, JES3 will not be notified of scheduling environment status changes. As a result, jobs may not be scheduled for execution when the scheduling environment is available or they may be scheduled for execution when the scheduling environment is not available. In the first case, if the job requires setup, a *RESTART,SETUP command will have to be issued to get the job to be scheduled for execution.

Operator response: Contact the system programmer.

System programmer response: Check SYS1.LPALIB to ensure modules IATCNNF and/or IATMDEN are defined. Also check for message IEA883I MODULE IATCNNF NOT FOUND or IATMDEN NOT FOUND in the messages.
that are issued during nucleus initialization processing. See [z/OS MVS System Messages, Vol 6 (GOS-IEA)] for more information.

</table>

Routing Code: Note 10  Descriptor Code: 3

IAT3269
Explanation:

NO VALUE FOR keyword—SPECIFIED, DEFAULT OF—nnn—USED

This message is issued during initialization stream processing. keyword is either LIMIT or INTERVAL.

In the message text:

nnn   The value assigned by JES3.

System action: Initialization continues.

Operator response: None.

System programmer response: Remove the specified keywords or add the other keyword needed. See z/OS JES3 [Initialization and Tuning Reference] for the required combinations of keywords needed for the WANTDUMP keyword on the OPTIONS statement.
IAT3270

Explanation:

>>-- INTERVAL SPECIFICATION IGNORED WHEN-- LIMIT VALUE SET TO 0 --

This message is issued during initialization stream processing. Since the LIMIT parameter specified a value of zero, the INTERVAL specification will be ignored.

System action: Initialization continues.

Operator response: None.

System programmer response: Specify a non-zero value for the LIMIT keyword, remove the INTERVAL keyword or change the INTERVAL value to zero.

IAT3271

Explanation:

>>-- KEYWORD kwd1-- IGNORED WHEN-- specvalu-- IS NOT-- SPECIFIED --

The NJERMT statement specifies an inconsistent combination of keywords.

In the message text:

kwd1
The inconsistent keyword, and is one of the following:
- BDTID
- NJEPR
- NJEPU
- NETHOLD
- PRTDEF
- PUNDEF
- PRTXWTR
- PRTTSO
- TYPE
- XNAMEREQ

specvalu
Identifies either an undefined prerequisite parameter or a defined mutually exclusive parameter, and is one of the following:
The definition of `specvalu` causes the inconsistency with `kwd1`.

**System action:** The keyword is ignored. Initialization continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Modify the statement to remove the keyword identified in the `kwd1` text, or change the definition identified in the `specvalu` text.

**Module:**

---

### IAT3272

**Explanation:**

A duplicate statement was detected. The first statement is honored.

**System action:** The duplicate statement is ignored. JES3 initialization continues.

**Operator response:** None.

**Programmer response:** None required, however, the system programmer should remove the extraneous statement.

**Module:**

---

### IAT3273

**Explanation:**

At the end of processing a JES3 initialization statement, a required keyword was detected as not being specified.

**System action:** The statement is ignored. JES3 initialization continues.

**Operator response:** None.

**Programmer response:** None required, however, the system programmer should add the keyword to the respective statement.

**Module:**
IAT3274 • IAT3275

IAT3274
Explanation:

EXTRA PARAMETERS SPECIFIED, DEFAULT parm IS BEING USED

The number of parameters specified for a keyword exceeded the maximum number of allowed parameters.

System action: If applicable, a default is provided. Otherwise, the keyword is ignored. JES3 initialization continues.

Operator response: None.

Programmer response: None required, however, the system programmer should properly specify the parameter(s).

Module:

IAT3275
Explanation:

NETSERV objectname IS ACTIVE AND NODE SOCKET HAS NOT BEEN DELETED REMAINS TYPE=TCPIP

The specified object objectname is checkpointed and active, but is not in the current configuration. Therefore, changes or deletions due to a hot start with refresh are not allowed.

System action: The specified object objectname is added back to the configuration and initialization continues.

Operator response: None.

Programmer response: None required. Optionally, add objectname to the current configuration to prevent future warnings.

Module:
IAT3276 • IAT3300

IAT3276
Explanation:

An incorrect pool partition name was found on a SPART= parameter in an NJERMT statement in the initialization
dek. The spool partition might be deleted or not defined.

System action: JES3 ignores the SPART parameter for that NJE node. It will assume the default spool partition and
JES3 initialization continues.

Operator response: None.

Programmer response: JES3 will be initialized with the default spool partition which may be undesired. If you want
to spool the NJE streams from a node to a particular spool partition, enter a valid SPART parameter in NJERMT
statement for that node.

Module:

Routing Code: Note 19

IAT3300
Explanation:

JES3 found a previous instance of the *MODIFY CONFIG command that has not yet completed:

date Date of the previous *MODIFY CONFIG change.
time Time of the previous *MODIFY CONFIG change.
sysname The system running the previous instance of *MODIFY CONFIG.

System action: The *MODIFY CONFIG command is terminated.

Operator response:
Check the status of the system sysname and make sure the JES3 address space on that system is running. If the
system is no longer operational, issue the *FLUSH command against that system.

Module:

Routing Code: None. This message is
put into the JES3OUT file associated
with the *MODIFY CONFIG
command.

Descriptor Code: Not applicable.
IAT3301
Explanation:

Failure in module IATMOSPL, MODIFY CONFIG TERMINATING

An uncorrectable error was detected by the error recovery routine in module IATMOSPL.

System action: The *MODIFY CONFIG command is terminated.

Operator response:
Analyze the output in JES3OUT from the *MODIFY CONFIG command and attempt to correct any problems reported by preceding messages.

Programmer response:
If the problem is not corrected by modifying the initialization statements, submit a problem report to IBM.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMOSPL</td>
<td>IATMOSPL</td>
<td>IATMOSPL</td>
</tr>
</tbody>
</table>

Routing Code: None. This message is logged in the JES3OUT file.

IAT3302
Explanation:

statement=keyword=old_value—CHANGED TO=new_value

The *MODIFY CONFIG command detected changes affecting system parameters. The statement value is the initialization stream statement (for example, OPTIONS), and keyword is the keyword whose value has changed from old_value to new_value.

System action: The specified parameter value is changed.

Operator response:
If the change is undesirable, use a *MODIFY command to reverse the change, or change the initialization stream member used on the *MODIFY CONFIG command and reissue the command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

---

IAT3359

Explanation:

**WARNING** ERROR DURING IATXBPL FOR OSR, RC=rc

An error was encountered during JES3 macro IATXBPL, IATXGCL, or IATXRCL processing for an output service restart record (OSR). For information about the return codes rc, see z/OS JES3 Customization for the specified macro.

System action: Output service processing continues. However, the functional subsystem (FSS) writers active before the hot start will not restart correctly. Some of the data sets being processed on the FSS writers may be re-scheduled on different writers.

Operator response: Notify the system programmer.

Programmer response: Issue the *DUMP command to provide sufficient diagnostic information. (See Chapter 30, “Problem Determination,” on page 1135.) If double printing of the output is intolerable, restart the system.

Problem determination: See Chapter 30, “Problem Determination,” on page 1135 and Table I, items 2, 3, 4, 16, 29; Table III, items 1, 2, or 3 and 4.

Routing Code: 10  Descriptor Code: 7

---

IAT3362

Explanation:

**VOLUME UNAVAILABLE—TABLE LOST OVER RESTART**

An error occurred while restoring the volume unavailable table from the checkpointed spool records.

System action: The volume unavailable table is initialized as empty.

Operator response: If the volume serial numbers of the unavailable volumes are known, issue the *MODIFY,S,VU= command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINAL</td>
<td>IATINAL</td>
<td>IATINAL</td>
</tr>
</tbody>
</table>

Routing Code: 2  Descriptor Code: 7
IAT3366
Explanation:

An error occurred while restoring the deadline scheduling data from the checkpointed deadline spool records. Some or all of the deadline-scheduled jobs no longer have a deadline entry.

System action: The jobs remain in the system and are scheduled normally without any priority changes generated by deadline scheduling.

Operator response: If the deadline-scheduled jobs in the system are known, either cancel and resubmit them or raise their priority with the *MODIFY,L,T=type,PRTY=+n command.

Problem determination: See Table III, item 11.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

Routing Code: 10
Descriptor Code: 4

IAT3395
Explanation:

JES3 is attempting to use a JESXCF service and the PC table has not yet been initialized. JES3 will wait a short time and recheck the JESXCF status.

Operator response: If the message persists, check the status of the JESXCF address space.

Programmer response: None

Module:
IAT3397 • IAT3400

IAT3397

Explanation:

The old global is being restarted as a local after a DSI was performed. Before the old global reattaches to JESXCF, it must wait until all other mains that were active when the DSI occurred have either reconnected to the new global, or have themselves been re-IPLed. Message IAT3397 is issued to inform the operator that the old global is waiting for this condition to be satisfied.

System action: The old global will wait for all active mains to reconnect before completing its initialization. IAT3397 will be issued periodically to remind the operator that the old global is still waiting. Once all active mains have reconnected, the old global will continue with initialization.

Operator response: Make sure that all active mains have reconnected to or are in the process of reconnecting to the new global.

Programmer response: None

Module:

IATINM3  IATINM3  IATINM3

Routing Code: 42  Descriptor Code: 7

IAT3400

Explanation:

The keyword indicated in the message is omitted from the GROUP or MAINPROC statement.

System action: JES3 initialization fails.

Programmer response: See z/OS JES3 Initialization and Tuning Reference for the required keywords on the GROUP or MAINPROC statement.

Module:

IATINMP  IATINMP  IATINMP

IATINGP  IATINGP  IATINGP

Routing Code: 2  Descriptor Code: 7
IAT3401
Explanation:

More than 255 job classes or groups defined **ERROR**

Only 255 CLASS or GROUP statements are allowed; more than 255 were defined.

System action:  JES3 initialization ends.

Programmer response: Correct the initialization stream to specify a maximum of 255 CLASS or GROUP statements. (See z/OS JES3 Initialization and Tuning Reference)

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINGP</td>
<td>IATINGP</td>
<td>IATINGP</td>

**Routing Code:** 2,Note 19  **Descriptor Code:** 7

---

**IAT3404**

**Explanation:**

***CONFLICTING DEVICE REQUIREMENTS ON— GROUP CARD***

A GROUP statement incorrect for one of the following reasons:
- The DEVPOOL parameter was specified more than once. You may specify only one DEVPOOL parameter.
- Both the DEVPOOL and EXRESC parameters were used to dedicate devices. You may use only one of these parameters to dedicate devices.

**System action:** JES3 initialization continues, but the second device specification encountered is ignored.

**Programmer response:** Examine the GROUP statement at fault and correct it as required for any subsequent reinitialization of JES3.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINGP</td>
<td>IATINGP</td>
<td>IATINGP</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  **Descriptor Code:** –

---

**IAT3405**

**Explanation:**

***TOO MANY—DEDICATED DEVICE TYPES SPECIFIED***

A GROUP statement containing dedicated devices contained too many different device types. It overflowed the work area obtained to build the device fence control block (DFCB) associated with this GROUP statement.

**System action:** JES3 initialization continues, but the device specification for this group is ignored.

**Programmer response:** Examine the GROUP statement for too many dedicated devices and correct it as needed. This error is unlikely to occur; it is caused by specifying approximately 80 device types when using the smallest available JES3 buffer size (1K).

**Module:**

<table>
<thead>
<tr>

IAT3421 • IAT3422

Routing Code: Note 19
Descriptor Code: –

IAT3421
Explanation:

>>>SPOOL PARTITION—spart—for main processor—main—does not exist. <<<

A spool partition named on a MAINPROC statement is not defined by an SPART statement. In the message text, spart identifies the spool partition; main identifies the processor.

System action: JES3 assigns spool output for jobs that run on the affected processor to the default spool partition.

Programmer response: If you accidentally omitted the spool partition definition during JES3 initialization, add an SPART statement to the initialization stream to define the partition. If the spool partition is incorrectly named on the MAINPROC statement, correct the MAINPROC statement.

Problem determination: See Table III, item 5.

Module:

Routing Code: 2
Descriptor Code: 7

IAT3422
Explanation:

>>>GROUP—group—will not be checkpointed for processor—main <<<

The EXPRESC parameter on the GROUP initialization statement was used to specify the execution resources for a job class group. JES3 will not checkpoint the execution resources for the group because the number of resources would cause the checkpoint record to exceed the length of the buffer.

System action: JES3 will not checkpoint the record and continues initialization processing.

Operator response: Contact the system programmer.

System programmer response: Recalculate the size of the buffers for the installation. If the size was not calculated correctly:
1. correct the buffer size on the BUFFER initialization statement
2. restart JES3 using a COLD start

Otherwise, determine which execution resources could be removed from the job class group.

Module:

Routing Code: Note 19
Descriptor Code: –
IAT3423
Explanation:

During a hot start with refresh, a MAINPROC statement for a processor was changed, but the processor that the statement describes has not been IPLed. The parameter in question defines a table or resource that is created at IPL time and therefore requires the processor to be IPLed.
In the message text:

parm The parameter for which a change was detected; this will be either FIXPAGE, PRTPAGE/CSA, or PRTPAGE/AUX.
main The name of the MAINPROC where the change was detected.

System action: JES3 waits for you to reset the processor in question, or reply CANCEL.
Operator response: Reset the processor in question or reply CANCEL. If you reply CANCEL, JES3 issues a DM026 abend.
System programmer response: None.

**Routing Code:** 2  
**Descriptor Code:** 7

---

**Explanation:**

**—MAINPROC—*main—is the global and cannot be deleted—**

If the message text contains MAINPROC CHANGE, ADDITION, OR DELETION: During a hot start with refresh, one or more MAINPROC or FORMAT/TRACK statements were changed, added or deleted, and there is at least one active processor that is not at the z/OS V1R4 JES3 level or higher (for the MAINPROC change), or z/OS V1R13 JES3 level (for the FORMAT/TRACK statement change). All such processors must be re-IPLed in order to pick up the MAINPROC, FORMAT or TRACK changes.

If the message text contains SPOOL CONFIGURATION CHANGE: During a hot start with refresh or upon entering the *MODIFY REFRESH command, one or more DYNALLOC, TRACK or FORMAT statements were changed or added, and there is at least one active processor that is below the z/OS V1R13 level; all such processors must be re-IPLed in order to pick up the spool configuration changes.

**System action:** JES3 waits for you to reset the processor in question, or reply CANCEL.

**Operator response:**

Reset all down level processors, or reply CANCEL. An IAT2061 message will be issued for each processor that must be reset. If you reply CANCEL, JES3 issues a DM026 abend.

**System programmer response:**

None.

212  z/OS V2R1.0 JES3 Messages
IAT3430
Explanation:

The SYSNAME of the processor being initialized does not match any system name specified on a MAINPROC statement. The system name of the processor is xxxxxxxx.

System action: JES3 initialization ends.
Programmer response: Correct the NAME= parameter on the MAINPROC statement for the system being initialized. It must match the MVS SYSNAME of the processor to initialize JES3.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>

<tr>
<td>IATINM3</td>
<td>IATINM3</td>
<td>IATINM3</td>
</tr>
</tbody>
</table>

Routing Code: 2,10  Descriptor Code: 7

IAT3433
Explanation:

The JUNIT parameter on a DEVICE statement does not define this processor main as the JES3 processor which is being initialized. This is not a valid condition since JES3 builds a DEVICE definition for any system that is not explicitly defined as a DEVICE,DTYPE=SYSMAIN if a MAINPROC statement exists and is defined correctly.

System action: JES3 initialization ends.
System programmer response: If no fix exists, contact the IBM Support Center.

Module:

Chapter 6. Initialization Messages  213
IAT3438 • IAT3441

Routing Code: 2,10  Descriptor Code: 7

IAT3438
Explanation:

An error occurred in a PGFIX macro while attempting to page fix areas in CSA during main service initialization.

System action: JES3 initialization ends.

Programmer response: See [z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU] for an explanation of the return code and ECB completion code from PGFIX. Correct the error, repeat the IPL of the MVS, and restart JES3.

Module:

IAT3441
Explanation:

An error occurred during the creation or initialization of the JES3 auxiliary address space. The reason code specifies the reason for the failure. Possible reason code values and their explanations are:

rc  Explanation
01  The GETMAIN for the USAM PBUFs in the JES3 auxiliary address space failed.
02  The PAGEFIX for the USAM PBUFs in the JES3 auxiliary address space failed.
05  The GETMAIN for the Program Call Descriptor (PCD) table failed.
06  The GETMAIN for the ETD table failed.
07  The AXSET macro failed.
0B  An error occurred while creating the JES3 auxiliary address space. Register 0 contains the reason code and register 15 contains the return code from the Create Address Spaces macro (ASCRE).
0D  Cross memory module IATDMXM was not LOADED successfully.
10  The timeout ECB was posted (cross memory POST failed in the JES3 auxiliary address space).
13  The LXRES macro failed.
14  The ETDEF macro failed.
15  The ETCRE macro failed.
16  The GETMAIN for the Entry Table Definitions failed.
17  The ETCON macro failed.
18  The ATTACH to IATDMCB failed.
19  The GETMAIN for the IATDMCB module work area failed.
20  The IXZXIXAT macro to attach JES3AUX to JESXCF failed.
The IXZIXMB macro to access the default mailbox failed.

The IXZIXMD macro to delete the default mailbox failed.

The IXZIXMB macro to create the multisystem core buffer mailbox failed.

The GETMAIN for the data buffer and related work area failed.

The ESTAEX macro in IATDMCB failed.

The timeout expired for multisystem core buffer task initialization.

JES3 appends *** ABEND *** to message IAT3441 when module IATINXM ends and the reason code in message IAT3441 is anything except 0B or 10.

**System action:** JES3 dumps one or two address spaces. If the system programmer has directed the dump to a printer, JES3 dumps only the JES3 address space. If the system programmer has directed the dump to the SYS1.DUMP data set, JES3 dumps the JES3 address space as well as the JES3 auxiliary address space.

For all reason codes, JES3 initialization continues. The JES3 address space is not created, however.

**Programmer response:** Check the PRTPAGE parameter on the MAINPROC statement to verify that you did not request more storage than is available. If the request for storage is valid, analyze the dump to determine what caused the error.

**Problem determination:** See Table III, items 5, 6, and 7.

</table>

**Routing Code:** Note 19

**Descriptor Code:** –

---

IAT3501

**Explanation:**

>>>CONVERTER/INTERPRETER INITIALIZATION IS COMPLETE [FSS=fssname, ASID=asid]

A new converter/interpreter subtask has been initialized. This occurs when:

- All active C/I subtasks are in use and the CI DSP max count allows another C/I subtask to be attached.
- A C/I subtask ended while processing a job, and a new one is initialized in its place.

The functional subsystem (FSS) name and ASID are also displayed if the C/I subtask has been initialized in an FSS address space.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</thead>
<tbody>
<tr>
<td>IATIIMS</td>
<td>IATINAT</td>
<td>IATINAT</td>
</tr>
</tbody>
</table>

**Routing Code:** 42

**Descriptor Code:** 7

---

IAT3504

**Explanation:**

>>>CONVERTER/INTERPRETER FAILED INITIALIZATION [FSS=fssname, ASID=asid]

The JES3 global or a CI FSS address space failed in its attempt to initialize a converter/interpreter subtask. If the error occurred during the initialization of a functional subsystem (FSS), the FSS name and ASID are included in the message.

**System action:** The converter/interpreter subtask that ended is cleaned up. Messages IAT4235 and IAT4236 are issued if additional action is taken.

**Operator response:** Notify the system programmer.

**Programmer response:** Check the SDUMP taken by the subtask's ESTAE exit to determine why the failure occurred.

**Module:**
IAT3505

Explanation:

►►—INVALID KEYWORD—keyd—ON STATEMENT—statement—**WARNING**

The keyword that appears on the JES3 initialization statement is not valid.

System action: JES3 ignores the statement and continues initialization.

Operator response: Notify the system programmer.

Programmer response: Correct the keyword and perform a cold start, warm start, or hot start with refresh if required.

Module:

IATINIF
IATINII

Routing Code: Note 19
Descriptor Code: –

IAT3506

Explanation:

►►—operand—KEYWORD OPERAND ON STATEMENT—statement—HAS INVALID LENGTH.

►►—IS IGNORED—**WARNING**

The operand on the specified initialization statement has an incorrect length.

System action: Depending on the operand, JES3 ignores either the operand or the entire statement. JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: Correct the operand and perform a cold start, warm start, or hot start with refresh if required.

Module:

IATINII

Routing Code: Note 19
Descriptor Code: –
IAT3507

Explanation:

**ERROR WHILE ATTEMPTING OPEN FOR DDNAME—**

An attempt to perform the indicated operation on the procedure library data set defined by the specified DD statement was unsuccessful.

System action: JES3 attempts to continue, but any references to the specified procedure library will probably result in the job abending.

Programmer response: Check the DD statement for validity and ensure that the specified data set actually exists.

Problem determination: See Table III, item 5.

Module:

<table>

<td>IATINIF</td>
<td>IATINIF</td>
</tr>
</tbody>
</table>

Routing Code: Note 19

Descriptor Code: –

IAT3509

Explanation:

**MISSING DD STATEMENT, DDNAME=**

The specified ddname is not allocated to JES3. This is issued only when the procedure library ddname IATPLBST (the standard, default procedure library) is not allocated.

System action: JES3 initialization ends.

Operator response: Notify the system programmer.

Programmer response: The procedure library may not have been allocated for one of the following reasons:
- The procedure library was deleted before the restart. If the procedure library is desired, run a job to recreate the procedure library using started system; then restart JES3.
The DD statement for this procedure library in the JES3 procedure is missing. Add a DD statement for this procedure library to the JES3 procedure and restart JES3.

The DYNALLOC statement for this procedure library in the JES3 initialization stream is missing. Add a DYNALLOC statement for this procedure library to the JES3 initialization stream and restart JES3.

The dynamic allocation of this procedure library (DYNALLOC statement) failed, and the operator allowed initialization to continue. Check the dynamic allocation error messages/return codes to determine the cause of the problem.

Module:

<table>

</tbody>
</table>

JES3 initialization continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the field in error for the next restart.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINII</td>
<td>IATINII</td>
<td>IATINII</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** –

---

**IAT3514**

**Explanation:**

```
>>>REGION PARAMETER—CONTAINS ERROR...DEFAULT—VALUE USED. REGION REGION=nnnnx—**WARNING**——<<<
```

An incorrect value was specified for the REGION= parameter on the CIPARM initialization statement. REGION=nnnnx identifies the parameter in error. See [z/OS JES3 Initialization and Tuning Reference](#).

**System action:** JES3 uses the region size specified or defaulted to in the CIPARM option list. JES3 initialization continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the field in error for the next restart.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINII</td>
<td>IATINII</td>
<td>IATINII</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** –

---

**IAT3515**

**Explanation:**

```
>>>NO INTERPRETERS ARE ACTIVE——FSS=fssname,—ASID=asid——<<<
```

All converter/interpreter subtasks have ended during JES3 or CI FSS initialization. Message IAT3504 is issued for each CI subtask that failed.

**System action:** If this occurs in the JES3 address space, initialization continues. No jobs will enter C/I processing until a C/I subtask is initialized using the *MODIFY X D=CI,MC=(nnnnn,nnnn) command. If the installation has defined any CI FSSs, they are not started, since the CI FSS is a demand select job and requires C/I processing. If the error occurs in a CI FSS address space, a DM204 abend is issued and the FSS ends.

**Operator response:** See message IAT3504.

**Module:**
IAT3516

Explanation:

JES3 detected an incorrect parameter on the CIPARM initialization statement. The parameter was either inconsistent with other valid parameters previously specified with the same AUTH parameter, or the parameter is not one of the allowable AUTH parameters.

In the message text:

parm The non-valid AUTH parameter specification.

System action: JES3 ignores the parameter. If there are no valid AUTH parameters specified, JES3 uses the default of AUTH=ALL.

Operator response: None. The messages is only written to the JES3OUT data set.

System programmer response: Correct the parameter for next restart.

Module:

IAT3517

Explanation:

A converter/interpreter subtask has ended and has completed DETACH processing. This occurs after the operator decreases the batch or demand select CI DSP max counts using the *MODIFY X or *MODIFY F commands.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:
IAT3518
Explanation:

A data set name specified on a RESDSN statement does not follow the JCL standards for coding a data set name.

System action: JES3 ignores the statement and JES3 initialization continues.

Operator response: Notify the system programmer.

Programmer response: Correct the data set name and perform a cold start, warm start, or hot start with refresh.

Module:

Routing Code: Note 19
Descriptor Code: –

IAT3520
Explanation:

The default CIPARM ID to be used for TSO logons, started tasks, or internal reader submitted jobs was not found in the CIPARM table.

System action: JES3 initialization continues. The default CIPARM ID/CI parameter list (01) will be used for all jobs of this type during converter processing.

Operator response: Notify the system programmer.

Programmer response: Correct the parameter on the STANDARDS statement and perform a cold start, warm start, or hot start with refresh.

Module:

Routing Code: Note 19
Descriptor Code: –

IAT3525
Explanation:

The default procedure library ID to be used for TSO logons, started tasks, or internal reader submitted jobs was not found in the procedure library table.

System action: JES3 initialization continues. The default procedure library (IATPLBST) is used for all jobs of this
type that use a procedure library (during C/I), and did not specify a procedure library on the //**MAIN statement.

Note: IATPLBST is required or JES3 initialization fails.

**Operator response:** Notify the system programmer.

**Programmer response:** The error may be caused because of incorrect syntax, or because the procedure library is not allocated to JES3:

- Correct the parameter on the STANDARDS statement (if incorrect), and restart the system.
- Add a IATPLBxx (where xx is the procedure library ID) DD statement to the JES3 procedure. This causes the procedure library to be allocated when JES3 is started.
- Add a DYNALLOC statement for this ddname to the JES3 initialization stream. This causes the procedure library to be dynamically allocated during JES3 initialization.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINIP</td>
<td>IATINIP</td>
<td>IATINIP</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** –

---

**IAT3526**

**Explanation:**

 Hiệp 24—PROCIB DDNAME-<ddn> NOT ALLOCATED. PROCIB ENTRY NOT BUILT

The specified or default <ddn> is not allocated to JES3. A PROCIB entry was not built for the specified <ddn>.

**System action:** JES3 continues but does not build the table for this procedure library.

**Operator response:** Notify the system programmer.

**System programmer response:** The procedure library may not have been allocated for one of the following reasons:

- The procedure library was deleted before the restart. If the procedure library is desired, run a job to recreate the procedure library; then restart the system.
- The DD statement for this procedure library in the JES3 procedure is missing. Add a DD statement for this procedure library to the JES3 procedure and restart the system.
- The DYNALLOC statement for this procedure library in the JES3 initialization stream is missing. Add a DYNALLOC statement for this procedure library to the JES3 procedure and restart the system.
- The dynamic allocation of this procedure library (DYNALLOC statement) failed, and the operator allowed initialization to continue. Check the dynamic allocation error messages/return codes to determine the cause of the problem.

**Module:**

</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** –

---

**IAT3527**

**Explanation:**

 Hiệp 24—CI DRIVER FUNCTION NOT INITIALIZED

The installation defined CI FSSs (FSSDEF statements) but the CI driver FCT could not be initialized. Messages
IAT3020 and/or IAT3528 may also be issued to indicate what happened.

**System action:** The CI driver FCT is not initialized; therefore, no CI FSS address spaces can be started. If this is a hot start, communication between the global and any active CI FSSs is not possible. In addition, the CI scheduling installation exits, IATUX46 and IATUX49, will not be called for jobs scheduled for C/I processing.

**Operator response:** Notify the system programmer.

**Programmer response:** Messages IAT3020 and IAT3528 provide more detail about the problem. If neither of these messages was issued, the CI driver was not initialized because the CI driver DSP dictionary entry in module IATGRPT is incorrect or missing.

**Module:**

Routing Code: 2  Descriptor Code: 7

---

**IAT3610**

**Explanation:**

\[**––THE DEVICE NUMBER—devnum—ASSOCIATED WITH SETNAME—xxx—IS**–**ERROR**–\]

\[**– IN MVS **ERROR**–\]

The device number specified on the XUNIT parameter for a DEVICE statement was either:

- Not defined in the MVS I/O definition.
- Defined in the MVS I/O definition, but with a different device type than the one specified on the XTYPE parameter of the DEVICE statement.

In the message text:

- devnum
  - The device number of the XUNIT parameter.

- xxx
  - The XTYPE specified on the DEVICE statement.

- err
  - One of the following error texts:
    - **UNDEFINED**, which indicates that the device unit is undefined in MVS.

228 z/OS V2R1.0 JES3 Messages
• **DEFINED INCONSISTENTLY**, which indicates that the MVS and JES3 definitions specify different device types.

**System action:** JES3 initialization continues.

**Operator response:** Notify the system programmer.

**Programmer response:** If the device is undefined to MVS, add its definition or remove the definition from JES3. If the device is defined inconsistently, change the JES3 XTYPE parameter to match the MVS definition, or change the MVS definition to match the JES3 XTYPE parameter.

**Module:**

</tr>
</thead>
<tbody>
<tr>
<td>IATINMD</td>
<td>IATINMD</td>
<td>IATINMD</td>
</tr>
</tbody>
</table>

IAT3628
Explanation:

➤➤IPL REQUIRED, NO MORE SETNAMES CAN BE ADDED—➤➤

This message is issued on the local system during JES3 initialization to indicate that the number of SETNAME or
XUNIT additions made during a hot start with refresh have exceeded the maximum. In order to make the additions, an IPL is now required on the local.

The maximum number of additions that can be made between IPLs of a local are:

- 20 SETNAME definitions, where each entry specified in either the NAMES= or XTYPES= parameter counts as a definition.
- \( m \times 100 \) XUNITs, where \( m \) is the number of MAINPROC statements and each XUNIT defined with a main name of *ALL counts as \( m \) definitions.

In the message text:

**SETNAMES**
Indicates that the maximum number of SETNAME additions has been exceeded.

**XUNITS**
Indicates that the maximum number of XUNIT additions has been exceeded.

**System action:** JES3 initialization ends.

**Operator response:** Notify the system programmer.

**System programmer response:** In order for the latest SETNAME or XUNIT additions to take effect, the local system must be IPLed. However, you can postpone the IPL further by deleting some XUNITs or SETNAMEs (which may or may not be the ones most recently added), performing a hot start with refresh on the global, and restarting JES3 on the local. In order to postpone an IPL in this manner, the same type of entry as indicated in this message must be deleted. You cannot postpone an IPL that is required because of XUNIT additions by deleting SETNAMEs, nor can you postpone an IPL that is required because of SETNAME additions by deleting XUNITs.

</thead>
<tbody>
<tr>
<td>IATINDYD</td>
<td>IATINDYD</td>
<td>IATINDYD</td>
</tr>
</tbody>
</table>

Routing Code: 2                  Descriptor Code: 7

IAT3632
Explanation:

NO DEFAULT DYNALDSN SPECIFICATION — PROTECT= (*) ASSUMED

No default was specified on the DYNALDSN initialization statement. The final specification should be either BYPASS= (*) or PROTECT= (*). Since neither was specified, PROTECT= (*) is assumed. This means that all data sets not specifically bypassed will be protected through JES3 data set allocation.

System action: JES3 initialization continues with PROTECT= (*) assumed.

Operator response: Notify the system programmer.

System programmer response: Add a default DYNALDSN statement specifying either BYPASS= (*) or PROTECT= (*).

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINDYD</td>
<td>IATINDYD</td>
<td>IATINDYD</td>
</tr>
</tbody>
</table>

Routing Code: Note 19  Descriptor Code: –

IAT3633
Explanation:

ILLOGICAL DYNALDSN SEQUENCE BYPASS ds2 IS ENTIRELY CONTAINED IN

An illogical sequence of either PROTECT= or BYPASS= parameters has been read on the DYNALDSN initialization statement. The specification dsn1 was read first and dsn2 was read last, but dsn2 will not be used since the range of data set names read first entirely covers the data set name or names specified as dsn2.

**System action:** JES3 continues to process the initialization statements. If both specifications are the same (both PROTECT or both BYPASS), the message is treated as a warning only. Otherwise JES3 initialization ends.

**Operator response:** Notify the system programmer.

**Programmer response:** Verify the specifications on the DYNALDSN initialization statement. See z/OS JES3 Initialization and Tuning Reference.

**Module:**

</tbody>
</table>

**Routing Code:** 2, Note 19 **Descriptor Code:** 7

---

**IAT3634**

**Explanation:**

**SYSTEM NAMES DO NOT MATCH FOR—main,—SMS DISABLED**

During JES3 initialization, JES3 determined that the main specified on the NAME parameter of the MAINPROC initialization statement did not match the system name specified at IPL time. At IPL time the main is specified by the SYSNAME parameter in the IEASYSxx member that is used to IPL the processor.

**System action:** JES3 does not invoke SMS on the specified processor. JES3 processing continues.

**Operator response:** Notify your system programmer.

**System programmer response:** To correct the problem, do one of the following:

- Re-IPL the system and specify SYSP=xx so that the SYSNAME parameter in the SYS1.PARMLIB member IEASYSxx matches the NAME parameter specified on the MAINPROC statement, or
- Change the NAME parameter on the MAINPROC statement so that it matches the SYSNAME parameter. Warm start JES3.

---

**IAT3640**

**Explanation:**

**THE FOLLOWING DEVICES WITH UNITNAME—name—are UNAVAILABLE FOR ALLOCATION:**

---

Chapter 6. Initialization Messages 235
JES3 has detected a subgeneric split. Some but not all of the devices in a subgeneric group were defined on DEVICE statements. The subgeneric group was defined to MVS with the SYSGEN UNITNAME macro instruction identified by name. (When you define devices in a subgeneric group to JES3, you must code a DEVICE statement for each device in the subgeneric group.)

The meanings of the terms in the message are:

name
   The name of the subgeneric group that was split.

dev
   The number of a device that is in the subgeneric group but is not defined on a DEVICE statement.

generic type
   The generic device type of device dev.

UNKNOWN
   JES3 could not determine the generic device type.

System action: If the device(s) are mountable, JES3 ensures that MVS cannot allocate the affected device(s). JES3 does this by marking the device(s) as JES3-managed. If the device(s) are permanently resident, then MVS or SMS (if the device(s) are SMS-managed) can allocate the device. However, in either case, JES3 cannot allocate the devices because they were not defined on DEVICE statements. JES3 initialization continues.

Programmer response: If the device(s) specified by dev are not physically attached to the JES3 system that received this message, or if the device(s) are SMS-managed, no action is required. Otherwise, take one of the following actions:

- Define all devices in the subgeneric group to JES3 by ensuring that the initialization stream contains a DEVICE statement for each device in the subgeneric group.
- Remove DEVICE statements from the initialization stream for all devices that belong to the same subgeneric group as the device identified by dev, and that were defined to JES3.

After taking one of these actions, reinitialize JES3.

Problem determination: See Table III, items 5, 6, and 11.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATINMD</td>
<td>IATINMD</td>
<td>IATINMD</td>
</tr>
</tbody>
</table>

Routing Code: Note 19

Descriptor Code: –

Explanation:

UNABLE TO BUILD CELL POOL, name=RETURN CODE=rc

The main device scheduler attempted to build a cell pool used to contain allocation requirements lists (ARL). JES3 uses an ARL to contain information on resources that are unavailable to the job.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: Since JES3 was unable to build a cell pool for ARLs, JES3 must perform more I/O to process an allocation request. To improve the performance of your installation, use the return code from the IATXBPL macro to determine the error.

Problem determination: Table I, item 3. Table III, items 1 or 2 and 4.
IAT3657
Explanation:

>>>ERROR BUILDING THE—ctype—CELL POOL RETURN CODE—rc—<<<

JES3 detected an error while trying to build the named pool or there was not enough storage available to build a cell pool.
In the message text:

ctype
Names the type of cell pool and is one of the following:
  • JESMSG
  • LOCAL
  • TEXT
  • IATCNWO

rc Return code from the IATXBPL macro.

System action: JES3 ends processing.
Operator response: Notify the system programmer.
System programmer response: Use [OS MVS System Codes] and the return code from the IATXBPL macro to diagnose the problem.

IAT3690
Explanation:

>>>-IS AN INVALID MSGROUTE CONSOLE **ERROR**-<<<

If INVALID is indicated, the console consname specified on the MSGROUTE statement for the active system is an invalid or reserved console name, or an error occurred validating the name.
If UNDEFINED is indicated, the console consname specified on the MSGROUTE statement for the active system is not known to the sysplex at this time.

System action: JES3 initialization continues. If INVALID is indicated, the console name is ignored. If UNDEFINED is indicated, the console name is used to build the MSGROUTE table.
For an MCS console, message delivery will begin when the system to which the console is attached joins the sysplex.
For an extended MCS console, message delivery will begin when the program defining the console is started.

Programmer response: Correct the console name if INVALID is indicated before the next JES3 initialization.
IAT3692 • IAT3695

Explanation:

JES3 issues this message during initialization or during *MODIFY,CONFIG command processing. This message indicates that there is no corresponding CONSOLE initialization statement for a RJPWS statement.

In the message text:

wsname  The workstation name that is missing a CONSOLE definition.

System action: JES3 initialization or *MODIFY,CONFIG processing continues, and the specified workstation is defined, but without a functioning console.

Operator response: Notify the system programmer.

Programmer response: Add a CONSOLE statement for the specified workstation name.

IAT3695

Explanation:

There is no RJPTERM or RJPWS statement which contains a name (N= parameter) that matches the JNAME on the CONSOLE statement.

If the message is issued during JES3 initialization, the text RJPWS/RJPTERM is present. If the message is issued during the processing of the MODIFY,CONFIG command, the text RJPWS is present.

In the message text:

con  The name of the console that is missing an RJP definition.

System action: JES3 initialization or *MODIFY,CONFIG processing continues, but the specified console is ignored.

If this message is issued during a hot start with refresh where a RJPWS or RJPTERM statement that was previously defined has been removed, but the corresponding CONSOLE statement has not also been removed, the console is deleted.

Operator response: Notify the system programmer.

Programmer response: For an RJP console, add a correct RJPTERM statement or remove the CONSOLE statement.
IAT3696

Explanation:

During JES3 initialization or *MODIFY,CONFIG processing, JES3 found a CONSOLE statement that was already defined with this name.

In the message text:

console The name of the duplicate console.

System action: JES3 initialization or *MODIFY,CONFIG processing continues. The duplicate console is ignored.

Operator response: Notify the system programmer.

Programmer response: Remove the duplicate console.

Module:

IAT3706
Explanation:

FSS WRITER PENDING DATASET QUEUE MANAGER—ERROR. ERROR REASON CODE IN REGISTER 9

A logic error has been found while running under a WTR DSP. Register 9 contains the error code which is described in the description of DM655 in z/OS JES3 Diagnosis.

System action: The WTR DSP fails with dump code DM655. JES3 attempts to reinstate a writer for the printer.

Operator response: Notify the system programmer.

Programmer response: Determine the reason for the failure using the error code in register 9. (There is a probable logic error in the code.) See z/OS JES3 Diagnosis for a description of DM655 and the error codes returned in register 9.

Problem determination: Table I, items 2, 3, 4, 16, 29; Table III, items 1, 2, 3, and 4.

Routing Code: 10
Descriptor Code: 3,4

IAT3707
Explanation:

OUTPUT SERVICE RESTART OSR—FREE CELL ERROR

An error was encountered when invoking module IATOSRS to delete a non-existing cell.

System action: The WTR DSP fails with an abend code of DM657. JES3 attempts to reinstate a writer for the printer.

Chapter 7. Failsoft and Abend Messages 243
### IAT3708 • IAT3709

**Operator response:** Notify the system programmer.

**Programmer response:** See [z/OS JES3 Diagnosis](#) for a description of the abend code DM657.

**Problem determination:** Table I, items 2, 3, 4, 16, 29; Table III, items 1, 2, or 3 and 4.

**Module:**

**Routing Code:** 10

**Descriptor Code:** 3,4

---

### IAT3708

**Explanation:**

```
   >>>--dspname (devname)--IS BEING REINSTATED-- FOR FSS--fssname--, ASID--asid--
```

The designated DSP is being reinstated for a retry attempt.

If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name and address space ID `asid` appear with the message. The absence of the text enclosed by brackets indicates the failure occurred during JES3 initialization.

**System action:** The DSP is reinstated.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** 10

**Descriptor Code:** 3,4

---

### IAT3709

**Explanation:**

```
   >>>--dspname (devname)--IS BEING TERMINATED-- FOR FSS--fssname--, ASID--asid--
```

After a program check, a FAILDSP macro, or *FAIL command, the DSP could not recover through its JESTAE exit routines (recovery routines).

If the failure occurred during the initialization of a functional subsystem (FSS), the functional subsystem name and address space ID `asid` appear with the message. The absence of this text indicates the failure occurred during JES3 initialization.

**System action:** The DSP ends.

**Operator response:** None. This is an informational message.

244 z/OS V2R1.0 JES3 Messages
IAT3710

Explanation:

—ERROR PROCESSING SWB CONTROL BLOCKS— BY OUTPUT SERVICE—

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout. The scheduler work block (SWB) data was in error. If the function control table (FCT) reported in message IAT3713 is a JES3 output writer, JES3 found the error during exit initialization processing for either installation Exit IATUX20 or IATUX21. If the reported FCT is a modify output service FCT, JES3 found the error when reading the SWB file before JES3 could modify that file.

System action: The FCT fails with abend code DM670. If the FCT is an output service writer, JES3 continues to process the data set without the data from the SWB file. If the FCT is a modify output service FCT, JES3 could not make some or all of the changes.

Operator response: Notify the system programmer. If the problem persists, place the active job in operator hold status (*F J=nnn,H), and then, if the job is on an output writer, restart the writer with the RSCD parameter (*R wrt,RSCD).

Programmer response: See z/OS JES3 Diagnosis for a description of abend code DM670.

IAT3711

Explanation:

—AN IATXCKPT REQUEST TO WRITE A NEW CHECKPOINT—RECORD, OR TO CHANGE THE SIZE OF AN EXISTING—

—RECORD, OR TO PURGE A RECORD WAS ILLEGALLY—ISSUED BY A DSP EXECUTING IN OTHER THAN THE—

—JES3 GLOBAL ADDRESS SPACE.—

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout for a DM060 failure. This message results when a DSP running on a JES3 local processor or in a functional subsystem (FSS) address space attempts to create a new checkpoint record, attempts to update and change the size of an existing record, or attempts to purge a checkpoint record. These operations are not allowed from a JES3 local processor or an FSS address space.

System action: If the DSP that issued the request does not elect to retry, JES3 ends the DSP and continues processing. If the error occurred during JES3 initialization, JES3 ends with a system completion code of 2FB.

Operator response: Notify the system programmer.

Programmer response: Follow the instructions listed in Chapter 30, “Problem Determination,” on page 1135.

Problem determination: See Chapter 30, “Problem Determination,” on page 1135, Table III, item 1.

MOD BASE= addr—DISP= xxxxxx—APAR NUMBER= xxxxxx—PTF= xxxxxx

PSW AT TIME OF FAILURE xxx—ILC n REASON nnnnnnnn—THE FAILING INSTRUCTION IS
This multi-line message gives logout information for a JES3 or FSS failure. If the failure occurred in a functional subsystem (FSS), the functional subsystem name \textit{fssname} and address space ID \textit{asid} appear in the message. If this text does not appear in the message, the failure occurred in JES3. This message provides the following information:

\textbf{DATE}={\textit{yyddd}}
- Year and day the failure occurred

\textbf{TIME}={\textit{hhmmsst}}
- Hour, minute, second, and tenth of a second of the time of day the failure occurred

\textbf{JES3|FSS FAILURE NUMBER}={\textit{nnnn}}
- The unique JES3 or FSS failure number

\textbf{ABEND} or \textbf{FAILED}
- Type of failure

\textbf{IN FSS}={\textit{fssname}}, \textbf{ASID}={\textit{asid}}
- The functional subsystem (FSS) \textit{fssname} and address space ID \textit{asid} of the failing FSS.

\textbf{Sxxx} or \textbf{Uyyy} or \textbf{DMzzz}
- Failure code where Sxxx is a system completion code, Uyyy is a user completion code, and DMzzz is a JES3 diagnostic message code. See \textit{z/OS JES3 Diagnosis} for explanation of the DM codes.

\textbf{ACTIVE FCT}={\textit{dspname}}
- The name of the function control table that was active at the time of the failure

\textbf{ASSOCIATED REMOTE DUMP: ASID}={\textit{rasn}} \textbf{ON} \textit{rsys}
- The ASID of a dump requested on the specified local system.

\textbf{DEVICE}={\textit{dev}} or \textbf{NONE}
- The number of the device used with the failing FCT, or NONE if no device was used

\textbf{INITIALIZATION}
- The failure occurred during initialization

\textbf{FCT FAILURE NO}={\textit{nnnn}}
- The failure count for the failing FCT

\{ \textbf{JOB NAME}={\textit{jobname}}, \textbf{JOB NUMBER}={\textit{jobno}} \}
\{ \textit{jobname} (\textit{jobid}) \}
- Name, number and identifier of the job active at the time of failure

\textbf{MODULE}={\textit{module}}
- Name of either the failing module or the calling module

\textbf{MOD BASE}={\textit{adr}}
- Base address of either the failing module or the calling module

\textbf{DISPLACEMENT}={\textit{xxxxxx}} or \textbf{DISP}={\textit{xxxxxx}}
- Displacement into the failing module or into the calling module

\textbf{APAR NUMBER}={\textit{xxxxxxx}}
- The specified number is the most recent APAR number that applies to the specified module. If ????? appears after APAR NUMBER, JES3 could not find the apar number of the failing module in the IATYMOD. A possible cause is the IATYMOD macro was not expanded within the first 255 bytes of the failing module.

\textbf{PTF NUMBER}={\textit{xxxxxxx}}
- The specified number is the most recent PTF number that applies to the specified module. If ????? appears after
PTF NUMBER, JES3 could not find the PTF number of the failing module in the IATYMOD. A possible cause is
the IATYMOD macro was not expanded within the first 255 bytes of the failing module.

PSW AT TIME OF FAILURE xxx
Program status word at the time of failure

ILC n
Instruction length code. If an abend occurred because you pressed the RESTART key, the information in this field
is not valid.

REASON nnnnnnnnn
Reason code associated with the abend code.

THE FAILING INSTRUCTION IS instruction or IMPRECISE (ILC = 0) or INACCESSIBLE
The instruction is given, or IMPRECISE indicates that no instruction could be found, or INACCESSIBLE indicates
the instruction could not be accessed.

REGISTERS AT TIME OF FAILURE
Lists general registers 0-15 and their contents at the time of failure.

System action: JES3 might obtain a dump of the failing address space and the other associated address spaces. The
WANTDUMP= parameter on the OPTIONS initialization statement determines if a dump is taken. If
WANTDUMP=ASK, the operator is asked if a dump should be obtained, and JES3 does not reinstate the DSP until
the operator responds. If WANTDUMP=NO, JES3 does not dump the address spaces and attempts to reinstate the
DSP. If WANTDUMP=YES, JES3 dumps the address spaces and attempts to reinstate the DSP.

Operator response: If the DSP could not be reinstated, the DSP is no longer active. To reinstate the DSP, issue the
appropriate *CALL command. See [z/OS JES3 Commands] for additional information on the *CALL command that is
used to restart the failed DSP.

Message IAT3713 may scroll off the screen. If the MCS message action retention facility is active, the message may be
retrieved by issuing a D R.L command. If the JES3 action message retention facility is active, the message may be
retrieved by issuing a *LR command. The active action message retention facility, retains the last JES3 failsoft banner
if a DSP in the JES3 address space abends. If a DSP abends in an FSS address space, the failsoft banner is not
retained by the action message retention facility.

Problem determination: See Table I items 2, 16; Table III items 1 or 2, or 3, and items 4 and 7. Also, collect any other
related information, including the dumps on the current and remote systems.

Descriptor Code: 3,4

Explanation:

SPECIFY DUMP OPTION FOR JES3 GLOBAL, main
JE S3 LOCAL, main
FSS fssname, ASID=asid

WANTDUMP=ASK was specified on the OPTIONS initialization statement, or has been assumed because the number
of failures within the defined WANTDUMP=YES interval has exceeded the WANTDUMP=YES limit. The address
space requesting the operator to specify the type of dump is identified as follows:

- For the JES3 global address space, the message contains the characters JES3 GLOBAL, and the main processor
  name.
- For a JES3 local address space, the message contains the characters JES3 LOCAL, and the main processor name.
- For an FSS address space, the message contains the FSS name and ASID.
Message IAT3822 is then issued which lists the valid dump options.

In the message text:

- **main**: The name of the main processor, if the failure occurred in the JES3 address space.
- **fssname**: The name of the functional subsystem, if the failure occurred in a functional subsystem.
- **asid**: The address space identifier of the functional subsystem, if the failure occurred in a functional subsystem.

**System action**: JES3 or the FSS waits for an operator response.

**Operator response**: Enter a valid dump option specified in message IAT3822. If message IAT3822 has rolled off the screen, you can retrieve the valid options by issuing the command `D R,MSG=IAT3822`.

IAT3737
Explanation:

➤ A BUFFER ADDRESS TO BE RETURNED—TO THE JES3SDM BUFFER POOL VIA AN APUTBUF MACRO IS INVALID.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMNC</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>
Routing Code: 10
Descriptor Code: 3,4

IAT3738
Explanation:

- AN ACLOSE MACRO HAS BEEN ISSUED AND NO ENTRY EXISTS IN THE JES3SDM FILE DIRECTORY.
- (FD) FOR THE FDB ADDRESS SUPPLIED.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMNC</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3739
Explanation:

- ILLEGAL INTERCOM COMMAND WAS ISSUED.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMNC</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3740
Explanation:

- NO JOB TAT WAS PROVIDED ON AN AOPEN OF A JES3SDM OUTPUT MULTI RECORD FILE OR ON AN AWRITE OF A NEW SINGLE RECORD FILE.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMNC</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
IAT3741 • IAT3743

Descriptor Code: 3,4

IAT3741

Explanation:

► A TRACK GROUP BEING RETURNED TO—THE PARTITION TRACK—ALLOCATION TABLE (TAT) ALREADY
► EXISTS IN THE TAT,—THE JOB TAT DOES NOT CONTAIN—THE TAT IDENTIFIER,—OR A PURGE OF A SINGLE
► RECORD FILE BACK INTO THE SINGLE—TRACK TABLE (STT) HAS—BEEN ATTEMPTED AND THE TRACK
► ADDRESS ALREADY EXISTS IN THE STT.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMTK</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3742

Explanation:

► AN I/O REQUEST TO JES3SDM—ON A MULTI RECORD FILE IS ISSUED—FOR A FILE THAT IS NOT OPEN.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3743

Explanation:

► A COUNT SPECIFIED IN EITHER—AN ALOCATE OR ABLOCK MACRO—CAN NOT BE PROCESSED BY JES3SDM

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
IAT3744
Explanation:

AN FDB PASSED TO THE ATRACK ROUTINE IN JES3SDM IS NOT VALID

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing	Detecting	Issuing
IATFSLG	IATDMTK	IATFSLG

Routing Code: 10
Descriptor Code: 3,4

IAT3745
Explanation:

A SINGLE RECORD FILE FDB PASSED TO THE JES3SDM PURGE ROUTINE VIA THE APURGE MACRO

CONTAINS A TRACK ADDRESS WHICH DOES NOT EXIST IN THE SINGLE TRACK TABLE (STT).

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing	Detecting	Issuing
IATFSLG	IATDMST	IATFSLG

Routing Code: 10
Descriptor Code: 3,4

IAT3746
Explanation:

AN AOPEND MACRO HAS BEEN ISSUED FOR A JES3SDM MULTI RECORD FILE THAT IS OPEN.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing	Detecting	Issuing
IATFSLG	IATDMDT	IATFSLG

Routing Code: 10
Descriptor Code: 3,4
IAT3747 • IAT3749

IAT3747
Explanation:

AN APEND MACRO IS ISSUED FOR A JES3SDM MULTI RECORD FILE AND THE LAST DATA BUFFER DOES NOT CONTAIN AN END OF DATA (EOD).

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3748
Explanation:

AN ALOCATE MACRO IS ISSUED FOR A JES3SDM OUTPUT MULTI RECORD FILE AND THE PREVIOUS CALL FOR THE FILE WAS ALSO AN ALOCATE.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3749
Explanation:

TWO SUCCESSIVE ABLOCK MACROS HAVE BEEN ISSUED AGAINST A JES3SDM OUTPUT MULTI RECORD FILE WITHOUT AN ALOCATE MACRO, OR AN ABLOCK WITHOUT A PRIOR ALOCATE.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATDMDT</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
IAT3750

Explanation:

ERROR ENCOUNTERED WHILE USING MACRO IATXRABC OR JDSCGET

An error return was received from the IATXRABC or JDSCGET macros issued from IATIICC or IATIIDR.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATIICC</td>
<td>IATFSLG</td>
</tr>
<tr>
<td>IATFSLG</td>
<td>IATIIDR</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10

IAT3751

Explanation:

THE VALIDATION FIELD (VALID) IN THE DATA BUFFER JUST INPUT FOR A MULTI RECORD FILE DOES NOT MATCH THE VALID IN THE JES3SDM FILE DIRECTORY (FD).

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATIICC</td>
<td>IATFSLG</td>
</tr>
<tr>
<td>IATFSLG</td>
<td>IATOSSI</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10

IAT3752

Explanation:

ERROR CONDITIONS OTHER THAN I/O ERRORS WERE DETECTED DURING ERROR RECOVERY FOR A SPOOL I/O ERROR, OR SPOOL I/O DID NOT TERMINATE NORMALLY. REGISTER 2 CONTAINS THE ERROR CODE.

The error recovery processing for a spool I/O error could not be completed. This message is embedded in the IAT3713 multi-line message.

Operator response: See message IAT3713.

Module:
IAT3753 • IAT3755

IAT3753
Explanation:

>>>THE DSP RETURNED TO JSS DRIVER—WITH AN OPEN SPOOL FILE<<<

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3754
Explanation:

>>>JES3 JOB QUEUE CHECKPOINT—CANNOT BE READ OR IS IN ERROR<<<

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:

IAT3755
Explanation:

>>>ERROR ACCESSING SYSOUT DATA SET—JOB NUMBER IS IN REGISTER 3<<<

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.
Operator response: See message IAT3713.
Module:
Descriptor Code: 3

IAT3757

Explanation:

AN UNRECOVERABLE ERROR OCCURRED CONSTRUCTING JDS ENTRIES BY AN INPUT SERVICE INTERPRETER JOB.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing Detecting Issuing
IATFSLG IATISFR IATFSLG

Routing Code: 10
Descriptor Code: 3,4

IAT3758

Explanation:

THE FCT ENQUEUED ON A RESOURCE IT ALREADY OWNS.

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing Detecting Issuing
IATFSLG IATGRQQ IATFSLG

Routing Code: 10
Descriptor Code: 3,4

IAT3759

Explanation:

AN ERROR OCCURRED IN JOB VALIDATION I/O SERVICES

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

Containing Detecting Issuing
IATFSLG IATDMVIO IATFSLG

Routing Code: 10
Descriptor Code: 3,4
IAT3760 • IAT3762

IAT3760
Explanation:

➤ — AN ERROR OCCURRED DURING — IATXSYSU PROCESSING

An error occurred while attempting to create a SYSUNITS entry through the IATXSYSU macro during *MODIFY,CONFIG processing. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

IAT3805

Explanation:

BAD VALIDATION FIELD DETECTED IN AWRITE PROCESSING

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:
IAT3806

Explanation:

OSS FOUND WITH NO MATCHING DISK OSE.

A function control table (FCT) that was attempting to process output found an output service summary entry (OSS) in storage describing eligible output. However, no output scheduler element (OSE) describing the eligible output was found on the disk. This indicates a mismatch between the OSS and OSE control blocks.

If register 3 does not contain zeros, it contains the address of the OSS. Register 6 contains the address of the job's rerqueue.

System action: The DSP fails with dump code DM206. JES3 will attempt to rebuild the OSS chain for the job and continue processing.

System programmer response: Determine the cause of the error from the DM206 dump.

IAT3807

Explanation:

CONFIRM "RETURN" COMMAND FOR **GLOBAL** 'systemname' (CONTINUE (U) OR CANCEL)

A potentially disruptive command, "RETURN" is about to be executed on processor 'systemname'. The processor is currently a global or local main as indicated in the message. If this command was entered with an incorrect prefix, this command may have inadvertently been routed to another processor when it was intended for the processor on which it was entered. Verify that this command should continue to be executed on the specified processor.

System action: None.

Operator response: The system programmer should reply 'U' or 'CONTINUE' to allow the command to be processed or 'CANCEL' to cancel the command.

This message is sent in response to a command to the console where the command was entered.
IAT3809
Explanation:

\[\text{PREFIX} - \text{prefix} - \text{IGNORED} - \text{CPF REQUEST} - \text{ENCOUNTERED}, \text{RC} = r_c, \text{RSN} = r_s_n,\]
\[\text{FOR} - \text{SYSPLEX} - \text{sysname}\]

JES3 attempted to delete the prefix from the COMMAND PREFIX FACILITY (CPF) and received the specified return and reason code. If SYSPLEX is specified, the error occurred attempting to delete a sysplex-scoped prefix. If sysname is specified, the error occurred attempting to delete a system-scoped prefix on the indicated system.

**System action:** Depending on the error, the prefix definition may not have been deleted from the COMMAND PREFIX FACILITY (CPF). JES3 termination continues. If the JES3 address space is terminating, CPF will delete all prefixes defined by JES3. If the error occurs during DSI processing on a local processor which is to become the new global processor, the new global may not be able to successfully define its SYSTEM scoped prefixes to CPF.

**Operator response:** The system programmer can use the D OPDATA,PREFIX command to see which prefixes are defined to CPF in the sysplex.

Descriptor Code: 7

IAT3811
Explanation:

\[\text{name} - \text{TRACE TABLE NOT ACCESSIBLE}\]

The IPCS VERBEXIT JES3 subcommand was entered with the TABLE parameter, but the system cannot access the table. The table cannot be accessed because either:

- The specified trace table is not in the dump.
The pointers to the trace table are not valid and the table cannot be accessed.

**System action:** The JES3 verb exit ends and IPCS processes the next control statement or subcommand. JES3 continues processing.

**System programmer response:** Reenter the IPCS subcommand with the correct value on the parameter.

---

**Explanation:**

NO TRACE ENTRIES FOUND

The IPCS VERBEXIT JES3 subcommand was entered with the ID or FCT parameters or both specified, but there are no trace entries found that match the search criteria.

**System action:** The JES3 verb exit ends and IPCS processes the next control statement or subcommand. JES3 continues processing.

**System programmer response:** Reenter the IPCS subcommand with the correct value on the subparameter.

---

**Explanation:**

NO FAILSOFT LOGOUT INFORMATION FOUND

The IPCS VERBEXIT JES3 subcommand was entered with OPTION=FSL, but the failsoft logout information does not exist in the dump.

**System action:** The JES3 verb exit ends and IPCS processes the next control statement or subcommand. JES3 continues processing.

**System programmer response:** None. This is an informational message.

---

Chapter 7. Failsoft and Abend Messages  281
IAT3814

Explanation:

NO RSQ FOUND FOR jobname jobnum

The IPCS VERBEXIT JES3 subcommand was entered with the jobname or jobnum parameter, but JES3 could not find the matching job name or job number within the resqueue chain.
Possible reasons the job could not be located are:
• Processing for the job completed
• Chaining for the resqueue chain is broken
System action: IPCS and JES3 continue processing.
Programmer response: None. This is an informational message.

Descriptor Code: –

IAT3821
Explanation:

**ABRT SNAP** TCB=tcbaaddress ID=snapid RC=returncode

The SNAP macro has been issued for the task control block (TCB) associated with the failing function control table (FCT). The SNAP output is sent to DDNAME JES3SNAP.

In the message text:

*tcbaaddress*  The address of the TCB for which the SNAP macro was issued.

*snapid*  The ID printed in the identification heading with the dump. The ID is used to correlate the message with the correct dump.

*returncode*  The return code from the SNAP macro. See the SNAP macro in [z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO](https://www.ibm.com/support/docview.wss?rs=28&context=ST90-2800-00&cc=us&lang=en&mode=pdf&docDescId=ST90-2800-00) for return code definitions.

System action: JES3 continues processing.

System programmer response: Analyze the SNAP dump to determine the error and correct the problem.

IAT3822
Explanation:

**NO - NODUMP, U - OBTAIN SVC DUMP, T - TERMINATE JES3 ADDRESS SPACE**

This lists the valid dump options because one of the following conditions occurred:

- The operator issued a *DUMP command for the JES3 global or a JES3 local address space.
- The operator issued a *FAIL J=jobno, DUMP command for a job that was being processed by the JES3 global or a CI FSS.
- An unexpected error occurred.
- The operator issued a *FAIL fssname, DUMP command for a CI FSS.
- A DSP encountered an error and issued a FAILDSP command with the DUMP=YES option.

Message IAT3714 is issued as a WTO and identifies the address space requesting the dump as follows:

- For the JES3 global address space, the message contains the characters JES3 GLOBAL, and the main processor name.
• For a JES3 local address space, the message contains the characters JES3 LOCAL, and the main processor name.
• For an FSS address space, the message contains the FSS fssname and ASID.

**Note:** These messages are only issued if the installation specified WANTDUMP=ASK on the OPTIONS initialization statement, or WANTDUMP=YES was specified but WANTDUMP=ASK was assumed because more failures than the number specified on the LIMIT= parameter occurred during the time interval specified on the INTERVAL= parameter.

**System action:** JES3 or the FSS waits for the operator to reply to message IAT3714. If the operator gives an incorrect reply, the messages are displayed again.

If an error occurred, data management messages IEC501, IEC502 and IEC705 will be displayed on an MCS console.

**Operator response:** Notify the system programmer. Reply to message IAT3714 with one of the following options:

- **NO**  Do not take a dump
- **U**   Obtain an SVC dump of the JES3 or FSS address space
- **T**   End the JES3 or FSS address space

**Programmer response:** If a dump is needed (because of an unexpected error), tell the operator to specify U, otherwise specify NO.

</table>

**Routing Code:** 10  
**Descriptor Code:** 4

---

**IAT3825**

**Explanation:**

`>>>WARNING: FCT CHAIN ERROR,— FCTS LOST BETWEEN—dspname1—AND—dspname2<<<`

An error was encountered during JES3 recovery while following the chain pointers for the FCT dispatching chain. To continue, the system has validated FCT control blocks from each end of the chain, and removed FCTs where errors were found. These represent the functions (DSPs) which execute in the JES3 address space.

In the message text:
**IAT3827 • IAT3828**

*dspname1*

The name of the DSP represented by the last valid FCT found starting at the top of the FCT chain.

*dspname2*

The name of the DSP represented by the last valid FCT found when validation was begun at the end of the FCT chain.

Displayed if no valid FCT control blocks were found from one end of the chain or the other.

**System action:** JES3 processing continues.

**Operator response:** Notify the system programmer. Call the JES3 dumpcore (DC) utility, then use the OPTION=FCT command option to determine if critical functions (DSPs) have been lost. If this is the case, a JES3 hotstart should be scheduled.

If the message contains "********", the chain was badly damaged and cannot be sufficiently mended. Issue a *DUMP command and restart JES3.

**Programmer response:** Compare the DSP names in the message with the DSP names contained in the DSP dictionary in module IATGRPT. Determine if any critical FCTs were lost and advise the operator on whether a JES3 hotstart should be scheduled.

If a dump was taken before JES3 issuing this message or by the operator, analyze the dump to determine the reason for the FCT chain error.

MDS RECEIVED ERROR RETURN—FROM NON-MDS MACRO SERVICE

The message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM452 failure.

Operator response: See message IAT3713.
IAT3853 • IAT3860

IAT3853

Explanation:

ERROR DETECTED DURING JSS PROCESSING. ERROR REASON CODE IN REGISTER 4

This message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM802 failure.

Operator response: See message IAT3713.

Problem determination: Use message IAT3713 and the system programmer response for DM802 in z/OS JES3 Diagnosis to help determine the error. The explanation of DM802 in z/OS JES3 Diagnosis contains the meanings of the error reason code.

Module:

IAT3860

Explanation:

INVALID RECORD FOUND IN INBOUND STREAM

An incorrect record was encountered while using SNA protocols to receive the network stream.

System action: The NJERDR DSP fails with an abend code of DM530. Additional work sent with SNA protocols cannot be processed until a *CALL NJERDR command is issued.

Operator response: If SNA protocols are used to transmit data between your installation and the remote node, the network job is placed in operator hold. At the node that receives the network stream:

• notify the user that the network stream could not be transmitted and ask the user to resubmit the job.
• issue a *CALL NJERDR command to reinitialize the NJERDR DSP.
• use the *F,U,Q=BDT,NH=N to release the job from operator hold.

Take a dump and notify the system programmer.

Programmer response: Analyze the dump to determine why the record is not valid. See the z/OS JES3 Diagnosis for information on how to determine the error.
IAT3862  •  IAT3872

IAT3862
Explanation:

AN ERROR WAS DETECTED BY THE ABACKR ROUTINE

The message is imbedded in the IAT3713 failsoft multi-line message as part of the JES3 failure logout for a DM748 failure.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>

IAT3870
Explanation:

AN IATXPRT MACRO HAS BEEN ISSUED WITH AN INVALID SIZE PARAMETER

This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout.

Operator response: See message IAT3713.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATFSLG</td>
<td>IATGRPR</td>
<td>IATFSLG</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 3,4

IAT3872
Explanation:

IATFSLG IS NOT AVAILABLE TO LOGOUT FAILURE, FOR FSS=fssname, ASID=asid.

JES3 or FSS recovery was unable to issue a logout failure message because IATYTVT does not point to IATFSLG, the module that issues the failsoft messages. The TVT table was not set up correctly during initialization.
The functional subsystem (FSS) fssname and address space ID asid appear in the message if the failure occurred in an FSS address space. If the text does not appear in the message, the failure occurred in JES3.

System action: ESTAE retry processing continues. JES3 or FSS recovery bypasses writing out the logout messages for the JES3 or FSS failure currently being processed.

Operator response: Notify the system programmer.

Programmer response: Verify that module IATFSLG is present in one of the following:

• The STEPLIB concatenation defined in the JES3 or FSS procedure, if used.
• A library included in the linklist specified in response to message IEA101A, SPECIFY SYSTEM PARAMETERS FOR RELEASE xxx.yyy.zz.

Module:
IAT3873

Explanation:

As the result of a failure under the JES3 auxiliary task, module IATABMN issued a SNAP macro instruction to dump the IATNUC task storage and control blocks to the JES3SNAP data set. The failure number nnnn identifies the JES3 auxiliary task failure with which the dump is to be associated. This number is the same as the JES3 failure number that appears in message IAT3713 when the auxiliary task failure information is logged out. The failure number is used as the SNAP ID for the dump.

System action: JES3 processing is temporarily halted until the SNAP is completed.

Operator response: None. This is an informational message.

Problem determination: See Table I, items 2 and 16.

Module:

IAT3874

Explanation:

The SNAP dump of the IATNUC task that was indicated in message IAT3873 has completed. RC=nn indicates the return code from SNAP. The failure number is used as the SNAP ID for the dump.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT3875

Explanation:

--AN ATTEMPT HAS BEEN MADE—TO USE AN ACTIVE RPL--
While execution was taking place under control of the SNARJP DSP, an attempt was made to reuse a request parameter list (RPL) that was still active.

**System action:** JES3 issues message IAT3713 and ends with failsoft code DM551.

**Operator response:** See message IAT3713.

---

An FSS-related error has occurred during execution of the driver DSP of the FSS writer. The error reason code in register 2 is described in z/OS JES3 Diagnosis.

**System action:** The writer DSP fails with dump code DM656. JES3 attempts to reinstate the writer DSP to clean-up and end.

**Operator response:** Notify the system programmer.

---

JES3 encountered an error while updating the use count of the logical control block (LCB). The use count of the LCB is changed by the IATXSNLK macro. Register 2 in the failsoft logout contains the address of the SNARJP failsoft work area that indicates which error occurred.

**System action:** The SNA/RJP FCT fails with a failsoft code of DM552.

**Operator response:** Notify the system programmer.

**System programmer response:** See z/OS JES3 Diagnosis for a description of DM552.

---
IAT3880

Explanation:

►►OUTPUT SERVICE UNUSABLE,—COULD NOT CREATE CELL POOL FOR
►►WRITER DMC(S), RETURN CODE IN REGISTER 9.

JES3 could not initialize the cell pool for WRITER data management control blocks (DMCs) because storage was unavailable. Register 9 contains the error return code passed from the build pool routine in module IATGRQC.

System action: The OUTSERV FCT fails with failsoft code DM734. The OUTPUT service functions are unavailable until the next restart of JES3.

Operator response: Notify the system programmer immediately.

Programmer response: Determine the reason for the failure using the error code in register 9. See z/OS JES3 Diagnosis for a description of DM734.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

IAT3910
Explanation:

ERROR DETECTED WHILE SENDING—a network job or SYSOUT stream

An error occurred while the NJESND DSP attempted to decompress a record that was too long.

System action: The NJESND DSP fails with a DM532 abend. The network job is placed in operator hold.
Operator response: Issue a dump and notify the system programmer.
Programmer response: [z/OS JES3 Diagnosis] contains more information about the DM532 dump code. If the data on spool is in error, delete the job and notify the job owner. If the error is a system problem which has been corrected, release the job from operator hold.

Problem determination: See Table I, item 29 and Table III, items 2, 4, and 7.

Chapter 8. Spool Initialization Messages

IAT4000

Explanation:

>>>CONFIRM DELETION OF SPOOL DATASET—ddn— (CONTINUE OR CANCEL)

None of the TRACK or FORMAT initialization statements specified DDNAME=ddn even though the corresponding spool data set was defined during the previous JES3 restart.

System action: Message IAT4001 is written to the JES3OUT data set and JES3 initialization waits for an operator reply of one of the following:

CONTINUE
JES3 initialization continues; spool data set with the ddname of ddn is removed from the checkpointed spool configuration. Any jobs found to have data on the spool data set will be deleted from the complex.

CANCEL
JES3 initialization ends with a DM011 abend; the status of jobs which have data on the spool data set is not modified.

Operator response: Consult the system programmer for the proper actions to be taken.

Programmer response: If deletion of the data set was unintentional, correct the JES3 initialization stream, IPL the processor, and perform a warm start of JES3.

Because deletion of a spool data set, the *INQUIRY,Q,DD=ddn command may be issued to determine if any jobs in the complex have data on the spool data set to be deleted; the DISPLAY utility may be used to determine which jobs have space allocated on the data set.

Routing Code: 1
Descriptor Code: 7

IAT4001

Explanation:

>>>NO TRACK OR FORMAT—INITIALIZATION STATEMENT—FOR SPOOL DATASET—ddn

None of the TRACK or FORMAT initialization statements specified DDNAME=ddn even though the corresponding spool data set was defined during the previous JES3 restart.

System action: This message is written to the JES3OUT data set to provide a hardcopy log of changes being made to the JES3 spool configuration during the current warm start. Message IAT4000 is issued in conjunction with this message to ask the system operator to confirm deletion of the spool data set.

Programmer response: If the operator response to message IAT4000 is CONTINUE, all knowledge of the spool data set will be deleted; additional messages may be issued as a result of the data set deletion. If the operator response to message IAT4000 is CANCEL, this message provides documentation in the JES3OUT data set of the JES3 initialization failure reason (DM011).

Module:
IAT4002 • IAT4003

**IAT4002**

**Explanation:**

<table>
<thead>
<tr>
<th>Routing Code: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Descriptor Code: 7</td>
</tr>
</tbody>
</table>

A global processor hot start or local processor restart is being performed in which the processor was not IPLed and an incorrect common-storage resident data area was encountered. The incorrect data area is one of the following:

**IOP**
- spool I/O scheduling data area, IATYIOP.

**SRB**
- SRB data area pool.

**RPS**
- RPS sector tables.

**System action:** JES3 initialization ends with a DM015 abend.

**Operator response:** IPL the system and proceed with the hot or local start that failed.

**Problem determination:** Table III, items 3, 4, and 5.

**Module:**

**IAT4003**

**Explanation:**

<table>
<thead>
<tr>
<th>Routing Code: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Descriptor Code: 7</td>
</tr>
</tbody>
</table>

JES3 was unable to open the spool data set with a ddname of *ddn*. JES3 initialization cannot continue if either of the following is true:

- The *ddn* is JES3JCT because access to the JCT data set is required.
- This is a local processor because all local processors must have access to all of the global's spool data sets.

**System action:** This message is written to the JES3OUT data set to provide a hardcopy log of changes being made to the JES3 spool configuration during the current restart. If this is a global processor and the failure was not for the JCT data set, message IAT4006 or IAT4007 is issued in conjunction with this message. They ask the system operator if JES3 should be allowed to continue execution without the data set.

**Programmer response:** If the operator response to message IAT4006 or IAT4007 is CONTINUE, the data set will be made unavailable. If the operator response is CANCEL, or if neither message was issued because JES3 initialization cannot continue without the data set, this message will provide documentation in the JES3OUT data set of the JES3 initialization failure reason (DM011).

**Module:**

314 z/OS V2R1.0 JES3 Messages
IAT4004
Explanation:

OPEN FAILED FOR OLD SPOOL DATASET—ddn,—DATASET WAS NOT USED AT LAST JES3 RESTART

JES3 was unable to open the spool data set with a ddname of ddn; the data set was not allocated to JES3 or dynamic allocation of the data set failed. The data set was not used by JES3 during the previous JES3 global processor restart.

**System action:** The spool data set is placed into an unavailable state; JES3 initialization processing continues without requiring access to the data set. The spool space allocation maps will be restored from the checkpoint data set, if possible, to allow jobs with data on the unavailable spool data set to be retained in the job queue.

**Programmer response:** If access to the spool data set is required, determine why the data set was not allocated and correct the situation; restart JES3 on the global processor, and then restart JES3 on all active local processors.

Module:

IAT4005
Explanation:

OPEN NOT ATTEMPTED—FOR SPOOL DATASET—ddn,—FORMATTING REQUIRED

During JES3 global processor hot start processing, initialization of spool data set with a ddname of ddn has been bypassed because formatting of the data set failed during the previous JES3 warm or cold start. Formatting of the data set is necessary before using the data set and formatting is not performed during hot starts.

**System action:** The data set is placed into an unavailable state; JES3 initialization processing does not perform any checks to determine if the data set was allocated to JES3 and does not attempt to open the data set.

**Programmer response:** If access to the spool data set is required, IPL the system and perform a warm start of JES3.

Module:

IAT4006
Explanation:

OPEN FAILED FOR OLD SPOOL DATASET—ddn,— (CONTINUE OR CANCEL)
IAT4007

JES3 was unable to open the spool data set with a ddname of `ddn`; the data set was probably not allocated to JES3 or dynamic allocation of the data set failed.

**System action:** JES3 initialization waits for one of the following operator replies:

- **CONTINUE**
  - the spool data set is placed into an unavailable state; JES3 initialization processing continues without requiring access to the data set. The spool space allocation maps will be restored from the checkpoint data set if possible, to allow jobs with data on the spool data set to be retained in the job queue.

- **CANCEL**
  - JES3 initialization ends with a DM012 abend.

**Programmer response:** If access to the spool data set is required, determine why the data set was not allocated and correct the situation; restart JES3 on the global processor, and then restart JES3 on all active local processors.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

</tbody>
</table>

**Routing Code:** 1

**Descriptor Code:** 7

---

IAT4007

Explanation:

```
>>> OPEN FAILED FOR NEW SPOOL DATASET `ddn` (CONTINUE OR CANCEL)
```

JES3 was unable to open the spool data set with a ddname of `ddn`; the data set was probably not allocated to JES3 or dynamic allocation of the data set failed. The spool data set was not previously used by JES3 and is being added during the current restart.

**System action:** JES3 initialization waits for one of the following operator replies:

- **CONTINUE**
  - JES3 initialization continues; spool data set with a ddname of `ddn` is removed from the checkpointed spool configuration.

- **CANCEL**
  - JES3 initialization ends with a DM012 abend.

If CONTINUE is replied, the spool data set definition is deleted; subsequent global processor hot starts and local processor restarts will not attempt to access the data set.

**Programmer response:** If access to the spool data set is required, determine why the data set was not allocated and correct the situation; IPL the system and perform a warm start.

If JES3 can continue without the data set, reply CONTINUE. During subsequent hot or local starts, no open will be attempted for the data set and no *INQUIRY (*INQUIRY,Q,DD) or *MODIFY (*MODIFY,Q,DD) commands will be accepted that specify the ddname of the data set.

**Module:**

</table>

**Routing Code:** 1

**Descriptor Code:** 7
IAT4008
Explanation:

►► ENTER DDNAME(S) OF REPLACED PRE-FORMAT TED—SPOOL DATASET(S), END, OR CANCEL ————

JES3 initialization is in progress with a start type of WR (warm with spool data set replace) or WAR (warm, with analysis and with spool data set replace). This WTOR is issued to obtain from the operator the ddnames, if any, of the previously used pre-formatted spool data sets that are to be replaced during this restart.

System action: JES3 initialization waits for an operator reply of:

\[dd1, dd2, ddn\]

specifies that the spool data sets with ddnames of \(dd1\), \(dd2\), and \(ddn\) were previously formatted and are being replaced during this JES3 restart.

END

specifies that input of the pre-formatted data set ddnames is complete.

CANCEL

specifies that JES3 initialization should end immediately.

Message IAT4010 is issued for each replied ddname to confirm that the requested data set will be processed as a replaced data set. Message IAT4008 will then be reissued until a reply of END is received. Jobs which are found to have data on a replaced spool data set will be deleted from the complex.

Operator response: Reply with the ddnames of the spool data sets to be replaced for which formatting is not necessary, or reply END. If the operator specified a wrong \(ddname\) and message IAT4010 was issued, a reply of CANCEL to IAT4008 ends JES3 initialization before the deletion of jobs that have data on the data set.

Module:

<table>
<thead>

</tbody>
</table>

Routing Code: 1
Descriptor Code: 7

IAT4009
Explanation:

►► ENTER DDNAME(S) OF REPLACED SPOOL—DATASET(S) TO BE FORMATTED, END, OR CANCEL ————

JES3 initialization is in progress with a start type of WR (warm with spool data set replace) or WAR (warm, with analysis and with spool data set replace). This WTOR is issued to obtain the ddnames, if any, of the spool data sets that are to be replaced during this restart for which formatting is required.

System action: JES3 initialization waits for an operator reply of:

\[dd1, dd2, ddn\]

specifies that the spool data sets with ddnames of \(dd1\), \(dd2\), and \(ddn\) require formatting to take place with this JES3 restart.

END

specifies that input of the data set ddnames is complete.

CANCEL

specifies that JES3 initialization should end immediately.

Message IAT4013 is issued for each replied ddname for which formatting is not mandatory to confirm that formatting is indeed required. Message IAT4010 is then issued for each replied ddname to acknowledge that the requested data set will be processed as a replaced data set. Message IAT4009 will then be reissued until a reply of END is received.
Jobs which are found to have data on a replaced spool data set will be deleted from the complex.

**Operator response:** Reply with the ddnames of the spool data sets to be replaced for which formatting is required, or reply END. If the operator specified a wrong ddname and message IAT4010 was issued, a reply of CANCEL to IAT4009 ends JES3 initialization before formatting of the data set or deletion of jobs that have data on the data set.

**Descriptor Code:** 7

---

**IAT4010**

**Explanation:**

```
>>>SPOOL DATASET--ddn--REPLACED--TO BE FORMATTED<<<
```

The system operator specified a ddname of `ddn` in response to message IAT4008 or IAT4009, and the ddname was found to be valid. This message acknowledges that JES3 initialization has accepted the ddname and that the corresponding spool data set will be processed as being replaced. If the ddname was specified in response to message IAT4009, the TO BE FORMATTED section of the message will be displayed. The corresponding spool data set will be formatted when END is responded to message IAT4009.

**System action:** JES3 processing continues with the processing of the next ddname in the reply. When processing of the reply is complete, the WTOR (IAT4008 or IAT4009) is reissued.

**Operator response:** None. This is an informational message.

---

</table>

**Routing Code:** 2  
**Descriptor Code:** 7

---

**IAT4011**

**Explanation:**

```
>>>DDNAME--ddn--NOT DEFINED OR INELIGIBLE<<<
```

The system operator specified a ddname of `ddn` in response to message IAT4008 or IAT4009, and one of the following conditions was detected:

- there is no spool data set defined with a ddname of `ddn`.
- the spool data set with a ddname of `ddn` was previously deleted.
- the spool data set with a ddname of `ddn` is not available during the current JES3 restart.

**System action:** JES3 processing continues with the processing of the next ddname in the reply; the input `ddn` is ignored. When processing of the reply is complete, the WTOR (IAT4008 or IAT4009) is reissued.

**Operator response:** Consult the system programmer to determine the correct ddname for your next response to IAT4008 or IAT4009.

---

**Module:**
IAT4012

Explanation:

Invalid reply—xxx—for a ddname.

The system operator specified a ddname of xxx in response to message IAT4008 or IAT4009, and one of the following conditions was detected:

- xxx is more than 8 characters in length.
- xxx contains characters which are not valid in a ddname.

System action: JES3 processing continues with the processing of the next ddname in the reply; the input ddn is ignored. When processing of the reply completes, the WTOR (IAT4008 or IAT4009) is reissued.

Operator response: Consult the system programmer to determine the correct ddname for your next response to IAT4008 or IAT4009.

Module:

IAT4013

Explanation:

Confirm format request—for spool dataset—ddn—on—vol—(u)

The system operator specified a ddname of ddn in response to message IAT4009 and one of the following conditions was detected:

- ddname ddn was defined in the JES3 initialization stream by a TRACK initialization statement.
- the corresponding spool data set was previously used by JES3 and completed spool data set validation in a previous JES3 restart.

This message asks the system operator to confirm that formatting of the data set is to be allowed.

System action: JES3 initialization processing waits for one of the following operator replies:

- U indicates that the ddname ddn was valid and that the corresponding spool data set resides on the proper DASD volume; JES3 formatting of the data set is to be performed.
- anything other than U indicates that the input ddn was in error; the spool data set is not to be formatted nor is it to be processed as being replaced.

When processing of the reply completes, message IAT4009 is reissued.

Operator response: If the spool data set which requires formatting resides on the proper DASD volume, reply U.

Module:
IAT4025 • IAT4026

Routing Code: 1
Descriptor Code: 7

IAT4025
Explanation:

*> SPool DATASET—ddn—MOVED FROM—old vol—TO—new vol—(CONTINUE OR CANCEL)*

Spool data set with a ddname of *ddn* was found on DASD volume ID “new”; however, the data set resided on the volume ID “old” the last time JES3 accessed the data set.

System action: For local processor restarts, message IAT4025 is written to the JES3OUT data set and JES3 initialization ends immediately with a DM012 abend.

For global processor restarts, this message is written as a WTOR to check with the system operator that the proper DASD volume is mounted and/or that the catalog is correct (if the data set was allocated to JES3 using the system catalog). JES3 initialization waits for one of the following operator replies:

CONTINUE
JES3 initialization continues; the checkpointed volume serial for this spool data set is updated for subsequent JES3 restarts.

CANCEL
JES3 initialization ends immediately with a DM011 abend.

Operator response: Contact the system programmer to determine the proper actions to be taken.

Programmer response: The proper procedure for moving a spool data set to a new DASD volume requires that the global processor be restarted, with the new volume mounted, before initiating any local processor restarts.

If the wrong spool volume is mounted, have the system operator reply CANCEL, mount the correct volume, and restart JES3. If the volume serial was changed, or the data set was moved to the new volume, reply CONTINUE.

Module:
Containing  Detecting  Issuing
IATINSD    IATINSD    IATINSD

Routing Code: 1
Descriptor Code: 7

IAT4026
Explanation:

*> EXTENT FOR SPool DATASET—ddn—CHANGED OVER RESTART—(CONTINUE OR CANCEL)*

The characteristics of the spool data set with a ddname of *ddn* were found to be different from the characteristics of the data set that was last accessed by JES3 using the same *ddn*. The modified characteristics may be one or more of the following:

• Data set starting track address (CCHH)
• Data set ending track address (CCHH)
• Number of records that will fit on a track
• Number of tracks per cylinder
To allow proper translation of DASD record addresses (CCHHR) to the form internally maintained by JES3, the above characteristics must always remain constant. A change in any of the characteristics may only be affected over a JES3 cold start or by performing a replace on the spool data set.

**System action:** For local processor restarts, message IAT4026 is written to the JES3OUT data set and JES3 initialization ends immediately with a DM012 abend.

For global processor restarts, this message is written as a WTOR to determine if JES3 can continue processing without the affected spool data set. JES3 initialization waits for one of the following operator replies:

**CONTINUE**
- The spool data set is dynamically unallocated and is placed into an unavailable state. Jobs which have written data to the affected spool data set will be placed into a spool hold state or will be purged from the system if necessary.

**CANCEL**
- JES3 initialization ends immediately with a DM011 abend.

**Operator response:** Contact the system programmer to determine the proper actions to be taken.

**Programmer response:** If the wrong spool volume is mounted, have the system operator reply CANCEL, mount the correct volume, and restart JES3. If the volume serial was changed, or if the data set was moved to the new volume, reply CONTINUE.

The proper procedure for replacing a spool data set requires that the global processor be restarted with the replaced data set before initiating any local processor restarts.

**Routing Code:** 1

**Descriptor Code:** 7

---

**IAT4027**

**Explanation:**

```
SPOOL DATASET—ddn—is NOT USABLE, RC=—rc,—ERR=—err,—reasontext—(CONTINUE OR CANCEL)
```

An error was encountered during validation or formatting of a previously used spool data set. The return code, error code, and error reason indicate the specific error; for each return code rc, one or more error codes err further qualifies the error.

**rc=04**
- data set not usable.

  **err=2c FORMAT VERIFY FAILURE**
  - the entire spool data set is described by BADTRACK entries.

  **err=30 FORMAT VERIFY FAILURE**
  - track format verification failed; the data set is not properly formatted.

  **err=34 FORMAT ERRORS EXCEEDED**
  - data set formatting prematurely ended because of consecutive formatting errors on a given DASD head.

  **err=38 FORMAT ERRORS EXCEEDED**
  - data set formatting prematurely ended because of consecutive formatting errors.

  **err=3C FORMAT ERRORS EXCEEDED**
  - data set formatting prematurely ended because of total number of formatting errors.

**rc=08**
- data set extent error.
**IAT4028**

*err=04* IATYIOP EXTENT ERROR
- the IATYIOP extent entry for the spool data set did not contain a valid data set control block (DCB) address.

*err=08* IATYIOP EXTENT ERROR
- the data set control block (DCB) for the spool data set was not open.

*err=0C* IATYIOP EXTENT ERROR
- the buffer size (spool record length) for the data set was larger than the maximum allowed.

*err=14* DEVICE TYPE ERROR
- DEVTYPE SVC error.

*err=18* DEVICE TYPE ERROR
- the device type on which the spool data set resides is not supported by JES3 for use in the spool.

*err=1C* MULTI-EXTENT DATA SET
- the spool data set consists of multiple DASD extents.

*err=20* NULL DATA SET
- the spool data set contains no tracks (null data set).

*err=24* TRACK CAPACITY ERROR
- TRKCALC service routine error.

*err=28* TRACK CAPACITY ERROR
- the spool buffer size is greater than the device track size.

*err=48* UNABLE TO ACCESS UCB
- the UCB address for the spool data set could not be translated by the IOS IOSCAPU service.

*err=4C* ERROR ACCESSING UCB
- the IOS IOSCAPU service encountered an unexpected error while processing a UCB request.

*rc=0C*
- insufficient virtual storage.

*rc=10*
- IATDMVR parameter error.

**System action:** JES3 initialization waits for one of the following operator replies:

**CONTINUE**
- the spool data set is placed into an unavailable state; JES3 initialization processing continues without requiring access to the data set. The spool space allocation maps will be restored from the checkpoint data set if possible, to allow jobs with data on the spool data set to be retained in the job queue.

**CANCEL**
- JES3 initialization ends with a DM012 abend.

**Operator response:** Contact the system programmer to determine the proper action to be taken.

**Programmer response:** If access to the spool data set is required, correct the situation, restart JES3 on the global processor, and then restart JES3 on all local processors.

**Module:**

**Descriptor Code:** 7

---

**IAT4028**

**Explanation:**
An error was encountered during validation or formatting of the spool data set with a ddname of *ddn*, which was being added to the JES3 spool configuration during the current restart. The return code, error code, and error reason indicate the specific error. See the explanation of message IAT4027 for details.

**System action:** JES3 initialization waits for one of the following operator replies:

- **CONTINUE**
  - JES3 initialization continues; the spool data set with a ddname of *ddn* is removed from the checkpointed spool configuration.

- **CANCEL**
  - JES3 initialization ends with a DM012 abend.

If CONTINUE is replied, the spool data set definition is deleted; subsequent global processor hot starts and local processor restarts will not attempt to access the data set.

**Operator response:** Contact the system programmer to determine the proper action to be taken.

**Programmer response:** If access to the spool data set is required, correct the situation, restart JES3 on the global processor, and then restart JES3 on all local processors.

IAT4030 • IAT4032

IAT4030
Explanation:

This is an informational message displayed during initialization of the JES3 spool to indicate the total number of accessible spool data sets.

System action: If no spool data sets were successfully opened and available for use, JES3 initialization ends with a DM012 abend. At least one spool data set must be available to JES3 at all times.

Operator response: None. This is an informational message.

Module: Containing Detecting Issuing
IATINSR IATINSR IATINSR

Routing Code: 2
Descriptor Code: 7

IAT4031
Explanation:

Formatting of the spool data set with a ddname of ddn has been initiated as a result of one of the following:

• the spool data set with a ddname of ddn was described by a FORMAT initialization statement and the data set was not previously used by JES3.
• the spool data set with a ddname of ddn was previously used by JES3 but is being replaced with formatting during the current restart; ddname ddn was replied to message IAT4009.
• formatting of the spool data set with a ddname of ddn failed during the previous JES3 restart (warm or cold) but the data set was defined by a TRACK or FORMAT initialization statement during the current warm start of JES3.

System action: JES3 initialization processing continues. JES3 issues message IAT4032 when formatting of the data set completes. If the data set is not acceptable for use in the JES3 spool, JES3 issues message IAT4027 or IAT4028.

Operator response: None. This is an informational message.

Module: Containing Detecting Issuing
IATINSR IATINSR IATINSR

Routing Code: 2
Descriptor Code: 2

IAT4032
Explanation:

Formatting of the spool data set with a ddname of ddn has completed. This message follows message IAT4031 which indicated that JES3 had initiated formatting of the data set. If all DASD tracks within the data set were properly
formatted, NO will be displayed in the message text. If there were formatting errors, \textit{nnn} indicates the total number of tracks that were not formatted.

\textbf{System action:} JES3 initialization processing continues; JES3 writes message IAT4035 to the JES3OUT data set for each of the \textit{nnn} tracks that were not successfully formatted.

\textbf{Operator response:} If errors were encountered during format processing of the data set, notify the system programmer.

\textbf{Programmer response:} Add a BADTRACK statement to the JES3 initialization stream for each spool track not formatted before the next warm or cold start. The JES3OUT data set indicates which DASD tracks were not formatted with message IAT4035.

\textbf{Module:}

\end{tabular}
\caption{IAT4034}
\end{table}

\textbf{Explanation:}

\begin{verbatim}
\textbf{ERROR WRITING THE SPOOL DATASET—CHECKPOINT RECORD, RC=rc}
\end{verbatim}

A change in status of a spool data set was detected during initialization of the JES3 spool. An error was subsequently encountered writing the updated IATYVOL record to the checkpoint data sets. If checkpoint duplexing was being used, JES3 issues this message only if the write operation failed on both checkpoint data sets.

\textbf{System action:} JES3 initialization processing continues; however, subsequent attempts to update the IATYVOL checkpoint record may fail. JES3 attempts recovery from the error before completion of JES3 initialization. If recovery fails, JES3 issues message IAT4142 at the time of failure.

If the current restart fails to complete, the intermediate status checkpoint data may be lost.

\textbf{Operator response:} Notify the system programmer. If JES3 initialization completes, reduce the queue backlog, particularly if JES3 local processors are still active. This is necessary since a cold start may eventually be required to correct the problem.

\textbf{Programmer response:} If there are indications of permanent errors, reallocate the checkpoint data sets and cold start the complex. See the IATXCKPT macro return codes in the \texttt{ZOS JES3 Customization}.

\textbf{Problem determination:} Table I, items 18 and 37; Table III, items 4 and 6.

\textbf{Module:}

\begin{tabular}{|l|l|l|}
\hline
IATINSR & IATGRCK & IATINSR \\
\hline
\end{tabular}
\caption{IAT4034}
\end{table}

\textbf{Explanation:}

\begin{verbatim}
\textbf{FORMAT COMPLETED FOR DDNAME=ddn, CYL=cyl, TRK=trk}
\end{verbatim}

A BADTRACK statement was read from the JES3 initialization stream identifying the track CYL\textit{cyl} and TRK\textit{trk} on
the spool data set with a ddname of \textit{ddn}; however, JES3 has formatted the spool data set and formatting of the identified track has successfully completed.

\textbf{System action:} JES3 ignores the corresponding BADTRACK initialization statement and permits allocation and use of the identified track unless I/O errors are later encountered for the track.

\textbf{Programmer response:} Delete the BADTRACK statement from the JES3 initialization stream that defines the identified track. The BADTRACK statement contains the following parameters: BADTRACK, DDNAME=\textit{ddn}, CYL=\textit{cyl}, TRK=\textit{trk}

Failure to update the initialization stream before performing the next warm start results in JES3 bypassing allocation of the track. If the identified track is actually usable, this can result in unnecessary performance degradation and wasting of the logical track group within which the track lies.

\textbf{Module:}

\begin{tabular}{lll}
\textbf{Containing} & \textbf{Detecting} & \textbf{Issuing} \\
IATINSR & IATDMVR & IATINSR \\
\end{tabular}

\textbf{Routing Code:} Note 19

\textbf{Descriptor Code:} –

\section*{IAT4036}

\textbf{Explanation:}

\begin{verbatim}
>>>FORMAT FAILED FOR DDNAME=--ddn--, CYL=--cyl--, TRK=--trk--

Formatting failed for track CYL=\textit{cyl} and TRK=\textit{trk} within the data set with the ddname of \textit{ddn} and no BADTRACK initialization statement describing the track was found.

\textbf{System action:} JES3 dynamically adds an entry to the BADTRACK checkpoint record describing the track and suspends allocation of the identified track until the next restart of JES3.

\textbf{Programmer response:} Add a BADTRACK statement to the JES3 initialization stream before the next warm or cold start to prevent JES3 from accessing the unformatted track. The BADTRACK statement contains the following parameters: BADTRACK, DDNAME=\textit{ddn}, CYL=\textit{cyl}, TRK=\textit{trk}

Failure to update the initialization stream before performing the next warm start can cause unnecessary JES3 spool error recovery processing when I/O is attempted to that track. For intermittent errors, failure to update the initialization stream can result in a loss of jobs and/or data.

IAT4047
Explanation:

During MODIFY CONFIG processing, data was found on a spool extent that was being deleted. An attempt was made to cancel the job(s) during a prior pass through the allocation tables.

This message indicates that a new check is starting, to ensure that no data exists on the affected spool. If data is found on the extent, message IAT4126, followed by WTOR IAT4174, will be issued.

System action: Processing continues.
Operator response: If the job is a started task, use the MVS CANCEL command or the appropriate stop procedure to stop the execution. Then start a writer to allow the output to be processed and the data to be purged from the spool.
If the job is the SYSLOG, use the WRITELOG CLOSE command, followed by the WRITELOG START command, to terminate the SYSLOG job and start a new one.
Programmer response: None. This is an informational message.

Issuing IATMOSQC

Routing Code: 2
Descriptor Code: 7

IAT4050
Explanation:

An SPART initialization statement was not found for a spool partition defined in the previous JES3 warm or cold start.
The text PARTITION DELETED is not displayed when the message is issued during *MODIFY CONFIG command
processing. The partition is not deleted and the command is eventually failed.

**System action:** None if this message is issued in response to the *MODIFY CONFIG command. If this message is issued during JES3 initialization, JES3 deletes spool partition `spart` and deletes all references to the partition from the system during JES3 initialization. For jobs previously read into the system requesting the spool partition, JES3 issues message IAT4125 and satisfies subsequent spool space allocation requests from the default spool partition. Spool data sets defined in the partition are placed into the default partition.

If this message is issued during *MODIFY CONFIG processing, no action is taken.

**Operator response:** Ensure that the SPART statement for the partition identified by `spart` is correct and included in the initialization stream.

**Programmer response:** If the SPART statement was unintentionally modified or deleted, correct the initialization stream and restart JES3.

If this message is issued as a result of the *MODIFY CONFIG command, add the missing SPART statements and reissue the command.

**IAT4051**

**Explanation:**

>>>**INVALID OVERFLOW PARTITION—spart1—REQUESTED FOR—spart2**

The SPART initialization statement for spool partition `spart2` specified OVRFL=`spart1` and spool partition `spart1` was not defined; that is, no SPART initialization statement specifies NAME=`spart1`.

**System action:** JES3 disables overflow out of spool partition `spart2` and processes space allocation from the partition `spart2` as if OVRFL=NO was specified.

**Operator response:** Consult the system programmer for the proper action to be taken. If applicable, issue the *MODIFY,Q,SP=`spart2`,OVRFL=option command to enable space allocation overflow from `spart2` to an appropriately defined spool partition.

**Programmer response:** If a previous JES3 initialization error has occurred when processing the SPART initialization statement for spool partition `spart1`, correct the SPART initialization statement before the next JES3 warm start. Otherwise, modify the SPART initialization statement for partition `spart2` to specify a valid spool partition name for overflow and perform a JES3 warm or cold start.

**IAT4056**

**Explanation:**

>>>—SPOOL SPACE ALLOCATION MAPS RESTORED—FROM CHECKPOINT (USE OR CREATE) <<<

At least one spool data set was found to be unavailable during JES3 global processor initialization. The spool space allocation maps (PTATs) were successfully read from the checkpoint data sets and have been restored. This message requests system operator confirmation that the checkpointed space allocation maps should be used.

**System action:** JES3 initialization waits for one of the following operator replies:

**USE**

specifies that the restored spool space allocation maps are to be used. If jobs are found that have data on the unavailable spool data set, JES3 issues message IAT4140 to determine if the jobs should be canceled or placed into a spool hold.

**CREATE**

specifies that the restored spool space allocation maps are to be discarded and that the space allocation maps are to be recreated. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set.
Operator response: Reply USE if no JES3 spool related failures have occurred since the previous JES3 warm start or if the current restart was preceded by an orderly shutdown of the global processor.

Reply CREATE if previously encountered situations indicated that the checkpointed spool space allocation maps might not be valid.

Routing Code: 1

Descriptor Code: 7

IAT4057

Explanation:

```
>>>ERROR RESTORING SPOOL SPACE ALLOCATION—MAPS FROM CHECKPOINT (CONTINUE OR CANCEL)
```

At least one spool data set was found to be unavailable during JES3 global processor initialization. The spool space allocation maps (PTATs) were successfully read from the checkpoint data sets; validity checking has determined that the checkpoint record was successfully written when JES3 previously ended. However, an error has occurred during restoration of the checkpointed space allocation maps.

This message is issued to ask the system operator if JES3 is to recreate the spool space allocation maps.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE

the spool space allocation maps (PTATs) will be recreated by reading the job and data set space allocation maps (TATs) for each job in the complex. If recovery of all of the job related spool space is possible, JES3 places into a spool hold the jobs found to have data on the unavailable data set. Otherwise, JES3 cancels the job.

CANCEL

JES3 initialization ends with a DM011 abend; data is left in storage for diagnostic purposes.

Operator response: Consult the system programmer for the proper action to be taken. If the impact of the failure is minimal, reply CONTINUE to allow JES3 initialization to continue. If diagnostic data (a dump) is required, reply CANCEL.

Problem determination: Table III, items 2, 5, and 6.

Module:

Routing Code: 1

Descriptor Code: 7

IAT4058

Explanation:

```
>>>SPOOL DATASET—ddn—CHECKPOINT RECORD ERROR—EXTENT SIZE MISMATCH
```

Validation of spool data set ddn failed during JES3 global processor initialization of spool space allocation. The spool data set checkpoint record (IATYVOL) contains data conflicting with the data set presently available for that ddname.

- if EXTENT SIZE MISMATCH present, the calculated number of logical track groups in the data set does not agree with the checkpointed number of track groups.
• if GROUP SIZE MISMATCH present, the number of spool records per logical track group does not agree with the
  checkpointed number of records per track group for the data set.

For either of the above cases, JES3 is unable to recover the spool space previously allocated to jobs on this data set
because the proper ownership boundaries are questionable.

**System action:** JES3 initialization ends with a DM012 abend.

**Programmer response:** Further access to the spool data set is impossible, since JES3 is unable to determine logical
track group boundaries on the data set. Perform a JES3 warm start with replace, and specify ddn in response to
message IAT4008. All jobs in the complex which have data on the spool data set will be lost.

**Problem determination:** Table III, items 2 and 5.

**Module:**

<table>

</table>

**Routing Code:** 2

**Descriptor Code:** 7

---

**IAT4059**

**Explanation:**

➤➤—LOAD FAILED FOR IATMOSP—➤➤

At least one spool data set was found to be unavailable during JES3 global processor initialization and the spool
space allocation maps (PTATs) were successfully restored from the checkpoint data sets. A change in status of one or
more spool data sets was detected, requiring that the space allocation maps be reconfigured to match the new spool
configuration. However, the load failed for module IATMOSP, which performs PTAT modifications.

**System action:** JES3 recreates the spool space allocation maps by recovering the spool space previously allocated to
each job and sysout data set in the complex. Spool space recovery requires that each TAT (IATYJBT) for each job and
spinoff data set be read and validated. JES3 cancels all jobs that have a job data set record (IATYJDS) or space
allocation record (IATYJBT) on an unavailable data set.

**Operator response:** None. This is an informational message.

**IAT4060**

**Explanation:**

➤➤—THE DEFAULT SPOOL PARTITION—spart— HAS NO DATASETS—➤➤

Upon completion of JES3 spool initialization, no spool data sets were defined in the default spool partition. At least
one spool data set must be available in the default partition to complete JES3 initialization.

**System action:** JES3 initialization ends with a DM012 abend.

**Programmer response:** Modify the JES3 spool configuration such that one or more spool data sets are in the default
partition. This can be accomplished by:
  • adding a new spool data set to the default partition.
moving a data set from one partition into the default partition.
changing a partition to become the default.
making an unavailable data set that is in the default partition available again.

Problem determination: Table III, item 5.

Module:

Containing  Detecting  Issuing
IATINSP    IATINSP    IATINSP

Routing Code: 2
Descriptor Code: 7

Note 19

IAT4061

Explanation:

The number of records per logical track group for all spool data sets in partition spart has been changed from xxx to yyy. The change may have been effected by:

• addition of the GRPSZ parameter to the SPART initialization statement for partition spart.
• addition of GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
• modification of GRPSZ=xxx to GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
• modification of GRPSZ=xxx to GRPSZ=yyy on the SPART statement for partition spart.

System action: JES3 initialization continues. The number of records per track group remains at xxx for all data sets previously added to or replaced within partition spart. The number of records per track group for data sets subsequently added to the partition or replaced within the partition is set to yyy.

JES3 issues message IAT4063 for each spool data set in partition spart whose logical track group size of xxx is still in use.

Operator response: Notify the system programmer.

Programmer response: If the logical track group size was unintentionally modified, correct the initialization stream before the next JES3 warm or cold start. If spool data sets were being added or replaced during the current restart, those data sets should be replaced during the JES3 warm start in which the corrected initialization stream is read.

To modify the logical track group size for the entire spool partition, it will be necessary to invoke replace processing for each spool data set in the partition eventually.

Routing Code: Note 19
Descriptor Code: –

IAT4062

Explanation:

SPOOL SPACE ALLOCATION MAPS TO BE—RECREATED. JOBS WITH UNAVAILABrush data
At least one spool data set was found to be unavailable during JES3 global processor initialization and JES3 was unable to restore the spool space allocation maps (PTATs) from the checkpoint data set. This message will be preceded by one or more of the following messages IAT4054, IAT4055, IAT4056, and IAT4057 indicating why the PTATs are being recreated.

**System action:** JES3 recreates the spool space allocation maps by recovering the spool space previously allocated to each job and sysout data set in the complex. Spool space recovery requires that the TAT (IATYJBT) for each job and spinoff data set be read and validated. JES3 cancels all jobs having a job data set record (IATYJDS) or space allocation record (IATYJBT) on an unavailable data set.

**Operator response:** None. This is an informational message.

**Explanation:**

The number of records per logical track group for all spool data sets in partition spart is currently defined as yyy; however, the number of records per track group for the data set with a ddname of ddn is xxx. This inconsistency may have been caused by:

- addition of the GRPSZ parameter to the SPART initialization statement for partition spart.
- addition of GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the BUFFER initialization statement if the GRPSZ keyword was omitted on the SPART statement for partition spart.
- modification of GRPSZ=xxx to GRPSZ=yyy on the SPART statement for partition spart.
- movement of the data set with a ddname of ddn from another partition into partition spart, where the originating partition's track group size was defined as xxx.
- the spool partition specified on the TRACK or FORMAT initialization statement for data set ddn was in error and the data set was moved to the default partition during JES3 initialization.

**System action:** JES3 initialization continues; the number of records per track group remains at xxx for data set ddn. However, the spool space utilization and access objectives defined by the installation may have been defeated.

**Operator response:** Notify the system programmer.

**Programmer response:** If the logical track group size was unintentionally modified, correct the initialization stream before the next JES3 warm or cold start.

To modify the logical track group size for the data set ddn, it will be necessary to invoke replace processing (start type WR or WAR) and specify ddn in response to message IAT4008 or IAT4009.
IAT4075

Explanation:

The maximum number of jobs that may reside in the JES3 job queue was found to be less than the number defined by the job limit subparameter of the JOBNO keyword parameter of the OPTIONS initialization statement. The maximum number of jobs is being restricted by either:

- the number of job numbers in the defined job number range is less than the defined maximum number of jobs. For example, the JOBNO keyword parameter of the OPTIONS initialization statement specified JOBNO=(1,100,1000). For this example, the job number range will support only 100 jobs, where the job queue size has been defined to allow 1000 jobs.
- the JES3JCT data set is not large enough to contain the JCT records for the defined maximum number of jobs.

System action: The storage resident job queue is constructed to support nnnnnnn jobs. An out-of-space condition on the JES3JCT data set can result if the storage resident job queue contains more jobs than the JES3JCT data set.

Operator response: Contact the system programmer to determine if this restriction requires his immediate attention.

System programmer response: If the maximum number of jobs is being restricted by the defined job number range, modify the JOBNO parameter such that the job number range is at least as large as the maximum number of jobs and perform a JES3 warm start or hot start with refresh.

If the maximum number of jobs is being restricted by the size of the JCT data set, do one of the following things:

1. Create a larger JCT data set, copy the existing JCT data set to it using the IATUTJCT utility, and restart JES3 using the new JCT data set.
2. Reallocate the JCT data set and perform a JES3 cold start.
3. Modify the JOBNO parameter to limit the storage resident job queue size.

Module:

Containing Detecting Issuing
IATINJQ IATINJQ IATINJQ

IAT4079

Explanation:

The job number range defined during the current JES3 warm start or hot start with refresh differs from the job number range that was previously in use. At least one job in the job queue has been encountered with a job number that was previously valid but which is outside the currently defined range.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE
JES3 initialization continues.

CANCEL
JES3 initialization ends immediately with a DM025 abend; the status of the affected jobs is left intact in the JES3JCT data set.

Operator response: Contact the system programmer to determine the action to be taken.

System programmer response: If the job number range was intentionally changed, have the system operator reply CONTINUE to allow JES3 initialization to continue. Otherwise, reply CANCEL to end JES3, correct the JOBNO keyword parameter on the OPTIONS initialization statement, and perform a JES3 warm start or hot start with refresh.
Before modification of the job number range, the JES3 job queue should be queried to determine how many jobs would be affected by the change.

**Explanation:**

An error was detected during JES3 initialization processing of the JES3JCT data set, which has resulted in the loss of one or more jobs.

**System action:** JES3 initialization waits for one of the following operator replies:

**CONTINUE**
JES3 initialization continues. The affected jobs are deleted from the job queue upon completion of JES3 initialization.

**CANCEL**
JES3 initialization ends immediately with a DM008 abend. The status of the affected jobs is left intact in the JES3JCT data set.

**Operator response:** Contact the system programmer to determine the action to be taken.

**Programmer response:** Examine the preceding messages to determine if the errors are recoverable.

An error occurred while JES3 was attempting to create a data space through the DSPSERV macro. The return and reason codes from the DSPSERV macro are displayed in the message. Message IAT3115 or IAT4085 follows to describe the JES3 function that is affected by the error and the action JES3 is taking.

**System action:** The data space function is disabled. JES3 initialization continues.

**Operator response:** Notify the system programmer. When the problem is fixed, hot start JES3 to create the data space.

**Programmer response:** Use the return codes and reason codes for the MVS DSPSERV macro described in z/OS MVS Programming: Assembler Services Reference ABE-HSP to determine the cause of the failure.
IAT4084

Explanation:

An error occurred while JES3 was attempting to add a data space to its access list through the ALESERV macro. The return and reason codes from the ALESERV macro are displayed in the message.

Message IAT3115 or IAT4085 follows describing the JES3 function that is affected by the error and the action JES3 is taking.

System action: The data space function is disabled. JES3 initialization continues.

Operator response: Notify the system programmer. When the problem is fixed, hot start JES3 to create the data space.

Programmer response: Use the return codes described in z/OS MVS Programming: Assembler Services Reference ABE-HSP to determine the cause of the failure.

Module:

IAT4085

Explanation:

An error occurred while attempting to create or obtain access to the JCT data space. Messages IAT4083 and IAT4084 precede this message if the error occurred during initialization. If the error occurred after initialization, message IAT8670 preceded this message.

System action: The data space function is disabled. JES3 continues processing.

Operator response: Notify the system programmer. When the problem is fixed, hot start JES3 to create the data space.

Programmer response: See message IAT4083, IAT4084, or IAT8670.

Module:

IAT4100
Explanation:

>>> ERROR RECOVERING STT SPOOL SPACE; — STT TAT INVALID —
<table>
<thead>
<tr>
<th>STT TAT ON AN UNAVAILABLE DATASET</th>
<th>STT TAT ON A REPLACED DATASET</th>
<th>DUPLICATE TRACK CONDITION</th>
</tr>
</thead>
</table>

Recovery of the spool space previously allocated to the single track table (STT) has failed during JES3 global processor warm or hot start processing. One of the following conditions was encountered:

STT TAT INVALID
the STT TAT (IATYJBT chain) failed validity checking or the STT TAT FDB (in the JESCKPNT data area) was not valid.

STT TAT ON AN UNAVAILABLE DATASET
one or more JBT records in the STT TAT chain were on a spool data set which is not accessible to JES3 during this restart.

STT TAT ON A REPLACED DATASET
one or more JBT records in the STT TAT chain were on a spool data set which was replaced during this restart.

DUPLICATE TRACK CONDITION
one of the JBT records in the STT TAT chain described a logical track group which (during some unknown time interval) was simultaneously allocated to another job.

STT TRT ON A NONEXISTENT DATA SET
An STT extent pointer was found in the STT track allocation table. There is no corresponding entry in the JES3 volume table that was checkpointed during the last JES3 warm start.

JES3 eventually aborts initialization and abends with a DM743.

System action:
JES3 will use the data set checkpoint (IATYVOL) STT record definitions to reconstruct a JBT to describe the STT spool space.

Operator response: Notify the system programmer.

Programmer response: If STT JBT recovery fails, the initialization debugging aid (INTDEBUG) facility may be used to obtain a dump where the error is detected.

For the ‘STT TAT ON A NONEXISTENT DATA SET’ condition, there has been a mismatched set of spools and a checkpoint data set being used. Verify that the same configuration is in use as was used the last time JES3 was initialized.

Problem determination: Table III, item 11.

IATINRN

Routing Code: 1
Descriptor Code: 7

IAT4104
Explanation:

>>INVALID STT ENTRY RANGE DEFINED FOR—SPOOL DATASET—ddn

The single track table (STT) entry range specified for the spool data set with ddname *ddn* was not valid. One or more of the following conditions were encountered:
IAT4105

STT=(*startcyl,endcyl*)
    was specified and the starting cylinder address was lower than the cylinder on which the data set starts.

STT=(*startcyl,endcyl*)
    was specified and the ending cylinder address was higher than the cylinder on which the data set ends.

STTL=(*startcyl,count*)
    was specified and the starting cylinder address was lower than the cylinder on which the data set starts.

System action: JES3 initialization continues; no single track table space is created on the identified spool data set.

Programmer response: Run the IEHLIST system utility to determine the cylinder boundaries for the spool data set
and correct the associated TRACK or FORMAT initialization statement. To effect the desired STT range it will be
necessary to:
    • perform a JES3 cold start.
    • perform a JES3 warm start with replace (start type WR or WAR) and specify ddn in response to message IAT4008.

If insufficient STT spool space is available to JES3 even without the data intended to be on data set ddn, JES3 will
dynamically extend the STT space as required. Performance degradation is possible because the STT extension logic
does not take into consideration all variables which may affect spool performance.

If the STT or STTL range specified for any of the format or track statements is not valid, JES3 allocates the centermost
two track groups of each data set in the default spool partition as the initial STT allocation.

If there is an incorrect STT or STTL range specified for any of the format or track statements, JES3 allocates the
centermost two track groups of each data set in the default spool partition as the initial STT allocation.

Problem determination: Table I, item 25; Table III, item 5.

Module:

Routing Code: 2
Descriptor Code: 7

Explanation:

The TRACK or FORMAT initialization statement for spool data set ddn contained the STTL=(*startcyl,count*) or the
STT=(*startcyl,endcyl*) parameter. The starting cylinder address was within the bounds of the data set; however, the
data set has fewer than count logical track groups between the starting cylinder address and the end of the data set.

System action: JES3 initialization processing continues; single track table space is created on the spool data set from
the starting cylinder address to the end of the data set.

Programmer response: Run the IEHLIST system utility to determine the cylinder boundaries for the spool data set
and correct the associated TRACK or FORMAT initialization statement. To effect the desired STT range it will be
necessary to:
    • perform a JES3 cold start.
    • perform a JES3 warm start with replace (start type WR or WAR) and specify ddn in response to message IAT4008.

If insufficient STT spool space is available to JES3 without the data intended to be on data set ddn, JES3 will
dynamically extend the STT space as required. Performance degradation is possible because the STT extension logic
does not take into consideration all variables which may affect spool performance.

Problem determination: Table I, item 25; Table III, item 5.

IAT4106

Explanation:

STT EXPANSION SEGMENT(S) LOST—FOR SPOOL DATASET—ddn—

Recovery of the spool space previously allocated to the single track table (STT) has failed during JES3 global processor warm or hot start processing; this message will be preceded by message IAT4100 which describes the type of error that was encountered. During reconstruction of the STT TAT, spool data sets were found to contain logical track groups that were dynamically added to the STT.

System action: Reconstruction of the STT job track allocation table (JBT) continues; additional messages may be issued during JES3 internal spool space recovery which identify the specific STT data that was lost (if any).

Operator response: None. This is an informational message.

Programmer response: During the next JES3 cold start, define enough sufficient STT spool space to prevent STT expansion in the future.

IAT4107

Explanation:

NET—netname—WILL NOT ACCEPT A RESUBMITTED JOB—WITH A JOB NUMBER GREATER THAN 65,534—

JES3 has detected that a Dependent Job Control network has been submitted on a release that does not support job numbers greater than 65,534 and is in the system. This message is a warning that until this net has completed, you should not attempt to increase the job number range beyond 65,534.

In the message text:

netname

The name of the net.

System action: JES3 initialization continues.

Operator response: Notify the system programmer.

System programmer response: If you have not made plans to increase the job number range beyond 65,534 no immediate action is needed. If you do make plans to increase the job number range you must either wait for this net to complete or cancel it. If you increase the job number range beyond 65,534 while the net is still in the system, and any job within the net is resubmitted and assigned a job number greater than 65,534, the job will fail with message IAT6179.

IAT4109

Explanation:

ERROR RESTORING JES3 DUMP SAYSUPPRESSION LIST

JES3 initialization was unable to restore the JES3 dump suppression checkpoint record spool space for one or more of the following reasons:

- The checkpoint FDB is incorrect
- The checkpoint record is on an unavailable spool data set
- The checkpoint record is on a replaced spool data set.

System action: JES3 issues message IAT4103, asking the operator if JES3 should continue initialization or cancel it. If the operator replies continue, the JES3 dump suppression checkpoint record is lost, and a new one is built with no dumps suppressed. If cancel is specified, JES3 ends with an DM011 code.

Operator response: Notify the system programmer to determine the action to take.

System programmer response: Reenter the operator commands to obtain the list of JES3 failsoft codes that are a result of the JES3 dump suppression checkpoint records being suppressed. Or, reply cancel to message IAT4103 and analyze the abend with DM011 code. See z/OS JES3 Diagnosis for more information on the DM011 code.

Problem determination: See Table III, items 4 - 6 and Table I, item 29.

Routing Code: Note 19
Descriptor Code: –

---

IAT4126

Explanation:

During JES3 global processor initialization, the specified job or DSP was found to have data on one or more spool data sets that were replaced or deleted during this restart:

- if REPLACED appears, spool data set ddn was replaced during this restart (ddn is replied to in messages IAT4008 or IAT4009); the data set is available during this restart; but, it no longer contains the data written on behalf of the specified job or DSP.
- if DELETED appears, spool data set ddn is deleted during this restart (the TRACK or FORMAT statement is deleted and the operator confirmed deletion of the data set by responding “continue” to message IAT4000).

System action: JES3 deletes the job from the job queue except in the case of a hot start with refresh. In that case, this message is followed by message IAT4141 asking the operator to terminate JES3.
Programmer response: In the case of a hot start with refresh, terminate JES3 by responding to message IAT4141. Then perform a hot start, which will reintroduce the deleted spool. Issue the *I Q,DD=spool,U command and purge all jobs on that spool. Retry the hot start with refresh or use the *MODIFY CONFIG command to delete the spool.

In all other cases, resubmit the canceled job, if possible.

Module:

Containing Detecting Issuing
IATDMJV IATDMJV IATDMJV

IAT4131

Explanation:

>SPOOL RECORD ERROR DETECTED—err FOR JOB—jobname(jobid)<

During JES3 global processor initialization, the system found an incorrect spool resident control block for the specified job.

In the message text, err is one of the following:

**JBT**
One or more records in the track allocation table (TAT) chain (IATYJBT).

**JDAB**
The job accounting block (IATYJDA).

**JDS**
The job data set control block (IATYJDS).

**OSE**
One or more records of the output service scheduling chain (IATYOSE).

**WOSE**
One or more records of the output service status chain (IATYOSE).

**PARM**
One of the JDAB parameter records.

**JMR**
The job management record (IATYJMR).

**JCT**
The job control table (IATYJCT).

**System action:** During a warm start, or during any restart, if the job was not active on main, JES3 issues message IAT4133 to indicate that the job is to be deleted and message IAT4174 to give the operator the option to delete the job or to end JES3 initialization.

During a hot start without refresh where the job was active on main, JES3 retains the job in the queue in a delete only state and issues message IAT4134.

During a hot start with refresh, where the job was active on main and is being deleted because of a change to the job number range on the OPTIONS initialization statement, JES3 issues message IAT4133 to indicate that the job is to be deleted and message IAT4174 to give the operator the option to delete the job or to end JES3 initialization. If the job number range is not changed, or is changed without deleting the active job, JES3 retains the job in the queue in a delete only state and issues message IAT4134.

**System programmer response:** See message IAT4174 to determine what action to take.

IAT4132
Explanation:

## JOB—jobno—RELEASED FROM SPOOL HOLD

During JES3 global processor initialization, job was found to have previously been placed into a spool hold state and all spool data sets which contain data for the job are available during this restart.

System action:  JES3 releases the job from the spool hold; resumes scheduling of work on behalf of the job.

Operator response:  None. This is an informational message.

Module:

Routing Code: 2
Descriptor Code: 7

IAT4133
Explanation:

## JOB—jobname(jobid)—HAS BEEN DELETED DUE TO—reason

During JES3 global processor initialization, an error was encountered during spool space recovery processing for the specified job. If the jobid displayed in this message is JOB*****, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. The job is to be deleted from the job queue for one of the following reasons:

**BY OPERATOR**

The job has data on one or more spool data sets which are unavailable during this restart and the operator replied CANCEL or CANCEL,ALL to message IAT4140.

**JCT READ ERROR**

An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

**JCT VALIDATION ERROR**

An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

**INVALID JCT JOB NUMBER**

The specified job had an incorrect job number.

**JCT WRITE ERROR**

An error prevented JES3 from writing to the job control table (JCT).

**JQE ALLOCATION ERROR**

An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

**ABEND DURING VALIDATION**

JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.
UNAVAIL SPOOL DATA SET(S)
The job has data on an unavailable spool data set and the operator has replied ‘CANCEL’ or ‘CANCEL,ALL’ to message IAT4140.

REPLACED SPOOL DATA SET(S)
one or more spool data sets were replaced and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

SPOOL OWNERSHIP ERROR(S)
a duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

SPOOL REALLOCATION FAILURE
the job has data on one or more spool data sets which are unavailable during this restart and the checkpointed space allocation maps (PTATs) were not restored.

SPOOL RECORD ERROR(S)
an error was detected validating spool control blocks or a user exit determined there was an error for the specified job. Message IAT4174 was previously issued.

DELETED SPOOL DATA SET(S)
one or more spool data sets were deleted and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

DSP FAILURE
before the restart, a JES3 dynamic support program (DSP) failed to run. Message IAT4149 was previously issued.

INCOMPLETE JOB PURGE
the specified job was still active in PURGE processing. Message IAT4150 was previously issued.

OUTSERV VALIDATION ERROR
an error was found in the output processing for the specified job.

OPERATOR ANALYSIS REQUEST
a warm start with analysis or hot start with analysis is being performed and the job was flagged for deletion.

ERROR IN PREVIOUS RESTART
a warm start is being performed and the job was flagged for deletion by analysis in a previous JES3 restart. Message IAT4148 was previously issued.

INCOMPATIBLE FUNCTION
the job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

System action: The job is deleted from the job queue.

Programmer response: Resubmit the canceled job, if possible.

IAT4134

Explanation:

 Lima—jobname(jobid)—HAS BEEN RETAINEDorate-to—the-canceler)

During JES3 global processor initialization, an error was encountered during spool space recovery processing for the specified job and the job is to be deleted from the job queue. However, the current restart type is hot (start type H or HA) and the status of the job indicates that the job may be executing on a processor in the complex. If the jobid
displayed in this message is JOB*****, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. The job was to be deleted from the job queue for one of the following reasons:

**JCT READ ERROR**
An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

**JCT VALIDATION ERROR**
An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

**INVALID JCT JOB NUMBER**
The specified job had an incorrect job number.

**JCT WRITE ERROR**
An error prevented JES3 from writing to the job control table (JCT).

**JQE ALLOCATION ERROR**
An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

**ABEND DURING VALIDATION**
JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.

**UNAVAIL SPOOL DATA SET(S)**
The job has data on an unavailable spool data set and the operator has replied ‘CANCEL’ or ‘CANCEL,ALL’ to message IAT4140.

**REPLACED SPOOL DATA SET(S)**
One or more spool data sets were replaced and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

**SPOOL OWNERSHIP ERROR(S)**
A duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

**SPOOL REALLOCATION FAILURE**
The job has data on one or more spool data sets which are unavailable during this restart and the checkpointed space allocation maps (PTATS) were not restored.

**DELETED SPOOL DATA SET(S)**
One or more spool data sets were deleted and the spool space allocation maps (PTATS) were not restored from the checkpoint data set. Message IAT4126 was previously issued.

**DSP FAILURE**
before restart, a JES3 dynamic support program (DSP) failed to run. Message IAT4149 was previously issued.

**INCOMPLETE JOB PURGE**
The specified job was still active in PURGE processing. Message IAT4150 was previously issued.

**OUTSERV VALIDATION ERROR**
An error was found in the output processing for the specified job.

**OPERATOR ANALYSIS REQUEST**
A warm start with analysis or hot start with analysis is being performed and the job was flagged for deletion.

**ERROR IN PREVIOUS RESTART**
A warm start is being performed and the job was flagged for deletion by analysis in a previous JES3 restart. Message IAT4148 was previously issued.

**INCOMPATIBLE FUNCTION**
The job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

Deletion of the job at this time is not possible because the job is executing.

**System action:** JES3 sets the job to a delete only state; further scheduling of the job is suspended. The job will be automatically deleted from the queue during the next JES3 warm start.

**Operator response:** Upon completion of JES3 initialization, cancel the job with the *MODIFY,J=jobno,C command.

**Programmer response:** Resubmit the canceled job, if possible.

---

IAT4136 Explanation:

JOBN—jobname(jobid)—PLACED IN SPOOL HOLD

During JES3 global processor initialization, the specified job was found to have data on one or more spool data sets that are not available during this restart. HOLD or HOLD,ALL was replied to message IAT4140 to request that jobs with unavailable data be retained in the job queue in a spool hold state.

System action: JES3 places the job into a spool hold; no further scheduling of the job is performed.

Operator response: To release the job from the spool hold it is necessary to return the unavailable spool data sets that the job requires to the spool and perform a hot start. JES3 initialization processing will release the job from the spool hold when all unavailable data sets that the job requires are again available.

---

IAT4137 Explanation:

*** WARNING *** A POTENTIAL DUPLICATE—TRACK CONDITION EXISTS *** WARNING ***

During JES3 global processor initialization, one or more spool data sets were unavailable and the spool space allocation maps (PTATs) were not restored from the checkpoint data set. At least one job is active in execution and must be deleted; for each such job, this message was preceded by a message which identifies the job and describes the reason for deleting the job. In the below description of the error, jobid refers to the job identification shown in a message issued for any job that was found to be active.

The situation exists where JES3 could reallocate the spool space which is presently in use by job jobid while the job is still reading and/or writing to that spool space:

• The space allocation maps (job/ data set TATs) for job jobid were on unavailable spool data sets.
• The job uses JES3 managed devices.
• An error was encountered in the space allocation maps (JBT chains) for the job.
• An error was encountered in the job data set block (JDS chains) for the job.

System action: JES3 issues message IAT4138 and retains the job in the job queue in a delete only state.

Operator response: Disable the processor identified by message IAT4138 immediately.

Programmer response: Resubmit the canceled job, if possible.

Module:

Containing Detecting Issuing
IATINRN

Routing Code: 2
Descriptor Code: 7

IAT4138
Explanation:

=>JOB jobname (jobid) IS ACTIVE ON MAIN main CANCEL JOB OR DISABLE MAIN

During JES3 global processor initialization, an error was encountered during recovery of spool space previously allocated to the specified job. The job is to be deleted from the job queue; however, the last known status of the job indicates that the job is executing on the specified main.

If CANCEL JOB OR DISABLE MAIN is present, this message was preceded by message IAT4137.

System action: JES3 sets the job to a delete only state; further scheduling of the job is suspended.

Operator response: If CANCEL JOB OR DISABLE MAIN is present, ensure that the job is no longer active on processor main. If necessary, disable the processor with a system reset.

Upon completion of JES3 initialization, cancel the job using the *MODIFY,J=jnum,C command.

Programmer response: Resubmit the job, if possible.

Module:

Containing Detecting Issuing
IATINJR IATINJR IATINJR

Routing Code: 2
Descriptor Code: 7

IAT4140
Explanation:

=>JOB jobname (jobid) HAS DATA ON AN UNAVAILABLE SPOOL DATASET, ENTER: HOLD (,ALL)

=>OR CANCEL (,ALL)

During JES3 global processor initialization, a job was found to have data on one or more spool data sets which are not available during this restart and the spool space allocation maps (PTATs) were not restored from the checkpoint data set.

System action: JES3 initialization waits for one of the following operator replies:

HOLD
the job is placed into a spool hold state; the job may only be released from the spool hold by reinstatement of the unavailable spool data sets. This message will be reissued as each job that has data on an unavailable spool data set is encountered.

HOLD,ALL
the job is placed into a spool hold state; the job may only be released from the spool hold by reinstatement of the unavailable spool data sets. All jobs subsequently found to have data on an unavailable data set will be placed into a spool hold; this message will not be reissued.
CANCEL
the job is deleted from the queue if a warm start is being performed or placed into a delete only state if a hot
start is in progress. This message will be reissued as each job that has data on an unavailable spool data set is
encountered.

CANCEL,ALL
the job is deleted from the queue if a warm start is being performed or placed into a delete only state if a hot
start is in progress. All jobs subsequently found to have data on an unavailable data set will be deleted; this
message will not be reissued.

Operator response: Display the JES3OUT data set for a list of jobs that have been released from the spool. Consult
the system programmer for the proper action to be taken.

If a large number of jobs are affected by the unavailable spool data sets or if the type of jobs affected is known or
predictable, determine the action to be taken and use the ,ALL option to minimize operator interaction.

System programmer response: If the unavailable spool data sets must remain unavailable to JES3 for a long time
period, retention of the jobs with unavailable data may significantly affect JES3 performance and scheduling ability.

Module:

IATINJR IATINJR IATINJR

Routing Code: 1
Descriptor Code: 7

IAT4141
Explanation:

One of the following situations occurred:
• The operator replied CANCEL,ALL to message IAT4140 or message IAT4175, requesting that all jobs that contain
  space on unavailable spool data sets be canceled; this message asks the operator to confirm that response.
• The operator replied SNAP,ALL to message IAT4174, requesting that diagnostic information for all faulty jobs in
  the system are to be written to the JES3 snap data set; this message asks the operator to confirm that response.
• The operator replied TERMINATE JES3 to message IAT4174, requesting that JES3 end with a DM011 abend.; this
  message asks the operator to confirm that response.

System action: JES3 initialization waits for an operator reply:

U  to indicate that the specified processing is to be allowed; no further confirmation will be requested.

anything other than U  to change the reply to message IAT4140 or message IAT4175; the previous response to the message is discarded
and the message is reissued.

Operator response: To request that the message IAT4140 or message IAT4175 be reissued, enter N (anything other
than U). To allow the specified processing to begin, reply U.

Explanation:

ERROR WRITING THE
  SPOOL DATASET CKPT RECORD
  SPOOL PARTITION CKPT RECORD
  PARTITION TAT CKPT RECORD
  BADTRACK CHECKPOINT RECORD

Updating of one of the JES3 spool related checkpoint records has failed during JES3 initialization. The type of write error is indicated by the IATXCKPT macro return code, rc. If checkpoint duplexing was being used, this message will occur only if the write operation failed on both checkpoint data sets.

System action: JES3 initialization waits for one of the following operator replies:

CONTINUE -
  JES3 initialization processing continues.

CANCEL -
  JES3 initialization ends with a DM011 abend.

Operator response: Consult the system programmer for the actions to be taken.

Programmer response: See the IATXCKPT macro return codes in the z/OS JES3 Customization. If the reply to this message is CONTINUE, JES3 initialization will proceed; however:

• other unrelated access requests to the checkpoint data set may fail.
• future checkpointing of the spool space allocation maps (PTATs) may fail; recreation of the PTATs may be required during subsequent JES3 restarts in which one or more spool data sets are unavailable.
• use of the checkpointed spool space allocation maps (PTATs) should be avoided; reply CREATE to message IAT4056 in all subsequent JES3 restarts.

Problem determination: Table I, items 18 and 37; Table III, items 4 and 6.

IAT4143

Explanation:

CONFIRM JOB OR FSS CANCEL AND MAIN—DISABLE REQUEST (U— OR CANCEL—)

During JES3 global processor initialization, at least one job was found to have data on an unavailable spool data set and the job was active in C/I in a functional subsystem (FSS) address space. If the job was active in MAIN processing, JES3 issues message IAT4138 to display the name and number of each job and the name of the processor on which the job was active. Message IAT4147 displays the name and number of each job and the FSS ID if the job was active in a CI FSS address space. Message IAT4143 prompts the system operator to confirm job or FSS cancellation and that the identified processors have been disabled (system reset) or to cancel initialization (CANCEL). A reply of CANCEL ends JES3 with a DM011 abend.

System action: JES3 initialization waits for an operator reply of U, CONT, CONTINUE or CANCEL. Any reply other than U or CANCEL results in this message being reissued.

Operator response: After disabling all of the processors identified in the preceding occurrences of message IAT4138, reply U to continue, or CANCEL to cancel initialization with a DM011 abend.

Routing Code: Note 19
During initialization, JES3 attempts to recover the job’s spool space. The job is being processed by a C/I functional subsystem (FSS) address space and one of the following conditions has occurred:

- The job has data on an unavailable spool data set.
- A potential duplicate track condition was detected.
- An error was encountered while validating the job’s control blocks.

If a potential duplicate track condition is detected, the message also contains the text “CANCEL FSS OR DISABLE MAIN”.

**System action:** Depending on the error, JES3 places the job either into spool hold, or flags the job for deletion.

**Operator response:** Notify the system programmer.

**Programmer response:** If a potential duplicate tracks condition is detected, it is possible that the job’s spool space may be allocated to another job, while this job is still using it. This can be prevented by disabling the FSS that is processing the job. The FSID indicates the relative number of the FSSDEF statement that defines the FSS in the initialization stream. The FSSNAME parameter can be used on an MVS cancel command to cancel the FSS. It must be issued on the processor where the FSS is executing. Another alternative is to IPL the processor where the FSS processes. Cancelling the job will not have any effect at this point. The FSS must be disabled before *S JSS is issued in order to prevent re-allocation of the job’s spool space.

IAT4151
Explanation:

The error is dependent on the checkpoint record being read:

- Complex Status Record - Either the record could not be read from the checkpoint data set, or the record is not valid.
- Initialization Checkpoint - Either the record could not be read from the checkpoint data set, or the initialization identifier (date/time) is not the same as the one in the complex status record.

System action: FSS initialization ends with a 2FB abend (no dump).

Operator response: Notify the system programmer.

Programmer response: Verify that the contents of the checkpoint record(s) are valid. Additional messages issued by module IATGRCK may provide more information about the error.

Module:
IAT4152 • IAT4157

IAT4152

Explanation:

A non-zero return code was returned from the IATXCKPT (checkpoint) routine. Either the routine was unsuccessful in reserving the checkpoint data set or the routine failed to release the checkpoint data set and/or the checkpoint access method.

System action: FSS initialization ends with a 2FB abend (with a dump). Register 15 contains the ABEND subcode (XX'4152')

Operator response: Notify the system programmer.

Programmer response: Messages issued by module IATGRCK may provide more information about the error.

Module:

IAT4157

Explanation:

The system name of the CPU where the functional subsystem (FSS) is currently running was not found in the complex status record (CSR).

System action: FSS initialization ends with a 2FB abend.

Operator response: Notify the system programmer.

Programmer response: Verify that the contents of the CSR are valid. An error may have occurred when JES3 (global or local) attempted to update the CSR (message IAT3001 was issued). If so, FSSs cannot be started until a warm or cold start is performed (to reinitialize the CSR).

Module:
IAT4158
Explanation:

During analysis, it was determined that a job specified by the operator in response to message IAT3146 is an active functional subsystem and cannot be deleted.

In the message text:

jobname  The name of the job.
jobid    The jobid of the job.
sys      The name of the system where the job is active.

System action:  The job is not deleted by the analysis request.

Operator response:  Typically, this is an informational message only; however, if you really need to delete the active FSS, you must reset the system indicated in the sys message text and perform another hot start with analysis.

System programmer response:  None. this is an informational message.

<td>IATINJR</td>
<td>IATINJR</td>
<td>IATINJR</td>
</tr>
</tbody>
</table>

Routing Code: 2
Descriptor Code: 7

IAT4159
Explanation:

JES3 initialization was unable to restore the TCP/IP/NJE status checkpoint record because of one or more of the following reasons:

- The TCP/IP checkpoint FDB, in the JESCKPNT data area, is incorrect. The typical reason for this is because a JES3 release that supports TCP/IP/NJE was previously installed, backed out to an earlier release (including a DSI that moves the global to an earlier release), and is being reinstalled.
- One or more of the TCP/IP checkpoint records were on unavailable spool data sets.
- One or more of the TCP/IP checkpoint records were on spool data sets that were replaced during this restart.

System action:  JES3 initialization continues; the status of some, or all, TCP/IP Netservs, sockets, and TCP/IP nodes is lost. TCP/IP connections that were active before the last JES3 restart need to be re-established. During this JES3 restart, a new TCP/IP checkpoint record is built.

Operator response:  After the JES3 restart is complete, issue an *LA command. For each IAT8524 line in the response that indicates a job name of IEESYSAS and a step name of a Netserv definition, cancel the address space using the MVS cancel command, C ntsvname, to clean up the Netserv address spaces. Then reestablish the Netserv by using a *CALL,TCP,NETSERV=ntsvname command, followed by an *S,TCP,SOCKET=scktname command for each socket that you want to activate.

System programmer response:  None. This is an informational message.

Explanation:

>>> CONFIRM DELETION RELOCATION OF JOB jobname (jobid) DUE TO reason text

370 z/OS V2R1.0 JES3 Messages
During JES3 recovery and/or validation of job related spool space, one or more errors were encountered that will result in the loss of a job. One or more messages that identify the specific errors and the affected jobs preceded this message. If the jobid displayed in this message is JOB******, it means that the job number was assigned a job number greater than 65,534 when it was submitted on a higher JES3 release. This message is also issued for DSPs, in which case a dspname is given and the jobid is set to N/A.

The job is to be deleted from the job queue for one of the following reasons:

**JCT READ ERROR**
An error prevented JES3 from accessing the job control table (JCT). Message IAT4080 was previously issued.

**JCT VALIDATION ERROR**
An error was encountered validating the JCT for the specified job. Message IAT4080 was previously issued.

**INVALID JCT JOB NUMBER**
The specified job had an incorrect job number.

**JCT WRITE ERROR**
An error prevented JES3 from writing to the job control table (JCT).

**JQE ALLOCATION ERROR**
An error prevented JES3 from allocating the job queue element (JQE). Message IAT4173 was previously issued.

**ABEND DURING VALIDATION**
JES3 ended during validation processing. Message IAT4163 or IAT4164 was previously issued.

**UNAVAIL SPOOL DATA SET(S)**
The job has data on an unavailable spool data set and the operator has replied ‘CANCEL’ or ‘CANCEL,ALL’ to message IAT4140.

**SPOOL OWNERSHIP ERROR(S)**
A duplicate tracks condition was detected during spool space recovery for the job. Message IAT4162 was previously issued.

**SPOOL REREALLOCATION FAILURE**
The job has data on one or more spool data sets which are unavailable during this restart and the checkpointed space allocation maps (PTATs) were not restored.

**SPOOL RECORD ERROR(S)**
An error was detected validating spool control blocks or a user exit determined there was an error for the specified job.

**DSP FAILURE**
Before the restart, a JES3 dynamic support program (DSP) failed to run. Messages IAT4149 and IAT4150 were previously issued.

**OUTSERV VALIDATION ERROR**
An error was found in the output processing for the specified job.

**INCOMPATIBLE FUNCTION**
The job was using a function that is available only at a higher JES3 release and a fallback was made to this release while the job was active. The job cannot be processed in this JES3 release.

**System action:** JES3 initialization waits for one of the following operator replies:

**CONTINUE or CONT or U**-
If a warm start is being performed, the job is deleted from the queue and message IAT4133 is issued.

If a hot start (with or without refresh) is being performed and the deletion is caused by anything other than the reduction of the JOBNO range on the OPTIONS statement, the job is placed into a delete only state if the job is active on MAIN or in a C/I FSS and message IAT4134 is issued.

If a hot start with refresh is being performed and the deletion is caused by the reduction of the JOBNO range on the OPTIONS statement, the job is deleted from the queue even if the job is active and an IPL is not being performed. JES3 does not end active jobs that are deleted. It is your responsibility to either wait for active jobs to end or cancel them before you delete them in this manner, or you can IPL the processor on which these jobs are active.
IAT4175

If you reply CONTINUE to delete a job, that job is deleted immediately even if you reply TERMINATE to a later occurrence of IAT4174 issued for a different job.

When JES3 detects an active job that is about to be deleted, it issues messages IAT3101 and IAT3062, requiring a reply. These messages are issued only once per processor. See these messages for further information.

**CONTINUE,ALL or CONT,ALL**
Deletes all jobs with no further IAT4174 request.

**SNAP**
Diagnostic information about the job is written to a snap data set. This response is only supported during JES3 initialization.

**SNAP,ALL**
Diagnostic information about this job and all following jobs in error is written to a snap data set. This response is only supported during JES3 initialization.

**TERMINATE or TERM or T**
JES3 initialization ends with a DM011 abend.

**Operator response:** Examine the preceding message to determine the impact of the failure and the appropriate action to be taken.

**Module:**

</tbody>
</table>

**Routing Code:** 2

**Descriptor Code:** 7

---

**Explanation:**

During initialization, a job’s track allocation table is on an unavailable spool data set. JES3 is unable to reallocate the spool space while creating new spool space allocation maps.

**System action:** JES3 waits for one of the following operator replies:

**CANCEL**
The job is deleted from the queue if:
- a warm start is being performed
- is placed into a delete only state
- a hot start is in progress.

This message will be reissued for each job that has a JOBTAT on an unavailable spool data set.

**CANCEL,ALL**
The job is deleted from the queue if:
- a warm start is being performed
- is placed into a delete only state
- a hot start is in progress.
All jobs subsequently found that have a JOBTAT on an unavailable spool data set will be deleted. Message IAT4141 will be issued to confirm the CANCEL,ALL command. Message IAT4175 will not be reissued.

**TERMINATE**

JES3 will end with a DM011. [z/OS JES3 Diagnosis](#) has more information concerning the DM011 code.

**Operator response:** Consult the system programmer for the appropriate action to be taken.

**Note:** If a large number of jobs are affected by the unavailable spool data sets or if the type of jobs affected is known or predictable, use the CANCEL,ALL command to minimize operator action.

**Programmer response:** Performance and scheduling maybe significantly affected if the spool data set must remain unavailable to JES3.

Chapter 9. Interpreter Messages

IAT4201
Explanation:

>>> CHARACTER—c—NOT VALID IN DEST—PARAMETER ON OUTPUT STATEMENT—outdd <<<

JES3 detected a character that is not allowed on the DEST parameter of the noted JCL OUTPUT statement (label outdd).
In the message text:

\( \text{c} \) the unidentified character

outdd the OUTPUT statement label

System action: The job is canceled.

Programmer response: Correct the value of DEST on the OUTPUT JCL statement (outdd) and resubmit the job.
DEST can be a name of up to two levels separated by a period. Each level can contain 1 through 8 alphanumeric or the special characters ($ # @).

Module:

<table>

- Issuing: IATIICC

Routing Code: Note 19

Descriptor Code: –

IAT4211

Explanation:

INTERPRETER HAS ABENDED, IN FSS fssname, ASID=asid

An interpreter subtask (C/I) has ended. If the failure occurred in a functional subsystem (FSS), the functional subsystem name fssname and address space ID asid appear in the message. If this text does not appear in the message, the failure occurred in JES3.

System action: JES3 attempts to initialize another subtask. If the attempt fails, the subtask counts are reduced.

Operator response: Notify the system programmer.

Programmer response: Check the dump taken by the subtask’s ESTAE and SYS1.LOGREC for the cause of the subtask failure.

Module:

- Containing: IATIIMS
- Detecting: IATINAT
- Issuing: IATINAT

Routing Code: 42

Descriptor Code: 7

IAT4213

Explanation:

JOB ENDED. THE USER REQUESTED THE JCLTEST FACILITY fssname, ASID=asid

The user’s job requested processing by the JCLTEST facility of the interpreter DSP. Having completed processing of the job, the JCLTEST facility ends and the job does not pass to MAIN for execution. This is normal for a job that requests the JCLTEST facility.

System action: The job is canceled and printed.

Operator response: None. This is an informational message.
Programmer response: Examine JESMSGGLG for any JCL syntax errors that the JCLTEST facility may have detected.

Module:

IAT4220 • IAT4225

IAT4220
Explanation:

A system error occurred in the interpreter DSP while the job was running.

System action: The job ended. This message is for programmer information only. See message IAT3713.

Operator response: Hold the dump for the system programmer.

Problem determination: See Table I, items 13 and 16; Table III, item 5.

Module:

IAT4221
Explanation:

System symbol substitution will be performed on the JCL of this batch job. The symbols values used are from the specified main.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Programmer response: None.

Module:

IAT4225
Explanation:

The job has exceeded the job or address space JCL limit, or the job SYSIN DD statement limit. If the SYSIN DD statement limit has been exceeded, only the IAT4225 message is displayed. For the JCL limit, message IAT4226 is also
issued to display the job JCL statement count, and the JCL limit that was exceeded. Message IAT4227 is also issued if the job was processed by a CI FSS address space.

**Note:** If the SYSIN DD statement limit has been exceeded, the job is flushed by input services. If the JCL limit has been exceeded, the job is flushed by converter/interpreter services.

**System action:** JES3 cancels the job.

**Operator response:** Notify the system programmer.

**Programmer response:** Do one or more of the following to modify the JCL or SYSIN DD statement limit.

- To increase the complex-wide job JCL statement limit if it was exceeded, issue the `*MODIFY X D=CI MAXJOBST=xxx` command.
- To increase the address space JCL limit for the address space in which the job will run, issue either the `*MODIFY X D=CI` or `*MODIFY F ...` command.
- Modify the C/I scheduling installation exits IATUX46 and IATUX49, so that the job is scheduled (for C/I) only to those address spaces that have an address space JCL statement limit larger than the job's JCL statement count.
- To increase the complex-wide job SYSIN DD statement limit if it was exceeded, modify the MAXINDD parameter on the STANDARDS statement in the JES3 initialization stream, and restart JES3 specifying hot start with refresh.

**IAT4230**

**Explanation:**

```plaintext
// JOB jobname (jobid), WITH nnn JCL STATEMENTS EXCEEDED THE AVAILABLE VIRTUAL STORAGE
```

The specified job includes the indicated number of JCL statements `nnn`. The job passed all JCL statement limit checks but sufficient virtual storage was not available for the MVS converter or interpreter to process the job. If the failure occurred in a C/I functional subsystem (FSS) address space, message IAT4227 is also issued. Message IAT4801 is issued at the end of C/I processing to indicate that the job was canceled.

**System action:** JES3 cancels the job.

**Operator response:** Notify the system programmer.

**Programmer response:** Modify the C/I scheduling installation exits IATUX46 and IATUX49 so that the job is scheduled (for C/I) only to those mains that have sufficient private regions for the job's SWA control block. Modify the number of C/I subtasks in selected address spaces so that the large jobs are scheduled (for C/I) to address spaces with a small number of subtasks.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATIIMS</td>

<td>IATIICCC</td>
</tr>
</tbody>
</table>

Routing Code: 42, Note 19  
Descriptor Code: 7

---

**IAT4231**

**Explanation:**

```plaintext
// CI WAITING, JCL LIMITS EXCEEDED IN FSS fssname, ASID asid JES3 ADDRESS SPACE
```

The current job's JCL statement count exceeded the address space JCL statement limit.

**System action:** JES3 quiesces C/I processing. All C/I subtasks and FCTs for jobs that have not entered MVS interpretation will wait until the address space JCL count is reduced below the address space limit. JES3 resumes processing after the address space JCL statement count is successfully updated.

**Operator response:** None. This is an informational message.

**Module:**
IAT4232

Explanation:

CI FUNCTIONS RESUMED IN FSS=fssname, ASID=asid JES3 ADDRESS SPACE

The address space JCL statement count is reduced below the address space JCL statement limit.

System action: JES3 resumes processing all C/I subtasks and FCTs.

Operator response: None. This is an informational message.

Module:

IAT4233

Explanation:

UNIT CONVERSION FAILED FOR catalog data set name

The catalog unit type for the specified data set name could not be converted into an EBCDIC unit type (for example, 3380). Before JES3 can add catalogs to the list of setup requirements for the job, the catalog unit type must be converted into a printable form.

System action: The job that is being processed is canceled. JES3 processing continues.

Operator response: Notify the system programmer.

System programmer response: Ensure that the catalog unit type appears in the eligible device table (EDT) for the processor where JES3 C/I processing was being performed. If the catalog unit type is in the EDT, contact IBM for support.

Module:
IAT4235

Explanation:

CI SUBTASK ATTACH FAILURE

FSS=fssname, ASID=asid

JES3 global or a C/I functional subsystem (FSS) address space failed in its attempt to initialize a C/I subtask. This message appears after message IAT3504 is issued informing the operator that the subtask failed to initialize. If the CI DSP max counts have been reset, message IAT4236 is also issued to indicate the new CI DSP max counts. The FSS name fssname and ASID are also displayed if the error occurred in an FSS address space.

System action: If the batch and demand select CI DSP max counts are greater than the number of attached batch and demand select C/I subtasks, the max counts are reset to the number of attached C/I subtasks. This prevents recursive errors by not allowing another CI DSP to initialize another C/I subtask until the operator modifies the CI DSP counts by issuing the *MODIFY,X or the *MODIFY,F commands.

Operator response: Notify the system programmer.

Programmer response: Check the SDUMP taken by the subtask’s ESTAE exit to determine why the error occurred.

IAT4250

Explanation:

DSNAME=dsname MUST BE ‘&’ FOLLOWED BY AN ALPHABETIC OR CHARACTERS @,#,$

This message is issued when the character following the ‘&‘ on the DSNAME specified on the SYSIN/SYSOUT DD
The DSNAME should be changed to start with an alphabetic or one of the @,#,$ characters following the ‘&’. For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

User response: The DSNAME should be shortened to eight characters. For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

User response: The DSNAME should be changed to meet standards. The valid format is an ‘&’ followed by an alphabetic character or one of the following: @,#,$,-,X'C0’ characters. For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

Module:

Routing Code: 42

Descriptor Code: 7
IAT4253  •  IAT4301

IAT4253
Explanation:

This message is issued when the DSNAME specified on a SYSIN/SYSOUT DD statement is reserved for JES3 use.

System action:  JES3 uses the jobname instead of the DSNAME specified when building the data set name. Processing continues.

User response:  The DSNAME should not be specified as one of the following:
• JESYSMSG
• JESJCL
• JESJCLIN
• JESMSGLG

For more information on the DSNAME parameter, see z/OS MVS JCL Reference.

Module:

Containing  Detecting  Issuing
IATIICX  IATIICX  MVS Converter

Routing Code: 42  Descriptor Code: 7

IAT4300
Explanation:

An error was encountered while processing the DISP=(NEW,PASS) parameter on a JCL DD statement.

System action:  The job is ended.

Programmer response:  This is probably a JES3 error. Invoke the interpreter debug facility and rerun the job with DEBUG=ALL specified. See z/OS JES3 Diagnosis.

Module:

Containing  Detecting  Issuing
IATIIIPR  IATIIIPR  IATIIIPR

Routing Code: 42  Descriptor Code: 7

IAT4301
Explanation:

The UNIT= keyword on the indicated DD statement did not include a valid unit parameter, and the job failed, where xxx is the procedure step name, yyy is the job step name, and ddn is the ddname.

Possible reasons why the unit specified was not valid are:
• The UNIT parameter was not specified when one is required (for example, when defining a new data set).
The same volume serial number was given for two unlike devices in the job. For example, one DD statement called for the volume serial on a tape while another DD statement used the same volume serial for a DASD request. One of the DD statements is treated as not valid.

The same volume serial number was given to two incompatible device types. Volume serial numbers must be assigned to compatible device types. For example, one DD statement was used to define the volume serial on a real type tape device while another was used the same volume serial for a cartridge type tape device.

**System action:** The job is ended.

**Programmer response:** Supply a valid unit type on the indicated DD statement and rerun the job.

**Problem determination:** See Table III, items 14a, 20, and 22; Table I, item 3.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>

</thead>
<tbody>
<tr>
<td>IATIIPR</td>
<td>IATIIPR</td>
<td>IATIIPR</td>
</tr>
<tr>
<td>IATIIP1</td>
<td>IATIIP1</td>
<td>IATIIP1</td>
</tr>
</tbody>
</table>

Routing Code: 42

**IAT4303**

**Explanation:**

>>>—JOB—jjj (jobno) — HAS EXCEEDED—THE MAXIMUM NUMBER OF REQUESTED VOLUMES—

An excessive number of volumes has been requested, probably through the unnecessary use of “VOL=(,,99)” for multi-volume data sets. The maximum of 32,767 has been exceeded.

**System action:** JES3 cancels the job.

**Operator response:** Notify the system programmer.

**Programmer response:** The job can be broken into smaller, more manageable jobs, or the volume count can be reduced to a more practical number.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATIIMS</td>
<td>IATIIPR</td>
<td>IATIIPR</td>
</tr>
</tbody>
</table>

**IAT4330**

**Explanation:**

>>>—UNABLE TO RESOLVE—UNIT/VOLUME(S) FOR—xxx,yyy, ddn—

The required unit or volume information for a temporary data set name was not available either on a DD JCL statement or passed from a DD statement in a previous step.

In the message text:

xxx
   The procedure step name

yyy
   The job step name

ddn
   The ddname.
IAT4331

Since the temporary data set name is not cataloged, JES3 fails the job during the prescan phase of the C/I DSP to avoid unnecessary LOCATE processing.

This is probably a user error. Either the DISP parameter on the JCL DD statement was erroneously coded (implying the presence of a nonexistent temporary data set) or the job may consist of a series of conditionally processed steps, one of which may have ended the passing of the data set name. Because JES3 does not consider conditional steps when determining setup requirements, the passing of the data set may appear to be prematurely ended.

System action: JES3 ends the job.

Programmer response: Correct the DISP parameter on the DD statement or make provisions to circumvent the conditional step restriction using the JES3 installation exit facility or dependent job control (DJC) facility.

Problem determination: See Table I, items 1 and 15; Table III, item 23.

Module:

IAT4331

Explanation:

`SMSHONOR UNITNAME—dddddddd—NOT VALID FOR REQUEST—xxx.yyy.ddn—JOB FAILED`

The unitname specified with the SMSSHONOR keyword was not a subset of any library unitnames of eligible devices for the request that was returned to JES3.

In the message text:

`dddddddd`
The unit name.

`xxx`
The procedure step name.

`yyy`
The job step name.

`ddn`
The ddname.

System action: The job failed.

Programmer response: Specify a different unit name, or remove the SMSSHONOR keyword and run the job again.

Problem determination: See Table III item 14a; Table I, item 3.

IAT4350
Explanation:

\[ \text{CALLING SEQUENCE: routine(n)} \]

Notes:

1 n can be from 1 to 6.

This message is issued after a locate subtask abends. The message shows the names of the subroutines within module IATLVLCL that were active at the time of the error.

**System action:** The locate subtask cleans up and ends. If a job was being processed at the time the locate subtask ended, the job is canceled. JES3 processing continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Examine the system dump that was taken to determine why the locate subtask abended.

**Module:**

Routing Code: 42  
Descriptor Code: 7

---

IAT4402
Explanation:
This message is the result of the locate request for data requested in the previously issued message, IAT4401.
If the data set is SMS-managed, the storage class, the data class (if present), and management class (if present) will
appear in this message.
If the storage class, data class and management class are unknown, the text, DATA SET IS SMS MANAGED, appears
in the message.
If the data set is not SMS-managed, and the unit returned from the catalog is managed by JES3, the unit name and
all the volume serial numbers will appear in the message.
If the data set is not SMS-managed, and the unit returned from the catalog or the unit specified in the JCL is not a
JES3-managed device, the volume serial numbers will be replaced with the phrase: N/A: UNIT NOT JES3.

System action: Processing continues.
Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATIIP0X    IATIIP0X    IATIIP0X

Routing Code: Note 19
Descriptor Code: –

IAT4403
Explanation:

A volume sequence number has been specified which exceeds the number of volume serials given for the statement
specified where xxx is the procedure step name, yyy is the job step name, and ddn is the ddname.

System action: The job is ended.

Programmer response: Change the JCL to eliminate the inconsistency, and resubmit the job.

Problem determination: See Table III, items 14a, 20, and 22; Table I, item 3.

Module:

Containing  Detecting  Issuing

IATIIMS    IATIIPA0X   IATIIP0X

Routing Code: 42,Note 19
Descriptor Code: 7

IAT4404
Explanation:

A volume sequence number has been specified which exceeds the number of volume serials given for the statement
specified where xxx is the procedure step name, yyy is the job step name, and ddn is the ddname.

System action: The job is ended.

Programmer response: Change the JCL to eliminate the inconsistency, and resubmit the job.

Problem determination: See Table III, items 14a, 20, and 22; Table I, item 3.
The data set specified in the preceding message, IAT4401, was not found on the indicated main (refer to the job listing). If the Hierarchical Storage Manager (HSM) is in the system, one of the following may have occurred:

- A VSAM data set that was eligible only for command migration was migrated.
- A VSAM data set was migrated automatically, but there was an error in the migration of the data set. Therefore, the data set is not eligible to be automatically recalled.

**System action:** The job is canceled with print.

**Programmer response:** Make the necessary corrections and resubmit the job. If a VSAM data set was migrated automatically and HSM is in the system, a command recall of the data set must occur before the data set can be used. When an HSM-managed VSAM data set was automatically migrated but there was an error, do one of the following:

- Access the data set by the base cluster name and it will be automatically recalled.
- Do a command recall on the base cluster name.
- Issue an HLIST DATASETNAME base cluster name SELECT VSAM command.

**Problem determination:** See Table III, items 14a, 20, and 22.

**Routing Code:** Note 19

**Descriptor Code:** –

IAT4405

**Explanation:**

An error occurred during LOCATE processing for the data set indicated by preceding message IAT4401. For specific error texts, see individual explanations below. For return code explanations, see IDC3009I in [z/OS MVS System Messages, Vol 6 (GOS-IEA)](https://www.ibm.com/docs/en/zos?topic=messages).

**Explanation:** Catalog management would not accept the password given, or a required password was omitted.

**Explanation:** JES3 (LOCATE subtask or LOCATE FCT) could not complete the LOCATE request.

**Explanation:** Catalog management encountered an I/O error.

**Explanation:** The catalog record specified a device type that is not available on the main where the locate was attempted.

**Explanation:** Either a generation data group (GDG) data set was used in a DCB parameter, or more than 255 data set names were concatenated under a single ddname.

**Explanation:** An error occurred during Locate processing for the data indicated by message IAT4401.

**Explanation:** The Hierarchical Storage Manager (HSM) is unable to fulfill the JES3 SUPERLOCATE request. HSM is operating with the catalog volume method of recall and was unable to obtain catalog information needed to inform JES3 where the data set would be placed after being recalled. In RA=nn, nn is the catalog locate reason code from the

---

Chapter 9. Interpreter Messages 391
IAT4405

HSM. (This text is sent to JES3 from HSM as return code 218 decimal.)

**Explanation:** The Hierarchical Storage Manager (HSM) is unable to fulfill the JES3 LOCATE request for the reason indicated by the reason code returned in register 15.

**Explanation:** JES3 could not find the locate response (LRS) for the data set.

**System action:** JES3 cancels the job with print, unless otherwise indicated under individual error texts below.

**System action:** This message is followed by message IDC3009I with the possible return codes that may have caused the problem.

**System action:** The system attempts locate processing on other eligible mains until successful, a failure is encountered, or there are not any more online mains that are eligible.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135. See **z/OS MVS System Messages, Vol 6 (GOS-JEA)** for more information about message IDC3009I.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** Ensure that the job is routed to an eligible main, and that the main is online and connected when C/I processes the job. If the error still persists, see Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**System programmer response:** See programmer response under individual error texts below.

**PASSWORD FAILURE**

**Programmer response:** Ensure that all correct passwords are available for the data set indicated in message IAT4401, and resubmit the job. If passwords are correct but still fail, notify the system programmer.

**Programmer response:** This is probably a JES3 error. Notify the system programmer.

**Programmer response:** Notify the system programmer.

**Programmer response:** Notify the system programmer.

**Programmer response:** Check the DD statements specified by the ddname in preceding message IAT4401. Resubmit the job with the correct JCL. If no error is found, contact the system programmer.

**Programmer response:** Notify the system programmer.

**Database Administrator Response:** Use the reason codes to diagnose the problem. Correct the problem if possible. If you are unable to correct the problem, see Chapter 30, “Problem Determination,” on page 1135.

**Programmer response:** Notify the database administrator.

**Database Administrator Response:** Use the reason code, RA=nn, to diagnose the problem. Correct the problem if possible. These reason codes are documented in **OS/VS2 Catalog Management Logic** If you are unable to correct the problem, see Chapter 30, “Problem Determination,” on page 1135.

**Programmer response:** Notify the database administrator.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135; Table I, items 13, 34, and 29.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135; Table I, items 13, 34, and 29.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135; Table I, items 13, 34, and 29.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135; Table I, items 13, 34, 17, and 29; Table III, items 23, 5, and 14.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135; Table I, items 8, 13, and 29; Table III, items 14 and 23.
Problem determination: See Chapter 30, “Problem Determination,” on page 1135, Table I, items 13, 34, and 29.

Explanation:

>>>—UNABLE TO CREATE SECURITY ENVIRONMENT

JES3 was unable to create the proper security environment because the user is not correctly defined to the security product.

System action: JES3 cancels the job.

Operator response: Notify the system programmer.

System programmer response: Ensure that the user is correctly defined to the security product.
IAT4469 • IAT4470

Explanation:

▷—JOB—jobname (jobid)— FAILED.—UNABLE TO ALLOCATE USER CATALOGS—}}

JES3 (MDS) catalog SETUP was unable to allocate the non-SMS user catalogs or the JOBCAT/STEPCAT data sets required by the job.

System action: The specified job is canceled. JES3 continues processing.

Operator response: Notify the system programmer.

System programmer response: Make the required catalog(s) available on a processor that is eligible to process the job.

Explanation:

▷—ddn— DISP FIELD INCOMPATIBLE WITH—DSNAME—dsname—}}

A DD statement requested a generation of a generation data group (GDG) data set, but the requested disposition is not valid. The DD statement defined either:

• A new GDG data set, as indicated by a qualifier of +1 or greater, but the user coded DISP=OLD or SHR
• An old GDG data set, as indicated by a qualifier of 0, -1, or less, but the user coded DISP=NEW

In the message text:

ddn
    the name of JCL DD statement requesting the GDG data set
dsname
    the name of the requested GDG data set

System action: The job is canceled.

Operator response: None.

System programmer response: Correct either the relative generation number or the DISP= value on the JCL DD statement such that the two values are compatible, and resubmit the job.
IAT4505
Explanation:

>>>—NO JST ENTRY FOUND FOR—USER OVERRIDE—xxx—<<<

A FETCH or SETUP user override specified on the //**MAIN statement does not match the JCL in the job. xxx is the information read from the //**MAIN statement.

System action: The job is canceled with print.
Operator response: Change the JCL or the override and resubmit the job.

Explanation:

>>>—JOB Ø SPINOFF FAILED SECURITY—JOB AUTHORIZATION. NO OUTPUT GENERATED.<<<

The spinoff job failed a security authorization check. The spinoff output was not generated.

System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:
IAT4726 • IAT4727

Routing Code: 10
Descriptor Code: 7

Explanation:

The order passed to the Functional Subsystem Application (FSS/FSA) through the Functional Subsystem Interface (FSI) ORDER function has not been processed by the FSS/FSA because of an environmental error. This message is associated with message IAT4726 that contains the fssname, the device name and address, and the order type.

In the message text:

ordertype
Identifies the order which was not processed.

fssname
Identifies the functional subsystem.

deename
Identifies the device name as defined on the JNAME initialization statement.

de
Identifies the device number. If a device number does not appear in the message, the device is a non-channel attached device (for example: 3820) MVS does not assign device numbers to non-channel attached devices.

System action: The Functional Subsystem Application sets a non-zero return code and the “environmental error” indicator in the order response area of the Functional Subsystem Interface (FSI). The order is ignored and processing continues. If the order is the result of an operator's command, the command is not processed.

Operator response: Reenter the rejected command where applicable. If another failure results, notify the system programmer.

System programmer response: This is probably an error in the FSS/FSA that is trying to use the FSI. Determine why the FSA has rejected the order. This message provides the order type and the return code from the FSA.

IAT4727

Explanation:

The order passed to the Functional Subsystem Application FSS/FSA, through the Functional Subsystem Interface (FSI) order function has not been processed by the FSS/FSA because of an environmental error. This message is a continuation of message IAT4726.

In the message text:
The return code returned from the Functional Subsystem Application.

cmd text

Identifies the operator command that was not processed.

**System action:** The Functional Subsystem Application sets a non-zero return code and the “environmental error” indicator in the order response area of the Functional Subsystem Interface (FSI). The order is ignored and processing continues. If the order is the result of an operator’s command, the command is not processed.

**Operator response:** Reenter the rejected command where applicable. If another failure results, notify the system programmer.

**System programmer response:** This is probably an error in the FSS/FSA that is trying to use the FSI. Determine why the FSA has rejected the order. This message provides the order type and the return code from the FSA.

---

**IAT4730**

**Explanation:**

[//]:<>![](image.png)

This action message is displayed when an output writer DSP trying to start a functional subsystem (FSS) was unsuccessful because the previous use of the FSS is still terminating. When the FSS address space completely ends, the WTR DSP for `devname(dev)` will re-attempt to start the FSS and make the device ready to process work.

**System action:** The system continues processing, but the WTR DSP for `devname(dev)` will wait until the FSS address space that had previously been active ends. When the FSS address space finishes terminating, the action message

---
IAT4730 will be dequeued, and the WTR DSP will reinitiate getting the FSS address space started for the new writer.

**Operator response:** There is no operator response necessary if the FSS address space end completely. However, if the FSS address space does not end within a reasonable time frame, then the following actions may be taken:

1. Issue 
   *I,F,FSS=fssname* for the FSS in question to obtain FSS status, ASID and MAIN, and related devices. The *fssname* may be obtained from message IAT8562 in response to an *
   I,D,D=devname* command. Or use the *
   I,F,TYPE=WTR* option and locate the device and its FSS in the IAT8701 and IAT8702 message table.
   - If the FSS status remains as STOP or FSSD for a long period, then there may be a problem with the termination of the FSS address space.
2. It may be necessary to issue the MVS DUMP command and reply with the ASID= option to get an SVC dump of the FSS address space to assist in determining why it did not finish terminating.
3. Issue *
   C,device* for each FSS writer associated with the FSS.
   - If this step is bypassed, then the FSS writers will be varied offline as a result of the FSSCONT DSP handling the *
   FAIL* command.
4. Issue *
   FAIL,FSS=fssname* to cause the FSSCONT to clean up the FSS table so that the FSS writers and FSS can be started fresh.

**System programmer response:** There is no system programmer response necessary if the FSS address space ends completely. If the FSS address space does not end within a reasonable time frame, follow the steps listed under the operator response section.

If a dump is taken of the FSS address space, see Chapter 30, “Problem Determination,” on page 1135.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135, Table I, items 16 and 29, and Table III, items 4 and 7.

**IAT4801**

**Explanation:**

---

`JOB—jobname (jobid)—EXPRESS CANCELED BY INTERPRETER DSP—`  

The indicated job was failed by the interpreter DSP for one of the following reasons:

- A JCL error was found.
- Input service found a control card error.
- The interpreter subtask DSP found either a JCL logic error in scanning the scheduler control blocks or a logic error in the ddname overrides for FETCH or SETUP.
- Subtask error occurred.

**System action:** The job is canceled with print on return from the interpreter DSP. This message is typically accompanied by another diagnostic message in the job’s JESMSGLG data set.

**Operator response:** No response is required. This message signifies only that this job is canceled from the system.

**Programmer response:** This is probably a user error. Check the JESYMSG messages and JESMSGLG data set for error specifications.

**Problem determination:** See Table III, item 20; Table I, item 3.

IAT4811
Explanation:

>>>—STP/DD PSTP/DEV MT/DV —DISP/PSTP# TYPE 1ST VOL —BK-REF SCR RING DSN (20BYT) <<<

This message comprises the column headings for output of the JSTTEST facility; it is followed by a series of IAT4812 messages describing the JST entries constructed for the user’s job. Entries appearing under each head are:

**STP/DD**
for a step entry, the field contains the step name, preceded by an asterisk. For a DD entry, the field contains the dname. If the field contains the characters “JES3CATLG”, the DD entry represents a catalog residing on a JES3-managed device that was returned by SMS pre-locate catalog orientation processing.

**PSTP/DEV**
a PROCSTEP name, for a step entry, or a device (for example, 3330-1), for a DD entry. If the field contains the text “N/A”, the DD entries are SMS-managed.
MT  YES if volume premount is required; NO if no volume premount is performed for the JST entry.

DV  YES if a unique device is needed; NO if the required device is allocated earlier in the job.

DISP/STP# for a DD entry, the disposition of the data set and whether the volume use is exclusive; for a step entry, the step number

TYPE the general device type, such as TAPE or DISK. If the field contains the text “SMS”, the data set is SMS-managed.

1ST VOL the volume serial number of the first volume of the data set. If the field contains the text “N/A”, the data set is SMS-managed and JES3 is unaware of the volser.

BK-REF any volume backward reference, or NONE

SCR YES if the volume backward reference is to a temporary or scratch data set; otherwise, NO

RING YES if a ring is required on the allocated tape volume; NO if a ring is not required

DSN the data set name, truncated on the right after 20 bytes

System action: The job is canceled with print after the JSTTEST information has been output and the interpreter DSP has completed.

Operator response: None. This is an informational message.

Chapter 10. Main Device Scheduler Messages

IAT5001
Explanation:

MDS SUBTASK ABEND

This message is issued when a main device scheduler (MDS) subtask has abended.

System action: JES3 will cleanup and reinstate a new MDS subtask, if possible. The job being processed at the time of the error is put on the MDS error queue, unless installation exit IATUX61 indicates that the job is to be canceled.

Operator response: Notify the system programmer.

System programmer response: Check the SDUMP taken by the subtask's ESTAE exit for the cause of the failure.

Module:

<table>
<thead>
<tr>
<th>Containing</th>

Containing Detecting Issuing
IATMDAT IATMDAT IATMDAT

Routing Code: Note 13
Descriptor Code: 7

IAT5004
Explanation:

>>>MDS SUBTASK TERMINATION COMPLETE<<<

A main device scheduler (MDS) subtask has ended normally.
System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 13
Descriptor Code: 7

IAT5005
Explanation:

>>>MDS MASTER TASK ABEND<<<

The main device scheduler (MDS) master task has experienced abends repeatedly during attach processing.
System action: JES3 fails the MDSRS DSP. Jobs requiring SMS resources will not continue through MDS. JES3 continues processing.
Operator response: To get jobs requiring SMS to run, hotstart JES3.
System programmer response: Check the SDUMP taken by the MDS master task's ESTAE exit for the cause of the failure.
Module:

Routing Code: 2
Descriptor Code: 4

IAT5006
Explanation:

>>>MDS MASTER TASK ATTACH—FAILURE, RC=rc<<<

This message is issued for any of the following reasons:
• The attach of the main device scheduler (MDS) master task did not successfully complete. The return code from the attach is displayed in the message text.

422 z/OS V2R1.0 JES3 Messages
The main device scheduler (MDS) master task abended before it completed initialization.

The main device scheduler (MDS) master task abended repeatedly while trying to attach an MDS subtask.

**System action:** The MDSSRS DSP is failed with dump code DM420.

**Operator response:** To get jobs requiring SMS resources to run, hotstart JES3.

**System programmer response:** Examine registers 2 and 3.

- an error code of 1 if the attach of the MDS master task did not successfully complete or if the MDS master task abended before it completed initialization.
- an error code of 3 if the MDS master task abends repeatedly.

Register 3 will contain

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**Programmer response:** Use a //*MAIN or JOB statement to place the job in a job class that does not have a setup depth of zero. Additionally, the system programmer may need to change the SDEPTH parameter on the CLASS statement.

---

**IAT5007**

**Explanation:**

>>>MDS MDS SUBTASKS ARE ACTIVE<<<

All of the main device scheduler (MDS) subtasks have abended. Message IAT5002 is issued for each MDS subtask that failed to initialize.

**System action:** JES3 will not process any jobs requiring SMS resources. The MDSSRS DSP will try to attach additional MDS subtasks. JES3 will continue processing.

**Operator response:** To get jobs requiring SMS resources to run as soon as possible, hotstart JES3. If no action is taken, JES3 will try to attach additional MDS subtasks.

**System programmer response:** Check any SDUMP's taken by the MDS subtasks' ESTAE exits to determine why the failure occurred.

**IAT5010 • IAT5012**

---

**IAT5010**

**Explanation:**

[SYSTEM MANAGED RESOURCE—STATUS HAS CHANGED]

This message, issued before message IAT5011, indicates the reason that the job identified in message IAT5011 was restarted. The status of system-managed resources, those resources managed by SMS, has changed between the time the job started resource allocation and the time the job completed MDS verify processing.

**System action:** The job is sent to MDS (main device scheduler) breakdown processing, where resources already allocated to the job are deallocated. The job is then restarted from the beginning of MDS system select processing or MDS allocation processing, depending on where the SMS-managed resources and the MDS-managed resources are currently available.

**Operator response:** In order for the job to continue through setup processing, all resources must be made available to the job.

**IAT5012**

**Explanation:**

[RESOURCE REQUIREMENTS NOT CONSISTENT—WITH CURRENT CONFIGURATION]

This message, issued before message IAT5011, indicates the reason why the job identified in message IAT5011 was restarted through JES3 C/I or Setup processing. The resource requirements that were written to spool during JES3 C/I or Setup processing are not the same as the current SMS configuration. Your storage administrator may have activated a new SMS configuration.
System action: All resources allocated to the job are deallocated and the job is restarted from the beginning of JES3 C/I or Setup processing. This message is followed by message IAT5011. JES3 continues processing.

Operator response: Notify the system programmer.

Storage Administrator Response: Do not change the SMS configuration while jobs are in MDS allocation processing and MDS verification processing, since it may result in the jobs being restarted.

JOB—jobname (jobid) GET UNAVE USES nnn vol AL dsn

This message indicates the action required, volume type, volume serial number, tape label type, and data set name for the volume referenced by the specified job.

In the message text:

GET
The volume that will be required by this job, but is currently not in use.

UNAV
The volume made unavailable by the operator.

USES
The volume that was previously fetched and has not yet been returned to the library.

nnn
The number of scratch volumes needed. For specific volume requests, this field is blank.

C The volume type is cartridge tape.
**IAT5200 • IAT5201**

D The volume type is disk.
T The volume type is reel-to-reel tape.

\(vol\)
The volume serial number of the required volume.

AL An American National Standard label tape.
BL Label processing is to be bypassed by the system.
NL A non-labeled tape.
SL An IBM standard label tape.
XL A nonstandard label tape.

\(dsn\)
The name of the referenced data set.

**Note:** If the data set name is preceded by an asterisk (*), it represents a non-SMS catalog required by the job. Do not enter *INQUIRY commands against this data set.

**System action:** The system places the job in the main device scheduling (MDS) volume wait queue, if the MDS allocation mode is manual; otherwise, the system places the job in the MDS allocate queue.

**Operator response:** If GET appears in the message text, make the volume available for subsequent use by the job. If UNAV appears in the message text, the job cannot be set up until the operator makes this volume available. If USES appears in the message text, no action is required.

---

**IAT5201**

**Explanation:**
This message is issued before message IAT5011. JES3 determined that it cannot allocate the job’s JES3-managed resources on the processor that has access to the job’s SMS-managed resources. If an SMS-managed resource on another processor becomes available, JES3 will allocate the JES3 resources required by the job.

System action: The job is sent to the MDS System Select queue to wait for the required SMS resources to become available.

Operator response: None. This is an informational message.

Module:

Containing: IATMDDA  
Detecting: IATMDSL  
Issuing: IATMDSL

Routing Code: Note 13, Note 19

Descriptor Code: 7

Explanation:

This message indicates that a volume is required and/or that a device has been allocated. The ddname rather than the job name may appear in the JESMSGLG.

If operator action is required, the jobname appears in the message with CHECK or MOUNT for the volume.

In the message text:

CHECK
A mount for the volume is not required, but the operator must check to see if it is mounted or not.

MOUNT
The operator must mount the volume on the device.
All graphics or unit record requests will show USING because there is no volume to mount.
The MOUNT section is present if the error can be corrected by mounting the correct volume and the number of attempts to correctly mount the job’s volumes is below the value specified in the REMOUNT parameter of the SETPARAM JES3 initialization statement. See z/OS JES3 Initialization and Tuning Reference for more information about SETPARAM.

RSRVD
The device is reserved for a deferred volume mount.

USING
The DASD device requires no volume mount, and no operator action is required (USING appears in JESMSGLG ONLY).

C The volume type is cartridge tape.
T The volume type is reel-to-reel tape.
D The volume type is disk.
The volume type is unit record.

G      The volume type is graphics.

vol    The volume serial number of the required volume, if any.

NL     A non-labeled tape.
SL     An IBM standard label tape.
AL     An American National Standard label tape.
XL     A nonstandard label.
BL     Label checking is bypassed.

RING   The file protect ring should be on the tape reel.
NORING No file protect ring should be on the tape reel.

dsni   The name of the data set referenced.

Note: If the data set name is preceded by an asterisk (*), it represents a non-SMS catalog required by the job. Do not inquire upon this data set name.

System action: The job is placed on the main device scheduler verify queue. If the message specifies MOUNT or CHECK, JES3 requests the volume be mounted or checks to ensure that the volume is mounted.

Operator response: Mount or check the tape or disk, as indicated. If you cannot respond as indicated because, for example, a volume is damaged and cannot be mounted, make the volume unavailable through the *MODIFY,S,VU= command. Then restart the job. See z/OS JES3 Commands for more information about these commands.

Module:

IAT5220

Explanation:

The main device scheduler has determined that the specified main is not eligible for setup of a job. The DD statements that failed are described in message IAT5295.

System action: The main device scheduler will no longer attempt to allocate the job to the specified main.

Operator response: Check message IAT5295 to determine the reasons for the job’s ineligibility on the specified main.

Module:
Routing Code: Note 17, Note 19
Descriptor Code: 7

IAT5230

Explanation:

Error text

Since several errors are detected by MDS allocation processing, the text of this message is variable. Messages IAT5220 and IAT5295 precede this message. The text of this message can be one of the following:

Explanation:

No devices available—of the type required

The job requested a device type which does not exist on the main indicated in the preceding message IAT5220. The DEVTYPE identifies the requested device type or device number.

Explanation:

Not enough devices available to setup job

The UNIT parameter of the DD statement required more devices than exist on the main specified in the preceding message IAT5220. The devtype identifies the requested device type or device number.

Explanation:

Demand allocation for unspecified main

The job requested a device by a specific device number, and the job is eligible for setup on more than one main.

Explanation:

Multi volume request for perm/res volume

The job requested multiple volume serial numbers on a DD statement. One of the volumes is permanently resident and cannot be demounted. The identified volume and device are the resources requested by the job.

Explanation:

Perm/res volume—not on required processor

The job referenced a permanently resident volume which is not attached to the main indicated in message IAT5220. Volume identifies the volume that the allocation attempt failed for.

Explanation:
The job requested a permanently resident volume mounted on a device of a type that is not the same as the type specified on the UNIT= parameter of the DD statement.

Explanation:

The job requested either a direct access volume which is not currently available to the main indicated in message IAT5220 or a non-direct access device setup and the setup depth for the job class is zero.

System action: The job is sent to the MDS error queue, unless installation exit IATUX61 selects the DONE or BREAKDOWN queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:  
• error is correctable  
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:  
• error is correctable  
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

Operator response: If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:  
• error is correctable  
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.
job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**Operator response:** If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**Operator response:** If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**Operator response:** If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**Programmer response:** If the error occurred while DB2® or SMS are active, the default unit supplied to SMS, must be available to all systems in the JES3 complex.

**Programmer response:** None.

**Programmer response:** Include a //*MAIN statement to specify the main on which the job is to run.

**Programmer response:** Do not make the specified volume permanently resident; or instruct users of the volume not to request it in a manner which requires that it be demounted.

**Programmer response:** None.

**Programmer response:** Change the unit parameter on the DD statement to one allowing access to the device on which the volume is mounted.

**Programmer response:** Use a //*MAIN or JOB statement to place the job in a job class that does not have a setup depth of zero. Additionally, the system programmer may need to change the SDEPTH parameter on the CLASS statement.

Routing Code: Note 17
Descriptor Code: 7

IAT5250

Explanation:

The main device scheduler has found that the indicated job references a volume that is currently unavailable. The referenced volume was previously made unavailable for use, using a *MODIFY, SETUP operator command.

System action: The job is placed in the volume unavailable queue of the main device scheduler.

Operator response: See z/OS JES3 Commands for *INQUIRY and *MODIFY, SETUP commands concerning unavailable volumes.

Routing Code: Note 13
Descriptor Code: 7

IAT5255

Explanation:

The volume/volume(s) could not be allocated for job jobname (jobid).

Routing Code: Note 13
Descriptor Code: 7

IAT5255

Explanation:

The main device scheduler has found that the indicated job references a volume that is currently unavailable. The referenced volume was previously made unavailable for use, using a *MODIFY, SETUP operator command.

System action: The job is placed in the volume unavailable queue of the main device scheduler.

Operator response: See z/OS JES3 Commands for *INQUIRY and *MODIFY, SETUP commands concerning unavailable volumes.

Routing Code: Note 13
Descriptor Code: 7

IAT5255

Explanation:

The volume/volume(s) could not be allocated for job jobname (jobid).
During deallocation of resources for the specified job, the entry for the specified volume or the specified
SMS-managed data set could not be located.

System action: Deallocation of resources for this job continues.
Operator response: None. This is an informational message.

IAT5295

Explanation:

>>>DD=ddn—UNIT=dev—DSN=dsn

This message follows each IAT5220 message and identifies the DD statement to which the error message applies, as follows:

- **ddn**: the name of the DD statement
- **dev**: the UNIT type specified on the DD statement
- **vol**: the first volume serial specified (or implied by catalog reference) in the SER subparameter of the VOLUME parameter in the DD statement
- **dsn**: data set name specified in the DSN parameter in the DD statement

Note: If DD=JS3CATLG, this message refers to a catalog, residing on a JES3-managed device, that is required by the job. The catalog was not specified by a JOBCAT or STEPCAT DD statement.

- **dev**: the UNIT type specified on the DD statement
- **vol**: the first volume serial specified (or implied by catalog reference) in the SER subparameter of the VOLUME parameter in the DD statement
- **dsn**: data set name specified in the DSN parameter in the DD statement

System action: Processing continues.
Operator response: None. This is an informational message.

Routing Code: Note 17, Note 19
Descriptor Code: 7

IAT5300

Explanation:

>>>JOB=jobname (jobid)  —  RESTARTED  —  BY SETUP

The indicated job had errors detected while mounting the volume requested by main device scheduler.
The main device scheduler has detected an error on a device during the mounting of a volume previously requested in message IAT5210.

In the message text:

*dev* Identifies the device on which the error was detected.

*description* Indicates the error detected and is one of the following:

**UNIT NOT READY**
A job requested tape unit is not ready and LABEL=BLP is specified on the job’s DD statement.

**INVALID VERID**
JES3 encountered an incorrect verify id while mounting the volume onto the device.

**VOL,LTYPE,RINGSTAT,MTD**
JES3 has the specified information for the mounted tape that is in error. Compare this information with the information in mount message IAT5210 for discrepancies.

**VOL,MOUNTED**
JES3 has the specified information for the DASD that is in error. Compare this information with the information in mount message IAT5210 for discrepancies.

**NO RESPONSE**
JES3 has not been notified of the mount completion.

**BUSY/UNAVAILABLE**
JES3 was unable to read the volume label within the allotted time.

**NON EXISTENT DEV**
There is no setunits entry or JES3 is unable to locate the SETUNITS entry for the specified device.

**PERM I/O ERROR**
A permanent input/output (I/O) error occurred while trying to read the volume label.

**VOLID READ ERROR**
An input/output (I/O) read error occurred while trying to read the volume label.

**VOL ALLOCATED**
The device is already allocated to another job in the system.
VOL DUP VOLID
JES3 found a volume with the same volume id on another device.

NOT OPERATIONAL
An input/output (I/O) error occurred on the device.

EXPDT NOT PAST
The expiration date for the volume has not been reached.

TAPE LOAD CHECK
Intervention is required on the device.

REJECTED BY EXIT
JES3 issues this text if installation exit IATUX62 determines that the mount is incorrect.

LTYPE
The label type associated with the volume:
N a non-labeled tape
S an IBM standard label tape
A an American National Standard label tape
X a nonstandard label
B bypass label processing

RINGSTAT
Indicates whether or not the file protect ring is on the tape reel.
RINGSTAT is one of the following:
RNG Indicates that the file protect ring is on the tape reel.
NOR Indicates that the file protect ring is not on the tape reel.

VOL
Identifies the volume serial number of the volume that was being mounted when the error occurred.
VOL is one of the following:
NO-VLM Indicates that a non-labeled volume was mounted or that the mounted volume has been moved to another device.
SCRTCH Indicates that a scratch volume was mounted.

System action: If no mount action is required, the subsequent message IAT300 indicates the job’s disposition. Otherwise, the job remains in the MDS VERIFY queue waiting for the requested mounts to be completed. Message IAT5210 may be reissued if necessary.

Operator response: If the mount message IAT5210 has been reissued, correct the described error and remount the volume.

Chapter 10. Main Device Scheduler Messages  443
IAT5350 • IAT5410

IAT5350
Explanation:

>>>-dev--CAN NOT BE ACCESSED FROM MAIN--main

The indicated device number dev cannot be accessed from the specified main. The reason it cannot be accessed is described in message IAT5310.

System action: The job will be automatically restarted by MDS (as if an *R,S,jobno command had been issued).

Operator response: Notify the system programmer if an equipment failure is indicated.

Module:

<table>
<thead>
<tr>

<td>IATMDVE</td>
<td>IATMDVE</td>
</tr>
</tbody>
</table>

Routing Code: 97
Descriptor Code: 7

IAT5410
Explanation:

>>> RETAIN C vol ON dev main

KEEP T

NO DEV

NO MAIN

This message is issued by the main device scheduler when a job has been processed by the MDS breakdown function; JES3 KEEP or RETAIN instructions, corresponding to previous GET and MOUNT messages, are issued to the operator based on JES3's knowledge of the job's volumes. For scratch tapes the MVS message IEF234E will be issued, with instructions for the operator instead of this message. This message may not correlate with message IEF234E issued by the MVS scheduler.

The meanings of the terms are:

**RETAIN**
- the volume should remain in the machine room because it is required by other jobs

**KEEP**
- the volume may be demounted and returned to the library

C
- the volume type is cartridge tape

T
- the volume type is reel-to-reel tape

D
- the volume type is disk

vol
- the volume serial number of the unloaded volume

dev
- the unit number of the device

**NO DEV**
- the volume cannot be accurately related to a device

main
- the name of the main if the device was allocated

**NO MAIN**
- the device was not allocated

dsn
- the data set name last referenced
For scratch tapes the MVS message IEF234E will be issued with instructions for the operator instead of this message.

**Operator response:** Remove the volume from the device and return it to the library if KEEP is specified; keep the volume in the machine room if RETAIN is specified.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATMDDA</td>
<td>IATMDBK</td>
<td>IATMDBK</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 17

**Descriptor Code:** 7

---

**IAT5420**

**Explanation:**

```
>>>—JOB—jobname (jobid)—TAPE—volser—HAS BEEN RELEASED RETAIN
HAS BEEN RELEASED KEEP
CANNOT BE RELEASED EARLY
```

The early volume release facility has released a tape volume, or the early volume release facility cannot release a tape volume. In the message text, `jobname` identifies the affected job and `volser` identifies the tape volume.

**RETAIN**

Keep the volume in the machine room because another job needs it.

**KEEP**

Return the volume to the library.

If the volume was used in a previous job step, IAT5420 will specify RETAIN.

If a volume cannot be released early, it is for one of the following reasons:

- A volume cannot be released until the end of a job step.
- The job will use the volume later.

**System action:** JES3 processing continues.

**Operator response:** If the message specifies RETAIN, keep the volume in the machine room.

If the message specifies KEEP, return the volume to the library.

---

**IAT5500**

**Explanation:**

```
>>>—xxxxxxx—ACCEPTED explanation
REJECTED
```

The main device scheduler has received an operator command.

In the message text:

`xxxxxxx`

The first 8 characters of the command entered.
IAT5500

**ACCEPTED**

The requested action will be performed.

**REJECTED**

The action will not be performed.

**explanation**

The reason the input was accepted or rejected.

**explanation** can be one of the following:

- **parameter INVALID**
  
The indicated parameter is not valid.

- **REQ NON-SPECIFIC**
  
The job number was omitted from the command.

- **ERR WAS PERM I/O**
  
The job is on the main device scheduler (MDS) error queue because of a permanent I/O error and may not be restarted thru SETUP.

- **I/O ERROR ON JOB**
  
  JES3 was unable to process the *START SETUP command because of a JST I/O error.

- **USE DJC CANCEL**
  
  A *CANCEL SETUP command was entered for a dependent job control (DJC) job. This is not allowed.

- **CANCEL PENDING**
  
  A *CANCEL SETUP command was entered for a job that was already scheduled for deallocation. This is not allowed.

- **NOT AWAITING *S**
  
  A *START SETUP command was entered for a job that was not on the WAITVOL queue.

- **JOB IN MAIN SERV**
  
  A *START SETUP, *CANCEL SETUP, or *RESTART SETUP command was entered for a job scheduled for processing or in processing.

- **JOB NOT FOUND**
  
  JES3 could not locate the job specified on the command.

- **MDS RESTARTING**
  
  The operator attempted to cancel an active job or restart a job before JES3 main device scheduler (MDS) has completed restart processing.

- **DEVICE FENCE JOB**
  
  The operator attempted to restart a SETUP-generated device fence job through the converter/interpreter (C/I).

- **MDS MOUNT JOB**
  
  The operator attempted to restart a SETUP-generated main device scheduler (MDS) mount job through the converter/interpreter (C/I).

- **CATLG SETUP JOB**
  
  The operator attempted to restart a SETUP-generated catalog SETUP job through the converter/interpreter (C/I).

- **PREV BKDN ERROR**
  
  The job is on the main device scheduler (MDS) error queue because of an abend in job breakdown. It may not be restarted through SETUP.

- **JOB NOT FOUND IN SETUP**
  
  The operator issued a *START SETUP, *CANCEL SETUP, or *RESTART SETUP command for a job that is not being processed by SETUP.

**System action:** If the command was accepted, the requested function will be performed; otherwise, see the operator response for possible action.

**Operator response:** If the command was rejected because of an error in keying input, reenter it in corrected form. If
the command is keyed correctly, check the text of the explanation for the reason the requested function cannot be performed.

**parameter INVALID**
None. This is an informational message.

**REQ NON-SPECIFIC**
None. This is an informational message.

**ERR WAS PERM I/O**
Cancel the job.

**I/O ERROR ON JOB**
Contact the system programmer.

**USE DJC CANCEL**
Use dependent job control (DJC) cancel.

**CANCEL PENDING**
None. This is an informational message.

**NOT WAITING */S**
None. This is an informational message.

**JOB IN MAIN SERV**
None. This is an informational message.

**JOB NOT FOUND**
None. This is an informational message.

**MDS RESTARTING**
Re-enter the command after restart processing has completed.

**DEVICE FENCE JOB**
None. This is an informational message.

**MDS MOUNT JOB**
None. This is an informational message.

**CATLG SETUP JOB**
None. This is an informational message.

**PREV BKDN ERROR**
Cancel the job.

**JOB NOT FOUND IN SETUP**
None. This is an informational message.

**System programmer response:** If there was an I/O error on the job, examine the system dump to determine the cause of the failure.

</tbody>
</table>

Routing Code: Note 18

Descriptor Code: 7

This message is issued in response to a *VARY command for device dev, or an assignable global device. The command was rejected either because the device could not be assigned to this system, or it was, and still is, allocated before MDS initialization, or the device could not be brought online to MVS.

The values of nn are:

04 Device is assigned to another system, but is allocated to the caller.
08 Device is assigned to another system, but is not allocated.
12 Device is assigned to another system, but is allocated to this system by someone other than the caller.
16 Multi-system ASSIGN is already in effect on this system (that is, the operator issued a VARY dev,ONLINE,SHR before MDS initialization).
20 I/O error occurred while processing a request for a device which is allocated to the caller.
24 I/O error occurred while performing ASSIGN.
28 An I/O error occurred while processing a request for a device. A SENSE operation failed while the system was performing I/O to assign the device.
32 An ABEND occurred during ASSIGN processing.
36 An ABEND occurred during MVS ASSIGN processing for a JES3 device. The device has been varied offline to MVS.
40 An unexpected error occurred.
41 An ESTAE create operation failed in an ASSIGN routine.
42 The requested function is not supported by the ASSIGN operation.

System action: Processing continues. The device remains offline to JES3, and the MVS status remains the same.

Operator response: If the ASSIGN failed because the device is assigned to another system, the device may be varied offline on that system and a JES3 *VARY command may be issued (on this system). If the device could not be varied online to MVS, see the message issued by MVS VARY. Otherwise, consult the system programmer or contact the IBM Support Center to have the abend reviewed.

Programmer response: Save the system log.

Problem determination: Table 1, Items 2, 29

Module:

448 z/OS V2R1.0 JES3 Messages
IAT5520

Explanation:

REAL DEVICE CHECKPOINT DISABLED DUE TO PERMANENT I/O ERROR

JES3 (module IATMDDR) was unable to record modifications to the ERROR device online checkpoint record because of a permanent JSAM I/O error.

System action:  Processing continues. The real device online checkpoint record is (in effect) cleared. At the next JES3 restart, all real devices will be initialized as specified in the initialization stream, regardless of their previous status.

Operator response:  Notify the system programmer. Re-enter any desired VARY commands after the next restart before entering *S JSS.

Programmer response:  Save the system log.

Problem determination:  See Table III, Item 2.

IAT5550 OPERATOR ISSUED

Explanation:

The operator requested the main device scheduler to start, restart, or cancel the job. If START is indicated, the job proceeds to the device allocation phase of MDS. This action is only required by the operator when automatic allocation is not in effect. If RESTART is indicated, the operator caused the job to return to the main device scheduler allocation phase or to C/I processing. If CANCEL is indicated, the operator canceled the job while it was being processed by MDS.

Note: The *MODIFY G command specifying a class, grpname, or select mode results in CANCEL SETUP - RESCHED SETUP appearing in the message text. The job will not be canceled but will be rescheduled for MDS processing.

System action: The function requested by the operator is performed for the job.

Operator response: None. This is an informational message.

Routing Code: Note 18
Descriptor Code: 7
IAT5606

Explanation:

This message is issued in response to either an *INQUIRY,S,V=vol or an *INQUIRY,S,D= command. J=nnnnnnn is the number of jobs known to MDS referencing this volume including dynamic allocations (which are considered jobs) by jobs that have not gone through job breakdown. DA is a direct-access volume; TA is a tape. AL=nnnnnnn is the number of jobs allocated to the volume by MDS including dynamic allocations which are currently allocated. The following fields appear, if appropriate:

**REX**
- The volume is reserved for exclusive use

**RSH**
- The volume is reserved for shared use

**prty**
- The priority number

**ONADEV**
- The volume is currently on a device

**VFYPD**
- This volume is referenced by a job in the MDS verify queue

**UNAV**
- The volume is unavailable

**SETACC**
- The volume represents processor access as specified in the SETACC JES3 initialization statement

In Version 3 Release 1.2 and subsequent releases, the command does not display the information in the dummy SETVOL entries; only real volsers are displayed.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

- **Containing:** IATMDIQ
- **Detecting:** IATMDIQ
- **Issuing:** IATMDIQ

**Routing Code:** Note 18

**Descriptor Code:** 7

---

IAT5608

Explanation:

This message, issued in response to an *INQUIRY,S,V=vol command, indicates that MDS has allocated the volume with the volume serial number vol to a different unit than the one on which it currently resides. For example, MDS may have requested that the volume be moved and the move has not yet been made.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**
IAT5610  •  IAT5612

IAT5610

Explanation:

This message is issued in response to an *INQUIRY,S,V=vol,E command or *INQUIRY,S,DE=dsn command. AL=nnnnnnn is the number of jobs currently allocated to the data set indicated by dsn. AL=EXC indicates that a job currently has exclusive use of the indicated data set. If the data set is reserved, the message indicates the type and priority of the reserve for it: REX if reserved for exclusive use, or RSH if for shared use. The priority number is indicated by prty.

Note: Use the *INQUIRY,S,D=dsn or *INQUIRY,S,DE=dsn command to determine the current allocation status of the indicated data set as described in message IAT5612 (AL=YES or AL=NO).

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT5612

Explanation:

This message is issued in response to an *INQUIRY,S,V=vol,E command or *INQUIRY,S,DE=dsn command. The indicated job references the requested volume and data set. The MDS allocated status given by AL, and the usage of the volume and data set are shown as either share (S), exclusive (E), or none (N).

Note:
1. The MDS allocated status is the original status of the allocation request. The disposition of the data set indicated by this message might not represent the current allocation status if the disposition of the data set has been promoted to DISP=EXC by one of the steps in the job using the data set. See the DISP and ENQ section of the z/OS MVS JCL Reference for a description of the enqueue promotion.
2. The *INQUIRY command does not display the information in the dummy SETVOL entries; only real volsers are displayed.
3. If the data set name is preceded by an asterisk (*), it represents a non-SMS catalog required by the job. Do not inquire upon the data set name.

System action: Processing continues.

- CURRENT SETUP DEPTH—ALL PROCESSORS—nnnnnn—
- MAIN NAME STATUS SDEPTH DASD TAPE—
- main stat1 stat2 smax,scur dmax,dcur tmax,tcur DEFERCT= YES/NO SDEPZERO= WAIT/ERROR—

This message is issued in response to an *INQUIRY,S command. In the message text:

- nnnnnnn Represents the current number of jobs for the specified queue
- main The main name.
- stat1 Displays the status ONLINE or OFFLINE.
- stat2 Displays the status IPLD, NOTIPLD, or FLUSHED.
- smax The maximum number of jobs in setup for the specified main.
- scur The current number of jobs in setup for the specified main.
- dmax The maximum number of DASD devices defined on the specified main.
- dcur The number of DASD devices on the specified main which are currently available for the mounting of devices.
- tmax The maximum number of tape devices defined on the specified main.
- tcur The number of tape devices on the specified main which are currently available for the mounting of devices.

**DEFERCT=**YES/NO
The current value of the DEFERCT option. This indicates whether or not JES3 is to include jobs that require only deferred mounts in the CLASS/SELECT SDEPTH counts.

**SDEPZERO=**WAIT/ERROR
The current value of the SDEPZERO parameter. This indicates whether jobs that require a tape mount, but are of a class that does not permit them, for example SDEPTH=0, should wait, for example, for a class or SDEPTH change, or be treated as if in error.

>>>SMS RES. NAVAIL
>>>SCHENV UNDEFINED
>>>SCHENV NAVAIL
>>>WLM GRP NOT SUPP

This message is issued in response to an *INQUIRY,S,A,J=jobno command. It identifies the main processors that are eligible to run the job after fetch processing and why allocation could not be attempted for each of these mains.

Note: During MDS fetch processing, JES3 will limit the job to run on those systems that have access to the device types and number of devices required by the job. For example, if a job requires ten 3490 tape drives and system SY2 only has nine 3490s defined, then SY2 will not be eligible to run the job. If the job was limited to run on a certain set of systems during fetch processing, the job's JESMSGGLG data set contains messages that describe why a particular system is not eligible to run the job.

RESOURCE UPDATE
the purpose of the last allocation scan was to update the available resource counters to include devices that were made available for allocation

JOB HOLD STATUS
the job is in hold status
IAT5642

REGION NAVAIL
the job’s region requirement exceeds the maximum available region size on the specified main

RESTART PASS
the job is not a restart job. MDS will not allocate resources to this job until MDS processes all jobs that need to be restarted. If this condition persists for an extended period of time, issue an *I S R command to determine which jobs are restart jobs, and *I S R J= commands to determine why the restart jobs have not been processed.

MAIN NAVAIL
the eligible main is not connected or not online. or the main was not IPLed.

REST MAIN NAVAIL
the job that is restarting cannot be selected on the specified main because the processor is online but not connected. Connect the specified processor or vary it offline. MDS scans for jobs that should be restarted until the processor connects or is varied offline.

GRP/CLS NAVAIL
the GMS GROUP/CLASS required by the job was not enabled on the specified main

RESOURCE NAVAIL
a resource (volume, device, etc.) required by the job was not available when allocation was last attempted for the job

DEV FENCE NAVAIL
the job requires a device fence which has not yet been created

Note: Use the *I S A J=jobno command, where jobno is the number of the job that JES3 creates to allocate the device fence, to determine why the device fence is not available.

MAIN DEPTH
the setup depth on the specified main has been exceeded

FAILED ARL SCAN
the preallocation scan indicated the job would not be able to allocate the resources the job required.

JOBCLASS DEPTH
the job’s job class depth has been exceeded on the specified main

SMS RES. NAVAIL
SMS-managed resources are not available

SCHENV UNDEFINED
the scheduling environment specified by the job on the SCHENV= parameter of the JOB statement is not defined in the WLM policy. This can occur when the job enters the system with a valid scheduling environment and then a new WLM policy is activated without the scheduling environment defined. Use the *I,J=jobno,X command to determine the name of the scheduling environment that the job requires. You must either cancel the job, or redefine the scheduling environment to WLM and activate it using the V WLM,POLICY=policy command.

SCHENV NAVAIL
the scheduling environment specified by the job on the SCHENV= parameter of the JOB statement is not available on the specified system. A scheduling environment will not be available on a particular system if its resources are not in the proper state. Use the *I,J=jobno,X command to determine the name of the scheduling environment that the job uses. To display the status of the resources associated with a scheduling environment on that system, issue the following command: D WLM,SCHENV=schenv,SYSTEM=main. Then issue V WLM,RESOURCE=resource,status commands to change the status of the resources and cause the scheduling environment to become available.

WLM GRP NOT SUPP
The job’s group is WLM managed but the specified main does not support WLM batch initiator management. That is, JES3 is not at the OS/390 Version 2 Release 8 level.

System action: Processing continues.

Operator response: Wait until the job can be set up through normal events, such as jobs ending on a main, or take appropriate action to make the specified job eligible for main device scheduling.

Module:
This message, issued in response to an *INQUIRY,S,E,J=jobno command, indicates the job to which the following message IAT5646 applies.

System action: Message IAT5646 is issued next.

Operator response: None. This is an informational message.

Module:

This message indicates the resources that MDS could not allocate for the job and main indicated in message IAT5648. text is one of the following:

nnnn OUT OF nnnn REQUESTS FOR DEVICE={devtype|dev}<LIST COUNT=nnnn>

Indicates MDS was not able to allocate all of the devices requested by the job. nnnn indicates the number of devices that MDS was not able to allocate to the job, nnnn indicates the total number of devices the job requested. The device names or device numbers of the devices requested by the job follow DEVICE=.

LIST COUNT, if specified, indicates the number of the specified requests that contain a list of unit names in addition to the unit name specified by devtype. All unit names contained within unit name lists belonging to the job will be displayed in message IAT5651.

Note: If the resources for the job are unknown, use the *CALL, DISPLAY, J=jobnum command to determine the devices required.

THE DEVICE REQUIRED FOR SERIAL=vol, EXCL={YES | NO}

MDS was unable to allocate the device required for a reserved permanently resident volume. If EXCL=YES appears in the message, the job requested exclusive use of the volume. If EXCL=NO appears in the message, the job requested shared use of the volume.

A REQUEST FOR SERIAL=vol, EXCL={YES | NO}

MDS was unable to allocate the volume to the job. If EXCL=YES appears in the message, the job requested exclusive use of the volume. If EXCL=NO appears in the message, the job requested shared use of the volume.

A REQUEST FOR DSNNAME=dsn ON SERIAL=vol, EXCL={YES | NO}

MDS was unable to allocate the specified data set on the specified volume to the job. If EXCL=YES appears in the message, the job requested exclusive use of the data set. If EXCL=NO appears in the message, the job requested shared use of the data set.
IAT5646

A REQUEST FOR DSNAME=dsn (SMS MANAGED), EXCL={YES | NO}
MDS was unable to allocate the specified SMS-managed data set. If EXCL=YES appears in the message, the job requested exclusive use of the data set. If EXCL=NO appears in the message, the job requested shared use of the data set.

A REQUEST FOR DSNAME=dsn (GDG BASE), EXCL= {YES | NO}
MDS was unable to allocate the specified GDG base data set. A job requires access to the GDG base when it allocates a data set which is a generation data group (GDG). See the z/OS MVS JCL User's Guide for more information about generation data groups. If EXCL=YES appears in the message, the job requested exclusive use of the GDG. If EXCL=NO appears in the message, the job requested shared use of the GDG.

System action: JES3 processing continues.

Operator response: If the job cannot wait for the resources to become available, determine if the resource required by the job are allocated to another job. Use the:
• *LS command to determine the status of a volume or data set
• *LD command to determine the status of the device

Issue the appropriate command to make the device available to the job. See z/OS JES3 Commands for information about the appropriate commands.

Note: When the text THE DEVICE REQUIRED FOR SERIAL=vol appears, issue the *INQUIRY D V=vol command to find out where the volume is mounted. If the volume is not found, all eligible devices are not mountable. The volume is on an unattached device or does not exist. Either attach the device or correct the job.

Routing Code: Note 18
Descriptor Code: 7

IAT5646

Explanation:

This message, issued following message IAT5644, describes the error encountered for the indicated DD statement. The message text in the message can be one of the error texts explained below.

Explanation: JES3 was unable to read the control blocks of the job from spool because there were no available buffers.

Explanation: The job requested a device type which does not exist on the main where setup was last attempted. DEVTYPE identifies the device requested by the job.

Explanation: The UNIT parameters of the DD statements requested more devices of the specified type than exist on the main where setup was last attempted. DEVTYPE identifies the device requested by the job.

Explanation: The job requested a device by a specific device number, and the job is eligible for setup on more than one main.

Explanation: The job requested a volume in a multiple volume serial reference on the DD statement; the volume is permanently resident and cannot be demounted. Volume identifies the volume requested by the job.

Explanation: The job requested a permanently resident volume mounted on a device that is not defined to the last main where setup was attempted.

Explanation: The job requested a permanently resident volume mounted on a device that cannot be allocated using the UNIT parameter on the DD statement.

Explanation: A permanent JSAM I/O error occurred while setup was processing the job.
Explanation: Setup abended while processing the job.

Explanation: An error was detected while JES3 was verifying whether the volumes required by the job were mounted.

Explanation: No processor has access to all the SMS and MDS resources required by the job.

Explanation: The job requested an SMS resource to which no processor has connectivity.

Explanation: An error occurred in SMS during an attempt to allocate an SMS resource.

Explanation: An MDS subtask abended while processing a job.

Explanation: The job contained an SMS request to a volume that JES3 could not find in the active SMS configuration.

System action: JES3 processing continues.

Operator response: See operator response under individual error texts below.

**NO JSAM BUFFERS AVAILABLE**

Operator response: Use the *RESTART SETUP command to return the job to the allocation stage. If this is a recurring problem, notify the system programmer.

Operator response: Determine if the:
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**NOT ENOUGH DEVICES AVAILABLE TO SETUP JOB [ -DEVTYPE=devtype | dev]**

Operator response: Determine if the:
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**DEMAND ALLOCATION FOR UNSPECIFIED MAIN**

Operator response: Determine if the:
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**MULTI VOLUME REQUEST FOR PERM/RES VOLUME [ -VOLUME=vol]**

Operator response: Determine if the:
• error is correctable
• job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

**PERM/RES VOLUME NOT ON REQUIRED PROCESSOR [ -VOLUME=vol]**

Operator response: Determine if the:
• error is correctable
IAT5646

- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

PERM/RES VOLUME NOT ON REQUIRED DEVICE [ -VOLUME = vol, DEVTYPE =devtype ]

Operator response: Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

PERMANENT JSAM I/O ERROR

Operator response: Determine if the:
- error is correctable
- job should be canceled or be allowed to remain on the ERROR queue

If the error is not correctable, cancel the job. If the error is correctable, the job can be run by correcting the error and restarting the job. If a warm or hot start is needed to correct the error, leave the job on the ERROR queue. When a warm or hot start is performed, JES3 tries to restart all jobs on the error queue.

JOB QUIESCED BY MDS FAILSOFT

Operator response: Restart setup on the indicated job. If the failure occurs again, cancel the job.

ERROR OCCURRED DURING VOLUME MOUNT VERIFICATION

Operator response: If all volumes required by the job are correct and mounted, restart setup. Otherwise, cancel the job.

NO MAIN PROCESSOR WITH ACCESS TO SMS AND MDS RESOURCES

Operator response: Allow the job to run on a processor with access to the desired resources. Otherwise, contact the system programmer.

NO PROCESSOR WITH CONNECTIVITY TO ALL SMS RESOURCES

Operator response: Re-configure the system if possible. Otherwise, cancel the job.

SMS PROCESSING ERROR

Operator response: If the SMS problem can be fixed, restart the job through C/I in setup. Otherwise, cancel the job.

MDS SUBTASK ABENDED WHILE PROCESSING A JOB

Operator response: Notify the system programmer.

System programmer response: A shortage of JSAM buffers might exist in your installation. See z/OS JES3 Diagnosis to resolve the shortage.

NO DEVICES AVAILABLE OF THE TYPE REQUESTED [ -DEVTYPE =devtype ]

System programmer response: Check the SDUMP taken by the ESTAE exit of the subtask for the cause of the failure.

JOB REFERENCES A VOLUME NOT IN ACTIVE SMS CONFIGURATION

System programmer response: If it is appropriate to add the volume to the active SMS configuration, add it and restart the job. Otherwise, cancel the job.

Module:
IAT5648  •  IAT5651

IAT5648
Explanation:

This message, issued in response to an *INQUIRY,S,A,J=jobno command, indicates the job and main to which the following message (IAT5645) applies. MDS attempted to allocate a resource on the specified main.

System action: Message IAT5645 is issued.
Operator response: None. This is an informational message.
Module:

IAT5649
Explanation:

This message is issued in response to an *I S A J= command if any IAT5645 response messages specify a count of requests with a list of unit names (as indicated by the LIST COUNT= label).

System action: Message IAT5651 is issued next.
Operator response: None.
Module:

IAT5651
Explanation:

This message, following IAT5649, lists all unit names (devtype) contained within unit name lists for any request by the job.

System action: JES3 processing continues.
**IAT5652 • IAT5654**

**Operator response:** If the job can not wait for its resources to become available, attempt to make available device(s) within the specified devtypes.

JES3 issues this message in response to command *INQUIRY,S,THWSSEP=. This message indicates the high watermark setup option with which JES3 is currently processing. The following option indicates the action JES3 takes when deciding whether to separate scratch and specific requests during tape HWS processing:

**IGNORE**
Specifies that JES3 not separate scratch and specific tape requests during high watermark processing.

**PREFER**
Specifies that JES3 attempt to allocate scratch and specific tape requests on separate tape drives without allocating additional devices.

**REQUIRE**
Specifies that JES3 should not allocate scratch and specific requests on the same drive, even if JES3 must allocate additional tape drives to satisfy the request.

**System action:** Processing continues.

**Operator response:** If you want to change the high watermark option, use the command *MODIFY,S,THWSSEP=.

IAT5664
Explanation:

This message is issued in response to an *LS,W,J=nnn command to display the volumes that need to be fetched. For example, volumes that are not mounted on a device.

System action: Processing continues.

Operator response: When all of the volumes have been retrieved from the tape library, issue an *S,S,jobno command to allow the job to proceed through setup processing.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

<tbody>
<tr>
<td>IATMDIQ</td>
<td>IATMDIQ</td>
<td>IATMDIQ</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT5671
Explanation:

JES3 issues this message in response to the *INQUIRY,S,SS,J=jobno or *INQUIRY,S,SV,J=jobno command. This command is used to obtain specific information about why the job is on the MDS system select or MDS system verify queue. The main device scheduler (MDS) subtask is still active on behalf of the job so no information can be obtained.

System action: JES3 ignores the command. Processing continues.

Operator response: Re-enter the command when the MDS subtask is no longer active on behalf of the job.

Module:

<td>IATMDIQ</td>
<td>IATMDIQ</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT5672
Explanation:

This message, issued in response to an *INQUIRY,S,SS,J=jobno command, indicates that the specified job is waiting for SMS resources to become available. One IAT5672 message is issued for each main that is eligible to process the specified job, but the unavailable SMS resources may be different for each eligible processor.

System action: JES3 issues message IAT5673 which lists the SMS resources that are unavailable to the specified processor. JES3 processing continues.

Module:
This message describes the SMS-managed resources required by the job (specified in message IAT5672), but not currently available to the eligible processor (specified in message IAT5672). Explanations of the message text follow:

resource name indicates the name of the unavailable SMS-managed resource.

VOL|SG indicates whether the resource is a SMS volume (VOL) or a storage group (SG)

status indicates the status that the required SMS resource should have before the job may use the resource. The possible status values follow:

ENABLE 
An enable status is required

ENABLE AND VOLUME 
A storage group enable status and an enabled and online volume in the group is required.

QUIESCE/NEW 
Quiesce new only status is required.

QUIESCE/NEW AND VOL 
A storage group quiesce new only status and an enabled and online volume in the group is required.

DISABLE/NEW 
Disable new only status is required.

DISABLE/NEW AND VOL 
A storage group disable new only status and an enabled and online volume in the group is required.

VOLUME ENABLE 
You must enable or vary online a volume in the storage group.

VARY VOLUME ONLINE 
The volume needs to be varied online to MVS and/or JES3.

UNKNOWN 
The required status is not known.

storage group name indicates the name of a storage group. Only one storage group in a collection is required by the job.

System action: JES3 processing continues.

Operator response: Contact the storage administrator to determine why the required SMS resources are not active. You must use the SMS commands to change the status of the unavailable SMS-managed resources. Use the JES3 *VARY or the MVS VARY command if the volume needs to be varied online.

Explanation:

➤—VOL=vol, ALREADY UNAVAILABLE

This message is issued in response to a *INQUIRY,SETUP,D=dsn command or a *INQUIRY,SETUP,DE=dsn command. This message indicates that the requested data set is SMS-managed.

System action: JES3 processing continues.

Operator response: None. This is an informational message.
This message, issued in response to a *MODIFY,S serial command, indicates that the command was processed.

**VOL=vol** \{AVAILABLE|NOT AVAILABLE\}
indicates that the volume serial number was recorded or removed by the main device scheduler.

**VOL=vol UNKNOWN TO JES3**
indicates all of the following:
1. the volume is not mounted.
2. the volume is not in the VOL UNAVAILABLE table from a prior *ES,VU= command.
3. no user has requested the volume.

**VOL=vol ALREADY UNAVAILABLE**
indicates that the vol has already been removed by the main device scheduler.

**System action:** If the volume serial number was recorded, any job references to the volume causes the job to be placed in the volume unavailable queue. If it was removed, any jobs previously referencing the volume can attempt allocation.

**Operator response:** None. This is an informational message.

**Module:**

**Routing Code:** Note 18

**IAT5702**

**Explanation:**

\[\text{xxx,---IS INVALID FIELD}\]

An incorrect parameter indicated by xxx has been specified in a *MODIFY,S command.

**System action:** Processing continues.

**Operator response:** Reenter the command correctly. See [z/OS JES3 Commands](#).

**Module:**

**Routing Code:** Note 18

**Descriptor Code:** 7

**IAT5706**

**Explanation:**

\[\text{dev,vol—UNLOADED ON---main} \]

This message, issued in response to a *MODIFY,S,U= command, indicates that the command was processed.

**System action:** The volume which was previously mounted is available for demounting by the main device scheduler.

**Operator response:** None. This is an informational message.

**Module:**
**IAT5708**

**Explanation:**

\[\text{dev}, \text{vol} | \text{NOT UNLOADED} -- \text{NOT PREVIOUSLY MOUNTED}\]

An MVS UNLOAD command has been issued for a device which was not previously mounted.

**System action:** The MVS UNLOAD command is ignored and processing continues.

**Operator response:** None. This is an informational message.

**Module:**

**IAT5710**

**Explanation:**

\[\text{JOB} (\text{jobname} \ (\text{jobid})) \rightarrow \text{SENT TO MDS FOR MOUNT OF} \rightarrow \text{vol}\]

This message, issued in response to a \*MODIFY,S,M= command, indicates that the command was processed.

**System action:** A mount job was created and contends for main device scheduler resources to accomplish the mount.

**Operator response:** None. This is an informational message.

**Module:**

**IAT5712**

**Explanation:**

\[\text{MOUNT} \rightarrow \text{vol} \rightarrow \text{REJECTED}. \rightarrow \text{error text}\]

This message, issued in response to a \*MODIFY,S,M= command, indicates the error detected while attempting to process the command. The \textit{err} field can be one of the following:

\textbf{ALREADY MOUNTED}

the volume is currently mounted.
MOUNT PENDING
an MSS virtual volume mount was requested but there is already a mount request pending for that volume.

NO DEVICES AVAILABLE OF THE TYPE REQUESTED
the specified device is not defined for the main.

dev IS NOT DIRECT ACCESS
for a non-MSS mount request, the real device specified is not a direct access device

DEVICE NUMBER dev NOT FOUND
the specified device is not a JES3 managed device

System action: Processing continues.
Operator response: Reenter the *MODIFY,S,M= command correctly, if necessary. See z/OS JES3 Commands.

Module:

**Routing Code:** Note 18

**Descriptor Code:** 7

---

This message indicates that the value specified by the *MODIFY,S,THWSSEP= command has been accepted. The new high watermark setup option is shown. The following option indicates the action JES3 takes when deciding whether to separate scratch and specific requests during tape HWS processing:

**IGNORE**

- Specifies that JES3 not separate scratch and specific tape requests during high watermark processing.

**PREFER**

- Specifies that JES3 attempt to allocate scratch and specific tape requests on separate tape drives without allocating additional tape drives to satisfy the request.

**System action:** Processing continues using the new setup option.

**Operator response:** None. This is an informational message.

**Module:**

---

Chapter 10. Main Device Scheduler Messages 475
IAT5731 • IAT5733

Explanation:

>>> JES3 CANNOT UPDATE INFORMATION FOR—DEVICE—devnum,—RC—rc,—RSN—rsn

IATMDCR, the JES3 configuration change exit, was in the process of updating information for a dynamic configuration change. IATMDCR used the UCBLOOK service to determine the address of a new UCB for a changed device, but the call to the UCBLOOK service did not complete successfully.

In the message text:

devnum
   The device number of the device that IATMDCR attempted to update.

rc
   The return code from the UCBLOOK service.

rsn
   The reason code from the UCBLOOK service.

System action: IATMDCR continues on to the next device in the dynamic configuration change data. Dynamic configuration change exit processing continues.

Operator response: Notify the system programmer.

System programmer response: See z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO for an explanation of the return code and reason code from UCBLOOK. Using these return codes, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:

Routing Code: 2, 10

Descriptor Code: 3

IAT5733

Explanation:

>>> JES3 CONFIGURATION CHANGE EXIT FAILED,—UNKNOWN IF JES3 CONTROL BLOCKS WERE CHANGED

IATMDCR, the JES3 configuration change exit, abended while processing a dynamic configuration change.

System action: The recovery processing in IATMDCR takes an SVC dump and then ends processing. Dynamic configuration change exit processing continues.

Operator response: Notify the system programmer.

System programmer response: Since IATMDCR might not have been able to complete processing, devices involved in the dynamic configuration change that were defined to JES3 might not have had corresponding information in JES3 changed. Verify that all changes performed in the configuration change did not affect devices defined to JES3. If any were affected, or you are not sure if any were affected, return the system to the previous configuration and hot start JES3 with refresh as soon as possible.

Using information from the SVC dump taken by IATMDCR’s recovery routine, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Explanation:

DEFERCT= YES

JES3 issues this message in response to command *F,S,DEFERCT=. This message indicates whether or not, based on the command just processed, JES3 is to include jobs that require only deferred mounts in CLASS/SELECT SDEPTH counts.

System action:   Processing continues.
Operator response: None. This is an informational message.

Module:
Containing    Detecting    Issuing
IATMDMO       IATMDMO       IATMDMO

IAT57343
Explanation:

INITIAL VERIFY RESPONSES WILL BE LOGGED

This message is issued in response to the *MODIFY,S,IVERMSG= command. If *MODIFY,S,IVERMSG=ALL is specified, the command will not remain in effect if the JES3 global is restarted. Therefore, you must reissue *MODIFY,S,IVERMSG=ALL after JES3 is restarted.

System action:   Processing continues.
Operator response: None. This is an informational message.

Module:
Containing    Detecting    Issuing
IATMDMO       IATMDMO       IATMDMO

IAT5800
Explanation:

JOB—jobname (jobid)—PLACED ON MDS ERROR QUEUE BY xxx

Either the main device scheduler or MDS system resource scheduling detected an error in the indicated job.
Installation exit IATUX61 determines which queue the job should be placed on. JES3 issues this message to inform the operator which queue the job was placed on. If the installation exit chooses to hold the job, the job is placed on the ERROR queue. If the installation exit places the job on the ERROR queue, the operator can issue an *INQUIRY command to determine if the error is correctable. If the installation exit chooses to cancel the job, the job is placed on the BREAKDOWN QUEUE or the DONE QUEUE. When a job is placed on the BREAKDOWN or DONE queue, JES3 ends the processing for the job.

**xxx** indicates the main device scheduler function or MDS system resource scheduling function that placed the job on the queue. The possible main device scheduler functions are FETCH, SELECT, VERIFY, and MDS FAILSOFT.

**System action:** The errors detected by the main device scheduler or by MDS system resource scheduling will not allow the job to run. Installation exit IATUX61 determines if the job should be canceled or held on the ERROR queue to be handled by the operator.

**Operator response:** If the job is placed on the ERROR queue, use the *INQUIRY,S,E,J=jobno command to determine if the:

- A device arm response (errors only).
- B initial verify response.
- C SYSUNITS ACL update.
- M volume mounted by operator.
- R MDS message route.
- U unload complete.
- V vary online response.

**ACL UPDATE**

indicates that JES3 detected a change in the ACL active/inactive status. In this case, the verify index (x) is blank.

**dev**

device number

**z** UCB/STATUS byte

- E execution device
- G global device

**[S]**

SMS-managed or blank

**{F|S}**

if vary on/off, small

---

**IAT5810**

Explanation:

<table>
<thead>
<tr>
<th>JOB—jobname (jobid)</th>
<th>COMMAND (INQUIRY)</th>
<th>EN countered</th>
<th>TEMPORARY</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND (MODIFY)</td>
<td></td>
<td>PERMANENT</td>
<td>NO BUFFER</td>
</tr>
<tr>
<td>JSTFDB=0</td>
<td></td>
<td></td>
<td>PLACED ON</td>
</tr>
</tbody>
</table>

A JSAM I/O error occurred during MDS processing. The meanings of the terms are:

**JOB jobname (jobid)**

The error occurred during the processing of the specified job.

**COMMAND (INQUIRY)**

The error occurred during the processing of a non-job-related *INQUIRY,S command.

**COMMAND (MODIFY)**

The error occurred during the processing of a non-job-related *MODIFY,S command.

**(MDS)**

The error occurred during non-job-related processing in the MDS module IATMDDR.
TEMPORARY
  Normal JSAM I/O error recovery was successful.

PERMANENT
  Normal JSAM I/O error recovery failed or was not attempted.

NO BUFFER
  All JSAM buffers are in use. JES3 has canceled the request to read a job's JST or JVT.

JSTFDB=0
  A previous JSAM I/O error was encountered during processing for this job. As a result, JES3 has set the JST FDB in the RESQUEUE entry to zero.

READING or RELEASING or WRITING
  The type of I/O operation JES3 was attempting when the error occurred.

bufferid
  The JES3 buffer identifier of the record being processed—for example, JST, JVT, RES, or VUT.

System action: For permanent errors not caused by hardware, JES3 takes a storage dump. For all errors except temporary errors or a non-job-related error, if the job is not executing on main, JES3 transfers it to the MDS error queue.

Operator response: If JES3 transferred the job to the MDS error queue—indicated by message IAT5800—issue command *C,S, jobno to remove the job from the system. If MDS allocated resources to the job, hot start JES3 to release those resources.

Programmer response: If permanent I/O errors occur frequently, reallocate and reformat the spool data sets.

Problem determination: See Table I, item 13; and Table III, items 3, 4, and 22.

</table>

IAT5918

Explanation:

This message is written to the hard-copy message log each time a verify response message is received and processed by MDS. The \textit{main} sends the verify response message. JES3V indicates a copy of the verify response message from an MVS processor described as follows:

\textit{x}, verify descriptions

1 character, 0-\textit{F}, or a blank (X'40'), corresponding to the following verify descriptions:

- **0 - \textit{xxxxxx} VERIFIED**
  - \textit{xxxxxx} has completed MDS verification.

- **1 - \textit{xxxxxx},L MOUNTED**
  - \textit{xxxxxx} is mounted on the indicated device (L is label type).

- **2 - UNIT NOT READY**
  - the device is not ready.

- **3 - NO RESPONSE**
  - no response has been received from MDS verify on the main.

- **4 - VERIFY TIMEOUT**
  - a timeout occurred during execution of a channel program.

- **5 - NON-EXISTENT DEV**
  - there is no unit control block (UCB) for the indicated device.

- **6 - PERM I/O ERROR**
  - a permanent I/O error has occurred on the indicated device.

- **7 - VOLID READ ERROR**
  - an error was encountered reading the volume label.

Chapter 11. Input Service Messages

IAT6100
Explanation:

The job specified by JOB jobname (jobid2) has been read into the system by input service. This message indicates input service is processing the job. If jobid1 appears in the message, it identifies the job number assigned to one of the following DSPs:

- CR - card reader DSP
- TR - tape reader DSP
- DR - disk reader DSP
- INTRDR - internal reader DSP

If DEMSEL appears in the message, the job was a demand select job. If the job is a DJC job, the dependent job control network name is specified by the NET-ID.

ID= specifies the job owner.

If HOLD is specified, the job is held.

If the job was submitted through the internal reader, SUB= will specify the job id of the submitting job.

System action:  Processing continues.
Operator response:  None. This is an informational message.
Module:

Containing   Detecting   Issuing
IATISEN      IATISEN    IATISEN

Routing Code: 41  Descriptor Code: –

IAT6102
Explanation:

A /*PROCESS DJC CARD PRESENT WITHOUT /*NET STATEMENT.
System action:  JES3 flushes the job.
Operator response:  Notify the system programmer.
Programmer response:  Correct the JCL and resubmit the job.
Module:
IAT6103 • IAT6105

IAT6103
Explanation:

A /*PROCESS DJCPROC or DJC control statement must be included in the JCL for nonstandard DJC jobs.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct and resubmit the job.

IAT6104
Explanation:

The RELSCHCT parameter may not be specified for nonstandard DJC jobs.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct and resubmit the job.

IAT6105
Explanation:

An UPDATE= parameter was specified on a /*MAIN statement, but the job does not have a MAIN SE.

System action: UPDATE= is ignored, and normal job processing continues.

Operator response: Notify the system programmer.
Programmer response: Correct and resubmit the job.

Module:

<td>IATISEN</td>
<td>IATISEN</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 7

IAT6107

Explanation:

```
>>> JOB—(jobname),—NET-ID=djnet—HAS FAILED IN INPUT SERVICE
```

This message informs the operator that the indicated DJC job has failed in input service. An error message is in JESYSMSG or logged on the operator's console. DJC jobs not present in the system may cause a DJC network to be suspended from processing.

System action: JES3 flushes the job.

Operator response: Notify the system programmer.

Programmer response: Correct the error noted in the error message, and resubmit the job.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISEN</td>
<td>IATISEN</td>
<td>IATISEN</td>
</tr>

<tr>
<td>IATISEN</td>
<td>IATISEN</td>
<td>IATISEN</td>
</tr>
</tbody>
</table>

**FAILED BY SECURITY CHECK**

indicates the job has failed verification of user identification during input service.
Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS
IATISEN  IATISEN  IATISEN

FAILED BY OPERATOR
the operator canceled the specified job

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

FAILED BY USER
the TSO user canceled the specified job

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

FAILED BY INTERPRETER
errors were found in the job's JCL

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

ENDED, COMP CODE=ZERO
indicates that the job has ended normally. The word ‘ZERO’ appears as the completion code.

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

ENDED, DUE TO SYSTEM IPL
indicates that the job was active in MVS when an IPL of the MVS system was performed. The JES3 failure option (CANCEL, HOLD, or PRINT) is taken for the job.

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

FAILED BY INITIATOR

JOB  jobname (jobid)  STEP=stepname, PROC=procedure stepname
errors were found in the job's JCL at initiation time

Module:
Containing  Detecting  Issuing
IATGRJS  IATGRJS  IATGRJS

ENDED, COMP CD=Snnn|Unnnn

JOB  jobname (jobid)  STEP=stepname, PROC=procedure stepname
indicates that the job has ended either with a system or user abend. If either code is zero, then an application program has issued an abend with a completion code of 0000.
ENDED, COND=code

JOB jobname (jobid) STEP=stepname, PROC=procedure stepname

the job ended because the job step returned a condition code which satisfied the COND parameter specified on the JOB statement.

STEP=stepname

Indicates one of the following:
- If a procedure was not called, stepname is the name of the failing job step.
- If a procedure was called, stepname is the name of the job step that called the failing procedure.
- If the job ended while starting, information is not available yet and N/A is displayed.

PROC=procedure stepname

Indicates one of the following:
- If a procedure was not called, there is no procedure stepname and NONE is displayed.
- If a procedure was called, procedure stepname is the name of the failing procedure step.
- If the job ended while starting, information is not available yet and N/A is displayed.

NOTIFY NOT SENT, NO PATH

indicates that no CTC path is currently available to the main; the user could not be notified.

Note: Do not confuse the completion code with the condition code. See z/OS MVS JCL Reference.

ENDED, MAXCC=nnnn

indicates that the job has ended normally. nnnn is the highest return code from any job step within the job.

The /*FORMAT statement indicates that it is to be continued, but no continuation statement was found.
System action:  JES3 flushes the job.
Programmer response:  Correct the /*FORMAT statement and resubmit the job.
Module:

Containing  Detecting  Issuing
IATISLG      IATISLG      IATISLG
IAT6124 • IAT6125

Routing Code: Note 19
Descriptor Code: –

IAT6124

Explanation:

While processing the job stream, input service encountered an // XMIT statement or //*ROUTE statement after an MVS JCL control statement. The XMIT or ROUTE statement must appear immediately after the JOB statement or any //*NETACCT statements. The possible error texts are:

- NETWORK JOB FLUSHED
  JES3 flushes the network job that the user submitted to be transmitted. Any JCL after the delimiter is processed.
- ENTIRE JOB STREAM FLUSHED
  If a //*ROUTE statement is used, JES3 flushes the network job until it reaches another JOB statement. If a XMIT statement is used, JES3 flushes the network job until the end-of-file is reached.

System action: Depending on the type of statement used to transmit the user's data, JES3 flushes the indicated portion of the network job. JES3 processing continues.

User response: Correct the job so that a XMIT or ROUTE statement is placed immediately after the JOB or NETACCT statements.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISJN</td>
<td>IATISJN</td>
<td>IATISJN</td>
</tr>
</tbody>
</table>

Routing Code: Note 19
Descriptor Code: –

IAT6125

Explanation:

JES3 was able to identify the //*ROUTE statement but input service cannot parse the parameters on the statement because of syntax errors.

System action: JES3 flushes the network job until the next recognizable JOB statement or an end-of-file is reached.

User response: Correct the //*ROUTE statement so that it meets the syntax rules. See the z/OS MVS JCL Reference for the rules on coding the //*ROUTE statement.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISJN</td>
<td>IATISJN</td>
<td>IATISJN</td>
</tr>
</tbody>
</table>

Routing Code: Note 19
Descriptor Code: –
IAT6126
Explanation:

JES3 was able to identify the // XMIT statement but syntax errors prevented input service from processing the parameters on the statement. The possible error texts are:

• NETWORK JOB FLUSHED
  JES3 flushes the network job that the user submitted to be transmitted. Any JCL after the job delimiter is processed.

• ENTIRE JOB STREAM FLUSHED
  JES3 flushes the network job stream until the end-of-file is reached.

System action: JES3 flushes the indicated portion of the network job stream. JES3 processing continues. The error and reason codes are:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>the XMIT statement has a syntax error.</td>
</tr>
<tr>
<td>04</td>
<td>the DEST= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
<tr>
<td>08</td>
<td>the DLM= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
<tr>
<td>12</td>
<td>the SUBCHARS= keyword is incorrectly specified on the XMIT statement.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>no keyword is specified.</td>
</tr>
<tr>
<td>04</td>
<td>an incorrect keyword is specified.</td>

<tr>
<td>12</td>
<td>the DEST= keyword is not specified.</td>
</tr>
<tr>
<td>16</td>
<td>there are duplicate keywords.</td>
</tr>
<tr>
<td>20</td>
<td>the value on the specified keyword is not the correct length.</td>
</tr>
<tr>
<td>24</td>
<td>the value on the specified keyword extends into the continuation boundary.</td>
</tr>
<tr>
<td>28</td>
<td>the second special character is missing.</td>
</tr>
<tr>
<td>32</td>
<td>the special character is not in quotes.</td>
</tr>
</tbody>
</table>

User response: Correct the syntax of the XMIT statement. See the [z/OS MVS JCL Reference] document.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATISJN</td>
<td>IATISJN</td>
<td>IATISJN</td>
</tr>
</tbody>
</table>

Routing Code: Note 19

Descriptor Code: –

IAT6127
Explanation:

JES3 was unable to locate the delimiter defined on the XMIT statement and the end-of-file indicator was reached.
System action: JES3 purges jobs found after the XMIT statement until an end-of-file (EOF) condition is reached.

Operator response: If the job stream is read from a card reader, resubmit each job separately. This will isolate the job that does not have a corresponding delimiter. When the job without a delimiter is located, notify the user and inform the user a correct delimiter needs to be included with the job.

User response: Resubmit the job with a delimiter.

Module:

IAT6128

Explanation:

CARD IS CONTINUED AS COMMENT - text

JES3 treats the specified text as the continuation of the comment field of the previous card.

System action: Processing continues.

Programmer response: If the job is processing correctly, this is an informational message.

If the job is flushed or not processing correctly, check to make sure the cards are continued properly. Correct any errors and resubmit the job.

Module:

IAT6129

Explanation:

INVALID CONTINUATION RECEIVED - 'text'

JES3 was processing a card that was to be continued. The next card to be processed has a label in the name field and is not a valid continuing card.

System action: JES3 flushes the job.

Programmer response: Check to make sure the cards are continued properly. Correct any errors and resubmit the job.

Module:

IAT6130

Explanation:

ERROR IN PROCESSING JOB CARD. CHECK JOB CARD AND RESUBMIT JOB

Module:

IAT6128 • IAT6130
An error has been detected in the JOB statement.

**System action:** The job is scheduled for the interpreter and output service segment, and then the job is purged.

**Programmer response:** Correct and resubmit the job.

**Explanation:**

```
parm IS INVALID keyword
```

The specified parameter value `parm` is not a valid keyword. In the message text, `keyword` is one of the following:

- PRIORITY
- CLASS
- MSGCLASS
- TYPRUN
- PERFORM
- PASSWORD

**System action:** JES3 flushes the job. (JES3 does not flush the job if the parameter value is not valid for keyword CLASS and is overridden by a JES3 /*MAIN statement CLASS parameter.)

**Programmer response:** If necessary, correct the JOB statement and resubmit the job.

**Explanation:**

```
DUPLICATE PASSWORD PARAMETER
```

A duplicate password parameter on a job statement was found.

**System action:** JES3 flushes the job.

**Operator response:** Notify the system programmer.

**Programmer response:** Ensure that the job statement is correct and resubmit the job.
IAT6133

Routing Code: Note 19
Descriptor Code: –

Explanation:

(EXPLANATION)

An error was found processing the JOB JCL statement. The text describing the error can be one of the following:

CLOSING QUOTE MISSING
indicates that an opening quote (" ) was found, but the closing quote was not found.

CONTINUATION NOT RECEIVED
the JOB JCL statement was coded to be continued, but the continuation statement was not found.

INVALID CONTINUATION
the JOB JCL statement was coded to be continued, but the following statement did not conform to the continuation syntax.

JOB CARD NOT FOUND
the character string 'JOB' was not found.

FIRST CHARACTER OF THE JOBNAME IS NUMERIC
indicates that the first character of the JOBNAME was not alphabetic or national. JES3 forces the JOBNAME to be FAILnnnn, where nnnn is the number assigned to the job.

JOBNAME IS NOT ALPHAMERIC OR NATIONAL
indicates that the JOBNAME does not consist of 1-8 alphameric and national(#,@,$) characters. JES3 forces the JOBNAME to be FAILnnnn, where nnnn is the number assigned to the job.

PASSWORD IS TOO LONG
Indicates that a password was found that is longer than eight characters.

ACCOUNTING INFORMATION IS TOO LONG
The accounting information parameter on the JOB JCL statement is longer than the allowable 142 characters.

NO CLASS SPECIFIED
Indicates that a job class was not specified on the CLASS= parameter.

CLASS NAME IS TOO LONG
Indicates that the job class specified on the CLASS= parameter was too long.

SYSTEM AND SYSAFF NOT ALLOWED
Only one occurrence of SYSTEM or SYSAFF can be specified.

SYSTEM OR SYSAFF PARAMETER ERROR
Indicates that one or more parameters specified for SYSTEM or SYSAFF are incorrect. Either the syntax is incorrect or a system name is not valid.

System action: JES3 flushes the job.

Programmer response: Correct the JOB statement and resubmit the job.

Module:

Routing Code: Note 19
Descriptor Code: –
IAT6134 • IAT6136

IAT6134
Explanation:

\[\text{JOB\{jobid\} JOBNAME INVALID \text{ffffff SUBSTITUTED}}\]

The JOBNAME on the JCL JOB statement could not be processed. The first character of the JOBNAME entered was numeric or the JOBNAME entered did not consist of 1 to 8 alphameric or national (#,@,$) characters.

**System action:** JES3 replaces the incorrect jobname with the characters \text{ffffff}. These characters consist of the job number left padded with zero prefixed with FAL if the job number is 99999 or less, otherwise it is prefixed by F. For example, for job number 314 the job name \text{FAL00314} is used, and for job number 159265 the job name \text{F0159265} is used.

**Operator response:** If the message is the result of an MVS \text{START} command, issue the \text{START} command again with the correct procedure name.

**Programmer response:** Correct the JOBNAME on the JOB statement and resubmit the job.

Explanation:

>>> JOB—jobname (jobid)—JESMSG LOG—DISABLED BY THE INSTALLATION

The installation decided to suppress the JESMSG logging based on the type of job or through installation exit IATUX29.
The JESMSG parameter on the STANDARDS statements allows logging to be suppressed for three classes of jobs:
• Batch jobs
• Started tasks
• TSO Logon jobs.

This message is logged in the JESMSG data set of the affected job and does not appear on any operator console.
System action: Processing continues.
Programmer response: None.

IAT6144
Explanation:

>>> DM702 OR DM722 OCCURRED WHILE READING—INPUT. JOB FLUSHED.

A DM702 or DM722 abend occurred while input service was reading a multi-record file containing an input job. A probable cause is the job abended that was creating the multi-record file, so that a buffer or end-of-file mark was not written. This is most likely to occur with an internal reader job.
System action: The job is flushed. If a job stream was input to the internal reader, the remainder of the stream is lost.
**IAT6146 • IAT6149**

**Programmer response:** Determine why the job abended submitting the input stream, and resubmit the job.

IAT6164
Explanation:

INVALID JOB RESUBMITAL, JOB FLUSHED

DJC allows a job that has failed in DJC processing to be resubmitted; however, the resubmit is disallowed in the following cases:
1. If the number of successor jobs has been changed on the resubmittal.
2. If the NRCMP=FLSH parameter is specified on the //*NET JECL statement and the job is submitted after it has run to normal completion. Message IAT6166 is also issued.
3. If the net was submitted on a JES3 release that does not support job numbers greater than 65,534 and the resubmitted job is assigned a job number greater than 65,534. Message IAT6179 is also issued.

System action: For case 1 and 3, the job is scheduled for the interpreter and output service segments, and then the job is purged. For case 2, see message IAT6166.

Programmer response: For case 1, resubmit the job with the original number of successor jobs. For case 2, the job cannot be submitted again. For case 3, see message IAT6179.

**Routing Code:** Note 19

**Descriptor Code:** 7

IAT6180

Explanation:
JES3 encountered problem while reading the original job header/trailer from spool. The size of the job header/trailer has exceeded the allowable size. A possible cause is spool overlaid after the nested NJE job entered to the system.

**System action:** JES3 purges the job from the system. JES3 processing and networking continues.

**Operator response:** Contact the user. Indicate the network job that failed.

**Programmer response:** Resubmit the job or submit the job directly to the execution node.

---

**IAT6182**

**Explanation:**

During demand select processing, the indicated job did not match the job currently defined to the functional subsystem (FSS). This is not an error condition if this occurred after a *RETURN command was issued while the FSS was initializing.

**System action:** JES3 flushes the job.

**Operator response:** Notify the system programmer.

**Programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135, Table III, items 2 and 4.

---

**IAT6190**

**Explanation:**

An incorrect DLM= parameter has been specified on a DD * or DD DATA statement.

**System action:** The system schedules the job for the interpreter and output service segments, and then purges the job.

**Programmer response:** Correct and resubmit the job. See z/OS MVS JCL Reference for the DLM parameter restrictions imposed by JES3.

IAT6192
Explanation:

acional action: Input service rejects the internal reader data set and JES3 issues a 1FB system completion code.

Operator response: Notify the system programmer.

System programmer response: If the error is not from IATUX27, see z/OS JES3 Diagnosis to help determine the problem.

Module:

Containing	Detecting	Issuing
IATISCD	IATISCD	IATISCD

Routing Code: Note 13  
Descriptor Code: 7
IAT6201
Explanation:

This is the sign-on message for the input service interpreter job that processes a batch of jobs into the JES3 queues. The terms in the message are:

**jobno**
- the JES3 job number.

**jobname**
- the JES3 job name.

**bb**
- the number of jobs in the batch.

**nnn**
- the number of card images read. After a hot start, this may be zero.

**prty**
- the scheduling priority of this interpreter job.

**HOLD**
- indicates that this job is in operator hold status.

**System action:** Input service starts to process a new interpreter job.

**Operator response:** No response is required unless HOLD appears in the message; if so, release this job so that the jobs it will interpret can be accessed by the system. All operator commands referring to this interpreter job must use the job number, for example, *MODIFY,J=jobno,R.

**Module:**
- Containing: IATISRL
- Detecting: IATISRL
- Issuing: IATISRL

**Routing Code:** Note 7

**Descriptor Code:** 7

IAT6202
Explanation:

When the hold option is in effect for the reader (for example, *X,CR,H), each job is logged after it has been completely read. This job will not need to be read again if there is a system failure and JES3 is restarted. The terms in the message are:

**jobname**
- the name on the JOB statement

**devname**
- the name of the RJP device reading the input job stream or the 3- or 4-character device number of the local reader.

**jobid**
- the JES3 job identifier (JOBnnnnn)
Operator response:  None. This is an informational message.

Module:

Routing Code: Note 18
Descriptor Code: 7

IAT6203

Explanation:

The number of jobs specified in a JOBS= operand was completely read before an end-of-file condition was reached. The jobname on the next JOB statement encountered in the file is given.

System action:  Processing continues as if an end-of-file had been encountered.

Operator response:  None. This is an informational message.

Module:

IATISRL  IATISRL  IATISRL

Routing Code: Note 18
Descriptor Code: 7

IAT6211

Explanation:

A // *DATASET statement for job (jobname) includes the MODE=C or DCB=MODE=C operand; however, the card reader was not called with the C operand specified.

System action:  This copy of the card reader is canceled. If the reader is a remote job processing device, the rest of the input stream is flushed. Message IAT6281 is issued after the reader has reached the end-of-file.

Operator response:  If this is a hot reader and further input is desired, manually clear the hopper of the job containing card-image input and ready the reader. Otherwise, resubmit the entire failing job and recall the card reader, using the C option, with the command *X,CR,C. If the input stream is being flushed, remove all cards from the hopper. Make sure the end-of-file key is pressed on the reader, and let the reader read all cards.

Programmer response:  In the job’s run instructions, note that the C option must be used when the card reader is called.

Module:

IATISRL  IATISRL  IATISRL

Routing Code: Note 18
Descriptor Code: –
IAT6212

Explanation:

A //*DATASET statement for job jobname includes the MODE=C or DCB=MODE=C operand; however, the input stream was from a tape, disk, or remote reader.

System action: This reader is canceled. If the reader is a remote job processing device, the rest of the input stream is flushed.

Operator response: Recreate the job stream without the MODE=C operand in the //*DATASET statement. The column binary parameter is meaningless for disk or tape input.

Module:

Routing Code: Note 18
Descriptor Code: –

IAT6221

Explanation:

The tape reader has obtained a tape drive with the number dev for the specified input tape reader job.

System action: The tape reader waits for an operator reply.

Operator response: Mount the input tape on the designated drive and issue an *S command, for example, *S,TR.

Module:

Routing Code: Note 18
Descriptor Code: 2,7

IAT6231

Explanation:

The device requested is not available because it is presently allocated to another DSP or it has been specified OFFLINE. If a particular device name was not specified using the IN= operand of the CALL command, then all readers (card or tape) are in use or offline.

System action: If the message suffix is CANX, no further action is taken. The hot reader (K) option is not honored. If the suffix is RESKED, JES3 automatically recalls this reader when the device is available.

Operator response: Enter the *VARY,dev ONLINE command, if necessary, to make a device available. Note that the distributed JES3 system defaults to the NAV=R option on the card reader and the tape reader.

Module:
IAT6232

Explanation:

"INVALID DEVICE REQUEST. RDR CANX"

The IN= operand on the *CALL command specified a nonexistent device; or the specified device is not a valid card device, if a card reader is being called, or a valid tape device, if a tape reader is being called.

System action: The call is unconditionally canceled.

Operator response: Call the reader again, specifying a valid device.

Module:

IAT6233

Explanation:

"M=MEMBER-NAME" NOT SPECIFIED.

No M= operand was included on the *X or *S command.

System action: The reader is canceled.

Operator response: Specify a member (M=) on the next *CALL or *START command.

Module:

IAT6234

Explanation:

"MEMBER mem NOT FOUND. RDR CANX"

The requested member is not in the partitioned data set directory.

System action: The reader is canceled.

Operator response: Verify that the name has been spelled correctly, and enter the *X,DR or *S,DR command again.

Module:
IAT6235 - IAT6237

IAT6235
Explanation:

The system attempted to open a partitioned data set (PDS) whose members are used as input to JES3 through the
disk reader. A DD statement with the ddname JES3DRDS was not included in the disk reader procedure.

System action: The system issues message IAT6237 after processing a *CALL,DR command without a JES3DRDS
DD JCL statement. The message states that the DR cannot run. Any other errors detected during the opening of the
data set causes JES3 to abend.

Operator response: Notify the system programmer.

Programmer response: Add a JES3DRDS DD JCL statement to the disk reader procedure.

Problem determination: See Table III, items 20 and 21.

Module:

IAT6236
Explanation:

Another copy of the disk reader is currently active. Only one disk reader may be active in JES3.

System action: The reader is canceled.

Operator response: Issue the *X,DR command when the active copy has ended.

Module:

IAT6237
Explanation:

Another copy of the disk reader is currently active. Only one disk reader may be active in JES3.

System action: The reader is canceled.

Operator response: Issue the *X,DR command when the active copy has ended.
When JES3 was initialized, the data set containing input for the disk reader was not opened. JES3 must be reinitialized before the disk reader can run.

**System action:** The reader is canceled.

**Operator response:** None. This is an informational message.

**Module:**

<table>

**Routing Code:** Note 18

**Descriptor Code:** 7

---

IAT6239

**Explanation:**

```plaintext
>>> JES3ORDS DD BLKSIZE NOT A MULTIPLE OF 80```

The partitioned data set (PDS) whose members were intended to be used as input to the disk reader was defined on the DD statement and the DCB=(BLKSIZE=) value is not a multiple of the card length.

**System action:** JES3 runs normally. If the operator attempts to call the disk reader, JES3 issues message IAT6237.

**Operator response:** Notify the system programmer.

**Programmer response:** Recreate the data set with a block size that is a multiple of card length (80).

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>

IAT6251

Explanation:

\begin{verbatim}
\texttt{dev NOT READY}
\end{verbatim}

On device number \texttt{dev}, the reader has encountered an intervention-required condition because it reached an end-of-file.

System action: The reader waits for the operator to correct the interrupting condition. It automatically starts reading again when the device is made ready.

Operator response: Perform any appropriate manual correction, and ready the device.

Problem determination: See Table I, items 2 and 30.

Module:

detial
IAT6252
Explanation:

On device number dev, the reader has encountered an intervention-required condition because an incorrect punch was in the card. If this is card-image data, possibly a /*DATASET MODE=C card or a DD *,DCB=MODE=C card does not precede the data.

System action: The reader waits for the operator to correct the interrupting condition. It automatically starts reading again when the device is made ready.

Operator response: Perform any appropriate manual correction and ready the device. If the data check was due to card-image data, enclose the data in DATASET-ENDATASET cards.

Problem determination: See Table I, items 2 and 30.

Module:

IAT6266

Explanation:

JES3RD, – dev, opr, err, cccchhhhrr

This message follows message IAT6265. The data for this message is extracted from the SYNADAF message buffer obtained during error analysis. The terms in the message are:

dev
the device number of the failing DASD

opr
the operand, typically READ

err
the type of error, such as DATA CHECK

cccchhhhrr
in hexadecimal, the absolute location of failure (cylinder, head, record)

System action: The reader is canceled.

Operator response: Do not try to read the member again.

Programmer response: Recreate the input stream member. It is possible that the track is bad and that you must assign an alternate track.
Problem determination: See Table I, items 2 and 30.

Module:

<table>
<thead>
<tr>

Routing Code: Note 18

Descriptor Code: 7

IAT6269

Explanation:

An unrecoverable error has occurred during the SYNAD processing that produced messages IAT6265 and IAT6266, which have preceded this message.

System action: Unpredictable. An attempt is made to continue normally after the cancel.

Operator response: Do not try to read the member again.

Problem determination: See Table I, items 2 and 30.
IAT6271

Explanation:

This message is issued after a JES3 restart has been completed and a reader that was active at the time of failure has been automatically recalled by JES3. The reader is operating under the conditions established by the original operator *CALL commands; any modifications made by the operator on subsequent *S and *C commands have not been saved. The specified job being read at the moment of failure is lost.

System action:  All jobs that have been completely read before failure will automatically be passed to an input service interpreter job. An artificial batch-full condition is set to force this.

If REPOSITIONING is included in the message, an attempt is made to reposition the file to the beginning of the job that was being read and to resume normal operation.

Operator response:  If this is a card reader, reload the input decks, starting with the job named in the message. Ready the reader.

Routing Code: Note 18
Descriptor Code: 7

---

IAT6281
Explanation:

A *CANCEL command was recognized while job <jobname> was being read. For a remote job processing reader, the ddname <ddn> of the device reading the input stream is given; for a locally attached reader, the 3- or 4-character device number is given.

System action: All jobs that were completely read before the cancel are passed to an input service interpreter job.

Operator response: None. This is an informational message.

Module:
IAT6291

Explanation:

The first statements read by the specified reader were not preceded by a JOB statement and were not JES3 /* command statements. The reader may be locally attached (indicated by a 3- or 4-character device number dev) or a remote job processing reader (indicated by blanks).

System action: If BEFORE JOB CARD FOUND is appended, a JOB statement was found and normal processing started. If this is not present, the reader has read to an end-of-file without recognizing a JOB statement.

Operator response: Notify the system programmer.

Programmer response: If this is a card reader, check for a missing JOB card at the front of the deck. If this is a disk reader or tape reader, recreate the input stream with a leading JOB statement.

Module:

IAT6292

Explanation:

An operator *CALL or *START command included the J= operand, specifying that input start with the job named, but an end of file occurred before the specified job was found.

System action: Processing continues as usual when an end of file is encountered.

Operator response: Verify that the jobname was spelled correctly.

• If this is a disk reader (DR), verify that the correct M=member-name was specified.

• If this is a tape reader (TR), the tape may not have been positioned to the correct file or may have been positioned to a point beyond the start of the job. Rewind the tape and try again.

Module:
IAT6294 • IAT6297

IAT6294
Explanation:

שחרר INVALID UPDATE DSN=dsn

This message is issued in conjunction with IAT6299 when the specified data set requested on an UPDATE= parameter was not found in the PROCLIB table or has a syntax error.

System action: The job fails with a JCL error and processing continues.

Operator response: Notify the system programmer.

Programmer response: Specify the correct data set name and resubmit the job. The UPDATE= parameter should not be used for non-procedure library data sets.

IAT6297
Explanation:

שחרר *WARNING* UNDEFINED SPOOL PARTITION—NAME=PREVIOUSLY DEFINED PARTITION, JOB

An incorrect spool partition name was found on a SPART= parameter in a //MAIN control statement.

System action: Job processing continues; JES3 places the job's spool data in the first valid spool partition previously defined in this job by a SPART= parameter, if any, in any partition defined during JES3 JES3 initialization for the job's class, or in the default partition.

Operator response: None. This is an informational message.

Module:
IAT6298

Explanation:

➤➤➤ WARNING* MULTIPLE SPART= PARAMETERS-- AN OVERRIDE HAS TAKEN PLACE—➤➤➤

More than one SPART= parameter was found on the //*MAIN control statements for a job.

System action: JES3 places the job's spool data in the spool partition specified in the last SPART= parameter in the job's control statements. Job processing continues.

Operator response: None. This is an informational message.

Module:

IAT6299

Explanation:

➤➤➤ SPECIFIED UPDATE= NOT IN PROCEDURE LIBRARY TABLE.—JOB FLUSHED—➤➤➤

The UPDATE keyword was incorrectly specified on the //*MAIN control statement. The specified data set name was not found in the PROCLIB table or has a syntax error. This message is issued in conjunction with message IAT6294.

System action: The job fails with a JCL error and processing continues.

Operator response: Notify the system programmer.

Programmer response: Specify the correct data set name and resubmit the job. The UPDATE= keyword should not be used for non-procedure library data sets. See message IAT6294 for more details.
Chapter 12. General Routines Messages

### IAT6300

**Explanation:**

- **USER EXIT 58 DISABLED DUE TO FAILURE**

Installation security exit IATUX58 or IATUX59 is disabled because a failure occurred while the exit was active.

**System action:** JES3 will not call the exit again until you restart JES3 (on the processor on which the failure occurred).

**Operator response:** Notify the system programmer.

**System programmer response:** Based on your installation's needs, determine whether or not to instruct the operator to restart JES3.

**Note:** Restarting JES3 will reinstate the same copy of the exit. An IPL is required to allow your system to load a new, possibly changed copy.

**Module:**

- Containing: IATGRSC

Routing Code: 10, Note 7
Descriptor Code: 7

IAT6306

Explanation:

A DSP requested by the operator or another DSP has been added to the JES3 job queue (JCT). The console name can be one of the following:

console name
  when issued by an RJP, MCS, or extended MCS console
INTERNAL
  when issued by an INTERCOM macro without a valid console identifier.
NETWORK
  when issued from a network operator.

System action: The DSP is subsequently scheduled as a JES3 job by normal job segment scheduler (JSS) processing.
Operator response: None. This is an informational message.

Routing Code: Note 18
Descriptor Code: 7

IAT6307

Explanation:

An operator *CALL command was rejected. One of the following reasons (err) is given:

DSI ONLY ON LOCAL
  the operator attempted to call a DSP other than DSI (dynamic system interchange) on the local; the only DSP that may be called on the local is DSI.
NAME NOT GIVEN
  no DSP name was specified in the request.
IAT6308

MORE THAN 8 CHARs
  the parameter exceeds the DSP name length.

NOT IN LIBRARY
  the requested DSP is not in the DSP dictionary.

NOT CALLABLE DSP
  the requested DSP may not be called by the operator.

SYSTEM ERROR
  the routine was entered in error; either the command is not *X or *CALL, or an unrecoverable JESIO error occurred.

REJ'D-INSTALLATION EXIT
  The *CALL command is ignored.

System action:  The *CALL command is ignored.

Operator response:  Correct the error, and reissue the call.

IAT6308

Explanation:

| (GRLD) - ABEND CODE | ac | RETURN CODE | rc | FROM (LOAD/BLDL) OF MODULE | mod |

During the execution of the ALOAD macro, module IATGRLD was unable to load the specified module. Return code rc and the abend code ac from the MVS LOAD or MVS BLDL (for a module residing in a private library) macro instruction are given.

System action:  JES3 abends.

Operator response:  Notify the system programmer.

System programmer response:  If an error address was specified when the ALOAD macro was issued, control returns to the issuing module which then issues the fail DSP. In the trace entry for the ALOAD module the abend code will be contained in register 1 and the reason code will be contained in register 14.

If the error address was not specified, module IATGRLD will issue the fail DSP. In the trace entry for the ALOAD module the abend code will be contained in register 1 and the reason code will be contained in register 4.

Problem determination:  See Table III, items 2 and 6.

</tbody>
</table>

Routing Code: 2,10 Descriptor Code: 4

IAT6318
Explanation:

>>> ERRORS DETECTED VERIFYING A JES3— STAGING AREA CHAIN MAILBOX NAME=mailbox_name, RETURN CODE=rc

During JES3 termination, JES3 was checkpointing the destination queue staging areas back to JES XCF. During
verification processing, JES3 determined that the queue corresponding to the JES XCF mailbox *mailbox_name* is damaged.

In the message text:

*mailbox_name*

The name of the JES XCF mailbox corresponding to the damaged staging area queue.

*rc* A return code passed from the MVS queue verify routine.

**System action:** If some staging areas were lost during JES3 queue verification and repair processing, some staging areas might not have been checkpointed before JES3 termination. This might cause jobs with outstanding subsystem requests to produce unpredictable results. JES3 returns the name of the mailbox of the queue that caused the verification problem and a return code from the MVS queue verify routine. JES3 continues checkpoint processing of the remaining staging areas on the current queue. JES3 termination processing continues.

**Operator response:** Notify your system programmer.

**System programmer response:** If the problem persists, contact the IBM Support Center.

**Module:**

IAT6320

Explanation:

CRITICAL VIRTUAL STORAGE SHORTAGE IN THE JES3 ADDRESS SPACE

The JES3 address space or FSS address space has encountered a critical shortage of virtual storage. If the shortage occurred in a FSS address space, the name and address space id of the functional subsystem appear at the end of the message. If the shortage appears in a JES3 address space, the message will specify the JES3 address space.

System action: JES3 has released two reserved 8K areas of storage in an attempt to make recovery processing possible.

Operator response: Notify the system programmer. Consult your installation’s procedures and/or the system programmer before starting any new functions in the JES3 address space.

Programmer response: An out-of-space abend has occurred; check SYS1.LOGREC to determine the cause. Lighten the storage load by reducing activity (such as the number of C/I subtasks) in the JES3 address space.

IAT6330
Explanation:

This message is issued as a result of the trace dump command, *MODIFY,E,DUMP=.

System action: Processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: 10,Note 18
Descriptor Code: 7

IAT6332
Explanation:

Processing of the last trace dump command, *MODIFY,E,DUMP=, is complete.

System action: Processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18
Descriptor Code: 7

IAT6333
Explanation:

This message is issued only in conjunction with a *MODIFY,E,STOP=WAIT command. The stop was invoked for trace ID xxx (a 4-digit decimal number).

System action: The FCT of the trace caller is placed in the AWAIT state on the STOP ECF.
Operator response: Use the *MODIFY,E,START=PGMCHK or *MODIFY,E,START=RESUME command to post the STOP ECF as required.
Module:
IAT6334
Explaination:

TRACE ACTIVE - NO DUMP

The trace routine is busy; no trace dump can be taken at this time.

System action: Processing continues.

Operator response: If an exclusive trace stop occurred, enter the "MODIFY,E,START=RESUME command to free the trace routine, then try another trace dump. For a normal busy condition, simply retry.

Module:

IAT6340
Explaination:

THERE ARE NO AVAILABLE JOB NUMBERS

All numbers in the job number table are currently in use.

System action: Any job unable to obtain a number is held until a job number becomes available.

Operator response: Notify the system programmer.

Programmer response: Restart the system with an increased job number range on the JES3 OPTIONS initialization statement.

Module:
IAT6341

Explanation:

---

95% of job numbers used up.

- calling DSP= dspname, USER= userid
- calling DSP= N/A, USER= N/A
- calling DSP= dspname, USER= N/A
- calling DSP= N/A, USER= userid

, JOB SUBMISSION SUSPENDED

---

JES3 monitors the usage of job numbers. When there is a significant increase or decrease in the percentage of job numbers used up, this message will be displayed. A significant change is considered to be 5%, and the only values displayed are 80, 85, 90, and 95. Once 95% is reached, depending on the threshold, you will see either 96%, 97%, 98% or 99% displayed and the message text JOB SUBMISSION SUSPENDED. (For example, if there are 3000 jobs, the threshold is 2900 job numbers in use, and 2900/3000 = 96%.)

In the message text:

\[ \text{nn\%} \]

- The percentage of job numbers used up.

\[ \text{dspname} \]

- The function that issued the AJOBNUM request.

\[ \text{userid} \]

- The userid of the job submittor.

\[ \text{CALLING DSP=} \]

- If N/A is displayed, the dspname or userid was not available, indicating that JES3 is becoming more constrained. As the constraint becomes less severe, text starting with CALLING DSP= will not be displayed.

\[ \text{JOB SUBMISSION SUSPENDED} \]

- If this message is displayed, JES3 reached a threshold and only 100 job numbers (or 5% of the total, whichever is less) are available. Only started tasks or callable DSPs can be started. Batch and TSO/E jobs attempting to submit other jobs will wait until this constraint has been relieved. Jobs must be removed from the system before new jobs will be accepted.

**System action:** If the text JOB SUBMISSION SUSPENDED is displayed, jobs that are unable to obtain a job number are held and only started tasks or called DSPs will be allowed to start.

**Operator response:** When the message is displayed without the optional text, no further action is necessary.

When CALLING DSP= appears in the message, monitor the userid displayed by the USER keyword. If the message is always displayed for the same userid, that user is likely causing the problem. Verify this by monitoring message IAT6100 and its ID keyword. Contact the user immediately or cancel the userid. If the text is repeatedly CALLING DSP= N/A N/A, go to the syslog and see what function is submitting jobs at a high rate. Stop that function.

**Programmer response:** When this message is issued frequently, evaluate the need to increase the job number range by changing the JES3 OPTIONS initialization statement and specifying a larger JCT data set.

**Module:**

- Detecting: IATGRJN
- Issuing: IATGRJN

Routing Code: 2  Descriptor Code: 2,7

---

IAT6345

Explanation:

---

***WARNING*** THE MAXIMUM \[ \text{number of jobs} \] ARE IN THE JOB QUEUE

---

546  z/OS V2R1.0 JES3 Messages
There are no JQEs available to allocate to the job. All available space for JQEs has been allocated.

**System action:** The FCT that is trying to obtain a JQE may wait until a JQE becomes available. This message will be removed from the JES3 action queue when the request is satisfied.

**Operator response:** Notify the system programmer.

**Programmer response:** You may want to ease the current situation by doing one of the following:
- Cancelling some jobs.
- Finding and correcting the error condition (output service, for example) that is causing jobs to backup in your installation.

To prevent this situation from recurring in the future, check the JOBNO parameter on the OPTIONS initialization statement. Allocate enough direct-access space to accommodate your installation’s working set for JCT records. (See [z/OS JES3 Initialization and Tuning Reference](https://www.ibm.com/support/knowledgecenter/en:zos/zos820/com.ibm.zos.r82r820.jes3ftm/jes3ftm.html).)

**IAT6350**

**Explanation:**

>>> JESCKPNT ERROR— xx — COLD START REQUIRED <<<

A checkpoint error occurred when writing the JESCKPNT record (CKP) to the checkpoint data set(s). As a result of the error, the JESCKPNT record in the checkpoint data set(s) is no longer valid or may have been destroyed. The type of checkpoint write error is indicated by xx which is the error return code from the IATXCKPT service. See [z/OS JES3 Customization](https://www.ibm.com/support/knowledgecenter/en:zos/zos820/com.ibm.zos.r82r820.jes3ftm/jes3ftm.html) for an explanation of the return codes.

**System action:** JES3 processing continues. JES3 will try to process any subsequent requests to update the JESCKPNT record, but the requests may end in an error. If the error is temporary, so that a subsequent JESCKPNT request completes successfully, JES3 will issue message IAT6354 to indicate that it recovered from the error.

**Operator response:** Notify the system programmer. If the error is a permanent error, begin to quiesce the JES3 complex. Clear up the job backlog as much as possible before JES3 ends. You can use the dump job (DJ) DSP to save jobs for later restoration.

If message IAT6354 appears (indicating recovery from the JESCKPNT error) while you are quiescing the complex, stop the quiesce process so that normal activity can resume.

**Programmer response:** If the error is a temporary I/O error condition caused by an operation or configuration problem, correct the problem causing the error. If the error is a permanent I/O error condition, reallocate the checkpoint data sets and perform a cold start. If the error is not an I/O error, see **Chapter 30, “Problem Determination,”** on page 1135.

**Problem determination:** See **Chapter 30, “Problem Determination,”** on page 1135, Table I, items 18 and 37, and Table III, items 1 and 4.

**Descriptor Code:** 2
IAT6351 • IAT6352

IAT6351
Explanation:

An error occurred when JES3 attempted to update the status in the spool data set checkpoint record (VOL). As a result of the error, the spool data set checkpoint record in the checkpoint data set(s) is no longer valid or may have been destroyed. The error type is one of the following:

MISMATCH
The spool data set entries in the spool data set checkpoint record do not match the spool data set entries in the resident spool extent table.

READ xx
A checkpoint read error occurred, where xx is the error code returned from the IATXCKPT service. See z/OS JES3 Customization.

WRITE xx
A checkpoint write error occurred, where xx is the error code returned from the IATXCKPT service. See z/OS JES3 Customization.

System action: JES3 processing continues. JES3 will try to process subsequent requests to update the spool data set checkpoint record, but the requests may end in an error. If the error is temporary, so that a subsequent update of the spool data set checkpoint record completes successfully, JES3 will issue IAT6354 to indicate that it recovered from the error.

Operator response: Notify the system programmer. If the error is a permanent error, begin to quiesce the JES3 complex. Clear up the job backlog as much as possible before JES3 ends. You can use the dump job (DJ) DSP to save jobs for later restoration.

If Message IAT6354 appears (indicating recovery from the spool data set checkpoint error) while you are quiescing the complex, stop the quiesce process so that normal activity can resume.

Programmer response: If the error is a temporary I/O error condition caused by an operation or configuration problem, correct the problem causing the error. If the error is a permanent I/O error condition, reallocate the checkpoint data sets and perform a cold start. If the error is not an I/O error, see Chapter 30, “Problem Determination,” on page 1135.

Routing Code: 1  Descriptor Code: 2

IAT6352
Explanation:

A checkpoint write error was encountered during JES3 recovery processing when attempting to validate or invalidate the partition track allocation table (PTAT) checkpoint record in the checkpoint data set(s). The type of checkpoint write error is indicated by xx which is the error return code from the IATXCKPT service. See z/OS JES3 Customization.

System action: If the error occurred when attempting to validate the partition TAT checkpoint record, the record remains not valid in the checkpoint data set(s) and JES3 continues recovery processing. If JES3 recovery processing fails and JES3 ends, the partition TAT checkpoint information cannot be used when JES3 is restarted. JES3 rebuilds...
the partition TAT checkpoint record, but jobs or data sets that have their track allocation tables (JBTs) on an
unavailable spool data set will be canceled since there is no way of identifying the spool space allocated to them.

If the error occurred when attempting to invalidate the partition TAT checkpoint record, JES3 ends.

**Operator response:** If JES3 ends because the partition TAT checkpoint record could not be invalidated, notify the
system programmer.

**Programmer response:** If the write error was due to a permanent I/O error condition, reallocate the checkpoint data
set(s) and instruct the operator to restart JES3. If the error was caused by a checkpoint access method busy condition,
the error can be ignored since this condition is only temporary. If any other condition caused the error, see
Chapter 30, “Problem Determination,” on page 1135.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135, Table I, items 18 and 37, and Table
III, items 1 and 4.

IAT6355
Explanation:

- (GRWD) - JES3 DUMP SUPPRESSION
- CHECKPOINT READ FAILED

JES3 was unable to read an existing checkpoint record while initializing the JES3 dump suppression table.

System action: JES3 failsoft codes with dump suppression were lost during the last restart of JES3. JES3 initialization continues with no failsoft codes with suppressed dumps.

Operator response: Use the *F X,ABEND= command to reset dump suppression.

Module:

- Containing: IATGRWD
- Detecting: IATGRWD
- Issuing: IATGRWD

Routing Code: 42  Descriptor Code: 7

---

IAT6356
Explanation:
JES3 was unable to write a new checkpoint record while initializing the JES3 dump suppression table.

**System action:** JES3 failsoft codes with dump suppression were lost. The dump suppression will remain active, but the list of failsoft codes will be lost with the next restart of JES3.

**Operator response:** None. This is an informational message.

**IAT6359**

**Explanation:**

>>> *** WARNING *** ONLY ONE JES3 CHECKPOINT— DATA SET IN USE. <<<

, FOR FSS— fssname—, ASID— asid—

During initialization of the checkpoint data sets, JES3 has determined that one of the two possible checkpoint data sets (CHKPNT or CHKPNT2) is unavailable. Message IAT6360, which appears before this message, describes the reason why the data set is not available. As a result, no duplexing of the checkpoint records will occur. If this condition was encountered while initializing a functional system (FSS) address space, the functional subsystem name fssname and address space ID asid appear in the message. Absence of the FSS text indicates that the condition was encountered while initializing the JES3 address space.

**System action:** Initialization continues.

**Operator response:** Notify the system programmer.

**Programmer response:** If checkpoint duplexing is desired, ensure that the JES3 and FSS start procedures define both the CHKPNT and CHKPNT2 data sets.

**Module:**

**Descriptor Code:** 4,7

---

**IAT6360**

**Explanation:**

>>> CHECKPOINT DATASET— ddn— UNAVAILABLE,— reason text

, FOR FSS— fssname—, ASID— asid—

Initialization of the checkpoint data set associated with the indicated ddn failed for one of the following reasons:

*ddn DO NOT DEFINED*

the ddname ddn was not defined in the JES3 or FSS start procedure.
IAT6360

OPEN WAS UNSUCCESSFUL
the data set could not be opened.

DEVICE TYPE NOT VALID
the device on which the checkpoint data set resides is not supported by JES3.

MULTI-EXTENT DATA SET
the checkpoint data set does not consist of a single contiguous DASD extent.

NOT ON CYL BOUNDARIES
the data set does not start and end on a cylinder boundary.

DEVTYPE UNSUCCESSFUL
a DEVTYPE macro request to obtain device information completed unsuccessfully.

TRKCALC UNSUCCESSFUL
a TRKCALC macro request to determine the number of checkpoint record segments per track completed unsuccessfully.

RDJFCB UNSUCCESSFUL
when attempting to read the JFCB for the data set, the RDJFCB macro request completed with a zero return code, but the JFCB was not read into the work buffer.

If this error condition was detected during initialization of a functional subsystem (FSS), the functional subsystem name fssname and address space ID asid appear at the end of the message. Absence of this text indicates that the error condition was detected during initialization of JES3.

System action: If at least one of the two possible checkpoint data sets (CHKPNT or CHKPNT2) is available, initialization continues normally. Otherwise, JES3 or the FSS is ended with a system completion code of 2FB.

Operator response: This message may be ignored if your installation has elected to run with only one checkpoint data set and it is not the data set identified in the message. Otherwise, notify your system programmer.

Programmer response: The action required for each of the reasons that can cause the data set to be unavailable is as follows:

**ddn** DD NOT DEFINED
include a DD statement with a ddname of ddn in the JES3 or FSS start procedure to define the checkpoint data set. At a minimum, only one checkpoint data set needs to be defined in the start procedure, that is, CHKPNT or CHKPNT2. Specifying both, however, will help to ensure the availability of valid checkpoint data in the event errors occur when accessing one of the data sets.

OPEN WAS UNSUCCESSFUL
see Chapter 30, “Problem Determination,” on page 1135.

DEVICE TYPE NOT VALID
reallocate the checkpoint data set on a direct access device supported by JES3.

MULTI-EXTENT DATA SET
reallocate the checkpoint data set with SPACE=(CYL,(n,0),,CONTIG).

NOT ON CYL BOUNDARIES
reallocate the checkpoint data set with SPACE=(CYL,(n,0),,CONTIG).

DEVTYPE UNSUCCESSFUL
see Chapter 30, “Problem Determination,” on page 1135.

TRKCALC UNSUCCESSFUL
see Chapter 30, “Problem Determination,” on page 1135.

RDJFCB UNSUCCESSFUL
see Chapter 30, “Problem Determination,” on page 1135.

Problem determination: Table I, item 29, and Table III, item 6.

</tr>
</tbody>
</table>
IAT6361 • IAT6362

Routing Code: 1
Descriptor Code: 7,11

IAT6361
Explanation:

When initializing the checkpoint data set defined by the indicated ddn, the track map record (CMAP) either could not be read successfully because of an I/O error or the record was found to be incorrect. This condition occurs if the data set is a new checkpoint data set since the data set has never been initialized with a track map record. This condition also occurs if the track map record is bad or down level in an existing checkpoint data set previously used for checkpointing during the last JES3 start. In either case, a new track map is created and initialized in storage.

If this condition is encountered when initializing JES3 on a local or when initializing a functional subsystem (FSS), the reinitialized track map will not be written to the checkpoint data set. If encountered when initializing JES3 on the global, or running the IATUTJCT utility, the reinitialized track map will be written to the checkpoint data set when the first checkpoint read, write, or purge request is successfully processed.

If this condition is encountered when running the IATUTJCT utility, IATUTJCT UTILITY appears at the end of the message. If this condition is encountered when initializing a functional subsystem (FSS), the functional subsystem name (fssname) and address space identifier (asid) appear at the end of the message. Absence of the IATUTJCT and FSS text indicates the condition was detected during initialization of JES3.

Furthermore, if this message is issued by the IATUTJCT utility, the ddname CHKPNT that appears in the message actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

System action: If this message was issued from the JES3 address space or an FSS address space, initialization of that address space continues. If this message was issued from an address space running the IATUTJCT utility, the utility continues.

Operator response: If the checkpoint data set is a new data set, this message should be ignored. If the checkpoint data set is an existing data set that should contain valid JES3 checkpoint data, notify your system programmer.

Programmer response: If the data set is an existing checkpoint data set that should be valid, examine the data in the SYS1.LOGREC data set and the hard-copy message log. If there are permanent error indications, reallocate the checkpoint data set and restart JES3.

Problem determination: See Table I, items 18, and 37, and Table III, items 4 and 6.

Routing Code: 2,10  Descriptor Code: 4,7

IAT6363

Explanation:

JES3 CHECKPOINT I/O ERROR, __ddn,volser,dev,rcd,cc,op,stat,sense,ccccccchrr________

, FOR FSS __fssname,-- ASID=-- asid--

IATUTJCT UTILITY

An I/O error occurred when accessing one of the JES3 checkpoint data sets.
If the I/O request occurred in a functional subsystem (FSS), the functional subsystem name (fssname) and address space identifier (asid) appear at the end of the message.
If the I/O request occurred in the IATUTJCT utility, IATUTJCT UTILITY appears at the end of the message. The absence of the FSS and IATUTJCT text indicates the I/O request occurred in the JES3 address space.
The fields in the second line of this message are as follows:

ddn

ddname of the checkpoint data set.

If this message is issued by the IATUTJCT utility, contains the ddname CHKPNT, and is followed by message IAT6361, the ddname actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. This is because IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

In all other cases, the ddname refers to the actual ddname that was specified in the JCL for JES3, the FSS, or the IATUTJCT utility.

volser

serial number of the volume on which the data set resides.

dev

device number

rcd

the checkpoint record that was being accessed

cc

I/O completion code posted in the ECB.

op

operation code of the channel command word (CCW) that was being processed when the error occurred.

stat

status portion of the channel status word (CSW).

sense

sense bytes 0 and 1.

ccccccchrr

disk address of the record being accessed.
System action:  If only one checkpoint data set is available (that is, no checkpoint duplexing), the checkpoint access method indicates the error condition to the function trying to access the checkpoint data set, and that function issues an error message further clarifying the severity of the error relative to its processing.

If two checkpoint data sets are being used, the checkpoint access method attempts to perform the I/O operation to the other data set if it has not already tried the operation on that data set. If successful, processing continues normally. If unsuccessful, the checkpoint access method indicates the error condition to the function trying to access the checkpoint data set, and that function issues an error message further clarifying the severity of the error relative to its processing.

Operator response:  Notify the system programmer.

Programmer response:  Analyze the error status. If the error is a permanent error, reallocate the checkpoint data set on a different volume/unit. If the error was detected in JES3, restart JES3. If the error was detected in IATUTJCT, rerun IATUTJCT.

Problem determination:  See Table I, item 18, and Table III, item 4.

Module:

<table>

<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATYCKI</td>
<td>IATGRCK</td>
<td>IATGRCK</td>
</tr>
</tbody>
</table>

Routing Code: 2,10  Descriptor Code: 4,7

IAT6364

Explanation:

An error occurred when reading the physical segments of a checkpoint record. The record identifier (rcd), timestamp, version number, segment number, or segment length in the header portion of one of the physical segments did not agree with the data that was expected. The variable fields in the message text are as follows:

rcd
  the checkpoint record that was being read at the time of the error.

ddn
  ddname of the checkpoint data set that was being accessed.

This problem could occur if during the last update to the record an error resulted ending the checkpoint operation before all physical record segments were written.

If the error was detected when running the IATUTJCT UTILITY, IATUTJCT UTILITY appears at the end of the message. If the error was detected when initializing a functional subsystem (FSS), the functional subsystem name (fssname) and address space identifier (asid) appear at the end of the message. The absence of the FSS and IATUTJCT text indicates the error was detected when initializing JES3.

System action:  If only one checkpoint data set is available (that is, no checkpoint duplexing), the checkpoint access method indicates the error condition to the JES3 or FSS function that issued the checkpoint read request, and that function issues an error message further clarifying the severity of the error relative to its processing.

If two checkpoint data sets are being used, the checkpoint access method attempts to read the logical checkpoint record from the other data set if it has not already done so. If the record is successfully read from the other data set, JES3/FSS/IATUTJCT processing continues normally. If the record cannot be successfully read from the other data set, the checkpoint access method indicates the error condition to the address space which issued the checkpoint read request and that function issues an error message further clarifying the severity of the error relative to its processing.

Operator response:  Notify the system programmer.
IAT6365 • IAT6366

Routing Code: 2,10  Descriptor Code: 4,7

IAT6365

Explanation:

CHECKPOINT WRITE FAILED —DUE TO INSUFFICIENT — SPACE— rcddn

A checkpoint record could not be successfully written to one of the checkpoint data sets because the data set did not have enough space to contain the record. The variable fields in the message text are as follows:

rcd
The checkpoint record.

ddn
The ddname of the checkpoint data set. If this message is issued by the IATUTJCT utility, this ddname will be CHKPNT but actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. This is because IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

System action: If only one checkpoint data set is available (that is, no checkpoint duplexing), the checkpoint access method indicates the error condition to the function issuing the checkpoint write request, and that function issues an error message further clarifying the severity of the error relative to its processing.

If two checkpoint data sets are being used and the record was successfully written to the other data set, processing continues normally. Otherwise, the checkpoint access method indicates the error condition to the function issuing the checkpoint write request, and that function issues an error message further clarifying the severity of the error relative to its processing.

JES3 or IATUTJCT also issues message IAT6368. If this error occurs when running IATUTJCT, IATUTJCT issues message IAT7787 and ends with a return code of 4.

Operator response: Notify the system programmer.

Programmer response: Reallocate the checkpoint data set with more space and restart JES3 or IATUTJCT.

Module:

Routing Code: 2,10  Descriptor Code: 4,7

IAT6366

Explanation:

CRITICAL CHECKPOINT PROBLEM - TRACK— MAP ERROR ON DATA SET— ddn

JES3 encountered an error when updating the track map record (CMAP) in the checkpoint data set defined by the indicated ddname. The track map record in the data set is either no longer valid or was destroyed by the write
operation. As a result, the checkpoint data set is no longer reliable for use during a JES3 restart.

If you are running the IATUTJCT UTILITY, note that although \texttt{ddn} specifies CHKPNT, the data set that ran out of space is the data set defined by the NCHKPNT DD statement for this utility.

**System action:** If this error is detected in JES3, JES3 processing continues normally since the copy of the track map record maintained in storage is still valid. Any subsequent checkpoint requests that cause the track map to be updated will be attempted, but they may also end in error. If the error is a temporary condition so that the track map is successfully updated during a subsequent checkpoint request, message IAT6367 is issued to indicate JES3 recovered from the error and message IAT6366 is deleted from the action message queue.

If this error occurs when running IATUTJCT, IATUTJCT issues message IAT7787 and ends with a return code of 4.

**Operator response:** If the error is a permanent error, and two checkpoint data sets are being used, end the JES3 processing in the complex as soon as possible so the problem can be corrected while there is still one good data set. Notify the system programmer. Once the problem has been corrected, hot start the JES3 complex.

If the error is a permanent error and only one checkpoint data set is being used, begin quiescing the JES3 complex gradually to prepare for a cold start. Clear up the queue backlog as much as possible before JES3 finally ends. The dump job (DJ) DSP may be used to save jobs for later restoration after the cold start. Once the JES3 complex has been quiesced and the problem corrected, perform a cold start to restart the complex.

If the error occurred when running IATUTJCT, notify the system programmer.

**Programmer response:** If the error was in JES3 and the track map error was caused by a temporary I/O error resulting from an operation or configuration problem, correct the problem causing the I/O error. If the track map error was caused by a permanent I/O error condition, reallocate the checkpoint data set and restart the JES3 complex.

If the track map error was not the result of an I/O error, see Chapter 30, “Problem Determination,” on page 1135.

If the error occurred when running IATUTJCT, reallocate the NCHKPNT data set and rerun IATUTJCT.

**Problem determination:** See Table I, items 18 and 37, and Table III items 1 and 4.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATYCKI</td>
<td>IATGRCK</td>
<td>IATGRCK</td>
</tr>
</tbody>
</table>

**Routing Code:** 1

**Descriptor Code:** 2,7

---

**Explanation:**

\[\text{RECOVERED FROM TRACK MAP ERROR ON — CHECKPOINT DATA SET— \texttt{ddn}}\]

JES3 or IATUTJCT has successfully recovered from an earlier track map error on the checkpoint data set defined by the indicated ddname \texttt{ddn}. The track map record in the data set is now valid.

If this message is issued by the IATUTJCT UTILITY, the ddname in \texttt{ddn} is CHKPNT but actually refers to the data set specified by the NCHKPNT DD in the procedure that runs IATUTJCT. This is because IATUTJCT reallocates the NCHKPNT data set as the CHKPNT DD before calling the JES3 checkpoint services to write the new checkpoint data set.

**System action:** JES3 or IATUTJCT processing continues.

**Operator response:** Notify the system programmer. Any action taken as the result of the previous track map error may be stopped.

**Programmer response:**

- If the error was detected in JES3:

  Although JES3 has recovered from the track map error, it may still be advisable to have the operator quiesce the complex and then reallocate the data set if intermittent I/O errors are occurring on the volume containing the data set.

**Module:**
IAT6368 • IAT6369

IAT6368

Explanation:

>>> CHECKPOINT SPACE PROBLEM — DATA SET — ddn — HAS INSUFFICIENT SPACE

The checkpoint data set associated with the indicated ddname ddn does not have enough space allocated. Attempts to write to the checkpoint data set have resulted in failure because of the lack of space.

If you are running the IATUJTJC utility, note that although ddn specifies CHKPNT, the data set that ran out of space is the data set defined by the NCHKPNT DD statement for this utility.

JES3 issues message IAT6365 before message IAT6368 to indicate the checkpoint record that was lost or not updated because of lack of space. After message IAT6368 is issued, other checkpoint write requests that fail because of insufficient space will also be reported with message IAT6365.

System action: JES3 continues processing until terminated by your response. Message IAT6368 remains displayed until JES3 is terminated.

Operator response: If two checkpoint data sets are being used and the other data set is still good, end the JES3 processing in the complex immediately so the problem can be corrected while there is still one good data set. Notify the system programmer. Once the problem is corrected (the checkpoint data set is reallocated with more space), hot start the JES3 complex.

If problems exist with both checkpoint data sets or if only one checkpoint data set is being used (message IAT6365 will report this information), begin quiescing the JES3 complex gradually to prepare for a cold start because key checkpoint data may have been lost. One way to do this is to put low priority jobs on the hold queue until the checkpoint data set can be reinstated. These jobs can be run after the checkpoint data set is reallocated with more space.

Clear up the job queue backlog as much as possible before JES3 terminates. The dump job (DJ) DSP may be used to save jobs for later restoration after the cold start. Notify the system programmer. Once the JES3 complex is quiesced and the problem corrected (the checkpoint data set(s) is allocated with more space), perform a cold start to restart the complex.

Programmer response: Reallocate the checkpoint data set with more space.

Module:

IAT6369

Explanation:

>>> JES3 WAITING FOR CHECKPOINT DATA — RESERVE — ddn,volser,dev

The JES3 checkpoint access method issued a RESERVE to gain access to one of the JES3 checkpoint data sets, but the data set has already been RESERVED by another address space on the same main.
The variable fields in the message text are as follows:

- **ddn**
  The ddname of the checkpoint data set.

- **volser**
  Serial number of the volume on which the data set resides.

- **dev**
  Device number.

The combination of functional subsystem name (fssname) and address space identifier (asid), or the text IATUTJCT
UTILITY appears at the end of the message if the condition is encountered within one of these environments.
Absence of both of these indicates that the WAIT is being done when running in the JES3 primary address space.

**System action:** JES3, the FSS, or IATUTJCT waits for the address space that currently controls the data set to release
it.

**Operator response:** Normally none, because control of the data set will typically be released by the current owner in
a few seconds. However, if JES3, the FSS, or IATUTJCT appears to wait for an abnormally long time, the other
address space that currently has control of the data set on this main may be waiting for the hardware reserve of the
device to complete before it can continue. Check all other mains having channel accessibility to the indicated device
to verify their operation. If a main has failed or a program has not canceled its reserve, no other channel can gain
access to the device. If there has been a hardware failure or the program cannot be ended, reset the reserving channel
with a SYSTEM RESET from the processor’s console.

If this message was issued when running IATUTJCT for production, ensure that JES3 and all CIFSS address spaces
are inactive on all processors in the JES3 complex. Also ensure that IATUTJCT has not been started multiple times. If
IATUTJCT is to be run as a test, has not been started multiple times, and this reserve condition persists, notify the
system programmer.

**Programmer response:** If no errors are found and the reserve condition persists, search problem reporting databases
for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Descriptor Code:** 4,7

---

**IAT6370**

**Explanation:**

```
| FSS | FSA | fssname  | STARTUP | REQUESTED | BY | dsname | REJECTED | reasontext |
```

A request to start, cleanup, checkpoint, post all functions, or abend an FSS or FSA has been rejected for one of the
following reasons:

**INVALID [FSS|FSA] TABLE (all types)**
the FSS or FSA table entry address is incorrect (FSA is only valid for the CLEANUP option).

**INVALID PARAMETER STRING (startup request only)**
an incorrect parameter string has been passed.

**FSS UNUSABLE (startup and fss start request only)**
an error in system specification during JES3 initialization has caused the FSS table entry to be marked unusable.
FSS ALREADY ACTIVE (startup and fss start request only)
the FSS is already active.

MAIN main NOT CONNECTED (startup or abend request)
identifies the main, where the FSS is assigned to run, is not connected.

MAIN PROCESSOR NOT FOUND (startup or abend request)
the main where the FSS is assigned to run cannot be found.

NO STORAGE AVAILABLE (startup request only)
there is not enough main storage available to process the request.

FSS CHECKPOINT DISABLED (startup or checkpoint request)
the FSS checkpoint facility was disabled by a previous error.

ALREADY REQUESTED (abend request only)
the abend request has been made already, and an MVS CANCEL command has been sent.

ALREADY TERMINATED (abend request only)
the abend request has been made for an FSS that has already ended.

System action:  Processing ends.
Operator response:  Following is a list of possible actions to be taken depending on the reason for the rejection of
the request:

FSS UNUSABLE
issue the *INQUIRY,F,FSS=fssname,S command to display the current system assignment for the FSS. Then issue a
*MODIFY,F,FSS=fssname,SYS= command to establish correct system assignments.

FSS ALREADY ACTIVE
no response is required

MAIN main NOT CONNECTED
issue an *S,main,CONNECT command to cause the required main to be connected, or issue a
*MODIFY,F,FSS=fssname,SYS= command to change the main where the FSS is to be started

FSS CHECKPOINT DISABLED
end all active FSSs as soon as possible, then hot start JES3 to obtain a new checkpoint spool area

Programmer response:  Follow the instructions listed in Chapter 30, “Problem Determination,” on page 1135.

Module:

IAT6371

Explanation:

FSS—START-UP ON main—FAILED
fssname—UNKNOWN

An attempt to start the specified functional subsystem (FSS) fssname has failed.

System action:  All processing for the FSS ends.

Operator response:  Do not try to restart the FSS. Notify the system programmer.

Programmer response:  Examine the console log for messages that indicate the source of the failure, such as a JCL
error, an allocation error from main device scheduling (MDS), or an operator cancel command.
IAT6372

Explanation:

The initialization of the address space in which the specified functional subsystem `fssname` is to run has been successful.

**System action:** FSS initialization proceeds normally.

**Operator response:** None. This is an informational message.

IAT6373

Explanation:

An MVS START command has been generated by JES3 to start the address space in which the specified functional subsystem (FSS) `fssname` is to run. The command has not yet completed processing.

**System action:** Message IAT6374 is issued following this message.

**Operator response:** See message IAT6374.

IAT6374

Explanation:

This message follows message IAT6373 and provides further information about the delayed start-up. If possible, JES3 displays the job number of the job created by the START command.

**System action:** JES3 continues to wait for START command completion unless instructed otherwise by the operator.
IAT6375 • IAT6376

**Operator response:** An immediate response is not required. If no apparent error has occurred, allow the process to continue unchanged. If the job number is displayed, the delay is probably in the JES3 global. Use the *INQUIRY commands to determine the job status, and take appropriate action. If the job number is not displayed, use the MVS DISPLAY command on the main named in message IAT6373, to look for a step name that matches the functional subsystem (FSS) `fssname` in message IAT6373, then take appropriate action.

If you decide to issue a JES3 *FAIL command, it may be necessary to repeat the *FAIL before the job is successfully removed from JES3 and the FSS made usable again.

**Explanation:**

>>> FSS/FSA CHECKPOINT DATA LOST— `fssname`

A checkpoint was attempted and it failed, causing the loss of checkpoint data.

**System action:** FSS checkpointing is ended until the next JES3 restart.

**Operator response:** End all FSS address spaces and hot start JES3 as soon as possible.

Module:

<table>
<thead>
<tr>

**Routing Code:** 10, Note 18

**Descriptor Code:** 7
IAT6377

Explanation:

--> DEVICE NUMBER— dev— ASSIGNED TO DEVICE— dev-- FOR FSS— fssname— ON SYSTEM— main

The execution of a *MODIFY,F command has caused a change in the device number assigned to device devname. The message provides the new device number and, if the device is in FSS mode, the name of the functional subsystem (FSS) and of the system where it is assigned to run.

System action: The device number is stored in the JES3 global device table entry for this device. The console class for messages is set from the DEVICE statement parameter for the global or for the local.

Operator response: Any command that refers to this device can use the device name devname. The device number dev may also be used, unless this message is followed by message IAT6379.

Module:

<td>IATGRFS</td>
</tr>
</tbody>
</table>

Routing Code: Note 17,Note 18    Descriptor Code: 7

IAT6378

Explanation:

--> DEVICE— devname— NUMBER— dev— NO LONGER AMBIGUOUS

The execution of a *MODIFY,F command has caused a change in the device number assigned to another JES3 global device. The number assigned to the specified device is now unique.

System action: Normal processing continues.

Operator response: Any command that refers to this device can use the device name or the device number.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATGRFS</td>
<td>IATGRFS</td>
<td>IATGRFS</td>
</tr>
</tbody>
</table>

Routing Code: Note 17,Note 18    Descriptor Code: 7

IAT6379

Explanation:

--> DEVICE NUMBER— devname— FOR DEVICE TYPE— devtype— IS AMBIGUOUS - USE DEVICE NAME— devname

The assignment of device number dev, described in message IAT6377 that was previously issued, has caused two or more JES3 global devices, including the one described in this message, to have the same device number.

System action: JES3 rejects any operator command that attempts to use device number dev.

Operator response: Any command that refers to this device must use the device name devname.

Module:
The execution of a *MODIFY,F command has created an incompatibility within the definition of device devname or between the status of device devname and the status of the functional subsystem (FSS) with which it is associated. The reason for the incompatibility is one of the following:

**COMP MODE REQUIRES GLOBAL ATTACHMENT**

Compatibility mode requires that the device be attached to the global system; this device has no such attachment.

**FSS MODE REQUIRES ATTACHMENT TO main**

FSS mode requires that the device be attached to the system where the FSS is assigned to run, specified by main; this device is not attached to the main.

**FSS fssname HAS NO ASSIGNED SYSTEM**

FSS mode has been set for the device, but the assigned FSS fssname is unusable or has not been assigned a system on which to run in conjunction with the current global system.

**System action:** JES3 marks the device offline to JES3 global functions.

**Operator response:** Use the *MODIFY,F command to correct the device mode specification or the FSS system assignments, then use the *MODIFY,V command to vary the device online.

**Module:**

An ambiguous device number dev was specified on an operator command, that is, two or more devices with that number exist.

**System action:** If the message was issued in response to a *MODIFY,W command, JES3 processes all devices in the list except the ambiguous device.

If the message was issued in response to a *VARY,dev-dev command, JES3 ignores the command if the initial device is ambiguous. If a device is ambiguous within the range, JES3 ignores only that device and processes the others within the range.

Otherwise, JES3 ignores the command.

**Operator response:** Issue *INQUIRY,D,D=dev command to determine the device name and reenter the command with the device name.

**Module:**

IAT6380 • IAT6381
IAT6390  •  IAT6395

IAT6390

Explanation:

The ESTAE established on behalf of the general subtask service failed. If the failure occurred in a functional subsystem (FSS) address space, the functional subsystem name fssname and address space ID asid appear in the message. Absence of the FSS text indicates the failure occurred in the JES3 address space.

System action:  Processing ends.

Operator response:  Notify the system programmer.

Programmer response:  Check the SDUMP taken by the subtask’s ESTAE exit to determine why the abend occurred.

IAT6395

Explanation:

Chapter 12. General Routines Messages  565
IAT6395

The monitor DSP is monitoring the resource or queue referenced in waittext. This message is a summary message that represents the number of requests waiting for the specified reason. The monitor DSP issues this message when SUMMARY=ONLY or SUMMARY=YES is specified on the MNTRDEF macro or on the *START,MONITOR,ID= command for the monitor DSP function.

In the messages text:

**nnnnn**  The number of jobs or Function Control Tables (FCT) that are waiting for the specified reason.

**waittext**  The reason the jobs or FCTs are waiting. The following are the JES3-supplied reasons; others can be added by your installation.

**WAITING FOR JES3 RESOURCES**  The job or FCT is waiting for one or more unavailable JES3 resources.

**WAITING FOR CATALOG LOCATE**  The job is waiting for catalog locate processing.

**ACTIVE IN A C/I FSS**  The job is currently scheduled to a Converter/Interpreter Functional Subsystem (C/I FSS) and waiting for catalog locate processing.

**WAITING IN SYSTEM SELECT**  The job is waiting in the Main Device Scheduling (MDS) system select queue for Data Facility Storage Management Subsystem (DFSMS)-managed resources to become available.

**WAITING IN ALLOCATION**  The job is waiting in the MDS allocate queue for a resource to become available.

**WAITING IN VERIFY**  The job is waiting in the MDS verify queue for one or more volume mounts to complete.

**WAITING IN SYSTEM VERIFY**  The job is waiting in the MDS system verify queue.

**WAITING FOR A dspname DSP**  The job is waiting for the specified DSP to become available.

**ENDING FUNCTION WAITING FOR I/O**  The ending function is waiting for Input/Output (I/O) to complete. When a job completes a function such as C/I, Job Segment Scheduler (JSS) checks to see if the job’s control blocks are still being used. If so, the job is suspended and not scheduled for the next JES3 phase. Normally, the function that is using the job’s control blocks finishes quickly and the job can then be scheduled. However, if the function does not perform the proper cleanup or abnormally ends while accessing the job’s control blocks, the control blocks are not released until the next JES3 restart.

**WAITING FOR A PROCLIB**  The job is waiting for a PROCLIB to become available.

**WAITING FOR A MAIN, CLASS, OR GROUP**  The job is waiting for a main processor, a class, or a group to become available.

**WAITING FOR SMS USER CATALOGS**  The job is waiting for DFSMS-managed user catalogs to become available.

**WAITING FOR A MAIN FOR LOCATE**  The job is waiting for a main processor to become available for catalog locate processing.

**System action:**  JES3 processing continues.

**Operator response:**  None. This is an informational message.

**Module:**

<table>

</thead>
<tbody>
<tr>
<td>IATGRMN</td>
<td>IATGRMN</td>
<td>IATGRMN</td>
</tr>
</tbody>
</table>

**Routing Code:**  –  **Descriptor Code:**  –
The specified job is waiting for the reason (wait text) indicated. The monitor DSP issues this message when both of the following occur:

- The value on the COUNT= parameter is greater than zero.
- You specified SUMMARY=YES or SUMMARY=NO on the MNTRDEF macro or the *START,MONITOR,ID= command.

In the message text:

- **jobname** The name of the job or *UNKNOWN* if the job name cannot be determined.
- **jobid** The job identifier associated with the job.
- **MAIN=main name** Identifies the processor on which locate of C/I FSS is occurring.
- **wait text** The reason why the job is waiting, as follows:

**WAITING FOR JES3 RESOURCES**
The job or function control table (FCT) is waiting for one or more unavailable JES3 resources.

**WAITING FOR CATALOG LOCATE**
The job is waiting for catalog locate processing.

**ACTIVE IN A C/I FSS**
The job is currently scheduled to a converter/interpreter functional subsystem (C/I FSS) and waiting for catalog locate processing.

**WAITING IN SYSTEM SELECT**
The job is waiting in the main device scheduling (MDS) system select queue for Data Facility Storage Management Subsystem (DFSMS)-managed resources to become available.

**WAITING IN ALLOCATION**
The job is waiting in the MDS allocate queue for a resource to become available.

**WAITING IN VERIFY**
The job is waiting in the MDS verify queue for one or more volume mounts to complete.

**WAITING IN SYSTEM VERIFY**
The job is waiting in the MDS system verify queue.

**WAITING FOR A dispname DSP**
The job is waiting for the specified DSP to become available.

**ENDING FUNCTION WAITING FOR I/O**
The ending function is waiting for input/output (I/O) to complete. When a job completes a function such as C/I, Job Segment Scheduler (JSS) checks to see if the job's control blocks are still being used. If so, the job is suspended and not scheduled for the next JES3 phase. Normally, the function that is using the job's control blocks finishes quickly and the job can then be scheduled. However, if the function does not perform the proper cleanup or abnormally ends while accessing the job's control blocks, the control blocks are not released until the next JES3 restart.

**WAITING FOR A PROCLIB**
The job is waiting for a PROCLIB to become available.

**WAITING FOR A MAIN, CLASS, OR GROUP**
The job is waiting for a main processor, a class, or a group to become available.

**WAITING FOR SMS USER CATALOGS**
The job is waiting for DFSMS-managed user catalogs to become available.
IAT6397 • IAT6398

WAITING FOR A MAIN FOR LOCATE

The job is waiting for a main processor to become available for catalog locate processing.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

<td>IATGRMN</td>
<td>IATGRMN</td>
</tr>
</tbody>
</table>

IAT6397

Explanation:

>>> FCT— fctname (devname) reasontext

The Function Control Table (FCT) is waiting for the device for the reason specified in waittext. The monitor DSP issues this message when:

- the value on the COUNT= parameter is greater than zero, and
- you specified SUMMARY=YES or SUMMARY=NO

on the MNTRDEF macro or the *START,MONITOR,ID= command.

In the message text:

fctname   The name of the FCT.

devname   The name of the device associated with the FCT, or *NODEVICE* if the FCT is not associated with a device.

In the message, reasontext is the reason why the FCT is waiting.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

</tbody>
</table>

IAT6398

Explanation:

>>> hhhh—HOURS—mm—MINUTES—ss—SECONDS

The monitor DSP issues this message to display the amount of time a job or FCT has exceeded the threshold.

In the message text:

hhhh   The number of hours the job or Function Control Table (FCT) has been waiting.

mm   The number of minutes the job or FCT has been waiting.
ss The number of seconds the job or FCT has been waiting.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

<td>IATGRMN</td>
</tr>
</tbody>
</table>

---

IAT6400

Explanation:

This message always follows the header message IAT6399. The monitor DSP issues message IAT6400 in response to the *START,MONITOR,DISPLAY command.

In the message text:

- **id** The name of the monitoring definition. The name is defined by the ID= parameter on the MNTRDEF macro.
- **interval** The time interval, in minutes, that the resource or queue is examined.
- **threshold** The minimum amount of time, in minutes, that a job or function control table (FCT) must have been waiting on the specified queue or for the specified resource before the monitor DSP will display it.
- **count** The number of FCTs or jobs over the threshold value that should be displayed. The jobs or FCTs are displayed in descending order based on the amount of time they have been waiting.
- **summary** Specifies whether a summary message describing the number of jobs or FCTs waiting is issued. If SUMMARY=YES is specified, a summary message is issued in addition to the messages issued for each job or FCT. If SUMMARY=NO is specified, messages are issued for each job or FCT; no summary message is issued. If SUMMARY=ONLY is specified, only the summary message is issued; no messages are issued for each job or FCT.
**IAT6401**

*status* Specifies whether monitoring is being performed for the specified resource or queue. If “ACTIVE” appears under the STATUS, monitoring is active for this resource or queue. If “INACTIVE” appears under STATUS, monitoring is not active for this resource or queue.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

```

**Routing Code:** –  **Descriptor Code:** –

---

**Explanation:**

```
>>> MONITOR START COMMAND REJECTED --- reasontext
```

The system rejected the *START,MONITOR command for the specified reason (*reasontext*), which is one of the following:

**SYNTAX ERROR DETECTED**

The system has detected an error in the *START,MONITOR command. For information on the correct command syntax see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html).

**INVALID PARAMETER LENGTH**

One or more of the parameters issued on the *START,MONITOR command is incorrect in length. For information on valid parameter lengths, see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html).

**INVALID VALUE LENGTH**

The value specified on one or more of the parameters issued on the *START,MONITOR command is incorrect in length. For information on valid value lengths, see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html).

**INVALID PARAMETER NAME**

One or more of the parameters issued on the *START,MONITOR command are incorrect. For information on valid parameters see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html).

**INVALID PARAMETER VALUE**

One or more of the values specified on a parameter of the *START,MONITOR command are incorrect. For information on valid parameter values see [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html).

**DUPLICATE PARAMETER**

One of the parameters of the *START,MONITOR command was entered more than once. Parameters must be stated only once for each *START,MONITOR command.

**NO PARAMETERS SPECIFIED**

No parameters were specified on the *START,MONITOR command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html) for the command syntax.

**REQUIRED PARAMETERS MISSING**

One of the required parameters is missing from the *START,MONITOR command. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html) for the required parameters.

**MUTUALLY EXCLUSIVE PARAMETERS**

The ID= and the DISPLAY parameters were issued on a single *START,MONITOR command. The ID= and DISPLAY parameters are mutually exclusive and must be issued on separate *START,MONITOR commands.

**INVALID ID VALUE**

The value specified on the ID= keyword is invalid. See [z/OS JES3 Commands](https://www.ibm.com/support/knowledgecenter/SSEPS9_2.2.0/com.ibm.zos.V2R2.MS.jes3.doc/doc/jes3/commands.html) for information of on correct values for the ID= parameter.

**System action:** JES3 processing continues.
Operator response: Reenter the command correctly. See z/OS JES3 Commands.

</thead>
<tbody>
<tr>
<td>IATGRMN</td>
<td>IATGRMN</td>
<td>IATGRMN</td>
</tr>
</tbody>
</table>

Routing Code: –
Descriptor Code: –

IAT6410

Explanation:

When issued, this message always follows messages IAT6397 and IAT6398. The messages are issued when JES3 Active FCT Monitor detected that the same FCT has been dispatched during the last monitoring interval. While this FCT is dispatched, no other FCT can perform any processing. JES3 may not respond to commands, no jobs may be selected for processing, etc.

In the message text:

- **nnn** Seconds 10 through 99,999,999.
- **reply** One of the following:
  - JES3 if the WTOR is issued for the JES3 global address space
  - System name, for example SY2, if the WTOR is issued for the JES3 local address space
  - C/I FSS name, for example CIFSS1, if the WTOR is issued for a C/I FSS address space.

System action: JES3 processing continues. When the FCT gives up control the WTOR is deleted.

Operator response: Determine if the FCT is legitimately monopolizing the JES3 Nuc or Aux tasks. If you think there is a reason for the same FCT to be active for an extended period of time, you can ignore this message or respond with a number of seconds (**nnn**) to request that JES3 wait for that period of time before issuing another message (if it finds that the same FCT is still active).

If you respond with JES3, system name of C/I FSS name, as displayed in the WTOR, JES3 will try to terminate the active FCT and eventually invoke its JESTAE recovery.

You may have to repeat the response several times if the FCT attempts to retry and enters a loop or MVS WAIT again. In that case, you may have to terminate JES3 by either responding to message IAT3822, if one is displayed, or by issuing the FORCE JES3,ARM command.
If you feel the default interval is too short causing the message to appear too frequently, you can adjust it by issuing the F JES3,INT=n command. n specifies the interval in seconds.

Note: JES3 cannot function correctly without some critical FCTs. If a critical FCT is terminated as a result of the FCT being failed, a JES3 restart might become necessary. Some of the critical FCTs include:
- JSS
- JSAM
- MAIN
- ENSTDRV
- WTDDRVR

**Routing Code:** 2  **Descriptor Code:** 2,7

---

**IAT6417**

**Explanation:**

---

COMMAND—command—EXCEEDED 1 MINUTE. —REPLY CANCEL TO STOP.

This message is issued when a F JES3 command has been executing for over one minute.

In the message text:

**command**  The command verb used on the F JES3 modify command.

For example, if F JES3, CHK was issued, CHK will be displayed.

**System action:**  None.

**Operator response:**  If no activity seems to be taking place (for example, no messages are being issued), respond to the message with CANCEL.

**Module:**
When issued, this message always follows messages IAT6397 and IAT6398. The messages are issued when JES3 active FCT monitor detects that the same FCT has been dispatched during the last monitoring interval. In the message text:

- **reply** Indicates one of the following items:
  - JES3 if the WTOR is issued for the JES3 global address space.
  - System name, for example, SY2, if the WTOR is issued for the JES3 local address space.
  - C/I FSS name, for example, CIFSS1, if the WTOR is issued for a C/I FSS address space.

- **nnn** Specifies seconds 10 through 99,999,999.

**System action**: JES3 processing continues. When initialization gets out of the condition it is in, the WTOR is deleted.

**Operator response**: Determine if JES3 initialization is legitimately busy. (You can check for any outstanding WTOs, and respond to them.) If you think there is a reason for JES3 initialization to be active for an extended period of time, you can ignore this message or respond with a number of seconds (nnn) to request that JES3 wait for that period of time before issuing another message (if JES3 finds that the same FCT is still active).

If you respond with JES3, system name or C/I FSS name, as displayed in the WTOR, JES3 will terminate.

If you feel the default interval is too short causing the message to appear too frequently, you can adjust it by issuing the F JES3,INT=n command. N specifies the interval in seconds.

**Module:**

A labeled tape was mounted when the dump job DSP was expecting an unlabeled tape to be mounted or vice versa. The *CALL command with LABEL= parameter determines which type of tape you want mounted. LABEL=SL specifies a standard labeled tape, and LABEL=NL specifies an unlabeled tape. DJ devnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

**System action**: Processing continues.

**Operator response**: If the dump job was called in input mode, mount the correct tape. If the dump job was called in output mode, mount a labeled tape if LABEL=SL is specified or an unlabeled tape if LABEL=NL is specified. If the proper tape is unavailable, or the parameters on the *CALL command are incorrect, issue a *CANCEL command.

**Module:**
IAT6602 • IAT6603

IAT6602

Explanation:

The specified job is within the range specified for dumping but jobs containing a multi-record file (MRF) contain spanned line mode records that cannot be dumped. The CALL,DJ,TRANS=YES command is causing DJ to translate all jobs to a previous release level before dumping. When translation is in effect, jobs that have an MRF containing spanned line mode records cannot be dumped back to a previous release.

DJ(dev-(jobid)) indicates the dump job dynamic support program (DSP) that issued the message, where dev indicates the tape device number and jobid indicates the DSP.

System action: The Dump Job DSP completes dump processing for the specified job and backspaces over any data written to tape for the job. Dump job DSP continues processing if there are more jobs for dependent job control (DJC) networks that need to be dumped based on the selection criteria specified on the current *START command.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18

IAT6603

Explanation:

The specified job is within the range specified for dumping but jobs containing a multi-record file (MRF) contain spanned line mode records that cannot be restored. The CALL,DJ command with TRANS=YES | NO specified causes DJ to translate or not translate jobs from a previous release level before restoring the jobs back. When translation is in effect, jobs that have an MRF containing spanned line mode records cannot be restored back to a previous release.

DJ(dev-(jobid)) indicates the dump job dynamic support program (DSP) that issued the message, where dev indicates the tape device number and jobid indicates the DSP.

System action: The dump job DSP completes dump processing for the specified job and backspaces over any data written to tape for the job. Dump job DSP continues processing if there are more jobs for dependent job control (DJC) networks that need to be dumped based on the selection criteria specified on the current *START command.

Operator response: None. This is an informational message.

Module:
Chapter 13. Subsystem Interface Messages

IAT6700
Explanation:

NO JDS FOUND FOR DSN=dsn

This message is issued by JES3 when the JDS access interface routine is executing on the global. It is issued in response to an SSISERV call if the JDS entry for the indicated data set was not found. The data set is a five-part identifier and consists of nodename, userid, jobid, dsnumber, and dsid.

System action: The step is ended with a system completion code of 1FB.
Operator response: None. This is an informational message.

Module:

IAT6716

Explanation:

>>> INVALID OPEN ISSUED FOR A SYSOUT DATA SET USED BY MULTIPLE TASKS

A task attempted to open a SYSOUT data set while the data set was being opened or closed by another task. JES3 detected a serialization failure while processing an open SYSOUT request.

System action: The system end this step with a system completion code of X'1FB'.

Operator response: None. This is an informational message.

System programmer response: See [z/OS MVS System Codes](https://www.ibm.com/docs/en/zos-system-codes) for an explanation of the X'1FB' system completion code.

Module:
IAT6717 • IAT6750

IAT6717

Explanation:

Module IATCNNF received a signal that contained incorrect data.

System action: The request is ignored. JES3 initialization continues.

Operator response: None. This is an informational message.

Module:

IAT6718

Explanation:

During OPEN processing of a SYSOUT data set, JES3 has reached the maximum number of SPOOL records for Output Scheduling Element (OSE) chain of the job.

System action: The request is ended with a 1FB completion code. The SYSOUT data set is not opened.

Operator response: Stop and restart the job. The job can be identified from message IEF450I specifying ABEND=S1FB U0000 REASON=0000006E.

Note: IEF450I is an MVS system message. For more information, see z/OS MVS System Messages, Vol 8 (IEF-IGD)

Module:

IAT6750

Explanation:

An ABEND5FB has occurred and the reason code is used to determine the cause of the abend. z/OS MVS System Codes describe the specified reason code.
IAT6801 • IAT6802

System action: The system abends the affected task.
Operator response: Notify the system programmer.
Programmer response: Determine the cause of the error. If the ABEND is from a JCL error, correct the problem and resubmit the job. If the ABEND cannot be determined, contact the system programmer.

IAT6805
Explanation:

An attempt to issue a FREEMAIN macro instruction failed for the specified JES3 control block for the indicated job.

System action:  Job failure or requeuing continues for the specified job. The initiator for this job is ended.

Operator response:  None. This is an informational message.

Module:

Routing Code: 2,11
Descriptor Code: 6

IAT6806
Explanation:

The ESTAE routine for the specified subsystem interface could not be successfully established. The subsystem interfaces are:

JOBS  Job select

JOBT  Job end

JOBR  Job requeue

RQJB  Request job ID

RTJB  Return job ID

System action:  The job, started task, or system log associated with the error is ended. If the associated job is a problem program, the initiator which selected the job is also ended.

Operator response:  None. This is an informational message.

Module:

Routing Code: 2,11
IAT6807

Explanation:

During job initiation, the specified system data set could not be successfully opened. A POINT operation was attempted and an unrecoverable error was encountered.

System action: The specified job is ended. If the job was a normal user job, the initiator involved selects another job. No dump is taken.

Operator response: Run the job again. If it fails, notify the system programmer. Save the console log.

Module:

Containing: IATSIJS
Detecting: IATSIJS
Issuing: IATSIJS

Routing Code: 2,11
Descriptor Code: 6

IAT6808

Explanation:

An end of the address space (paging data set error, page table errors, etc.) or system task (initiator) occurred while the specified job was in execution.

System action: If the job was successfully journaling, it is put back in the JES3 queue in hold status for an MVS warm start to clean up any scratch or VIO data sets and to determine MVS restartability. If the journaling for the job was not begun or failed, the job’s JES3 failure options are exercised.

Operator response: If this job is eligible for automatic restart, message IEF225D is issued asking you if the job should be MVS restarted. If the job is not eligible for MVS restart or you reply NO to message IEF225D, the job’s JES3 failure options are exercised.

IAT6818
Explanation:

✂️ JOB jobname (jobid) — FAILED DUE TO GETMAIN FAILURE IN C/I

A GETMAIN failure occurred during either MVS conversion or interpretation for a demand select job. There was not enough available storage in the address space (JES3 or CI FSS) for the MVS converter or interpreter to create the necessary control blocks. Messages IAT4230 and IAT4227 were also issued by C/I processing when the error was detected. The error indication is set in the job select queue (JSQ) (for the demand select job) and used to end the address space.

System action: The demand select job’s address space ends.

Operator response: Notify the system programmer.

Programmer response: Use IATUX46 and IATUX49 to control the processor and address space where MVS C/I is performed. Demand select jobs can be sent to an address space which is not storage constrained. The address space JCL limit can also be used to control the amount of storage in an address space being used for SWA control blocks. See explanations of messages IAT4230 and IAT4227.

- The parameter list passed to the functional subsystem interface (FSI) connect/disconnect function was incorrect for
  the one of the following indicated reasons:
  - INVALID FSI FUNCTION CODE
  - FSS NOT YET CONNECTED
  - INVALID FSS ID
  - INVALID FSA ID
  - FSS ALREADY CONNECTED
  - FSA ALREADY CONNECTED
  - FSS ALREADY DISCONNECTED
  - FSA ALREADY DISCONNECTED
  - FSA NOT YET DISCONNECTED

- An environmental error occurred during an FSI connect function because of the following reason:
  - SYSTEM BEING PARTITIONED

This message is followed by message IAT6998 identifying the functional subsystem (FSS).

System action: If the reason text is “SYSTEM BEING PARTITIONED”, this indicates that the system that the FSS
attempted to start on is being partitioned out of the SYSPLEX and all requests to join any group are permanently
suspended. If the FSS is a C/I FSS, it will end abnormally with a DM207 reason code X'2C'. If the FSS is a WTR FSS,
other abends are possible and can usually be ignored.

For all the other reason text, this is probably an error in the FSS that is trying to use the FSI. The FSS will end
abnormally. See the description of the message or system completion code provided by the FSS when it ends.

Operator response: If the cause of this error cannot be determined from the message, inform the system
programmer.

System programmer response: For all errors other than “SYSTEM BEING PARTITIONED”, this is probably an error
in the FSS that is trying to use the FSI. The FSS will end abnormally. See the description of the message or system
completion code provided by the FSS when it ends.

Chapter 15. Output Service Messages

IAT7000

Explanation:

DLOG ALERT - MESSAGE LIMIT ALMOST REACHED
MESSAGE LIMIT REACHED
MESSAGE DATA SPACE FULL
CONDITION HAS ENDED

The JES3 hardcopy log (DLOG) function has detected an alert condition associated with the DLOG extended MCS console; or an existing condition has been relieved.

System action: For MESSAGE LIMIT REACHED and MESSAGE DATA SPACE FULL conditions, messages will no longer be queued to the DLOG extended MCS console until the alert condition has been relieved. It is possible that messages may be missing from DLOG while this alert condition is in effect.

Operator response: For MESSAGE LIMIT ALMOST REACHED, MESSAGE LIMIT REACHED, and MESSAGE DATA SPACE FULL conditions, the problem may be one of the following:

- A SYSLOG WTL buffer shortage may have occurred (indicated by the display of MVS message IEE767A). Issue D C,HARDCOPY to display the number of buffers in use. Issue K,M,LOGLIM=nnnn to increase the number of SYSLOG WTL buffers.

- A JES3 spool space shortage may have occurred. If a JES3 spool space shortage occurs (for example, JES3 displays message IAT1016 or IAT1017), SYSLOG may not be able to allocate spool space to write WTL requests to the JES3 spool. This in turn may cause all of the SYSLOG WTL buffers to be used up, which will cause messages to back up in the DLOG message data space. Issue *I,Q,S or *I,Q,SP=spart (where spart is the spool partition being used by SYSLOG) to determine if there is a spool space shortage. If there is a spool space shortage, take the appropriate steps to eliminate shortage (such as purging held output over a certain age).

Note: To determine the spool partition being used by SYSLOG, issue the *I,J=SYSLOG,SP command.

- SYSLOG is not started. If the global has just been IPLed and the Job Segment Scheduler (JSS) has not been started, issue a *S,JSS to start JES3 scheduling. SYSLOG will not start until JSS has been started.

  If JSS has been started, issue an *I,J=SYSLOG command to determine if SYSLOG is active. If not, then issue a WRITELOG START command to start SYSLOG and VARY SYSLOG,HARDCOPY command to assign SYSLOG as the hardcopy medium.

If the alert condition is not caused by one of the above conditions, take a dump of the JES3DLOG address space to determine whether there is a problem with the JES3DLOG address space. Notify the system programmer.

System programmer response: If you cannot determine the cause of the alert condition, contact IBM support. Documentation should include the dump that was taken and the SYSLOG from the JES3 global.

IAT7001

Explanation:
The output for the named job has been selected by the writer (dev) for processing. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. In this message nnn specifies the number of records to be printed and mmm specifies the number of stream mode pages to be printed. NAVAIL specifies that the number of records is not available. For a 3800 printer, the named job's output has begun to appear on paper. RESTARTED is displayed in the message text when the JES3 global was hot started with this writer active.

**System action:** JES3 continues processing.

**Operator response:** None. This is an informational message.

</table>

**Routing Code:** Note 17

**Descriptor Code:** 7

---

**IAT7005**

**Explanation:**

\[\text{WTR (jobno), ON devname(devnum) WAITING FOR WORK WS=(x)} \]

\[\text{WTR, sysout class(es) F= form-name CT= carriage-tape-name} \]

In the *X,WTR command, the device specified on the OUT= parameter or, if OUT= was not specified, all devices of the type PRT were not available.

**System action:** The writer is ended if the message states CANCELED, or it is rescheduled if the message states RESCHEDULED.

**Operator response:** If the writer was canceled, reissue the *X,WTR command when the required devices are available.
A hot writer has done all the work in the output queue that it can process. If a device number does not appear in the message, the device is a non-channel attached device (such as 3820). MVS does not assign device numbers to non-channel attached devices. The keywords that might appear in the message are:

**WS=**
The writer selection criteria in effect. A list of the possible criteria follows:
- Carriage tape or FCB (C)
- Sysout class (CL)
- Copy modification (CM)
- Data set destination (D)
- Form Requested (F)
- Flash (FL)
- Line or Page Limit (L)
- Stacker (SS)
- Data set priority (P)
- Device type (T)
- Train Image (U)
- Process mode (PM)

**WC=**
The sysout class(es) that the writer can process.

**F=**
The forms that are mounted and held.

**CT=**
The carriage tape or FCB ID that is set up and held.

**U=**
The UCS ID of the mounted train that is held.

**CH=**
The character arrangement table(s) that is held.

**FL=**
The flash image name that is held.

**CM=**
*Module* is the copy modification module name that is held; *refchar* is the reference character that is held.

**SS=**
C means that the continuous forms stacker is held. S means that the burster-trimmer stacker is held.

**L=**
The line limit for the device.

**PG=**
The page limit for page-mode data.

**PM=**
Indicates the process mode(s) defined for this printer or punch device. If the printer is a device capable of operating in either compatibility mode or FSS mode (for example, a 3800 model 3 printer), PM indicates the process mode(s) defined for the current device operating mode.
When listed, any of the preceding keywords indicates that the attribute of the device cannot be changed except by a *START or *RESTART writer command.

System action: The writer waits for an operator command or for new work to process. The criteria in HELD state are preventing the writer from selecting work.

Operator response: Issue a *START or *RESTART command to change or release the desired attributes from HELD status, or issue a *CANCEL command to cancel the writer.

When this message first appears, JES3 will display only the first line as an action message. To display all attributes of the device, including those criteria in HELD state, issue the *I,D,D=devname or devnum command.

Routing Code: Note 17
Descriptor Code: 2,7

IAT7006

Explanation:

\[ \text{JOB} -- \text{jobname (jobid)} -- \text{ON} -- \text{devname(devnum)} -- \text{COPIES=} -- \text{xxx} -- \text{RECORDS=} -- \text{nnn} \]
\[ \text{NAVAIL} \]

\[ \text{PAGE=} -- \text{nnn} \]
\[ \text{NAVAIL} \]

JES3 has selected the data set specified in message IAT7057 for processing. The JOB jobname (jobid) contains the transaction program job name and transaction identifier when the job exists for an Advanced Program-to-Program Communication (APPC) transaction program. The output is written to device dev.

If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

In this message, the number of copies to be transmitted to the output device is specified by \text{xxx}. \text{nnn} indicates the number of records to be printed and \text{mmm} indicates the number of stream mode pages to be printed. (If the number of records or pages is unknown, NAVAIL appears).

System action: Processing continues.

Operator response: None. This is an informational message.

</tr>
<tr>
<td>IATOSWP</td>
<td>IATOSWP</td>
<td>IATOSWP</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 7, Note 17

**Descriptor Code:** –

---

**IAT7008**

**Explanation:**

An error occurred when a job accessed the data set *dsn*. The *jobname* *(jobid)* contains the transaction name and transaction identifier when the job exists for an Advanced Program-to-Program Communication (APPC) transaction program. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The system does the following, depending on the message text:

- **OPEN ERROR DM701, DM719, DM721, DM722, DM725, or DM731**
  The output of the current data set is ended.

- **READ ERROR DM724**
  Output continues with the next good block of data (if it can be found) from the current data set.

- **READ ERROR DM702, DM722, DM725, or DM731**
  Output of the current data set is ended.

- **SPLT ERROR DM731**
  A length error has occurred while processing a record that is split across two spool buffers. More printable data may exist for this data set. JES3 waits for an operator response before processing any more data.

- **BUFF SHORT (DM731)**
  A split stream mode data record has been encountered. The non-page mode device does not have adequate input/output (I/O) buffers defined to continue processing. JES3 waits for the operator response.

- **R=*nn* EOF**
  This indicates forward repositioning to the end of the data set. The writer will wait for the appropriate operator response before processing any data.

- **DS IS HELD**
  An error occurred while either JES3 or the functional subsystem (FSS) processed the data set. The exact cause is defined by preceding message IAT7061. The specified data set has been placed in operator hold. The next possible data set is selected for processing.

**Operator response:** Depending on the message text, one of the following:

- **DM701, DM719, DM720, DM721, DM722, DM724, DM725, or READ ERROR DM731 displays**
  No operator response is required.
Repositioning error displays
Enter a *START, *RESTART, or *CANCEL command.

SPLT ERROR DM731 displays
Enter a *START command to continue processing at the next record. The error record is skipped. To discontinue processing of the current data set, enter a *CANCEL command.

BUFF SHORT (DM731) displays
The data set cannot continue on the current printer. Enter *CANCEL to discontinue the current data set, or enter the *RESTART command to reschedule the output to another device which has sufficient buffers to process the data set.

Notify the system programmer and inform the user of the data set in error. If the error can be corrected, JES3 releases the data set for printing.

Programmer response: Analyze the dump and correct the problem. For more information about the job, see message IAT7061.

Note that for a 3800, message IAT7001 may not have been written for the indicated job.

To define I/O buffers for BUFF SHORT (DM731), see the RECORDS= parameter in z/OS JES3 Initialization and Tuning Reference.

Problem determination: See Table I, item 16.

**Routing Code:** Note 18

**Descriptor Code:** 2,7

**IAT7019**

**Explanation:**

```plaintext
>>> devname (devnum), — REPOSITIONING BY LINE— INVALID FOR PAGE-ORIENTED DEVICES— (text) — <<<
```

A *START,devname or *RESTART,devname command with the R=parameter (specifying line count) was issued, but the indicated device dev is a page-oriented device that cannot be repositioned by line count. A page-oriented device can be repositioned only by page count, a checkpoint, or to the beginning of the data set or the beginning of a job. The *R or *S command can be used but it must be used to specify the count in pages.

If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The writer waits for you to correctly enter the command.

**Operator response:** Issue the *START or *RESTART command with a valid page count specified. See [z/OS JES3 Commands](#) for more information about these commands and the R= parameter.

A bus-out parity error occurred on the indicated printer or punch device.

System action: The writer waits for an operator response.
Operator response: Issue a *START, *CANCEL, or *RESTART command.
Data LOST is issued for a 3800 printer when a system-restart-required type of paper jam has occurred; the writer has automatically repositioned to the data at the fuser, if possible. The system restart indicator will be set on the 3800.

Note that, for a 3800, message IAT7001 may not have been written yet for the indicated devname.

EQUIPMENT CHECK means that there was an equipment check or that, after a unit check, sense byte 0 was set to X'00'.

System action: The writer waits for an operator command unless the CANCEL key was pressed on a 3800 printer which would be indicated by DATA CANCELLED appearing in the message.

Operator response: If you pressed the cancel key on the 3800, you do not need to respond to this message. The data set whose page is visible at the transfer station has been canceled, as if you entered *CANCEL devname.

Clear the hardware condition as described for the system restart indicator in IBM 3800 Printing Subsystem Operator’s Guide and then issue a *START, *RESTART or *CANCEL command. The command will apply to the data at the fuser. It is typically appropriate to issue *START without further repositioning.
IAT7024 • IAT7025

IAT7024
Explanation:

WRITER— jobname (jobno) devname (devnum) — INTERVENTION REQUIRED
PRINT QUALITY ERROR
FORMS CHECK
INTERLOCK CONDITION

DATA LOST. OUTPUT WILL RESTART.— ENTER *S, *R OR *C COMMAND.

The indicated device was removed from ready status during writer processing, for the reason given.

System action: The writer waits for an operator response.

Operator response: If you pressed the cancel key on the 3800, you do not need to respond to this message. Ready the device.

If DATA LOST. OUTPUT WILL RESTART. ENTER *S, *R OR *C COMMAND appears in the message, clear the hardware condition for the system restart indicator in IBM 3800 Printing Subsystem Operator’s Guide and then issue a *START, *RESTART or *CANCEL command. The command will apply to the data at the fuser. It is typically appropriate to issue *START without further repositioning. Note that after readying the 3800, a writer command must be entered.

Note: If message IOS002A DEV, NO PATH AVAILABLE, precedes this message, respond to IOS002A before responding to IAT7024. The writer will wait for a *START, *RESTART, or *CANCEL command.

Descriptor Code: 2,7

IAT7030
Explanation:

The indicated job is scheduled for device dev. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.
The job’s setup requirements are shown as follows:

- F=form-name
- U=UCS image name
- C=carriage tape name
- FL=flash name
- SS=the stacker to thread.

In the case of the 3800, SS will be C for the continuous-forms-stacker or S for the burster-trimmer-stacker.

If message IEE704I REPLY nn NOT OUTSTANDING is issued shortly after this message, JES3 could not automatically reply to message IAT7030. In this case the operator must reply. If the device is a 3800 and its status is known to JES3, a code is displayed on the 3800 operator panel. Following is a list of the possible codes and their meanings:

- F1 Thread forms to continuous forms stacker. Make no changes to the forms or the flash.
- F2 Thread forms to burster-trimmer-stacker. Make no changes to the forms or the flash.
- F3 Change only the flash, to the value shown for FL= in this message (IAT7030).
- F8 This message (IAT7030) shows required values for forms, forms, flash, and/or forms threading.

System action: The writer waits for an operator response. If the device is a 3800 printer and if the device was previously setup, it is made not ready.
Operator response: Ensure that the device is set up properly, then enter the command *S,devnum or *S,devnum

626 z/OS V2R1.0 JES3 Messages
command. If the device is a 3800 printer, you must make the printer ready.

IAT7031

Explanation:

```
>>> devname (devnum) — JOB — jobname (jobid) text1, text2
```

A SETPRT call tried to set up the indicated device, but the errors shown in the message occurred.

text1

- IMAGE WAS NOT FOUND FOR text2
- LIBRARY DIRECTORY I/O ERROR ON text2
- PERMANENT I/O ERROR LOADING text2
- NOT ENOUGH VIRTUAL STORAGE TO OPEN SYS1.IMAGELIB
- CANNOT OPEN SYS1.IMAGELIB
- TOO MANY CGM'S REQUIRED
- INVALID TABLE REFERENCE CHARACTER FOR MODIFY
- ERROR TRYING TO INITIALIZE PRINTER
- PERMANENT I/O ERROR ON SENSE
- CHARACTER ARRANGEMENT ENTRY REFERENCED AN UNSPECIFIED CHARACTER SET
- SETPRT SUBTASK ABENDED, TO CONTINUE REPLY *S, *R, or *C DEVICE
- NOT ENOUGH VIRTUAL STORAGE FOR PRINTER SETUP
- UNEXPECTED ERROR FROM SETPRT. RC=xx
- FAILURE DURING SETTING UP OF PRINTER

text2

- FCB=fcb-name
- UCS=ucs-name
- TRANSLATE TABLE
- COPY MODIFICATION RECORD
- COPY NUMBER
- GRAPHIC CHARACTER MODIFICATION RECORD
- FORMS OVERLAY SEQUENCE CONTROL RECORD
- CHARACTER GENERATION MODULE
- FORMS CONTROL BUFFER
  (unknown)

Note that for a 3800 printer, message IAT7001 might not have been written for the indicated job.

**FAILURE DURING SETTING UP OF PRINTER** [ yy, dd, hh, mm, ss ] - a previously-issued operator message with an IEC message number describes the specific failure. If separator pages have not been suppressed (H=N, B=N on the *CALL, *RESTART or *START command or on the DEVICE initialization statement), this message is also written on the 3800 printer after the IEC message. When on the printer, this message contains the date and time and is written several consecutive times so that it stands out.

Chapter 15. Output Service Messages 627
IAT7032 • IAT7033

UNEXPECTED ERROR FROM SETPRT, RC=xx - The indicated code is either 10, 18, 1C, 28, 2C, 3C, or greater than 44. These codes are documented in "z/OS DFSMS Macro Instructions for Data Sets".

System action: If header and burst pages have not been suppressed and a failure occurs during printer setup, IEC messages are written to the printer.

Operator response: Notify the system programmer. Often the job separator pages have not been printed before this message appears. The failure commonly has been caused by the user, not the hardware, operator, or system programmer.

If this message is printed on the printer, give the pages containing the messages to the submitter of the job. Your installation may choose to adopt a policy of also giving the user information about solutions to common problems. For example, supply a list of which forms can be used with the various FCB loads and a list of the names and purposes of the modules in SYS1.IMAGELIB. This information helps when the user has misspelled a name.

Issue a *CANCEL command to cancel the job's data sets that required the setup or issue *RESTART to override or retry the setup.

Programmer response: For UNEXPECTED ERROR FROM SETPRT, there is a probable programming error in JES3 or in SETPRT. If you cannot determine the cause of the alter condition, contact IBM support.

### IAT7036

**Explanation:**

> **CONNECT NOT RECEIVED FOR** FSS WRITER—*fssname*— IN ASID—*asid*— ON— main—

An FSS controller DSP trying to start the address space supporting a functional subsystem (FSS) has not received a connect request from that address space.

**System action:** The FSS controller DSP resets its timer and waits again for the address space to connect or for an operator response.

**Operator response:** There is no need for an immediate response. Check for previously issued console messages IAT6373 and IAT6374. If they have been issued, follow the instructions given in the description of message IAT6374. If the messages have not been issued, you can determine device and FSS status by using *INQUIRY,D and *INQUIRY,F commands. If the message is issued several times, enter a *FAIL,*devname,DUMP command and report the problem to the system programmer.

**Problem determination:** See Table III, items 3 and 4.

Routing Code: 10
Descriptor Code: 7

IAT7041
Explanation:

OUTPUT SERVICE INITIALIZATION ERROR

A system failure occurred during output service initialization processing. The failure may be due to a program check, a JSAM error, or an error in a JES3 general routine.

System action: If multiple OUTSERV FCTs are defined in your initialization stream through the OUTSVFCT parameter on the OUTSERV statement, JES3 places the OUTSERV FCT that encountered an error into a permanent wait state. When an FCT is placed into a permanent wait state, it will not accept additional work for output service writers. However, other active OUTSERV FCTs can continue to process work.

Operator response: Your installation may be able to continue output service processing if other OUTSERV FCTs are active. Issue an *S,DC,OPTION=(FCT=OUTSERV) to determine if there are active OUTSERV FCTs in the complex. If there are, these FCTs can continue output service processing.

If all the OUTSERV FCTs are inoperative, perform a hot start to reinstate output service processing.

<td>IATOSDR</td>
<td>IATOSDR</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 7

IAT7047

Explanation:

➤➤ MORE THAN 8 MODES DEFINE FOR DEVICE.. COMPLEX. OVERFLOW IGNORED ➤➤

A writer command (that is, *CALL WTR, *START WTR, or *RESTART WTR command) was issued to specify the number of process modes. The command would cause JES3 to define more than 8 process modes for the device or 255 process modes to the complex.

System action: JES3 accepts only the first eight process modes defined for a device or the first 255 process modes defined for the complex. Any additional values specified by using the PM parameter is ignored by JES3. JES3 processing continues.

Operator response: If the new process modes are required for the device:
- issue an *I D D=dev to determine the current process modes defined for the device
- determine the process modes that can be deleted for the device
- issue a writer command with a PM=(/value) parameter to delete the undesired process mode
- issue a writer command with a PM=(value) to add the desired process mode
If there are process modes that need to be removed from the complex, contact the system programmer.

**System programmer response:** When 255 process modes are defined for the complex, the operator cannot define any new process modes for a device or the complex. You must determine which process modes are not needed for the complex. To correct the process modes for the next restart, change the DEVICE statement so that undesired process modes are deleted. To correct the process modes for current processing, issue a writer command with a `PM=(value,...)` to delete the undesired process modes. Issue a writer command with a `PM=(value)` to add the desired process mode.

---

**IAT7048**

**Explanation:**

```
77    WRITER   FSS  fssname  ADDRESS SPACE  FAILED  CANCELED
77    BY OPERATOR  ON  main  FOR  devname (devnum)  
77    FSS CONTROLLER
```

The address space supporting a functional subsystem (FSS) writer has failed; either because its system was IPLed or ended, or the address space was ended by a FORCE or CANCEL command, or an abend occurred. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

**System action:** The FSS controller DSP and all output writer DSPs supporting the FSS end.

**Operator response:** When the processor becomes available, the writers can be restarted.

---

**IAT7049**

**Explanation:**

```
77    WRITER   jobname (jobid)  USING  devname (devnum)  ON FSS  fssname
77    TERMINATING - FSA REQUEST TERMINATION
```

A non-channel attached device runs under a WRITER DSP which runs under control of a functional subsystem address space (FSS). The specified writer DSP is ending because the FSA requested disconnect processing.

**System action:** JES3 ends the specified writer DSP. JES3 performs disconnect processing for the FSA and FSS address space.
IAT7050 • IAT7051

Operator response: If a hardware failure occurred (messages were issued to indicate there was a hardware failure),
vary the device offline to JES3. When the device is varied offline, it cannot be selected by output service for a
dynamic writer. If the writer is a hot writer, issue a *CANCEL WTR,RSC,T command to end the hot writer.

Module:

IATOSFT  IATOSFT  IATOSFT

Routing Code: Note 17
Descriptor Code: –

Explanation:

>>> JOB— jobname (jobid) — ON WTR— devname— PERMANENT DEV ERROR, SENS=— sens—

The jobname writer has received a permanent device failure indication from device devname. The sense bytes received
are given in sens.

System action: JES3 takes the device offline. The current data set is requeued from its most recent checkpoint. If
CHNSIZE=DS is in effect, the data set is requeued from the start of the data set.

Operator response: Fix the device and then vary it online to JES3.

Module:

IATODSN  IATOSSN  IATOSSN

Routing Code: Note 17
Descriptor Code: 2,7

Explanation:

>>> JOB— jobname (jobid) — ON WTR— devname— INTERVENTION REQD — CHNSZ=— xxx—

The jobname writer has encountered a condition that requires operator intervention. If CHNSZ=xxx is given, the error
occurred on a data set, and xxx is the current chain size. The intervention required condition at the physical device
may cause loss of data.

System action: The writer waits for operator response.

Operator response: Issue a *RESTART,dev command.

Module:

IAT7053
Explanation:

Job—jobname (jobid)—ON WTR—devname—TERMINATE REQUESTED

This message indicates one of the following three conditions: (1) the writer could not obtain a session to send data because a workstation cancel was in progress, (2) workstation cancel was detected while sending data, or (3) severe protocol error occurred on the session.

System action: The data set is requeued from its checkpoint, and, in case of item 1, the device is varied offline. If CHNSIZE=DS is in effect, this checkpoint will be the start of the data set.
Operator response: None. This is an informational message.

IAT7054
Explanation:

Job—jobname (jobid)—ON WTR—devname—PDIREJECT FOR FORMS=xxx
TRAIN=yyy
FCB=zzz
SENSE=sens

The writer has rejected setup header (PDIR) for the indicated reason. If SENSE=, the reject is unexpected.

System action: The writer waits for operator response, unless SENSE= is specified. In this case, processing continues with the PDIR function inoperative for writer, jobname.
Operator response: Issue a *RESTART command to respecify setup for writer, jobname.

Module:
IAT7055

Explanation:

>>> JOB— jobname (jobid)— ON WTR— devname— TRANSMISSION ERR SENSE=— sense

The writer has encountered either a transmission error or has lost its session as indicated by the message text. If CHNSZ=yyy is given, the error occurred on an active data set where yyy is the current chain size.

System action: For transmission errors, JES3 waits for operator response unless the error occurred on header or trailer pages. In this case processing continues. For session errors, the writer will attempt to obtain a new session.

Operator response: If FCB= is given, it is likely that the FCB load sequence is not acceptable to the workstation. In this case, restart the writer specifying an alternate FCB or enter a *START command to continue with the current FCB. In all other cases, restart the writer.

Module:

IAT7056

Explanation:

>>> JOB— jobname (jobid)— ON WTR— devname— CONV ERR ON FCB=— xxx,— SPECIFY ALT FCB

The FCB image obtained from SYS1.IMAGELIB cannot be converted to an SNA set vertical forms (SVF) sequence required to load the image.

System action: JES3 waits for operator response.

Operator response: Restart the writer and specify a new FCB.

Module:

IAT7057

Explanation:

>>> JOB— jobname (jobid)— ON DEVNAME— (devnum)— DSN=— dsn

The writer has encountered either a transmission error or has lost its session as indicated by the message text. If CHNSZ=yyy is given, the error occurred on an active data set where yyy is the current chain size.

System action: For transmission errors, JES3 waits for operator response unless the error occurred on header or trailer pages. In this case processing continues. For session errors, the writer will attempt to obtain a new session.

Operator response: If FCB= is given, it is likely that the FCB load sequence is not acceptable to the workstation. In this case, restart the writer specifying an alternate FCB or enter a *START command to continue with the current FCB. In all other cases, restart the writer.
JES3 selected the data set specified in this message. The output is written to device \textit{dev}. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. Message IAT7006 contains additional information about the data set.

**System action:** If the manual mode is in effect, the writer waits for an operator command to start processing. Otherwise, transmission of the data set begins.

**Operator response:** If this message is issued as a result of being in diagnostic mode, no operator response is necessary. Otherwise, the operator must issue the \texttt{*START} writer command to start the writer or the \texttt{*RESTART} or \texttt{*CANCEL} command to change the writer status or cancel the writer.

**Explanation:**

\begin{verbatim}
>>> WRITER — jobname (devnum), — PRINTER CLEARED, OUTPUT RESTARTED - PAGES

The indicated device has performed a re-IML in order to recover from an error. All data for this device has been rescheduled.

**System action:** The writer is idle; JES3 waits for an operator command.

**Operator response:** Enter a \texttt{*START}, \texttt{*RESTART}, or \texttt{*CANCEL} command. The following messages will direct operator action. Note that the job now on this device may not be the same job that was interrupted by the error. The job that was interrupted by the error has been rescheduled; it may print on this or another device. When it prints, pages that were printed before the error will be reprinted.

**Explanation:**

\begin{verbatim}
<<< JOB— jobname (jobid) — REQUESTED INVALID— NODE— (nodename).— OUTPUT WILL BE PUT IN HOLD.

The node specified was not defined to JES3.

**System action:** JES3 places the job's output on the output service writer queue.

**Operator response:** If possible, determine the proper destination and specify it in the \texttt{*CALL,NJEROUT,JOB=jobno,TO=nodename} command. Then release the job's output with the \texttt{*MODIFY,U,Q=WTR,J=jobno,NH=N} command. Tell the user to correctly specify the node in the JCL.

**Operator response:** If possible, determine the proper destination and specify it in the \texttt{*CALL,NJEROUT,JOB=jobno,TO=nodename} command. Then release the job's output with the \texttt{*MODIFY,U,Q=WTR,J=jobno,NH=N} command. Tell the user to correctly specify the node in the JCL.
IAT7060 - IAT7061

IAT7060

Explanation:

This message is issued in response to any command for a writer after diagnosis mode is turned on by issuing a *CALL, *START, *RESTART, or *CANCEL command for that writer with the D parameter specified. This message contains a 7-byte diagnostic field \textit{diagfld} in the writer data area (IATODWD). See \textit{z/OS JES3 Diagnosis} for an explanation of the output service diagnostic mode information displayed in the diagnostic field \textit{diagfld}.

For 3800 printers with the 3800 MVS enhancements installed, \textit{rqaddr} specifies the address of the RESQUEUE for the job currently at the writer; \textit{chnaddr} specifies the address of the RESQUEUE for the job currently at the channel; \textit{rcdsn} specifies the address of the most recent data set or start of transmission pending page queue (PPQ) entry. The \textit{rcdsn} field is zero if the printer is not a 3800. The in field specifies the current index of WTRINDEX.

For FSS mode printers, \textit{rcdsn} specifies the most recent data sets selected to print pending data set queue (PDQ) entry. The second diagnostic field \textit{diagfld2} is obtained from WTRFFIG1-WTRFFIG5 in the writer data area (IATODFD).

\textbf{System action:} Processing continues.

\textbf{Operator response:} None. To turn off the diagnostic mode, specify the /D (diagnosis) parameter on any *X, *S, *R, or *C writer command.

Module:

IAT7061

Explanation:

This message is issued in conjunction with message IAT7008. This message indicates the reason a data set is being placed in held state. If an FSS writer is being used the \textit{reasonext} is from the FSA.

\textbf{System action:} An attempt is made to process the next data set within the job.

\textbf{Operator response:} Notify the security product administrator of the JES (SECURITY) reason.

\textbf{Programmer response:} Make the correct security product data base updates to allow the data set to print if that is desired.

Module:

Routing Code: Note 18
Descriptor Code: 2,7

IAT7063

Explanation:

devname RESP= aabb,rc,copyno,pageno,recno id

This message is issued to the hardcopy message log when an FSI SYNCH or QUERY order response is received during FSS writer command processing. The output service diagnostic mode must be active for this message to be issued.

devname identifies the name of the device where the data set is being printed.

aa identifies the status of the device.

bb identifies the processing status of the data set.

rc identifies the return code from the requested function.

copyno identifies the copy number of the data set at the operator observation point (OOP) station in the printer.

pageno identifies the page number of the data set at the OOP station in the printer.

recno identifies the logical record number of the data set at the OOP station.

id identifies the data set identifier at the OOP station.

Message IAT7077 contains the name of the data set being processed. For the possible values for aa, bb and rc, see the Output Service Diagnostic Facility section in z/OS JES3 Diagnosis.

System action: JES3 processing continues. The output diagnostic mode will continue to write messages to the hardcopy message log.

Operator response: None. This is a diagnostic message for the system programmer.

Programmer response: Check the hardcopy message log for the diagnostic messages.

Module:
IAT7064 - IAT7065

Containing Detecting Issuing
IATOSMV IATOSMV IATOSMV

Routing Code: Note 13
Descriptor Code: 7

IAT7064

Explanation:

\[
\text{devname} - \text{RELSD} - \text{DISP} - \text{UNPRINTABLE} -\ldots\] \begin{tabular}{ll}
\text{COMPLETE} & \text{VALID} \\
\text{INCOMPLETE} & \text{N/A}
\end{tabular} \quad , \text{CHKPT} - \text{INVALID} , \text{DSID} - \text{id}

This message is issued to the hardcopy message log when an FSS releases a data set during FSS processing. The output service diagnostic mode must be active for this message to be issued. \text{devname} identifies the name of the device where the data set is being printed. \text{DISP} identifies the disposition of the data set. The possible values and the associated meanings for the data set's disposition are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNPRINTABLE</td>
<td>JES3 was unable to print the specified data set.</td>
</tr>
<tr>
<td>COMPLETE</td>
<td>JES3 printed the entire specified data set.</td>
</tr>
<tr>
<td>INCOMPLETE</td>
<td>JES3 was unable to completely print the specified data set.</td>
</tr>
</tbody>
</table>

System action: JES3 processing continues. The output diagnostic mode will continue to write messages to the hardcopy message log.

Operator response: None. This is a diagnostic message for the system programmer.

Programmer response: Check the hardcopy message log for the diagnostic messages.

Module:

Containing Detecting Issuing
IATOSFR IATOSFR IATOSFR

Routing Code: Note 17
Descriptor Code: 7

IAT7065

Explanation:

\[
\text{JOB} - \text{jobname} (\text{jobid}) - \text{ON} - \text{devname} (\text{devnum}) - \text{AWAITING DATA SET SYNCHRONIZATION} \]

After the last operator command, an order has been issued causing the FSS address space to release all data sets following the one listed in the message IAT7018. If a device address does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device addresses to non-channel attached devices.

System action: The writer DSP waits until all the data sets following the one identified by message IAT7075 or IAT7089 are released, then deletes this message.

Operator response: If this message remains outstanding for a long time (as shown on the output for an D R,L,KEY=WTR command), end the writer DSP with a dump. Provide both dumps (JES3 and the FSS address space) to the system programmer. Restart the writer.
System programmer response: Analyze the dump to determine the problem.

IAT7066

Explanation:

An operator command was entered to change the status of the output on the specified device. If you specify both BURST=YES and HEADER=YES or you let JES3 default to BURST=YES and HEADER=YES for an FSS-supported device, JES3 prints message IAT7066 and IAT7067 on the user's output whenever you enter a command that modifies the data on this device. The meanings of the terms in the message are as follows:

**JOB**
- Specifies that all of the data sets for the current job are to be either restarted or canceled.

**GROUP**
- Specifies that all of the data sets processed by the same device that is processing the current job are to be either restarted or canceled.

**CANCELED**
- Indicates that the specified data sets will be canceled.

**RESTARTED**
- Indicates that the specified data sets will be reprinted.

System action: The specified data sets are either canceled or reprinted. JES3 processing continues.

Operator response: None. This is an informational message.

IAT7067

Explanation:
An operator command was entered to alter the specified output. If you specify both BURST=YES and HEADER=YES or you let JES3 default to BURST=YES and HEADER=YES for an FSS-supported device, JES3 prints message IAT7066 and IAT7067 on the user's output whenever you enter a command that modifies the data on this device. The meanings of the terms in the message are as follows:

**CANCELED**
Indicates that the current data set was canceled.

**RESTARTED**
Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint.

**INTERRUPTED**
Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint and requeued for scheduling at another time.

**CHANGED**
Indicates that the current data set was restarted from the beginning of the data set or from the last checkpoint and the changes requested by the command were made.

**FROM CHECKPOINT**
Indicates that the current data set was restarted, requeued, or repositioned from the last checkpoint.

**FWD-SPACED nnn PAGES**
The requested number of pages are forward spaced and processing continues.

**BACKSPACED nnn PAGES**
The requested number of pages are backspaced and processing continues.

**COPIES**
The requested number of pages that are copied.

**INCREASED BY ccc**
Indicates that the number of copies was increased by ccc.

**DECREASED BY ccc**
Indicates that the number of copies was decreased by ccc.

**UPDATED TO ccc**
Indicates that the number of copies was changed to ccc.

**HELD**
Indicates that the current data set was interrupted and placed in operator hold.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

Routing Code: Note 18
Descriptor Code: 7

IAT7072

Explanation:

>>> devname (devnum)— ISSUE CORRECTED COMMAND OR ALTERNATE COMMAND

The writer has not accepted an operator command. The specific error reason appears in the preceding message.

System action: The writer waits for you to enter the corrected command.

Operator response: You can correct the operator command using the following guidelines:
1. Re-enter only the items that need correction. JES3 will process all of the valid keywords and parameters from the original command.
2. Enter another writer command. All of the keywords and parameters from the command in error are ignored and the new command is processed.
3. If a *CALL,WTR command contained the error, correct the error with a *START,WTR command.

If JES3 allocated a device different from what you expected, you either issued the *CALL command without the OUT= keyword and JES3 provided the default device allocation, or the OUT= specification was not valid. Issue the *CANCEL command to cancel the writer, then reissue the *CALL,WTR command with the correct device.

----- devname— RELDS FOR DSN— dsn-----

This message is issued to the hardcopy message log when an FSS releases a data set during FSS processing. The output service diagnostic mode must be active for this message to be issued. devname identifies the name of the device where the data set is being printed. dsn identifies the data set name. For more information about the job, see message IAT7064.

System action: JES3 processing continues. The output diagnostic mode will continue to write messages to the hardcopy message log.

Operator response: None. This is a diagnostic message for the system programmer.

Module:

Containing  Detecting  Issuing
IATOSFR     IATOSFR     IATOSFR

Routing Code: Note 17
Descriptor Code: 7

IAT7075
Explanation:

----- GROUP----- JOB----- DSN=dsn----- REQ----- STARTED----- RESTARTED----- CANCELED----- WITH LOAD-----
The writer has accepted an operator input command. If a device number does not appear in message IAT7089, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. This message is issued only if all the parameters or keywords on the issued command were valid. The meanings of the terms in the message are as follows:

**GROUP**
- The requested action applies to all data sets for the group.

**JOB**
- The requested action applies to all data sets for the job.

**DSN=dsn**
- The requested action applies only to the data set currently being processed by the writer. For a 3800 printer, the current data set is the data set that is visible at the transfer station. The name of the current data set is *dsn*.

**REQ**
- The requested action applies to all data sets associated with the current device setup.

**STARTED or RESTARTED or CANCELED**
- Indicates which action is being taken.

**WITH LOAD**
- The request was for a UCS or FCB load.

**FROM NOTE or CHECKPOINT**
- The data set will be restarted from the last note or checkpoint.

**APRL=nnnnnnnn** or **NAVAIL**
- This field appears in response to a *S,writer,P command, a *R,writer,P command, or a *C,writer,P command if a data set is active on the specified writer and if all the records in the data set have not yet been processed. When a value appears, it indicates the approximate number of records left to be processed for all copies of the current data set on the specified writer.

If NAVAIL appears, a problem occurred while the writer was processing the current data set. The system's statistics for this data set are not valid. The count of the number of records left to be processed for the data set is not available.

**APRX=**
- Traditional writer (non-FSS writer). The specified values in the field have the following meanings:
  - *nnnnnnnnR*
    - Specifies the approximate number of records remaining in the current data set that have not been sent to the device's page buffer.
  - *nnnnnnnnP*
    - Specifies the number of pages that are in the device's page buffer. (Each page with copy grouping is counted only once.) If *nnnnnnnnP* appears without *nnnnnnnnR*, the last record for the last copy of the current data set has been sent to the device.

**APRF=**
- This field is included in the message for all FSS supported printers in response to the ‘P’ parameter on the input command.
  - *nnnnnnnnR*
    - Specifies the approximate number of records remaining in the current data set that have not yet been printed.
  - *nnnnnnnnP*
    - Specifies the approximate number of pages remaining in the current data set that have not yet been printed.
NAVAIL

If this appears, the page and record counts were unavailable (that is, there is no current data set in the transfer station).

**System action:** JES3 processing continues.

An attempt to update the JESNEWS data set was unsuccessful. The security product returned a security failure and the action was not permitted.

System action: The JESNEWS update was not performed. Processing continues.

Operator response: Notify the system programmer or security product administrator.

Programmer response: Notify the security administration to perform the appropriate security product profile modifications needed to allow the update to take place.

Module:

Routing Code: Note 13, Note 18

Descriptor Code: 7

IAT7080

Explanation:

This message is issued in response to the *CALL,JESNEWS command.

System action: IATGRAN waits for further operator communication, if called, or reads the SYSIN data set, if processed.

Operator response: Issue a *START, *RESTART, or *CANCEL,JESNEWS command.

Module:

Routing Code: Note 18

Descriptor Code: 7

IAT7081

Explanation:

Processing has completed for a NEWS data set with the indicated results.

System action: IATGRAN returns control to JSS.

Operator response: None. This is an informational message.
IAT7082
Explanation:

JESNEWS PREVIOUS TEXT ADDED

IATGRAN has processed the most recent *START command and added the text to the appropriate NEWS data set.

System action: IATGRAN waits for an operator response.
Operator response: Issue the *START, *RESTART, or *CANCEL command as desired.

IAT7083
Explanation:

JESNEWS CALL PARAMETER—(parm)—IS IN ERROR

The parameter parm on the JESNEWS command is incorrect.

System action: IATGRAN is canceled.
Operator response: Reissue the *CALL command using the correct parameters.

IAT7084
Explanation:

JESNEWS CALL PARAMETER(S) MISSING—(parm)

The required parameters were not found on the *CALL,JESNEWS command.

System action: IATGRAN is canceled.
**IAT7085 • IAT7086**

**Operator response:** Reenter the *CALL command using all the required parameters.

Routing Code: 10
Descriptor Code: 7

IAT7098

Explanation:

One of two errors occurred when the MVS/BDT communications interface FCT tried to get a network job by issuing an IATXOSBM TYPE=GET macro.

1. The network job must be transmitted using SNA protocols for MVS/BDT to process it. However, the destination node for the requested network job is not defined as a node that uses SNA protocols.
2. An authorization error occurred while attempting to get the network job.

System action: JES3 places the network job in operator hold.

Operator response: Notify the system programmer or the security product administrator.

Programmer response: Request a dump and analyze it to determine the reason for the error. See z/OS JES3 Diagnosis for information on how to interpret the dump.

If this message was issued because of an authorization error, see the SYSLOG for associated authorization failure messages from the security product.

</thead>
<tbody>
<tr>
<td>IATOSBM</td>
<td>IATOSBM</td>
<td>IATOSBM</td>
</tr>
</tbody>
</table>

Routing Code: 42
Descriptor Code: 7
Explanation:

Network streams are built by:
- input service when the network job originates at your node
- the store and forward function if the network job was transmitted by a path node
- output service when it is preparing a network stream to be transmitted.

If input service or store and forward prepare a network stream for transmission, both the job header and job trailer should be provided. Output service is responsible for preparing a network stream that will be transmitted. Output service requires the job header and job trailer in the network stream before it can be processed. Message IAT7099 is issued when output service found it necessary to build a job header or job trailer missing from the network stream.

**System action:** Output service builds the missing job header or trailer. Processing continues and the network stream will be prepared for transmission. However, information that may have been added to the job header or trailer by installation exit IATUX40 or IATUX43 is lost.

**Operator response:** Note the job number and the job name of the network job. Give the information to the system programmer so that if a problem exists, it can be corrected. JES3 networking and other JES3 processing continues.

**System programmer response:** This message can be issued because of one of the following reasons:
- Output service abending
  Determine if output service previously abended. If the output service abended, the job header or trailer may not have been built. This message is informational and is part of output service recovery processing.
- an error occurred during input service
  If a user submitted the network stream at your node, an error was encountered during input service processing that caused the job header or trailer not to be built. Determine the error from the information listed in Chapter 30, "Problem Determination," on page 1135.
- an error occurred during store and forward processing
  the store and forward DSP received a network stream that did not contain the job header or trailer data set. Determine the error from the information listed in Chapter 30, “Problem Determination,” on page 1135.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135, Table 1, items 3, 4, and 13. Also see Table 3, item 4.

</table>

Routing Code: Note 13 Descriptor Code: 7

IAT7103
Explanation:

>>> JOB — jji (jobid) — ON— devname (devnum) — AWAITING SYNCHRONIZATION FOR JOB TRAILER

An error occurred causing the FSS address space to release all data sets from that point on the printer’s queue. It is necessary to send a job trailer and/or JESNEWS for the job identified in the message. If a device number devnum does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

In the message text:

jjj The name of the job active on the device when the error occurred.

jobid The id of the job active on the device when the error occurred.

devname The device name.

dev The device number

System action: The writer DSP waits until all the data sets are released and then sends a job trailer or JESNEWS to the device.

Operator response: If this message remains outstanding for a long time (as shown on the output for the *INQUIRY,R,WTR command), end the writer DSP with a dump. Provide both dumps (JES3 and the FSS address space) to the system programmer.

System programmer response: Analyze the dumps to determine the problem.

<td>IATCNIA</td>
<td>IATCNIA</td>
</tr>
</tbody>
</table>

**Routing Code:** Hardcopy Log  
**Descriptor Code:** –

---

**IAT7108**

**Explanation:**

```plaintext
➤➤ ERROR FROM CONVCON MACRO FOR CONSOLE ' — consname—' ,RC= xx ,RSN= xx —
➤— CURRENT CNDB REPLACED BY DEFAULT— CNDB, FCT= xxxxxxx
```

Following the migration to JES3 5.2.1, JES3 was not able to successfully validate the console name contained in the CNDB passed to the IATXCNDB service. The CONVCON service JES3 uses to validate the console name, returned with the indicated return and reason codes. This message does not necessarily indicate an error condition. Rather, it is intended to provide a record in the hardcopy log that a default CNDB substitution has been performed. For example, if a console defined to JES3 in the initialization stream on a JES3 SP 5.1.1 system is not defined to MCS in CONSOLxx using a console NAME on the JES3 5.2.1 system, JES3 will be unable to route messages for restarting DSPs to the same console. 

`consname` is the console name used by the prior JES3 system. The FCT= will display the calling FCT name if the IATXCNDB service is running under the JES3 NUC task. FCT= N/A will be displayed if the IATXCNDB service is running under a user address space.

**System action:** JES3 uses the dummy CNDB in place of the one passed on the IATXCNDB call. Subsequent processing for this command/message will use the dummy CNDB. Commands issued using the dummy CNDB will use console name INTERNAL. Messages issued using the dummy CNDB will be recorded only in the hardcopy log.

**Operator response:** None.

**System programmer response:** If console names changed as part of the migration to JES3 5.2.1, called DSPs may be canceled and then called again to restore message routing.

The return and reason codes from the CONVCON service are contained in the message text. See [z/OS MVS Programming: Assembler Services Reference ABE-HSP](https://www.ibm.com/support/knowledgecenter/SSD79A_12.1.0/com.ibm.zos.v1r12.bsh.control.doc/a_zos_mvs_programming.html) for a description of these codes.

**IAT7109**

**Explanation:**

```plaintext
➤➤ AN ERROR OCCURRED PROCESSING A IATXMLWO REQUEST. THE REASON CODE INDICATES:
```

---

Chapter 16. Console Service Messages 661
An error occurred while processing an IATXMLWO request to build or cleanup a multi-line message. This message is embedded in the IAT3713 multi-line message as part of the JES3 failure logout for failure code DM761.

System action: The DSP's JESTAE exits, if any exist, are invoked. If no JESTAE exit exists, or none of the JESTAE exits request retry, the DSP is ended.

Operator response: See message IAT3713

Module:

Routing Code: 10
Descriptor Code: 3

IAT7111
Explanation:

DLOG ADDRESS SPACE CREATE FAILED, RETURN CODE=rc, REASON CODE=rsn.

The installation has requested that JES3 maintain the hardcopy log (DLOG), however JES3 was unable to create the JES3DLOG address space using the ASCRE system service. The return and reason codes indicate the specific error encountered.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

Module:

Routing Code: 10
Descriptor Code: 7

IAT7112
Explanation:

UNABLE TO CREATE DLOG RESMGR, RETURN CODE=rc, REASON CODE=rsn.

The installation has requested that JES3 maintain the hardcopy log (DLOG), however JES3 was unable to create the resource manager for the JES3DLOG address space using the RESMGR system service. The return and reason codes indicate the specific error encountered.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

IAT7113
Explanation:

>:: DLOG INITIALIZATION FAILED

The installation has requested that JES3 maintain the hardcopy log (DLOG). While waiting for the JES3DLOG address space to initialize, it instead terminated.

System action: The JES3 DLOG is disabled.

Operator response: Notify the system programmer.

System programmer response: Contact the IBM Support Center.

Module:

Routing Code: 10  Descriptor Code: 7

IAT7114
Explanation:

>:: DLOG INITIALIZATION SUCCESSFUL

The installation has requested that JES3 maintain the hardcopy log (DLOG). The DLOG function has been successfully activated.

System action: JES3 begins recording the sysplex hardcopy message log to DLOG.

Operator response: None. This is an informational message.

Module:

Routing Code: 42  Descriptor Code: 7

IAT7122
Explanation:

>:: WAITING FOR THE DLOG ADDRESS SPACE— TO— INITIALIZE— TERMINATE

JES3 is waiting for the JES3DLOG address space to complete either initialization or termination.

System action: JES3 continues waiting for the JES3DLOG address space to initialize or terminate. When either of these events occurs, JES3 deletes this message.
IAT7123 • IAT7124

Operator response: If JES3DLOG initialization is taking too long:
1. Dump the JES3DLOG.
2. Then issue a FORCE command.

This will end the JES3DLOG address space and allow JES3 initialization to continue.

System programmer response: None.

IAT7130

Explanation:

cmd— REJECTED,— reasontext

The named command was rejected for one of the following reasons:

ALL INVALID ON REPLY
This command cannot be used to respond to write-to-operator-with-reply (WTOR) requests.

JES INIT INCOMPLETE
The command was received before JES3 initialization was complete.
The command was not recognized.

The cited text exceeded the allowable number of characters.

A DSP was referenced by name while more than one copy was active. The reference must be made by device name, device number, or job number.

The named device does not exist or is not currently allocated.

The named DSP was not logged into console service.

The message could not be accepted by the cited DSP.

The command is not recognized by the IC DSP.

A *SWITCH command could not be implemented because the cited RJP console was already switched.

A *SWITCH restore command was ignored because the console was not previously switched.

The named console does not exist.

A DSP message appendage routine was abended.

The command is not authorized from the requesting console, or the JES3 command issued is not valid on local processors.

A DSP requested the queueing of a command or reply, but there are no buffers available.

Either a command was directed to a local processor which can only be processed on the global, or a command for the global was entered while JES3 on the global was not available.

The command contains a syntax error.

A *SWITCH command was rejected because the receiving console was not active.

A *RETURN command was issued to end JES3 but the command was rejected because dynamic device reconfiguration (DDR) was active. When DDR is active, you cannot end JES3 without affecting MVS as well.
WTR FSS/FSA INACTIVE
The message was not accepted by the WTR DSP because the associated FSS or FSA was not active when the command was entered.

DEVICE NOT YET ACTIVE
The message was not accepted by the WTR DSP because the device was not yet initialized when the command was entered.

PREV WTR CMD ACTIVE
The message was not accepted by the WTR DSP because previous command processing had not completed.

WTR SETUP IN PROGRESS
The message was not accepted by the WTR DSP because the device setup (operator intervention) was initiated but message IAT7030 was not yet displayed.

INVALID DESTINATION
A *MESSAGE command could not be honored because the destination was incorrect.

NJECONS NOT ACTIVE
A *SEND or *MESSAGE command was issued to a networking destination but was rejected because console communication has not been established with the other node.

QUALIFIER TOO LONG
A *MESSAGE or *SEND command was rejected because the qualifier exceeded the allowable number of characters.

NO TEXT SPECIFIED
A *MESSAGE or *SEND command was rejected because there was no text specified.

INVALID QUALIFIER
A *MESSAGE or *SEND command was rejected because the qualifier was incorrect.

AMBIGUOUS DEV NUMBER
This message is issued in response to an *S, *R, or *C command that specified an ambiguous device number. Issue an *INQUIRY,D,D=devnum command to obtain the unique identifier (JNAME) for the required device.

NO FSS DEFINED
FSS= was specified on a *RETURN command, but no FSS has been defined to JES3.

INVALID FSS NAME [LIST]
An incorrect combination of parameters was specified with the FSS= keyword on a *RETURN command.

fssname NOT FOUND
FSS= was specified on a *RETURN command, but the named FSS could not be located.

fssname NOT ACTIVE
FSS= was specified on a *RETURN command, but the named FSS is inactive.

operand INVALID
The indicated operand is incorrect.

INVALID LENGTH
A JES3 command was entered containing too many characters. JES3 will only accept a command of 80 characters or less for most commands. See z/OS JES3 Commands for information about those commands that support greater than 80 character length.

TRACE ID IS MISSING
You did not select any JES3 GTF trace records when you issued the *TRACE,ON command. GTF records are selected by specifying a function id on the *TRACE command. See z/OS JES3 Diagnosis for the syntax of the *TRACE command.

TRACE COMMAND FAILURE
The trace command failed.

CLEAR PRT IN PROGRESS
The requested device is undergoing clear print processing.

RJP OPERAND NOT VALID
The command was issued from a remote (RJP) workstation. During default command authorization checking,
JES3 determined that either an operand and/or parameter is missing (for example, JES3 detected too many spaces), or the specified device and/or job is not associated with this remote (RJP) workstation.

**DEVICE IN USE**
The device specified in the command is already allocated to another MVS component.

**MCS SERVICE REQ ERROR**
The device specified in the command could not be obtained or released because of an MCS service request error.

**ALLOC ERR,RC=return code,E=error code**
The device specified in the command could not be obtained because of a dynamic allocation error described by the given *return code* and *error code*.

**MCS REQ & UNALLOC ERR**
The device specified in the command could not be obtained because of an MCS service request error and also cannot be released because of a dynamic unallocation error.

**UNALLOC ERR,RC=return code**
The device specified in the command could not be released because of a dynamic unallocation error as described by the given *return code*.

**CONSOLE NOT ACTIVE**
The console specified on the *MESSAGE command is not active.

**CANCELLED BY OPERATOR**
An *FAIL command was issued for an FCT name and there is more than one FCT with the given name. When JES3 requested the operator to choose from a list of FCTs with the given name, the operator replied NONE.

**FCT NO LONGER ACTIVE**
An *FAIL command was issued for an FCT name for which multiple FCTs exist. JES3 requested the operator to choose from a list, but the selected FCT ended.

**SOCKET OR NODE REQD**
A *S,TCP command was issued but did not specify either the SOCKET=socket or NODE=node parameter. One of these is required.

**SOCKET REQUIRED**
A *C,TCP command was issued but did not specify the SOCKET=socket parameter. This parameter is required.

**NODE NOT TCP/IP**
A *S,TCP,NODE=node command was issued but the specified node is not defined with TYPE=TCP/IP.

**NO ELIGIBLE SOCKET**
A *S,TCP,NODE=node command was entered but rejected, because there is no socket eligible to start a session with the requested node. To make the socket eligible, all of the following requirements must be met:
- The socket is defined with NODE=, which specifies the requested node.
- The Netserv that the socket runs under is active.
- The socket is not active.

**EXTRANEOUS CHARACTERS**
A command was issued with extraneous characters.

**ALL SOCKET(S) ACTIVE**
A *S,TCP,NODE=node command was entered but rejected, because all sockets defined for the node are currently active.

**NO SOCKET(S) DEFINED**
A *S,TCP,NODE=node command was entered but rejected, because there is no socket defined to start a session with the requested node. A socket must be defined by using the *F SOCKET,ADD=’ command.

**NODE NOT ACTIVE**
The node specified on a *C TCP,NODE= command has no active sockets.

**System action:** The command is ignored.

**Operator response:** Correct the error, and reissue the command. If NJECONS NOT ACTIVE was indicated, issue the *CALL,NJECONS* command to establish communication with the other nodes in your network.

**Module:**

668  z/OS V2R1.0 JES3 Messages
IAT7131

Explanation:

This message, issued in response to the *CALL,NJECONS command, indicates that the NJECONS DSP is active.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCNJ</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7131

Explanation:

This message, issued in response to the *CANCEL,NJECONS command, indicates that the NJECONS has ended.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCNJ</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7134

Explanation:

JES3 detected that nn% (70%, 80%, or 90%) of the non-reserved buffers of the console buffer cell pool are in use. JES3 uses this cell pool for non-action messages and commands. This is an action message.
IAT7136 • IAT7138

System action: JES3 continues. Message IAT7141 is also displayed and lists the three FCTs with the most commands queued to them.

Operator response: Determine if this is a problem and, if necessary, take action to remove the source of the problem. For example, if a job is issuing the commands, consider canceling it.

System programmer response: If appropriate, correct the source of the commands or messages (for example, an installation exit).

Programmer response: If a job is the source of the commands or messages, correct it.

Module:

<table>

Routing Code: 2, 10
Descriptor Code: 2, 7

IAT7136
Explanation:

>>> JES3 GTF TRACE STATUS—TRACE ID TRACE NAME STATUS— traceid tracename status

The variable text in the message provides the following information:

- **traceid**
  - is the trace identification number

- **tracename**
  - is the trace name

- **status**
  - is ACTIVE if the trace is active or INACTIVE if the trace is inactive.

System action: JES3 continues processing.
Operator response: None. This is an informational message.

IAT7138
Explanation:

>>> SECURITY CHECK FAILED - JES3 COMMANDS— NOT PERMITTED FROM NODE— nodename

A security check failed with a return code of 8 which indicates the processing was unsuccessful and the command was rejected.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

Module:
IAT7140  •  IAT7141

Routing Code: Note 20
Descriptor Code: 7

IAT7140
Explanation:

The operator issued a command either to transfer the assignment of one RJP console to another or to restore a RJP console to its original assignment.

System action: Output for the switched console is rerouted to the new destination.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7141
Explanation:

JES3 issues this message to accompany IAT7134. It indicates the three FCTs that have the most commands queued to them and the number of queued commands (nnnn). If fewer than three FCTs have queued commands, the message displays fewer FCTs. Each FCT is identified by a DSP name and, optionally, a GETUNIT DD name. If an FCT has more than 9999 queued commands, JES3 displays the number 9999.

In the message text:

dspname
The name of the FCT with queued commands.

devname
The device name associated with the FCT (if any).

nnnn
The number of queued commands (maximum of 9999).

System action: JES3 continues.

Operator response: Determine if this is a problem and, if necessary, take action to remove the source of the problem. For example, if a job is issuing the commands, consider canceling it.

System programmer response: If appropriate, correct the source of the commands or messages (for example, an installation exit).

Programmer response: If a job is the source of the commands or messages, correct it.

Module:
IAT7142 • IAT7145

Routing Code: 2, 10
Descriptor Code: 4

Explanation:

PATH TO nodename NOT ACTIVE. COMMAND MESSAGE DISCARDED

JES3 attempted to send a message to the specified node but an active path to the node does not exist.

System action: The transmitted message is lost.

Operator response: If the message was entered at a terminal in your installation, reenter the *MESSAGE command with the correct destination node.

***** text ***** INVALID COMMAND

The text specified in the message is an incorrect command for the local JES3 node.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCNNJ</td>
<td>IATCNNJ</td>
<td>IATCNNJ</td>
</tr>
</tbody>
</table>

Routing Code: Note 17
Descriptor Code: 7

Explanation:

NJECONS HAS ABENDED. COMMAND/MESSAGE DISCARDED ALL COMMANDS/MESSAGES LOST.

While processing a nodal message record (NMR), networking encountered an error that caused the NJECONS DSP to abend. COMMAND/MESSAGE DISCARDED indicates the NJECONS DSP was able to recover from the error and the NMR was discarded. Networking will continue to process any NMRs. ALL COMMANDS/MESSAGES LOST indicates the NJECONS DSP was unable to recover from the error and the DSP must end.

System action: If COMMAND/MESSAGE DISCARDED appears in the message, the NJECONS DSP will continue to process any commands and messages that the network must process. If ALL COMMANDS/MESSAGES LOST appears in the message, the network will not process any commands or messages. JES3 processing continues.

Operator response: If ALL COMMANDS/MESSAGES LOST appears in the message, issue a *CALL NJECONS to
restart a NJECONS DSP so that commands and messages can be processed at your node. Contact the system programmer.

**System programmer response:** Use the abend code and [z/OS JES3 Diagnosis](#) to determine the error.

**Module:**

IAT7151 • IAT7153

IAT7151

Explanation:

► MORE THAN ONE FCT NAMED—fctname—EXISTS ►

An *FAIL,fctname command was issued, but the FCT is not unique. JES3 requires you to specify which one to fail.

In the message text:

FCTNAME
The name of the FCT that the operator requested to fail.

System action: JES3 issues IAT7152 for each FCT with the given name, then JES3 issues IAT7153 and waits for you to select an FCT from the list.

Operator response: See messages IAT7152 and IAT7153.

Module:

Containing        Detecting        Issuing
IATCNIN           IATCNIN          IATCNIN

Routing Code: 1    Descriptor Code: 7

IAT7152

Explanation:

► selno—fctaddr—awrc—awrtext ◄

This message displays information about an FCT that was specified on the *FAIL,fctname command, along with a selection number that can be used to select the FCT in reply to message IAT7153.

This message contains a header line with fixed text and two or more data lines for particular FCT information.

In the message text:

selno The selection number. The header contains the text SELNO.

fctaddr The address in storage of the FCT. The header contains the text FCT ADDR.

awrc A reason code indicating why the FCT is waiting. The header contains the text AWRC.

awrtext The text associated with the AWAIT reason code. The header contains the text AWAIT REASON TEXT. See z/OS JES3 Diagnosis Reference for a list of different AWAIT reason codes and associated text.

System action: JES3 processing continues. JES3 issues message IAT7153 next.

Operator response: Using the selection number displayed for each FCT, determine the reply to IAT7153.

Module:

Containing        Detecting        Issuing
IATCNIN           IATCNIN          IATCNIN

Routing Code: 1    Descriptor Code: 7

IAT7153

Explanation:

► REPLY WITH SELECTION NUMBER,—'NONE' TO CANCEL, OR—'LIST' TO REPEAT LIST ◄
All FCTs with the name specified in the "FAIL, fctname" command have been displayed and JES3 is requesting a selection of which one to fail.

**System action:** JES3 waits for a response. No other commands can be issued at this point, but all JES3 processing that does not require commands to be entered continues.

**Operator response:** Reply with a selection number (as shown in the IAT7152 messages). To display the IAT7152 messages again, reply LIST. If you do not want to fail any of the FCTs listed, reply NONE.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATCNIN</td>
<td>IATCNIN</td>
<td>IATCNIN</td>
</tr>
</tbody>
</table>

**Routing Code:** 1  
**Descriptor Code:** 7

---

### IAT7154

**Explanation:**

>>>—REPLY IS NOT ONE OF THE ALLOWED VALUES,—RE-ENTER REPLY

Message IAT7153 was issued and the operator reply was not valid, either because it was a number outside the range of the selection numbers presented in the IAT7152 message list, or because it was neither LIST nor NONE.

**System action:** JES3 repeats message IAT7153.

**Operator response:** Reply to IAT7153 correctly.

**Module:**

<table>

### IAT7155

**Explanation:**

>>> A STAGING AREA WAS RECEIVING FROM— sender text

*sender* is one of the following:

- **JOB jobname (jobid)**
- **ASID (asid)**

*text* is:

- THAT DID NOT HAVE AN S34 CONTROL AREA

JES3 console services received incorrect data while processing the JES3 command staging area queue.

**JOB jobname (jobid)**

This text is displayed if the staging area originated from a job. The message indicates the job name and job number.

**ASID (asidno)**

This text is displayed if the staging area did not come from a job. The message indicates the address space number of the sender.
IAT7175 • IAT7181

THAT DID NOT HAVE AN S34 CONTROL AREA

The S34 control area did not contain the correct acronym and therefore could not be identified.

jobname the job name
jobid the job id
asidno the address space number of the sender.

System action: JES3 ignores the command.
Operator response: None. This is an informational message.

Module:

Chapter 17. Dump Job (DJ) Messages

IAT7200
Explanation:

As a result of either a "CANCEL command or an internal error, the indicated dump job DSP is ending. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number, and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a tape device number. If an internal error occurred, a diagnostic message preceded this message.

System action: The indicated dump job DSP cleans up and ends.
Operator response: None. This is an informational message.
Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJOB</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7201
Explanation:

JES3 has detected that a Dependent Job Control network that was submitted on a release that does not support job numbers greater than 65,534 has been read into the system through Dump Job. This message is a warning that until this net has completed, you should not attempt to increase the job number range beyond 65,534.

In the message text:

- dev The tape device number for the Dump Job DSP.
- jobid The job identifier for the Dump Job DSP.
- netname The name of the net.

System action: JES3 Dump Job processing continues.
Operator response: Notify the system programmer.
System programmer response: If you have not made plans to increase the job number range beyond 65,534, no immediate action is needed. If you make plans to increase the job number range, you must either wait for this net to complete or cancel it. If you increase the job number range beyond 65,534 while the net is still in the system, and any job within the net is resubmitted and assigned a job number greater than 65,534, the job will fail with message IAT6179.

</tbody>
</table>

Routing Code: Note 18

© Copyright IBM Corp. 1988, 2013
The dump job DSP has detected a syntax error in the operator command that was just entered. *err* indicates the parameter on the command that JES3 was processing when the error occurred. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a tape device number.

**System action:** If the command was *CALL, the indicated dump job DSP issues message IAT7200 and ends. If the command was *START, the dump job DSP waits for the command to be entered again.

**Operator response:** Correct and reenter the command.

**Module:**

</table>

**Routing Code:** Note 18

**Descriptor Code:** 7

---

**IAT7205**

**Explanation:**

The *CALL command contained both or neither of the operands IN and OUT. Djdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

**System action:** The dump job DSP issues message IAT7200 and ends.

**Operator response:** Issue the *CALL command for the dump job DSP again, specifying one and only one processing mode.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDTS</td>
<td>IATDJOB</td>
<td>IATDJDTS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18

**Descriptor Code:** 7

---

**IAT7206**

**Explanation:**

For nonserver mode requests (SERVER=NO was specified on the *CALL command), the GETUNIT macro issued for the device specified in the processing mode operand of the *CALL command took the error return or did not return a tape device. Or the DEN= parameter specified a density that is incorrect for the type of tape specified.

For server mode requests (SERVER=YES was specified on the *CALL command), the dynamic allocation for the device failed because the device is not valid or is not available.

Djdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape device has not yet been allocated, then the characters ### are displayed instead of a device number.

**System action:** The dump job DSP issues message IAT7200 and ends.

**Operator response:** Issue the *CALL command for the DJ DSP again, specifying a valid tape device with a density valid for the input or output device.

**Module:**
IAT7207 • IAT7208

Routing Code: Note 18
Descriptor Code: 7

IAT7207

Explanation:

The GETUNIT macro issued for the device specified in the processing mode operand of the *CALL command took the NAVAIL return. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

System action: The dump job DSP examines the DSP NAV option, and either ends or is rescheduled when the device becomes available, depending on the option. This message is followed by message IAT7200 or message IAT7208.

Operator response: Either issue the *CALL command for the DJ DSP again, specifying a different tape drive, or wait until the required device is available.

Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7208

Explanation:

The requested tape drive was unavailable, and the DSP NAV option was R. This message is preceded by message IAT7207. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters ### are displayed instead of a device number.

System action: JES3 places the dump job DSP in specialized rescheduling, with the requested tape drive as its only requirement.

Operator response: Wait until the dump job DSP is assigned its required tape drive (announced by the LOGIN message), and continue.

Module:
IAT7209
Explanation:

More than one job-range operand was specified in the *START command.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 requesting a new *START command or a *CANCEL command, and then waits for a command to be entered.

Operator response: Decide upon one job range, and enter the *START command again with that operand.

Module:

Containing

**Routing Code:** Note 18  
**Descriptor Code:** 7
IAT7214
Explanation:

A tape must be mounted on unit dev for dump job DSP input or output processing. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP waits for a *START command to be entered once the tape has been mounted and readied.

Operator response: Mount and ready a tape for dump job's use on the specified tape device and enter a *START command.

Module:

IAT7215
Explanation:

A tape has been mounted for output mode processing but the tape needs a write ring before processing can continue. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP rewinds and unloads the tape and waits for it to be mounted again.

Operator response: Insert a write ring in the tape volume on specified device, and mount the volume on the device.

Module:

IAT7216
Explanation:

An operator command other than *START or *CANCEL has been entered. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP waits for a new command.

Operator response: Enter either a *START or *CANCEL command.

Module:

IAT7222

Explanation:

➤➤ DJdevnum (jobid):— END-OF-VOLUME ON UNIT— dev— WHILE DUMPING JOB— jobname (jobid)➤➤

An EOF condition occurred while writing the indicated job to tape. 

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP temporarily suspends processing on the job and issues message IAT7223 requesting a new tape be mounted on the same tape drive.

Operator response: Wait for message IAT7223 and take the action indicated by the message.

Module:

Containing  Detecting  Issuing
IATDJD T  IATDJO T  IATDJD T

Routing Code: Note 18
Descriptor Code: 7

IAT7223

Explanation:

➤➤ DJdevnum (jobid):— MOUNT VOLUME NUMBER— nn— ON UNIT— dev➤➤

The indicated tape must be mounted on unit dev to process multiple volume DJ files. This message is preceded by message IAT7222, indicating that processing is suspended until a new tape is mounted.

DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP waits for a tape to be mounted on the specified drive. Once a tape is mounted, the dump job DSP resumes dumping the job that it was processing at the time it detected end-of-volume.

Operator response: Mount another tape for DJ output on device dev.

Module:

Containing  Detecting  Issuing
IATDJD T  IATDJO T  IATDJD T

Routing Code: Note 18
Descriptor Code: 2,7
IAT7224
Explanation:

>>> DJdevnum (jobid):— JOB— jobname (jobid)— CANNOT BE DUMPED - IS A MEMBER OF NET— djnet

The indicated job is within the job range specified on the *START command, but since it is a member of a DJC network, the job cannot be dumped by itself. To dump the job, the entire DJC network must be dumped. DJdevnum (jobid) indicates the dump job DSP that issued the message, where devnum is the tape device number and jobid identifies the DSP.

System action: The dump job DSP bypasses dumping the indicated job and continues processing if more jobs need to be dumped based on the specified job selection criteria.

Operator response: If the job must be dumped, wait for the current dump request to complete. Then, place the network in DJC network hold, and enter the *START,DJdevnum,N=djnet command to dump the entire DJC network.

Module:

<table>

IAT7229

Explanation:

DJdev (jobid): SUCCESSFULLY DUMPED FOR JOB jobname (jobid)

,NET—djnet

The indicated job has been successfully copied, control block by control block, to tape. If the job is a member of a DJC network, the name of the DJC network will be identified in the message text.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: Processing continues with the next job in the specified job range.

Operator response: None. This is an informational message.

Module:

Containing IATDJDJT
Detecting IATDJOT
Issuing IATDJDJT

Routing Code: Note 18
Descriptor Code: 7

IAT7230

Explanation:

DJdev (jobid): DUMP PROCESSING COMPLETE FOR NET—djnet
JOB RANGE—(jobid1-jobid2)
JOBCLASS—cls
PRIORITY_LEVEL—prty
DD_NAME—ddn
JOBS REQUEST
NETS REQUEST
ALL REQUEST

DJ successfully completed dump processing for the indicated category of jobs. All jobs in the indicated category that could possibly be dumped were dumped. However, there may have been some jobs that could not be dumped successfully. See the DJ message log for a list of which jobs were successfully dumped and which ones were not.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and either jobno or jobid identifies the DSP.

System action: Processing continues if the category of jobs is only a subset of the job range that was specified by the current *START command request. Otherwise, messages IAT7220 and IAT7228 are issued to ask for a new *START command or a *CANCEL command.

Operator response: When messages IAT7220 and IAT7228 are issued, either specify a *CANCEL command to end the DSP, or enter a new *START command.

Module:

Containing IATDJDJT
Detecting IATDJOT
Issuing IATDJDJT

Routing Code: Note 18
Descriptor Code: 7
IAT7231  •  IAT7232

IAT7231
Explanation:

Due to either an error or a *CANCEL command, DJ output processing was ended before normal completion of the
indicated category of jobs. If the job ended because of an error, this message will be preceded by a diagnostic
message.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and either
jobno or jobid identifies the DSP.

System action: If processing was ended prematurely by a *CANCEL command, the dump job DSP ends.
If processing was ended prematurely by an error and the indicated category of jobs is only a subset of the jobs
specified by the current *START request, DJ will attempt to continue. For example, if the current *START request was
a JOBS request and processing was canceled for priority level 14 jobs, DJ will attempt to continue dumping jobs in
the next priority level (for example, priority 13). If processing cannot be continued because of the severity of the
error, DJ ends the current *START request and issues messages IAT7220 and IAT7228 to prompt for a new *START
command or a *CANCEL command.

When processing of a specific job is canceled because of an error, DJ will always attempt to backspace over any
records for the job that had been written to tape before the error.

Operator response: If messages IAT7220 and IAT7228 are issued, either specify a *CANCEL command to end the
DSP, or enter a new *START command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJOT</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7232
Explanation:

While attempting to honor a DISP=PURGE request, DJ encountered a JCT entry without a purge scheduler element.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid
identifies the DSP.

System action: If possible, DJ attempts to continue dumping other jobs in the specified job range. Otherwise, DJ
ends the current *START request and issues messages IAT7220 and IAT7228 to request a new *START command or a
*CANCEL command.

Operator response: Notify your system programmer.

Problem determination: See Chapter 30, “Problem Determination,” on page 1135 Table I, item 29, and Table III,
items 4 and 14.
IAT7233

Explanation:

```
|--- DJdev (jobid):— DSN— IS NOT ALLOWED WITH SERVER=NO—|
```

The DSN= parameter is not allowed to be specified with SERVER=NO on the *CALL,DJ command.

DJdev (jobno) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters #### are displayed instead of a device number.

System action: The dump job DSP issues message IAT7200 and ends.

Operator response: Issue the *CALL,DJ command with correct syntax.

IAT7234

Explanation:

```
|--- DJdev (jobid):— JSAM DM— xxx— ERROR DETECTED—|
```

DJ received an error return code from the JES3 spool access method (JSAM) when attempting to read, write, or release a spool buffer. DMxx is the JES3 dump code associated with the error.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: If a job was being dumped when the error occurred, DJ ends processing of the job and issues messages IAT7231 to identify the job that failed. DJ backspaces over any data written to tape for the job. Additionally, if the job is a member of a DFC network, DJ ends processing for the entire network and issues message IAT7231 a second time to identify the network that failed. In this case, DJ does not backspace over the network jobs that were written to tape before the error. Thus, a partial dump of the network may exist on the tape.

If possible, DJ attempts to continue dumping other jobs/networks that meet the selection criteria specified on the current *START request. If DJ cannot continue, DJ ends the current *START request and issues messages IAT7220 and IAT7228 to request a new *START command or a *CANCEL command.

Operator response: Notify your system programmer. If messages IAT7220 and IAT7228 were issued, enter a *CANCEL command to end the dump job DSP or a new *START command request to continue processing.

Programmer response: See z/OS JES3 Diagnosis for a description of the indicated DMxxx code and the appropriate action to be taken.

Problem determination: See Table I, items 18 and 30, Table III, item 4.

Module:
IAT7235

Routing Code: Note 18
Descriptor Code: 7

Explanation:

The header portion of a record that was read from the input tape contains unexpected data or indicates that the input is not at the expected level. One of the following error reasons will be appended to the message:

**INVALID RELEASE LEVEL** $fmid$
the release level in the header $fmid$ is not the expected release level.

**INVALID DATA LEVEL** $hdrlvl$ $djclvl$
the input data was translated from another JES3 release or is being translated from another release. The IATDJCR level field in the header $hdrlvl$ however does not match the level field in the front end of module IATDJCR in the current release $djclvl$. The input data is therefore not at the right level and cannot be restored.

**“DUMP JOB” LABEL MISSING**
the header record does not contain the identifier “DUMP JOB”.

**DATA LENGTH MISMATCH**
the data length in the header does not match the length that was actually read.

**INCORRECT REEL NUMBER**
the reel number in the header is not the tape reel number that was expected.

**JOB NUMBER MISMATCH**
the job number in the header is not the job number that was expected.

**RECORD OUT OF SEQUENCE**
the record number in the header is not the record number that was expected.

$Djdev$ ($jobid$) indicates the jump job DSP that issued the message, where $dev$ is the tape device number and $jobid$ identifies the DSP.

System action: If the input is at the wrong release level or contains the wrong level of data, the dump job DSP ends. In all other cases, the dump job DSP ends only the job that was being processed and spaces forward to the next file to continue processing the next job in the specified job range.

Operator response: Notify the system programmer.

Programmer response: Enter the *CALL,TD command to invoke the TD DSP. Then enter the *START,TD,...,M=H command to dump the erroneous tape file. Examine the 80-byte record header for the indicated problem.

Problem determination: See Table I, item 29, and Table III, item 4.

---

IAT7242

Explanation:

```plaintext
>>> DJdev (jobid):— JOB jobname— IS A MEMBER OF NET djnet
```

The job specified in a *START,DJdev,J= command is a member of the specified network and cannot be retrieved separately.

**DJdev (jobid)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a *START command or *CANCEL command.

**Operator response:** Either issue a *START,DJdev,N=djnet,... command to dump the network that includes the indicated job or issue a *CANCEL command to cancel the Dump Job DSP.

**Module:**

---

IAT7243

Explanation:

```plaintext
>>> DJdev (jobid):— NO JOBS OF PRIORITY— jobname— LEVEL—prty— FOUND
```

In response to a *START,DJdev,P= command, no jobs of the specified priority level could be found on the tape.

**DJdev (jobid)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a *START or *CANCEL command.
IAT7244 • IAT7245

Operator response: Either specify a different job range, or cancel the dump job DSP.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATD]DT</td>
<td>IATDJIN</td>
<td>IATD]DT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

Explanation:

In response to a *START,DJdev,DD=ddn command request to dump jobs with data on spool data set ddn, the specified spool data set is not defined to JES3. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for another *START command or a *CANCEL command.

Operator response: Reissue a *START command with another request, or a *CANCEL command to end the dump job DSP.

Module:

</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7249
Explanation:

>>> DJdev (jobid):— CURRENT JES3 BUFSIZE— nnn— <— INPUT TAPE BUFSIZE— nnn—

The JES3 buffer size of the system which created the input tape is different from the buffer size of the current JES3 system. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the job DSP.

System action: If the inequality is less than (<), the dump job DSP issues message IAT7250 and then ends the
IAT7250 • IAT7251

*START request currently being processed. If the inequality is greater than (>), the dump job DSP continues
processing after issuing a warning message, IAT7251.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJIN</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 18

**Descriptor Code:** 7

---

**IAT7250**

**Explanation:**

```
>>-- DJdev (jobid):— PROCESSING ABORTED DUE TO— INSUFFICIENT BUFFER SIZE—
```

The current JES3 buffer size is smaller than that of the JES3 system which created the input tape. This message is
preceded by message IAT7249.

**DJdev (jobid)** indicates the dump job DSP that issued the message, where dev is the tape device number and jobid
identifies the DSP.

**System action:** The dump job DSP ends processing the current *START request and issues messages IAT7220 and
IAT7228 to prompt for a new *START command or *CANCEL command to be entered.

**Operator response:** Notify the system programmer. Issue a *START command to continue processing or a *CANCEL
command to end DJ processing.

**Programmer response:** If it is necessary to restore the jobs from the input tape to the current JES3 system, the buffer
size of the current JES3 system will have to be changed so it is equal to or larger than the buffer size that was used
to create the tape. This will require a cold start.

**Module:**

IAT7252

Explanation:

>>> DJdev (jobid):-- JOB-- jobname (jobid)-- CANNOT BE DUMPED - IT IS A CALLED DSP

The indicated job is within the range of jobs to be dumped, but the job cannot be dumped because DJ does not support dumping called DSPs.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape unit address and jobid identifies the DSP.

System action: The dump job DSP bypasses dumping the job and continues processing if there are more jobs to be dumped based on the job selection criteria that was specified.

Operator response: None. This is an informational message.

Module:

Containing Detecting Issuing
IATDJDIT IATDJOT IATDJDIT

Routing Code: Note 18
Descriptor Code: 7

IAT7253

Explanation:

>>> DJdev (jobid):-- nnn-- JOB-- $-- SUCCESSFULLY DUMPED TO TAPE

This message is a summary message that indicates the number of jobs that were successfully dumped in response to a *START command request in output mode.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: DJ processing of the current *START command request is complete. The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

Operator response: Issue a new *START command to continue processing or a *CANCEL command to end DJ processing.

Routing Code: Note 18

Descriptor Code: 7

IAT7257

Explanation:

Field: DJdev (jobid):— ERROR WRITING— blkname— FOR JOB— jobname— TO SPOOL - DMxxx—

DJ received a JSAM error return code on an attempt to write a control block or chain of control blocks to spool. DMxxx is the JES3 dump code associated with the error.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP ends processing of the indicated job, and continues processing with the next job in the job range. This message is followed by message IAT7280 to indicate that restore processing is ended for the indicated job. However, if the job is a member of a DJC network, the dump job DSP does not end processing for the entire DJC network but marks the indicated job “FAILED” in an appropriate network control block (NCB).

Operator response: Notify the system programmer.

Programmer response: See z/OS JES3 Diagnosis Reference for a description of the indicated DMxxx code and the appropriate action to be taken.

Problem determination: See Table III, item 4.

Explanation:

The restore attempt was failed by SAF checking. Ensure that the job owner has authority to enter jobs into JES3 using the specified job class. For more information, refer to z/OS JES3 Initialization and Tuning Guide

System action: The dump job DSP ends restoring the indicated job and processing continues with the next job in the job range.

Operator response: Notify your system programmer.

Programmer response: See Chapter 30, “Problem Determination,” on page 1135. Search the Problem Repository Data Base for a fix for this problem. If a fix does not exist, contact the IBM Support Center.

IAT7264 • IAT7265

IAT7264
Explanation:

|-- DJdev (jobid):-- END-OF-TAPE ENCOUNTERED

The DJ tape EOF mark was encountered.

System action: The dump job DSP ends input processing and issues messages IAT7220 and IAT7228 to prompt for a new *START command or *CANCEL command.

Operator response: Issue a new *START command to continue processing or a *CANCEL command to end DJ processing.

Module:

IAT7265
Explanation:

|-- DJdev (jobid):-- END-OF-TAPE WHILE— READING JOB CLASS— cls

The end of the DJ tape was encountered while scanning the tape for more jobs in the specified job class.

System action: The dump job DSP ends restoring of jobs in the specified job class and issues messages IAT7220 and IAT7228 to prompt for a new *START command or *CANCEL command to be entered.

Operator response: Issue a *START command to continue processing or a *CANCEL command to end DJ processing.

Module:
IAT7266

Explanation:

This message is issued in response to a *START, DJdev, N=djnet command when the specified dependent job control (DJC) network djnet was found on tape but could not be restored because it already exists in the JES3 system. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for a *START or *CANCEL command to be entered.

Operator response: Wait until the current network ends, then reissue the *START command to restore the desired DJC network.

Routing Code: Note 18
Descriptor Code: 7

IAT7269

Explanation:

A tape error, spool error, translation error, or *CANCEL command occurred while dumping the network control
blocks for the indicated DJC network. In the case of a tape, spool, or translation error, this message is preceded by a
diagnostic message indicating the specific nature of the error.

DJ dev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid
identifies the DSP.

**System action:** In the case of a tape, spool, or translation error, the dump job DSP attempts to backspace over any
data for the indicated DJC network that was written to tape before the error. The dump job DSP ends dump
processing for the indicated DJC network and continues processing if there are more DJC networks or jobs that need
to be dumped. Based on the selection criteria specified on the current *START command request.

**Operator response:** Notify the system programmer.

**Programmer response:** See Chapter 30, “Problem Determination,” on page 1135.

**Problem determination:** See Chapter 30, “Problem Determination,” on page 1135.

---

**Explanation:**

A *START,DJdev,RESET command request cannot be processed because there are still other dump job DSPs active in output mode.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 to prompt for another *START command or a *CANCEL command to be entered.
**Operator response:** Either cancel the other dump job DSPs that are running in output mode, or allow them to complete. Then reissue the *START,DJdev,RESET command.

**Descriptor Code:** 7

---

**IAT7277**

**Explanation:**

```plaintext
➤➤ DJdev (jobid):— JOB CLASS— cls— IS NOT DEFINED TO JES3➤➤
```

In response to a *START command request to dump, restore, or reset jobs by job class, the job class that was specified by the C= parameter is not a job class defined to JES3.  
**DJdev (jobid)** indicates the dump job DSP that issued the message, where *dev* is the tape device number and *jobid* identifies the DSP.

**System action:** The dump job DSP issues messages IAT7220 and IAT7228 to prompt for another *START command or a *CANCEL command to be entered.

**Operator response:** Reissue the *START command with a valid job class specified on the C= parameter.

IAT7279

Explanation:

Error releasing control of job queue priority level — prt - rc

The indicated error return code rc was received from IATXJQE when attempting to release control of the indicated priority level. Djdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP ends processing of the current *START request and issues messages IAT7220 and IAT7228 to prompt for another *START command or a *CANCEL command to be entered.

Operator response: Notify your system programmer and reissue a *START command with another request or a *CANCEL command to end the Dump Job DSP.

Programmer response: See the z/OS JES3 Customization for a description of the error return code.

Problem determination: See Table III, item 4.

Module:

<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJOT</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18

Descriptor Code: 7

IAT7280

Explanation:

Restore processing aborted for — jobname — jobid — dnet

Due to either an error or a *CANCEL command, restore processing of jobs in the indicated category has ended before normal completion. If an error caused the job to end, this message will be preceded by a diagnostic message. Djdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and either jobno or jobid identifies the DSP.

System action: If processing was ended prematurely by a *CANCEL command, the dump job DSP ends.

If processing ended prematurely by an error and the indicated category of jobs is only a subset of the jobs specified by the current *START request, DJ will attempt to continue. For example, if the current *START request was a JOBS request and processing was canceled for a single non-DJC job, DJ attempts to continue restoring the next possible non-DJC job from the tape.

If processing cannot be continued because of the severity of the error, the dump job DSP ends the current *START request and issues messages IAT7220 and IAT7228 to prompt for a new *START command or a *CANCEL command.

Operator response: Depending on the nature of the abnormal job end, either cancel the dump job DSP with a *CANCEL command, or reenter the *START command with a new request.

Module:
IAT7281

Explanation:

DJ successfully completed restore processing for the indicated category of jobs. All jobs in the indicated category that could possibly be restored in the system are restored. However, there may have been some jobs that could not be restored. See the DJ message log data set.

When restoring jobs by job class or by priority level, DJ restores only the jobs in the specified job class that are grouped together in sequential order on the tape.

If all the jobs in the given job class or priority level are to be restored, reissue the "START command, using the OLD parameter.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and either jobno or jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for another "START command or another "CANCEL command.

Operator response: Issue the "START command to process another request or issue a "CANCEL command to end the dump job DSP.

Module:

IAT7282

Explanation:

No jobs were found when a "START,DJdev,JOBS command requested to retrieve all jobs that are not members of a DJC network.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The dump job DSP issues messages IAT7220 and IAT7228 to prompt for another "START command or a "CANCEL command to be entered.
**IAT7283 • IAT7285**

**Operator response:** Reissue a *START command with another request or a *CANCEL command to end the dump job DSP.

**Module:**

<table>
<thead>

---

**IAT7285**

**Explanation:**

```plaintext
>>> DJdev (jobid): OLD IS NOT ALLOWED WITH SERVER=YES
  -DEN=2 OR 5 IS NOT ALLOWED WITH SERVER=YES
  -NAV=C FORCED FOR SERVER=YES
  -DSN= IGNORED FOR OUT=, SERVER=YES
  -VOL= IGNORED FOR OUT=, SERVER=YES
  -VOL= REQUIRED WHEN DSN=—dsname—IS SPECIFIED
  -VOL= IS NOT ALLOWED WITH SERVER=NO
  -DSN= REQUIRED FOR IN=, SERVER=YES
```

This message is issued when there is a syntax error in the *CALL,DJ command for SERVER=YES request. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP. If a tape unit has not yet been allocated, then the characters #### are displayed instead of a device number.

**System action:** The dump job DSP ignores the incorrect parameter and continues processing if IAT7285 contains the following:

- NAV=C FORCED FOR SERVER=YES
- DSN= IGNORED FOR OUT=, SERVER=YES
- VOL= IGNORED FOR OUT=, SERVER=YES
- VOL= REQUIRED WHEN DSN=—dsname—IS SPECIFIED
- VOL= IS NOT ALLOWED WITH SERVER=NO
- DSN= REQUIRED FOR IN=, SERVER=YES

Otherwise, the dump job DSP issues message IAT7200 and ends.
**Operator response:**  If the dump job DSP ended, issue the \*CALL,DJ command with correct syntax.

- **Detecting**
  - IATDJOT
- **Issuing**
  - IATDJDT

**Routing Code:** Note 18

**Descriptor Code:** 7

---

**IAT7288**

**Explanation:**

```plaintext
>– DJdev (jobid): — TRANSLATION ERROR – error text —
```

DJ was invoked with the TRANS=YES parameter specified on the DJ \*CALL command. While translating a control block for a job or a DJC network, an error was detected as indicated by the error text. The error text is:

**DSP \[dspname\] UNDEFINED IN TARGET RELEASE**

While translating the JCT or JDAB for a job, DJ translation processing detected a scheduler element that could not be translated. The DSP associated with the scheduler element is not defined in the DSP dictionary in the target release.

DJ\[dev (jobid)\] indicates the dump job DSP that issued the message, where \[dev\] is the tape device number and \[jobid\] identifies the DSP.

**System action:** If DJ was invoked for input processing, the dump job DSP ends restore processing for the job or DJC network and then issues message IAT7280 indicating that the job or DJC network could not be restored. In the case of a job, the dump job DSP purges any data written to spool. The dump job DSP then continues restore processing if there are more jobs or DJC networks that need to be restored based on the selection criteria specified on the current \*START request.

If DJ was invoked for output processing, the dump job DSP ends dump processing for a job or DJC network and then issues message IAT7231 indicating that the job or DJC network could not be dumped. In the case of a job, the dump job DSP backspaces over any data written to tape. The dump job DSP then continues processing if there are
more jobs or DJC networks that need to be dumped based on the selection criteria specified on the current *START request.

Operator response: None. This is an informational message.

Routing Code: Note 18

Descriptor Code: 7

IAT7371

Explanation:

A previous request to dump the indicated DJC network failed and caused the network to be marked nondumpable. The network can no longer be dumped by DJ until a *START,DJdev;RESET,N=djnet command is issued to reset the DJ dump control flags for the network. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The DJ DSP bypasses dumping the indicated DJC network and continues processing if there are
more jobs or DJC networks that need to be dumped. This is based on the selection criteria specified on the current
*START request.

Operator response: If the network must be dumped, wait for the current *START request to complete, ensure there
are no other DJ DSPs active for output processing, and then enter a *START,Djdev,RESET,N=djnet command to reset
the network. When reset processing is complete, enter a *START,Djdev,N=djnet command to attempt to dump the DJC
network again.

IAT7385 • IAT7386

Descriptor Code: 7

IAT7385
Explanation:

>>> DJdev— (jobid):— LEVEL MISMATCH —— IATDJCR— level aparnum,— IATDJOR— level aparnum

RECOVERY

The TRANS=YES parameter was specified on the *CALL command to translate jobs between the current JES3 release and an old JES3 release. In preparing to setup for translation, DJ detected that the IATDJOR module describing job control blocks at the old release level is not at a compatible service level with the IATDJCR module in the current release level. The level and aparnum information included in the message for each of the modules indicates the maintenance level of the module and the number of the APAR that last caused the maintenance level to be changed. The maintenance level for the two modules must agree in order for translation to be performed successfully. DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

System action: The DJ DSP ends processing.

Operator response: Notify the system programmer.

Programmer response: Ensure that module IATDJOR is an up-to-date copy of IATDJCR from the old JES3 release. Then if the version of IATDJOR from the old release and the version of IATDJCR in the current release still are not at the same maintenance level, the module with the lowest maintenance level is the down level module and requires application of a PTF for the APAR identified by the up level module.

Problem determination: See Table I, item 29, TABLE III, items 4 and 7.

<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDJDT</td>
<td>IATDJOT</td>
<td>IATDJDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT7388
Explanation:

This message is written to the JESMSGLG data set for a job when DJ dumps the job to tape or restores the job from tape. jobid1 is the job number of the job before it was dumped and jobid2 is the new job number assigned to the job when it is restored.

If the job was migrated from an old release of JES3 to a new release of JES3, the JESMSGLG output may indicate only that the job was restored from tape, but not indicate that the job was dumped. On the other hand, if the job was migrated to an old release of JES3, the JESMSGLG output received under the old JES3 release may indicate only that the job was dumped to tape even though it also was restored.

DJdev (jobid) indicates the dump job DSP that issued the message, where dev is the tape device number and jobid identifies the DSP.

If the old jobid contains JOB******, it means that the job was dumped on a higher JES3 release and had a job number that was greater than 65,534.

**System action:** Once the job has been restored, it will continue execution.

**Operator response:** None. This is an informational message.

Module:

The specified job has been completed and purged from the system. Resources used by this job have been returned.

System action: Processing continues.

Operator response: None. This is an informational message.

Module: Containing Detecting Issuing
IATYDEL IATPURG IATPURG

Routing Code: Note 7
Descriptor Code: 7

IAT7451
Explanation:

>>> JOB—jobname (jobid)—IN PURGE WITH UNPROCESSED INTRDR—JOBS, REPLY WAIT OR CONTINUE

This message is issued during purge processing when unprocessed internal reader data sets are found for the job being purged.
Replying WAIT will pause purge processing for a short time to allow internal reader jobs to process. When the time interval expires message IAT7451 is presented again.
Replying CONTINUE allows purge processing of the job to proceed.

Note: Internal reader jobs can be lost or abends can occur with this reply.

System action: Purge processing waits for the operator to reply.

Operator response: Reply WAIT or CONTINUE.

Module: Containing Detecting Issuing
IATPURG IATPURG

Routing Code: 1
Descriptor Code: 7
IAT7452
Explanation:

This message is issued when an incorrect reply to message IAT7451 is entered.

System action: Message IAT7451 is reissued.
Operator response: None.

Chapter 20. BSC RJP Messages

IAT7500
Explanation:

RJP IS ACTIVE

BSC RJP initialization has been completed and control is being passed to the BSC RJP line manager. The line manager, on first entry, attempts to start all lines defined as requiring automatic start. The operator may now communicate with BSC RJP to start, restart, or cancel BSC RJP lines.

System action: Control is transferred to the BSC RJP line manager.

Operator response: Follow your defined BSC RJP startup procedure, and respond to BSC FJP error messages as required.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATRJDV</td>
<td>IATRJDV</td>
<td>IATRJDV</td>
</tr>
</tbody>
</table>

Routing Code: 8
Descriptor Code: 7

IAT7505
Explanation:

LINE lname IS ALREADY ACTIVE

A *START,RJP command was issued to a line already in use by BSC RJP.

System action: JES3 ignores the command.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATRJM4</td>
<td>IATRJM4</td>
<td>IATRJM4</td>
</tr>
</tbody>
</table>

Routing Code: 8
Descriptor Code: 7

IAT7510
Explanation:

RJP HAS BEEN CANCELED

A *CANCEL,RJP,L=ALL command was accepted or an *START,RJP command was rejected because BSC RJP is withdrawing from the system in response to a previous *CANCEL,RJP,L=ALL command.

System action: The active BSC RJP lines are canceled when no remote device is in use by a JES3 function on that line. When all active lines have been canceled, BSC RJP withdraws from the system.

Operator response: None. This is an informational message.
IAT7515 • IAT7525

Module:

Containing  Detecting  Issuing

<tr>
<td>IATRJM4</td>
<td>IATRJM4</td>
<td>IATRJM4</td>
</tr>
</tbody>
</table>

Routing Code: 8

Descriptor Code: 7

IAT7530

Explanation:

(SS) 1/0 ERROR ON lname (ladr) com stat sens internal-ccw-id

An I/O error occurred on the specified line. The meanings and values of the fields in the message are as follows.

Variable \textit{ccm} is the channel command word (CCW) op code:

- 01 - WRITE
- 02 - READ
- 03 - NOP
- 08 - TIC
- 23 - SET MODE
- 27 - ENABLE
- 2F - DISABLE

Variable \textit{stat} is the channel status word (CSW) status code. These codes are documented in the \textit{System/370 Reference Summary}.

Variable \textit{sens} is the sense information code:

- 80 - Command reject
- 40 - Intervention required
- 20 - Bus out check
- 10 - Equipment check
- 08 - Data check
- 04 - Overrun
- 02 - Lost data
- 01 - Time out

Variable \textit{internal-ccw-id} is a code describing the command type and sequence. It is a 2-digit hexadecimal number formed by the addition of the definition values below. For example, an \textit{internal-ccw-id} of 94 indicates binary synchronous sequence (80) from a programmable-type terminal (10) for a read-type command (04): $80 + 10 + 04 = 94$.

The following are CCW sequence type definitions:

- 80 - Binary synchronous sequence
- 40 - Prepare sequence
- 20 - Write sequence
- 10 - Programmable interface sequence
The following are CCW command type definitions:

- 00 - DISABLE
- 01 - SET MODE
- 02 - ENABLE
- 04 - READ
- 05 - READ RESPONSE (normal)
- 06 - READ RESPONSE (to inquiry)
- 07 - PREPARE
- 08 - WRITE
- 09 - WRITE RESPONSE
- 0A - SEND INQUIRY
- 0B - SEND EOT
- 0C - READ 3741 STATUS MSG

**System action:** If the error can be corrected, the I/O operation is attempted; otherwise, the line is canceled.

**Operator response:** None. This is an informational message.

**Problem determination:** See Table III, item 9.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATRJM5</td>
<td>IATRJM4</td>

</table>

**Routing Code:** 8

**Descriptor Code:** 7

---

**IAT7540**

**Explanation:**

| iname | IS NOT ACTIVE |

---
One of the following serious errors occurred on the specified line:

- INTERVENTION REQUIRED
- DISASTROUS ERROR
- NON-SIGNON CARD READ
- BLOCK SEQUENCE ERROR
- CARD DEBLOCKING ERROR
- CONSOLE COMMAND TOO LONG
- WORKSTATION RE-IPL
- RCB MATCH NOT FOUND
- INT REQ CC3 PATH/TCU INOP
- 30 CONSECUTIVE NAKS

**System action:** For INTERVENTION REQUIRED, NON-SIGNON CARD READ, BLOCK SEQUENCE ERROR, CARD DEBLOCKING ERROR, and CONSOLE COMMAND TOO LONG, the line is canceled and then automatically restarted.

**Operator response:** INT REQ CC3 PATH/TCU INOP or DISASTROUS ERROR may indicate that power is off at the control units or that modems are not ready. 30 CONSECUTIVE NAKS indicates that a potential NAK (negative acknowledgment character) loop exists. Ensure that the manual switches are properly set, then start the line again.

**Problem determination:** See Table III, item 4.

**Module:**

<table>

<td>IATRJM4</td>
</tr>
</tbody>
</table>

Routing Code: 8

Descriptor Code: 7
IAT7550
Explanation:

A *START, *RESTART, or *CANCEL,RJP,L= command was rejected.

System action: The system issues message IAT7505, IAT7510, IAT7525, or IAT7535 as explanation.

Operator response: None. This is an informational message.

Module:

Routing Code: 8
Descriptor Code: 7

IAT7560
Explanation:

A /*SIGNOFF statement was submitted from the remote workstation.

System action: When JES3 functions currently active on the workstation end, the line is canceled.

Operator response: None. The line is automatically canceled and started with no operator intervention.

Module:

Routing Code: 8
Descriptor Code: 7

IAT7565
Explanation:

BSC RJP could not be initialized for the reason stated.

System action: The *X,RJP command is ignored.

Operator response: If BSC RJP is already active, no action is required. If no BSC RJP lines are defined, change the initialization stream and restart the system to initialize BSC RJP.

Module:

Routing Code: 8
IAT7566

Explanation:

>>> SPOOL READ ERROR DURING RJP INIT—FOR LINE—lname, RJP CONTINUES

A disk-resident control block could not be read from the spool.

System action: The line is not automatically started.

Operator response: If the line must be active, enter a ‘START,RJP,L=’ command.

Problem determination: See the I/O error trace output that will be printed.

Module:

<table>

</table>

Routing Code: 8

Descriptor Code: 7

IAT7567

Explanation:

>>> RECURSIVE ABEND ON—lname—FOR—xxx—LINE BEING DEACTIVATED

An abend occurred on a RJP line or terminal recursively.

System action: The line is varied offline and then deactivated by dechaining it from the active line queue. This prevents the abend from degrading the system. Additionally, this prevents the possibility of RJP being quiesced. Any control blocks associated with the line before it was deactivated are not deleted. Any terminal signed on to the line before it was deactivated is quiesced until the next JES3 restart.

Operator response: The operator can vary the line back online and restart it. This restart causes new control blocks and pointers to be created.

Module:

Explanation:

>>> ERROR ATTEMPTING TO CLOSE SPOOL FILE—FOR—device name—ERROR CODE—error code

An ACLOSE macro was issued and an error occurred while attempting to close a multi-record file (MRF) on spool.

System action: JES3 cancels the RJP line and issues message IAT7570. JES3 processing continues.

Operator response: Attempt to restart the RJP line.

Module:
IAT7570 • IAT7575

Routing Code: 8
Descriptor Code: 7

IAT7570
Explanation:

RJP abended for the reason stated.

**System action:** After a dump has been produced, BSC RJP is reinstated and the line that caused the failure is canceled immediately.

**Operator response:** Save the dump and the hard-copy message log. If RJPSONPS was active and SNAP recording was enabled for the failing line, enter the *CANCEL RJPSONPS command and save the output.

**Problem determination:** See Table III, items 2 and 4.

**Module:**

Routing Code: 8
Descriptor Code: 7

IAT7575
Explanation:

The named remote workstation was successfully signed on to the line. If console support was specified and a CONSOLE initialization statement for line lname was provided, the text is WITH CONSOLE SUPPORT.

**System action:** If the workstation has output ready on the JES3 queue, the system attempts to send it to the remote workstation or punch. If the workstation has console support, any messages waiting are sent to the remote console.

**Operator response:** None. This is an informational message.

**Module:**

Routing Code: 8
Descriptor Code: 7
IAT7576
Explanation:

**LINE— lname (dev)— IS TERMINATING**

This message indicates entry into IATCNRM to ensure writing any remaining messages to the spool file and closing of the spool file.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

**Module:**

IAT7582

Explanation:

AUTO SIGNON INVALID FOR— termname, lname— LINE STARTED, AUTO SIGNON IGNORED

An RJP line is being started, but it has the AUTO sign-on parameters specified for an intelligent workstation.

System action: JES3 starts the line as if AUTO had not been specified. A workstation may sign on using the normal sign-on record.

Programmer response: Remove the AUTO parameter from the RJP LINE initialization statement.

Module:

Containing IATRJM5
Detecting IATRJM1
Issuing IATRJM1

Routing Code: 8
Descriptor Code: 7

IAT7583

Explanation:

PATH VALIDATION FAILED,— lname (dev)

RJP line path validation failed.

System action: The RJP line will not be started. Any line control blocks obtained will be released.

Operator response: Notify the system programmer.

Programmer response: Check any control units pertaining to the RJP line path.

Module:
IAT7585

Explanation:

\[\text{RTAM ABENDED PROCESSING} \quad \text{OPEN} \quad \text{FOR DEVICE—} \quad \text{devname} \quad \text{CLOSE} \quad \text{GET} \quad \text{PUT}\]

RTAM abended for the reason stated.

**System action:** After a dump has been produced, the function using RTAM is reinstated. The corresponding line is canceled immediately.

**Operator response:** Save the dump and the hard-copy message log. If RJPSNPS was active and snapshot recording was enabled for the failing line, enter the *CANCEL, RJPSNPS command and save the output.

**Problem determination:** See Table III, items 2 and 4.

**Module:**

IAT7586

Explanation:

\[\text{NEW PASSWORD REJECTED FOR WS=} \quad \text{wsname} \quad \text{ON} \quad \text{linename} \quad \text{- CHANGE NOT ALLOWED}\]

RJP password checking was performed by JES3 rather than by RACF® or another security product. The new password field on the /*SIGNON statement is ignored.

In the message text:

- **wsname** is the workstation for which the new password was rejected.
- **linename** is the name of the line used to communicate with JES3.

**System action:** The RJP WS logon continues normally.

**Programmer response:** A new password can be assigned to the workstation only through the *MODIFY T operator command when RACF or other security product password protection is inactive.

**Module:**

IAT7762

Explanation:

>>> prty jobid jobname optional information

This message is issued in response to a *CALL,DISPLAY,J= command. The entire status of the designated job, as determined by internal job-related control blocks, is displayed.

See also Table 1 on page 4 for the meanings of data appearing in the message.

Brackets such as these, indicate that the enclosed information is printed only when the specific data is present. Field names provided (in parentheses) for the fields being formatted, or from where the information is being obtained. The optional information is listed below in brackets [ ]:

- prty jobid jobname - priority, job ID, and name of the job (JCTPRTY, JCTJOB, JCTJBNAM)
- [SE=(dsnname-status,...)] - all scheduler elements, if any, for the job are listed. (DSPNAME, SEFLAGS) For each scheduler element, the status is one of the following:
  - ACTIVE - this SE is active
  - COMPLETE - this SE is complete
  - RESCHDL - this SE is returned for rescheduling
  - NOSTAT - this SE is none of the above
- [JCTMAINS=(mpname,...)] - JCTMAINS is a list of the mains where the job is eligible to run. ‘NONE’ indicates that no main is eligible. (JCTMAINS/MPNAME)
- [SRVCLASS=srvclass] - the service class for the job
IAT7762

• [SCHENV=schenv] - the job's scheduling environment if one was specified
• [ORG=device group origin] - group of devices or node from which the job originated (JCTGPORG)
• [CLASS=cls] - job class (JCTSCHCL)
• [GROUP=group] - job class group (MGNAME)
• JTRACKS=trks-groups - the number of track groups allocated for job (JTSGRPCT)
• [DSTRACKS=(DSNAME=dsname | DDNAME=ddn, TRACKS=trks-groups,...)]
  – DSNAME=userid.jobname.jobid.dnumber.name, if dnumber exists, (JCTOUSID, JCTJBNAM, JCTJOB, JDSDSNUM, JDSDNSAM) otherwise,
  – DDNAME=PROCSTEPNAME.STEPNAME.
  – DNAME (JDSPROCN, JDSSTEPN, JDSDDNAM)
  – TRACKS=number of track groups allocated for data set. (JTSGRPCT)
  – Provided for each sysout data set in the job that has its own track allocation table (TAT) (DSISO).
  – ‘**** JOB TAT SEARCH INCOMPLETE ****’ - an error occurred in trying for format the spool track groups.
• [RUN COMMAND] - indicates that a *MODIFY,J=nnn,RUN command was issued for the job
• [IORATE=iorate] - (JCTFL3) one of:
  LOW - low
  MED - medium
  HIGH - high
• [.PROCLIB=ddn] - name of procedure library, IATPLBxx. (JCTPROC)
• [MAINTYPE=system type - either JES or ANY (JCTSYSTM)
• [MVTREGN=region size] - first step region size (RQMVTSIZ)
• [VSREGN=region size] - largest step region size (RQVS2SIZ)
• [MAINS=(mpname,...)] - a list of the mains where the job is eligible to run (RQMAINS/MPNAME)
• [INDEX=rqindex] - the job is: (RQINDEX)
  ACTIVE IN C/I IN AN FSS - active in a C/I FSS address space (RQFSSCI)
  WAITING FOR POSTSCAN - waiting for postscan processing (batch job) (RQPCSBAT)
  WAITING FOR POSTSCAN - waiting for postscan processing (demand select) (RQPCSDSL)
  QD MDS FETCH PROCESSING - waiting for or active in MDS fetch processing (QRFETCH)
  WAIT ON OPER VOL FETCH - waiting for the *START SETUP,jobno command to be issued (RQVOLWT)
  QD FOR MDS SYS SELECT - waiting for or active in MDS system select processing (RQSYSSEL)
  QD MDS ALLOC PROCESSING - waiting for or active in MDS allocation processing or waiting for one or more resources (RQALLOC)
  WAIT ON UNAVAIL VOL(S) - waiting for a volume that was made unavailable because of the *MODIFY S,VU=T-volser or *MODIFY S,VU=D-volser command being issued (RQVOLUAV)
  WAIT ON OPER VOL MOUNT - waiting for a volume to be mounted or active in MDS verify processing (RQVERIFY)
  QD FOR MDS SYS VERIFY - waiting for or active in MDS system verify processing (RQSYSVER)
  ON MDS ERR Q (*C OR *R) - on the MDS error queue. Jobs that are put on the MDS error queue must be canceled or restarted by the operator (RQERROR)
  QD FOR MAIN (NORMAL) - waiting to be selected on a main (RQSELECT)
  IN EXECUTION ON MAIN - scheduled to execute or executing on a main (RQONMAIN)
  QD FOR MDS BREAKDOWN - waiting for or active in MDS breakdown processing (RQBRKDWNN)
  QD FOR MDS RESTART - waiting for or active in MDS restart processing (RQRESTRT)
  MAIN AND MDS COMPLETE - has completed GMS and MDS processing (RQDONE)
  WAITING FOR OUTSERV - waiting for output service processing (RQOUTPT)
  WAITING FOR WRITER - waiting for output service writer (RQOUTQUE)
WAITING FOR RESVD SERV - has completed MAIN processing but has not completed output service processing (RQOSWAIT)
OUTPUT SERVICE COMPLETE - has completed output service processing (RQCMPLT)
QD FOR MAIN (DEMAND) - is a demand select job
WAITING ENDING FUNCTION - is in the ending function but is waiting for I/O to complete (RQEFWAIT)
FAILED ENDING FUNCTION - encountered an error while it was in the ending function (RQEFBAD)
OUT OF VALID RANGE - the value in RQINDEX is greater than the maximum valid value

- [WAITING FOR wait reason] - If “WAITING FOR wait-reason” appears in the message, then the job is waiting for one of the following reasons (JQEQLGFLS):
  - SCHEDULING/ENDING FUNCTION
    The job has just become ready and is waiting for the job segment scheduler (JSS) to schedule the job, or the job has just completed a JES3 function (such as C/I) and is waiting for JSS to mark the function complete and schedule the next function.
  - A DSP TO BECOME AVAILABLE
    The job is waiting for DSP to become available. To determine which DSP the job is waiting for, examine the scheduler elements that appear in the “SE=…” status messages above and find the first one marked “NOSTAT.” Then issue the *I,X,D=dspname command to determine whether there are enough DSPs defined or whether the DSP is in hold.
  - AN RQ TO BECOME AVAILABLE
    JSS was unable to create an RQ to schedule the job because there are no RQs in the RQ cellpool, and storage for another cellpool extent could not be obtained. No action is required unless the condition persists for a long time.
  - A PROCLIB TO BECOME AVAILABLE
    The job is waiting for the procedure library (PROCLIB=dbname) to become available. Either the procedure library could not be allocated, or another job is updating the PROCLIB. To determine the status of the procedure library, issue a *I,PROCLIB,ID=nn command, where nn is the last two characters of the DDNAME.
  - A MAIN/CLASS/GROUP
    The job is waiting for a main processor, a job class, or a job class group to become available. Either the main processor is offline, the job class is disabled on all main processors, or the group is disabled on all main processors.
    If the job is waiting to be scheduled for C/I; i.e., (SE=(...,CI-NOSTAT,...) ) appears in the message, the job can only be waiting for a main processor because the status of the job's class and group does not affect C/I scheduling. To determine on which main processors the job is waiting, issue a *LS command (provided you are using JES3 setup), and examine the status of those main processors identified by “JCTMAINS=.” At least one of these main processors must be connected or online to allow the job to be scheduled for C/I.
    If the job is waiting to be scheduled for main (SE=(...,MAIN-NOSTAT,...) ) appears in the message), then the job can be waiting for a main processor, a job class, and/or a job class group. To determine on which main processors the job is waiting, issue a *LS command (provided you are using JES3 setup), and examine the status of those main processors identified by “JCTMAINS=.” At least one of these main processors must be connected or online in order for the job to be scheduled for main. Then issue a *LG,ALL,classname command for the class name identified by “CLASS=”. The class must be enabled on at least one main processor in order for the job to be scheduled for main. Then issue a *LG,ALL,G,groupname command for the group name identified by “GROUP=”. The group must be enabled on at least one main processor in order for the job to be scheduled for main.
  - COMPLETION OF QUEUE PROCESSING
    The job is waiting for JSS to complete processing its queues so that it can later be put back on the DSP wait queue. No action is required unless the condition persists for a long time.
  - SMS RESOURCES TO BECOME AVAILABLE
    The job requires SMS-managed user catalogs to become available. This condition occurs when the volume or storage group, where the SMS-managed user catalog resides, is quiesced or disabled. You cannot list the specific storage groups and volumes that are required by this job; however, you can issue the D SMS,SG(ALL),LISTVOL command to list all of the storage groups and volumes defined in your installation.
  - A LOCATE MAIN TO BECOME AVAILABLE
    The job is waiting for a main processor to become available for locate processing. This condition occurs when a job, that needs catalog-locate processing, is scheduled for C/I and the main becomes unavailable before the job
begins catalog-locate processing. To determine on which main processors the job is waiting for, issue a *LS
command (provided you are using a JES3 setup), and examine the status of those main processors identified by
"JCTMAINS=." At least one of these main processors must be available in order to be scheduled for C/I
processing.

- A JOB WITH SAME NAME TO END
  The job is waiting for a some other job with the same name to end (two jobs with the same name cannot be
  scheduled at the same time). Issue an *J=jobname command to determine which job has already been
  scheduled.

- SOME UNKNOWN REASON
  JES3 was unable to identify the reason that the job is waiting, probably because of a system error. Contact the
  system programmer.

- [LINEST=line estimate] - (JCTMAXL)
- [PAGEST=page estimate] - (JCTMAXP)
- [BYTEST=byte estimate] - (JCTMAXB)
- [CRDEST=card estimate] - (JCTMAXC)
- [JESMSGLG={LOG NOLOG}] - (JCTNOJLG)
- [OUSID=owning userid] - (JCTOUSID)
- [TUSID=submitting userid] - (JCTTUSID)
- [HOLD=hold status] - one of
  ARM - job is held for automatic restart management (JCTARMH in JCTFL2)
  OPR - operator hold (JCTOPHLD in JCTFL1)
  DJC - DJC hold (dependent job control) (JCTDJCOH or JCTDJHLD in JCTDJFL1)
- [JCN=job net id] (JCTJNET)
- RQJSTAT, See IAT8685 for description.

[UNIT=(DD=jname, TYPE=dtype,
  UNIT=NO/devnum),...] - The name,

| type of device, and device number (or 'NO') is provided for each device required by a DSP if the job being
| displayed is being processed by that DSP or is active on that DSP. (FCTGLIST / SUPDD, SUPTYPE, SUPDEVAD)
- [JUNIT=(...) ] - for each allocation request (JST DD entry), the following information is formatted:
  - [STEP=stepname] (JSTSTNM)
  - [DD=ddname] (JSTDDNM)
  - [SMS MANAGED] - if applicable. (JSTSMS in JSTDFLG2) Not all possible message lines appear. For example, if
    the data set is SMS-managed, the beginning of the formatting for XUNIT appear as:
    ,XUNIT=(STEP=stepname,
             ,DD=ddname
             ,SMS MANAGED
             ,TYPE=type of device
    but, if the data set is not SMS-managed, this area appears as:
    ,XUNIT=(STEP=stepname,
             ,DD=ddname
             ,VOL=volser
             ,UNIT=unit parm from JCL/text unit
             in SVC99 parmlist
             ,TYPE=type of device

  - [VOL=(SCRATCH|volser)] - (JSTSCR in JSTDFLG3 / JSTVOLID)
  - [UNIT=unit parm from JCL/text unit in SVC99 parmlist] - (JSTTYPE)
  - [TYPE=type of device] - (JSTDFLG1) one of:
    TAPE - tape device
**DA** - direct access device
**UR** - unit record device
**GRPH** - graphic device
**UNKN** - none of the above

- **[DISP=disposition] - (JSTDFLG2)** one of:
  - OLD
  - NEW
  - SHR
  - MOD
  - [ALLOC=device number] - the number of the JES3-managed device allocated to this request, if any (JSTDEV / SETUADR)
- **[REASON=allocation failure reason]** - why the job remains on the allocate queue (JSTMFAIL). One of:
  - DEV ALLOC FAILED - device allocation was unsuccessful (JSTDVNAL)
  - DSN ALLOC FAILED - data set allocation was unsuccessful (JSTDSNAL)
  - VOL ALLOC FAILED - volume allocation was unsuccessful (JSTVLANAL)
  - UNAVAIL VOLUME - the volume is unavailable (JSTVUNAL)
  - VOL MOUNT PENDING - The volume was referenced in an IAT5210 message telling the operator to mount or check this volume and now needs to be verified (JSTMNTPD)
  - [RING] - ring required for tape (JSTRING in JSTDFLG2)
- **[LVOL]** - last use of volume by job (JSTVLINC in JSTDFLG4)
- **[LDSEN]** - last use of data set by job (JSTDSINC in JSTDFLG4)
- **[LDEV]** - last use of device by job (JSTDVINC in JSTDFLG4)
- **[DEFER]** - UNIT=(,,DEFER) specified (JSTDEFER in JSTDFLG2)
- **[NOMOUNT]** - no volume mount is required for pre-execution SETUP (JSTNOMNT in JSTDFLG3)
- **[NODEV]** - no device required because this is not the first reference to the device (JSTNODEV in JSTDFLG3)
- **[BYPDSAL]** - bypass data set allocation for this data set (that is, do not build a SETDSN for this data set) (JSTBDSAL in JSTDFLG6)
- **[DSN=data set name]** - data set name (JSTDSNAM)

• **[MDS FAILED TO ALLOCATE THE FOLLOWING ON mpname]** - MDS was unable to allocate a resource to the job. mpname is the main where allocation failed during MDS processing (ARLMAIN). The reason is one of the following:
  - [mmmm OUT OF nnnn REQUESTS FOR DEVICE=devtype] - MDS was not able to allocate all of the devices requested by the job.
    - nnnn - the total number of devices the job requested (ARLDEVFL)
    - mmmm - the number of devices that MDS was not able to allocate to the job (ARLDEVFL)
    - devtype - the unit names (NAME in IATYNAM) or device number (SETUADR) of the device requested (ARLNAME)
  - [THE DEVICE REQUIRED FOR SERIAL=vol] - the job was unable to allocate the device required for a permanently resident volume (ARLVOLAD / VLMSER)
  - [A REQUEST FOR SERIAL=volser EXCL=[YES|NO]] - the job was unable to allocate the specified volume (ARLVOLAD / VLMSER). EXCL = YES/NO refers to the volume.
  - [A REQUEST FOR DSNAME=data set name ON SERIAL=volser EXCL=[YES|NO]] - the job was unable to allocate the specified data set (ARLDSNAD / DSNAME) on the specified volume (ARLVOLAD / VLMSER). EXCL = YES/NO refers to the data set.
  - [A REQUEST FOR DSNAME=data set name ,SMS MANAGED EXCL=[YES|NO]] - the job was unable to allocate the specified SMS managed data set (ARLDSNAD / DSNAME). EXCL = YES/NO refers to the data set.
  - [MVSMINLV=z/OS vv.rr.mm] - the MVS converter has determined that this job must execute on a system whose level matches or exceeds the level shown, where vv is the version, rr is the release and mm is the modification level for MVS z/OS. If MVSMINLV is omitted, there is no minimum MVS level associated with this job.

**System action:** Processing continues.

**System programmer response:** The action to be taken depends on the reason for issuing the *CALL,DISPLAY
IAT7763 • IAT7765

command. See z/OS JES3 Commands for specific *INQUIRY commands.

Module:
Containing IATUTJEE  Detecting IATUTJEE  Issuing IATUTJEE

Routing Code: 2
Descriptor Code: 4

IAT7775
Explanation:
>>> UNABLE TO IDENTIFY VOL — VERSION FOR MIGRATION

The IATUTJCT utility was invoked with the MIGRATE parameter, but IATUTJCT could not find the JCT's version in the VOL checkpoint record to validate the MIGRATE parameter.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:
Containing IATUTJEE  Detecting IATUTJEE  Issuing IATUTJEE

Routing Code: 2
Descriptor Code: 4

IAT7776
Explanation:
>>> CHECKPOINT OPERATION — ckptop FOR RECORD — rec — FAILED, R15= — r15

While running the IATUTJCT utility, a checkpoint error occurred. In the message text:

ckptop  The checkpoint operation that failed. The operation will be RESERVE, READ, WRITE, or PURGE. The failing record will be present if the operation is READ or WRITE.

rec  The identification of the checkpoint record for the failing READ or WRITE operation.

r15  The return code from the checkpoint operation as described under the IATXCKPT macro in z/OS JES3 Customization.

If rec is NONE, there was an unexpected error leading the IATUTJCT utility to detect that there were no checkpoint records to write. In this case, r15 will be the text N/A.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: Verify that the IATUTJCT procedure contains correct DD statements for CHKPNT and CHKPNT2. In particular, verify that the DD statements for the new and old checkpoint data sets were not inadvertently reversed. If no installation errors are found, retry the IATUTJCT utility. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:
IAT7777 • IAT7779

IAT7777

Explanation:

TOO MANY RECORDS IDS—IN CHECKPOINT DATA SET

The IATUTJCT utility was unable to read the old checkpoint data set into storage because it contains too many checkpoint record identifiers (record ids). IATUTJCT supports a maximum of 100 record ids. This message is issued because the installation writes its own checkpoint records, and the combination of JES3 and installation-defined checkpoint record ids exceeds this limit.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: If the number of installation-defined checkpoint record identifiers cannot be reduced, contact the IBM Support Center.

Module:

Routing Code: 2
Descriptor Code: 4

IAT7778

Explanation:

IATUTJCT MIGRATE FALLBCK FUNCTION ACTIVE

The IATUTJCT utility was invoked and accepted by IATUTJCT.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: 2
Descriptor Code: 4

IAT7779

Explanation:
While validating the checkpoint data set, the IATUTJCT utility was either unable to find a VOL (volume) record, or it was unable to find a VOL (volume) entry for the JES3JCT extent.

The type of data that was not found:

**VOL RECORD**
- The entire VOL record

**JES3JCT VOL ENTRY**
- The entry for the JES3JCT extent within the VOL record.

**System action:** IATUTJCT also issues message IAT7767 and ends with a return code of 4.

**Operator response:** Notify the system programmer.

**System programmer response:** Verify that JES3's most recent global initialization completed successfully. Verify that the IATUTJCT procedure contains correct DD statements for CHKPNT (and CHKPNT2 if the alternate checkpoint data set is in use). In particular, verify that the DD statements for the new and old checkpoint data sets were not inadvertently reversed. Also determine if the new alternate checkpoint data set is referenced in the IATUTJCT procedure; if it is present, remove the reference. If no installation errors are found, retry the IATUTJCT utility. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:**
- Containing: IATUTJDD
- Detecting: IATUTJDD
- Issuing: IATUTJDD

**Routing Code:** 2

**Descriptor Code:** 4

**IAT7780**

**Explanation:**

IATUTJCT was unable to accept the data set identified by the specified DD because the data set violates a restriction identified by the error text.

In the message text:

**ddn**  The ddname of the data set that has the error.

**err**  Identifies why the data set was not acceptable and is one of the following:

- **MULTIPLE EXTENTS**
  The data set was allocated with multiple extents and only one extent is allowed.
- **NO SPACE ALLOCATED**
  The data set was allocated with zero space specified.
- **NOT ON CYLINDER BOUNDARY**
  The data set was not allocated in space units of cylinders.

**System action:** IATUTJCT also issues message IAT7767 and ends with a return code of 4.

**Operator response:** Notify the system programmers.

**System programmer response:** Correct the allocation of the incorrect data set.

**Module:**
- Containing: IATUTJDD

Routing Code: 2
Descriptor Code: 4

IAT7783

Explanation:

-ddn— OPERATION FAILED FOR DDNAME=— ddn—

IATUTJCT attempted the listed operation for the DD in order to obtain data set characteristics needed to process the data set, but this operation failed.

In the message text:

-ddn— The ddname for which the operation failed.

-dsop— The data set operation that failed.

Operations include:

- OPEN
  IATUTJCT was attempting to open the data set allocated under the specified ddn.
- RDJFCB
  IATUTJCT was attempting to read the job file control block for the data set allocated under the specified ddn.
- DEVTYPE
  IATUTJCT was attempting to determine device information for the data set allocated under the specified ddn.

System action: If the operation is RDJFCB and the DD is CHKPNT2, IATUTJCT continues; otherwise, IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: If the operation is RDJFCB, this is most likely caused by a missing DD statement in the IATUTJCT procedure. The ddnames CHKPNT, JES3JCT, NCHKPNT, and NJES3JCT are required. If one or more of these DD statements are missing, supply the missing DD statement(s). If all required DD statements are already present, or the operation listed is OPEN or DEVTYPE, and the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IAT7784

Explanation:

- NEW JCT DATA SET IS FULL

While IATUTJCT was copying JCT entries from the old JCT data set to the new JCT data set, the new JCT data set filled up before all entries from the old JCT data set had been read.

System action: JES3 also issues message IAT7767 and IATUTJCT ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: Reallocate the JCT data set with more space and retry the IATUTJCT utility.

Module:

Containing | Detecting | Issuing
---|---|---
IATUTJCJ | IATUTJCJ | IATUTJCJ
IAT7785 • IAT7786

Routing Code: 2
Descriptor Code: 4

**IAT7785**

**Explanation:**

```
>>> TRACK CAPACITY ERROR FOR DDNAME= ddn—— R15=—r15, — R0=—r0
```

The IATUTJCT utility was attempting to determine data set space characteristics for the data set allocated under the specified `ddn` using the TRKCALC service, but this operation resulted in values that are not acceptable to IATUTJCT. This message is typically issued because the block size for the JCT data set exceeds the maximum allowable track size on the device where the JCT data set resides.

In the message text:

- `ddn` The ddname for which the TRKCALC service was being performed.
- `r15` Register 15 as returned by the TRKCALC service.
- `r0` Register 0 as returned by the TRKCALC service.

**System action:** IATUTJCT also issues message IAT7767 and ends with a return code of 4.

**Operator response:** Notify the system programmer.

**System programmer response:** Correct the allocation of the incorrect data set. If the data set is allocated correctly, see the DFSMSdfp Advanced Services document for the explanation of `R15` and `R0` as returned by the TRKCALC macro with the `FUNCTN=TRKCAP` parameter. Using this information, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**IAT7786**

**Explanation:**

```
>>> POTENTIAL CONFLICT, LAST KNOWN STATE OF—JES3 ON— system— WAS:— status
```

The IATUTJCT utility has been started on a complex where the state of JES3 is in potential conflict with IATUTJCT. This message is issued if JES3 is up or coming up. This message is also issued if a processor failed, was IPLed or reset and a *RETURN was not performed first, or if a dynamic system interchange (DSI) was in progress but not completed. This message is repeated for each processor that is identified.

In the message text:

- `system` The name of the system that was found.
- `status` The status of the system, and is one of the following:
  - UP
    JES3 is active, or was last known to be active, on the specified system.
  - INITIALIZING
    JES3 is initializing, or was last known to be initializing, on the specified system.
  - IN DSI AS NEW GLOBAL
    A DSI is in progress, or was last known to be in progress, and the specified system is the new global or was going to be the new global.
System action: IATUTJCT also issues message IAT7787.
Operator response: Reply to message IAT7787.
System programmer response: See message IAT7787.

Chapter 22. Utilities Messages 779
Routing Code: 2
Descriptor Code: 4

IAT7789
Explanation:

>>> CHECKPOINT ERROR reason

The IATUTJCT utility has detected an error reading the combination of the CHKPNT and CHKPNT2 ddnames. The reason text further identifies the error. All of the error conditions indicate some kind of corruption of the checkpoint data set(s).
In the message, reason

- NO USABLE CHECKPOINT DATA SET
  Neither the CHKPNT nor the CHKPNT2 DD statements in the IATUTJCT procedure define a valid checkpoint data set.
- NO CHECKPOINT DATA MAP
  The active checkpoint data set contains no data map. (The active checkpoint data set is CHKPNT if it or both checkpoint data sets are usable, CHKPNT2 if it is usable but CHKPNT is not.)
- NO TRACK MAP ENTRIES DEFINED
  The active checkpoint data set contains no track map entries defined in the checkpoint area.
- NO MAIN PROCESSOR ENTRIES
  The complex status record (CSR) contains no main processor entries.

System action: IATUTJCT also issues message IAT7767 and ends with a return code of 4.

Operator response: Notify the system programmer.

System programmer response: Verify that JES3’s most recent global initialization completed successfully. Verify that the IATUTJCT procedure contains correct DD statements for CHKPNT (and CHKPNT2 if the alternate checkpoint data set is in use). In particular, verify that the DD statements for the new and old checkpoint data sets were not inadvertently reversed. Also ensure that the new alternate checkpoint data set is not referenced in the IATUTJCT procedure; if it is present, remove the reference. If no installation errors are found, retry the IATUTJCT utility. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Routing Code: Note 18
Descriptor Code: 7

IAT7933
Explanation:

TOO MANY OPTIONS, DC REQUEST— TERMINATED

The last request contained too many options in the OPTION= parameter. A maximum of 6 keyword options and 15 to 30 nonkeyword options may be specified.
Operator response: Reenter the request with fewer options.
Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7934
Explanation:

SEVERE I/O ERROR OCCURRED. DC TERMINATED

A severe JSAM I/O error occurred while attempting to write the TAT for a DC spin data set.
System action: The DC DSP is ended.
Operator response: None. This is an informational message.
Module:
Routing Code: Note 18
Descriptor Code: 7

IAT7935
Explanation:

-The last request required DC to obtain or save dynamic storage. There was none available.

Operator response: None. This is an informational message.

Module:

Containing       Detecting       Issuing
IATUTDA          IATUTD1         IATUTDC

Routing Code: Note 18
Descriptor Code: 7

IAT7936
Explanation:

-The job specified by the job number of the J= parameter of the last request was not found.

Operator response: Verify that the job number is correct and that the job is still in the system. Then reenter the request.

Module:

Containing       Detecting       Issuing
IATUTDA          IATUTD1         IATUTDC

Routing Code: Note 18
Descriptor Code: 7

IAT7937
Explanation:

-The DC DSP utilizes the JES3 abend formatting routines to process some of its requests. One of the JES3 abend routines found an error and returned to DC with an abnormal return code.

System action: The remaining options specified in the request are ignored, and the output created up to this point is printed or sent to the operator console as requested.

Operator response: Check the output in an attempt to determine the error.

Module:

Containing       Detecting       Issuing
IATUTDA          IATUTD0         IATUTDC
IATUTD1
Routing Code: Note 18
Descriptor Code: 7

IAT7938
Explanation:

The last request—caused the DC task to fail. DC has been reinstated.

The last request was incorrect and should not be attempted again.

System action: A failure logout to the operator console should have preceded this message. A JES3 dump of the error condition should have been taken. Message IAT7921 follows this message.

Operator response: Enter a different request.

Module:

Containing    Detecting    Issuing
IATUTDA       IATUTDC     IATUTDC

Routing Code: Note 18
Descriptor Code: 7

IAT7939
Explanation:

There is no DC trap—output to print.

The PTRAP parameter was specified, requesting DC to send the output from the trap facility of DC to output service. However, there was no output from the DC trap function.

Operator response: Enter the ACTIVE parameter and verify that the traps are correctly set.

Module:

Containing    Detecting    Issuing
IATUTDA       IATUTD2     IATUTDC

Routing Code: Note 18
Descriptor Code: 7

IAT7940
Explanation:

Trap table full, request ignored.

The active trap table is full. No additional traps can be entered.

System action: The system ignores the request.

Operator response: If the trap is required, reset all active traps and reenter those that are required.

Module:

Containing    Detecting    Issuing
IATUTDA       IATUTDC     IATUTDC
IAT7941

Explanation:

\>— FUNCTION NOT ALLOWED WITHOUT VALID PASSWORD

An *X,DC command was issued without a valid password.

System action: The request to dump core is ignored; however, DC remains initialized.

Operator response: If the use of functions requiring a password is desired, cancel the current DC job, obtain a valid password from the system programmer, and reissue the *X,DC command with the password. Then reenter the desired function.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD0</td>
<td>IATUTDC</td>
</tr>
</tbody>
</table>

IAT7942

Explanation:

\>— *** WARNING *** TRAP AT ADDRESS xxx NOT RESET

The trap was not reset because the storage location xxx has been freed (FREEMAIN) or the location xxx has been modified.

System action: JES3 continues processing the *RESTART or *CANCEL command.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTDA</td>
<td>IATUTD0</td>
<td>IATUTDC</td>
</tr>
</tbody>
</table>

IAT7943

Explanation:

\>— OPTION=FSS REJECTED

A *S DC,OPTION=FSS command has been rejected or ended for the indicated reason.

System action: JES3 ignores the request. Processing continues.

Operator response: Correct and reenter the command, if appropriate.

Module:
IAT7944 • IAT7946

Routing Code: Note 19
Descriptor Code: –

IAT7944
Explanation:

Storage was not changed because it is either permanently not modifiable or REFRPROT is enabled.
System action: JES3 issues message IAT7921 and then waits for an operator response.
Operator response: Determine the cause of the error and retry the command, if appropriate.
Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7945
Explanation:

This message is issued in response to an *S,IC or *C,IC command. The starting to (--->) stop times, elapsed time, and month, day, and year for this iteration count sample are given.
System action: Processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18
Descriptor Code: 7

IAT7946
Explanation:

This message is issued in response to an *S,IC or *C,IC command. It provides a count of the occurrences of a given event. The offset is the TVTABLE (IATYTVT) offset to the entry point occurrence specified by entry point. The call to this entry point occurred the number of times specified by nnn.
System action: Processing continues.
Operator response: None. This is an informational message.
IAT7947

Explanation:

This message is issued as a header for message IAT7946.

**System action:** Not applicable.

**Operator response:** None. This is an informational message.

---

IAT7948

Explanation:

This message is issued in response to an *S,J or *C,I command. The total count of occurrences for all entry points (ALL EP) or a specific entry point is given. The total includes special cell counts.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

---

IAT7949

Explanation:

A permanent I/O error occurred while reading the parameter buffer or the JDAB (IATYJDA).

**System action:** The iteration counter DSP is canceled.
Operator response: Reissue the *CALL,IC command.

Module:

Containing  Detecting  Issuing
IATUTIC       IATUTIC       IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7950
Explanation:

PARAMETER ERROR, IATUTIC TERMINATED

One or more parameters specified with the *CALL,IC command were incorrect.

System action: The iteration counter DSP is not activated.
Operator response: Reissue the *CALL command correctly.

Module:

Containing  Detecting  Issuing
IATUTIC       IATUTIC       IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7951
Explanation:

(entry-point) CAN NOT BE COUNTED, IATUTIC TERMINATED

The entry point specified is not eligible for monitoring by the iteration count DSP.

System action: The DSP is ended.
Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATUTIC       IATUTIC       IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7952
Explanation:

(module-name + offset--nnn)

This message is issued in response to an *S,IC or *C,IC command. The designated module, at the offset value (in hexadecimal), called the specific entry point the number of times specified by nnn.

System action: Processing continues.
Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATUTIC   IATUTIC   IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7953

Explanation:

\[ (name1- name2- main- \cdots nnn)-CI \]

This message is issued in response to an *SJIC or *CJIC command. The counter specified by name1 is mapped by the DSECT name2. If the DSECT applies to a specific processor, then that processor name is given. Otherwise, CI indicates that the DSECT relates to the converter/interpreter. The counter value (decimal) specified by nnn is the accumulation from the time the *CALLJIC command was issued.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATUTIC   IATUTIC   IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7954

Explanation:

\[ IC \text{ REINSTATED FOR CLEANUP} -\text{ IC WILL BE PURGED} \]

The iteration counter (IC) completed JESTAE exiting and cleanup will occur before the IC being purged.

System action: The IC DSP is ended.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATUTIC   IATUTIC   IATUTIC

Routing Code: Note 18
Descriptor Code: 7

IAT7960

Explanation:

\[ \text{INITIALIZATION STREAM CHECKING—PROGRAM, IATUTIS, ENDED RC=} \quad rc \]

Chapter 22. Utilities Messages  795
This message is issued when IATUTIS ended. Following are the IATUTIS return codes and their meanings.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The initialization stream has been checked, and no errors could be detected.</td>
</tr>
<tr>
<td>4</td>
<td>The initialization stream has been checked, and warning messages have been issued.</td>
</tr>
<tr>
<td>8</td>
<td>The initialization stream contains one or more errors.</td>
</tr>
</tbody>
</table>

**System action:** If the return code rc equals 4 or 8, the JES3 initialization stream checker ends. If the return code equals zero, phase two of initialization stream checking can begin.

**Programmer response:** Check messages on the JES3OUT file. If errors were encountered, correct any incorrect initialization stream statements and rerun IATUTIS.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  
**Descriptor Code:** 7

---

**IAT7961**

**Explanation:**

#### STG1CODE DATA SET DID NOT OPEN, NO MDS ANALYSIS PERFORMED

During phase two of the initialization stream checker, the STG1CODE data set is needed to compare the MVS Stage1 tables against the JES3 initialization statements. STG1CODE must be a partitioned data set, and each member must be named the same as a processor name in the initialization statements.

**System action:** JES3 initialization stream checker bypasses phase two.

**Programmer response:** If only a syntax check was desired, by purposely leaving out the PDS containing processor names, then this message may be ignored. Otherwise, see [z/OS JES3 Initialization and Tuning Reference](#) to assemble the MVS Stage1 statements for each processor. After assembling the Stage1 statements, allocate the PDS created by SYSPUNCH to the STG1CODE DD statement and run IATUTIS again.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  
**Descriptor Code:** 7

---

**IAT7962**

**Explanation:**

#### LOGICAL ANALYSIS HAS BEGUN FOR PROCESSOR main

This message is to inform you that the IATUTIS program is now checking the processor main. All messages between this message and the next time it is issued see this processor.

**System action:** JES3 initialization stream checking continues.

**Operator response:** None. This is an informational message.
IAT7963

Explanation:

>Error encountered in syntax, MDS analysis may be wrong.

During initialization stream checking, syntax error messages have been written during phase one. They appear in the initialization stream listing right after the statement in error. The error caused the corresponding statement not to be written as table entry for phase two, so phase two could not be processed for the statement in error.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the syntax error and rerun IATUTIS.

IAT7964

Explanation:

>Error setunit — dev — was not found.

SETUNIT dev was specified in a DEVICE statement in the initialization stream, but the required corresponding IODEVICE statement in the Stage1 is missing.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the XUNIT parameter on the DEVICE statement and rerun IATUTIS.

IAT7965

Explanation:

>Error setunit — dev — conflicting device types.

SETUNIT dev was specified in a DEVICE statement in the initialization stream, but the corresponding IODEVICE
statement specified a different device type. For instance, DEVICE specified a tape and IODEVICE specified a disk device.

**System action:** JES3 initialization stream checking continues.

**Programmer response:** Correct the XUNIT parameter on the DEVICE statement and resubmit the initialization stream.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** 7

---

**IAT7966**

**Explanation:**

```plaintext
ten

PROCESSOR—main— NOT IN INITIALIZATION STREAM—
```

The specified processor was found as a member name in STG1CODE, but no MAINPROC statement's NAME entry matched it.

**System action:** JES3 initialization stream checking continues.

**Programmer response:** Change the MAINPROC statement's NAME entry, or rename the member name in the data set referred to by STG1CODE, so it will match one of the MAINPROC statements in the initialization stream.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATUTIS</td>
<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** 7

---

**IAT7967**

**Explanation:**

```plaintext
  supunit—dev— NOT FOUND—
```

SUPUNIT `dev` was specified as a JUNIT in a DEVICE statement in the initialization stream, but a corresponding IODEVICE statement in the Stage1 is missing.

**System action:** JES3 initialization stream checking continues.

**Programmer response:** Delete the DEVICE statement, or change its JUNIT definition.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>

<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>
Routing Code: Note 19
Descriptor Code: 7

IAT7971
Explanation:

➤➤➤ PUN3525M— dev— MULTI-LINE FEATURE MISMATCH

Either an IODEVICE statement for the 3525 specified FEATURE=MULTILINE, but the DEVICE statement's DTYPE was not PUN3525M, or the reverse is true.

System action: JES3 initialization stream checking continues.

Programmer response: Change either the IODEVICE FEATURE= field or the DEVICE statement's DTYPE= field so that they are equal to each other.

Module:

Containing
IATUTIS

Detecting
IATUTIS

Issuing
IATUTIS

Routing Code: Note 19
Descriptor Code: 7

IAT7972
Explanation:

➤➤➤ UNITNAME— name— NOT FOUND

A SETNAME statement defined unit name name, which is not a UNITNAME in MVS Stage1.

System action: JES3 initialization stream checking continues.

Programmer response: Correct or delete the SETNAME statement.

Module:

Containing
IATUTIS

Detecting
IATUTIS

Issuing
IATUTIS

Routing Code: Note 19
Descriptor Code: 7

IAT7973
Explanation:

➤➤➤ UNITNAME— name— NOT GENERATED FOR DEVICE— dev

A DEVICE statement had an XTYPE assigned to SETNAME name, but the UNITNAME statement in MVS Stage1 did not include device dev.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the XUNIT keyword on the DEVICE statement.

Module:
IAT7974 • IAT7976

IAT7974

Explanation:

>>> UNIT/XTYPE—dev1/name—HAS SUBGEN SPLIT WITH UNIT—dev2—

A DEVICE statement for dev1 specified XTYPE name, but unit dev2, which belongs to the same subgeneric group, was not within the same XTYPE.

System action: JES3 initialization stream checking continues.

Programmer response: Make sure that all units of this subgeneric group are defined with the same XTYPE in order to avoid a subgeneric split. Example: MVS Stage1 defined a bank of 8 DASD devices on 160-167, but the DEVICE statements in the initialization stream incorrectly defined unit 165 to another XTYPE.

Module:

IAT7975

Explanation:

>>> SETNAME—xxx—UNITNAME—yyy,—NO MATCHING XTYPE FOUND

The initialization stream checker could not find a matching XTYPE on any JES3 SETNAME initialization statement for SYSGEN UNITNAME device yyy.

System action: JES3 initialization stream checking continues.

Programmer response: Change the SETNAME statement XTYPE parameter.

Module:

IAT7976

Explanation:

>>> HWSNAME—xxx—IS NOT A UNITNAME

The major or minor name on a HWSNAME statement is not defined in MVS Stage1.

System action: JES3 initialization stream checking continues.
Programmer response: Change the HWSNAME statement to specify a valid UNITNAME.

Module:

Containing       Detecting       Issuing
IATUTIS          IATUTIS        IATUTIS

Routing Code: Note 19
Descriptor Code: 7

IAT7977

Explanation:

>>> HWSNAME—xxx—is NOT A SETNAME—

The major or minor name on a HWSNAME statement is in MVS Stage1, but the corresponding SETNAME statement is missing.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the HWSNAME statement, or add a SETNAME statement.

Module:

Containing       Detecting       Issuing
IATUTIS          IATUTIS        IATUTIS

Routing Code: Note 19
Descriptor Code: 7

IAT7978

Explanation:

>>> NO SETNAME STATEMENT SPECIFIED—FOR UNITNAME—name—

UNITNAME name was specified in MVS Stage1 and all its units have been defined in the initialization stream with DEVICE statements, but no SETNAME statement specified this UNITNAME.

System action: JES3 initialization stream checking continues.

Programmer response: If you want JES3 to handle the setup for this UNITNAME, add a corresponding SETNAME statement.

Module:

Containing       Detecting       Issuing
IATUTIS          IATUTIS        IATUTIS

Routing Code: Note 19
Descriptor Code: 7

IAT7979

Explanation:

>>> UNDEFINED PROCESSOR—proc—SPECIFIED—FOR—type ident—

A DEVICE initialization statement specifies an undefined processor name on either a JUNIT or XUNIT parameter.
In the message text:

proc specifies the name of the undefined processor which is referenced on the DEVICE statement.

type is one of the following:

- **JNAME** indicates that the undefined processor is on a JUNIT parameter.
- **XUNIT** indicates that the undefined processor is on an XUNIT parameter.

ident If type is JNAME, ident is the JNAME of the device containing the undefined processor.
If type is XUNIT, ident is the XUNIT that is associated with the undefined processor.

System action: JES3 initialization stream checking continues.

Operator response: Notify the system programmer.

System programmer response: Add a MAINPROC initialization statement with the specified processor name, or remove the system and its associated JUNIT or XUNIT from the DEVICE initialization statement.

Module:

<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19  
**Descriptor Code:** 7

---

#### IAT7984

**Explanation:**

```plaintext
>>> RJPLINE— dev— IS A DUPLICATE
```

An RJPLINE statement was found with a unit that has been defined previously for this processor.

**System action:** JES3 initialization stream checking continues.

**Programmer response:** Correct one of the duplicate statements.
IAT7985

Explanation:

```plaintext
>>> NO MATCHING SETNAME— setname— FOUND— FOR SETUNIT— dev—
```

A DEVICE statement had XTYPE= setname specified, but no SETNAME statement with XTYPE= setname could be found.

System action: JES3 initialization stream checking continues.

Programmer response: Correct the DEVICE or SETNAME statement.

IAT7986

Explanation:

```plaintext
>>> UNIT— dev— NOT DEFINED TO JES3
```

UNIT dev was defined in the MVS Stage 1 stream, but was not included as a device in the JES3 initialization stream.

System action: JES3 initialization stream checking continues.

Programmer response: If you want to define the specified device, include it in the initialization stream, and resubmit the initialization stream.

IAT7987

Explanation:

```plaintext
>>> UNITNAME— name— NOT DEFINED— TO PROCESSOR— main
```

JES3 found a SETNAME statement that does not have a corresponding UNITNAME statement in the MVS Stage1 of system generation that is being analyzed for the processor main.

System action: JES3 initialization stream checking continues.
**IAT7988 • IAT7989**

**Operator response:** Notify the system programmer.

**Programmer response:** Verify that the processor being analyzed should not have this UNITNAME included in the MVS Stage1 or add the UNITNAME if it has been omitted.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>

<td>IATUTIS</td>
<td>IATUTIS</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 19

**Descriptor Code:** 7

---

**IAT7988**

**Explanation:**

>>>— RJPLINE/RJPTERM STATEMENT MISSING —— RJP WILL NOT INITIALIZE

Either RJPLINE statements but no RJPTERM statements were found or in the initialization stream RJPTERM statements but no RJPLINE statements were found. When RJP is called after JES3 initialization, RJP will not activate.

**System action:** JES3 initialization stream checking continues.

**Operator response:** Notify the system programmer.

**Programmer response:** At least one valid RJPLINE and one valid RJPTERM statement must be coded in the initialization stream in order for RJP to initialize when it is called. Both RJPLINE and RJPTERM statements must be included when RJP is used by JES3. If RJP is not going to be included in your installation, both RJPLINE and RJPTERM should be removed.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</table>

**Routing Code:** Note 19

**Descriptor Code:** 7

---

**IAT7989**

**Explanation:**

>>>— NO SETNAME STATEMENTS INCLUDED

The initialization stream that the system programmer submitted for checking did not contain the SETNAME statements needed to process one or more of the following:

- SETUNIT
- ALTERNATE NAMES
- SETNAME
- UNITNAME
- HWSNAME

**System action:** The system branches around the tests for the missing statements.

**Operator response:** Notify the system programmer.

**System programmer response:** Add the missing SETNAME statements.

**Module:**
A *CALLJU,J= command was issued and the IATUTJU utility did not convert the JESJCLIN data set successfully for the specified jobid. The reason text provides one of the following explanations:

**JOB NOT FOUND (1)**
The requested job was not found on spool.

**DATA SET NOT FOUND (2)**
The job has no JESJCLIN data set.

**PURGE IN PROGRESS (3)**
The requested job was being purged.

**DUMP JOB ACTIVE (4)**
The dump job (DJ) utility was active for the requested job.

**CONVERSION NOT REQUIRED (5)**
The JESJCLIN data set is already formatted correctly.

**DATA SET BUSY (6)**
The JESJCLIN data set is in use by another JES3 function.

**IATXFKIO INIT FAILURE (7)**
Block spooler initialization failed.

**IATXFKIO READ FAILURE (8)**
Block spooler read failed.

**IATXJCJ TYPE=RO FAILED (9)**
The requested job’s JCT (IATYJCT) could not be accessed.

**IATXJDS ACCESS ERROR (10)**
The requested job’s JDS (IATYJDS) could not be accessed.

**CONVERSION DSP ABEND (11)**
The DSP’s JESTAE exit was entered.

**CONVERSION SUBTASK ABEND (12)**
The subtask’s ESTAEX exit was entered.

**Note:** When all jobs are being converted (*CALLJU,J=ALL*), the IAT7990 message is issued for reasons 6 - 12 only.

**System action:** If the utility was invoked to process a specific job, the Dynamic Support Program (DSP) will terminate. If the utility was invoked to process all jobs, the DSP will continue for all reasons except a DSP abend (11) or a subtask abend (12). These exceptions will cause the DSP to terminate.

**Operator response:**

1-5 No response required.

6 Retry the request.

7-12 Notify your system programmer.

**System programmer response:** If the problem persists, search problem reporting databases for a fix. If no fix exists, contact the IBM Support Center.
IAT7991 • IAT7992

Explanation:

巨—JESJCLIN CONVERSION SUCCESSFUL—FOR JOB—jobname—(jobid)——

A *CALL,JU,J=xx command was issued for a specific job, and the JESJCLIN data set was successfully converted. If the utility was invoked to process all jobs, this message will not be issued for every job; this is done to limit the number of messages being sent.

System action: The Dynamic Support Program (DSP) terminates.

Operator response: None.

System programmer response: None.

Explanation:

巨—cccccccc—JOBS CONVERTED,—eeeee——JOBS IN ERROR,—ttttttt—JOBS CHECKED——

A *CALL,JU,J=ALL command was issued for all jobs, and conversion processing results are displayed. The message indicates that cccccccc jobs were successfully converted, eeeeee jobs were skipped due to an error condition, and a total of tttttttt jobs were checked.

System action: The Dynamic Support Program (DSP) terminates.

Operator response: None.

System programmer response: None.
IAT7993

Explanation:

JESJCLIN CONVERSION UTILITY FAILED—\textit{reasontext}\rightleftharpoons

A *CALL,JU command was issued because the utility was unable to retrieve the command input buffer, or found an error while parsing the command parameters. The \textit{reasontext} provides one of the following explanations:

**PARAMETER ERROR (1)**

The specified parameter was incorrect. The only permitted parameters are \texttt{J=jobnum} or \texttt{J=ALL}.

**COMMAND INPUT ERROR (2)**

The utility could not read the console input buffer.

System action: The Dynamic Support Program (DSP) terminates.

Operator response:

1. Correct the parameter error and retry the command.
2. Notify your system programmer.

System programmer response: If the problem persists, search problem reporting databases for a fix. If no fix exists, contact the IBM Support Center.

Chapter 23. Modify Messages

IAT8001

Explanation:

In the message text:

* The return code from the IATXCKPT macro. See the macro description in z/OS JES3 Customization for an explanation of the reported value.

System action: JES3 processing continues. Because the result of the command may not have been checkpointed, it is unpredictable whether a subsequent JES3 hot start will use the desired value. The command may have to be repeated. A JES3 warm start or cold start will rebuild the checkpointed information based on the initialization stream specification.

Operator response: Notify the system programmer.

Programmer response: Re-issue the last command entered. If this problem persists, a JES3 warmstart should be scheduled to rebuild the initialization checkpoint.

IAT8003  •  IAT8006

IAT8003
Explanation:

This message is issued in response to a *MODIFY,J=jobname,C command. Job specified job cannot be canceled because a system error occurred sometime during the life of the job.

System action: JES3 ignores the command.
Operator response: None. This is an informational message.

Module:

IAT8004
Explanation:

This message is issued in response to a *MODIFY,J=jobname,LOG|NOLOG command. JES3 could not find the job as specified. If the system was specified, the text ON main is included. If the command included the ASID parameter, the message contains the text IN ASID asid. If both the system and ASID were specified, the message contains both text inserts.

System action: JES3 ignores the command.
Operator response: Correct the parameters and reissue the command.

Module:

IAT8006
Explanation:

This message is issued in response to a *MODIFY,J=jobno command. The specified number is not assigned to a job.

System action: JES3 ignores the command.
Operator response: Verify the job number, and resubmit the request.

Module:
Routing Code: Note 18
Descriptor Code: 5,7

IAT8007
Explanation:

This message is issued in response to a *MODIFY,J=jobname,LOG|NOLOG command. JES3 found more than one job with the same name on the specified system or in the specified ASID (on two or more different systems).

System action: JES3 ignores the command.

Operator response: Either specify a jobid or use additional parameters (for example, SYS= and/or ASID=) to better identify the job.

IAT8037

Explanation:

According to the message, this message is issued in response to a *MODIFY,J=nnn,RUN command. `reasonext` is one of the following:

**MAIN SERVICE COMPLETE**
- The job has already completed execution.

**JOB NOT IN GMS SELECT**
- The job is not on the GMS select queue waiting to be selected for execution.

**JOB NOT ELIGIBLE TO RUN**
- The job is not eligible to run on any systems. Message IAT8095 is issued for each system associated with the job to describe why the job cannot run on that system.
  - Class disabled.
  - Group disabled.
  - Job not eligible for main, based on /*MAIN specifications.
  - Main offline.
  - Scheduling environment unavailable.
  - Scheduling environment undefined.
  - Job in DJC hold.
  - Marginal spool condition.

**GROUP NOT WLM MANAGED**
- The job's group is not WLM managed.

**REJECTED BY WLM**
- The job cannot be scheduled by WLM. Additional text is issued identifying the WLM service that failed, the return code, and the reason code.
  - JOB IS IN SPOOL HOLD
  - SERVICE CLASS NOT FOUND - the job's service class is not known to JES3.
  - SERVICE = { IWMBLOC | IWMBREQ }, RETURN CODE = retcode
    - This is a secondary message when "REJECTED BY WLM" appears in the initial message

System action: The run request is rejected.

Operator response:
- GROUP NOT WLM MANAGED - Use the *MODIFY,G command to change the job's group to WLM managed or use the *MODIFY,J=jobno,CLASS=cls command to change the job's class to one that belongs to a WLM-managed group.
- JOB IS IN SPOOL HOLD - If possible, use the *MODIFY,Q command to release the job from spool hold.
- SYSTEM sysname NOT FOUND - Contact the system programmer.
- JOB NOT IN GMS SELECT - None
- JOB NOT ELIGIBLE TO RUN - Examine the reasons why the job cannot run in message IAT8095 and if necessary, issue the required commands to allow the job to run. For example, if a job's scheduling environment is not available on any systems, you may want to issue the MODIFY,WLM command to cause the scheduling environment to become available.
- SERVICE CLASS NOT FOUND - Contact the system programmer.
JOB REJECTED BY WLM - If the failing service is IWMBLOC and the return code is X'C' and the reason code is xxxx0C34, WLM is unable to select a system to start an initiator for the job. Two possible reasons for this reason text are:

1. All processors in the complex are in WLM COMPAT mode instead of GOAL mode.
2. WLM has determined that there is not enough capacity on the available systems to run the job.

If at least one processor in the complex is in GOAL mode and the problem persists, contact the system programmer.

Programmer response: Contact the IBM Support Center.

>>> TYPE= t, PRTY= pp, LEAD= iii MINUTES, PINC= pp, INT= iii MINUTES

This message is issued in response to a *MODIFY,L command, where t is the TYPE specified. The other keywords specify the deadline algorithm as changed by the command.

System action: A new deadline algorithm is used.
Operator response: None. This is an informational message.
IAT8043

Explanation:

This message is issued in response to a *MODIFY,C=class command. The command has completed successfully.

Additional text can follow the class name. This can be the following:

• WARNING, SYSTEM LISTS FOR CLASS AND GROUP ARE NOT THE SAME - This text appears if a
  *MODIFY,C=cls,GROUP=grp command is issued to change the group for a class. The systems defined to the class
  are a subset of the systems defined to the class. For example, the GROUP is defined to run on systems SY1, SY2,
  and SY3, but the class is defined to run on systems SY1 and SY2. As a result, jobs in the specified class will be able
  to run on all systems assigned to the group except SY3.

System action: Processing continues.

Operator response: None.

IAT8044

Explanation:

This message is issued in response to a *MODIFY,L command. Deadline type xxx on the command was not defined
to JES3.

System action: JES3 ignores the command.

Operator response: Reissue the command with a valid deadline type specified.

Problem determination: See Table III, items 4 and 5.
IAT8045  •  IAT8048

IAT8045
Explanation:

This message indicates that the associated (*MODIFY) command did not complete normally. The origin console type was not known or an error occurred while processing the command.

System action:  JES3 processing continues. This is an informational message.

Operator response:  Resubmit the command.

System programmer response:  None. This is an informational message.

</thead>
<tbody>
<tr>
<td>IATMOCW</td>
<td>IATMOCF</td>
<td>IATMOCF</td>
</tr>
</tbody>
</table>
This message is issued in response to a *MODIFY,Q command. The JES3 queue has been successfully placed in hold or release status.

**System action:** Queue is held or released.

**Operator response:** None. This is an informational message.

One of the following *MODIFY commands was entered:

```
MODIFY,Q,DD=dnn, { DRAIN}
    { HOLD }
    { CANCEL }
    { STOP }
    { USE }
    { RELEASE }
    { R }
*MODIFY,Q,DD=dnn,SP=spart name
*MODIFY,Q,DD=dnn,CYL=cyl,TRK=trk
```

In the message, *reasontext* is one of the following:

**INVALID DNAME**

An incorrect *dnn* was specified. All ddnames must be valid for the command to process.

**INVALID PARTITION NAME**

An incorrect partition name was specified. The partition name must be valid for the command to process.
DATA SET IS HELD -
A previous HOLD, STOP or CANCEL was done on this spool data set.

DATA SET IS IN USE -
A previous USE or RELEASE was done on this spool data set.

DATA SET IS UNAVAILABLE -
The data set specified in the MODIFY command is unavailable.

ALL DEFAULT SPECIFIED -
The MODIFY would result in no spool data sets being left in the default partition. This is not allowed and the command is ended.

MINIMAL TRACK GROUP CONDITION SURPASSED -
The MODIFY would result in the number of available track groups in the default partition decreasing below the number defined as minimal. This is not allowed and the command is ended.

ERROR PROCESSING EXTENT MODIFY -
An error was encountered processing the MODIFY request. Check the status of the spool by issuing the *INQUIRY,Q,DD=ALL command.

CYL NOT SPECIFIED -
A BADTRACK command was not processed because the cylinder value (CYL=) was missing from the command.

TRK NOT SPECIFIED -
A BADTRACK command was not processed because the track value (TRK=) was missing from the command.

INVALID CYLINDER/HEAD ADDRESS SPECIFIED -
A BADTRACK command was not processed because the cylinder or track value is not valid. The value is not valid for one of the following reasons:
• The ddname specified on the command refers to the JCT data set.
• The value is not 4 hexadecimal digits.
• The CYL or TRK value is not within the bounds of the spool data set specified.

To determine the valid range of cylinder/head addresses for the spool data set, examine the JMF spool data set description section. If JMF is not available, the Extent Table entry of the spool data set may be examined for the high and low cylinder/head addresses. The Dump Core (DC) JIO option can be used to display this table.

INTERNAL PROCESSING ERROR -
The code that processes the BADTRACK command was not able to complete the command because of one of the following conditions:
• Storage could not be obtained for a BADTRACK record.
• The Main Processor Control table entry (MPC), needed to send the BADTRACK record, could not be found.

System action: The modify is not done. The *INQUIRY,Q,DD=ALL command will display the spool data sets in the complex.

Operator response: None. This is an informational message.

Module:
IAT8059 • IAT8061

IAT8059

Explanation:

This message is issued in response to a *F,J=nnn,H/R command when the requested job is not found.

System action: JES3 ignores the command.

Operator response: Verify the job number, and reenter the command.

IAT8060

Explanation:

This message is issued in response to a *MODIFY,T command when no BSC RJP (RJP=BSCRJP) lines or workstations or SNA RJP (SNA=SNARJP) workstations are defined to JES3.

System action: JES3 ignores the command.

Operator response: None. This is an informational message.

IAT8061

Explanation:

This message is issued in response to a *MODIFY,O command which requested that the JES3 hardcopy log (DLOG) be enabled or disabled. The reasontext is one of the following:
DLOG IS ALREADY ACTIVE
An attempt was made to enable DLOG when it was already active.

SYSTEM ERROR
An error occurred while attempting to enable DLOG. This message is preceded by message IAT7111, IAT7112, or IAT7713 which detail the error encountered.

THIS IS A LOCAL PROCESSOR
JES3 attempted to start the JES3DLOG address space on a local processor. This address space only runs on the global processor.

DLOG IS NOT TURNED ON
JES3 attempted to activate DLOG under inappropriate conditions.

System action: None. The state of DLOG is unchanged.

Operator response: Verify the desired command for the current DLOG state, and resubmit the command if necessary. If THIS IS A LOCAL PROCESSOR or DLOG IS NOT TURNED ON appears in the message, contact the IBM Support Center.

</tbody>
</table>

**Routing Code:** Note 18
The *MODIFY,J=,CLASS= command was rejected for one of the following reasons:

CLASS AND //*MAIN INCONSISTENT
There are no main processors identified on the //*MAIN statement in common with those specified for the new class.

JOB IS ACTIVE ON MAIN

JOB IS ACTIVE IN BREAKDOWN

JOB HAS COMPLETED MAIN
The job class cannot be modified for jobs that are in execution on a main processor or have completed main processing.

JOB IS ACTIVE IN C/I FSS

JOB IS ACTIVE IN MDS RESTART
The job class of a job active in a converter/interpreter (C/I), functional subsystem (FSS), or in main device scheduler (MDS) restart, cannot be modified.

JOB DOES NOT HAVE A MAIN S.E.
For a job that does not have main scheduler scheduling element (SE), the job class cannot be modified.

OPERATOR NOT AUTHORIZED
The operator who issued the change job class command is not authorized to modify the specified job class.

JOB OWNER NOT AUTHORIZED
The job owner is not authorized to modify the target job class.

System action: JES3 ignores the command and does not modify the job class.

Operator response: When either JOB IS ACTIVE IN C/I FSS or JOB IS ACTIVE IN MDS RESTART are displayed, retry the command when current processing completes.

When either OPERATOR NOT AUTHORIZED or JOB OWNER NOT AUTHORIZED is displayed, rerun the command with a job class that the operator or job owner is authorized to use. Refer to z/OS JES3 Initialization and Tuning Guide for more information.
IAT8080
Explanation:

This message is issued in response to a *MODIFY,J= jobno, H or R command. The designated job has been successfully placed in hold or release status.

System action: Processing continues.

Operator response: None. This is an informational message.

Routing Code: Note 13
Descriptor Code: 5,7

IAT8081
Explanation:

A *MODIFY command was issued to change the status of a particular job or of all jobs that have data on the spool data set(s) specified in the command. JES3 issues this message once for each job affected by the command. The message gives the status of the specified job after the command has completed, as follows:

IN SPOOL HOLD
One of the following has occurred:

- JES3 has released the job from operator hold status but the job cannot continue processing because it is also in spool hold status.
- JES3 has released a spool data set that contains data for the specified job from spool hold status but the job cannot continue processing; it is still in spool hold status. At least part of the job's data is located on one or more spool data sets that are still in spool hold status.

CANCELLED
JES3 has canceled the job and all output from the job.

IN HOLD
JES3 has released the job from spool hold status but the job cannot continue processing because it is being held for some other reason (for example, at the operator's request).

RELEASED FROM SPOOL HOLD
JES3 has released the job from spool hold status. If the job is not being held for some other reason (for example, at the operator's request), the job resumes processing. If it is being held, JES3 issues this message again with IN HOLD appearing in the message text.

RELEASED
JES3 has released the job from hold status. The job resumes processing.

System action: Command processing continues.

Operator response: If IN SPOOL HOLD appears in the message, use the *INQUIRY,J=jobname,SH command to display the name(s) of the spool data set(s) that are in spool hold status and contain data for the job. Check with
your system programmer to be sure you can release the data set(s). If so, issue the *MODIFY,Q,DD= ddn,RELEASE command to release the data set(s).

If IN HOLD appears in the message, issue the *INQUIRY,J=jobname command to determine why the job is still in hold status. Respond as required.

If CANCELLED, RELEASED FROM SPOOL HOLD, or RELEASED appears in the message, no response is required.

---

**IAT8083**

**Explanation:**

\[JOB QUEUE FOR SPECIFIED EXTENTS\]

HELD

STOPPED

RELEASED

CANCELLED

This message is issued in response to a *MODIFY,Q,DD= command. JES3 has successfully changed the status of the spool data set(s) specified in the command. The preceding messages describe the status of each job affected by the command.

**System action:** If HELD, STOPPED, or CANCELLED appears in the message, JES3 puts the specified spool data sets in spool hold status and does not allocate any additional space on the data set.

If RELEASED appears in the message, JES3 removes the data set from spool hold status; the data set is now available for use.

**Operator response:** None. This is an informational message.

**Module:**
IAT8084 • IAT8086

IAT8084
Explanation:

⎰ JOB—jobname (jobid)—CHANGED FROM P—xx TO P—yy CLASS—cls TO CLASS—cls⎰

This message is issued in response to a *MODIFY,J=jobno, P=ppty or *MODIFY,J=jobno,CLASS=cls command. The specified job has been changed to a new priority or job class.

System action: Processing continues.
Operator response: None. This is an informational message.
Module:

IAT8085
Explanation:

⎰ CAN’T CANCEL DJCUDPAT⎰

The operator tried to cancel DJCUDPAT, a system control DSP.

System action: JES3 ignores the cancel command.
Operator response: None. This is an informational message.
Module:

IAT8086
Explanation:

⎰ JOB—jobname (jobid)—IS NOT IN DJC NET NOT CANCELLED⎰

An attempt was made to cancel a DJC job using the *MODIFY,J=jobno, C command, or to cancel a non-DJC job using the *MODIFY,N command.

System action: Not applicable.
**IAT8087 • IAT8088**

**Operator response:** See the *MODIFY,N command in [z/OS JES3 Commands](https://www.ibm.com/docs/en/zos/2.2.0?topic=jes3-modify-n).

**Explanation:**

> **JOB—jobname (jobid)—NOT CANCELLED** — DYN ALLOCATION ACTIVE
> 
> MDS RESTART ACTIVE
> 
> ACTIVE DEMAND SELECT JOB
> 
> SYSTEN NON-CANCELLABLE

The operator attempted to cancel a job that is currently active in dynamic allocation or MDS restart, or the job is a demand select job that is currently active on a main.

**System action:** The cancel command is ignored.

**Operator response:** If the job is active in MDS restart or dynamic allocation, try canceling the job again at a later time by entering *C,S,jobno. If a mount is outstanding, reply CANCEL to the WTOR message.

If the job is an active demand select job, wait until processing ends and reenter the *CANCEL command.

If the job is a system non-cancellable job, enter the MVS FORCE JOB,ARM command.

**Routing Code:** Note 18

**Descriptor Code:** 5,7

---

**IAT8088**

**Explanation:**

> **JOB—jobname (jobid)—NOT FOUND** — JCT BUSY-DJ ACTIVE
> 
> JCT BUSY

This message is normally issued in response to a *MODIFY,J=jobno,C command or an *I,j=jobno command. For *

*I,j=jobno commands, when the JCT is busy, the system will respond with UNKNOWN in the job name. For

*I,j=jobname commands, UNKN will be placed in the job number field. See individual explanations below for specific message texts.

**JOB NOT FOUND:** The designated job jobname or jobno could not be found or is not the correct DJC job.

**JCT BUSY-DJ ACTIVE** The JCT could not be accessed; the dump job DSP is active for the job.

**JCT BUSY** JCT is busy, in use by another FCT.

**System action:** Processing continues.
Operator response:

**JOB NOT FOUND:**
Verify that the correct job identification is being used and retry the command. If the job is not in the correct DJC network or the job number and name are not the same as those of a job to be canceled, the DJC network may have to be forced from the system.

**JCT BUSY-DJ ACTIVE**
Wait until the dump job DSP is complete and retry the command.

**JCT BUSY**
Retry the command.

IAT8095
Explanation:

/SM590000/SM590000
sysname – reason text

This message is issued when a *MODIFY J=job,RUN command is rejected for the job and message IAT8037 indicates
that the job is not eligible to run. Message IAT8095 is issued for each system associated with the job to describe why
the job cannot run on that system.
System action:  Processing continues.

Operator response:  The following reasons can prompt action on your part. Do not take action blindly (e.g. enabling a class on a system where it was not intended to be enabled).

- **JOB CLASS DISABLED** - The job class is disabled on the specified system. Issue a *MODIFY,G,sysname,C,cls,ON command to enable the job class on that system.
- **JOB IN DJC HOLD** - The job is in DJC hold. Issue a *MODIFY,N command to release the job from DJC hold.
- **GROUP DISABLED** - The job class group is enabled on the specified system. Issue a *MODIFY,G,sysname,G,grp,ON command to enable the group on that system.
- **MAIN OFFLINE/NOT CONNECTED** - The main processor (system) has been varied offline or is not connected. Issue the *VARY,sysname,ON command to vary the system online or perform the required procedures to make the system available so it can connect to the global.
- **WAITING FOR SPOOL SPACE** - There is not enough spool space available to schedule the job for execution. That is, the spool partition assigned to the job, class, or system is below the marginal spool space threshold. Make spool space available in the job’s, class’s, or system’s spool partition by canceling jobs, starting writers, dumping jobs to tape with DJ or whatever mechanism you use to free up spool space.
- **SCHEDULING ENVIRONMENT NOT DEFINED** - The job’s scheduling environment is not defined in the current WLM policy. Have the system programmer modify the policy to include the scheduling environment. Then install the new WLM service definition and activate the new policy using the VARY WLM,POLICY= command.
- **SCHEDULING ENVIRONMENT NOT AVAILABLE** - The job’s scheduling environment is not available. Issue a MODIFY WLM,RESOURCE= command to make the resources associated with the scheduling environment available on the specified system.
- **WLM RECLASSIFICATION IS IN PROGRESS** - A new WLM service definition has been installed and a new policy has been activated. JES3 is in the process of reclassifying jobs in the JES3 job queue. Wait for message, IAT2011, to be deleted and message IAT2016 to be issued indicating that reclassification has completed. Then reissue the *MODIFY,J=job,RUN command.
- **SRVCLASS MODIFY IN PROGRESS** - The job’s service class is being modified (e.g. from a *MODIFY, J=job,SRVCLASS=srvclass command). Wait for the service class modify to complete and then reissue the *MODIFY,J=job,RUN command.
- **MAX JES MANAGED JOBS ON SINGLE MAIN** - The maximum number of jobs (65535) that can run concurrently in JES managed initiators (65535) is active and no new job can run on this main in a JES managed initiator until one of these active jobs ends or is canceled.
- **MAX WLM MANAGED JOBS ON SINGLE MAIN** - The maximum number of jobs (65535) that can run concurrently in WLM managed initiators (65535) is active and no new job can run on this main in a WLM managed initiator until one of these active jobs ends or is canceled.
- **JESLOG VALUE NOT SUPPORTED ON MAIN** - The job specified (on the JOB statement or the START command) or inherited (from the class definition) a JESLOG attribute of SUPPRESS or SPIN. The main processor for which this text is displayed for the job is not at a sufficient JES3 level to allow the job to run on that processor.

➤➤ SPOOL DATA DDNAME ___ ddn___ -CONTAINS ALLOCATED SST EXTENTS. ➤

➤ RESTART JES3 ON THE GLOBAL PROCESSOR. ❯

One of the following commands was issued so that JES3 cannot allocate spool space from the specified data set.
*MODIFY,Q,DD=ddn,{ DRAIN } { HOLD } { CANCEL } { STOP }

However, the spool data set specified in the *MODIFY command contains spool space allocated from the single track table (STT). If the spool space can no longer be allocated from the specified spool data set, JES3 will fail any job with spool space allocated from this data set.

**System action:** Command processing continues.

**Operator response:** If you issued the command with the DRAIN or HOLD parameter after receiving I/O error messages and you plan to leave the volume containing the spool data set online, no response is required. Be aware that additional I/O errors might occur that can impact the allocated STT records on the data set.

If you issued the command with the STOP or CANCEL parameter to make the spool data set unavailable to JES3 on the global, restart JES3 to remove the spool data set from the system. Restart processing automatically cancels all jobs with STT records on the data set. (You must also restart the locals when removing a spool data set.) When restart is complete, you can resubmit the canceled jobs.

---

**IAT8097**

**Explanation:**

 Partition — spart — WILL NOW OVERFLOW INTO— spart2 —

One of the following commands was issued to allow spart-name to overflow into spart2 or the default partition.

*MODIFY,Q,SP=spart-name,O={ ovrl-spart2 } { YES }

**System action:** Track groups will now be allocated from the spool partition defined by spart2 when the partition spart becomes full. The *INQUIRY,Q,SP=spart-name,O command will display the partition overflow list for a spool partition.

**Operator response:** None. This is an informational message.

**IAT8098**

**Explanation:**

 Overflow MODIFY FOR — spart — REJECTED, CIRCULAR OVERFLOW WOULD RESULT

- OVERFLOW FROM DEFAULT PARTITION
- NOT ALLOWED
- SAME PARTITION NAME SPECIFIED
- INVALID PARTITION NAME SPECIFIED
A *MODIFY,Q,SP=part1,O=part2 command was issued to change the overflow capability of the specified spool partition. One of the following error conditions occurred.

**CIRCULAR OVERFLOW WOULD RESULT**
The MODIFY would result in a circular overflow chain. This is part1 -> part2 -> part3 -> part1. This is not allowed and the command is ended.

**OVERFLOW FROM DEFAULT PARTITION NOT ALLOWED**
The MODIFY would result in the default partition overflowing. By definition the default partition cannot overflow.

**SAME PARTITION NAME SPECIFIED**
The operator entered the same partition name for both the overflowing spool partition and the overflow spool partition. This is not allowed and the command is ended.

**INVALID PARTITION NAME SPECIFIED**
An incorrect spool partition name was specified for one or both of the spool partitions referenced in the command. The command is ended.

**System action:** Processing continues.

**Operator response:** Check the partitions defined by issuing the *INQUIRY,Q,SP=ALL command.

**IAT8100**

Explanation:

This message is in response to a *MODIFY,G command used to modify any of the following initiator options for a WLM-managed group:
• Number of initiators
• Initiator allocation
• Initiator deallocation
• BAR - job selection priority barrier
• JSPAN - Number of jobs to examine when attempting to select a job

**System action:** JES3 ignores the command.

**Operator response:** If you need to change the initiator or job selection options, first change the group's mode to JES3 managed using the *MODIFY,G,ALL,grp,MODE,JES command. Then reissue the command to change the initiator or job selection options.

**IAT8102**

**Explanation:**

```
>>> MODE CHANGE REJECTED FOR group-reasontext
```

This message is issued in response to a *MODIFY,G,ALL,group,MODE,[WLM|JES] to change a job class group mode from JES managed to WLM managed or from WLM managed to JES managed. *reasontext* is one of the following:

• SYSTEM MUST BE SPECIFIED AS ‘ALL’ - ALL must be specified as the system name because the MODE setting is not system specific (you can't have a group WLM managed on one system and JES managed on another).
• WLM RECLASSIFICATION IN PROGRESS - A new WLM service definition has been installed and a new WLM policy has been activated. JES3 is in the process of reclassifying all of the jobs. Message IAT2011 is issued to indicate reclassification is in progress. Message IAT2016 will be issued when reclassification completes.
WLM INITIALIZATION FAILED - WLM batch initiator management initialization did not complete successfully. Message IAT3115 was previously issued during JES3 initialization.

System action: JES3 ignores the command.

Operator response: If the command was rejected because ALL was not specified as the system name, correct and reissue the command. If the command was rejected because reclassification is in progress, wait until message IAT2016 is issued to indicate reclassification has completed. Then reissue the command.

Module:

IAT8103

Explanation:

>>> MODE CHANGED TO {WLM|JES} FOR group

This message is issued in response to a *MODIFY,G,ALL,G,group,MODE,{WLM|JES} to change a job class group mode from JES managed to WLM managed or from WLM managed to JES managed.

System action: Processing continues.

Operator response: None.

Module:

IAT8104

Explanation:

>>> WARNING, SYSTEM main IN WLM MODE DOES NOT SUPPORT GROUP group

This message is issued in response to a *MODIFY,G,main,G,grp command to enable a WLM-managed group on a system that is not at least at the JES3 OS/390 Version 2 Release 8 (HJ86608) level. The group was successfully enabled, but since JES3 is not at a level that supports WLM initiator management, no WLM-managed initiators will be started, and no jobs in the job class group will be selected for execution on that system.

System action: Processing continues, but no WLM-managed initiators will be started on that system.

Operator response: None.
IAT8105

Descriptor Code: 5,7

IAT8106

Explanation:

**MODIFY REJECTED FOR CLASS** cl - reasontext

A *MODIFY,C=cls request was rejected. "reasontext" specifies the reason the command was rejected and can be one of the following:

- KEYWORD kw - kw is not a valid keyword.
- CLASS NOT FOUND - The specified job class is not defined to JES3.
- INSUFFICIENT STORAGE - Unable to obtain storage necessary to satisfy the *MODIFY request.
- SPART spart NOT FOUND - A *MODIFY,C=cls,SP=spart command was rejected because the spool partition is not defined to JES3.
- SPART spart DELETED - A *MODIFY,C=cls, SP=spart command was rejected because the spool partition is deleted.
- SPART spart ALLOCATION IS NOT ALLOWED - A *MODIFY,C=cls,SP=spart command was rejected because spool space allocation is not allowed in the spool partition.
- GROUP grp NOT FOUND - A *MODIFY,C=cls,GROUP=group command was rejected because the group is not defined to JES3.
- MDS RESTART IS NOT COMPLETE - A *MODIFY,C=cls,GROUP=group command was rejected because MDS restart has not completed.
- CLASS SYSTEMS NOT SUBSET OF GROUP SYSTEMS - A *MODIFY,C=cls,GROUP=group command was rejected because the systems defined for the class are not a subset of the systems defined for the group. For example, the class is defined to run on SY1 and SY2, but the group is defined to run on systems SY1 and SY3.
- SDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,SDEPTH= command was rejected because the value specified for SDEPTH is not a valid numeric value.
- SDEPTH xxx TOO HIGH - A *MODIFY,C=cls,SDEPTH= command was rejected because the value specified for SDEPTH is greater than the maximum allowable value.
- TDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,TDEPTH= command was rejected because the value specified for TDEPTH is not a valid numeric value.
- TDEPTH mnn TOO HIGH - A *MODIFY,C=cls,TDEPTH= command was rejected because the value specified for TDEPTH is greater than the maximum allowable value.
- TLIMIT clns SAME AS MODIFY CLASS - A *MODIFY,C=cls,TLIMIT= command was rejected because the class specified in the TLIMIT parameter is the same as the class being modified.
TLIMIT cls NOT FOUND - A *MODIFY,C=cls,TLIMIT= command was rejected because the class specified in the TLIMIT parameter is not defined to JES3.

TLIMIT xxx NOT A NUMBER - A *MODIFY,C=cls,TLIMIT= command was rejected because the value specified for TLIMIT is not a valid numeric value.

TLIMIT nnn TOO HIGH - A *MODIFY,C=cls,TLIMIT= command was rejected because the value specified for TLIMIT is greater than the maximum allowable value.

MDEPTH main NOT FOUND - A *MODIFY,C=cls,MDEPTH= command was rejected because the main specified in the MDEPTH parameter is not defined to JES3.

MDEPTH xxx NOT A NUMBER - A *MODIFY,C=cls,MDEPTH= command was rejected because the value specified for MDEPTH is not a valid numeric value.

MDEPTH nnn TOO HIGH - A *MODIFY,C=cls,MDEPTH= command was rejected because the value specified for MDEPTH is greater than the maximum allowable value.

MLIMIT cls SAME AS MODIFY CLASS - A *MODIFY,C=cls,MLIMIT= command was rejected because the class specified in the MLIMIT parameter is the same as the class being modified.

MLIMIT main NOT FOUND - A *MODIFY,C=cls,MLIMIT= command was rejected because the main specified in the MLIMIT parameter is not defined to JES3.

MLIMIT cls NOT FOUND - A *MODIFY,C=cls,MLIMIT= command was rejected because the class specified in the MLIMIT parameter is not defined to JES3.

MLIMIT xxx NOT A NUMBER - A *MODIFY,C=cls,MLIMIT= command was rejected because the value specified for MLIMIT is not a valid numeric value.

MLIMIT nnn TOO HIGH - A *MODIFY,C=cls,MLIMIT= command was rejected because the value specified for MLIMIT is greater than the maximum allowable value.

JESMSG AND SPIN INCONSISTENT - A *MODIFY,C=cls,JESMSG= or *MODIFY,C=cls,SPIN= command was rejected because it would result in mutually inconsistent SPIN and JESMSG settings. In particular, when JESMSG=NOLOG for a class, the SPIN parameter for the same class cannot be anything other than NO, and when the SPIN parameter for a class is YES, a time, time interval, or line interval, JESMSG cannot be set to NOLOG.

SPIN xxxxxxxx UNKNOWN FORMAT - A *MODIFY,C=cls,SPIN= command was rejected because the SPIN value is not YES or NO and is not recognized as a valid time of day, time interval or line interval. This reason text includes an hour, minute, hour interval, or minute interval that exceed two digits or a line interval that exceeds three digits.

SPIN xxxxxxxx HOUR EXCEEDS 23 - A *MODIFY,C=cls,SPIN=hh:mm command was rejected because the hour value on the specified time of day exceeds 23.

SPIN xxxxxxxx MINUTE EXCEEDS 59 - A *MODIFY,C=cls,SPIN=hh:mm command was rejected because the minute value on the specified time of day exceeds 59.

SPIN xxxxxxxx MINUTES EXCEED 59 - A *MODIFY,C=cls,SPIN=+hh:mm command was rejected because the minute value on the specified time interval exceeds 59.

SPIN xxxxxxxx INTERVAL BELOW +00:10 - A *MODIFY,C=cls,SPIN=+hh:mm command was rejected because the interval is less than the required minimum of 10 minutes.

SPIN xxxxxxxx LINE INTERVAL BELOW 500 - A *MODIFY,C=cls,SPIN-nnn,*MODIFY,C=cls,SPIN=nnnK, or *MODIFY,C=cls,SPIN-nnnM command was rejected because the specified line interval is less than the required minimum of 500 lines.

System action: JES3 ignores the command.

Operator response: Correct and reissue the command.

IAT8121 • IAT8122

IAT8121
Explanation:

NO indicates that an *INQUIRY,U or *MODIFY,U command was entered and no output service element (OSE) in the output queue matches the selection parameters entered. The job may already have been selected by a writer which would account for no OSE in the output queue. If received in response to a *MODIFY U command, this message may indicate that the data set's OSE or JDS control block was in use by another function. LIMITED indicates that processing of a *MODIFY,U command was prematurely ended because of system limitations.

_Formal text_ is one of the following:

**JOB NOT FOUND**
- One of the following has occurred:
  - The requested job is not in the requested output queue.
  - The requested job did not contain an OSE that matched the parameters of the input command.
  - The requested job did not contain the requested ddname.

**OSE NOT FOUND**
- An output service element that matched the selection criteria was not found or an OSE that matched the selection criteria was found but it was previously scheduled by an external writer, the SYSOUT Application Programming Interface (SAPI), or the Process SYSOUT (PSO) interface.

**JDS ENTRY NOT FOUND**
- The JDS entry for the requested data set was not found.

**NO MATCH ON PARM**
- An OSE could not be found which matched the selection parameters entered.

**NO REQUIREMENTS**
- An OSE is found that satisfies a *IJ,REQ= command but there are not any requirements that indicate why a writer is not scheduling an OSE.

_System action:_ Processing of the command is ended.

_Operator response:_ Reenter the command, or not, as indicated by the error text.

Explanation:

➤➤— INVALID COMBINATION OF J= OR APPC= AND— reasonext

An *INQUIRY, U or *MODIFY, U command was entered with a missing parameter or a parameter that is not valid. In the message text, reasonext can be one of the following:

- DD= parameters
- DD= and DSN= parameters
- DSN= parameters
- S= and DD= parameters
- TK= parameters

The valid parameter combinations are:

- J= jobname DD= parameters
- J= jobname DSN= parameters
- J= jobname DD= parameters S= sequence_number
- J= jobname TK= parameters
- APPC= tpjobname DD= parameters
- APPC= tpjobname DSN= parameters

System action: JES3 ignores the command.
IAT8130 • IAT8131

Operator response: Reenter the command.

Problem determination: Save the hard-copy message log.

IAT8131

Explanation:

>>> JOB jobname(jobid) P= prty D= destination AGE= nnnnD,nnnnH

W= external-writer-name T= terminal-name DG= devgrp

F= form-name C= carriage-tape-name fcb-id

CH= chid, chid... FL= flash id CJ= client-jobname(client-jobid)
JES3 issues this message in response to an *INQUIRY, U command. If *I,U,Q=| WTR | HOLD | was entered, the parameters that appear in the message are the same as the parameters that were entered in the command. The exceptions are the L=, PG=,SR=, and BY= parameters, which always appear. COPIES= appears when DD= is specified. DG= appears when either T= or DG= is specified on the *I,U,Q= command. T= appears if no parameters are specified.

If the *I,U,Q=TCP or *I,U,Q=BDT command is entered, the parameters that appear in the message are the same as the parameters that are entered in the command. The exceptions are D= and TG= or BG=. This information will always appear if J= is specified.

**jobname (jobid)**
- Specifies the job name and job identifier associated with the output.

**P=**
- Specifies the priority assigned to the output.

**D=**
- Specifies the destination for the output.

**AGE=**
- Specifies the total number of days or hours the job has been on the spool.

**W=**
- Specifies the name of the external writer that can process this output. You can use a TSO userid as the external writer name if the data set is on the HOLD queue waiting for a TSO receive request.

**T= or DG=**
- Specifies the value for the device group as assigned on the DGROUP= parameter on the DEVICE initialization statement. The T= parameter refers to the RJP terminal name.
**F=** Specifies the form name needed to process the output.

**C=** Specifies the name of the carriage control tape or the forms control block needed to process the output.

**U=** Specifies the type of train that must be in a printer to process the output.

**CH=** Specifies the character generation module names.

**FL=** Specifies the flash image name.

**CJ=** Indicates that the data set was created with a spinoff name or job ID, or both. If none of the CJ=, CJID=, and CJNM= parameters is specified with the inquiry command, all work is displayed and SYSOUT with spinoff job names is returned.

**CM=** Specifies the copy modification module name.

**trc** Specifies the table reference character.

**SS=**
- **C** specifies the continuous forms stacker.
- **S** specifies the continuous forms stacker.

**CL=** Specifies the SYSOUT class assigned to the output.

**ID=** Specifies the TSO/E userid associated with the output.

**DD=data set DDNAME(seq-number)**

- **data set** specifies the ddname of the data set. The ddname can contain one to three levels of qualification. The sequence number is the order of occurrence of that ddname within the job.

**DD=ddn NAVAIL**

Indicates that the ddname could not be accessed at the time the *INQUIRY command was issued.

**DSN=dsn**

- **dsn** contains a five-part identifier consisting of the nodename, userid, jobid, dsnumber, and dsname

**H=types**

Indicates one of the following hold types:

- **OPER | O**
  - The operator placed the data set in hold. This keyword can be used with the SYS and USER keywords.

- **SYS | S**
  - The JES3 subsystem placed the data set in hold. This keyword can be used with the OPER keyword.

- **USER | U**
  - The user placed the data set in hold. This keyword can be used with the OPER keyword.

- **YES | Y**
  - The output is currently held. This keyword will not be used with any other keyword.

- **NO | N**
  - The output is currently not held. This keyword will not be used with any other keyword.

**Note:** If Q,H=types was specified, the parameter types and associated reason codes are not valid. If H=SYS and R=(002) appeared, see the accompanying message for more information.

If H=SYS appears in the message text, then R=(0000 variable-text) will also be displayed following the hold keyword. *nnm* is the decimal reason code associated with one of the following variable-texts:

- (000) UNKNOWN REASON CODE
PM= Specifies the mode needed to process the output.
L= Specifies the total number of lines for the output.
PG= Specifies the total number of pages for the output.
SR= Specifies the total number of spool records the output occupies.
BY= Specifies the number of bytes in this job’s data set.
COPIES=num-of-copies[,QS]
QS indicates that this copy of the data set is queued for separate writer scheduling. Several writers may concurrently print one copy of a multiple-copy data set. This also indicates that *MODIFY,U commands that are data set specific might not produce the desired output.
BG= Indicates the MVS/BDT group identifier that is assigned to a network job.
BJ=bdt_job# | (NAVAIL)
Indicates the BDT job number assigned to the network job. If NAVAIL appears, no BDT job number was assigned because there is no connection or the jobpool is exhausted.
BS= Indicates the status that a network stream is in. The possible states are:
   INACTIVE
       JES3 has not sent the network stream to the MVS/BDT subsystem.
   SENT
       JES3 sent the network stream to the MVS/BDT subsystem.
   QUEUED
       The network job is on the MVS/BDT job queue and is waiting to be processed by the MVS/BDT subsystem.
   ACTIVE
       The network stream is being sent to the next node in the path.
BT= Specifies if the network stream is a network job or SYSOUT stream.
BY= Specifies the number of bytes in this job’s data set.
IAT8132

SL=security label | (NAVAIL)
Indicates the security label assigned to the data set by the security product. If NAVAIL appears, the security label was not assigned by the security product.

APPC=Y|N|tpjobname(tpid)
Specifies that the data set was generated by an Advanced Program-to-Program Communication (APPC) transaction program. Specifying Y allows you to display all APPC output while specifying N display non-APPC output. The tpjobname displays a specific transaction program.

OB=outbin value
Indicates the OUTBIN value associated with the SYSOUT data.

IP={ipaddr | N}
Specifies the IP address for the output.

FD={formdef | NONE}
Specifies the FORMDEF for the output.

PD={pagedef | NONE}
Specifies the PAGEDEF for the output.

TG=
Indicates the TCP/IP group identifier that is assigned to a network job.

TS=
Indicates the status that a network stream is in. The possible states are as follows:

INACTIVE
JES3 has not sent the network stream to a Netserv.

QUEUED
JES3 sent the network stream to a Netserv. The stream is waiting to be processed by the Netserv.

ACTIVE
The network stream is being processed by a Netserv.

TT=
Specifies if the network stream is a network job or SYSOUT stream.

System action: Processing continues.

Operator response: None. This is an informational message.

IAT8132

Explanation:

>>> JOB — jjj(jobid) — I/O ERROR, OUTPUT MAY BE LOST

This message is issued when an I/O error occurs reading OSE control blocks. Recovery is attempted but the OSE chain may have been truncated, which results in a loss of output for the job. In the message text: jjj is the affected job name, jobid is the affected job id.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:
IAT8133 • IAT8134

IAT8133
Explanation:

>>> UNABLE TO COMPLETE INQUIRY— (REISSUE REQUEST)

This message indicates that an *INQUIRY, U command was issued but JES3 was unable to respond properly. One or more of the response entries will be missing.

System action: Processing continues.

Operator response: Issue the *INQUIRY, U command again.

Module:

IAT8134
Explanation:

>>> INVALID DEST CHANGE REQUEST, USE NJE REROUTE

An *F,U,Q= BDT or *F,U,Q= [HOLD | WTR], ND= command was issued in an attempt to reroute a job's output to another node for processing.

USE NJE REROUTE
appears in the message if the operator attempted to reroute a data set from the BDT queue.

HOME NODE CANNOT BE USED
appears in the message if the operator attempted to reroute a data set to the home node.

System action: The destination change request is not made. JES3 processing continues.

Operator response: Issue a *CALL NJEROUT command to reroute the data set from the BDT queue or from the home node.

Module:
IAT8135  •  IAT8138

IAT8135
Explanation:

MAXIMUM *I,U COMMAND ACTIVITY,— REISSUE COMMAND

For each *INQUIRY command issued, JES3 creates a DSP to process the command and it is chained from the appropriate FCT. JES3 issues this message when the maximum number of DSPs is chained from the FCT that handles the specified command.

System action:  The command is rejected and JES3 processing continues.

Operator response:  Use the *MODIFY,X,D=INQOSFCT,MC=nnn command to increase the number of INQOSFCT DSPs.

IAT8138
Explanation:

DUPLICATE PARAMETER— xxxx— FOR KEYWORD H=

The H= keyword on the *INQUIRY,U or *MODIFY,U command allows you to specify multiple parameters. Each parameter type can only be specified once on a single command. The possible values of xxxx are:

• O | OPER
• S | SYS
• U | USER
• Y | YES
System action: JES3 processing continues.

Operator response: Respecify the command. For more information about INQUIRY or MODIFY commands, see z/OS JES3 Commands.

Routing Code: Note 18
Descriptor Code: 5,7

IAT8139

Explanation:

>>> NO STORAGE AVAILABLE FOR *I,U FCT, — REENTER COMMAND <<<

This message is in response to an *INQUIRY command that was unable to obtain sufficient storage for the FCT.

System action: The command is rejected. JES3 processing continues.

Operator response: When the storage shortage is alleviated, reissue the command.

Routing Code: Note 18
Descriptor Code: –

IAT8140

Explanation:

>>> DD= ddn or DSN= dsname IS REQUIRED WHEN H= OPER SYS USER SECONDARY DESTINATION <<<

An inquiry command was entered, specifying the H= keyword without a ddn or a dsname. The ddn or dsname is required for a specific HOLD type.

System action: JES3 processing continues.

Operator response: Respecify the command with the appropriate DD= ddn or DSN= dsname. See z/OS JES3 Commands for more information on using the INQUIRY command.

Routing Code: Note 18
Descriptor Code: –
IAT8141

Explanation:

\[ \text{NUMBER OF TCP} \text{ JOBS FOUND: } nnnnn \]

This summary message is issued in response to a *INQUIRY,U,Q=TCP command or *INQUIRY,U,Q=BDT command when the S parameter is specified. It indicates the number of TCP/IP or BDT jobs.

In the message text:

nnnnn The number of TCP/IP jobs in the TCP queue or BDT jobs in the BDT queue.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

Containing  Detecting  Issuing
IATIQOI     IATIQOI     IATIQOM

Routing Code: Note 18
Descriptor Code: 5,7

IAT8142

Explanation:

\[ \text{A SWB UPDATE WAS UNSUCCESSFUL— FOR JOB— jobname (jobid)} \]

This message is issued in response to a *MODIFY,U,Q=WTR or *MODIFY,U,Q=HOLD command. The system attempted to update the output SWB file on the JES3 spool and failed for at least one data set in the job.

System action: SYSOUT data might be bundled between a job header and trailer correctly but might not appear in the correct printer output bin, or SYSOUT data might not be bundled correctly between a job header and trailer, in addition to not appearing in the correct printer output bin. JES3 processing will continue as follows:

- If the output SWB file for at least one data set under a variable section of an OSE (IATYOSE) had been modified on the JES3 spool before the failure occurs, the OSE and the JES3 in-storage output service data base will be updated to reflect the requested change, allowing the OSE to be synchronized with the output SWB files.
- If no SWBTU file on the JES3 spool had been updated before the failure, the variable OSE and its data set sections will not be updated for any of the information on the MODIFY command, thereby preventing the OSE and output SWB from no longer being synchronized. The MODIFY will not take place in this case.

Operator response: Contact the system programmer to correct the system problems causing the output SWB update to fail, and then reenter the MODIFY command.

System programmer response: Possible causes for an error while trying to update the output SWB file on the JES3 spool include read or write failures on the JES3 SPOOL, a Scheduler JCL Facility SWBTU_MERGE failure, or a failure in the JDSPOINT routine. Check the SYSLOG for more information.

For additional information on SJF services, see the z/OS MVS Programming: Authorized Assembler Services Guide.

IAT8146

Explanation:

MODIFY FAILED FOR JOB— job name (job id)—JESMSGLG RSN=rsn

System action: JES3 processing continues. The following reason codes can be returned:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>EXECUTION COMPLETED</td>
</tr>
<tr>
<td>8</td>
<td>JESMSG MACRO ERROR</td>
</tr>
</tbody>
</table>

The following JESMSG macro return codes can be returned:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>The JDS FDB field of RESQUEUE contained zeros. One possible cause could be an incorrect RESQUEUE address specified on the JESMSG macro.</td>
</tr>
<tr>
<td>08</td>
<td>There is no JESMSG entry in the JDS. The RESQUEUE may contain an incorrect JDS pointer or an incorrect RESQUEUE address may have been specified on the JESMSG macro.</td>
</tr>
<tr>
<td>0C</td>
<td>An incorrect TYPE subparameter was specified on the JESMSG macro.</td>
</tr>
<tr>
<td>C</td>
<td>JESMSGLG SUPPRESSED</td>
</tr>
</tbody>
</table>

Operator response: Determine if the job's JESMSGLG data set can be updated ("F J=xx MSG="), can be spun off ("F J=xx SPIN"), or can have its logging option changed ("F J=xx LOG|NOLOG"). The job can be in a state which does not allow the command to be processed. See the message reason code for an explanation.

For "F J=xx LOG|NOLOG" processing, a reason code of 'X08' would have return code as any one of 'X04' or 'X08' or 'X10'. For "F J=xx MSG=" processing, a reason code of 'X08' could have any return code from 'X04' to 'X18'.

Reissue the command if TRY AGAIN was appended to the message.

Explanation:

verb—COMPLETE FOR SOCKET—sname—(INTERNAL)—

This message is issued in response to a *MODIFY,SOCKET command. The command has completed successfully. If the text (INTERNAL) is present, this is a result of an internally issued modify command during initialization to restore information that was in place before the restart. This form of the message is only written to the system log.
In the message text:

verb The verb indicating the type of request (MODIFY, ADD, DELETE).
sname The name of the socket that was added, deleted, or changed.

System action: Processing continues.
Operator response: None.
System programmer response: None.
Module:

Containing Detecting Issuing
IATMOSOC IATMOSOC IATMOSOC

Routing Code: Note 18
Descriptor Code: 5, 7

Explanation:

This message is issued in response to a *MODIFY, SOCKET command. The command could not be completed for the given reason.

In the message text:

verb The verb indicating the type of modify (MODIFY, ADD, DELETE).
sname The name of the socket that was added, deleted, or changed.
errobj The object that has the error. This object is either of the following items:
  • The text ‘KEYWORD’ if a keyword is incorrect or specified more than once.
  • The name of a keyword (for example, ‘PORT’) if the specified keyword is syntactically legal but the name is specified incorrectly or this keyword is not allowed to be modified under the present conditions (for example, socket is active).
errval The value of the object that has the error.
reasontext The reason the MODIFY command was rejected, as indicated below.

reasontext specifies one of the following reasons that the command was rejected:

UNKNOWN The keyword specified on the *MODIFY command is not valid.
NOT FOUND The object specified on the DELETE=, SOCKET=, NETSERV=, or NODE= parameter does not exist.
NOT A NUMBER The value specified for PORT=port is not a number.
TOO HIGH The value specified for PORT=port exceeds 65535.
NOT TCPIP The node specified on the NODE=node parameter exists, but the node is not defined with TYPE=TCPIP.
**IAT8162**

**MUST BE YES OR NO**

The value specified for the indicated keyword is incorrect. YES and NO are the only acceptable values for this keyword.

**DUPLICATE**

The socket specified on the ADD= keyword already exists, or the indicated keyword was specified more than once.

**SOCKET IS ACTIVE**

The specified socket is active. The only keywords that can be modified for an active socket are JTRACE, ITRACE, and VTRACE.

**SOCKET IS PENDING**

The socket cannot be modified or deleted at this time because a start command (either *S,TCP,SOCKET=socket or *S,TCP,NODE=node) was previously issued and the socket is in a pending state while waiting for the connection to be made.

**INTERNAL ERROR**

An unexpected error occurred.

**System action:** The command is rejected.

**Operator response:** Take one of the actions as indicated below:

**SOCKET IS ACTIVE**

Retry the command with a different socket, or cancel the socket and reissue the command.

**INTERNAL ERROR**

Notify the system programmer.

**Anything else**

Correct and reissue the command.

**System programmer response:** For INTERNAL ERROR, retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:**

**Routing Code:** Note 18

**Descriptor Code:** 5, 7

IAT8162

**Explanation:**

\[verb\]—COMPLETE FOR NETSERV—\textit{nname}—(INTERNAL)\[verb\]

This message is issued in response to a *MODIFY,NETSERV command. The command has completed successfully. In the message text:

\textit{verb} The verb indicating the type of request (MODIFY, ADD, DELETE).

\textit{nname} The name of the Netserv that was added, deleted, or changed.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**Module:**
This message is issued in response to a *MODIFY,NETSERV command. The command could not be completed for the given reason.

In the message text:

verb
- The verb indicating the type of modify (MODIFY, ADD, DELETE).

nname
- The name of the Netserv that was requested to be added, deleted, or changed.

errobj
- The object that has the error. This object is either of the following items:
  - The text 'KEYWORD' if a keyword is incorrect or specified more than once.
  - The name of a keyword (for example, 'PORT') if the specified keyword is syntactically legal but the name is specified incorrectly or this keyword is not allowed to be modified under the present conditions (for example, Netserv is active).

errvol
- The value of the object that has the error.

reasontext
- The reason the modify command was rejected, as indicated below.

reasontext specifies one of the following reasons that the command was rejected:

UNKNOWN
- The keyword specified on the *MODIFY command is not valid.

NOT FOUND
- The object specified on the DELETE=, NETSERV=, or SYSTEM= parameter does not exist.

NOT A NUMBER
- The value specified for PORT=port is not a number.

TOO HIGH
- The value specified for PORT=port exceeds 65535.

MUST BE YES OR NO
- The value specified for the indicated keyword is incorrect. YES and NO are the only acceptable values for this keyword.

DUPLICATE
- The Netserv specified on the ADD= keyword already exists, or the indicated keyword was specified more than once.

NETSERV IS ACTIVE
- The specified Netserv is active. The only keywords that can be modified for an active Netserv are JTRACE, ITRACE, and VTRACE.

System action: The command is rejected.

Operator response: Take one of the actions as indicated below:
IAT8164 • IAT8165

NETSERV IS ACTIVE

Retry the command with a different Netserv, or cancel the Netserv and reissue the command.

Anything else

Correct and reissue the command.

IAT8165

Explanation:

>—TRANSMITTER OR RECEIVER COUNT—MUST BE FROM 1 TO 7, REQUEST IGNORED<

This message is issued in response to a *MODIFY,NJE,NAME= command for a node that is defined with TYPE=TCPIP node. The JT=, JR=, OT=, or OR= parameter was specified. The command could not be completed because the specified value was 0 or a number greater than 7.

System action: The command is rejected.

Operator response: Correct and reissue the command.

System programmer response: None.

Module:
### IAT8166

**Explanation:**

```
>>> UNEXPECTED MODIFY ERROR OCCURRED
```

This message is issued in response to a *MODIFY,NJE,NAME= command for a node. The node is defined with the TYPE=TCPIP parameter. While scanning the modify parameters, an inconsistency occurred such that the JT, JR, OT, OR, SS, or TLS parameter was not detected when it had been specified.

**System action:** The command is rejected.

**Operator response:** Notify the system programmer.

**System programmer response:** Reissue the command. If the error persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

### IAT8180

**Explanation:**

```
>>> dev devname VARIED ONLINE ON GLOBAL main
```

This message is issued in response to a *VARY command. The *VARY was successful.

**Note:** After a device is varied online to a main, jobs and users running on that main can use it. After a device is varied online to global, JES3 Dynamic Support Programs (DSPs) can use it. For example, if the device being varied online is a printer, the WTR DSP can now use it. If the device being varied online is a tape, jobs running on that main and the Dump Job (DJ) DSP can now use it. If a device is varied online to a local that is not connected, you cannot use this or any other device on that local until it connects.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.
IAT8181
Explanation:

This informational message is issued when OSEs belonging to jobs match the *MODIFY U command selection criteria, but were not modified because the OSE was scheduled by an external writer, the SYSOUT Application Program Interface (SAPI), or the Process SYSOUT (PSO) interface.

System action: Processing continues.

Operator response: None required. This is an informational message. Issue a *INQUIRY U command using the same selection criteria as the *MODIFY U command that generated this message for more information about the bypassed OSE(s).

Module:

IAT8183
Explanation:

This message is issued in response to a *VARY OFFLINE command for execution device dev that is currently allocated. This message is also issued when an operator attempts to *VARY online a device that is pending offline because of a library vary.

System action: The device is marked JES3 pending-offline and will be varied offline when it is deallocated, unless it is varied online again. If the message was issued because an operator issued a *VARY online for a device pending-offline because of a library vary, the device remains pending-offline and is varied offline when it is deallocated, unless the library is varied online again.

Operator response: None. This is an informational message.

Module:

IAT8185
Explanation:

This message is issued in response to a *VARY RECOVER command for execution device dev that is a non-DASD device, DDR SWAP active, SPOOL device, or mount pending.
This message is issued in response to a *VARY,dev,RECOVER,proc command. The command was rejected for one of the following reasons:

1. The command was entered from a console that had an authority level lower than 15.
2. An incorrect parameter was specified on the command.
3. Volume verification could not be performed for the specific device.

**System action:** The command is ignored. Processing continues.

**Operator response:** Correct the problem depending on the reason specified. The following responses correlate to the reasons in the explanation.

1. Reenter the command from a console with authority level fifteen.
2. Correct or remove the incorrect parameter specified in the message.
3. Enter the correct device address in the *VARY command or modify the status of the device for volume verification.

**Routing Code:** Note 18

**Descriptor Code:** 5,7

---

This message is issued in response to a *VARY command of an RJP line. The command was rejected because:

**PREVIOUS CONSOLE STATUS**
the console is allocated. If you wanted to give the device console status, the device is already an active console. If you wanted to change the console status to offline, you may not do so because the console is allocated.

**DEVICE CURRENTLY IN USE**
the device is active with another DSP.

**ALREADY PROCESSING VARY**
JES3 is currently processing a *VARY ONLINE command for that device.

**SETUP NOT IN USE**
Varying a SETUNITS device is invalid.

**System action:** JES3 ignores the command and processing continues.

**Operator response:** Either resubmit the command when the device is available, or contact the system programmer for assistance. *INQUIRY,O may be used to display all remote consoles and their switched status.

Explanation:

[Message]

This message is issued in response to a *MODIFY,F command. The DSPC, MAST, and ST keywords do not apply to an output writer functional subsystem (FSS) and cannot be modified for a writer FSS.

**System action:** JES3 ignores the command.

**Operator response:** Correct and resubmit the command.

**Module:**

- **Containing:** IATMOFS
- **Detecting:** IATMOFS
- **Issuing:** IATMOFS

**Routing Code:** Note 18

**Descriptor Code:** 5,7

---

**IAT8309**

Explanation:

[Message]

This message is issued in response to a *MODIFY,F or a *MODIFY,W command. If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices. The mode of the specified device cannot be changed for the indicated reason:
DEVICE CANNOT RUN UNDER FSS CONTROL
Device mode is valid only for those devices which are eligible to run under the control of a functional subsystem (FSS); this device is not eligible.

REQUESTED DYN ALREADY SET
The *MODIFY,W command that the operator issued specified whether or not the device can be used by JES3 as a dynamic writer. The device is already set to the requested specifications.

DEVICE CANNOT RUN UNDER COMP MODE
Compatibility mode is valid only for those devices which are eligible to run under the control of both a functional subsystem (FSS) and JES3; this device is not eligible.

REQUESTED MODE ALREADY SET
The device is already in the requested mode.

DEVICE ONLINE OR ALLOCATED
The device mode may not be changed while the device is in use; to prevent erroneous mode changes, the device must be both offline and not currently allocated.

FSS fssname HAS NO ASSIGNED SYSTEM
FSS mode has been requested, but the assigned FSS fssname is unusable or has not been assigned a system on which to run in conjunction with the current global system.

COMP MODE REQUIRES GLOBAL ATTACHMENT
Compatibility mode requires that the device be attached to the global system; this device has no such attachment.

FSS MODE REQUIRES ATTACHMENT TO main
FSS mode requires that the device be attached to the system where the FSS is assigned to run, specified by main; this device has no attachment to system main.

DGRPONLY=YES REQUIRES A DEVICE GROUP TO BE DEFINED
Dgroup only mode is valid only if a device group has been defined.

REQUESTED DGRPY ALREADY SET
The device is already set to the requested specifications.

REQUESTED SETUPMSG ALREADY SET
The *MODIFY,W command specified whether or not message IAT7030 is suppressed. The device is already set to the requested specifications.

SETUPMSG VALID FOR FSS SUPPORTED DEVICES ONLY
The suppression of message (IAT7030) is valid only for those devices which are eligible to run under the control of a functional subsystem (FSS); this device is not eligible.

PDEFAULT VALID FOR FSS SUPPORTED DEVICES ONLY
The PDEFAULT= parameter on the DEVICE (I/O) initialization statement is only valid for FSS devices. It cannot be specified or modified for non-FSS devices.

keyword VALID FOR RJP DEVICES ONLY
The keyword specified is valid only for RJP printers or punches, but the specified printer or punch is not RJP.

XLATE IGNORED FOR 3211 COMPATIBLE DEVICES
The XLATE keyword is ignored for 3211 compatible devices because the device performs its own translation.

WORKSTATION IS ACTIVE
The printer or punch cannot be modified while the workstation owning it is signed on.

System action: JES3 ignores the command.

Operator response: The *MODIFY,V command may be used to vary the device offline. The *MODIFY,F command may be used to change the FSS system assignments. If the error condition can be corrected, and if the mode change is still desired, reenter the command.

Module:

<table>
<thead>

IAT8332

Explanation:

>>> INCORRECT PARAMETER parm FOR KEYWORD keyword

An incorrect parameter was identified for a keyword in a *MODIFY,W command or a *MODIFY,DEST command.

System action: JES3 ignores the command.

Operator response: Reenter the command with the valid parameters.

Module:
IAT8333

Explanation:

Unable to checkpoint writer FSS fssname for device(dev).

An output writer DSP is unable to checkpoint the status of its functional subsystem (FSS). If a device number does not appear in the message, the device is a non-channel attached device (for example, 3820). MVS does not assign device numbers to non-channel attached devices.

System action: JES3 processing continues.

Operator response: Cancel the writer(s) operating under the FSS fssname at the end of the current job, and hot start JES3 as soon as possible.

IAT834

Explanation:

Modify complete for device device.

The *MODIFY,W command has completed for the specified device. If the command parameters were correct for this device, the requested changes will have been made for the device; however, if this device did not meet the required environmental characteristics of a parameter (for example, not an FSS device and the SETUPMSG= parameter was specified) that specific parameter will not have been processed for this device.

Note: If a parameter did not apply to this device, the IAT8334 message should be preceded by informational messages explaining which parameters did not apply and why they did not apply.

System action: JES3 processing continues.

Operator response: None. However, using the *I D D= command to verify the results of the MODIFY command is recommended.

Module:
**IAT8335 • IAT8336**

**IAT8335**

Explanation:

A MEMBER member NOT FOUND IN dsn.

During *MODIFY,CONFIG processing, JES3 could not find member member in the data set dsn specified in the JES3 procedure.

In the message text:

- **member**: The member name that you specified on the *MODIFY,CONFIG command.
- **dsn**: The data set name that you specified on the JES3IN DD statement in the JES3 cataloged start procedure.

**System action**: *MODIFY,CONFIG processing ends.

**Operator response**: Reissue the command with the correct member name.

**System programmer response**: None

**Module**: Containing Detecting Issuing

IAT8337

Explanation:

JES3 issues this message in response to the *F CONFIG,ADD= command. Verify that JES3 should continue to execute this command.

**System action:**

- If you specify CANCEL, JES3 cancels the *MODIFY,CONFIG request.
- If you specify CONTINUE or U, JES3 continues *MODIFY,CONFIG processing.
- The LOG option will appear in the message only if a log was requested on the *MODIFY,CONFIG command. If you specify LOG in response to IAT8337, JES3 reissues the message without the LOG option.

**Operator response:** Reply LOG if you need to review the *MODIFY,CONFIG log before deciding whether to continue or cancel the modify process. Then reply ‘U’, ‘CONT’, or ‘CONTINUE’ to allow JES3 to process the command or ‘CANCEL’ to cancel the command.

**System programmer response:** Examine the initialization statements you are attempting to add and correct the error if JES3 issued any error/warning messages.

**Module:**

- Containing: IATMOCW

Routing Code:  Note 30
Descriptor Code:  5

IAT8349

Explanation:

During *MODIFY,CONFIG processing, the read or write of the JES3 checkpoint data set failed. If a read error occurred, *MODIFY,CONFIG processing ended before any of the requested changes could be made. If a write error occurred, the requested changes have been made in storage, but they will not be available if you perform a hot start. If you have to restart JES3, you should add the requested information to your initialization stream and perform a hot start with refresh or a warm start.
You should not attempt to issue any more *MODIFY,CONFIG commands until you perform a hot start with refresh or a warm start since the checkpoint was not updated during the last *MODIFY,CONFIG command. Errors may occur if you attempt to do so.

In the message text:

rc  The return code from the IATXCKPT macro. See the macro description in z/OS JES3 Customization for an explanation of the reported value.

System action:  *MODIFY,CONFIG processing ends. However, the changes that were made are not checkpointed.

Operator response:  Notify the system programmer.

System programmer response:  If you need to restart JES3, be certain to add the initialization statements from the *MODIFY,CONFIG command to your initialization stream and perform a hot start with refresh or a warm start.

IAT8460
Explanation:

NJERMT UPDATE COMPLETED.— REQUEST HONORED

This message, issued in response to the *MODIFY,NJE command, indicates that the modification has completed successfully.

System action: Processing continues.
Operator response: None. This is an informational message.

Module:

IAT8461
Explanation:

INVALID, DUPLICATE, OR NO KEYWORD.— REQUEST IGNORED

The *MODIFY,NJE command was entered with an incorrect, duplicate, or no parameter specified.

System action: JES3 ignores the command.
Operator response: Reissue the *MODIFY,NJE command specifying the correct parameter.

Module:

IAT8462
Explanation:

REMOTE NAME NOT SPECIFIED.— REQUEST IGNORED

The *MODIFY,NJE command was entered with the FORCE, HOLD, or NOHOLD parameter. However, the NAME=nodename parameter was not specified. This parameter is required for this command.

System action: JES3 ignores the command.
Operator response: Reissue the command with the NAME= parameter specified.
IAT8463

Explanation:

NO CHANGES SPECIFIED.— REQUEST IGNORED

This message is issued in response to a *MODIFY,NJE,NAME=nodename command. The command was entered without specifying any NJE parameters to change for the specified node.

System action: JES3 rejects the command. JES3 processing continues.

Operator response: Correct and reissue the command.

IAT8464

Explanation:

NAME=nodename— NOT FOUND IN THE NJERMT— TABLE. REQUEST IGNORED.

The *MODIFY,NJE, NAME=nodename command specified a node name that was not defined during JES3 initialization and is, therefore, not a valid node name.

System action: JES3 ignores the command.

Operator response: Reissue the *MODIFY,NJE command with a valid node name specified in the NAME=nodename parameter.

IAT8465

Explanation:

PATH=nodename1— NOT FOUND IN THE NJERMT— TABLE. REQUEST IGNORED.

The *MODIFY,NJE,N=nodename PATH=nodename1 command specified a node name that was not defined during JES3 initialization and is, therefore, not a valid node name.
System action: JES3 ignores the command.

Operator response: Reissue the *MODIFY,NJE,N=nodename command with a valid node name specified in the PATH=nodename parameter.

Explanation:

⇒ PARAMETER— errkeywd— IS NOT ALLOWED FOR— nodetype⇒

This message is issued in response to a *MODIFY,NJE,NAME= nodename command. This message is also issued if the PATH keyword on the *MODIFY,NJE command specifies the home node or an alias.

In the message text:

errkeywd

The keyword on the *MODIFY command that does not apply to the requested node. The keyword is one of the following:

- FORCE
- HOLD
- NOHOLD
- PATH
- PRTDEF
- PRTTSO
- PRTXWTR
- PUNDEF
- PWCNTL
The type of node for which the modify was requested.

A SNA CONNECTED NODE
The node requested was defined as TYPE=SNA.

AN INDIRECTLY CONNECTED NODE
The node requested was defined with the PATH parameter.

THE HOME NODE
The node requested was defined with the HOME=YES parameter.

AN ALIAS
The node requested is an alias of the home node.

A NODE OTHER THAN HOME/ALIAS
The node requested is not the home node or an alias of the home node. This node type appears in this message only when the rejected keyword is PRTDEF, PRTTSO, PRTXWTR, OR PUNDEF.

A TCPIP CONNECTED NODE
The node requested was defined as TYPE=TCPIP.

AN ACTIVE TCPIP NODE
The node requested was defined as TYPE=TCPIP and is currently active.

A TCPIP NODE WITH SOCKETS
The node requested was defined as TYPE=TCPIP and has sockets referencing the node even though the node is not necessarily active.

System action: The system rejects the command. JES3 processing continues.
Operator response: Correct and reissue the command.
Module:

System action: The system rejects the command. JES3 processing continues.
Operator response: Reissue the command with T= specifying a SNA workstation name.

IAT8469

Explanation:

wsname— NOT MODIFIED, NOT A— SNA WORKSTATION

JES3 issues this message in response to the *MODIFY,T,T=wsname command. JES3 rejects the modify for the specified workstation because the parameter is valid only for SNA workstations, and the specified workstation is not SNA. In the message text:

wsname The workstation name specified on the *MODIFY,T command. command.

System action: JES3 rejects the command. JES3 processing continues.
Operator response: Reissue the command with T= specifying a SNA workstation name.

Explanation:

 REQUEST IGNORED

This message is issued in response to a *MODIFY,NJE,ADD= nodename, *MODIFY,NJE,ADDAL= nodename, or a
*MODIFY,NJE,DEL= nodename command. The command was not accepted for the specified reason.
In the message text:

*nodename

The nodename specified on the*MODIFY,NJE,ADD= nodename, *MODIFY,NJE,ADDAL=nodename, or the
*MODIFY,NJE,DEL=nodename command.

reasontext

The reason the command was not accepted.

reasontext is one of the following:

HAS ACTIVE SOCKETS
an attempt was made to delete a directly connected TCPIP node that is signed on to the home node by one or
more sockets.

ALREADY DEFINED
an attempt was made to add an existing node to the network.

IS NOT DEFINED
an attempt was made to delete a node that did not exist in the network.

IS THE HOME NODE
an attempt was made to delete the home node.

HAS ACTIVE LINES
an attempt was made to delete a directly-connected BSC node that is connected to the home node by one or
more lines.

NOT A VALID NAME
an attempt was made to add or delete a nodename that is not valid.

REF BY SOCKET SNAME
an attempt was made to delete a directly connected TCPIP node that has one or more sockets referencing it. The
socket name "sname" shown in the message text is the first such socket that was found.

System action: JES3 ignores the command.

Operator response: Verify the name of the node you want to add or delete, and re-enter the command with the
correct node name.

Explanation:

INVALID VALUE FOR RETRYCT,— REQUEST IGNORED

The operator issued a *MODIFY NJE,NAME=nodename,RETRYCT=nnn command with a value for nnn that was 0 or greater than 300.

System action: The command is rejected. JES3 processing continues.

Operator response: Reissue the MODIFY command with a value within the range of 1 to 300.

Module:
IAT8475 • IAT8476

IAT8475

Explanation:

This is the response to a valid *INQUIRY,X,D= command. MXCT is the maximum number of copies of the DSP that may be active concurrently, and USE is the current number of active copies. The CI and POSTSCAN DSP maximum use count and current use count for batch jobs are represented by nnnnnn and nnnnnnnn. The counts for TSO logons and started tasks (demand select jobs) are represented by xxxxxx and yyyyyy. MOD is either YES or NO, specifying whether the maximum use count for this DSP may be modified using the *MODIFY,X command.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

IAT8476

Explanation:

module
The name of the module being displayed.

RES
The module's residency count. This is not displayed if the module was not loaded using the ALOAD macro.

910 z/OS V2R1.0 JES3 Messages
USE
The module's current use count. This is not displayed if the module was not loaded using the ALOAD macro.

LOADS
The number of times the module was loaded. This is not displayed if the module was not loaded using the ALOAD macro.

EP
The entry point of the module. This will contain zeros if the module is not currently loaded. PREV= will contain the previous entry point of the module.

LOADMOD
If the module name specified on the *L,X,M= command is a CSECT within IATNUC, the name of the load module (IATNUC) is displayed.

DELETE
The module deletion option. This is set by the *F,X,M=modname,DELETE= command. This is not displayed if the module was not loaded using the ALOAD macro.

REL
The release value (from the IATYMOD in the module) or NONE.

DATE
The compile date (from the IATYMOD in the module) or NONE.

TIME
The compile time (from the IATYMOD in the module) or NONE.

APAR
The APAR number (from the IATYMOD in the module) or NONE.

PTF
The PTF number (from the IATYMOD in the module) or NONE.

BASE
The module's base address if the module entry point is different from the base.

OFFSET
If an *L,X,M= by address is issued, the offset of the address from the module base.

SIZE
The module size or zero (if the module is not loaded). If the module is a CSECT within IATNUC, the size is estimated based on the address of the CSECT that follows it in IATNUC.

AMODE
The AMODE of the module.

RMODE
The RMODE of the module.

NUC-REFRESH
The module is a refreshed IATNUC module. That is, a *MODIFY,X,M=module,REFRESH command was issued for this module and it is part of the IATNUC load module.

PREV
If the module is no longer loaded, the address where the module was previously loaded. This is not displayed if the module was not loaded using the ALOAD macro.

REFRESH PENDING
Indicates that a refresh is pending for this module. This can occur as a result of a *MODIFY,X,M=modname,REFRESH command, or if an FCT specified R=YES (refresh = yes) on the ADELETE macro.

REFRESH ALLOWED
Indicates that a particular IATNUC module can be refreshed using the *MODIFY,X,M=modname,REFRESH command.

CSECT=YES
Indicates whether the module was loaded as a data CSECT (CSECT=YES specified on the ALOAD macro).
**IAT8477 • IAT8478**

**REUSE=YES**
Indicates whether the module is serially reusable (REUSE=YES specified on the ALOAD macro).

**LOC**
The location of the module if it is located in PLPA, MLPA, FLPA, or CSA.

**System action:** Processing continues.

**Operator response:** None. This is an informational message.

Explanation:

A *MODIFY,X command was issued and rejected for one of the following reasons.

MODULE NOT FOUND
The specified module is not loaded.

NO MODULES REFRESHED
No modules were refreshed as a result of a *MODIFY,X,M=modname,REFRESH command. This could be caused by one of the following:
1. The specified module is not loaded.
2. The specified module was loaded CSECT=YES (CSECT=YES specified on the ALOAD macro).
3. The module is already waiting to be refreshed.
4. The module is in the process of being loaded.

MODULE IATXXXX IS NOT REFRESHABLE
The user exit specified on the refresh command is not refreshable according to the information in the IATYUXL.

MODULE module IS ALREADY LOADED
A *MODIFY,X,M=modname,LOAD command was issued and the module is already loaded.

UNABLE TO LOAD USER EXIT IATXXXX
An error occurred while attempting to load the user exit. Message IAT6308 precedes this message and describes why the load request failed.

UNABLE TO LOAD MODULE module
An error occurred while attempting to load the module. Message IAT6308 precedes this message and describes why the load request failed.

System action: JES3 ignores the command. Processing continues.

Operator response: Correct and reissue the command.

IAT8489 • IAT8491

Routing Code: Note 18
Descriptor Code: 5,7

IAT8489

Explanation:

MODULE modname ------- REFRESH IS PENDING ------- HAS BEEN REFRESHED

This message is issued in response to an *F,X,M=modname,REFRESH command.
If the module is a user exit, a new copy of the module has been loaded into storage and the bit in the IATYUXL indicating the exit is a dummy has been turned off. The original copy has not been deleted from storage.
If REFRESH IS PENDING appears in the message, the module cannot be deleted at this time because it is still in use.
When there are no more functions using the module, the module will be deleted and message IAT8489 with the text "HAS BEEN REFRESHED" will be issued.
If HAS BEEN REFRESHED appears in the message and the module is not a user exit, the module has been deleted from storage and its load count set to zero; a new copy of the module will be loaded the next time an ALOAD request is issued.

System action: The module is deleted from storage if it is not a user exit.

Operator response: None. This is an informational message.

Explanation:

\[\text{spart} \quad mmmmm \quad \text{GRPS,} \quad nnnnn \quad \text{LEFT:} \quad (ppp\%) \quad \text{MIN:} \quad \text{xx\%}, \quad \text{MARG:} \quad \text{yy\%} \]

\[\text{DEF}, \quad \text{OVFL}, \quad \text{OVIN}, \quad \text{INIT} \]

An *INQUIRY,Q,SP=spart command was input to request display of the status of spool partition spart.

spart
the name of the spool partition.

mmmmmm
the total number of logical track groups in the spool partition.
The number of logical track groups in the spool partition which are available; the track groups are not currently allocated to any job.

The percentage of the total number of logical track groups in the spool partition that are available.

The minimal condition available logical track group percentage, as defined by the SPLIM parameter on the SPART or BUFFER initialization statement. The minimal percentage value has no meaning for the DRAINED and UNAVAIL spool partitions and will not be displayed.

The marginal condition available logical track group percentage, as defined by the SPLIM parameter on the SPART or BUFFER initialization statement. The marginal percentage value has no meaning for the DRAINED and UNAVAIL spool partitions and will not be displayed.

DEF indicates that this partition was defined as the default spool partition (using the DEF=YES parameter on the associated SPART initialization statement) or was selected to be the default partition because no spool partition was explicitly defined as the default. It is not displayed for the DRAINED or UNAVAIL spool partitions.

OVFL indicates that overflow from this spool partition is allowed; overflow was specified on the OVRFL parameter of the SPART initialization statement or was enabled by the *MODIFY,Q,SP=spart,OVRFL=option command. The *INQUIRY,Q,SP=spart,O command may be entered to display the partition overflow hierarchy for this spool partition. It is not displayed for the DRAINED or UNAVAIL spool partitions.

OVIN indicates that some other spool partition overflows into this partition. It is not displayed for the DRAINED or UNAVAIL spool partitions.

INIT indicates this spool partition contains the data that is required to complete JES3 initialization. It is not displayed for the DRAINED or UNAVAIL spool partitions.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

IAT8513

Explanation:

Chapter 24. Inquiry Messages 927
An *INQUIRY,Q,DD=ddn command was input to request display of the status of spool data set ddn.

**spart**
The name of the spool partition that the data set is associated with. If the data set is in a HELD, DRAINED, or UNAVAIL state, this is the partition that the data set will be returned to when the data set is released and available.

**nnnnnn**
The total number of logical track groups in the data set.

**nnnnnn**
The number of logical track groups in the data set that are available; the track groups are not currently allocated to any job.

**ppp%**
The percentage of the total number of logical track groups in the spool data set that are available.

**sysname**
The systems that need to connect before the extent can be used for spool allocations. Alternatively, the systems can be flushed.

**DRAINED**
Indicates that the spool data set is in a drained state; a *MODIFY,Q,DD=ddn,DRAIN command has been entered. Further space allocation from the data set has been suspended.

**UNAVAIL**
Indicates the spool data set is not currently available to JES3; the data set was not allocated to JES3 or was found to be unusable during the previous JES3 restart. Further space allocation from the data set has been suspended and jobs that previously allocated logical track groups on the data set have been purged from the complex or were placed into a spool hold state.

**HELD**
Indicates that the spool data set is in a held state; a *MODIFY,Q,DD=ddn,HOLD, *MODIFY,Q,DD=ddn,STOP, or a *MODIFY,Q,DD=ddn,CANCEL command has been entered.

**BT**
Indicates that one or more unusable physical tracks within the data set exist; the unusable tracks were either defined using the BADTRACK initialization statement, formatting failed, or an I/O error was encountered. The *INQUIRY,Q,BT command may be entered to display the specific physical tracks within the spool which are unusable.

**STT**
Indicates this spool data set contains single track table (STT) expansion segments; a loss of this spool data set results in a loss of JES3 STT data.

**ADDED**
Indicates the extent was added during a recent *MODIFY CONFIG change and has not been fully activated. The text following the message lists the systems (sysname) that need to connect to the global before the extent can be used for spool allocations. Alternatively, the systems can be flushed.

**System action:** JES3 processing continues.

**Operator response:** This is an informational message. If the text WAITING FOR THE FOLLOWING MAIN(S) TO BE CONNECTED OR FLUSHED is displayed, make sure the systems listed are either connected to the global or flushed via the *FLUSH command.

Explanation:

This message is issued in response to an *INQUIRY,C,C command or *INQUIRY,C,C,R command. It serves as a general header for the specific type of console buffers which are:
- console text buffers
- work cell usage

In the message, text is one of the following:
- CONSOLE BUFFER POOL USAGE
- CONSOLE TEXT BUFFERS
- IATCNWU WORK CELL USAGE

This message precedes messages IAT8501, IAT8503, IAT8508, IAT8510, IAT8720, and IAT8721 for the types of console buffers listed.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Chapter 24. Inquiry Messages 929
IAT8517
Explanation:

This message is issued in response to an *INQUIRY,A,D=DLINE command. The deadline, as specified on the
//*MAIN JCL statement for this job, is given. The time of day is given as tt tt, ddd is the day and yyyy is the year.
The priority currently assigned to the job is given as nn and t is the deadline type as specified in the JCL.

System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18 Descriptor Code: 5,7

IAT8519
Explanation:

This message is issued in response to an *INQUIRY,A,D=DLINE command where there are no jobs on the deadline
queue.

System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

Routing Code: Note 18 Descriptor Code: 5,7

IAT8520
Explanation:

This message is issued in response to an *INQUIRY,A, dspname command. The specified DSP has no jobs to process.

System action: JES3 processing continues.
Operator response: None. This is an informational message.
Module:

IAT8522
Explanation:

Job (jobid) — Active on name text

text is one of the following:
  ddn mm.th MINS [FOR nodename]
  TIME NAVAIL [SCHED FOR {devname|nodename}]

This message is issued in response to an *INQUIRY,A command to obtain the status of all active jobs being processed by JES3.

ddn mm.th MINS [FOR nodename]
  This text is displayed if the job is active.

TIME NAVAIL [SCHED FOR {devname|nodename}]
  This text is displayed if the job is not active. If the job is in specialized reschedule status, SCHED FOR devname or nodename is also displayed.

For a 3800 printer, this message displays the job at the transfer station.

Note: For an FSS writer DSP, the display contains information for the output sent to the FSS. This may be a job that has completed processing on the output device but is being retained by the FSS. See the FSS application documentation [z/OS MVS Using the Functional Subsystem Interface] to determine if there is a better way to monitor job status.

For jobs currently being transmitted to another NJE node, NJESND appears in the message as the dsnname, ddn is the name of the logical sender that is currently transmitting the indicated job, and FOR nodename shows the node that is receiving the network stream. For jobs waiting to be transmitted to another node, TIME NAVAIL SCHED FOR nodename indicates the node which will receive the network stream.

jobname The name of the active job.
jobid The id of the active job.
name Either the name of the DSP that is currently processing the job or the name of the converter/interpreter (C/I) functional subsystem (FSS) in which the job is active.
ddn Indicates the support device, if any, the function is using.
mm.th Indicates how long the job has been active in minutes, tenths of minutes, and hundredths of minutes.
devname
Indicates the device for which the function is scheduled.

nodename
Indicates the node of the device for which the function is scheduled.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

IAT8523
Explanation:

>>> INTRDR COUNTS - MAX=(n,m),- ACTIVE=nn-, - FCT=nnn, - HWATER=nnnn

This message is issued in response to an *I A D=INTRDR command. It follows message IAT8522 or message IAT8520 for the INTRDR DSP.

MAX=(n,m)
- n is the current maximum number of DSPs allowed; m is the initialization value.

ACTIVE=nn
- the current number of active INTRDR jobs. This includes the number of INTRDR FCTs and the INTRDR jobs waiting to be processed.

F=nnn
- the current number of INTRDR FCTs attached.

HWATER=nnnn
- the high water mark value for the INTRDRs.

Note: ACTIVE and HWATER are not applicable if there are no IRA control blocks. If there are no IRA control blocks, no INTRDRs have been called.

System action: JES3 processing continues.
Operator response: None. This is an informational message.

IAT8524
Explanation:

>>> JOB jobname (jobid) stepname ON main mmmmmm.th MIN JOB JMF (jobid)

932  z/OS V2R1.0 JES3 Messages
This message is issued in response to one of the following commands to provide you with the status of jobs currently active on the designated main processor:

*INQUIRY,A,main
*INQUIRY,A,main,G=group
*INQUIRY,A,main,C=class
*INQUIRY,A,J=jobid

This message is also issued in response to an *INQUIRY,A,D=JMF command to provide you with the status of the JES3 Monitoring Facility (JMF) dynamic support program (DSP).

In the message text:

* **jobname** the name of the active job. (For JMF this is always “JMF”).
* **jobid** the job identifier of the active job.
* **stepname** for batch jobs only, the current step of the active job.
* **main** the system on which the job is active.

* **mmmmmm.th** for batch jobs only, this is the number of minutes, in tenths of minutes and hundredths of minutes, that the job has been active. For jobs that were identified to JES3 using the “request jobid” function, this is the total time that JES3 has been aware of the job. If the job remains active longer than one year, the active time is reset to zero.

* **mmmm.th** for JMF only, this is the number of minutes, in tenths of minutes and hundredths of minutes, that the job has been active. This time cannot exceed 10,080 (7 days); it is the maximum allowable time on the *CALL,JMF command. After a JES3 restart, the active time is reset to zero.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

IAT8527

Explanation:

spart — JOB — jobname (jobid) gg,ggg — TRKGPS, — ppp%

A spool space user "INQUIRY command, "INQUIRY,Q,SP={spart | ALL},U,N=nnn command, was entered for partition spart and the specified job was found to be one of the largest users of spool space in the partition.

In the message text:

spart
  The name of the spool partition.

jobname
  The job name.

jobid
  The job identifier (JOBnnnnn).

gg,ggg
  The number of logical track groups allocated to the job from spool partition spart. This value will be displayed as "*** ****" if the number exceeds 99,999.

ppp%
  Is gg,ggg expressed as a percentage of the total number of track groups in the partition.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

IAT8535

Explanation:

>>> ERROR PROCESSING EXTENT REQUEST << Request - CANCELLED <<<

This message is issued when you issue a *MODIFY,Q command to hold or release a specific spool data set or to hold or release all jobs that have data on that data set. An error was detected by macro IATXJBTS. The IATXJBTS macro determines if the job has data on a held data set. For more information about macro IATXJBTS, see z/OS JES3 Customization.

System action: The command is rejected and JES3 processing continues.

Operator response: Contact your system programmer.

System programmer response:
1. If this problem occurs often, you can issue the *FAIL,MODDRVR,DUMP command to fail the MODIFY DSP. This will generate a JES3 abend dump of the system. The system continues to process normally.
2. In the dump, locate the RETURN entry for the IATXJBTS macro.
3. Examine register 15 for the return code from macro IATXJBTS. If register 15 contains:
   
   4 An incorrect JCT address was supplied in the JOBTAT search parameter list. Correct the parameter list. Link-edit the DSP and reissue the command.
   8 An incorrect address for the JOBTAT search parameter list was supplied on the JTS parameter of the IATXJBTS macro. Correct the address in the parameter list. Link-edit the DSP and reissue the command.
   10 An incorrect JBT address or JDS address was specified in the JOBTAT search parameter list. Correct the address in the parameter list. Link-edit the DSP and reissue the command.
   14 An error occurred while JES3 was attempting to read the JDS or JBT. Locate the JESREAD entry in the trace table. Use the JESREAD return codes to correct the problem.
   18 The required control block is on an unavailable spool data set.
   1C The control block resides at a track group address that is not valid.

```
This message is issued in response to the operator command *I,D,D=dev (where dev is a device number). If a device is offline because of path reasons, the characters “OFN” will appear in the message. If a device is allocated somewhere in the complex, but is offline because of path reasons to this processor, the characters “ACN” will appear. It is issued once for each device identified by the command. If the device is an active 3800 printer, the display includes the names of all active jobs that have output scheduled to the device that have not yet been stacked. The names appear in sequence starting with the name of the job whose output is closest to the end of the pipeline. The values in all the fields in the message apply to the job whose data sets were most recently sent to the printer (the last job name in the display).

Also included for SNA devices are the fssname, mode and NPRO values for that device. If ambiguous devices are found, a field stating that the device is ambiguous will also be displayed. If “INTERVENTION REQ” is also displayed, then JES3 has been notified that an “intervention condition” exists on the device.

If the device is an active 3800 printer, the display includes the names of all active jobs that have output in the printer's buffer, on the drum, or in the paper line. The names appear in sequence starting with the name of the job whose output is closest to the end of the paper line. The values in all the fields in the message apply to the job whose data sets were most recently sent to the printer (the last job name in the display).

Note: The FSS/FSA will notify JES3 about interventions on SNA-attached printers.

In the message text:

\textit{devname}  

The device name as defined on the JNAME initialization statement.

\textit{dev}  

The device number.

\textit{AV}  

Indicates that the device is available (JUNIT status).

\textit{AC}  

Indicates that the device is active (JUNIT status).

\textit{ACO}  

Indicates that the device is currently active, but has been varied offline (JUNIT status).
OFF Indicates that the device is offline to JES3 (JUNIT status).

OFN Indicates that the device is offline because it has no paths.

ACN Indicates that the device is allocated and is offline because of no paths.

dspname This field appears if the device is currently in use by a JES3 DSP; if the device is in use by a job, the field is blank.

AMBIGUOUS Indicates that the device is ambiguous.

F= Indicates the name of the forms currently in use on the device. H indicates that JES3 cannot change the forms.

U= Indicates the ID of the train currently in use on the device. H indicates that JES3 cannot change the train.

CH= Specifies the name(s) of the character arrangement table(s) in use for the device. H indicates that JES3 cannot change this characteristic.

DYN= Indicates whether the device can be started by JES3 as a dynamic writer (Y) or not (N).

FL= Specifies the name of the forms overlay frame in use for the device. H indicates that JES3 cannot change this characteristic.

H= Indicates whether header records are to be printed (Y) or not (N).

B= Indicates whether burst records are to be printed (Y) or not (N). M indicates that the edges of the burst page or the three blank pages following a job's output are to be marked for ease of separation.

M= Indicates whether scheduling is automatic (A) or manual (M).

CB= Indicates whether clear-printer processing is being used for a 3800, 4245, or 4248 printer as follows:
   D Clear-printer processing is being performed after each data set.
   J Clear-printer processing is being performed only at the end of each job.
   N Clear-printer processing is not being performed.

L= Specifies the maximum or minimum nnn number of lines a data set can have to be selected for this device.

PG= Specifies the maximum or minimum (nnn) number of pages a data set can have to be selected for this device.

CK= Specifies the checkpoint interval (nnn) for an FSS-supported device in pages (P) or seconds (S).

NPRO= Defines the non-process-run-out interval for this device.

MODE= Defines the FSS (functional subsystem) mode or the COMP (compatibility) operating mode for this device.

OPACTLOG= OPACTLOG=Y specifies that operator command actions will be logged in the output of the displayed device using message IAT7066 or IAT7067. This parameter is only displayed when the OPACTLOG parameter is set to YES for an FSS device. OPACTLOG=N specifies that operator command actions will not be logged in the output. This parameter is only displayed when the OPACTLOG parameter is set to NO for an FSS device.

FSS= Defines the fssname for this FSS device.

C= Indicates the name of the carriage tape currently in use on the device. H indicates that JES3 cannot change the carriage tape.

PM= Indicates the process mode(s) defined for this printer or punch device. If the printer is a 3800 model 3 printer, PM indicates the process mode(s) defined for the current device mode.

PDEFAULT= Indicates which JES3 defaults (CHARS, FCB, or NONE (indicating all are applied) ) are not applied to FSS printers.
XLATE=
  Specifies whether the device translates nondisplay characters to blanks.

PDIR=
  Specifies at what point(s) a peripheral data set information record is sent with a job.
  
  **ALL**
  Specifies that a PDIR precedes every data set in a job.
  
  **BDS**
  Specifies that a PDIR is sent at the beginning of a job, when JES3 sends the begin destination select (BDS) command.
  
  **SS**
  Indicates the stacker option in use on a 3800 printer, as follows:
  
  S  sheet stacker
  C  continuous forms stacker
  
  **H**
  Indicates that JES3 cannot change the stacker option.

CGS=
  Indicates the amount of character generation storage in the 3800 printer, as follows:
  
  1  There is enough storage for 128 characters (2 WCGMs)
  2  There is enough storage for 255 characters (4 WCGMs)

CM=
  Specifies the name of the copy modification module *mod* and the tape reference character *trc* in use for the device. H indicates that JES3 cannot change this characteristic.

JOB
  Specifies the name and number of the job or jobs that are using the device.

  **NOTE:**
  For an FSS device, the display contains job information for the output sent to the FSS. This may be a job that has completed processing on the output device but is being retained by the FSS. See the FSS application documentation (*z/OS MVS Using the Functional Subsystem Interface*) to determine if there is a better way to monitor job status.

DGRPY=
  If DGRPONLY=Y then only output data sets with a destination equal to the device group will be scheduled to that device. If DGRPONLY=N then that device will accept output data sets with destinations equal to ANYLOCAL, as well as data sets with destinations equal to that device group.

MK
  Specifies that copymarking should be done on:
  
  C  copies of data sets.
  J  a job basis.
  N  none - no change should be made.

DGRP=
  The **device group name** that is defined on the initialization stream during initialization.
  
  DGRP=LOCAL if none is specified.

INTERVENTION REQ
  Indicates an intervention condition on the device which must be corrected before processing on the device continuing.

SETUPMSG=
  Indicates whether or not setup message IAT7030 is suppressed for this device (Y) or not (N).

NOT RESPONDING TO FSS
  JES3 received an indication from the functional subsystem (FSS) indicating that the device is no longer responding to the FSS. To determine why the device is not responding, check the device and/or communication components (for example, VTAM).

  To determine what action you need to take to restore the communication from the FSS to the device, see previous messages issued by the FSS and/or communication software.

TIMEOUT=
  The specified timeout value for writer termination when no more work can be selected by the writer. The specified **TIMEOUT** value can be one of the following:
  
  **NONE**
  Indicates that the writer will remain active indefinitely.
  
  0  Indicates that the writer will terminate when no more output can be selected.
IAT8564

Indicates the duration of the timeout: \(xxxD\) is the timeout value in days (if the timeout value is less than one day, this portion of the message is omitted); \(yyH\) is the timeout value in hours; \(zzM\) is the timeout value in minutes.

**IDLE=** Indicates the time period that the writer has been waiting and unable to select any work: \(xxxD\) is the idle time period in days (if the idle time value is less than 1 day, this portion of the message is omitted; if the value exceeds 999 days, a maximum of 999 is displayed); \(yyH\) is the idle time period in hours; \(zzM\) is the idle time period in minutes.

**WC=sysout_classes**

Specifies one or more sysout classes that the writer can process.

**WS=selection_criteria**

Specifies one or more of the following writer selection criteria which are in effect:
- Carriage tape or FCB (C)
- Sysout class (CL)
- Copy modification (CM)
- Data set destination (D)
- Form Requested (F)
- Flash (FL)
- Line or Page Limit (L)
- Stacker (SS)
- Data set priority (P)
- Device type (T)
- Train Image (U)
- Process mode (PM)

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

---

This message is issued in response to an *INQUIRY,J=jobno,X command to display extended information for a job. text is:

**SCHENV=schenv**

The scheduling environment associated with the job.

**SRVCLASS=srvclass**

The job's service class name.

**GROUP=group (WLM|JES)**

The job's group name and whether the group is JES managed or WLM managed.

**RUN COMMAND**

Indicates that a *MODIFY,J=jobno,RUN command was issued for the job.
JESLOG=SPIN
The job produces a log that can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=(SPIN, '+hh:mm')
The job produces a log that is automatically spun off every hh hours and mm minutes; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=(SPIN, 'hh:mm')
The job produces a log that is automatically spun off every day at hh:mm; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=(SPIN, nnn)
The job produces a log that is automatically spun off every nnn lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=(SPIN, nnnK)
The job produces a log that is automatically spun off every nnn thousand lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=(SPIN, nnnM)
The job produces a log that is automatically spun off every nnn million lines; furthermore, the log can be spun off at any time using the command "*MODIFY,J=job,SPIN".

JESLOG=NOSPIN
The job produces a log but the log cannot be spun off.

JESLOG=SUPPRESS
The job does not produce a log.

If there is no extended information to display, THERE IS NO ADDITIONAL INFORMATION is displayed.

Note:
1. If a job did not specify JESLOG and the class is defined to either suppress the log or to make it eligible for spinning, JESLOG text will be displayed according to the class definition.
2. JESLOG=NOSPIN will be displayed only if the job specified JESLOG=NOSPIN on the JOB statement. If JESLOG is not specified and the job's class is not defined to make jobs eligible to spin, no JESLOG text will be displayed for the job.

IAT8572

Explanation:
This message is issued in response to an "INQUIRY,D" command. It provides the device name (XTYPE name) and the address of the device identified by the command, the display status for the device, the mount status for the volume, and allocation information. The terms in the message are:

- **AC**: the device is in use by a setup job. (XUNIT status)
- **ACO**: the device is in use but has been varied offline to JES3. (XUNIT status)
- **ACP**: the device is in use but is pending offline.
- **RS**: the device is reserved by a setup job above a setup barrier. (XUNIT status)
- **RSO**: the device is reserved but has been varied offline to JES3. (XUNIT status)
- **AV**: the device is online and not in use. (XUNIT status)
- **AVU**: the device is online and not in use, but it is in the process of being unloaded.
- **OFF**: the device is offline to JES3. (XUNIT status)
- **OFN**: the device is offline because there are no paths available
- **ACN**: the device is allocated and is offline because there are no paths available
- **main**: the main to which the device is attached.
- **volser**: the volume serial number of tape or disk mounted on this device, based on the last volume verification. If the verify status field indicates NO RESP, then the volume serial number of the tape or disk which was previously mounted on the device is given.
- **JES=**: the volume (if any) is removable by JES3.
  - **R**: the volume is removable by JES3.
  - **M**: the volume is JES3 mounted.
  - **P**: the volume is permanently resident to JES3.
- **OS=**: the volume (if any) is removable to the operating system.
  - **R**: the volume is removable to the operating system.
  - **M**: the volume is reserved by the operating system.
  - **P**: the volume is permanently resident to the operating system.
  - **MS**: the volume is reserved by the operating system and is SMS-managed.
  - **PS**: the volume is permanently resident to the operating system and is SMS-managed.

**Note**: The **OS=** field reflects the last verify for the device inquired on.

**ALLOC=** user-count

This is indicated only if the inquiry is made of a direct-access device which is allocated. The number of users currently allocated to the device is given.
jobname (jobid)
this is indicated only if the inquiry is made of allocated devices other than direct-access devices. The job name and the job identifier of jobs allocated to that device are given.

verify status
this indicates the results of the last attempt to perform volume verification and may be one of the following:

- **VERIFIED**
  - the volume has completed MDS verification.

- **MOUNTED**
  - the volume is mounted on the indicated device.

- **NOT RDY**
  - the device is not ready.

- **NO RESP**
  - no response has been received from MDS verify on the local.

- **I/O ERR**
  - a permanent I/O error has occurred on the indicated device.

- **VOLID ERR**
  - an error was encountered reading the volume label.

- **ALLOCATED**
  - the device is allocated.

- **DUP VOL**
  - the indicated volume serial number is in use on another device.

- **OFFLINE**
  - the device is offline but contains a permanently resident volume.

- **INIT COMP**
  - the initial MDS verifies are complete (that is), restart is complete.

- **NOT OPR**
  - the device is not operational.

- **EXPD ERR**
  - the expiration date has not yet been reached.

- **LOAD CHK**
  - a load check error has occurred.

- **TIMEOUT**
  - an execute channel program has timed-out.

- **NO DEVICE**
  - there is no unit control block (UCB) for the indicated device.

- **GRP**
  - the device is dedicated to a job class group.

- **NET**
  - the device is dedicated to a DJC job network.

- **name**
  - the name of the job class group or DJC network ID to which the device is currently dedicated.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

Explanation:

djnet jobname jobid nhold—succesr rel/sch status

This message is issued in response to an *INQUIRY,N,ID=,J= or an *INQUIRY,N,ID=,LIST command. Net ID and job information are defined as follows:

- **djnet**
  - The name of the DJC network.

- **jobname**
  - The job name.

- **jobid**
  - The job number or job identifier.

- **nhold**
  - The current NHOLD count.

- **succesr**
  - The number of successor jobs to this job.

- **rel/sch**
  - The current RELEASE or SCHEDULE count.

- **status**
  - The current DJC status of the specified job. The STATUS indicators are defined as follows:
    - AC the job completed abnormally
    - F the job failed at the reader/interpreter or the converter/interpreter
    - C the job is complete
    - OH the job is in DJC operator hold
    - H the job is in DJC hold
    - N the job is null
    - E the job is eligible for scheduling and may be active

IAT8587

Explanation:

```
> > > spart— USERS FOUND=— xxxx— JES3— jjjjj— JOBS;— uuu— DISPLAYED
```

This is a summary message issued in response to the *INQUIRY,Q,SP=spart | ALL,U,N=nnn command.
In the message text:

- `spart`  The name of the spool partition to which this summary message applies.
- `xxxx`  The number of JES3 users found that are using spool space in the indicated spool partition. JES3 users include JES3RJP, JES3INIT, JES3STT, RJP console names, output for JES3 job 0, callable JES3 dynamic support programs (DSPs), and temporary jobs created during JES3 input service.
- `jjjjj`  The number of jobs that use spool space in the indicated spool partition, including JES3 DSPs. Note that a job may use spool space in more than one partition, and will then be displayed in all applicable partitions.
- `uuu`  The number of users displayed. If you specified N=ALL or N=a value greater than the maximum display value (100), only the maximum (100) is displayed.

System action: JES3 processing continues.
Operator response: None. This is a informational message.

CONSOLE DISPLAY—Tabular Information—ROUTE CODE = (rout)—DEST CLASS = (dest)

SWITCHED CONSOLES = (swtcons)

Tabular Information:

| name | cnt | swtch | ll | a | sav |

This is the output from the *I O command.

In the message text:

name
Shows the name of the console.

cnt
Shows the number of messages waiting to be displayed on this console.

swtch
Shows the current switch status of the console. If a console name is shown, this console is switched to the swtch console.

ll
Indicates the line length used by JES3 when sending data to this console.

swtcons
Indicates whether or not JES3 is currently saving messages that are being sent to the remote while it is not signed-on.

rout
Shows the routing codes being received by the console.

dest
Shows the JES3 destination classes being received by the console.

swtcons
Shows the consoles which are switched to this console.

IAT8615
Explanation:

JES3 IS PACING THE INQUIRY FCT DUE TO A MESSAGE BUFFER SHORTAGE

An *INQUIRY,D command was issued that resulted in more than 200 messages (because either N=ALL or a value greater than N=200 was specified on the command). The high number of messages caused a JES3 console buffer shortage (IAT7186). To avoid making the shortage worse, JES3 will use AWAIT processing to pace the INQUIRY FCT during processing of the command response.

System action: JES3 processing continues. This message will remain outstanding until the shortage is relieved and the command response finishes. During this time other *INQUIRY commands will be enqueued to be processed after the *INQUIRY,D command completes.

Operator response: No action is required. If, however, you want to process other *INQUIRY commands before this command has finished processing, issue a *FAIL,INQDRVR command to cancel the original JES3 *INQUIRY,D command processing. (JES3 will stop pacing the INQUIRY FCT and process other *INQUIRY commands.)

Programmer response: No action is required. You can, however, cancel this command and reissue it, or another, after you have increased either WTO buffers or JES3 console buffers. For information on how to increase the buffer size, see message IEA404A (for WTO buffers) or the CONSTD initialization statement located in z/OS JES3 Initialization and Tuning Reference (for JES3 Console buffers).

Explanation:

DLOG STATUS — status

968 z/OS V2R1.0 JES3 Messages
This message is issued in response to an *INQUIRY DLOG command which requested that the status of the JES3 hardcopy log (DLOG) be displayed. The status is one of the following:

**DISABLED**
- DLOG is disabled

**ENABLED BUT INACTIVE**
- DLOG is enabled (i.e. the DLOG option is turned on) but the JES3DLOG address space is not active.

**ACTIVATE IN PROGRESS**
- DLOG is in the process of being activated. That is, the JES3DLOG address space is started and JES3 is waiting for it to initialize.

**ACTIVE**
- DLOG is active and is ready to process messages.

**ACTIVE AND SUSPENDED**
- DLOG is active but is suspended temporarily because of a WTL buffer shortage or because SYSLOG is not active.

**DEACTIVATE IN PROGRESS**
- DLOG is in the process of being deactivated. That is, the JES3DLOG address space has been posted for termination processing, and JES3 is waiting for it to terminate.

**System action:** None. The state of DLOG is displayed.

**Operator response:** None. This is an informational message.

**Routing Code:** Note 18  
**Descriptor Code:** 5,7

---

**Explanation:**

```
[ ] lname  wsname       NOT SIGNED ON,  TRACE ON,  PL=n  ,RDRS HELD
    | SNA RJP  TRACE OFF,  
    | SPOOLED MSG= nn
```

JES3 issues this message in response to an *INQUIRY command that requested the status of a BSC RJP line or workstation or a SNA RJP workstation. The designated line or workstation is not signed on. If SNA RJP is included in the message text, the specified workstation is a SNA RJP workstation; otherwise, the workstation or line is BSC RJP.

TRACE ON or TRACE OFF indicates the status of the SNA RJP trace facility. Tracing can be specified even if the workstation is not signed on. The trace facility is specified using the TRACE=ON parameter of the RJPS initialization statement or the *MODIFY,T command.

PL=n indicates the number of times an incorrect password will be allowed on a SNA RJP workstation before logons from that workstation are rejected. Use the PL=n parameter of the RJPWS initialization statement or the *MODIFY,T command to specify the password limit.

SPOOLED MSG= indicates the number of messages spooled for this workstation. Messages may be spooled while the workstation is signed off, for later delivery when the workstation signs on. The message count is updated for each line of a message. For instance, each line of a multi-line message will cause the count to be incremented. Therefore, the number of unique message ids may be less than the count displayed on the ‘SPOOLED MSG=’ parameter. This option is controlled by the SAVEMSG keyword of the CONSOLE initialization statement and the *F O command.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

Explanation:

- **lname**
- **(SNARJP)**
- **wsname**
- **TRACE ON**
- **PL=n**
- **RDRS HELD**
- **CHAINED MSG=nn**

This message is issued in response to an *INQUIRY command that requested the status of a BSC RJP line or workstation or a SNA RJP workstation. The designated line or workstation is signed on. RDRS HELD indicates that jobs submitted from the workstation will enter the system in hold status. This setting is controlled using the H (hold) or R (release) parameter of the *MODIFY,T command. TRACE ON or TRACE OFF indicates the status of the SNA RJP trace facility. Tracing can be specified even if the workstation is not signed on. Use the TRACE=ON parameter of the RJPWS initialization statement or the *MODIFY,T command to enable the TRACE facility. CHAINED MSG= indicates the number of message lines queued in JES3 storage for this workstation. PL=n indicates the number of times an incorrect password will be allowed on a SNA RJP workstation before logons from that workstation are rejected. Use the PL=n parameter of the RJPWS initialization statement or the *MODIFY,T command to specify the password limit.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

---

This message is issued in response to an *INQUIRY,D,T=tname command. It gives the status of devices at the
indicated workstation, as follows:
- **AL** allocated, not active
- **AV** available, not active
- **OFF** offline, not active
- **AC** active
- **ACO** active with a pending offline request; the DSP requesting the device is given
- **UA** indicates that the device is unavailable. This indicator is displayed only after the terminal has signed on
  **jobno** is the job number associated with the device or DSP
  **jobid** is the job identifier associated with the device or DSP

If the inquiry is of a SNA RJP workstation, the logical unit being used by the device is given as **luname**.
- **REAL** indicates that the terminal has a real console
- **SIMU** indicates that the terminal has a simulated console

**System action:** JES3 processing continues.

**Operator response:** If the workstation is functioning normally, no response is needed. Otherwise, make sure the
devices specified as being active are ready.

---

972  
z/OS V2R1.0 JES3 Messages
IAT8625

Explanation:

This message is issued in response to an *INQUIRY,D,T=wsname command. It may be issued one or more times to give the status of each communication session between the specified workstation wsname and JES3. The status of devices at the SNA RJP workstation wsname are as follows:

- **luname** — name of the workstation logical unit (LU) that has a session with JES3.
- **CID** — communication identifier (network address) for the session.
- **AL(ddn)** — the session is allocated for communication with the device ddn.
- **UA** — session is not allocated to any device.
- **UP** — session is running.
- **Q** — device is quiescing.
- **QI** — device is immediately quiescing.
- **PC** — the session is pending closing. JES3 has not issued a VTAM CLSDST request to close down the session.
- **CR** — JES3 issued a VTAM CLSDST request to close down the session. The CLSDST request has not yet completed.
- **CC** — CLSDST completed for the session. All session activity has stopped.
- **FB** — the session is pending free block processing which will remove it from the JES3 SNARJP control structure. JES3 flagged the session for removal, but is waiting for the session use count to reach zero before scheduling it for removal.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

IAT8643

Explanation:

--- MAIN INQUIRY INFORMATION — INFORMATION FOR MAINPROC — name

--- Short Information | Extended Information

Short Information:

- FMID=fmid
- STATUS=ONLINE, OFFLINE, CONNECTED, NOT-CONNECTED, ATTACHED, NOT-ATTACHED, DOWN, JESXCF-ERROR
- JESMSGLMT=limit, intvl

Extended Information:

- ID=id
- MDEST=mdest
- SELECT=select
- SPART=spart
- TRKGRPS=(pri, sec)
- PLEVEL=p1
- SLEVEL=s1
- FIXPAGE=fixpage
- PRTPAGE=(csa, aux)
- USRPAGE=usrp

This message is issued in response to an *INQUIRY,MAIN command. For an *INQUIRY,MAIN=name, information about the requested main processor is returned. For an *INQUIRY,MAIN=ALL, information about all main processors is returned.

The status indicators are:

- **Online status**, in which the following text can appear:
  - **ONLINE**: The processor has been varied on line to the global, or was defined (explicitly or by default) as being initially on line to the global at initialization time.
  - **OFFLINE**: The processor has been varied off line to the global, or was defined explicitly as being initially on line to the global at initialization time. The status OFFLINE is also displayed if the processor has been flushed.

- **Connect status**, in which the following text can appear:
  - **CONNECTED**: The processor has connected to the global and is capable of receiving jobs.
  - **NOT-CONNECTED**: The processor has not connected to the global.

- **JES3 status as viewed by JESXCF**, in which the following text can appear:
  - **DOWN**: Either the processor is completely down, or JES3 has never attached to JESXCF since the processor was IPLed.
  - **ATTACHED**: JES3 has initialized and attached to JESXCF.
  - **NOT-ATTACHED**: JES3 was previously attached to JESXCF, but has been brought down.
  - **JESXCF-ERROR**: The attach status of JES3 could not be obtained because of an error.

- **Global status**, in which the following text can appear:
  - **GLOBAL**: The processor is the JES3 global.
LOCAL
The processor is a JES3 local.

If the X parameter is specified (*INQUIRY,MAIN=name,X or *INQUIRY,MAIN=ALL,X) then short and extended information are returned; otherwise only short information is returned.

In the message text:

name  The name of the main processor for which information is being returned.

fmid  The JES3 FMID level of the main processor.

pl    The JES3 product level of the main processor.

sl    The JES3 service level of the main processor.

id    The message prefix id of the main processor, as defined by the ID= parameter on the MAINPROC initialization statement.

MDEST  The message destination class of the main processor, as defined by the MDEST= parameter on the MAINPROC initialization statement.

SELECT The select mode of the main processor, as defined by the SELECT= parameter on the MAINPROC initialization statement.

SPART  The default spool partition for jobs that run on this main processor, as defined by the SPART= parameter on the MAINPROC initialization statement. If no partition is defined, the text NONE is displayed.

pri    The default primary track group allocation for jobs that run on this main processor, as defined by the TRKGRPS= parameter on the MAINPROC initialization statement.

sec    The default secondary track group allocation for jobs that run on this main processor, as defined by the TRKGRPS= parameter on the MAINPROC initialization statement.

limit  The maximum number of messages that a job can issue within a given time interval before a warning message is issued, as defined by the JESMSGLMT= parameter on the MAINPROC initialization statement.

intvl  The time interval for the above message limit, as defined by the JESMSGLMT= parameter on the MAINPROC initialization statement.

fixpage The number of pages that are fixed at initialization time for this main processor, as defined by the FIXPAGE= parameter on the MAINPROC initialization statement.

csa    The number of pages that are allocated in the Common Storage Area for this main processor, as defined by the PRTPAGE= parameter on the MAINPROC initialization statement.

aux    The number of pages that are allocated in the JES3 Auxiliary address space (JES3AUX) for this main processor, as defined by the PRTPAGE= parameter on the MAINPROC initialization statement.

usrpage The number of pages that JES3 uses for each open SYSOUT data set, as defined by the USRPAGE= parameter on the MAINPROC initialization statement.

System action:  JES3 processing continues. This is an informational message.

Operator response: None. However, if the text JESXCF-ERROR appears in either the FMID or the status, notify the system programmer.

System programmer response: If the text JESXCF-ERROR appears in either the FMID or the status, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IAT8649

Explanation:

\[\text{--- linename - nodename - IN QUIESCE MODE}\]

This message is issued in response to an *I,NJE or *I,NJE,N= nodename,LINE command. A remote node is in the process of sending a job or a SYSOUT data stream to the local node and the local node has initiated a security request to the security product. Until the security request completes, the local node is indicating to the remote node that no more data for the stream should be sent.

**System action:** JES3 processing continues.

**Operator response:** No action is necessary unless a line remains in quiesce mode for an inordinate amount of time. This may indicate that the security product is unable to complete the request. This may result from the security product data base or that the security request is hung. To recover from this condition, cancel the line by using the *C,linename,I command. After the security product or the security product data base have been cleared up, restart the line by using the *X,NJE,N= nodename command.

**System action:** JES3 processing continues.
**Operator response:** None. This is an informational message.
IAT8657

Explanation:

This message, issued in response to the *INQUIRY,NJE command, indicates that the line is ending.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT8658

Explanation:

This message is issued in response to an *INQUIRY,NJE command in which an incorrect parameter parm was specified. COMMAND appears in the message when the incorrect parameter cannot be determined.

System action: JES3 ignores the command.

Operator response: Resubmit the command, using the correct parameters.
This message is issued in response to an *INQUIRY,NJE,NAME=nodename command. Various information about the requested node name is included in this message. DEFINED LINE NAME is displayed if the node is a directly connected binary synchronous (BSC) node; SNA PROTOCOL is displayed if the specified node is allowed to receive and send a network job using SNA protocols. The default print, external writer, TSO, and punch classes are displayed if the node is the home node or an alias.

In the message text:

**nodetype**
The type of the node being displayed.

**HOME**
The node being displayed is the home node.

**ALIAS**
The node being displayed is an alias of the home node.

**NODE**
The node being displayed is a directly or indirectly connected BSC or SNA node.

**nodename**
The name of the node for which information is being displayed.

**hold**
A hold status of either HOLD or NOHOLD.

**pathname**
The path of the node if the requested node is directly or indirectly connected. If the node is directly connected and the path has not been modified through the *MODIFY,NJE,NAME=node,PATH=path command, the node's path is itself.

**lname**
The name of the line, if the requested node is directly connected.

**prtclass**
The default print class as defined by the PRTDEF keyword on the home node or alias definition.

**tsoclass**
The default TSO class as defined by the PRTTSO keyword on the home node or alias definition.

**xwrclass**
The default external writer as defined by the PRTXWTR keyword on the home node or alias definition.

**punclass**
The default punch as defined by the PUNDEF keyword on the home node or alias definition.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**
This message is issued in response to an *INQUIRY,NJE,NAME=\textit{nodename},LINE command. In addition to the line status messages for the specified node \textit{nodename} and \textit{linename}, RCV|NORCV status for active lines for the specified node are given. RCV indicates node is receiving. NORCV indicates node is not receiving.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

---

**IAT8666**

**Explanation:**

\[\text{JOB--jobname (jobid)-- MAIN CHANGE REJECTED -- reasontext}\]

An *F,J=nnnn, M=mains command was issued to change the job's main eligibility but the command was rejected for one of the following reasons (reasontext):

**JOB IS INELIGIBLE**

- The job is a proclib update job.
- The job is a demand select job.
- The job is already in execution.
- The job is has completed execution.
- The job is in MDS restart.
- The job is active in some other function except main service.
- The job does not require main service.

**MAINS ARE INCONSISTENT WITH JOB CLASS**

The main processors specified are not eligible to run with the job's job class.

**nnnnnn IS AN INVALID MAIN NAME**

An incorrect main name was specified on the *F,J=nnnn, M=mnnnnn command.

**System action:** The command is rejected.

**Operator response:** If MAINS ARE INCONSISTENT WITH JOB CLASS is displayed, correct the command so that the mains specified are eligible to run with the job's job class. You can issue an *F,J=nnnn,CL=class command to change the job's job class.

Routing Code: 18,10  Descriptor Code: 5,7

IAT8671

Explanation:

An unrecoverable error has occurred while processing an IATXJQE or IATXJCT macro instruction. Possible causes of the error are:

- Unrecoverable read/write error on JCT record
- Incorrect control block structure for this job
- Damage to JQE/JCT service control blocks
- Program interrupt
- Machine error

System action: The error condition is flagged in the IATYJQE control block, and all further access to the job is inhibited. All control blocks remain in storage for diagnostic purposes. The DSP issuing the macro instruction may issue a DM abend.

Operator response: Notify the system programmer and/or the submitter of the job about the error for each unique job. Each of the jobs may need to be rerun.

System programmer response: Dump JES3 address space and capture dump.

Problem determination: See Table I, items 2 and 16; Table III, items 2, 3, 4, and 7.

Routing Code: Note 18  Descriptor Code: 5,7

IAT8673
Explanation:

```
>>> JOB jobname (jobid) OF NET net id IS IN SETUP OR ON MAIN
```

The specified job of network net id was in setup processing, or executing on a processor, when a *MODIFY,N,ID=net id,F command was issued. The job might remain active, and even though the network has completed processing, data sets will continue to be updated.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>

</table>

Routing Code: Note 18  Descriptor Code: 5,7

IAT8674
Explanation:

```
>>> JOB jobname (jobid) text
```

JES3 issues this message in response to an *INQUIRY,J, an *INQUIRY,P, or an *INQUIRY,Q command. This is the job or queue status report.

In the message, text is one of the following:

- **P= prty** identifies the job priority. (This field appears only if the request is job-specific.)
- **CL= cls** identifies the job class as specified in the CLASS= parameter of the JOB statement for this job.
- **NET= djnet** identifies the the dependent network name.
HOLD=

*holdtype* identifies the hold status.

*holdtype* is one of the following:

- **OP** Operator hold status.
- **DJ** DJC operator hold status.
- **N** DJC network hold status.
- **ER** Operator hold status because of an error in the job.
- **PR** Priority hold status.
- **SP** Spool hold status.
- **ARM** Automatic restart management hold status

**Note:** In response to an *INQUIRY,Q,H* command, a job in priority hold only displays HOLD=PR if other hold types also apply. If PR is the only hold type that applies, IAT8674 is not issued for that job. If you need to see which jobs are in priority hold, use the *INQUIRY,Q,H,PR* command.

The status of the job appears in terms of the JES3 function (scheduler element) being processed for the job, as follows:

- **dspname** [**status**]

  - The name of the DSP that is associated with the scheduler element being processed is waiting for output service to complete processing data sets that were spun off by the previous DSP. This DSP will be scheduled when all spinoff data sets have completed output service processing.

  - **status** is one of the following:

    - **ACTIVE** Active.
    - **COMPLETE** Complete.
    - **RESCHEDULED** This DSP was rescheduled.
    - **SPEC RESCHED** This DSP has specialized rescheduling and is waiting for devices.
      
      If the dspname is NJESND, the job is waiting for a connection to the destination node. Use the *INQUIRY A,D=NJESND* and the *INQUIRY NJE,NAME=node* commands to determine whether the job is formatted with the same protocol with which the destination node is defined.

      If the dspname is not NJESND, the job needs to be rerouted using NJEROUT DSP before it can be sent.
    
    - **PENDING WTR** The job's data set is waiting for a writer if DSP=OUTSERV.
    - **ACTIVE ON WTR** The job's data set is active on a writer if DSP=OUTSERV.
    - **DSP ABEND** JES3 failsoft processing this DSP.
    - **PENDING SPIN** The job is waiting for output service to complete processing data sets that were spun off by a previous DSP. For example, spinoff output was created by the job during execution (MAIN DSP) as a result of specifying FREE=CLOSE on a DD statement. The DSP specified in this message will be scheduled when all spinoff data sets have completed output service processing.

  - **MAIN** **status1**

    - the MAIN scheduler element is ready to be processed or is being processed for the job. If no DSP is running yet, only MAIN appears in the message. Otherwise, **status1** indicates where the job is in relationship to the functions of main service processing.

Chapter 24. Inquiry Messages  995
status1 is one of the following:

**FETCH**  The job is waiting for volume fetch processing.

**WAITVOL**  The job is waiting for "S setup processing.

**SYSTEM SELECT**  The job is on the system select queue.

**ALLOCATE**  The job is waiting for resources to be allocated.

**VOL UNAVAIL**  The job is waiting for an unavailable volume.

**VERIFY**  The job is waiting for volumes to be mounted.

**SYSTEM VERIFY**  The job is on the system verify queue.

**MDS ERROR**  The job is waiting for an operator decision. (MDS error queue)

**GMS SELECT**  The job is waiting to be selected for processing on the main.

**EXECUTING**  The job is in execution.

**BREAKDOWN**  The job is waiting for its resources to be deallocated (MDS breakdown).

**MDS RESTART**  The job is waiting for MDS restart processing.

**MAIN COMPLETE**  The job is complete on main.

**OUTSERV WAIT**  The job is in the process of being rescheduled.

**DEMAND SELECT**  The job is a demand-select job that is waiting to be selected for processing on the main.

**I/O WAIT**  The ending function RESQUEUE is waiting for I/O to complete.

**ENDFUNC ERROR**  Error - the ending function RESQUEUE was not processed.

**DSP ABEND**  The main service scheduler element was ended by JES3 failsoft processing.

**DELETE ONLY**  Restart processing with analysis found that the job's control blocks contain incorrect data.

**CI**

The C/I scheduler element is ready to be, or is being, processed for the job. If the element is not being processed, only 'CI' appears in the message. Otherwise, status indicates where the job is processing in C/I processing. Inquiries on the POSTSCAN DSP also display 'CI' since the POSTSCAN DSP runs under the C/I scheduler element.

**status** is one of the following:

**CATALOG SETUP**  The job is in catalog setup (JOBCAT or STEPCAT DDs).

**CI IN FSS**  The job is active in C/I and PRESCAN processing in a functional subsystem (FSS) address space. In this case, the FSS name of the CI FSS that is processing the job is also displayed.
**ACTIVE**
The job is active in C/I and PRESCAN processing in the JES3 address space.

**LOCATE**
LOCATE processing is being performed for the job.

**POSTSCAN**
The job is active in POSTSCAN processing in the JES3 address space.

**RESCHEDULED**
The CI DSP had specified rescheduling because a main was not available to do LOCATE processing, or the job is in DJC hold status.

**WAIT POSTSCAN**
The job is waiting to be scheduled for POSTSCAN processing. The name of the FSS that the job is associated with is also displayed.

**DSP ABEND**
The C/I scheduler element was ended by JES3 FAILSOFT processing.

FSS=fssname
fssname identifies functional subsystem (FSS) name.

MPNAME=mpname
mpname identifies the main processor name.

System action: JES3 continues processing.

Operator response: No specific action is required if this message is issued in response to a command. If it is issued during restart processing, cancel the indicated job when restart processing is complete. (The only commands that JES3 can accept for the job are *INQUIRY and *MODIFY,jobno,C.)

**IAT8675**

Explanation:

```
   JOB—jobname (jobid) nn—EXTENTS HELD—{(:ddn[,ddn]...}—
```

This message is issued in response to the *INQUIRY,J=jobname|jobno,SH command to display the names of the held spool data sets that contain data for the indicated job.

In the message text:

- **jobname**
  The job name.

- **jobid**
  The job identifier.

- **nn**
  A count of the number of held spool data sets that contain data for the job. If unspecified as NO, the job has no data on held spool data sets and no spool data set **ddnames** will be displayed.

- **ddn**
  The **ddname** of a spool data set that is in a held state containing data for the job in question.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

**Routing Code:** Note 18  
**Descriptor Code:** 5,7

---

**Explanation:**

This message is issued in response to an *I,Q, an *I,P, or an *I,J= command with the W operand. It is displayed when the job is on a Job Segment Scheduler (JSS) wait queue, and indicates why the particular job is waiting to be scheduled:

**SCHEDULING/ENDING FUNCTION**

The job has just become ready and is waiting for the Job Segment Scheduler (JSS) to schedule the job. Or the job has just completed a JES3 function (such as C/I) and is waiting for JSS to mark the function complete and schedule the next function. Nothing needs to be done for this condition unless it persists for a long time.

**A DSP TO BECOME AVAILABLE**

The job is waiting for a DSP to become available. To determine which DSP the job is waiting for, find the DSP name in message IAT8674, and issue the *I,X,D=dspname command to determine whether there are enough DSP's defined or whether the DSP is in hold.

**A DSP TO BECOME AVAILABLE AT THE PROPER JES3 LEVEL**

The job is waiting for a C/I DSP to become available on a main processor at HJS7790 level or higher. The job card for this job specified a class of more than one character, or the job class is defined with SYSSYM=ALLOW. Either condition requires C/I service at this level.

**AN RQ TO BECOME AVAILABLE**

JSS was unable to create an RQ to schedule the job because there are no RQs in the RQ cell pool, and storage for another cell pool extent could not be obtained. Nothing needs to be done for this condition unless it persists for a long time.

**A PROCLIB TO BECOME AVAILABLE**

The job is waiting for the procedure library to become available. This means that either the procedure library could not be allocated, or another job is updating the PROCLIB. To determine which procedure library the job is waiting for, issue a *X,DISPLAY command and find the procedure library identified by “PROCLIB=IATPLBnn”. To determine the status of the procedure library, issue a *I,PROCLIB,ID=nn command, where “nn” is the last two characters of the procedure library name. If a job is updating the procedure library, the job number will appear in the output from the *I,PROCLIB,ID=nn command.

**A MAIN/CLASS/GROUP**

The job is waiting for a main processor, a job class, or a job class group to become available. This means that either the main processor is not connected, the main processor is offline, the job class is disabled on all main processors, or the group is disabled on all main processors.

If the job is waiting to be scheduled for C/I, the job can only be waiting for a main processor since the status of the job's class and group does not affect C/I scheduling. To determine which main processors the job is eligible for, issue a *I,J=nnnn,M command. To determine the status of those main processors, issue an *I,S command (provided you are using JES3 setup), and examine the status of those main processors that appeared in the *I,J=nnnn,M command. At least one of these main processors must be connected and online in order for the job to be scheduled for C/I.
If the job is waiting to be scheduled for MAIN, then the job can be waiting for a main processor, a job class, and/or a job class group. To determine which main processors the job is eligible for, issue a *I,J=nmmm,M command. To determine the status of those main processors, issue an *I,S command (provided you are using JES3 setup), and examine the status of those main processors that appeared when you issued the *I,J=nmmm,M command. At least one of these main processors must be connected and online in order for the job to be scheduled for MAIN.

To determine the status of the job's class, issue a *I,G,ALL,C,classname command, where “classname” is the name of the class that appears in message IAT8674. The class must be enabled on at least one main processor that is eligible to run the job.

To determine which group the job is associated with, issue a *I,G,ALL,C,classname command, where “classname” is the job class name that appears in message IAT8674. The name of the group will appear in the output from the *I,G,mainname,G,groupname command to determine the status of the group. The group must be enabled on at least one main processor that is eligible to run the job.

**COMPLETION OF QUEUE PROCESSING**
The job is waiting for JSS to complete processing of its queues so that it can later be put back on the DSP wait queue. Nothing needs to be done for this condition unless it persists for a long time.

**SMS RESOURCES TO BECOME AVAILABLE**
The job requires SMS-managed user catalogs to become available. This condition occurs when the volume or storage group, where the SMS-managed user catalog resides is quiesced or disabled. There is no method by which you can list the specific storage groups and volumes that are required by this job. However, you can issue the “D SMS,SG(ALL),LISTVOL” command to list all of the storage groups and volumes defined in your installation.

**A LOCATE MAIN TO BECOME AVAILABLE**
The job is waiting for a main processor to become available for locate processing. This condition occurs when a job that needs catalog locate processing, is scheduled for C/I and the main becomes unavailable before the job begins catalog locate processing. To determine which main processors the job is eligible for, issue a *I,J=nmmm,M command. To determine the status of those main processors, issue an *I,S command (provided you are using JES3 setup), and examine the status of those main processors that appeared when you issued the *I,J=nmmm,M command. At least one of these main processors must be available in order for the job to be scheduled for C/I processing.

**SOME UNKNOWN REASON**
JES3 was unable to identify the reason that the job is waiting. This is probably due to some system error; the system programmer should be contacted.

**JOB WITH SAME NAME TO END**
A job with the same name has been scheduled for main service processing. To determine which job has been scheduled for main service, issue an *I,J=jobname command.

**JOB PRIORITY IS IN HOLD**
The job's priority was put into hold through a *F,Q,H command or a *F,Q,P=prty,H command. The job's priority appears in message IAT8674.

**JSAM BUFFERS TO BECOME AVAILABLE**
The job requires POSTSCAN processing, and POSTSCAN cannot proceed until system-wide JSAM buffer usage by C/I decreases below the allowable threshold.

**System action:** JES3 processing continues.

**Programmer response:** The action to be taken depends on the reason why the job is waiting.

Explanation:

JOB jobname (jobid) text ELIGIBLE ON main
NOT ELIGIBLE FOR MAIN main

This message is issued in response to an *INQUIRY,J=jobno or jobname,M command.

ELIGIBLE ON main, [main,] [GLOBAL]
   Indicates the name(s) of the main(s) on which the job is eligible for execution.

NOT ELIGIBLE FOR MAIN
   The job does not have a main scheduler element or the job has completed main processing.

jobid
   The job identifier.

jobname
   The job name.

main
   The name of a JES3 main (as defined by a MAINPROC initialization statement). Up to eight main names may be
displayed.

GLOBAL
   the job is a called DSP and runs only on the global processor.

System action: JES3 continues processing.
Operator response: None. This is an informational message.

IAT8685

Explanation:

main - reason
text

This message is issued in response to the *INQUIRY,Q,*INQUIRY,P, and *INQUIRY,J commands when the W operand is specified. It is displayed when the reasons why the job is waiting may vary from main processor to main processor. The message indicates which main processor the delay is associated with and why the job is waiting on that main and cannot be scheduled on that main. Most of the reasons are similar to the ones displayed when you issue a *CALL,DISPLAY command. They are as follows:

• [RQJSTAT=(mpname,selection status/bypass reason,...)] - The selection status or bypass reason is given for each main for which this job is eligible (if present) (MPNAME/RQJSTAT). Selection status is one of:
  - VALUE NOT DEFINED - means that RQJSTAT has not yet been filled in (RQJXZERO); either the job has:
    not yet reached MDS or GMS processing
    reached MDS or GMS processing but has not yet been selected for a main, and there are not yet any reasons why the job can not be allocated or selected.
  - ON MAIN - job selected for a main (RQJXONMN)

The bypass reasons are divided into GMS reasons and MDS reasons. Through various initialization statements (MAINPROC, SELECT, CLASS, GROUP), the installation defines throughput objectives to be used as GMS balances the workload. If RQJSTAT is one of the GMS reasons, it may mean that the job was not selected on the main specified because of a conflict with one of the installation defined criteria and the current workload of the JES3 complex. The GMS bypass reasons are:

  INSUFFICIENT STORAGE - from the LSTOR parameter (RQJXSTOR)
  TLIMIT EXCEEDED - (RQJXTLIM)
  NO MATCH ON IORATE - (RQJXIORT)
  NO MATCH ON RQMAINS - the job is not eligible to run on this processor (RQJXMAIN)
  JOB CLASS DISABLED - (RQJXCLAS)
  LSTOR UPDATE PENDING - (RQJXLSPN)
  JOB IN HOLD OR ACTIVE - (RQJXHOLD)
  JOB IN DJC HOLD - (RQJXDJCH)
  GROUP OFF THIS MAIN - group disabled on this main (RQJXMGMN)
MAIN OFFLINE - (RQXJMNOF)
TDEPTH EXCEEDED - (RQXJTDPT)
CANCL/RSTRT SETUP ISSUED - a cancel/restart setup command was issued (RQJXRCNS)
WAITING FOR REQ MVSLVL - waiting for a system at a particular release level or higher to become available (RQJXW522)
SCHENV UNDEFINED - the scheduling environment is undefined in the current WLM policy (RQJXSEUD)
SCHENV NAVAIL - the scheduling environment is not available (RQJXSEUN)
WAITING FOR SPOOL SPACE - (RQJXWSPL)
MAX JES MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in JES managed initiators (65535) is active and no new job can run on this main in a JES managed initiator until one of these active jobs ends or is canceled.
MAX WLM MANAGED JOBS ON SINGLE MAIN - The maximum number of jobs (65535) that can run concurrently in WLM managed initiators (65535) is active and no new job can run on this main in a WLM managed initiator until one of these active jobs ends or is canceled.
GROUP NOT SUPPORTED IN WLM MODE - (RQJXGPWL)
MLIMIT EXCEEDED - (RQJXMLMT)
SRVCLASS MODIFY IN PROGRESS - (RQJXSrvm)
WLM RECLASSIFICATION IS IN PROGRESS - (RQJXWRlc)
SYSTEM NOT AT MIN MVSEXECUTION LEVEL - During JCL conversion, MVS determined that this job must execute on a system of a minimum MVS level. The system does not meet the minimum MVS level that is required for this job - (RQJXMNLv)

The MDS bypass reasons explain why MDS could not perform allocation for the job. The MDS bypass reasons are the following:
RESOURCE UPDATE ONLY - resource update scan is in progress (RQJMDRSU)
JOB HOLD STATUS - job is held (RQJMDHLd)
MAX REGION SIZE EXCEEDED - job exceeds maximum region size (RQJMDRGN)
RESTART JOB PASS ONLY - following a warm start, JES3 allocation first processes jobs that had been allocated before the warm start (RQJMDrSt)
MAIN OFFLINE OR NOIPL - main offline/not connected (RQJMDOff)
RESTART MAIN NOT IPLD - restart main not connected (RQJMDrOI)
GROUP/CLASS DISABLED - group/class disabled (RQJMDGMS)
REQ RESOURCE NAVAIL - required resource not available (RQJMDrSC)
DEVPool FENCE PENDING - device pool fence is pending, not available, and/or not built (RQJMDFNC)
MAIN SDEPTH EXCEEDED - main setup depth exceeded (RQJMDMDp)
CLASS SDEPTH EXCEEDED - class setup depth exceeded (RQJMDCDP)
FAILED PRE-ALLOC SCAN - pre-allocation scan failed (RQJMDSCn)
SYS MNGD RESOURCES UNAVL - SMS managed resources not available (RQJMDSMS)
SCHENV UNDEFINED - the scheduling environment is undefined in the current WLM policy (RQJMSEUD)
SCHENV NAVAIL - the scheduling environment is not available (RQJMSEUN)
GROUP NOT SUPPORTED IN WLM MODE - WLM groups are not supported by this system (RQJMGpwL)
JESLOG VALUE NOT SUPPORTED ON MAIN - The job specified (on the JOB statement or the START command) or inherited (from the class definition) a JESLOG attribute of SUPPRESS or SPIN. The main processor for which this text is displayed for the job is not at a sufficient JES3 level to allow the job to run on that processor (RQJMJLNS)

The following additional reasons can be displayed:
MAIN OFFLINE/NOT CONNECTED
GROUP DISABLED
JOB CLASS DISABLED
IAT8686

NO GROUP INITIATORS STARTED -

There are no initiators associated with the job's job class group that are started, or there are initiators that are in the process of being started. To determine which group the job is associated with, issue an *INQUIRY,G,main name,C,classname, where main name is the name of the main processor that appears in message IAT8685, and classname is the job class name that appears in message IAT8674. Then issue an *INQUIRY,G main name,G,groupname command for that group. The output from the command should show the status of the initiators for that group including the number of initiators that have been allocated (started). If the number of allocated (started) initiators is non-zero, then there are probably some initiators that are in the process of being started and are held up for some reason. To determine the status of the JES3 initiators, issue an *

ALL GROUP INITIATORS IN USE -

All initiators associated with the job's job class group are in use by jobs in execution. To determine the status of the job's group, use the same steps as when there are no started initiators.

NO INITIATORS STARTED IN SRVCLASS (RQJNSIST)

No initiators are associated with the service class. To determine the resource group associated with a service class or the WLM initiator information, use the MVS "LIST ALL" command; *I,G,ALL,G,group gives the status of the group on all the systems.

ALL INITIATORS IN SRVCLASS IN USE (RQJASIUS)

All the initiators associated with a service class are in use by jobs in execution. To determine the job group's status, use the same steps as when no initiators started in SRVCLASS.

System action: JES3 processing continues.

Operator response: The action to be taken depends on the reason why the job is waiting.

IAT8686

Explanation:

> JOB— jobname (jobid)   ESTIMATES   xxx— LINES,   xxx— PAGES,   xxx— BYTES,       

> xxx— CARDS

This message is issued in response to an *INQUIRY,J=jobname or jobno, E command. The message includes estimates of the number of lines, pages, or bytes to be printed and the number of cards to be punched for the specified job. If the job has completed processing, the display contains the actual counts. The actual counts for the job will not contain the counts for the JESYSMSG, JESMSGLG, and JESJCL system data sets. The actual byte count will specify the spool space used by the job. Because of the manner in which the statistics are saved in the JES3 job queue, up to 7 lines or cards may not have been counted.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Routing Code: Note 18  Descriptor Code: 5,7

IAT8689
Explanation:

More than one job was found based on the selection criteria specified on the *MODIFY,J=jobname command. JES3 will only process the request if the specified criteria applies to a single job.

System action: JES3 rejects the command.
Operator response: To see all the jobs that match the selection criteria, issue an *INQUIRY J=jobname command specifying the same set of parameters that were used on the *MODIFY,J command. To change one job, use that job number on the *MODIFY,J=jobnum command.
To modify more than one job with the same name, or to modify all jobs whose name begins with the same character string, specify additional parameters on the *MODIFY,J=jobname command to define the selection.

If the additional parameters do not make the name unique, use the N=ALL parameter on the *MODIFY,J command. Use caution when using N=ALL, especially when canceling jobs. For more information on how to use the parameters, see /z/OS JES3 Commands.

Chapter 24. Inquiry Messages  1007
IAT8692 • IAT8693

Routing Code: Note 18
Descriptor Code: 5,7

IAT8692

Explanation:

An *LM command was issued to display JES3 routing information for all MVS messages that are assigned to a specific MCS routing code. The following list defines the information specified in the message.

RC — the routing code

CONS= the name of the console where the messages will be displayed. If (NONE) appears, a specific console is not defined to receive messages with the specified routing code.

constatus
The status of the console assigned to receive messages with the specified routing code.

• (ACTIVE) - the indicated console is active in the sysplex
• (INACTIVE) - the indicated console is defined in the sysplex but is not currently active
• (UNDEFINED) - the indicated console is not defined in the sysplex
• (ERROR) - an error occurred determining the status of the indicated console

CLASS=
the JES3 destination class that is used to route the message. The MVS routing code equivalent of the destination class is also displayed.

Destination class ALL and destination class MLG do not map to a specific MVS routing code. For these classes, BROADCAST (for dest class ALL) or HARDCOPY (for dest class MLG) is displayed. If (NONE) appears, a specific destination class has not been defined for messages with the specified routing code. If ? appears, an error occurred while determining the destination class.

J This option indicates that the routing code equivalent of the JES3 destination class is used for the message in place of the message’s original routing code(s). The absence of ‘J’ indicates the routing code equivalent of the JES3 destination class is merged with the message’s original routing codes.

System Action: JES3 processing continues.
Operator Response: None. This is an informational message.

parm IS AN INVALID MAIN PROCESSOR
MCS ROUTE CODE
MAIN-NOT IPL'D
MAIN-OFFLINE

This message is issued in response to an *INQUIRY,M command. It indicates an erroneous parameter and the reason for the error.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

IAT8696

Explanation:

nn JOB(S) IN holdtype

JES3 issues this message in response to an *INQUIRY,Q,H,holdtype or *INQUIRY,Q,H command. This is the summary report for the number of jobs in the requested holdtype. holdtype is one of the following:

OPERATOR HOLD
Indicates that the job(s) are in operator hold.

DJC OP HOLD
Indicates that the job(s) are in dependent job control (DJC) operator hold.

DJC NET HOLD
Indicates that the job(s) are in dependent job control (DJC) hold.

ERROR HOLD
Indicates that the job(s) are in error hold.

SPOOL HOLD
Indicates that the job(s) are in spool hold.

PRIORITY HOLD FOR PRIORITY nn
nn can be 1 to 15. Indicates that the job(s) are in priority hold for the specified priority.

ARM HOLD
Indicates that the job(s) are awaiting possible restart by automatic restart management.

System action: JES3 continues processing.

>>> INQUIRY ON JOB STATUS COMPLETE, — nnnnnn — JOBS DISPLAYED

This message indicates the job "INQUIRY" command is complete. The message indicates the number of jobs (nnnnnn) that are displayed.

System action: JES3 continues processing.

Operator response: None. This is an informational message.

1010  z/OS V2R1.0 JES3 Messages
### IAT8700

**Explanation:**

> INVALID INFORMATION AFTER PARAMETER— param — COMMAND IGNORED

This message is issued in response to an *INQUIRY,F command indicating that extra parameters have been specified in a command or when a positional parameter is not in its correct opinion.

**System action:** JES3 ignores the command.

**Operator response:** Correct and resubmit the command.

### IAT8701

**Explanation:**

> FSSNAME  TYP  SYSTEM  PROCNAME  JOBID — STAT  T  S  MD  RC  DSP/DEV  MAXASST

This message is issued in response to an *INQUIRY,F command. It provides the column headings for message IAT8702. Entries appear under each head are:

- **FSSNAME**  
  Functional subsystem (FSS) name.

- **TYP**  
  Type of FSS function (WTR or C/I).

- **SYSTEM**  
  Main where the FSS is currently active or where it is assigned to run in conjunction with the current global.

- **PROCNAME**  
  Name of the procedure library member.

- **JOBID**  
  Job number of the job that is executing as the FSS address space.

- **STAT**  
  Current status of the FSS.

- **T**  
  Specifies whether the FSS ends.

- **S**  
  Specifies whether this CI FSS is to be started automatically.

- **MD**  
  Message Destination class.

- **RC**  
  MVS routing code.

- **DSP/DEV**  
  Number of C/I subtasks to be started in the CI FSS address space or the name of a device assigned to an output writer FSS.
IAT8702

MAXASST
Maximum number of JCL statements.

System action: JES3 formats and issues message IAT8702.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>

</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 5,7

---

This message is issued in response to an *INQUIRY,F command. One IAT8702 message is written for each FSS to be displayed; in addition, one message is written for each FSA assigned to an output writer FSS. The values that may be displayed are as follows:

- **fssname**
  The functional subsystem (FSS) name. This field is blank for an output writer FSA.

- **type**
  The type of function (WTR or C/I) being supported by this FSS. This field is blank for an output writer FSA.

- **system**
  The main where this FSS is currently active or where it is assigned to run in conjunction with the current global. This field is blank for an output writer FSA.

- **procname**
  The name of the procedure library member to be used to start the FSS address space. This field is blank for an output writer FSA.

- **jobid**
  The job number of the job that is executing as the FSS address space. This field is blank for an output writer FSA.

- **status**
  The current status of the FSS is one of the following:
  
  **UNUS**
  The FSS is unusable.

  **INAC**
  The FSS is inactive.

  **FAIL**
  The FSS START command or the FSS address space has failed.

  **RSTR**
  Processing for this FSS in the JES3 global has not yet resumed following a hot start.

  **STRT**
  The MVS START command for the FSS address space has been sent.
FSSC
The FSS has connected.

PLIC
For a C/I FSS only, the FSS has connected, and procedure library initialization is complete.

ACTV
For a C/I FSS or an FSA. For a C/I FSS, subtask initialization is complete and the FSS address space is fully active. For an FSA, the device shown for the FSA is active.

STOP
For an FSA only. The STOP DEVICE order has been sent.

DSTP
For an FSA only. The FSA device has been stopped.

FSAD
For an FSA only. The FSA has been disconnected.

term
Specifies whether the FSS ends when the JES3 global address space ends by a *RETURN command. The possible value is Y or N. This field is blank for an output writer FSA.

start
Specifies whether this CI FSS is to be started automatically when the main where it is assigned to run connects to the JES3 global; the possible values are Y or N. This field is blank for both an output writer FSS and an output writer FSA.

dest-class rc
Specifies the routing information for messages concerning this FSS. This routing information is displayed in JES3 destination class format and MVS routing code format. If current routing information does not correspond to a JES3 destination class, for example, 1,2,4,5,6, and 11 through 40 then “n/a” is displayed for the JES3 destination class. This field is blank for both a C/I FSS and an output writer FSA.

dspcount
The number of C/I subtasks to be started in this CI FSS address space. Two numbers are given. The first one indicates the maximum number of batch jobs that may be processed concurrently. The second one indicates the maximum number of TSO logons and started tasks (demand select jobs) that may be processed concurrently. This field is normally blank for an output writer FSS and contains the device name for an output writer FSA.

devname
The name of a device assigned to an output writer FSS. If there are multiple devices, subsequent IAT8702 messages are written; one for each such device, with all other fields blank.

maxasst
The maximum number of JCL statements that can be processed concurrently by all CI DSPs in the C/I FSS Address Space. This field is blank for both an output writer FSS and an output writer FSA.

System action:  Processing continues.
Operator response:  None. This is an informational message.

**Routing Code:** Note 18 **Descriptor Code:** 5,7

---

**IAT8705**

**Explanation:**

This message is issued in response to an *INQUIRY,F...S command. For each FSS displayed, one line of output is displayed for each main in the complex, starting with the current global.

**fssname**

The name of the functional subsystem (FSS). This field is blank on all lines after the first line for a single FSS.

**sysnamei**

The name of a main that is a potential global.

**sysnamej**

The name of the main on which FSS fssname runs if sysnamei is the global. If the FSS cannot run on any main when sysnamei is the global, the word NONE appears in the message.

**msysnamej**

The name of the main on which FSS fssname will run if sysnamei is the global after a pending *MODIFY command has been processed. If there is no such modify pending, the word NONE appears in the message.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**
IAT8706  •  IAT8707

IAT8706

Explanation:

FSS—fssname—NOT FOUND

This message is issued in response to an *INQUIRY,F command indicating that an incorrect functional subsystem
(FSS) name has been specified.

System action: JES3 ignores the command.

Operator response: Correct and resubmit the *INQUIRY command.

Module:

IAT8707

NETSERV INQUIRY RESPONSE

INFORMATION FOR NETSERV:

INFORMATION FOR NETSERV—nname—SYSTEM=sysname—HOST=host—PORT=port—STACK=stack

JTRACE=YES—ITRACE=NO—VTRACE=YES—TLS=YES—NETSERV JOBID=njobid

DSP JOBID=djobid—ACTIVE=YES—SOCKETS DEFINED IN THIS NETSERV=NONE

socket information:

SOCKET ACTIVE NODE SERVER—sname_n—YES—nname_n=NO

This message is issued in response to an *I,NETSERV= command to display information about a given Netserv
definition, or all Netserv definitions.

In the message text:

system

The system on which the Netserv runs, or blank if none is defined.
**IAT8708**

*host*
   The name of the IP host that the Netserv uses to listen to TCP/IP, or blank if none is defined.

*port*
   The name of the IP port for the Netserv, or blank if none is defined.

*stack*
   The TCP/IP stack name containing the TCP/IP definition for the host, or blank if the default stack is used.

*njobid*
   The job ID of the Netserv address space, or blank if it is not active.

*djobid*
   The job ID of the TCP DSP, or blank if it is not active.

*sname_n*
   A socket name within a list of socket lines, each representing a socket that is defined for the given Netserv, and an active status.

*nname_n*
   The node name with which the home node uses the socket named sname_n to communicate.

**System action:**  Processing continues.

**Operator response:**  None.

**Module:**  None.

---

**Explanation:**

```
NETSERV—netserv— NOT FOUND
```

This message is issued in response to an *I,NETSERV= command. The specified Netserv cannot be displayed because it does not exist.

In the message text:

*net*serv
   The name of the requested Netserv. If this name is blank, an *I,NETSERV=ALL command was issued and there are no Netservs.

**System action:**  Processing continues.

**Operator response:**  Correct and reissue the command.

**System programmer response:**  None.

This message is issued in response to an *SOCKET= command to display information about a given socket
definition, or all socket definitions.
In the message text:

nsvname
The name of the Netserv on which this socket is defined, or blank if none is defined.

host
The name of the IP host that the socket uses to communicate with TCP/IP, or blank if none is defined.

port
The name of the IP port for the socket or zero. Zero is displayed in one of the following cases:
- Inactive port that was not specifically defined.
- Inactive port that was defined as zero, PORT=0.

In all other cases, port displays the actual port defined or assigned to it.

node
The node that uses this socket, or blank if none is defined.

IAT8710
Explanation:

**SOCKET—socket— NOT FOUND**

This message is issued in response to an *SOCKET= command. The specified socket could not be displayed because
it does not exist.
In the message text:
socket
   The name of the requested socket. If this name is blank, an *I,SOCKET=ALL command was issued and there are no sockets.

System action: Processing continues.
Operator response: Correct and reissue the command.
System programmer response: None.

Module:

Routing Code: Hardcopy log
Descriptor Code: 5

This message is issued in response to an *INJE,NAME=nname command to display information about a node that uses TCP/IP protocols. If the requested node has BSC or SNA protocol, this message is not issued; message IAT8659 is displayed instead.

In the message text:
nname
   The name of the node.
jobtrans
   The number of job transmitters for this node.
jobrecv
   The number of job receivers for this node.
outtrans
   The number of output transmitters for this node.
outrecv
   The number of output receivers for this node.
**IAT8720**

**Explanation:**

```
>>> CURRENT NUMBER OF RESERVED CELLS— IN USE—.nnnnnnnnnnn
```

This message is the response to an *INQUIRY,C,C command or *INQUIRY,C,C,R command where *nnnn indicates the number of primary extent reserved cells in use. The type of cells is identified by header messages IAT8514. This message precedes message IAT8721.

**System action:** JES3 processing continues.

**Operator response:** None, unless the value of *nnnn is other than zero. A non-zero *nnnn value indicates an abnormal condition and action to relieve the cell shortage should be taken.

**IAT8721**

**Explanation:**

```
>>> MAXIMUM NUMBER OF RESERVED CELLS— USED—.nnnnnnnnnnn
```

This message is issued in response to an *INQUIRY,C,C command or *INQUIRY,C,C,R command where *nnnn indicates the maximum number of primary extent reserved cells ever used. The type of cells is identified by header messages IAT8514. This value is reset in response to the *INQUIRY,C,C,R command.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

**Module:**
IAT8722 • IAT8724

Routing Code: Note 18  Descriptor Code: 5,7

Explanation:

PRIMARY EXTENT SIZE — nnnn

This message is issued in response to an *INQUIRY,C command. nnnn represents the number of buffers in the primary extent of the JSAM Buffer Pool.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT8723

Explanation:

SECONDARY EXTENT SIZE — nnnn

This message is issued in response to an *INQUIRY,C command. nnnn represents the number of buffers in a secondary extent of the JSAM Buffer Pool.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT8724

Explanation:

SECONDARY EXTENTS ALLOWED — nnnn

This message is issued in response to an *INQUIRY,C command. nnnn represents the maximum number of secondary extents of the JSAM Buffer Pool that is allowed.

System action: JES3 processing continues.

Operator response: None. This is an informational message.
IAT8725

Explanation:

TOTAL NUMBER OF JSAM BUFFERS—nnnn

This message is issued in response to an *INQUIRY,C command. nnnn represents the total number of buffers in the primary extent and all secondary extents currently in use.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

IAT8742

Explanation:

KEYWORD INTERVAL LIMIT MAY NOT BE SPECIFIED WITH WANTDUMP SET TO ASK COMMAND IGNORED

This message is issued in response to the *MODIFY WANTDUMP operator command. Either the current setting for WANTDUMP was what the message indicates, ASK or NO, or the command tried to change it to that value.

System action: None. The command is ignored.

Operator response: Reissue the command with the correct keyword combination.

IAT8750

Explanation:

JOB jobname (jobid) DD= ddn gg,g gg TRKGPS

An *INQUIRY,J=jobno or jobname,SD or SH,U command was issued to display the names of the spool data sets that contain data for the indicated job, and to display the number of logical track groups allocated to the job from the spool data sets.
**IAT8751 • IAT8752**

**jobname**  The job name.

**jobid**    The job identifier.

**ddn**    The DD name of the spool data set which contains data for the job.

**gg,ggg**    The number of logical track groups allocated to the job from spool data set **ddn**. This value will be displayed as "***,***" if the number exceeds 99,999.

**System action:** JES3 processing continues.

Containing Detecting Issuing
IATIQGM IATIQGM IATIQGM

Routing Code: Note 18 Descriptor Code: 5,7

IAT8932
Explanation:

Under the current select mode for the main, the current status of group grp is STATUS=, whether the group is online or offline to this main. For JES-managed groups, all values are displayed except the part indicated as "NOT SUPPORTED". For WLM-managed groups, only STATUS=, MODE=, main, and "NOT SUPPORTED" are displayed.

Other terms in the message are:

DI= the dedicated initiator count for this group for this main (JES-managed groups only)
AI= the allocated initiator count (JES-managed groups only)
UI= the number of initiators in use (JES-managed groups only)
ALLOC= the group execution resource allocation option (JES-managed groups only)
UNAL= the group execution resource unallocation option (JES-managed groups only)
BAR= the current group scheduling barrier (JES-managed groups only)
JSPAN= the number of jobs in this group to be examined in selecting a job to be scheduled (JES-managed groups only)
IAT8934

MODE=
  whether the group is JES3 managed (JES) or WLM managed (WLM)

STATUS=
  the status of the WLM-managed group

main
  the main processor

NOT SUPPORTED
  text displayed if the group is WLM managed (MODE=WLM) and the system does not support WLM batch
  initiator management (WLM-managed groups only)

System action:  JES3 processing continues.
Operator response:  None. This is an informational message.

Routing Code: Note 18  Descriptor Code: 5,7

IAT8934

Explanation:

An *INQUIRY,J=jobno or jobname,SP command was issued to display the name of the spool partition assigned to a
job.

jobid
  job identifier

jobname
  job name

SP=spart
  indicates that spool partition spart has been assigned to the job. If CL=class is not present, the spool partition
  was specified on the /*MAIN statement for the job. If CL=class is present, the job requested job class class and
  spool partition spart has been assigned to that job class.

SP=UNASSIGNED
  indicates that no spool partition has been assigned to the job; the JCL for the job did not specify a specific spool
  partition and there was no spool partition assigned to the job class that was specified by the job.

Under the current select mode for the specified main, the status for class cls is:

STATUS=
  whether this class is online, offline, or N/E (not eligible) for this main

GRP=
  the group to which this class belongs

System action:  JES3 processing continues.
Operator response:  None. This is an informational message.

IAT8952
Explanation:

| PROCLIB IATPLB— nn— IS: HELD FOR UPDATE AND DISABLED |
| UNALLOCATED AND DISABLED  |
| DISABLED  |
| ENABLED  |

This message is issued in response to an *INQUIRY,PROCLIB,ID=nn command. The proclib DDNAME (IATPLBnn) is in one or more of the following states:

**HELD FOR UPDATE AND DISABLED**
The proclib is being held for a job which will update the proclib. Jobs which use the proclib will not be scheduled for C/I processing until after the proclib update is complete.

**UNALLOCATED AND DISABLED**
The proclib has been unallocated in the JES3 and all CI FSS address spaces to allow execution of a proclib update job.

**DISABLED**
The proclib has been disabled because of an error. This may occur during initialization, or during enable processing. A disabled proclib may also be HELD FOR UPDATE or UNALLOCATED.

**ENABLED**
The proclib is not being updated or held by any job.

Message IAT8952 is also issued to display the status of each of the data sets in the proclib concatenation.

**System action:** JES3 processing continues.

**Operator response:** None. This is an informational message.

This is a secondary message in response to a TSO/E status command. This message is only issued if IATUX30 is used for authority checking.

**IN** *dspname*

The job is currently associated with the names Dynamic Support Program.

**ACTIVE IN AN FSS CI**

The job is currently undergoing C/I processing in a JES3 FSS C/I address space.

**AWAITING POSTSCAN (BATCH)**

The batch job is waiting for JES3 C/I processing in the JES3 global address space.

**AWAITING POSTSCAN (DEMSEL)**

The demand select job is waiting for JES3 C/I processing in the JES3 global address space.

**AWAITING VOLUME FETCH**

The job is waiting volume fetch processing.

**AWAITING START SETUP**

The job is waiting for the system operator to issue a *START SETUP JES3 command.

**AWAITING RESOURCE ALLOCATION**

The job is currently waiting for resources to be allocated.

**AWAITING UNAVAILABLE VOL(S)**

The job is currently waiting for one or more unavailable volumes.

**VERIFY - nnn VOL MOUNTS PENDING**

The job is currently undergoing verify processing with *nnn* mounts pending.
IAT8968

AWAITING OPERATOR ACTION
The job is currently waiting action to be taken on its behalf by the system operator (Main Device Scheduler error queue).

AWAITING SELECTION ON MAIN
The job is awaiting selection for MVS processing on a JES3 MAIN processor.

AWAITING BREAKDOWN
The job has finished processing and is waiting for deallocation of resources.

AWAITING MDS RESTART PROC
The job is waiting for restart processing through JES3 Main Device Scheduler functions.

MAIN AND MDS PROC. COMPLETE
The job has completed MVS processing on a JES3 MAIN processor and all resources have been deallocated.

AWAITING OUTPUT SERVICE
The job is waiting for output service processing.

AWAITING OUTPUT SERVICE WRITER
The job is waiting for the availability of a JES3 output service writer.

AWAITING RESERVED SERVICE
The job is unable to be scheduled for output service processing.

OUTPUT SERVICE COMPLETE
The job has completed output service and will be transitioning to the next JES3 scheduler element, most likely PURGE.

MAIN SERVICE IS FOR DEMAND SELECT
The job is a demand select job that is waiting to be selected for processing on a JES3 MAIN processor.

stepname ON sysname TIME(MM:SS)
The job is currently processing on a JES3 MAIN processor and is in step sysname. The amount of processing time completed is MM:SS.

RESALLOC ww DASD xx TAPE yy OTHER
The job is currently waiting for ww DASD to be allocated, xx tapes to be allocated, and/or yy other devices (for example: unit record devices) to be allocated.

DJC NET netid -- OPERATOR HOLD
The job is in a Dependent Job Control (DJC) NET netid. The job has been held by a system operator.

DJC NET netid -- DJC HOLD
The job is in a DJC NET netid. The job is in DJC network hold status.

WAITING FOR THE NEXT JOB PHASE
The job is waiting for processing by JES3 for its next processing phase.

UNKNOWN RESQUEUE INDEX
The job has an unknown status state (error condition).

ENDING FUNCTION I/O WAIT
The function is in JES3 ending function processing and is waiting for I/O operations to complete.

ENDING FUNCTION IN ERROR
The job is in JES3 ending function and is in error (error condition).

SYSTEM SELECT PROCESSING
The job is on the system select queue (waiting for SMS-managed resources or is active in system select processing).

SYSTEM VERIFY PROCESSING
The job is waiting for system verify processing.

AWAITING ARM RESTART
The job is waiting for automatic restart management to restart it. This message appears after the job ends and before automatic restart management tells JES3 whether or not to restart it.

***WARNING*** ADDITIONAL JOB INFORMATION NOT AVAILABLE
Additional information about the job is not available.
Note: JES3 will send an OK return code to TSO with the STATUS of all the JES3 jobs that it was able to provide before the maximum staging area size was exceeded.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Chapter 25. JES3 Networking Messages

IAT9101
Explanation:

-The *CALL,NJE command was issued but there were no parameters specified. The NAME= parameter is required.

System action: JES3 does not initialize networking.

Operator response: Reissue the *CALL,NJE command with at least the NAME= parameter specified.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTDR</td>
<td>IATNTDR</td>
<td>IATNTDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT9102
Explanation:

-The *CALL,NJE command contained a NAME= or LINE= parameter that exceeded eight characters.

System action: JES3 does not initialize networking.

Operator response: Reissue the *CALL,NJE command with the correct parameters.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTDR</td>
<td>IATNTDR</td>
<td>IATNTDT</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT9103
Explanation:

-JES3 determined an incorrect node name was specified on a networking command. The node name was incorrect because of one of the following reasons:

- the NAME= parameter on the *CALL NJE command contained a node name that has not been defined to JES3 using a NJERMT initialization statement.
- the node name specified on the command is the home node.
- the node name specified on the command specified a remote node that uses SNA or TCP/IP protocols to receive network jobs.

System action: JES3 does not initialize networking.
Operator response: Reissue the *CALL,NJE command with a valid node name specified.

Module:

Containing  Detecting  Issuing
IATNTDR      IATNTDR   IATNTDT
IATNTRS

Routing Code: Note 18
Descriptor Code: 7

IAT9104
Explanation:

>>> PATH FOR NODE— nodename— IS INVALID

The node name specified on the *CALL,NJE command is not directly connected to the node from which the command was entered.

System action: JES3 does not initialize networking.

Operator response: The *CALL,NJE command cannot be used to initialize the networking capability between two indirectly-connected nodes. Issue the *CALL,NJE command for directly-connected nodes. If a line exists between these two nodes, but the direct path has not been defined, use the *MODIFY,NJE,N=nodename... command to define the path.

Module:

Containing  Detecting  Issuing
IATNTDR      IATNTDR   IATNTDT

Routing Code: Note 18
Descriptor Code: 7

IAT9105
Explanation:

>>> LINE— lname— IS NOT AVAILABLE

The line specified (or defaulted to) on the *CALL,NJE command could not be allocated. Either an error occurred while trying to allocate the line or the LINE= parameter was not specified on the *CALL,NJE command nor the LINE= parameter on the NJERMT initialization statement.

System action: JES3 does not initialize networking.

Operator response: If you did not specify the LINE= parameter, reissue the *CALL command and specify a line. If you specified the LINE= parameter, reissue the command. If the message persists, contact your system programmer.

Module:

Containing  Detecting  Issuing
IATNTDR      IATNTDR   IATNTDT

Routing Code: Note 18
Descriptor Code: 7
IAT9106

Explanation:

MISSING INTERRUPT ON lname

An I/O interrupt has not been received during the last 5 minutes. If the line is CTC connected, the system at the other node is probably down. If the line is BSC connected, there may be a hardware problem.

System action: Processing continues.

Operator response: When this message is received for a BSC connection, cancel the line immediately using the *CANCEL,lname,I command.

Module:

Containing    Detecting    Issuing

</tbody>
</table>

Routing Code: Note 17
Descriptor Code: 7

IAT9122

Explanation:

As the home node received a network job or SYSOUT stream using BSC protocols, an error was found. For example:

- Incorrect record length was found
- Incorrect record identifier (RID) was found

System action: JES3 cancels the job stream for reason codes:

- 004 - 400
- 504 - 600

Operator response: Notify the system programmer.

Programmer response: Analyze the reason code to determine the reason for the error.

1046 z/OS V2R1.0 JES3 Messages
While processing a job stream, a job header was expected. A record other than the job header was received before receiving a job header record.

While processing the job stream, a job header segment was expected. A record other than a job header segment was received before receiving the entire job header.

While processing a job stream from a BSC node, a record was received after the job trailer that was not valid. The only valid record after the job trailer is an end of file (EOF).

A subsequent job header record was received after a data record had been received.

A record was removed from the transmission buffer. The length of the record is zero.

A job header segment was received for a job stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

A record was received that contained a zero length job header segment.

The job stream contains a zero length job trailer record.

A job trailer segment was received for a job stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

The first segment of a job trailer has been received. An additional record was found in a job trailer buffer while processing a job stream from a BSC node. The additional record was not a job header, job trailer, or an end of file record.

The first segments of the job header and the job trailer have not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was not a job header or a job trailer record.

The first segment of the job trailer has not been received. An additional record was found in a job header or job trailer buffer while processing a job stream. The additional record was not a job header, job trailer, or a data record. The first segment of the job header has been received.

While processing a SYSOUT stream, a job header was expected. A record other than the job header was received before receiving a job header record.

While processing a SYSOUT stream, a job header segment was expected. A record other than a job header segment was received before receiving the entire job header.

While processing a SYSOUT stream from a BSC node, a record was received after the job trailer that was not valid. The only valid record after a job trailer is an end of file (EOF).

While processing a SYSOUT stream, a data record was received before receiving a data set header.

While processing a SYSOUT stream, a data record’s carriage control type was not recognized from the subrecord control byte (SRCB).

While processing a SYSOUT stream, a data record’s spanned record indication was not recognized from the subrecord control byte (SRCB).

While processing a SYSOUT stream, a data record’s spanned record indication was not recognized from the subrecord control byte (SRCB).

While processing a SYSOUT stream, a data record’s length exceeded the maximum allowed for a spool data management spanned record.

While processing a SYSOUT stream, a network spanned data record’s length exceeded the maximum logical record length defined for this data set. The maximum logical record length is indicated in the field NDHGLREC of the associated data set header.

While processing a SYSOUT stream data record, a “first” segment of a network spanned data record was received when an outstanding “first” segment had already been received.

While reconstructing a SYSOUT stream network spanned data record, a segment was detected when no outstanding “first” segment was received.

While processing a SYSOUT stream network spanned data record, a problem was detected with a work area.

While processing a SYSOUT stream non-spanned data record, a “first” segment of a spanned data record was detected.
While processing a SYSOUT stream, a job header record was detected after receiving data or data set header records.

While processing a SYSOUT stream job header record, a zero length record was detected.

A job header segment was received for a SYSOUT stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

While reconstructing a SYSOUT stream job header, a segment with a zero length was detected.

While processing a job trailer buffer, a zero length job trailer record was detected.

A job trailer segment was received for a SYSOUT stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

While processing a data set header buffer, a zero length data set header record was detected.

While reconstructing a SYSOUT stream data set header, a zero length segment was detected.

A data set header segment was received for a SYSOUT stream. While rebuilding the data set header, the length of the data set header exceeded the maximum size allowed.

The first segment of the job header has not been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record.

The first segment of the job header has been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record. A data set header was currently being constructed.

An incorrect specification of the job header password encryption bits was detected.

The length of a job header section is not positive.

The total length of all of the job header sections is not equal to the length of the entire job header minus the job header prefix.

The length of a data set header section is not positive.

The total length of all of the data set header sections is not equal to the length of the entire data set header minus the data set header prefix.

A stream was either rejected by the security product or an error occurred during the processing of the security request.

An error was detected while decompressing a BSC record from the transmission buffer.

An error was detected while validating the next record within the transmission buffer. The next record was beyond the end of the transmission buffer.

While processing a SYSOUT stream record, a “first” segment of a sdm spanned record was received when an outstanding “first” segment of a sdm spanned record has already been received.

While processing a SYSOUT stream record, a “first” segment of a sdm spanned record was received when an outstanding “first” segment of a spanned record has already been received.

While processing a SYSOUT stream record, an “nth” segment of a sdm spanned record was received when no “first” segment was received.

While processing a SYSOUT stream record, a last segment of a sdm spanned record was received when no “first” and/or “nth” segment was received.

While processing a SYSOUT spanned record, a “first” segment of a spanned record was detected when an outstanding “first” segment of a sdm spanned record has been received.

While processing a SYSOUT non-spanned record, an outstanding “first” segment of a sdm spanned record was detected.

A job trailer has been received and the prior SYSOUT stream contained a sdm spanned record and the last segment of the sdm spanned record has not been received.

A job trailer has been received and the prior SYSOUT stream contained a spanned record and the last segment of the spanned record has not been received.
A data set header has been received and the prior SYSOUT stream contained a spanned record and the
last segment of the spanned record has not been received.

A data set header has been received and the prior SYSOUT stream contained a spanned record and the last
segment of the spanned record has not been received.

While processing a SYSOUT stream record, the length of the record exceeded the logical record length.

While processing a SYSOUT stream, the segments of a spanned record exceeded the spanned record length
that was contained in the first segment.

Unknown error (the reason code returned by the common receiver was not recognized).

IAT9125
Explanation:

An error occurred while JES3 was trying to add a job to the job queue.

System action: JES3 ends the line.

Operator response: Notify the system programmer.

Programmer response: Take a dump of JES3 and analyze it to determine the reason for the error.

Module:

Routing Code: Note 17
Descriptor Code: 7

IAT9126
Explanation:

Each job in JES3 is assigned a JES3 job number. This message is issued when there are not any available JES3 job numbers.

System action: JES3 ends the line.

Operator response: Contact your system programmer.

Programmer response: You may want to ease the current situation by canceling some jobs; or you may be able to find a bottleneck (output service, for example) in your installation.

To prevent this situation from recurring in the future, check the JOBNO parameter on the OPTIONS initialization statement. Allocate enough direct-access space to accommodate your installation's working data set for JCT records. (See z/OS JES3 Initialization and Tuning Reference for more information on the OPTIONS statement.)

Module:

Routing Code: Note 17
Descriptor Code: 7

IAT9127
Explanation:

The system has added a job to the job queue. This job can be a job stream or a SYSOUT stream from another node.

System action: The system continues processing.

Operator response: None. This is an informational message.

Descriptor Code: 7

IAT9143

Explanation:

 ERROR RETURN FROM CALL TO MACRO—IATXOSPC

A network stream was received using SNA protocols by the NJE Reader DSP. The NJE Reader DSP added the job to the job queue so that JES3 will process the network stream. The NJE Reader DSP created data sets for the:

- job header
- data set header
- data
- job trailer

but could not delete the data set containing the network stream because of an error from the IATXOSPC TYPE=PUT macro.

System action: JES3 successfully processed the network stream. The NJERDR DSP ends and JES3 processing continues.

Operator response: JES3 processing continues. Issue a *IJ=NJERDR to determine the number of NJERDR DSPs that are active. If a NJERDR DSP is active, JES3 will continue to transmit network streams. If there are not any active...
**System programmer response:** To indicate the data set can be deleted, the NJERDR DSP issues an IATXOSPC TYPE=PUT request to update the output service element (OSE) that represents the network stream. Use a slip trap for module IATNTNR and IATOSPC to isolate the errors. Because the data set containing the network stream has not been deleted, JES3 may process the network stream again.

**Module:**

<table>
<thead>

**Routing Code:** Note 17

**Descriptor Code:** 7

---

**IAT9144**

**Explanation:**

▌▌▌ USER - userid - JOB - jobname▌▌▌

While MVS/BDT was receiving a network stream, an error occurred that caused MVS/BDT to end processing. Due to the error, the partial stream was sent to JES3 for processing. JES3 flushes the partial network stream.

**System action:** JES3 processing and networking continues.

**Operator response:** None. This is an informational message.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATYNDN</td>
<td>IATNTNR</td>
<td>IATNTNR</td>
</tr>
</tbody>
</table>

**Routing Code:** Note 17

**Descriptor Code:** 7

---

**IAT9145**

**Explanation:**

▌▌▌ RC - rc▌▌▌

As the home node received a network job or SYSOUT stream using SNA protocols, an error was found. For example:

- Incorrect record length was found
- Incorrect record identifier (RID) was found

**System action:** The network job stream or network SYSOUT stream is not processed. The NJERDR ends with an abend code of DM530. Network streams cannot be received at this node until a *CALL NJERDR is reissued. JES3 processing continues.

**Operator response:** Request a dump. Notify the system programmer. Reissue a *CALL NJERDR command to initialize another NJERDR DSP. Another NJERDR DSP enables your node to receive a network stream that require SNA networking protocols. Other JES3 processing continues.

**System programmer response:** Analyze the dump provided by the operator. For additional information on DM530,
see [z/OS JES3 Diagnosis](#) and use the appropriate return code listed below.

**RC in decimal**

</table>
While processing a SYSOUT stream, a data record’s length exceeded the maximum allowed for a spool data management spanned record.

While processing a SYSOUT stream, a network spanned data record’s length exceeded the maximum logical record length defined for this data set. The maximum logical record length is indicated in the field NDHGLREC of the associated data set header.

While processing a SYSOUT stream data record, a “first” segment of a network spanned data record was received when an outstanding “first” segment had already been received.

While reconstructing a SYSOUT stream network spanned data record, a segment was detected when no outstanding “first” segment was received.

While processing a SYSOUT stream network spanned data record, a problem was detected with a work area.

While processing a SYSOUT stream non-spanned data record, a “first” segment of a spanned data record was detected.

While processing a SYSOUT stream, a job header record was detected after receiving data or data set header records.

While processing a SYSOUT stream job header record, a zero length record was detected.

A job header segment was received for a SYSOUT stream. While rebuilding the job header, the length of the job header exceeded the maximum size allowed.

While reconstructing a SYSOUT stream job header, a segment with a zero length was detected.

While processing a job trailer buffer, a zero length job trailer record was detected.

A job trailer segment was received for a SYSOUT stream. While rebuilding the job trailer, the length of the job trailer exceeded the maximum size allowed.

While processing a data set header buffer, a zero length data set header record was detected.

While reconstructing a SYSOUT stream data set header, a zero length segment was detected.

A data set header segment was received for a SYSOUT stream. While rebuilding the data set header, the length of the data set header exceeded the maximum size allowed.

The first segment of a job trailer has already been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream from a SNA node. The additional record was not a job header, data set header, job trailer, or an end of file record.

The first segment of a job trailer has already been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream from a BSC node. The additional record was not a job header, data set header, job trailer, or an end of file record.

The first segment of the job header has not been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record.

The first segment of the job header has been received. An additional record was found in a job header, data set header, or job trailer buffer while processing a SYSOUT stream. The additional record was not a job header, data set header, or job trailer record. A data set header was currently being constructed.

An incorrect specification of the job header password encryption bits was detected.

The length of a job header section is not positive.

The total length of all of the job header sections is not equal to the length of the entire job header minus the job header prefix.

The length of a data set header section is not positive.

The total length of all of the data set header sections is not equal to the length of the entire data set header minus the data set header prefix.

A stream was either rejected by the security product or an error occurred during the processing of the security request.

An error was detected while decompressing a BSC record from the transmission buffer.
IAT9146

236  An error was detected while validating the next record within the transmission buffer. The next record was beyond the end of the transmission buffer.
404  The end of file record was passed to the common receiver in the last transmission buffer, but the common receiver did not detect the end of file record.
408  The end of file record was not passed to the common receiver in the last transmission buffer, but the common receiver detected an end of file record.
412  While processing a job stream, the common receiver has detected a transmitter abort record within the transmission buffer.
416  While processing a SYSOUT stream, the common receiver has detected a transmitter abort record within the transmission buffer.
420  While processing a stream, the common receiver detected a job header, data set header, or job trailer that exceeded the allowable size.
424  The records within the stream are not in the proper order. Either a job header record was expected and not found, a job trailer record was expected and not found, or an end of file record was expected and not found.
504  A transmitter abort or an end of file record was received for a job stream that is not active.
508  A transmitter abort or an end of file record was received for a SYSOUT stream that is not active.
512  A decompression error occurred while processing a nodal message record (NMR).
999  Unknown error (the reason code returned by the common receiver was not recognized).

IAT9146

Explanation:

Invalid Record Found In Input Stream

While using SNA protocols to receive a network job or SYSOUT stream, an incorrect record was found in the inbound stream. JES3 cannot identify the type of data that was received from the remote node that used SNA protocols to transmit the network stream.

System action: The NJERDR DSP fails with an abend code of DM530. The NJERDR DSP ends and additional work sent by a SNA node cannot be processed until the DSP is called again.

Operator response: Request a dump and notify the system programmer. JES3 processing other than SNA networking continues.

Programmer response: Analyze the dump to determine why the records in the transmitted data set are incorrect. See z/OS JES3 Diagnosis for assistance in determining the error.

Module:

<td>IATNTNR</td>
</tr>
</tbody>
</table>

Routing Code: Note 17

Descriptor Code: 7
IAT9147 • IAT9149

IAT9147
Explanation:

While the NJERDR DSP was attempting to add a network job to the job queue, an error occurred.

**System action:** The NJERDR DSP ends and the network stream is released so that it can be processed when the job can be added. SNA networking ends and other JES3 processing continues.

**Operator response:** Request a dump and notify the system programmer.

**Programmer response:** Analyze the dump to determine why the job could not be added to the job queue. See [z/OS JES3 Customization](#) for a list of the reason codes for the IATXJCT macros.

**Module:**

**Routing Code:** Note 17

**Descriptor Code:** 7

---

IAT9149
Explanation:

A network stream was received using SNA protocols by the NJE Reader DSP. The NJE Reader DSP added the job to the job queue so that JES3 will process the network stream. The NJE Reader DSP created data sets for the:

- job header
- data set header
- data
- job trailer

but could not delete the data set containing the network stream because of an error from the IATXJQE macro.

**System action:** JES3 successfully processed the network stream. The NJERDR DSP ends and JES3 processing continues.

**Operator response:** JES3 processing continues. Issue a *I,J=NJERDR to determine the number of NJERDR DSPs that are active. If a NJERDR DSP is active, JES3 will continue to transmit network streams. If there are not any active NJERDR DSPs, JES3 cannot transmit any network streams using SNA protocols until a *CALL NJERDR command is issued.

**System programmer response:** To indicate the data set can be deleted, the NJERDR DSP issues an IATXOSPC TYPE=PUT request to update the output service element (OSE) that represents the network stream. Use a slip trap for module IATNTNR and IATGRJX to isolate the error. Because the data set containing the network stream has not been deleted, JES3 may process the network stream again.

Routing Code: Note 7, Note 17
Descriptor Code: 7
IAT9202 • IAT9204

IAT9202
Explanation:

The operator specified the TO=* parameter on one of the following statements:

- *CALL,NJEROUT
- *START,NJEROUT
- *RESTART,NJEROUT

The reroute DSF will reroute the jobs specified on the J=, or JG= parameter. nnn specifies the number of jobs that were successfully rerouted.

System action: The network streams are routed to their original destinations and processing continues.

Operator response: None. This is an informational message.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTRD</td>
<td>IATNTRS</td>
<td>IATNTRS</td>
</tr>
</tbody>
</table>

Routing Code: Note 17
Descriptor Code: 7

IAT9203
Explanation:

If a *RESTART NJEROUT command is issued, it runs before a previously issued *CALL, *RESTART, or *START NJEROUT command.

System action: The last *RESTART command that was issued runs.

Operator response: The message is an informational message. It does no require any response.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTRD</td>
<td>IATNTRS</td>
<td>IATNTRS</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT9204
Explanation:

The reroute command specified a job number and groupid that either did not exist or is being currently transmitted by MVS/BDT.

System action: Processing continues.

Operator response: Check the job number and groupid and reissue the reroute command.
IAT9205

Explanation:

►► JOB—( jobid)— IS NOT ELIGIBLE FOR NJEROUT

An attempt was made to reroute a network stream that is formatted to be transmitted over BSC protocols, but the network job was not in specialized reschedule status, or an attempt was made to reroute a job that was not supposed to be transmitted to another node.

System action: The NJEROUT DSP does not reroute the job and processing continues.

Operator response: Verify the job number and the status of the job.

IAT9206

Explanation:

►► UNABLE TO REROUTE JOB— (jobid) —GROUPID (groupid) — RC= rc

The operator issued a reroute command but an error occurred that caused the job not to be routed. The error that occurred is indicated by a return code. If the return code is in the range of 1-3, the affected network stream is using BSC protocols. If the return code is in the range of 4-6 or 15, the affected network stream is using SNA or TCP/IP protocols. The other return codes can be issued when sending a network stream using any protocol. See the list specified below for the possible return codes and their meanings.

RC in decimal

<tr>
<td>7</td>
</tr>
</tbody>
</table>
IAT9207

8 a RESQUEUE could not be found for the network job.
9 an error occurred while trying to access a job’s JCT element.
10 an error occurred while trying to obtain a new job number.
11 an error occurred while trying to add the job to the job queue.
12 An IATXJCT error occurred (BSC).
13 An IATXJCT error occurred (SNA) or TCP/IP. Queue (SNA) or TCP/IP.
14 An error occurred while trying to delete the origin job (SNA) or TCP/IP.
15 the first data set of a network stream did not contain a job header.
16 the authorization failed by SAF.
17 protocol error occurred.
18 a current OSE FDB was not found.
19 the job being processed no longer exists.
20 data set header contained an incorrect length while trying to AOPEN sysout stream data.

System action: JES3 does not reroute the network stream. The network job is left on the job queue in operator hold. JES3 processing continues.

Operator response: Your response is dependant on the return code in the message.

If the return code is a 7, verify the job number that was issued on the reroute command. If the return code is valid, there may be a system error and the system programmer should be contacted. Otherwise, reissue the reroute command with the correct job number. If the return code is a 9 or 10, there may be a system error and the system programmer should be contacted.

For the other return codes, the message was issued because of an error in the job. Issue a *S DC (OPTION=SNP) J=jobno and contact the system programmer.

Programmer response: Determine the error by using the return code supplied in the message and the accompanying snap dump.

---

IAT9207

Explanation:

```plaintext
>>> ERROR DELETING ORIGINAL JOB— (jobid) GROUPID (groupid) RC—rc
```

JES3 successfully rerouted a network stream but an error occurred during cleanup processing for the network job. See the list specified below for the possible return codes and their meanings.

RC in decimal

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
</tr>
<tr>
<td>13</td>
</tr>
<tr>
<td>14</td>
</tr>
</tbody>
</table>
System action: JES3 rerouted the network stream but the network job at your node cannot be deleted from the job queue.

Operator response: The error was issued because of a problem with the network job. Issue a "S DC (OPTION=SNP) jobno for a snap dump of the job's control blocks dump and contact the system programmer. Other, JES3 processing continues.

Programmer response: Determine the error from the return code and the accompanying snap dump.

</table>

Routing Code: Note 17
Descriptor Code: 7

IAT9208

Explanation:

--- NODE NAME (nodename) NOT DEFINED ---

Each node in the network is defined to JES3 by a NJERMT initialization statement. From the NJERMT statements, a networking node table is created that identifies the nodes and the type of networking protocols used to transmit data. The reroute command specified a networking node that was not defined to the home node by a NJERMT statement.

System action: JES3 rejects the command and the NJEROUT DSP continues.

Operator response: Verify the name of the node. If the remote node is defined to your node, the home node, reissue the command with the corrected node name. If the remote node is not defined to the home node, contact the system programmer.

Programmer response: Include a NJERMT initialization statement in the network stream to define the remote node to your node. Restart JES3 using a warm start, cold start or hot start with refresh.

Module:

IAT9210 • IAT9212

Routing Code: Note 18
Descriptor Code: 7

IAT9210

Explanation:

➤➤— DUPLICATE PARAMETER— (text)— SPECIFIED

The reroute command included more than one of these keywords:
• T
• JOB=
• TO=
• ID=

System action: JES3 rejects the command and continues the NJEROUT DSP.
Operator response: Correct the reroute command to include only one of these parameters. Reissue the command.
Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTRD</td>
<td>IATNTRS</td>
<td>IATNTRS</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT9211

Explanation:

➤➤— NO PARAMETER FOR KEYWORD— (text)— SPECIFIED

A keyword on the reroute command did not include a value. The text specifies the keyword that did not have a value assigned to it.

System action: JES3 rejects the command and continues the NJEROUT DSP.
Operator response: Correct the reroute command to include a value for the keyword.
Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATNTRD</td>
<td>IATNTRS</td>
<td>IATNTRS</td>
</tr>
</tbody>
</table>

Routing Code: Note 18
Descriptor Code: 7

IAT9212

Explanation:

➤➤— BAD PARAMETER— (text)— SPECIFIED

A keyword other than:
• J=
• JG=
• JOB=

1074 z/OS V2R1.0 JES3 Messages
was specified on the reroute command. The text specifies the incorrect keyword.

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Correct the keyword on the reroute command and reissue the command.

**Explanation:**

The reroute command is missing a required keyword.

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Correct the reroute command to include the TO= keyword and the J= keyword if rerouting a network job using BSC protocols or the JG= keyword if rerouting a network job using SNA protocols.

**Explanation:**

The J= and JG= keyword cannot be specified together on the reroute command. Use the J= parameter, if rerouting a network job using BSC protocols. Use the JG= parameter, if rerouting a network job using SNA protocols.

**System action:** JES3 rejects the command and continues the NJEROUT DSP.

**Operator response:** Determine the type of networking protocol that the networking stream is currently formatted for. To determine the format of the network stream, use the *I,U,Q=BDT, J=jobno or the *I,A,D=NJESND command. Message IAT8522 or IAT8524 is issued in response to the *I,A,D=NJESND command. Either message displays all the network jobs that will be transmitted using BSC protocols. If the job number for the network job is displayed by one of these messages, the network stream will be transmitted by using BSC protocols. Message IAT8131 is issued in response to the *I,U,Q=BDT command. If a message is issued in response to the inquiry, the network stream will be transmitted using SNA protocols. Correct and reissue the reroute command.
IAT9215

Explanation:

>>> GROUPID MUST BE SPECIFIED FOR JG=

The JG= keyword on the reroute command included only the job number and not the groupid(s) of the job to be rerouted. For each job number, at least one job group identifier must be specified.

System action: JES3 rejects the command and the NJEROUT DSP will process the next command that was issued.

Operator response: Correct the reroute command to include at least one job group identifier. Reissue the reroute command to transmit the network job to another node.

Module:

IAT9216

Explanation:

>>> TOO MANY JOB NUMBERS--AND GROUPIDS SPECIFIED

The command contained too many job numbers and/or groupids.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Reduce the number of job number(s) or groupid(s) in the command.

Module:

IAT9217

Explanation:

>>> USE THE J= PARAMETER FOR BSC SNA TCP TYPE JOB (jobname | jobid)

An incorrect keyword, J= or JG=, was specified on the reroute command.

System action: The NJEROUT DSP continues and the command is ignored.
Operator response: Correct and reissue the reroute command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>

IAT9220
Explanation:

On an *CALL,NJEROUT or *START,NJEROUT command, the PATH= or FDEST= (final destination) parameter was specified. There were no jobs found matching the specified parameter.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Correct and reissue the reroute command.

Module:

Routing Code: Note 18
Descriptor Code: 2,7

IAT9221
Explanation:

On an *CALL,NJEROUT or *START,NJEROUT command, the J= (job) or JG= (job group) keyword was specified. The Q= (queue) keyword was also specified. This combination of keywords is not allowed.

System action: The command is rejected and JES3 continues the NJEROUT DSP.

Operator response: Correct and reissue the reroute command.

Module:

Routing Code: Note 18
Descriptor Code: 2,7

IAT9222
Explanation:

The NJEROUT DSP could not find more data or an end-of-file marker for the data set while processing the job. This can occur if there was a system failure while a job was writing an output data set or an IPL caused the job to cancel.

System action: The data set is ended and the reroute is completed. Processing continues.

Operator response: None. This is an informational message.

Module:
IAT9225

Explanation:

acional

NJERDR IS ACTIV

This message is issued to inform the operator that the NJERDR DSP is active and is ready to process a job or
SYSOUT network stream from a node that used SNA protocols to transmit the data.

System action: Processing continues.

Operator response: None. This is an informational message.

Module:

Routing Code: Note 17
Descriptor Code: 7

IAT9230

Explanation:

acional

JOB— jobname (jobno)— HAS BEEN PUT IN OPERATOR HOLD

An error occurred while JES3 was attempting to send a network stream to a remote node. While recovering from the
error networking released the resources allocated to the job and placed the job in operator hold.

System action: JES3 places the network job used to transmit the network stream into operator hold. JES3 continues
processing.

Operator response: Notify the system programmer.

System programmer response: Use the DM code and z/OS JES3 Diagnosis to determine the error.

Module:

Routing Code: Note 17
Descriptor Code: 7

IAT9231

Explanation:

acional

THE LAST LOGICAL SENDER FOR NODE— nodename— HAS BEEN VARIED OFFLINE

The NJESND DSP has varied the last sender offline because of an error detected by the BSC NJE line driver (NJE
DSP).

System action: All networking traffic to the specified node stops.

Operator response: Use the *I NJE,N=nodename,SNDR command described in z/OS JES3 Commands to determine the
names of the senders and vary them back online. If the message persists, notify the system programmer.
**Programmer response:** Start the networking logging facility for the line(s) to the specified node and determine why the line driver is requesting the sender to be varied offline.

**Routing Code:** –
**Descriptor Code:** –

---

**IAT9300**

**Explanation:**

```
command — FOR — object — name — FAILED - reasontext
```

A command for the TCP DSP failed.
In the message text:

- **command**: The command that failed. It is one of the following:
  - CALL
  - START
  - RESTART

- **object**: The type of object on which the command was intended to be performed. It is one of the following:
  - NETSERV
  - SOCKET

- **name**: The name of the object on which the command was intended to be performed, or UNKNOWN if the name cannot be determined.

- **reasontext**: The reason that the command failed. It is one of the following:
  - **ERROR RETRIEVING CONSOLE INPUT**
    An internal error occurred when retrieving the input console command.
  - **EXTRANEOUS *CALL,TCP PARAMETERS**
    The only allowable parameter on the *CALL,TCP command is NETSERV=ntsvname. This parameter was found, but extraneous parameters were also found.
  - **INCORRECT *CALL,TCP PARAMETERS**
    The only allowable parameter on the *CALL,TCP command is NETSERV=ntsvname. Some other parameter was found instead.
  - **NETSERV NAME TOO LONG**
    The name on the NETSERV= parameter cannot exceed eight characters.
  - **NETSERV IS NOT DEFINED**
    The name on the NETSERV= parameter is not defined.
  - **NETSERV SYSTEM NAME sysname NOT DEFINED**
    The NETSERV definition does not specify a system name. A system name must be defined before the NETSERV can be started.
  - **NETSERV SYSTEM NAME sysname DOWNLEVEL**
    The NETSERV definition specifies a system name, but the system name is not at the required JES3 release.
  - **NETSERV SYSTEM NAME sysname IS DOWN**
    The NETSERV definition specifies a system name, but the processor is down.
NETSERV ALREADY STARTED

The NETSERV cannot be started because there is already a TCP DSP active using that NETSERV.

NETSERV GETUNIT ERROR

The NETSERV cannot be started because an internal error issued a GETUNIT for the NETSERV device in question. This text should not normally be issued; NETSERV IS UNAVAILABLE is the only expected error from the GETUNIT.

SOCKET IS ALREADY ACTIVE

The specified socket cannot be started because it is already active.

SOCKET IS PENDING START

The command is not allowed for the socket at this time because a start command (either *S,TCP,SOCKET=socket or *S,TCP,NODE=node) was previously issued and the socket is in a pending state while waiting for the connection to be made.

TIMEOUT DURING SIGNON

During a *S,TCP,SOCKET= command to start a socket, 30 seconds elapsed before the socket was successfully started. The start of the socket is considered unsuccessful and the socket is returned from the pending to inactive state.

CANCEL OR FAIL BY OPERATOR

The NETSERV address space failed to start. Message IAT9308 was issued one or more times if at least 60 seconds have elapsed without the NETSERV starting successfully. While JES3 was waiting for the NETSERV to start, the operator entered the *CANCEL or *FAIL command to abandon all attempts to start this NETSERV.

System action: The command is rejected.

Operator response: If the reason text indicates a parameter error, correct and reissue the command. Otherwise, if the probable cause of the error cannot be determined, notify the system programmer.

System programmer response: If the error is caused by an incorrect NETSERV definition, correct the definition and reissue the command. If the reason text indicates an internal error, retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Explanation:

TCP START FAILED FOR SERVER—netserv—ASCRE RC—rc—RSN—rsn—UNABLE TO CREATE NSCT

A Netserv failed to start either because of an address space creation error or because of an error obtaining storage. If the reason for the failure is an address space creation error, the return code from ASCRE is included in the message.

In the message text:

netserv  
The name of the Netserv that failed to start. Typically this occurs because of an address space or storage limit preventing the creation of the address space or data areas. Other messages at the time of issuing the *CALL,TCP command should also be present to further clarify the error.

rc  
The return code from the ASCRE service.

System action: The server address space fails to start.

Operator response: Notify the system programmer.
System programmer response: If the probable cause of the error cannot be determined, retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IAT9304

Explanation:

NETSERV-netserv—FAILED—INCORRECT ID IN ASCRE PARAMETER—UNABLE TO CREATE TCT—MEM—IEANTCR RC=crrc—DUPLICATE NAME TOKEN, IEANTDL RC=dlrc

A Netserv address space started, but one of the following internal errors was detected. The error prevented the Netserv address space from continuing.

**INCORRECT ID IN ASCRE PARAMETER**

The Address Space Create service was called with an incorrect identifier in the parameter string.

**UNABLE TO CREATE TCT or MEM**

The Netserv address space was unable to create the indicated data area.

**IEANTCR RC=crrc**

The Name Token create service (IEANTCR) failed with the indicated return code.

**DUPLICATE NAME TOKEN, IEANTDL RC=dlrc**

The Name Token create service (IEANTCR) failed because a name token with the same name already exists, and an attempt to call the Name Token Delete service (IEANTDL) to delete the duplicate failed with the indicated return code.

In the message text:

- **crrc** The return code from the IEANTCR service.
- **dlrc** The return code from the IEANTDL service for the duplicate name token that was found.
- **netserv** The name of the Netserv that failed.

System action: Netserv address space started, but stopped because of an internal error.

Operator response: Notify the system programmer.

System programmer response: Retry the command. If the problem persists, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Routing Code: 10

Descriptor Code: 4, 7
IAT9305
Explanation:

A remote node has signed on or off by using TCP/IP protocol.
In the message text:
node  The name of the remote node.
netserv  The name of the Netserv on which the sign on/off is occurring.
socket  The name of the socket on which the sign on/off is occurring.

If the text (SECURE) appears, this indicates that secure signon has taken place. Secure signon is an optional NJE definition parameter that requires nodes to confirm their identities to each other.

System action:  Processing continues.
Operator response:  None.
System programmer response:  None.

Module:

Routing Code: 10
Descriptor Code: 4, 7

IAT9306
Explanation:

A *CANCEL,TCP,SOCKET= socket command was entered. The command cannot be completed because the socket is not active.
In the message text:
socket  The name of the socket that was requested in the command.

System action:  The command is rejected. Processing continues.
Operator response:  None.
System programmer response:  None.

Module:

Routing Code: Hardcopy log
Descriptor Code: 5
An NJE signon was attempted by using TCP/IP protocol but the signon failed for the indicated reason.

In the message text:

node  The name of the remote node.
rsntext  The reason that the signon failed. The reason text is one of the following:

- **NO SESSION KEY DEFINED**
  The session key for the remote node is not defined in the security product APPCLU security class.

- **INCONSISTENT SECSIGNON DEFINITIONS**
  The two nodes involved in the signon do not both specify the same SECSIGNON settings in the NJERMT definition. (In JES2, SIGNON=COMPAT is equivalent to SECSIGNON=NO in JES3, and SIGNON=SECURE is equivalent to SECSIGNON=YES in JES3.)

- **ENCRIPT OF LOCAL KEY FAILED**
  The security call to encrypt the home node's session key has failed.

- **ENCRIPT OF REMOTE KEY FAILED**
  The security call to encrypt the remote node's session key has failed.

- **ENCRYPTION KEYS DO NOT MATCH**
  The nodes do not consistently define the session keys in the security product APPCLU security class.

- **APPCLU SECURITY CLASS NOT ACTIVE**
  The APPCLU security class has not been activated in the security product.

- **INCONSISTENT TLS DEFINITIONS**
  The two nodes involved in the signon do not both specify the same TLS settings in the NJERMT definition. (In JES2, the TLS setting is on the socket definition.)

- **UNDEFINED NODE**
  The remote node is not defined.

- **NODE IS NOT TCP/IP**
  The remote node is defined but does not specify TYPE=TCPIP.

**System action:** The signon of the nodes will not complete.

**Operator response:** Notify the system programmer.

**System programmer response:** If the reason text says ENCRYPT OF LOCAL KEY FAILED or ENCRYPT OF REMOTE KEY FAILED, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

If the reason text says UNDEFINED NODE, add the remote node with the command

```
*MODIFY,NJE,ADD=nodename,TYPE=TCPIP
```

If you need this node permanently added, include an NJERMT statement to define it during the next hot start with refresh or warm start.

If the reason text says INCONSISTENT SECSIGNON DEFINITIONS or INCONSISTENT TLS DEFINITIONS, correct the NJE definitions. If the change is required on the home node, stop and restart the TCP DSP for the affected Netserv.

If the reason text says NO SESSION KEY DEFINED, APPCLU SECURITY CLASS NOT ACTIVE, or ENCRYPTION KEYS DO NOT MATCH, correct the security product definitions and retry the *S,TCP command.

**Module:**

- **Detecting:** IATNTTXR
- **Issuing:** IATNTTXR

**Routing Code:** 10
IAT9308 • IAT9309

Descriptor Code: 4, 7

IAT9308

Explanation:

A time interval of 60 seconds has elapsed during which a NETSERV that was requested to start as a result of a "CALL,TCP" command has not proceeded far enough for JES3 to recognize a successful start request. Typically this occurs because of an address space or storage limit preventing the creation of the address space. It can also occur because of DASD contention delaying the address space start. One or more other messages at the time of the "CALL,TCP" command should also be present to further clarify the error. If the problem is with the address space create service, message IAT9303 will also be issued.

In the message text:

NSVNAME
   The name of the NETSERV that has not yet initialized.

System action: JES3 repeats this message at 60 second intervals until the operator takes an action or the NETSERV successfully starts.

Operator response: If you want to give the NETSERV more time to start, do nothing. If you believe that the NETSERV has a problem coming up and want to stop JES3 from waiting, enter either the "CANCEL,nsvname' or "FAIL,nsvname' command. If the NETSERV comes up after one of these commands is entered, you must then cancel the address space by entering the MVS command 'C nsvname'.

System programmer response: Look for messages or other conditions that might prevent the NETSERV from starting, and correct these conditions.

Routing Code: Hardcopy log

Descriptor Code: 5

IAT9309

Explanation:

A Netserv was defined to run on a particular system, but the system in question has not been connected to the global. The Netserv cannot start until that system is connected.

In the message text:

system  The name of the system.

netserv  The name of the Netserv.

System action: The Netserv does not start. This message is repeated every 30 seconds until either the system is connected or reset, or the operator cancels the TCP DSP by issuing the command "CANCEL,netserv'.

Operator response: If the system is expected to connect, no further action is needed. If the system does not need to be connected, issue the "CANCEL,netserv' command to cancel the TCP DSP for the Netserv in question. Alternatively, the system in question can be flushed or partitioned out of the SYSPLEX.

System programmer response: None.

Module:
Chapter 25. JES3 Networking Messages 1087
Operator response: If the socket is defined, start the socket by using the *START,TCP,SOCKET=socket command to establish the TCP/IP NJE connection with the destination node. Otherwise, notify the system programmer.

System programmer response: Define a socket either by adding a SOCKET statement and performing a hot start with refresh, or by using the *MODIFY,SOCKET,ADD= command.

IAT9379

Explanation:

JOB TRAILER NOT RECEIVED FOR JOB jobname ORIGIN NODE (node) USER (user)

Chapter 25. JES3 Networking Messages 1091
A specified job or SYSOUT stream has been partially received from the origin node. The job header was received, but no job trailer was received. Because the transmission was incomplete, the data was discarded.

**System action:** JES3 discards all data received for the job.

**Operator response:** Notify the system programmer.

**System programmer response:** Report the problem to the IBM Support Center.

**Module:**

- **Containing Module:** IATNITXR
- **Detecting Module:** IATNITXR
- **Issuing Module:** IATNITXR

**Routing Code:** 2

**Descriptor Code:** 4

---

**Explanation:**

---

A severe error occurred in the transmitter/receiver exits like SYSIN TRANSMITTER, SYSIN RECEIVER, SYSOUT TRANSMITTER, or SYSOUT RECEIVER because of the following reasons:

- ZERO TPRM ADDRESS
- INCORRECT TPRM ADDRESS
- ZERO TSCT ADDRESS
- INCORRECT TSCT ADDRESS
- ZERO TDBC ADDRESS
- INCORRECT TDBC ADDRESS
- ZERO NSST ADDRESS
- INCORRECT NSST ADDRESS
- INCORRECT RCB
- INCORRECT STREAM NUMBER
- TRANSMITTER AREA CORRUPTED
- RECEIVER AREA CORRUPTED

This might be caused because of program logical error or storage overlay.

**System action:** The X'EC8' abend with RC=10 is issued after the message and the corresponding socket connection is terminated.

**Operator response:** Notify the system programmer.

**System programmer response:** Report the problem to the IBM Support Center.
IAT9381

Explanation:

As the home node received a network job or SYSOUT stream using TCP/IP protocol, one of the following protocol error was occurred:

- A different data set record is received before the job header record.
- A sysout data set record is received before the data set header record.
- A job header record is received after the data set header record.
- A job header record is received after the data set record.
- A non end-of-file record is received after the job trailer record.
- The job header record is incorrect.
- The data set header record is incorrect.
- The sysin data set record is incorrect.
- The sysout data set record is incorrect.
- The job trailer record is incorrect.

System action: The network job or SYSOUT stream is not processed. JES3 puts the job in system hold on the transmitter side.

Operator response: Release the job using *F UJ=XX,H=y,NH=n command and see whether the job/sysout stream is successfully transmitted next time. If the problem persists, take the dump and notify the system programmer.

System programmer response: Report the problem to the IBM Support Center.
IAT9382  •  IAT9383

IAT9382

Explanation:

As the home node received a network job or SYSOUT stream using TCP/IP protocols, an error occurred while processing the dummy data set or network stream data set.
The sysin or sysout receiver allocated and opened a dummy data set to get a spool address or record allocation block (RAB). The same RAB is used by all data sets for that network stream.
The dummy data set with data set name T3xxxxxx is allocated and deallocated using DYNALLOC. The MVS macro OPEN is used to open the dummy data set and it is closed using CLOSE.
The network stream data sets like job header data set (*NJEJBHD), sysin data set (*NJEINPT), data set header (*NJEDHDR), File FDB data set (*NJEFDB), sysout data sets (DSxxxxxx), and job trailer data set (*NJEJBTR) are allocated, open, close and deallocated using IATXSDM macro.

System action: The X'EC8' abend with RC=10 is issued after the message and the corresponding socket connection is terminated.

Operator response: Notify the system programmer.

System programmer response: For network stream data set errors, see z/OS JES3 Customization for the explanation of the return codes. For dummy data set errors, see z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN for the explanation of the return codes. If the problem could not be diagnosed with this information, report the problem to the IBM Support Center.

</tbody>
</table>

Routing Code: 10
Descriptor Code: 4

IAT9500

Explanation:

`>>—INVALID—BDT SYSTEM ID:—sys-id—DUPLICATE<<<<`

If **INVALID BDT SYSTEM ID** was issued a JES3 operator entered a MVS/BDT command or transaction that could not be processed because the `sys-id` specified on the transaction or command is not valid. JES3 could not locate a SSCVT that exists for the MVS/BDT subsystem.
If **DUPLICATE BDT SYSTEM ID** was issued two or more MVS/BDT subsystems exist with the same **sys-id**. While processing a shuttle BSID, JES3 encountered more than one BSID that contained the same **sys-id**.

**System action:** JES3 rejects the command or transaction; other JES3 processing continues.

**Operator response:** If an incorrect **sys-id** was entered for the MVS/BDT subsystem:
- correct the **sys-id**, if possible
- reissue the command or transaction

If you cannot correct the **sys-id**, contact your system programmer.

If a duplicate **sys-id** was entered, note the duplicate **sys-id** of the MVS/BDT subsystem and contact the system programmer so that the initialization stream may be changed for the next restart. Issue a dump for the system programmer.

**Programmer response:** If an incorrect **sys-id** was specified, provide a valid **sys-id** for the operator to specify. If a duplicate **sys-id** was specified, two or more MVS/BDT subsystems communications tables (BSCTs) contained the same **sys-id**. Each MVS/BDT subsystem in a JES3 complex must have a unique **sys-id**.
- determine the duplicate **sys-id** of the MVS/BDT subsystem from the dump and the message.
- correct the BDTNODE statement in the MVS/BDT initialization stream so that the error will be corrected during the next restart.

**Routing Code:** Note 18

**Descriptor Code:** 7

**IAT9501**

**Explanation:**

```
>>> ERROR ACCESSING JOB— jobname (jobid)— RD— rc—
```

While JES3 was accessing a job’s JCT or JQE from spool an error was encountered. The job related information is obtained from spool when:
- establishing communications between JES3 and MVS/BDT
- placing a network job in operator hold
- MVS/BDT requests JES3 to delete a job from the JES3 job queue

**jobno** in the message indicates the job number of the job. **jobid** in the message indicates the job identifier (JOBnnnnn).

**rc** indicates the reason JES3 could not obtain the job’s data. For information on the reason code, see [z/OS JES3 Customization](https://www.ibm.com/support/knowledgecenter/SSEPGG_2.2.0/com.ibm.zos.V2R2.MT/zos/jes3ventions/000-jes3-1924.html).

**System action:** If MVS/BDT was establishing communications with JES3, communications between the two subsystems is in a:
- disconnect state for Version 1 of MVS/BDT
- initialize state from Version 2 of MVS/BDT

When communications between the subsystems enter this state, JES3 and MVS/BDT are not aware of each other and will not send or receive transactions. JES3 processing will continue but all transactions are ignored until communications are established between the two subsystems.

If MVS/BDT issued a request to place a network job in hold or to delete a job from the JES3 job queue, the request is ignored and JES3 processing continues.
Operator response: Notify the system programmer.

Programmer response: Use the return code to determine the error. See z/OS JES3 Customization for a description of the return codes from the IATXJCT and IATXJQE macros.

Module:

</tbody>
</table>

Routing Code: 42

Descriptor Code: 7

IAT9504

Explanation:

```
>>> BDT/JES3 COMMUNICATIONS ESTABLISHED WITH BDT SUBSYSTEM sys-id <<<
```

If communications were rejected, the request failed because of one of the following:

- JES3 encountered a duplicate or incorrect sys-id for a MVS/BDT subsystem. (Message IAT9500 was issued to indicate the error)
- JES3 cannot access the job related control blocks associated with the MVS/BDT subsystem. Message IAT9501 was issued to indicate the job could not be accessed.

If communications were established, transactions can be sent to either subsystem.

System action: JES3 processing continues. If communications were rejected, future processing for the MVS/BDT subsystem is rejected until communications are established between the two subsystems.

Operator response: If communications are not established, inform the system programmer of the sys-id so that the problem can be corrected over the next restart.

Programmer response: If message IAT9500 was issued to indicate duplicate or incorrect sys-ids were specified, provide a valid subsystem ID for the MVS/BDT subsystem. If the message IAT9501 was issued to indicate the job's control blocks could not be accessed, determine the error from the reason code given in message IAT9501.

Routing Code: 42

Descriptor Code: 7

IAT9506

Explanation:

```
>>> INVALID STAGING AREA RECEIVED: ID=cbname MC=code FROM BDT SUBSYSTEM sys-id <<<
```

While processing a subsystem interface (SSI) request, the BDT subsystem interface data area (BSID) contained one of the following errors:

- the BSID ID field cbname did not contain the characters, BSID.
- a staging area that does not contain a shuttle BSID was placed on the shuttle destination queue.
- the BSID modifier code (code) was not in the range defined for use by the user. The range defined for the user is 128-255.
IAT9507 • IAT9508

- the BSID modifier code (code) was in the range reserved for use by the installation. (The range defined for the user is 128-255.) However, the BSID modifier code was not defined for the installation.
- the modifier code (code) was in the user range. However, installation exit, IATUX50, was not modified by the installation.
- installation exit, IATUX50, rejected the modifier code in the BSID.
- installation exit, IATUX50, set a return code other than X’00’, X’04’, or X’08’ before returning to the MVS/BDT communications interface FCT.

**System action:** JES3 ignores the SSI request; other JES3 processing continues.

**Operator response:** Request a dump and notify your system programmer.

**Programmer response:** Examine the BSID in the staging area to determine the cause of the problem. Check installation exit IATUX50 for the possible error.

</table>

**Routing Code:** 10

**Descriptor Code:** 7

---

IAT9508

**Explanation:**

>>> BDT/JES3 COMMUNICATIONS TERMINATED WITH DISCONNECTED FROM BDT SUBSYSTEM—sys-id<<<

JES3 ends communications or disconnects with MVS/BDT subsystem sys-id in response to an MVS/BDT VARY JES3 OFFLINE command or a MVS/BDT subsystem failure. If your installation has MVS/BDT Version 1, communications between JES3 and MVS/BDT are in an ended state. If your installation has MVS/BDT Version 2, communications between JES3 and MVS/BDT are in a disconnected state. When communications are in a disconnected state, JES3 and MVS/BDT are unable to send requests to each other.
System action: JES3 processing continues. The message is issued to inform the operator of the state of the communications between JES3 and MVS/BDT. If your installation has installed Version 2 of MVS/BDT, JES3 will not send any networking work to MVS/BDT for processing. Therefore, JES3 can not indicate to MVS/BDT that network streams, commands, or messages are ready to be transmitted using SNA protocols.

Note: The only command that can be issued when communications between MVS/BDT and JES3 are in a disconnect state is the *START BDT command. See z/OS JES3 Commands for a description of this command.

Operator response: Notify the system programmer.

**System action:** JES3 rejects the command or transaction; other JES3 processing continues.

**Operator response:** Notify the system programmer.

**Programmer response:** Field SSOBRETN in the SSOB contains the reason code.

**Module:**

1100  
z/OS V2R1.0 JES3 Messages
IAT9514  •  IAT9515

IAT9514

Explanation:

A command or transaction was sent to MVS/BDT using an IEFSSREQ and was accepted. MVS/BDT TQI is enabled or disabled.

System action: JES3 processing continues.

Operator response: None. This is an informational message.

Module:

IAT9515

Explanation:

The MVS/BDT subsystem requests a service from JES3 by sending a MVS/BDT subsystem interface data area (BSID) to JES3. This message is issued if:

• JES3 receives a BSID from the MVS/BDT subsystem for a request other than connect before communications between the two subsystems enters a connect state. This will only occur if your installation has installed MVS/BDT Version 2.
• the MVS/BDT subsystem identified by the sys-id is not defined to JES3.
• a Version 1 MVS/BDT subsystem sent a Version 2 BSID to JES3. (that is, a BSID that contains a suspend, resume, or connect request)

System action: JES3 ignores the request. The staging area is purged or returned to the MVS/BDT subsystem. Unless message IAT9508 was issued to indicate JES3 and MVS/BDT could not issue any requests, future processing between JES3 and MVS/BDT can still be performed. JES3 processing continues.

Operator response: None. This is an informational message.

Module:
IAT9516  •  IAT9518

IAT9516
Explanation:

While MVS/BDT was trying to process a transaction or network job a permanent error occurred. Either jobname or jobid identifies the job number that JES3 assigns to the network job. The BDT jobno identifies the job number that the MVS/BDT subsystem assigns to the job. The groupid is a unique JES3 identifier assigned to a job or to each SYSOUT data set that is being transmitted by the MVS/BDT using SNA protocols.

System action: JES3 places the job in operator hold.

Operator response: See the MVS/BDT messages that are issued, these will direct your response.

<td>IATBDCI</td>
<td>IATBDCI</td>
</tr>
</tbody>
</table>

Routing Code: 42
Descriptor Code: 7

IAT9518
Explanation:

MVS/BDT is trying to send a network stream to a remote node using SNA protocols. The nodes are indirectly connected and the stream must be sent to a path node. However, the path node is defined to JES3 as a node that can receive a network stream using SNA protocols but the node is not defined to the MVS/BDT subsystem. Either jobname or jobid indicates the job number assigned to the job by JES3. groupid is a unique JES3 identifier assigned to the network job or to each SYSOUT data set that is being transmitted by the MVS/BDT subsystem using SNA protocols.

System action: The indicated job is placed in operator hold.

Operator response: Notify the system programmer. Issue a *CALL NJEROUT command to reroute the job to a different execution node.
Programmer response: Include a BDTNODE initialization statement in the MVS/BDT initialization stream to define the node to MVS/BDT.

Module:

**Containing**: IATYBDD

**Detecting**: IATBDCI

**Issuing**: IATBDCI

Routing Code: 42

Descriptor Code: 7

---

**IAT9519**

Explanation:

```plaintext
JOBJOB—jobname (jobid)— GROUPID— groupid— REMOVED FROM BDT JOB QUEUE,
PATH NODE UNDEFINED TO BDT
```

MVS/BDT is trying to send a network stream to a remote node using SNA protocols. The nodes are indirectly connected and the stream must be sent to a path node. The path node is defined to JES3 as a node that can receive a network stream using SNA protocols. However, the MVS/BDT subsystem at the home node ended. When the MVS/BDT subsystem was restarted, the path node was not defined to the MVS/BDT subsystem. Either `jobname` or `jobid` indicates the job number assigned to the job by JES3. group is a unique identifier assigned to a job or to each SYSOUT data set that is being transmitted by the MVS/BDT subsystem using SNA protocols.

**System action**: The job is placed in operator hold.

**Operator response**: Notify the system programmer. Issue a `CALL NJEROUT` command to reroute the job to a different execution node.

**Programmer response**: Either include a BDTNODE initialization statement in the MVS/BDT initialization stream or remove the NJERMT statement from the JES3 initialization stream that defines the node to JES3.

---

**IAT9520**

Explanation:

```plaintext
BDT—sys-id— CANNOT BE DEFINED AS THE— SNA NJE BDT
```

**System action**: This node will not transmit or receive any network jobs that use SNA networking protocols.

**Operator response**: Notify the system programmer if the node is expected to receive or send network jobs by using SNA protocols.

Routing Code: 42
Descriptor Code: 7

IAT9522

Explanation:

►— CHECKPOINT DATA LOST,— BDT COMMUNICATIONS— INTERFACE FCT PERMANENTLY DISABLED—

A permanent error occurred while updating the checkpoint data set. This error caused all the JES3 MVS/BDT checkpoint data to become inaccessible.

System action: JES3 removes the MVS/BDT communications interface FCT from the FCT chain. All communication between JES3 and all the MVS/BDT subsystems are disabled. JES3 processing can continue, however, JES3 cannot communicate with the MVS/BDT subsystem.

Operator response: Notify the system programmer.

Programmer response: A return code of 20 was returned in register 15 from the WRTCHAIN macro. The MVS/BDT communications interface FCT ends with an abend code of 703. Determine the reason for the permanent error. See z/OS JES3 Diagnosis and z/OS JES3 Customization to help diagnosis the error. To establish communications between JES3 and the MVS/BDT subsystems, JES3 must be restarted by performing a warm or hot start.

Module:

<td>IATBDCI</td>
</tr>
</tbody>
</table>

Routing Code: 42
Descriptor Code: 7

IAT9523

Explanation:

►— UNABLE TO SEND AVAILABLE SNA NJE— TRANSACTION, NO SNA NJE BDT—

An MVS/BDT subsystem is not yet defined to JES3 for one of the following reasons:

• a Version 2 MVS/BDT subsystem was not defined to JES3 by a SYSID or NJERMT initialization statement.
• the MVS/BDT subsystem has not sent a CONNECT request to JES3.

System action: Any network job to be transmitted by MVS/BDT using SNA protocols, is placed on the JES3 job queue. The network job remains on the queue until MVS/BDT is defined to JES3 and communication is in the connected state.

Note: JES3 spool may reach maximum capacity if there is an abnormal number of networking jobs waiting for MVS/BDT.

Operator response: Notify the system programmer about the BDT subsystem condition.

Programmer response: Check the initialization stream to ensure a Version 2 MVS/BDT subsystem is defined to JES3. The initialization stream should include a BDTID parameter on the NJERMT statement or a SYSID initialization statement. If a Version 2 MVS/BDT subsystem is defined to JES3, initialize the MVS/BDT subsystem. If the MVS/BDT subsystem is not defined and the node will be receiving jobs sent to the node over a SNA connection, correct the initialization stream and restart JES3 by performing a warm start, cold start, or hot start with refresh.

</tbody>
</table>
IAT9524

Explanation:

The MVS/BDT subsystem requested a job be held or deleted from the JES3 job queue. This message indicates the requested job could not be found on the JES3 job queue.

System action: The request is ignored and processing continues.

Operator response: If more of these messages appear, notify the system programmer.

Programmer response: If this message appears whenever MVS/BDT requests to hold or delete a job from the JES3 job queue, it may be an indication that the JES3 and MVS/BDT job queues are out of synch. Restart the MVS/BDT subsystem.

Module: Containing: IATYBDD Detecting: IATOSPC Issuing: IATBDCI

Routing Code: 42
Descriptor Code: 7

IAT9525

Explanation:

A IATXOSBM macro was issued to obtain a job from the MVS/BDT subsystem. While attempting to get a job, an error occurred. JES3 entered the JESTAE recovery routine in IATBDCI to recover from the error.

System action: Processing continues.

Operator response: Request a dump and notify the system programmer.

Programmer response: See z/OS MVS Diagnosis: Tools and Service Aids on how to read a formatted dump. See z/OS JES3 Diagnosis for information on how to determine the error.

Module: Containing: IATYBDD Detecting: IATBDCI Issuing: IATBDCI

Routing Code: 10
Descriptor Code: 7

IAT9526

Explanation:

An error occurred during a JES3 hot start. During a hot start, initialization information is kept in checkpoint data sets. While reading records from the JES3 checkpoint data set, an error occurred. The JESREAD macro, that was
IAT9528 • IAT9529

issued to read the information from spool, supplies these return codes rc when an error occurs.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'04'</td>

Routing Code: 42

Descriptor Code: 7

---

IAT9528

**Explanation:**

An error occurred while reading information from the JES3 checkpoint data set.

**System action:** Processing continues.

**Operator response:** Because information in the checkpoint data set is lost, the states of any MVS/BDT subsystems defined to JES3 are also lost. To establish communication between JES3 and the MVS/BDT subsystems, issue an MVS/BDT VARY JES3 ONLINE command. See the MVS/BDT Commands document for the correct syntax of the command. Notify the system programmer.

**Programmer response:** Use the return code specified in message IAT9526 to help determine the error.

**Module:**

<table>
<thead>

IAT9656
Explanation:

The *CALL VARYL command is executing on the local main. The VARYL DSP has determined that JES3 is abending on the local main.

System action: VARYL and JES3 processing ends.
Operator response: Contact your system programmer.

System programmer response: JES3 is ending because of a problem in a functional area other than VARYL. Use the DM code and the failsoft logout in the messages contained in the hardcopy message log to determine where the problem exists.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</thead>
<tbody>
<tr>
<td>IATMOVL</td>
<td>IATABIP</td>
<td>IATMOVL</td>
</tr>
<tr>
<td></td>
<td>IATSIEM</td>
<td></td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 7

Explanation:

Common message: VARYL- SETUNITS TABLE NOT FOUND

An incorrect device address was specified on the *START VARYL command entered on the local main. No SETUNITS table for the device attached to the local main was found. The main processor control table (MPC) doesn't contain the address of the SETUNITS table.

System action: VARYL processing ends. JES3 processing continues.

Operator response: Determine if the device specified in the *START command is valid. Contact your system programmer.

System programmer response: The main processor control table (MPC) does not contain a valid address of the SETUNITS table. Follow the procedure described below to correct the incorrect address:

1. Locate the incorrect SETUNITs address by:
   a. Using IPCS or the JES3 nucleus section of the formatted dump to locate the transfer vector table (T VT). Locate the TVT in storage to obtain the address of the MPC.
   b. Locate the MPC in storage. The MPC contains the incorrect address of the SETUNITs table.
2. Locate the SSVT to obtain the valid SETUNITs address
3. Use dump core to correct the address of the incorrect SETUNITs table in the MPC.

Problem determination: See Table I, items 4,5,7 and 16; Table III, item 7.

<td>IATMOVL</td>
<td>IATMOVL</td>
</tr>
</tbody>
</table>

Routing Code: 10
Descriptor Code: 7

Explanation:

Common message: VARYL — devname(dev) — NOT IN SETUNITS TABLE

This message is issued in response to a *START VARYL command. An incorrect device number has been specified for the dev parameter when entering the command.

System action: JES3 ignores the command and reissues message IAT9665 asking you to enter a *START or *CANCEL command.
Operator response: Reissue the *START command with the correct device number. If you do not know the number of the device you want to unassign from the local main, ask your system programmer.

Module:

<table>
<thead>
<tr>

Routing Code: 10
Descriptor Code: 7

IAT9663
Explanation:

The device specified by the dev parameter of the *START VARYL command is not currently multi-system assigned.

System action: The VARYL DSP issues message IAT9665 requesting a *START command or *CANCEL command, and then waits for a command to be entered.

Operator response: Reissue the *START VARYL command with the correct device number. If you do not know which devices in your complex are currently multi-system assigned, ask your system programmer.

Module:
**IAT9665 • IAT9667**

Routing Code: 10  
Descriptor Code: 7

---

### IAT9665

Explanation:

>>> VARYL - ENTER *START or *CANCEL

This message is issued in response to the *CALL VARYL command or when the *START VARYL command is entered incorrectly. Specify work for VARYL by issuing a *START or *CANCEL command.

System action: JES3 waits for a *START or *CANCEL command to be entered.

Operator response: Issue a *START VARYL or *CANCEL VARYL command.

Module:

Routing Code: 10  
Descriptor Code: 7

---

### IAT9666

Explanation:

>>> VARYL - NOT FOUND ON FCT CHAIN

A *CANCEL command was issued to end VARYL.

System action: JES3 issues message IAT9667 and cancels the VARYL DSP. JES3 processing continues. VARYL processing is complete.

Operator response: None. This is an informational message.

Module:

Routing Code: 10  
Descriptor Code: 7

---

### IAT9667

Explanation:

>>> VARYL - CANCELLED

This message is issued in response to a *CANCEL VARYL command.

System action: JES3 processing continues. VARYL processing is complete.

Operator response: None. This is an informational message.
**IAT9668 • IAT9800**

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>

Chapter 28. JES3 macro messages

The following sections describe JES3 macro messages.

IATDV100

Explanation:

SYNTAX ERROR:
- No model DEVICE statement specified
- Incorrect range specified
- No range specified
- DEVICEs must be of the form \( x_{xxx} \)
- Incorrect device specified
- Only one model DEVICE statement allowed
- No device(s) specified

‘MOD’ must be specified at the beginning of a DEVICE statement. An IATDEV or IATDEVA edit macro was invoked using incorrect syntax.

No model DEVICE statement specified.
An existing DEVICE statement needs to marked with ‘MOD’ on the line command to be used as a model.

Incorrect range specified.
The last number specified in the device range must be greater than the first.

No range specified.
‘CC’ must be specified to identify the DEVICE range to be changed; or, a DEVICE range or DEVICE list must be specified on the command.

DEVICEs must be of the form \( x_{xxx} \).
Device numbers need to be 3 or 4 digits.

Incorrect device specified.
The device statement specified must be a valid hexadecimal number.

Only one model DEVICE statement allowed.
More than one model DEVICE statement was specified.

‘MOD’ must be specified at the beginning of a DEVICE statement.
A model was specified, however, it was not found on the first line of a DEVICE statement.

No device(s) specified.
No devices were marked or specified.

System action: The system ends processing.
System programmer response: Fix the command syntax and try the command again.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVA</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
<tr>
<td>IATDEV</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
</tbody>
</table>

IATDV200

Explanation:
IATDV205 • IATDV300

Unmatched parentheses in parm-parameter for devnum—model DEVICE statement—

The DEVICE statement for the specified device (devnum) contained an unmatched parenthesis or the model DEVICE statement contained an unmatched parenthesis.

System action: The edit macro makes no changes to the specified device; or, the macro does not add the requested devices.

System programmer response: Correct the DEVICE statement and re-issue the command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVA</td>
<td>IATDEVA</td>
<td>n/a</td>
</tr>
<tr>
<td>IATDEVC</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
</tbody>
</table>

IATDV205

Explanation:

Missing XUNIT/JUNIT on device statement—line—

A required parameter, either XUNIT or JUNIT, was missing from the DEVICE statement specified (line).

System action: The edit macro makes no changes.

System programmer response: Select a different DEVICE statement and re-issue the command.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVA</td>
<td>IATDEVA</td>
<td>n/a</td>
</tr>
<tr>
<td>IATDEVC</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
</tbody>
</table>

IATDV210

Explanation:

ERROR: No MAINPROC statements found in the initialization stream.

No MAINPROC statements were found. MAINPROC statements are needed to determine how to build the specified DEVICE statements.

System action: The edit macro makes no changes.

System programmer response: Re-issue the command in a valid initialization stream that contains MAINPROC statements.

Module:

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVC</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
</tbody>
</table>

IATDV300

Explanation:

Device devnum—specified in range—list—does not exist. It will not be changed.
A DEVICE statement was not found for the specified device number (devnum).

**System action:** The edit macro makes no changes for the specified device.

**System programmer response:** Re-issue the command with an existing device number.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVC</td>
<td>IATDEVC</td>
<td>n/a</td>
</tr>
</tbody>
</table>

---

**IATDV400**

**Explanation:**

>>> Attempted to add a DEVICE—that is already defined:—devnum—

One of the DEVICEs, devnum, is already defined. It cannot be added again.

**System action:** The edit macro makes no changes.

**System programmer response:** Reissue the IATDEVA command, specifying device(s) that are not already defined in the initialization stream; or, issue IATDEVC to change the existing DEVICE statement(s).

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IATDEVA</td>
<td>IATDEVA</td>
<td>n/a</td>
</tr>
</tbody>
</table>

---

**IATDV800**

**Explanation:**

>>> WARNING! Order of the MAINPROC—statements may have changed—

An IATDEVC edit macro was invoked to add a new processor to, or delete an existing processor from, a DEVICE statement. The order of the MAINPROC statements may have changed because a new MAINPROC statement was added somewhere other than at the end of MAINPROC statements. When this initialization stream becomes effective, any scheduled jobs defined after the addition or deletion may not run properly.

The system issues the WARNING message when a MAIN is detected on the XUNIT or JUNIT parameters and the MAIN is no longer defined by a MAINPROC statement.

If any new MAINs are detected in the middle of the existing MAINPROC statements, the system issues the WARNING message. Any jobs scheduled to processors defined after the addition may not run properly.

**System action:** Processing continues.

**System programmer response:** Ensure that the MAINPROC statements are in the correct order. New MAINPROC statements should be added at the end of the existing list; MAINs removed should be deleted from the end.

If this is not done, ensure that no jobs are scheduled to the processors following the added/deleted MAINPROC statements when the initialization stream is applied.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>

</tbody>
</table>
IATDV900 • IATDV905

IATDV900
Explanation:

Command completed successfully. Device # used JNAME
Last defined DESTCODE repeated as necessary Updated

Updated:

Update as appropriate

The command completed successfully; however, detailed processing conditions may be displayed.

no text

The IATDEVA or IATDEVC edit macro completed successfully.

Device number was used for JNAME. Update as appropriate.

An IATDEVA edit macro was successfully completed. The device numbers were used as the JNAMEs on the new DEVICE statements. This is an informational message for the system programmer.

Last defined DESTCODE was repeated as necessary. Update as appropriate.

An IATDEVC edit macro was successfully completed. Either a sequential DESTCODE pattern (i.e., S1, S2, S3) was not recognized; or the DESTCODES were sequential, but not enough valid sequential DESTCODES existed to complete the DEVICE statement. In either case the last valid DESTCODE defined or generated on the DEVICE statement was propagated as the DESTCODE for the added processor(s).

System action: Processing continues.

System programmer response: One of the following:

no text

None.

Device number was used for JNAME. Update as appropriate.

If this is not acceptable, the JNAME may need to be changed.

Last defined DESTCODE was repeated as necessary. Update as appropriate.

If this is not acceptable, the DESTCODEs may need to be changed.

Chapter 29. JES3 IPCS Messages

The ISPF dialog messages consist of a short message followed by an optional long message.

IATKM720
Explanation:

GROUP—group—IS EMPTY

NO CONTROL BLOCK IN GROUP—group

JES3 could not display any installation-defined control blocks for the specified group because they were previously deleted from the group.
System action: Processing continues. The IPCS session remains active.
User response: Make another selection or press the PF3 key to exit.
Module:

Containing Detecting Issuing
ISPMLIB IATJIPCS IATJIPCS

IATKM721
Explanation:

SELECT ONLY ONE OPTION

NO MORE THAN ONE SELECTION CAN BE MADE

On one of the selection panels for the JES3 component of IPCS, more than one option was specified.
System action: The panel reappears, allowing you to select only one option.
User response: Enter ‘S’ next to one option only.
Module:

Containing Detecting Issuing
ISPMLIB IATJIPCS IATJIPCS

IATKM722
Explanation:

ENTER REQUIRED FIELD

PLEASE ENTER THE REQUIRED FIELD

On one of the input panels for the JES3 component of IPCS, a required field was not completed.
**IATKM723 • IATKM724**

**System action:** The panel reappears with the cursor at the required field, allowing you to fill in the required information.

**User response:** Enter the required information.

**Explanation:**

- **NO MORE SPACE IN DATA SET—**dataset—

- **REALLOCATE THE DATA SET WITH MORE SPACE**

IPCS could not add the group or control block specified when you were using one of the following panels:

- ADD AN INSTALLATION DEFINED CONTROL BLOCK
- ADD AN INSTALLATION DEFINED CONTROL BLOCK GROUP

IPCS attempted to add the control block or group to the preallocated data set `userid.ISPTABLE`, but IPCS failed to add because of insufficient space in the data set.

**System action:** JES3 processing continues. The IPCS session remains active.

**User response:** Exit JES3 IPCS and reallocate data set `userid.ISPTABLE` with more space. After reallocating the data set, return to the IPCS session to add the control block or the control block group.

**IATKM724**

**Explanation:**

- **NOTHING TO DELETE**

- **THERE ARE NO INSTALLATION-DEFINED TO DELETE**

The DELETE A USER DEFINED CONTROL BLOCK GROUP option was selected, but JES3 determined that there are no installation-defined control blocks.

**System action:** The system waits for the you to select another option.

**User response:** Make another selection or press the PF3 key to exit.

**Module:**

<table>
<thead>
<tr>
<th>Containing</th>
<th>Detecting</th>
<th>Issuing</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISPMLIB</td>
<td>IATJIPCS</td>
<td>IATJIPCS</td>
</tr>
</tbody>
</table>
Explanation:

Highlighting

NOTHING TO DELETE

THERE ARE NO INSTALLATION-DEFINED—CONTROL BLOCK GROUPS TO DELETE

The DELETE A USER DEFINED CONTROL BLOCK GROUP or the DELETE A USER DEFINED CONTROL BLOCK FROM A GROUP option was selected, but JES3 determined that no user-defined control blocks exist.

System action: The system waits for you to enter select another option.

User response: Make another selection or press the PF3 key to exit.

Module:

—# control blocks added—

—# control blocks are added successfully—

This message notifies you of the number of control blocks you have successfully added.

System action: Processing continues.

User response: None. This is an informational message.

Module:
This message notifies you of the number of control blocks you have successfully deleted.

**System action:** Processing continues.

**User response:** None. This is an informational message.

**Module:**

**Explanation:**

**IATKM733**

- 

This message notifies you of the number of control block groups you have successfully deleted.

**System action:** Processing continues.

**User response:** None. This is an informational message.

**Module:**

**Explanation:**

**IATKM734**

- 

A 'P' was entered to print the formatted output for a summary or a control block. Print processing is complete.

**System action:** Processing continues.

**User response:** None. This is an informational message.

**Note:** If the IPCSPRNT data set was allocated, you will have to log on to TSO again to view the output.
IATKM735 • IATKM736

Module:
Containing Detecting Issuing
ISPMLIB IATJIPCS IATJIPCS

IATKM735
Explanation:

>>>--INVALID NAME--control block--CANNOT HAVE IMBEDDED BLANKS

>>>-- CONTROL BLOCK--control block--CANNOT HAVE IMBEDDED BLANKS

While attempting to add an installation defined control block, a blank was specified in the control block name.

System action: The system waits for a valid control block name to be entered.

User response: Either:
• Enter a valid control block name of one to eight characters with no embedded blanks or
• Press PF3 to exit this panel.

Module:
Containing Detecting Issuing
ISPMLIB IATJIPCS IATJIPCS

IATKM736
Explanation:

>>>--TABLE IN USE

>>>-- CONTROL BLOCK DEFINITIONS CANNOT--BE MODIFIED IN SPLIT SCREEN MODE

An attempt was made to modify a control block definition while in split screen mode. A control block definition cannot be modified within split screen mode.

System action: The system rejects the command.

User response: Get out of split screen mode and reissue the command(s) to modify the control block definition.

Module:
Containing Detecting Issuing
ISPMLIB IATJIPCS IATJIPCS
Chapter 30. Problem Determination

Problem determination is the activity required to identify a failing hardware unit or program and determine who is responsible for support.

Problem determination is accomplished by using procedures specified by IBM. In some cases, these procedures may be initiated by a message or code which requires operator or programmer response. The response may include the requirement for additional problem-related data to be collected and will attempt, where possible, to indicate "probable" failure responsibility.

Problem determination information is included for applicable messages and codes under the heading "Problem Determination."

For z/OS problem determination procedures, see IBM's [z/OS Problem Management](https://www.ibm.com/support/docdisplay?rs=13910&lid=0000000217015091&ss=Go+to+Document+Display&doc肱=0000000217015091), and for further JES3 problem determination procedures, see IBM's [z/OS JES3 Diagnosis](https://www.ibm.com/support/docdisplay?rs=13910&lid=0000000217015091&ss=Go+to+Document+Display&doc肱=0000000217015091). In any case, it is intended you take the specified actions and collect any requested documentation before calling IBM for support.

### TABLE I

#### Standard Problem Determination

If the problem recurs, follow the problem determination aids specified by the associated message or code before calling IBM for support.

1. If MSGLEVEL=(1,1) was not specified in the JOB statement, specify it and rerun the job.
2. Save the console sheet from the primary console. For systems with remote consoles, save the remote console sheet. In systems with Multiple Console Support (MCS), save a copy of the hard copy log.
3. Save the job stream associated with the job.
4. Save the system output (SYSOUT) associated with the job.
5. Make sure that the failing job step includes a:
   - a. SYSABEND DD statement.
   - b. SYSUDUMP DD statement.
   - c. PL1DUMP DD statement.
   - d. SYSMDUMP DD statement.
6. Make sure that the PARM parameter of the EXEC statement specifies the following:
   - a. MAP
   - b. LIST
   - c. DIAG
   - d. MSG=AP
   - e. CORE, if applicable
   - f. XREF
   - g. DUMP
7. If SMP is used to make all changes to the system, run the LIST CDS and LIST PTFBY functions of SMP to obtain a list of the current maintenance from the SMP control data set (CDS).

   If any changes are made to the system without using SMP, run the LISTIDR function of the AMBLIST service aid program to obtain a list of all members with a PTF or local fix, and save the output. Run the program against the:
   a. SYS1.LINKLIB data set.
   b. SYS1.SVCLIB data set.
   c. Library containing the program that issued the message.
   d. SYS1.LPALIB data set.

8. Run the IMCJOBQD (stand-alone) or IMCOSJQD (system-assisted) service aid program to obtain a formatted copy of the contents of the SYS1.SYSJOBQE or SYS1.SYSWADS data sets, SWADS or the resident job list.

9. Run the AMBLIST service aid program to obtain:
   a. An object module listing, specifying the LISTOBJ function.
   b. A load module map and cross-reference listing, specifying the OUTPUT=BOTH option of the LISTLOAD function.

10. Have a copy of the Message Control Program (MCP) available.

11. Run the AMDSADMP service aid program to dump the contents of real storage and page data sets on magnetic tape.

    After restarting the system, use IPCS to print the required portion of the dump tape produced by AMDSADMP.

    Save both the tape from AMDSADMP (should further information from the tape be required) and the listing from IPCS.

12. Run the SEREP program, and save the resulting output.

    (Note: The SEREP program is not supported on processors in the 4300 series.)

13. Save all the associated output.

14. The normal response to this message requests the programmer/operator to run a specific program. Save all output from that program.

15. Save the program listing associated with the job.

16. Save the dump.

17. Run the EREP service aid, to dump the SYS1.LOGREC data set and save the resulting output.

18. Save the assembly listing associated with the job.

19. Save the control cards associated with the job.

20. Save the compiler output associated with the job.

21. Save the source input associated with the job.

22. Save the source program listing associated with the job.

23. Run OLTEP diagnostics for the problem device and save the output.

24. Run the IEHLIST system utility program to obtain a list of the:
   a. Volume table of contents of the associated volume, specifying the FORMAT option.
   b. Volume table of contents of the associated volume, specifying the DUMP option.
   c. Directory of the associated data set

25. Run the IEBPTPCH data set utility to print the:
   a. Directory of the applicable data set.
   b. Applicable data set.
c. Applicable member.
d. Applicable procedure.

26. Have the linkage editor/loader map available.
27. Save the associated volume.
28. Contact your programming support personnel.
29. Contact your hardware support personnel.
30. Save the trace output data set.
31. Print the GTF trace data set using IPCS.
32. Print the associated SVC Dump data set using IPCS.
33. Run the access method services LISTCAT command to:
   a. List the contents of the applicable catalog.
   b. List the catalog entries for the applicable objects and any related objects.
34. Run the following access method services command:
   a. The PRINT command to list the contents of the mass storage volume
      control inventory data set.
   b. The LISTMSVI command.
   c. The LISTMSF command with the ALL parameter.
35. Run the access method services PRINT command to print the repair work file.
36. Run the AMASPZAP service aid program using the ABS_DUMP statement to
    print the contents of the applicable:
    a. Data set.
    b. Track.
37. Run the access method services COMPARET command.
38. Display units for units associated with the problem area. If specific unit(s) is
    not known, display range of all virtual units. See your configuration path
    chart for address ranges.
39. Obtain the RACF profile of the associated data set, where applicable.
40. Stop the processor and use the hardware ALTER/DISPLAY facility to display:
    a. All general purpose registers.
    b. The PSW.
    c. Main storage locations 0 through 200 (hexadecimal) and 7000 through 7080
       (hexadecimal).
41. If the AMDSADMP program resides on tape, save the tape. If the
    AMDSADMP program resides on disk, use the DUMP feature of IEHDASDR
    to print the SYS1.PAGEDUMP data set and cylinder 0 track 0 of this residence
    disk.
42. Save the output (listings) of the stage 1 and stage 2 AMDSADMP initialization
    jobs.
43. Follow the procedures for item 9b of this table for load modules AMDSAPGE,
    AMDSAPRO and AMDSALDR of SYS1.LINKLIB. Use IEBUPDTE or IEBPTCH
    to print the AMDSADMP and AMDSADM2 macros from SYS1.MACLIB.
44. Save the AMDSADMP dump output (tape or listing).
45. If the program seems to be looping, use the display PSW feature of the
    hardware ALTER/DISPLAY facility along with the hardware instruction Step
    facility to trace the loop, instruction by instruction.
46. If there is an error in the contents of a page data set dump, restart the system
    using a different page data set, then dump the original page data set.
47. Use IEBCOPY to unload SYS1.IMAGELIB to tape.
48. Have a list of RACF-defined entities available.
49. Contact your IBM system engineer.
50. Save the log from all active global resource serialization systems, and from any systems that are restarting or joining the global resource serialization complex.
51. Use the following instructions to find the IPL WTO buffer and locate a message in that buffer.

Before a stand-alone dump is taken:
   a. Using the hardware ALTER/DISPLAY facility, read the address in storage location X'14'; this address points to the IPL diagnostic area.
   b. Add X'28' to the address in location X'14'; the result is a 31-bit pointer to the virtual address of the IPL vector table (IVT).
   c. Add X'E0' to the IVT address; the result is a 31-bit pointer to the IVTMQHP field of the IVT. IVTMQHP contains the address of the message queue header (MQH).
   d. Add X'8' to the address of the MQH; the result is a 31-bit pointer to the youngest message queue element (MQE), which is the message you want to see.
   e. Add X'A' to the address of the MQE; the result points to the MQETEXT field of the MQE. MQETEXT contains the text of the most recent message.

After a stand-alone dump has been taken and copied to DASD, you may use either ISPF browse or IPCS to find the buffer and locate a message:
   • Using ISPF browse
     a. Search the dump for the message string you want to locate. For example, if your system is in a wait state, code 055, you want to locate message IEA086W; so enter Find 'IEA086W'.
     b. Repeat Find ‘message ID’ until you have located all occurrences of that message.
   • Using IPCS
     a. Enter the VERBX CPUDATA command to get the value in control register 1; this value points to the segment table.
     b. Enter the EQUATE command to equate the segment table (SGT1) to the value in control register 1. Ignore the low-order byte; the segment table will always be on a page boundary. An example of this EQUATE command follows:

        EQU SGT1 FFE000. ABSOLUTE STR(SGT)

     c. Enter EQU PSA0 0. ABSOLUTE to equate PSA0 to absolute location 0.
     d. Enter DROPD RECORDS(TRANSLATION) to reinitialize the dump so that IPCS can process virtual addresses in the dump.
     e. The IPL vector table (IVT) will always be at virtual storage address X'2000 1000'. Add X'E0' to the IVT address; the result is a 31-bit pointer to the IVTMQHP field of the IVT. IVTMQHP contains the address of the message queue header (MQH).
     f. Add X'8' to the address of the MQH; the result is a 31-bit pointer to the youngest message queue element (MQE), which is the message you want to see.
     g. Add X'A' to the address of the MQE; the result points to the MQETEXT field of the MQE. MQETEXT contains the text of the most recent message.
**TABLE II**

**GTF Problem Determination**

**Format 1: Tracing Without Prompting for Event Keywords:**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type TRACE=opt, where opt is the trace option indicated for the particular message or code, within the text of his reply.

When data for the problem has been recorded, use IPCS to format the trace output, specifying DDNAME=(ddname of the trace data set).

**Format 2: Tracing With Prompting for Event Keywords:**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to the message AHL100A, the operator should specify the trace options indicated for the associated message or code within the text of his reply. Then, in response to the message AHL101A, the operator should specify the event keywords also indicated with the associated message or code.

When data for the problem has been recorded, use IPCS to format the trace output, specifying DDNAME=(ddname of the trace data set).

**Format 3: Specialized Tracing Action:**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type ‘TRACE=SYS,USR,SLIP’. The DD statement for a data set in error should specify DCB=DIAGNS=TRACE.

When data for the problem has been recorded, use IPCS to format a dump.

**Format 4: Specialized Tracing Action for VSAM:**

Before reproducing the problem, have the system operator issue a START GTF command specifying tape output, MODE=EXT and TIME=YES. In response to message AHL100A, the operator should type ‘TRACE=SYS,USR’. The DD statement for a data set in error should specify AMP=TRACE.

When data for the problem has been recorded, use IPCS to format a dump.

---

**TABLE III**

**JES3 Problem Determination**

If a problem occurs in JES3, one or more of the following steps may be taken to assist in determining the cause:

1. Take a stand-alone dump of the system by specifying DUMP=PRDMP on the OPTIONS card in the initialization deck and save the output (SYS1.DUMPnn).
2. Take a standard dump of the system by specifying DUMP=JES on the OPTIONS card in the initialization deck and save the output (JESABEND).
3. Take an operating system dump including the nucleus and SQA by specifying DUMP=MVS on the OPTIONS card in the initialization deck and save output (SYSABEND).
4. Save the MLOG listing or get a print of DLOG.
5. Provide listing of initialization deck (JES3OUT).
6. Provide console log from initialization.
7. Determine z/OS level and JES3 PTF level.
8. Provide z/OS nucleus LOADMOD map.
9. Issue *F T,L=linename, SNAPON and *X RJPNSPS.
10. Issue *F T,L-linename, TRCEON. This will give an RJP event trace on the MLOG console. Save MLOG output.
11. Take a system dump by placing an INTDEBUG,n, message-text$$ card in the initialization deck. The message-text field is compared for occurrences of the chosen message. The n field specifies the number of message occurrences before the system is dumped.
12. Issue *X DISPLAY and save output.
13. Issue *X DISPLAY, SNAPS and save the output.
   a. After Interpreter DSP
   b. After Main Service
   c. After Input Service
15. Rerun job with EXEC PGM=JCLTEST and save output.
16. Rerun job with EXEC PGM=JSTTEST and save output.
17. Rerun job with TYPRUN=SCAN specified on JOB card and save output.
18. Issue *X DISPDJC when problem occurs and save output.
19. Restart system with specifying a start type of WA (Warm start with queue analysis) and save output (JES3SNAP).
20. Check JESYSMSG data set for error indications.
21. Provide a listing of the JES3 start up procedure, containing all JCL used to start the subsystem.
22. Save the IOERR trace that will be printed.
23. Rerun job with DEBUG=All immediately following PROCESS CI or PROCESS RI card.

Appendix. Accessibility

Accessible publications for this product are offered through the z/OS Information Center, which is available at [www.ibm.com/systems/z/os/zos/bkserv/](http://www.ibm.com/systems/z/os/zos/bkserv/).

If you experience difficulty with the accessibility of any z/OS information, please send a detailed message to mhvrcls@us.ibm.com or to the following mailing address:

IBM Corporation  
Attention: MHVRCFS Reader Comments  
Department H6MA, Building 707  
2455 South Road  
Poughkeepsie, NY 12601-5400  
USA

Accessibility features

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size.

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to [z/OS TSO/E Primer](http://www.ibm.com/systems/z/os/zos/iz2/primer/), [z/OS TSO/E User’s Guide](http://www.ibm.com/systems/z/os/zos/iz2/ISODE/guides/), and [z/OS ISPF User’s Guide Vol I](http://www.ibm.com/systems/z/os/zos/iz2/ISODE/guides/) for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users accessing the z/OS Information Center using a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line, because they can be considered as a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that your screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1) are mutually
exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, you know that your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a syntax element with dotted decimal number 3 is followed by a series of syntax elements with dotted decimal number 3.1, all the syntax elements numbered 3.1 are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add information about the syntax elements. Occasionally, these words and symbols might occur at the beginning of the element itself. For ease of identification, if the word or symbol is a part of the syntax element, it is preceded by the backslash (\) character. The * symbol can be used next to a dotted decimal number to indicate that the syntax element repeats. For example, syntax element *FILE with dotted decimal number 3 is given the format 3 \* FILE. Format 3* FILE indicates that syntax element FILE repeats. Format 3* \* FILE indicates that syntax element * FILE repeats.

Characters such as commas, which are used to separate a string of syntax elements, are shown in the syntax just before the items they separate. These characters can appear on the same line as each item, or on a separate line with the same dotted decimal number as the relevant items. The line can also show another symbol giving information about the syntax elements. For example, the lines 5.1*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the LASTRUN and DELETE syntax elements, the elements must be separated by a comma. If no separator is given, assume that you use a blank to separate each syntax element.

If a syntax element is preceded by the % symbol, this indicates a reference that is defined elsewhere. The string following the % symbol is the name of a syntax fragment rather than a literal. For example, the line 2.1 %OP1 means that you should refer to separate syntax fragment OP1.

The following words and symbols are used next to the dotted decimal numbers:
• ? means an optional syntax element. A dotted decimal number followed by the ? symbol indicates that all the syntax elements with a corresponding dotted decimal number, and any subordinate syntax elements, are optional. If there is only one syntax element with a dotted decimal number, the ? symbol is displayed on the same line as the syntax element, (for example 5? NOTIFY). If there is more than one syntax element with a dotted decimal number, the ? symbol is displayed on a line by itself, followed by the syntax elements that are optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that syntax elements NOTIFY and UPDATE are optional; that is, you can choose one or none of them. The ? symbol is equivalent to a bypass line in a railroad diagram.
• ! means a default syntax element. A dotted decimal number followed by the ! symbol and a syntax element indicates that the syntax element is the default option for all syntax elements that share the same dotted decimal number. Only one of the syntax elements that share the same dotted decimal number can specify a ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the default option for the FILE keyword. In this example, if you include the FILE keyword but do not specify an option, default option KEEP will be applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1!
(KEEP), and 2.1.1 (DELETE), the default option KEEP only applies to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

- * means a syntax element that can be repeated 0 or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3*, 3 HOST, and 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

**Note:**

1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you could write HOST STATE, but you could not write HOST HOST.
3. The * symbol is equivalent to a loop-back line in a railroad syntax diagram.

- + means a syntax element that must be included one or more times. A dotted decimal number followed by the + symbol indicates that this syntax element must be included one or more times; that is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can only repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loop-back line in a railroad syntax diagram.
Notices

This information was developed for products and services offered in the U.S.A. or elsewhere.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.
19-21, Nihonbashi-Hakozakicho, Chuo-ku
Tokyo 103-8510, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.
IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

Site Counsel
IBM Corporation
2455 South Road
Poughkeepsie, NY 12601-5400
USA

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

COPYRIGHT LICENSE:

This information might contain sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted.
for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

**Minimum supported hardware**

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: [IBM Lifecycle Support for z/OS](http://www.ibm.com/software/support/systemsz/lifecycle/)
- For information about currently-supported IBM hardware, contact your IBM representative.
