MVS System Messages
Volume 1 (ABA - AOM)
Note

Before using this information and the product it supports, be sure to read the general information under "Notices" on page 641.

Twentieth Edition, September 2009

This is a major revision of SA22-7631-18.

This edition applies to Version 1 Release 11 of z/OS (5694-A01), and to all subsequent releases and modifications until otherwise indicated in new editions.

IBM welcomes your comments. A form for readers’ comments may be provided at the back of this document, or you may address your comments to the following address:

International Business Machines Corporation
MHVRCFS, Mail Station P181
2455 South Road
Poughkeepsie, NY 12601-5400
United States of America

FAX (United States & Canada): 1+845+432-9405
FAX (Other Countries):
   Your International Access Code +1+845+432-9405

IBMLink™ (United States customers only): IBMUSM10(MHVRCFS)

This document supports z/OS® (5694-A01).

The MVS™ System Messages documents primarily describe messages that are issued to the system operator at the system console and system messages that are logged. These include the following messages:

- Operator messages issued by the BCP and DFSMS/MVS™.
- Log messages issued by the BCP and DFSMS/MVS.
- Some SYSOUT messages issued by the BCP and DFSMS/MVS. SYSOUT messages are issued by utilities that normally run in batch, such as SPZAP.
- Batch job messages issued by the BCP. Messages issued by JES2 or JES3 for batch jobs are in the JES messages documents.

For the most part, messages issued at interactive terminals (like TSO/E and CICS® terminals) are documented by the specific elements and products that support those terminals.

The titles of the MVS System Messages documents indicate the range of message prefixes in the documents:

- z/OS MVS System Messages, Vol 1 (ABA-AOM), SA22-7631
- z/OS MVS System Messages, Vol 2 (ARC-ASA), SA22-7632
- z/OS MVS System Messages, Vol 3 (ASB-ASA), SA22-7633
- z/OS MVS System Messages, Vol 4 (CBD-DMO), SA22-7634
- z/OS MVS System Messages, Vol 5 (EDG-GFS), SA22-7635
- z/OS MVS System Messages, Vol 6 (GOS-IEA), SA22-7636
- z/OS MVS System Messages, Vol 7 (IEB-EE), SA22-7637
- z/OS MVS System Messages, Vol 8 (IEF-IGD), SA22-7638
- z/OS MVS System Messages, Vol 9 (IGF-IGM), SA22-7639
- z/OS MVS System Messages, Vol 10 (IXC-IZP), SA22-7640

If you do not know which document describes a particular message, try using LookAt (see "Using LookAt to look up message explanations" on page xi). Here are some of the documents on that bookshelf:

- The MVS System Messages documents
- z/OS MVS Dump Output Messages, SA22-7590
- z/OS MVS System Codes, SA22-7626
- z/OS and z/VM HCD Messages, SC33-7986
- z/OS JES2 Messages, SA22-7537
- z/OS JES3 Messages, SA22-7552
- z/OS TSO/E Messages, SA22-7786
- z/OS UNIX System Services Messages and Codes, SA22-7807

For a list of message documents sorted by message prefix, see "Message directory" on page 15.

This document also contains the routing and descriptor codes that IBM assigns to the messages that z/OS components, subsystems, and products issue. Routing and descriptor codes are specified by the ROUTCDE and DESC keyword parameters on WTO and WTOR macros, which are the primary methods that programs use to issue messages. The routing code identifies where a message will be displayed. The descriptor code identifies the significance of the message and the color of the message on operator consoles with color.
Who should use these MVS System Messages documents

The system messages documents are for people who receive messages from the system. Usually, these people are system operators, system programmers, and application programmers who do any of the following tasks:

- Initialize the operating system and its subsystems
- Monitor system activity
- Keep the system running correctly
- Diagnose and correct system problems
- Diagnose and correct errors in problem programs

How to use these documents

The system messages documents contain descriptions of messages, along with the following topics:

- “Building your own message library” on page 25 tells how to create a customized message library.
- “Message directory” on page 15 lists all message prefixes and the documents containing the message descriptions.
- Chapter 1, “Introduction,” on page 1 describes how the system issues messages, where it places them, and their formats.
- “Routing codes” on page 9 and “Descriptor codes” on page 12 contain an introduction to routing and descriptor codes. These sections describe:
  - The meaning of each code
  - How to specify these codes
  - How the system uses these codes

For information on using routing and descriptor codes to route messages, see z/OS MVS Planning: Operations.

Message Explanations: Message chapters are arranged alphabetically by the message prefixes. In each chapter, the messages are arranged numerically by the numbers following the prefix. For a general description of message explanations, see “Message description” on page 8.

Where to find more information

Where necessary, the message documents reference information in other books, using shortened versions of the book title. For complete titles and order numbers of the books for all products that are part of z/OS, see z/OS Information Roadmap.

Many message descriptions refer to the following terms. You need to consult the reference listed below for more information:

- Data areas and control blocks: See z/OS MVS Data Areas, Vol 1 (ABEP-DALT), z/OS MVS Data Areas, Vol 2 (DCCB-ITZYRETC), z/OS MVS Data Areas, Vol 3 (IVT-RCWK), z/OS MVS Data Areas, Vol 4 (RD-SRRA), and z/OS MVS Data Areas, Vol 5 (SSAG-XTLST).
- Dumps: For examples of ABEND, stand-alone, and SVC dumps and how to read them, see z/OS MVS Diagnosis: Tools and Service Aids. For examples of component output from dumps and how to read and request it, see z/OS MVS Diagnosis: Reference.
- Identification of a component, subsystem, or product: See z/OS MVS Diagnosis: Reference to identify the component, subsystem, or product from the name of an IBM® module or for a macro. The module prefix and macro tables give the program identifier to be used in a PIDS symptom in a search argument.
- System completion and wait state codes: See z/OS MVS System Codes.
- Logrec data set error records: For the formatted records, see z/OS MVS Diagnosis: Reference.
• **Trace output**: For the formats and the meaning of the information in the generalized trace facility (GTF) trace, instruction address trace, master trace, system trace, and component trace, see [z/OS MVS Diagnosis: Tools and Service Aids](http://publibz.boulder.ibm.com/cgi-bin/bookmgr_OS390/Shelves/ZDOCAPAR).

• **hardware**: Use the appropriate *Principles of Operation* document for the hardware you have installed.

### Where to find the most current message information

The MVS System Messages documents are cumulative. As messages are added to the system they are added to the documents. Similarly, when messages are changed on the system, they are changed in the documents. However, when a message is deleted from the system (no longer issued), the message is *not* deleted from the document. This means that users can look in the most recent message documents for the most current descriptions of system messages.

To find the most current edition of a document, you can look on the Web. Point your browser to the z/OS home page and click on Library:

When you are in the z/OS library area, use the messages and codes database to search for the message ID you are interested in.

### Information updates on the web

For the latest information updates that have been provided in PTF cover letters and Documentation APARs for z/OS, see the online document at:

This document is updated weekly and lists documentation changes before they are incorporated into z/OS publications.

### Using LookAt to look up message explanations

LookAt is an online facility that lets you look up explanations for most of the IBM messages you encounter, as well as for some system abends and codes. Using LookAt to find information is faster than a conventional search because in most cases LookAt goes directly to the message explanation.

You can use LookAt from these locations to find IBM message explanations for z/OS elements and features, z/VM®, z/VSE™, and Clusters for AIX® and Linux®:

- **The Internet.** You can access IBM message explanations directly from the LookAt Web site at [www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/).
- **Your z/OS TSO/E host system.** You can install code on your z/OS systems to access IBM message explanations using LookAt from a TSO/E command line (for example: TSO/E prompt, ISPF, or z/OS UNIX® System Services).
- **Your Microsoft® Windows® workstation.** You can install LookAt directly from the z/OS Collection (SK3T-4269) or the z/OS and Software Products DVD Collection (SK3T-4271) and use it from the resulting graphical user interface (GUI). The command prompt (also known as the DOS > command line) version can still be used from the directory in which you install the Windows version of LookAt.
- **Your wireless handheld device.** You can use the LookAt Mobile Edition from [www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/lookatm.html](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/lookatm.html) with a handheld device that has wireless access and an Internet browser.

You can obtain code to install LookAt on your host system or Microsoft Windows workstation from:

- A CD in the **z/OS Collection** (SK3T-4269).
- The **z/OS and Software Products DVD Collection** (SK3T-4271).
• The LookAt Web site (click Download and then select the platform, release, collection, and location that suit your needs). More information is available in the LOOKAT.ME files available during the download process.

The z/OS Basic Skills Information Center
The z/OS Basic Skills Information Center is a Web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS system programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:
• Provide basic education and information about z/OS without charge
• Shorten the time it takes for people to become productive on the mainframe
• Make it easier for new people to learn z/OS.

To access the z/OS Basic Skills Information Center, open your Web browser to the following Web site, which is available to all users (no login required): http://publib.boulder.ibm.com/infocenter/zos/basics/index.jsp
Summary of changes

New, changed, or deleted messages can affect your system's automation routines. To ensure that your installation's automation routines are current, review the new, changed, and deleted messages listed in z/OS Summary of Message and Interface Changes. z/OS Summary of Message and Interface Changes is available on the z/OS Collection, SK3T-4269 and in the z/OS Internet library at:

Summary of changes
for SA22-7631-19
z/OS Version 1 Release 11

This document contains information previously presented in z/OS MVS System Messages, Vol 1(ABA-AOM), SA22-7631-18, which supports z/OS Version 1 Release 10.

You may notice changes in the style and structure of some content in this document—for example, headings that use uppercase for the first letter of initial words only, and procedures that have a different look and format. The changes are ongoing improvements to the consistency and retrievability of information in our documents.

This document contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Summary of changes
for SA22-7631-18
z/OS Version 1 Release 10
as updated April 2009

This document contains information previously presented in z/OS MVS System Messages, Vol 1(ABA-AOM), SA22-7631-17, which supports z/OS Version 1 Release 10.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.

Summary of changes
for SA22-7631-17
z/OS Version 1 Release 10

This document contains information previously presented in z/OS MVS System Messages, Vol 1(ABA-AOM), SA22-7631-16, which supports z/OS Version 1 Release 9.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.

Summary of changes
for SA22-7631-16
z/OS Version 1 Release 9
as updated April 2008

This document contains information previously presented in z/OS MVS System Messages, Vol 1(ABA-AOM), SA22-7631-15, which supports z/OS Version 1 Release 9.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.
Summary of changes
for SA22-7631-15
z/OS Version 1 Release 9

This document contains information previously presented in z/OS MVS System Messages, Vol 1(ABA-AOM), SA22-7631-14, which supports z/OS Version 1 Release 8.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.
Chapter 1. Introduction

The z/OS operating system issues messages from z/OS elements and features, and from program products and application programs running on the system. The system issues messages in different ways and to different locations:

- **WTO and WTOR macros**: Most messages are issued through WTO and WTOR macros to one of the following locations:
  - Console
  - Operations log (OPERLOG)
  - System log (SYSLOG)
  - Job log
  - SYSOUT data set

Routing codes determine where the messages are displayed or printed. The routing codes for messages issued by the operating system are included with each message.

- **WTL macro or the LOG operator command**: Some messages are issued through the WTL macro or the LOG operator command to the system log (SYSLOG).

- **Dumping services routines**: Dump messages are issued through the Dumping services routines and can appear in one of the following locations:
  - SVC dumps, stand-alone dumps, or SYSMDUMP ABEND dumps formatted by the interactive problem control system (IPCS)
  - Trace data sets formatted by the interactive problem control system (IPCS)
  - ABEND dumps or SNAP dumps produced by the dumping services

In dump or trace data sets formatted by IPCS, the messages appear interactively on a terminal or in a printed dump.

- **DFSMS/MVS access methods**: Some messages are issued through DFSMS/MVS access methods directly to one of the following locations:
  - Output data set
  - Display terminal

Messages are sent to different locations to meet some specific needs. For example, messages routed to a console usually shows the result of an operator command and sometimes require an operator reply, while messages recorded in the hardcopy log permanently are often used for auditing. Understanding the locations where you receive messages can help you manage your message flow.

**Console**

Messages sent to a multiple console support (MCS) console, an SNA multiple console support (SMCS) console, or an extended MCS (EMCS) console are intended for the operators. Operations can control which messages are displayed. See [z/OS MVS Planning: Operations](#) for information about controlling message display.

The system writes in the hard-copy log all messages sent to a console, whether the message is displayed or not.

**Operations log**

The operations log (OPERLOG) records all message traffic from each system in a sysplex that activates the OPERLOG. The operations log consists of the following data:

- Messages to and from all consoles
- Commands and replies entered by the operator

**System log**

The system log (SYSLOG) is a SYSOUT data set that stores the messages and commands from the current system. SYSOUT data sets are output spool data sets on direct access storage devices (DASD) provided by the job entry subsystem (either JES2 or JES3). An installation usually prints the system log periodically. The system log consists of:
All messages issued through WTL macros
All messages entered by operator LOG commands
Usually, the hard-copy log
Any messages routed to the system log from any system component or program

Job log
Messages sent to the job log are intended for the programmer who submitted a job. The job log is specified in the system output class on the MSGCLASS parameter of the JCL JOB statement.

SYSOUT data set
Messages sent to a SYSOUT data set are intended for a programmer. These messages are issued by an assembler or compiler, the linkage editor and loader, and an application program. If the SYSOUT data set and the MSGCLASS parameter on the JCL JOB statement specify the same class, all messages about a program will appear in the same SYSOUT listing.

Message format
A displayed or printed message can appear by itself or with other information, such as a time stamp. The following topics show the format of the message body and the formats of accompanying information when the message is sent to various locations.

Format of the message body
The message body consists of three parts: the reply identifier (optional), the message identifier, and the message text. The following formats are possible:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>id CCCnnn text</td>
<td>Message identifier.</td>
</tr>
<tr>
<td>id CCCnnns text</td>
<td>Message identifier.</td>
</tr>
<tr>
<td>id CCCnnnns text</td>
<td>Message identifier.</td>
</tr>
<tr>
<td>id CCCnnnnns text</td>
<td>Message identifier.</td>
</tr>
<tr>
<td>id CCCSnnns text</td>
<td>Message identifier.</td>
</tr>
</tbody>
</table>

id Reply identifier: It is optional. It appears if an operator reply is required. The operator specifies it in the reply.

CCCnnn, CCCnnns, CCCnnnns, CCCnnnnns, CCCSnnns
Message identifier.

CCC
A prefix to identify the component, subsystem, or product that produced the message. The prefix is three characters.

S
The subcomponent identifier, which is an optional addition to the prefix to identify the subcomponent that produced the message. The subcomponent identifier is one character.

nnn, nnnn, nnnnn
A serial number to identify the individual message. The serial number is three, four, or five decimal digits.

s An optional type code, which is one of the following:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td><strong>Action</strong>: The operator must perform a specific action.</td>
</tr>
<tr>
<td>D</td>
<td><strong>Decision</strong>: The operator must choose an alternative.</td>
</tr>
<tr>
<td>E</td>
<td><strong>Eventual action</strong>: The operator must perform action when time is available.</td>
</tr>
<tr>
<td>I</td>
<td><strong>Information</strong>: No operator action is required.</td>
</tr>
<tr>
<td>S</td>
<td><strong>Severe error</strong>: Severe error messages are for a system programmer.</td>
</tr>
<tr>
<td>W</td>
<td><strong>Wait</strong>: Processing stops until the operator performs a required action.</td>
</tr>
</tbody>
</table>
The text provides information, describes an error, or requests an operator action.

**Note:** The following messages have special format for the message body. Refer to the specific message chapters for details.

- ADR messages
- CNL messages
- EWX messages
- IDA messages
- IEW messages
- IGW01 messages

**Messages sent to MCS/SMCS consoles**

Messages sent to MCS/SMCS consoles appear in one of the following formats:

```
  f hh.mm.ss sysname jobname message
  f hh.mm.ss sysname message
  f hh.mm.ss jobname message
  f hh.mm.ss message
  f sysname jobname message
  f sysname message
  f jobname message
  f message
```

- A screen character to indicate the status of certain messages, as follows:
  - `l` The operator has performed the action required for the message. The message has been deleted.
  - `-` The message is for information only; no operator action is required. The message was issued by the system or by a problem program.
  - `*` The message requires specific operator action and was issued by a WTOR or by an authorized program. The message has a descriptor code of 1, 2, or 11.
  - `@` The message requires specific operator action and was issued by a WTOR or by a problem program. The message has a descriptor code of 1, 2, or 11.
  - `+` The message requires no specific operator action and was issued by a problem program using a WTO macro.
  - `blank` The message requires no specific operator action.

- `hh.mm.ss` Time stamp: the hour (00-23), minute (00-59), and second (00-59).

- `sysname` System name for the system that issued the message.

- `jobname` Job name for the task that issued the message. This field is blank if a job did not issue the message.

- `message` Reply identifier, message identifier, and text.

**Messages sent to hardcopy log in JES2 system**

Multiple console support (MCS) handles message processing in:

- A JES2 system
- A JES3 system on a local processor
A JES3 system on a global processor, if JES3 has failed

MCS sends messages with routing codes 1, 2, 3, 4, 7, 8, and 10 to the hardcopy log when display consoles are used or more than one console is active. All other messages can be routed to the hard-copy log by a system option or a VARY HARDCPY operator command.

Messages sent to the hardcopy log appear in the format:

```
tcrrrrrr sysname yyddd ident msgflags message
   t     message
   t     lid message
```

<table>
<thead>
<tr>
<th>t</th>
<th>The first character on the line indicates the record type:</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>Data line of a multiple-line message; this line may be the last line of the message.</td>
</tr>
<tr>
<td>E</td>
<td>End line or data-end line of a multiple-line message.</td>
</tr>
<tr>
<td>L</td>
<td>Label line of a multiple-line message.</td>
</tr>
<tr>
<td>M</td>
<td>First line of a multiple-line message.</td>
</tr>
<tr>
<td>N</td>
<td>Single-line message that does not require a reply.</td>
</tr>
<tr>
<td>O</td>
<td>Operator LOG command.</td>
</tr>
<tr>
<td>S</td>
<td>Continuation of a single-line message or a continuation of the first line of a multi-line message. This continuation may be required because of the record length for the output device.</td>
</tr>
<tr>
<td>W</td>
<td>A message that requires a reply.</td>
</tr>
<tr>
<td>X</td>
<td>A log entry that did not originate with a LOG command or a system message.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>c</th>
<th>The second character on the line indicates whether the line was generated because of a command:</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Command input.</td>
</tr>
<tr>
<td>R</td>
<td>Command response.</td>
</tr>
<tr>
<td>I</td>
<td>Command issued internally. The job identifier contains the name of the internal issuer.</td>
</tr>
<tr>
<td>blank</td>
<td>Neither command input nor command response.</td>
</tr>
</tbody>
</table>

rrrrrr

Hexadecimal representation of the routing codes 1 through 28. To understand this hexadecimal number, convert it to binary; each binary 1 represents a routing code. For example, X'420C' represents routing codes 2, 7, 13, and 14 as shown here:

<table>
<thead>
<tr>
<th>Hexadecimal:</th>
<th>4</th>
<th>2</th>
<th>0</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Binary:</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Routing Codes:</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

sysname

The system name from the SYSNAME parameter in parmlib.

yyddd

The Julian date, given as the year (00-99) and the day of the year (000-366).

Note: If HCFORMAT(CENTURY) is specified in the CONSOLxx parmlib member, the Julian date appears as yyyyddd.

hh:mm:ss.th

Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and hundredths of a second (00-99).
ident
The job identifier for the task that issued the message, if the second character on the line is blank.

If the second character on the line is C or R, this field contains one of the following:

jobid   The job identifier of the task that issued the message, if it was issued by a job.
conname Console name of the console which issued the command or received the message.
INTERNAL For a command generated by a problem program or the system.
INSTREAM For a command read from the input stream.
blank   If MCS could not determine the source or destination for the message.

lid   Multiple-line identifier for the second and succeeding lines of a multiple-line message. This field appears after the message text (1) on the first line or (2) in the message area and is not followed by text on a continuation of the first line. The identifier appears on all lines of the same message.

msgflags
Installation exit and message suppression flags. For information about the description of the hardcopy log message flags, see HCL in [z/OS MVS Data Areas, Vol 2 (DCCB-ITZYRETC)].

message
Reply identifier, message identifier, and text. The reply identifier and message identifier appear only on the first line of a multiple-line message.

Messages sent to hardcopy log in JES3 system
Messages sent to the JESMSG hardcopy log in a JES3 system appear in the format:

```
hh:mm:ss$t message
```

Messages sent to the MLOG/DLOG hardcopy log appear in the format:

```
dest console yyddd hhmmss$tia[prefix] message
```

dest
JES3 destination class, which corresponds to the MVS routing code.

console
JES3 or MVS console name, as follows:

blank   For a message issued without a console name.
nnnnn   The JES3 console name (JNAME) from the JES3 initialization stream. This applies to remote consoles only.
cnname   The MCS console name, as specified on the NAME(cnname) parameter under the CONSOLE definition in SYS1.PARMLIB(CONSOLxx).
INTERNAL For a command generated by a problem program or operating system routine.
NETWORK   For a message issued to the network job entry (NJE) console.

yyddd   The Julian date, given as the year (00-99) and the day of the year (000-366).

Note: If HCFORMAT(century) is specified in the CONSOLxx parmlib member, the Julian date appears as yyyyddd.
hhmsst
Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and tenth of a second (0-9).

i Attention indicator for JES3 space constraints, as follows:
  blank    Normal output or no action required.
  #        The message is rerouted automatically or by a command from another console.
  %        Minimum space (track) situation (JSAM).
  =        Marginal space (track) situation (JSAM).
  <        Minimum buffer situation (JSAM).

Note: The above four symbols can be changed by a CONSTD statement in the JES3 initialization stream.

a Action prefix character, as follows:
  blank    Normal message.
  +        JES3 input command, issued on the global processor.
  -        MVS input command, issued on the global processor.

Operator action required.

prefix
  sysname R=jobname

Optional prefix for messages issued outside the JES3 address space or on a local processor, as follows:

  sysname
  The name of the system where the issuing program is running. JES3 determines the name from
  the ID parameter on the MAINPROC statement in the JES3 initialization stream.

  jobname
  The job name of the issuing program. It is all blanks for an system routine.

message
  Reply identifier, message identifier, and text.

Messages sent to the job log, to other data sets, and to display terminals
Messages sent to the job log, to other data sets, and to display terminals appear in the format designed by
the program that issued them.

Truncated data in multi-line messages
Under any one of the following conditions, the system might need to truncate a multi-line message:
  • When a message is being transported from one system to another in a sysplex, the sending or
    receiving system might encounter an error that prevents some or all of the message text from
    appearing. This can be caused by any of the following:
      – The issuing system is stopped or quiesced.
      – The issuing system fails to end a multi-line message.
      – The issuing system has an XCF buffer shortage.
      – A disruption occurs in sysplex communication.
      – An error occurs on the receiving system.

When one of the above conditions occurs, one of the following messages can appear within the
message text, indicating such an error:
LOSS OF DATA - MESSAGE COMPLETION FORCED
LOSS OF INTERMEDIATE MESSAGE DATA

• When no data line or endline has been issued for a multi-line message after an interval of thirty seconds, the system issues the following endline:
MESSAGE TIMED OUT - MESSAGE COMPLETION FORCED

• When a connect request exceeds the limit of 65533 lines, the system truncates the message with the following text:
EXCEEDED LINE LIMIT - MESSAGE COMPLETION FORCED

• When a multi-line message is issued with no end line, and it is not possible for the system to obtain space to temporarily store the message, the system truncates the message with the following text:
CONNECT UNAVAILABLE - MESSAGE COMPLETION FORCED

• When a multi-line connect request is issued, and the system is unable to obtain space to store the connecting lines, the system truncates the message with the following text:
CONNECT UNSUCCESSFUL - MESSAGE COMPLETION FORCED

• When a message is too long to fit into 80% of the Console message cache, the system truncates the message with the following text:
MESSAGE TRUNCATED FOR CONSOLE MESSAGE CACHE

• When there is a shortage of WTO buffers for display on MCS consoles, the screen display may be truncated with one of the following lines of text:
NUMBER OF LINES EXCEEDED MLIM - MESSAGE TRUNCATED
STORAGE CONSTRAINT - MESSAGE TRUNCATED
Message description
The following topics describes the different message description items, and in particular, the routing and descriptor codes.

Description items
The message explanation information is presented by the following items:

Explanation
The meaning of the message, including why the system issued the message.

System Action
- What the system did as a result of the system condition reported by the message. A system condition could include running out of storage, a hardware or software failure, an abend, a wait state.
- What the system did as a result of user input. User input can include a system command, a job running on the system, a transaction, a query, or another user-system interaction.

Operator Response
Instructions for the system operator, including, as appropriate, decisions to make and actions to take.
Only provided for messages that could appear at the operator console.

User Response
Instructions for the end user.
Only provided for messages that could appear at an interactive interface such as a TSO/E terminal or ISPF application.

Note: Most user messages are explained in other message books, such as z/OS TSO/E Messages.

Application Programmer Response
Instructions for an application programmer.
Only provided for messages that could appear in SYSOUT produced by a job, for example SPZAP.

System Programmer Response
Instructions for the system programmer.
Only provided for messages that require additional action beyond the operator response, user response, or application programmer response.

Storage Administrator Response
Instructions for the DFSMSdfp™ storage administrator.

Security Administrator Response
Instructions for the security administrator.
Only provided for security-related messages.

Problem Determination
Additional instructions for determining the cause of the problem, searching problem databases, and, if necessary, reporting the problem to the IBM support center. These instructions are for a customer support person who can troubleshoot problems, such as the system programmer or system administrator, an experienced security administrator, or an experienced storage administrator.
For additional information on performing problem determination procedures, see \textit{z/OS Problem Management} and the appropriate diagnosis guide for the product or element issuing the message, such as:

- DFSMS/MVS diagnosis guides and references
- \textit{z/OS JES2 Diagnosis}
- \textit{z/OS JES3 Diagnosis}

\textbf{Source}

Element, product, or component that issued the message.

\textbf{Detecting Module}

Name of the module or modules that detected the condition that caused the message to be issued.

\textbf{Routing Code}

For WTO or WTOR messages, the routing code of the message. See "Routing codes" for more information about the code meaning.

\textbf{Descriptor Code}

For WTO or WTOR messages, the descriptor code of the message. See "Descriptor codes" for more information about the code meaning.

\textbf{Routing codes}

Routing codes send system messages to the consoles where they are to be displayed. More than one routing code can be assigned to a message to send it to more than one console. For more information on message routing, see the following books:

- \textit{z/OS MVS Programming: Authorized Assembler Services Guide}
- \textit{z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO}
- \textit{z/OS MVS Installation Exits}
- \textit{z/OS MVS Initialization and Tuning Reference}

\textbf{Specification}

The routing codes are specified in the ROUTCDE parameter of the WTO or WTOR macro. If you specify a message which contains no routing codes, MVS may provide one or more default routing codes, based upon the presence or lack of other queuing specifications.

If you specify a message containing descriptor codes but no routing codes and no target console, MVS will not assign any routing codes and will write the message to the hardcopy log.

If you specify a message containing no routing codes, no descriptor codes, and no target console, MVS will assign a default set of routing codes. This set of default routing codes is specified at MVS initialization on the DEFAULT statement in your CONSOLxx parmlib member. If a set of default routing codes was not provided on the DEFAULT statement, MVS will assign routing codes 1 through 16.

\textbf{Routing code meaning}

Routing codes appear within the associated message. The routing code field can contain the following numeric values, special characters, or notes:

\begin{tabular}{|c|l|}
\hline
\textbf{Code} & \textbf{Meaning} \\
\hline
1 & \textbf{Operator Action} \\
& The message indicates a change in the system status. It demands action by a primary operator. \\
2 & \textbf{Operator Information} \\
& The message indicates a change in system status. It does not demand action; rather, it alerts a primary operator to a condition that might require action. \\
\hline
\end{tabular}
This routing code is used for any message that indicates job status when the status is not requested specifically by an operator inquiry. It is also used to route processor and problem program messages to the system operator.

3  **Tape Pool**
The message gives information about tape devices, such as the status of a tape unit or reel, the disposition of a tape reel, or a request to mount a tape.

4  **Direct Access Pool**
The message gives information about direct access storage devices (DASD), such as the status of a direct access unit or volume, the disposition of a volume, or a request to mount a volume.

5  **Tape Library**
The message gives tape library information, such as a request by volume serial numbers for tapes for system or problem program use.

6  **Disk Library**
The message gives disk library information, such as a request by volume serial numbers for volumes for system or problem program use.

7  **Unit Record Pool**
The message gives information about unit record equipment, such as a request to mount a printer train.

8  **Teleprocessing Control**
The message gives the status or disposition of teleprocessing equipment, such as a message that describes line errors.

9  **System Security**
The message gives information about security checking, such as a request for a password.

10 **System/Error Maintenance**
The message gives problem information for the system programmer, such as a system error, an uncorrectable I/O error, or information about system maintenance.

11 **Programmer Information**
This is commonly referred to as write to programmer (WTP). The message is intended for the problem programmer. This routing code is used when the program issuing the message cannot route the message to the programmer through a system output (SYSOUT) data set. The message appears in the JESYSMSG data set.

12 **Emulation**
The message gives information about emulation. (These message identifiers are not included in this publication.)

13-20  For customer use only.
21-28  For subsystem use only.
29  Disaster recovery.
30-40  For IBM use only.
41  The message gives information about JES3 job status.
42  The message gives general information about JES2 or JES3.
43-64  For JES use only.
65-96  Messages associated with particular processors.
97-128 Messages associated with particular devices.

*   The message will be routed back to the consoles that initiated the associated requests.

/   The message will be routed to different locations according to the task issuing it. For example, */2/3 means the message is routed back to the console that initiated the request, to a primary operator, or to the tape pool.

#   The message will be routed in one of the following ways:
   • According to the routing indicators specified by the operator
   • According to the default routing instructions previously specified by the operator
   • Back to the console that initiated the associated request

—   The message has no routing code.

N/A  A routing code is not applicable for the message.

Note 2 The message is issued by a WTO or WTOR macro, but has no routing or descriptor codes (old format WTO or WTOR macro).

Note 3 The message has a routing code of 1, which sends the message to a primary operator, and the message is also routed to the console that it describes.

Note 4 The message is sent to all active consoles; this is a broadcast message.

Note 5 The message has a routing code of 2, which sends the message to a primary operator.

Note 6 The message is routed only to non-printer consoles. This message is not issued by a WTO or WTOR macro.

Note 7 The message is routed to consoles where one or more of the following are active:
   • MONITOR JOBNAME
   • MONITOR SESSION
   • MONITOR STATUS

Note 9 The message is issued during the nucleus initialization program (NIP) processing.

Note 10 The message is issued by the WTL macro.

Note 11 The message is routed to a SYSRPRNT data set by data management.

Note 12 The message is issued by a WTO or WTOR macro with SYNCH=YES. See z/OS MVS Initialization and Tuning Reference for more information.

Note 13 The message is routed only to receivers of the hardcopy message set.

Note 14 The message is routed back to the console that initiated the request and to all associated consoles.

Note 16 The message is routed to the IPCS print file IPCSPRNT.

Note 17 The message is issued by JES3. A JES3 destination class is specified either by the initialization stream or by operator commands.

Note 18 The message is sent in response to a command to the console where the command was entered.

Note 19 The message is written to a data set. If routing and descriptor codes are also included for the message, the message might also be displayed according to the specified routing and descriptor codes. (The descriptor code does not apply to writing the message to the data set.)
Note 20 JES3 does not issue the message. JES3 sends the message to another subsystem for processing.

Note 21 This message is a trailer attached to multiple messages previously issued. It has the same routing and descriptor codes as the first line of the conglomerate.

Note 22 This message is routed to the transaction program (TP) message log.

Note 23 This message is issued by the device controller. The routing code will vary according to the device controller's task.

Note 24 This message is routed to the assembly listing.

Note 25 When this message is issued during IPL, the routing codes are 2 and 10 and the descriptor code is 12. When it is issued after IPL, it has no routing code and the descriptor code is 5.

Note 26 When this message is issued during NIP processing, the descriptor code is 12. When it is issued after NIP processing, the descriptor code is 4.

Note 27 The indicated route codes are used only if this message is issued in response to a reply of CKPTDEF during a JES2 checkpoint reconfiguration. This message might be issued to a specific console rather than directed by route code. For further information concerning the routing of JES2 messages issued during a reconfiguration, see z/OS JES2 Initialization and Tuning Guide.

Note 28 These routing and descriptor codes apply only when SMS issues the message. If SMS returns the message to its caller and the caller issues the message, the codes do not apply.

Note 29 This message is written to the JES3OUT data set.

Note 30 This message is issued by JES3. The message is written to the *MODIFY CONFIG (*F MODIFY) log and/or the issuer of the *F CONFIG command.

Note 31 The routing and descriptor codes for this message are dependent on the setting of indicator bits within the S99EOPTS field in the SVC 99 Request Block Extension (S99RBX). See the z/OS MVS Programming: Authorized Assembler Services Guide, Processing Messages and Reason Codes from Dynamic Allocation for additional information.

Note 32 Routing code 2 is only applicable if message IYP050D was issued.

Note 33 Routing code 2 is only applicable if message IZP050D was issued.

Note 34 This message is only displayed on the SMCS Console Selection screen, and is not issued via WTO support.

Note 35 By default, IBM Health Checker for z/OS messages does not use routing codes, but the installation can override the default to use routing codes using either the MODIFY hzsproc command or in the HZSPRMxx parmlib member. See IBM Health Checker for z/OS: User's Guide for more information.

Note 36 This message is written to the JESYSMSG data set.

Descriptor codes
Descriptor codes describe the significance of messages. They indicate whether the system or a task stops processing, waits until some action is completed, or continues. This code also determines how the system will display and delete the message.

Association with message type code
 Descriptor codes are associated with message type codes, specified by a letter following the message serial number, as follows:
<table>
<thead>
<tr>
<th>Descriptor Code</th>
<th>Type Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>W (wait)</td>
</tr>
<tr>
<td>2</td>
<td>A (action) or D (decision)</td>
</tr>
<tr>
<td>3</td>
<td>E (eventual action)</td>
</tr>
<tr>
<td>4 through 10</td>
<td>I (information)</td>
</tr>
<tr>
<td>11</td>
<td>E (critical eventual action)</td>
</tr>
<tr>
<td>12 and 13</td>
<td>I (information)</td>
</tr>
</tbody>
</table>

**Valid combinations and restrictions for descriptor codes**

Descriptor codes are specified in the DESC parameter of the WTO or WTOR macro. The following restrictions apply when specifying descriptor codes:

- Descriptor codes 1 through 6, 11, and 12 are mutually exclusive. Assign only one of these codes to a message. If you assign two mutually exclusive codes to one message, the system uses the most important code and ignores the other.
- Descriptor codes 7 through 10 and 13 can be assigned in combination with any of the mutually exclusive codes.
- Descriptor code 9 can be used only with descriptor code 8.

Under certain conditions, the system uses a descriptor code other than that specified in the macro as follows:

- The system assigns descriptor code 6 if the macro specifies a ROUTCDE parameter, but no DESC parameter.
- The system assigns descriptor code 7 if all of the following are true:
  1. A problem program issued the macro.
  2. The macro omits both DESC and ROUTCDE parameters, or specifies descriptor codes 1 or 2.
  3. The message is not a multiple-line WTO message.
- The system assigns no descriptor code if all of the following are true:
  1. An authorized program issued the macro.
  2. The macro omits both DESC and ROUTCDE parameters.
  3. The message is not a multiple-line WTO message.

**Note:** An authorized program has at least one of these characteristics:
- Authorized by the authorized program facility (APF)
- Runs in supervisor state
- Runs under PSW key 0 through 7

**Message deletion**

With multiple console support (MCS), action messages with descriptor code 1 or 2 issued by problem programs are assigned descriptor code 7; thus, they are automatically deleted from the system at task or address space ending.

The system deletes messages issued by any program when that program issues the DOM macro for a message.

The operator can manually remove all messages from a display console screen or can set the console to roll messages off the screen.
Message Color
On operator consoles with color, the descriptor code determines the color of the message. The use of color is explained in [z/OS MVS System Commands]. Also see the descriptions of the CONSOLxx and MPFLSTxx parmlib members in [z/OS MVS Initialization and Tuning Reference].

Descriptor code meaning
Descriptor codes appear within the associated message. The descriptor code field can contain the following numeric values, special characters or note.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>System Failure</td>
</tr>
<tr>
<td></td>
<td>The message indicates an error that disrupts system operations. To continue, the operator must reIPL the system or restart a major subsystem. This causes the audible alarm to be sounded.</td>
</tr>
<tr>
<td>2</td>
<td>Immediate Action Required</td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action immediately. The message issuer could be in a wait state until the action is performed or the system needs the action as soon as possible to improve performance. The task waits for the operator to complete the action. This causes the audible alarm to be sounded.</td>
</tr>
<tr>
<td></td>
<td>Note: When an authorized program issues a message with descriptor code 2, a DOM macro must be issued to delete the message after the requested action is performed.</td>
</tr>
<tr>
<td>3</td>
<td>Eventual Action Required</td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action eventually. The task does not wait for the operator to complete the action.</td>
</tr>
<tr>
<td></td>
<td>If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.</td>
</tr>
<tr>
<td>4</td>
<td>System Status</td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a system task or of a hardware unit.</td>
</tr>
<tr>
<td>5</td>
<td>Immediate Command Response</td>
</tr>
<tr>
<td></td>
<td>The message is issued as an immediate response to a system command. The response does not depend on another system action or task.</td>
</tr>
<tr>
<td>6</td>
<td>Job Status</td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a job or job step.</td>
</tr>
<tr>
<td>7</td>
<td>Task-Related</td>
</tr>
<tr>
<td></td>
<td>The message is issued by an application or system program. Messages with this descriptor code are deleted when the job step that issued them ends.</td>
</tr>
<tr>
<td>8</td>
<td>Out-of-Line</td>
</tr>
<tr>
<td></td>
<td>The message, which is one line of a group of one or more lines, is to be displayed out-of-line. If a message cannot be displayed out-of-line because of the device being used, descriptor code 8 is ignored, and the message is displayed in-line with the other messages.</td>
</tr>
<tr>
<td>9</td>
<td>Operator’s Request</td>
</tr>
<tr>
<td></td>
<td>The message is written in response to an operator’s request for information by a DEVSERV, DISPLAY, or MONITOR command.</td>
</tr>
</tbody>
</table>
10 Not defined

Descriptor code 10 is not currently in use.

11 Critical Eventual Action Required

The message indicates that the operator must perform an action eventually, and the action is important enough for the message to remain on the display screen until the action is completed. The task does not wait for the operator to complete the action. This causes the audible alarm to be sounded.

Avoid using this descriptor code for non-critical messages because the display screen could become filled.

If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.

12 Important Information

The message contains important information that must be displayed at a console, but does not require any action in response.

13 Automation Information

Indicates that this message was previously automated.

14-16 Reserved for future use.

/ The message will have different descriptor codes according to the task issuing it. For example, 4/6 means the message can describe system status or job status.

— The message has no descriptor code.

N/A A descriptor code is not applicable for the message.

Note 1 The descriptor code for an IBM Health Checker for z/OS check exception message might vary, because the installation can override the descriptor code either using the MODIFY hzsproc command or in the HZSPRMxx parmlib member. See IBM Health Checker for z/OS: User’s Guide for more information. In addition to the descriptor code selected by the installation, one of the following descriptor codes is also included based on the severity of the check:

- High severity checks use a descriptor code of 11.
- Medium severity checks use a descriptor code of 3.
- Low severity checks use a descriptor code of 12.

Message directory

To use a message prefix to locate the document containing a specific message, see the following table.

**Building your own message library**

If you are operators or programmers in an installation, you can build your own libraries of the message and code information that fits your specific needs. You can place into binders the chapters and documents containing only the messages and codes you receive.
Basic documents

Each installation requires at least one copy of each of the MVS System Messages documents and of \textit{z/OS MVS Dump Output Messages}. Regardless of the specific options of your system, you will receive at the console or in listings some subset of the messages in these documents.

Each installation also requires at least one copy of \textit{z/OS MVS System Codes}, which contains the 3-digit hexadecimal system completion codes (abend codes) and the wait state codes produced by all the components of the system.

Note: 4-digit decimal user completion codes appear in documents for the component, subsystem, or product that produces the codes. Codes produced by installation-provided programs do not appear in IBM documents.

All programming and operations personnel need access to the basic documents, although application programmers might not need to have their own copies.

Optional documents

For information about message changes for multiple \textit{z/OS} elements including JES2, JES3, RACF, TCP/IP, and others, see \textit{z/OS Summary of Message and Interface Changes}.

CD-ROM collection

A comprehensive source of messages for IBM products is contained in the \textit{IBM Online Library Productivity Edition: Messages and Codes Collection}, SK2T-2068.

Translating messages

Using the MVS message service (MMS), you can translate MVS system messages into other languages. The following messages cannot be translated:

\begin{itemize}
  \item Initialization messages
  \item DFSMS/MVS messages
  \item JES3 messages
  \item Some complicated multiple-line messages
\end{itemize}

See \textit{z/OS MVS Planning: Operations} and \textit{z/OS MVS Programming: Assembler Services Guide} for information about using the MMS.

Finding changes to system message texts

Automation routines are sensitive to message text changes between releases. So before migrating from your current release to another one, you might need to check out the message changes. The summary of changes of the related messages books can be a helpful reference; an alternative can identify changes to message texts more accurately: comparing the SYS1.MSGENU data set.

IBM supplies a data set containing the text of system messages that are translated. This data set, called SYS1.MSGENU, contains the text of system messages in the form of message skeletons.

Note that this method will not show changes to messages that are not translated:

\begin{itemize}
  \item MVS system messages that are not translated, such as IPL and NIP messages (which are issued before the MVS message service is available)
  \item Other product messages that are not translated, such as DFSMS/MVS messages, and JES3 messages.
\end{itemize}

You can compare the new data set with the data set on the system from which you are migrating. Depending on how you do the comparison, you can get output like the following.
For new messages, the output might show an I (for Insert) on the left:
I - IEA403I       VALUE OF RMAX HAS BEEN CHANGED TO 99

For messages with changed text, the output might show both an I and a D, indicating that a record in the message file has been replaced:
I - IEE162I 46  &NNN. ROLL &A. MESSAGES (DEL=R OR RD)
D - IEE162I 46  &NNN. ROLL &A. MESSAGES (DEL=R, RD)

This means that, in message IEE162I, (DEL=R, RD) was replaced by (DEL=R OR RD).

Using this information, you can decide if your automation routines need to be changed.
Chapter 2. ABA messages

ABA001I  AGGREGATE BACKUP ASSIST V1.0
STARTING — It
Explanation: This is an informational message to alert you that ABA is starting. It is the update level of ABA.
System action: None.
Application Programmer Response: None.
Source: DFSMS/hsm

ABA002S  OPEN ERROR ON FILE ddname
Explanation: A data set required by ABA was not opened successfully. The ddname is the DD name of the data set.
System action: ABA discontinues processing.
Operator response: Verify the data set is defined correctly in the JCL.
Source: DFSMS/hsm

ABA003S  UNABLE TO OBTAIN SUFFICIENT STORAGE. nnnnnn Bytes
REQUIRED. RS=ssss
Explanation: ABA was unable to obtain sufficient storage for its internal work areas.
• nnnnnn is the amount of storage requested.
• sssss indicates what the storage is for and is not meaningful to the operator.
System action: ABA discontinues processing.
Operator response: Rerun ABA with a larger region size.
Source: DFSMS/hsm

ABA004I  JOB NAMES FOUND IN SMF DATA BY ABA:
Explanation: This message is followed by the job names that have been found by ABA when searching SMF records. This information is useful in verifying that the generic job names you specified have been able to correctly identify the desired job names.
System action: None.
Application Programmer Response: None.
Source: DFSMS/hsm

ABA005S  ERROR RETURN FROM DFSORT. RETURN CODE cc
Explanation: The call to DFSORT has been unsuccessful. The return code returned by DFSORT is cc.
System action: ABA discontinues processing.
Application Programmer Response: None.
Source: DFSMS/hsm

ABA006S  INVALID SELECTION DATA SET SPECIFIED. RECORD FORMAT NOT
FIXED, FIXED BLOCK, OR RECORD LENGTH NOT 80
Explanation: To be consistent with ABARS requirements a selection data set must have fixed length records 80 bytes in length. The data set you specified on the SELECTDS DD statement in the JCL does not meet these requirements.
System action: ABA discontinues processing.
Operator response: Correct the SELECTDS DD statement specification and rerun ABA.
Source: DFSMS/hsm

ABA007S  INPUT JOB NAME FILTER HAS INVALID FORMAT: ffffffff
Explanation: The generic job name identified by ffffffff is not in a format accepted by ABA.
System action: ABA discontinues processing.
Operator response: Refer to z/OS DFSMS/hsm Storage Administration "Aggregate Backup and Recovery Support (ABARS)" for ABA generic job names syntax. Correct the SYSIN input and rerun ABA.
Source: DFSMS/hsm

ABA008I  SYSIN INPUT DATA:
Explanation: This message is followed by an echo of the SYSIN input stream.
System action: None.
Application Programmer Response: None.
Source: DFSMS/hsm

ABA009I  TOTAL NUMBER OF DATA SETS FOUND: nnnnnnnn
Explanation: The number of data set names written to the output selection data set is nnnnnnnn.
System action: None.
Application Programmer Response: None.
Source: DFSMS/hsm
ABA010I  TOTAL NUMBER OF JOBS FOUND: nnnnnnnn
Explanation: The number of jobs found in the SMF data that meets the input criteria is nn.nn.nn.nn. The actual job names follow message ABA004I.
System action: None.
Application Programmer Response: None.
Source: DFSMShsm

ABA020I  STORAGE USED, LOCATION — ANY: nn.nn.nn.nn bytes
Explanation: The number of bytes of storage used by ABA for in-storage tables and program buffers, which reside above or below the 16M line, is nn.nn.nn.nn. This value does not include the storage required to hold the ABA module, the access method buffers for each data set, the storage required by DFSORT, or the normal overhead required by MVS.
System action: None.
Application Programmer Response: None.
Source: DFSMShsm

ABA021I  STORAGE USED, LOCATION — BELOW: nn.nn.nn.nn BYTES
Explanation: The number of bytes of storage used by ABA for in-storage tables and program buffers which must reside below the 16M line is nn.nn.nn.nn. This value does not include the storage required to hold the ABA module, the access method buffers for each data set, the storage required by DFSORT, or the normal overhead required by MVS.
System action: None.
Application Programmer Response: None.
Source: DFSMShsm

ABA030I  NUMBER OF RECORDS PASSED TO SORT: nn.nn.nn.nn
Explanation: The number of data set name records passed to DFSORT for sorting is nn.nn.nn.nn.
System action: None.
Application Programmer Response: None.
Source: DFSMShsm

ABA031I  NUMBER OF RECORDS RECEIVED FROM SORT: nn.nn.nn.nn
Explanation: The number of data set name records that DFSORT has passed back to the ABAE35 exit module is nn.nn.nn.nn.
System action: None.

ABA032E  ERROR, RECORDS LOST DURING SORT PROCESSING
Explanation: An error occurred during sort processing. The number of records passed to the DFSORT program does not match the number received from DFSORT. Refer to messages ABA030I and ABA031I for the number of records passed to and received from DFSORT.
System action: ABA continues processing. However, data set records be lost.
Operator response: Run ABA again and specify DISP KEEP or CATLG on the SORTIN DD statement. Then run DFSORT against this data set outside of ABA control. This give you a sort failure which is independent of the ABA utility.
Contact the support group for the DFSORT program.
Source: DFSMShsm

ABA033I  SORT CNTL STMT: sssssssss....
Explanation: The sort control statement passed to DFSORT is sssssssss.... This message is printed along with message ABA032I to assist in diagnosing possible sort program problems.
System action: None.
Application Programmer Response: None.
Source: DFSMShsm

ABA040W  WARNING, RECORD FORMAT ERRORS FOUND IN SMF DATA SET
Explanation: This message is issued whenever ABA finds an incomplete SMF record. The usual cause of the error is a system failure which occurs while SMF is writing to the SMF data set.
System action: ABA will discard all or part of the bad SMF record and continue processing. This result in missing data set name entries.
Application Programmer Response: None.
Source: DFSMShsm

ABA050I  AGGREGATE BACKUP ENTERING {SMF PROCESSING | LOCATE PROCESSING | SORT PROCESSING} yy.ddd.hh.mm.ss
Explanation: This message informs the user of the progress of ABA processing. Each message is time
stamped with the current system date and time.

**System action**: None.

**Application Programmer Response**: None.

**Source**: DFSMSshsm

ABA098I ABA ENDING

**Explanation**: ABA has successfully finished processing.

**System action**: None.

**Application Programmer Response**: None.

**Source**: DFSMSshsm

ABA099S ABA TERMINATING

**Explanation**: ABA is discontinuing processing because of an error. The message preceding this message indicates what the error is.

**System action**: ABA discontinues processing.

**Operator response**: See the message preceding this message for any possible operator actions you need to take.

**Source**: DFSMSshsm
Chapter 3. ADR messages

ADR is the message prefix for system DFSMSdss™ messages. The format of these messages is as follows.

Format of system DFSMSdss messages

ADRdssu is the program that produces system DFSMSdss messages. For programmers, ADRdssu produces the messages in the SYSPRINT data set, and for operators, by way of the console.

Note: The system messages are from ADR001T through ADR998W.

The format of messages written to SYSPRINT is:

ADRnnnt (xxx)-mmmm(yy), message text

The format of messages written to the console is:

zzADRnnnt (xxx)-mmmm(yy), message text

Figure 1 illustrates the format of a system DFSMSdss message.

Figure 1. Format of a System DFSMSdss Message

zz	Message reply identification (absent if reply is not required).
ADR	Standard 3-character component name prefix.
nnn	Message number. This three-digit number is unique to each message.
t	Type code. This one character code identifies either the console operator type or the SYSPRINT message severity. For console messages, the types are:
A	Action: Operator must perform a specific action.
D	Decision: Operator must choose an alternative action.
I	Information: No operator action is required.
W	Attention: No operator action is required, but an error occurred.

For SYSPRINT messages, the type code indicates the severity as follows:
I	Informational message.
W	Attention message. Task continues, but an error occurred.
ADR001T  •  ADR002T

**E**  Error message. The particular task might end or might continue without completing all requests.

**T**  Termination message. DFSMSdss ends.

**(xxx)**  The task ID of the requested function. For each function requested in the input control statements, a task ID is assigned. Each message related to a task contains this task ID in the message. If the message is general (that is, not relating to a particular function), this field is omitted.

**mmmmm(yy)**  Diagnostic information used by IBM service representatives as an aid in problem determination.

The text of the message itself follows the diagnostic information and completes the standard format for system DFSMSdss messages.

As a function completes, two values are set: LASTCC and MAXCC.

- LASTCC contains the return code of the completing task until the task following this task completes. Then the LASTCC value is assigned from the subsequent completed task.
- MAXCC is set whenever a completing task has a return code greater than the previous value of MAXCC.

For any task, the return code is set equal to the maximum level message issued for that task. Return codes and their explanations are as follows:

- 0  Operation was successful.
- 4  Operation completed, but an attention (W) message was issued during processing.
- 8  Either (1) a function did not execute or began execution but ended prematurely, or (2) an error (E) message was issued during processing.
- 12 A terminating (T) message was issued. No functions were performed.
- 16 A function executed leaving at least one volume or data set in an unusable condition (for example, a DUMP or a full volume RESTORE prematurely ended).

**Note to Application Programmers:** Some of the text under “Explanation,” “System Action,” and “Application Programmer Response” is oriented toward system programmers, data administrators, or data management personnel. Contact the appropriate person in your facility if an explanation is necessary. All addresses denoted with ‘c:h’ in the following messages are in normalized form.

### ADR message explanations

#### ADR001T

**Explanation:** The DD statement `ddname` does not exist or is coded incorrectly. This message is printed if a SYSPRINT DD (or alternative as indicated in the message) is not found or cannot be opened.

**System action:** The job ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Probable user error. Verify that a SYSPRINT (or acceptable alternative) DD statement is present in the step. Correct the error, and resubmit the job.

**Source:** DFSMSdss

#### ADR002T

**Explanation:** Not enough main storage was available to perform the initialization functions of DFSMSdss. Message ADR018I follows this message to indicate the storage needed.

**System action:** Processing ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Probable user error. One of the following responses is appropriate:
• Increase REGION value in the JOB or EXEC statement to at least the value indicated by message ADR018I, and retry.
• If the SIZE= parameter was specified, increase the parameter value. This value must not exceed the storage available in the REGION value.

Source: DFSMSdss

ADR004I  (ttt)-mmmmm(yy), USER ABEND 0001 WILL BE ISSUED ON | AN SVC DUMP WILL BE REQUESTED FOR) OCCURRENCE n OF MESSAGE ADRnnn

Explanation: The PARM statement contains the ABEND= or SDUMP= keywords. An abend or SVC dump is generated at the nth occurrence of the indicated message.

System action: Processing continues until the nth occurrence of the indicated message is encountered. DFSMSdss will issue a USER ABEND 0001 for the ABEND= keyword and terminate. DFSMSdss will request an SVC dump for the SDUMP= keyword and continue processing.

Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR005T  (ttt)-mmmmm(yy), NO SYSIN FILE

Explanation: A SYSIN DD statement (or acceptable alternative ddname) was not present in the job stream.

System action: Processing ends. The return code is 12.

Operator response: None.
Application Programmer Response: Probable user error. Make certain a SYSIN DD statement is present, and retry the job.

Source: DFSMSdss

ADR006I  (ttt)-mmmmm(yy), date_and_time EXECUTION (BEGINs | ENDs | HALTED)

Explanation: This message gives the date and time a particular task begins or ends processing.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR007E  (ttt)-mmmmm(yy), TASK CONTAINS AN INVALID NUMBER OF I/O FILE REQUESTS

Explanation: The number of input or output files specified in the control statements was incorrect. The following are possible conditions:
• A full or tracks restore or copy did not have exactly one input and one output file.
• A full or tracks DUMP had more than one input volume.
• A DEFRAg function specified more than one volume.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.
Application Programmer Response: Correct the statement, and rerun the job.
Source: DFSMSdss

ADR008E  (ttt)-mmmmm(yy), INSUFFICIENT STORAGE AVAILABLE TO SCHEDULE TASK

Explanation: Insufficient storage space was available for this function. Message ADR018I follows this message to indicate the storage for this task.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.
Application Programmer Response: Probable user error. Correct the error as indicated by message ADR018I, and resubmit the job.
Source: DFSMSdss

ADR009T  (ttt)-mmmmm(yy), INVALID {LINECNT | SIZE | TYPRUN | PAGENO | ABEND | AMSGCNT | TRACE | UTILMSG | XABUFF | ZBUFF64R | RACFLOG | SDUMP | SMSGCNT | TMPMSGDS | WORKVOL | WORKUNIT} VALUE SPECIFIED IN PARM STATEMENT

Explanation: The indicated parameter on the EXEC statement was incorrectly specified.

LINECNT Must be between 1 and 9999
SIZE Must be less than or equal to 9999K bytes
TYPRUN Must be TYPRUN=SCAN or TYPRUN=NORUN
PAGENO Must be between 0 and 9999
ABEND Must be between 0 and 999
ADR010I (ttt-mmmmm(yy), date_and_time SIZE VALUE OF size WILL BE USED FOR GETMAIN

Explanation: This message indicates the value of the SIZE parameter that the requester specifies. The value does not include the storage acquired by the programs or utilities that DFSMSdss calls.

System action: The storage used by DFSMSdss does not exceed the indicated value.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR011I (ttt-mmmmm(yy), LINECNT VALUE OF line_count WILL BE USED

Explanation: This message indicates the value of the LINECNT parameter that the requester specifies.

System action: SYSPRINT output is printed at the indicated lines per page. If a value of 9999 is specified, no page eject occurs.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR012I (ttt-mmmmm(yy), date_and_time DFSMSDSS PROCESSING COMPLETE. HIGHEST RETURN CODE IS return_code [FROM:]

Explanation: This message is issued after a DFSMSdss job step completes. The MAXCC, or highest condition code (return_code), set during the job step is printed (see message ADR013I) and returned to the DFSMSdss invoker in register 15. If the highest condition code is not zero, a list of the tasks completed with that code is printed. If the highest condition code is received from the syntax checking of the control statements, the word SYNTAX is printed. If the highest condition code is generated by a SET command, the words SET COMMAND are printed.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR013I (ttt-mmmmm(yy), date_and_time TASK {COMPLETED | ABENDED} WITH {RETURN | SYSTEM ABEND | USER ABEND} CODE {return_code | abend_code}

Explanation: If the command did not abend, the return_code is the condition code generated during processing of the command. If the command abended, the abend code (abend_code) is also printed. The system abend code is in hexadecimal, and the user abend code is in decimal.

System action: If the command abended, LASTCC is set to 8, or it is set to the return_code. If MAXCC is less than LASTCC, MAXCC is set so it is equal to LASTCC.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR014I (ttt-mmmmm(yy), date_and_time ALL PREVIOUSLY SCHEDULED TASKS COMPLETED. (SERIAL/PARALLEL) MODE NOW IN EFFECT

Explanation: A switch was made from serial mode to parallel mode or from parallel mode to serial mode (at the request of the user in the control statement or by the installation-wide options exit routine).

System action: All previously scheduled tasks either running or waiting to run have completed. Processing continues.

Operator response: None.

Application Programmer Response: None.
ADR015I (ttt-mmmmm(yy), {MAXIMUM CONDITION CODE IF RETURN CODE OF TASK} HAS BEEN RESET FROM return_code_1 TO return_code_2

Explanation: A SET command was encountered and successfully reset a condition code (return_code_1 and return_code_2). The text indicates which task ID was affected, what the return code was before and after the reset, and to what the return code was reset.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR016I (ttt-mmmmm(yy), RACF LOGGING OPTION IN EFFECT FOR THIS TASK

Explanation: RACF logging for volume and data set authorizations by DFSMSdss will be performed in accordance with the resource profile specifications. The option is in effect because RACFLOG=YES was specified or the installation-wide options exit forced it.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR017E (ttt-mmmmm(yy), date_and_time TASK NOT SCHEDULED DUE TO ERROR. TASK RETURN CODE return_code

Explanation: The task was not performed. Processing continues with the next control statement. The return code (return_code) is 8.

System action: Processing continues with the next control statement. The return code (return_code) is 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR018I (ttt-mmmmm(yy), STORAGE REQUIRED nK1. STORAGE AVAILABLE nK2

Explanation: A task was not performed or the job did not start because of lack of storage. This message follows either message ADR002T or ADR008E and indicates the approximate amount of storage required (nK1) when the job is rerun and the storage available (nK2). The values refer only to the failure indicated in message ADR002T or ADR008E and do not take into account storage required for subsequent task scheduling.

System action: Message ADR002T or ADR008E indicates the return code and system action.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR019E (ttt-mmmmm(yy), THE {INPUT | OUTPUT} FILE HAS AN INVALID DEVICE TYPE FOR THE COMMAND SPECIFIED

Explanation: The DASD device is not supported for the command specified.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.
Operator response: None.
Application Programmer Response: Probable user error. Correct the error, and resubmit the job.
Source: DFSMSdss

ADR020E (ttt-mmmmm(yy), DDNAME ddname NOT FOUND

Explanation: A ddname specified in a DFSMSdss control statement has no corresponding ddname in a DD statement. Either a necessary DD statement is missing, or a ddname is misspelled in an existing DD statement.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.
Operator response: None.
Application Programmer Response: Probable user error. Correct the error, and resubmit the job.
Source: DFSMSdss

ADR021I (ttt-mmmmm(yy), THE ALLOCATION OF THE MESSAGE DATA SET HAS FAILED. DYNAMIC ALLOCATION ERROR CODE: error_code, INFORMATION CODE: information_code. MESSAGES WILL BE SPOOLED TO SYSPRINT

Explanation: DFSMSdss attempted to allocate a temporary data set to store task-related messages. If the WORKUNIT or the WORKVOL parameters, or both, were specified, they will be used to allocate the temporary data set. The error code (error_code) and information code (information_code) are returned by dynamic allocation. The codes are listed in the [z/OS MVS Programming: Authorized Assembler Services Guide](https://www.ibm.com/support/docview.wss?uid=swg27046654) An undocumented error code be displayed if an installation-wide validation exit is used to deny dynamic allocation.
ADR022T • ADR026E

Allocation but fails to get a reason code returned by dynamic allocation.

**System action:** Messages not be grouped according to task, if DFSMSdss is running in parallel mode.

**Operator response:** None.

**Application Programmer Response:** Correct the problem as indicated by `error_code` and `information_code`, or specify a different volume or esoteric name with the `WORKUNIT` or `WORKVOL` parameters or both.

**Source:** DFSMSdss

---

ADR022T (xxx)-mmmm(yy), INVALID DCB SPECIFIED FOR (SYSPRINT | ddname)

**Explanation:** The DCB for the SYSPRINT file (or its acceptable alternative) must have a RECFM of VB or VBA. The logical record length (LRECL) must have a value between 84 and 137. The BLKSIZE must have a value of at least 4 greater than the LRECL. The actual printed line will be 5 less than the LRECL. If the LRECL is greater than 137, it is changed to 137 and message ADR030I is issued.

**System action:** The job ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Probable user error. Correct the error, and rerun the job.

**Source:** DFSMSdss

---

ADR023E (xxx)-mmmm(yy), DDNAME ddname CONCATENATED

**Explanation:** A DDNAME specified in a DFSMSdss control statement requests that a data set be concatenated. The DFSMSdss task being performed does not support data set concatenation.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**Source:** DFSMSdss

---

ADR024E (ttt)-mmmm(yy), TRACKS/OUTTRACKS VALUE IS INVALID FOR DEVICE. VALID CYLINDER RANGE IS 0 TO X'ccccccc'. VALID TRACK RANGE IS 0 TO X'h'

**Explanation:** The following values are not valid for the specified device types: (1) the range specified in the TRACKS keyword of a DUMP, COPY, RESTORE, or PRINT, or (2) the range specified for the OUTTRACKS keyword for COPY or RESTORE. The TRACKS values must fall within the cylinder and track range indicated in the message. The `cccc` and `hhhh` are high cylinder and head numbers, respectively, in decimal notation.

**System action:** The task ends. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the error, and rerun the job.

**Source:** DFSMSdss

---

ADR025E (ttt)-mmmm(yy), {INPUT | OUTPUT} DEVICE TYPE IS INVALID FOR TASK

**Explanation:** The input or output device type for the command is not allowed. For a DUMP or a CONVERT, input must be DASD. For a RESTORE, output must be DASD. For a copy, both input and output must be DASD. For a PRINT, input must be DASD. For a DEFRAG, the volume must be DASD. For BUILDSA, the output device type must be one of the device types supported for Stand-Alone Services IPL. For all functions of DFSMSdss, VIO devices are not supported.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the error, and reissue the command.

**Source:** DFSMSdss

---

ADR026E (ttt)-mmmm(yy), {volume_serial_number | ddname} IS INVALID AS OBJECT DDNAME

**Explanation:** A reference was made to an incorrect `volume_serial_number` or `ddname`. The following restrictions apply to DD references from the control statements:
- SYSPRINT (or its alternative) can be referred to only from the PRINT command.
- SYSSIN (or its alternative) cannot be referred to at all.
- The indicated volume serial number was specified more than once in the INDYNAM, LOGINDYNAM, DYNAM, LOGDYNAM, or OUTDYNAM parameter list, or the STORGRP parameter list, which contains the volume serial number, was specified more than once.
• The volume serial number associated with the indicated DDNAME was specified more than once in the DDNAME, INDDNAME, LOGINDDNAME, or OUTDDNAME parameter list.
• The volume serial number associated with the indicated ddname was specified more than once for the INDDNAME or OUTDDNAME parameter on a COPY, CONVVERT, or DUMP command.

System action: The task ends. Processing continues with the next control statement. The return code is 8.

Operator response: None.
Application Programmer Response: Correct the error, and reissue the command.
Source: DFSMSdss

ADR028I (ttt-mmmmm yy), TYPRUN=SCAN REQUESTED. ONLY CONTROL CARD SYNTAX CHECKING WILL BE DONE

Explanation: No tasks will be performed. Only checking of the input control statements will be done.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR029T (ttt-mmmmm yy), KEYWORD PRECEDING POSITION nn IN PARM STATEMENT IS INVALID

Explanation: In the EXEC statement, the keyword preceding the = sign in the indicated position of the parameter of the PARM keyword is not recognized as a valid keyword option.

System action: The job ends. The return code is 12.
Operator response: None.
Application Programmer Response: Correct the error in the PARM statement, and rerun the job. The valid parameter keywords are shown in DFSMSdft Storage Administration. Also, for debugging purposes, the parameter list passed to DFSMSdss is printed immediately following this message.
Source: DFSMSdss

ADR030I (xxx-mmmmm yy), DCB VALUES HAVE BEEN MODIFIED FOR ddname

Explanation: In the DCB information you specified, either the LRECL or the BLKSIZE value was outside the allowable range. The LRECL and the BLKSIZE are set to default values of 137 and 141, respectively.

System action: The job continues with the modified DCB for the ddname.

Operator response: None.
Application Programmer Response: In the future, supply a correct DCB or let the DCB for the ddname default to its allowable values.
Source: DFSMSdss

ADR031I (ttt-mmmmm yy), TYPRUN=NORUN REQUESTED. TASKS WILL EXECUTE IN NORUN MODE

Explanation: TYPRUN=NORUN was specified in the EXEC statement parameter. Subtasks will run in NORUN mode.

System action: All subtasks except CONVERTV, DEFRAG, and data set DUMP and RESTORE bypass processing. Data set DUMP and RESTORE only do only data set filtering and not DUMP or RESTORE functions. CONVERTV does data set filtering and volume and data set eligibility tests, but does not actually convert any volumes. DEFRAG prints the fragmentation index but does not relocate data set extents. Message ADR040I for the scheduled tasks follows this message.

Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR032W (ttt-mmmmm yy), INSTALLATION-WIDE OPTIONS EXIT SPECIFIED CONFLICTING KEYWORDS xxxx and yyy

Explanation: The installation-wide options exit changed keyword settings that will result in a conflict. Some commands contain parameters that are defined to be mutually exclusive. For such commands, if one parameter is specified, the other parameter is not allowed. xxx and yyy are the keywords that conflict.

System action: Processing continues. The conflicting keywords are reset to the values specified in the command SYSSIN stream.

Operator response: None.
Application Programmer Response: Correct the source of the conflict and reissue the command.
Source: DFSMSdss

ADR033W (ttt-mmmmm yy), INSUFFICIENT STORAGE AVAILABLE FOR OPTIMIZE n. OPTIMIZE n-1 WILL BE ATTEMPTED

Explanation: Not enough storage was available to schedule the function with the indicated OPTIMIZE value n. The OPTIMIZE value is reduced by 1, and another attempt is made. This message can appear more than once as the OPTIMIZE value is decreased.

Chapter 3. ADR messages 39

ADR035I (ttt-mmmmm(yy)), INSTALLATION EXIT ALTERED keyword [DEFAULT | REQUEST | OPTION | VALUE ] [TO xxxx]

| Explanation: | The installation-wide options exit routine has changed the default or requested option or value to xxxx. See z/OS MVS Data Areas, Vol 4 (RD-SRRA) for details. |
| System action: | The DFSMSdss function runs with the altered options. |
| Operator response: | None. |
| Application Programmer Response: | To get the desired result from the installation-wide exit routine, check with your system programmer. |
| Source: | DFSMSdss |

ADR036W (ttt-mmmmm(yy)), TASK NOT SCHEDULED AT REQUEST OF INSTALLATION EXIT

| Explanation: | The installation-wide exit requested that this task not be performed. |
| System action: | The task is not performed. Processing continues with the next control statement. The return code is 8. |
| Operator response: | None. |
| Application Programmer Response: | Check with your system programmer for restrictions placed by the exit. |
| Source: | DFSMSdss |

ADR037E (ttt-mmmmm(yy), FAILURE WHILE ATTACHING TASK. [ATTACH RETURN CODE IS return_code | INSUFFICIENT STORAGE TO ATTEMPT ATTACH]

| Explanation: | A task could not be attached because one of the following conditions existed: |
| · The system-attach macro returned a nonzero return code (return_code) while attaching a task. Probably not enough storage was available to attach the task. |
| · Not enough storage was available to even attempt the attach for the task. |
| For information about the ATTACH return codes, see z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN |
| Source: | DFSMSdss |

ADR038W (ttt-mmmmm(yy), INSTALLATION-WIDE OPTIONS EXIT SPECIFIED keyword1 WITHOUT REQUIRED KEYWORD keyword2)

| Explanation: | The installation-wide options exit changed keyword settings results in an invalid keyword combination. Some commands contain parameters that must be specified with another parameter. Keyword keyword1 lists the designated option(s), Keyword keyword2 lists the required keyword that must also be specified. |
| System action: | Processing continues. The invalid keywords are reset to the values specified in the command SYSIN stream. |
| Operator response: | None. |
| Application Programmer Response: | Correct the source of the invalid keyword combination and reissue the command. |
| Source: | DFSMSdss |

ADR039W (ttt-mmmmm(yy), INSTALLATION-WIDE OPTIONS EXIT SPECIFIED INVALID VALUE (value) FOR keyword)

| Explanation: | The installation-wide options exit routine attempted to alter the value of the specified keyword. However, the value specified by the exit is not valid for the keyword. The result is as if the exit requested the default value. |
| System action: | Processing continues. The return code is 4. |
| Operator response: | None. |
| Application Programmer Response: | The installation-wide options exit routine is in error. For information about how to write the exit, see z/OS MVS Data Areas, Vol 4 (RD-SRRA) For information about the valid values for the keyword, see the appropriate keyword description in the z/OS DFSMSdfp Storage Administration |
| Source: | DFSMSdss |
ADR040I  (ttt)-mmmmm(yy), PROCESSING BYPASSED DUE TO NORUN OPTION

Explanation: Further processing is bypassed because TYPRUN=NORUN was specified in an EXEC statement parameter. This option results in the following:

• BUILDLSA - Task ends.
• CONSOLIDATE – Only volume statistics are printed; data set extents are not relocated.
• COPY FULL/TRACKS - Task ends.
• COPY DATA SET - Filtering is performed and the names of the selected data sets are printed; data sets are not copied.
• COPYDUMP - Task ends.
• DEFRAG - Only volume statistics are printed; data set extents are not relocated.
• DUMP FULL/TRACKS - Task ends.
• DUMP DATA SET - Filtering is performed and the names of the selected data sets are printed; data sets are not dumped.
• PRINT - Task ends.
• RESTORE FULL/TRACKS - Task ends.
• RESTORE DATA SET - Filtering is performed and the names of the selected data sets are printed; data sets are not restored.
• COMPRESS and RELEASE - Filtering is performed and the names of the selected data sets are printed; data sets are not compressed or released.

System action: Further processing is bypassed for the volume or task.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR041I  (ttt)-mmmmm(yy), I/O BUFFER {ABOVE | BELOW} 16MB VIRTUAL REQUESTED

Explanation: You requested that the DFSMSdss I/O buffers reside above or below 16 megabytes virtual address.

System action: If you requested that buffer storage reside above 16 megabytes virtual address, DFSMSdss attempts to allocate storage for the buffers above 16 megabytes virtual address.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR042I  (ttt)-mmmmm(yy), {I/O | APPLICATION INTERFACE) BUFFER WAS OBTAINED BELOW 16MB VIRTUAL ADDRESS

Explanation: Not enough storage was available above 16 megabytes virtual address to satisfy the buffer request.

System action: The buffer is obtained below 16 megabytes virtual address, and DFSMSdss processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR045T  (ttt)-mmmmm(yy), DFSMSDSS IS NOT LICENSED FOR USE ON THIS SYSTEM

Explanation: The DFSMS/MVS license agreement does not allow execution of DFSMSdss.

System action: The job ends. The return code is 12.

Operator response: None.

Application Programmer Response: If you are licensed to use DFSMSdss, update the IFAPRDxx member of SYS1.PARMLIB to set the correct value that enables DFSMSdss to be used.

Source: DFSMSdss

ADR047T  (xxx)-mmmmm(yy), THE ENCRYPTION FACILITY DFSMSDSS ENCRYPTION FEATURE IS NOT INSTALLED ON THIS SYSTEM

Explanation: DFSMSdss has been requested to perform encryption, but the DFSMSdss Encryption Feature of the Encryption Facility product is not installed on the system. Without this feature, DFSMSdss does not perform any encryption or decryption of user data during DUMP or RESTORE processing.

System action: The job ends. The return code is 12.

Application Programmer Response: Ensure that the DFSMSdss Encryption Feature of the Encryption Facility product is correctly installed.

Operator response: None.

ADR049E  (ttt)-mmmmm(yy), DFSMSDSS FUNCTION TASK ABEND RECOVERY ROUTINE WAS ENTERED, {SYSTEM ABEND | USER ABEND) CODE=nnnn

Explanation: A function task request that an abend request be recovered and control returned to the function task for cleanup processing before terminating. This message is issued when an abend occurs and the function task abend recovery routine has successfully returned control to the function task.

System action: An SVCDUMP is requested by the recovery function and the system is directed to return control to the function task. The function task performs any necessary cleanup processing and terminates.

Operator response: None.

Application Programmer Response: Determine the cause of the abend. Correct and rerun if applicable.
ADR050I  (ttt)-mmmmm(yy), DFSMSdss INVOKED VIA [CROSS MEMORY] APPLICATION INTERFACE

Explanation: An application used the DFSMSdss application interface to invoke DFSMSdss.

System action: DFSMSdss interacts with the application's UIM via the DFSMSdss application interface.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR051I  (ttt)-mmmmm(yy), I/O BUFFER BACKED {ANYWHERE | BELOW 2GB} IN REAL STORAGE REQUESTED

Explanation: There was a request to have the DFSMSdss I/O buffers backed up anywhere in 64-bit real storage or below 2 gigabytes in real storage.

System action: If the request was for buffer storage to be backed up below 2 gigabytes in real storage, DFSMSdss attempts to allocate storage for the buffers to be backed up in 31-bit real storage. Otherwise, DFSMSdss allocates I/O buffers backed up anywhere in the 64-bit real storage.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR101I  (ttt)-mmmmm(yy), TASKID xxx HAS BEEN ASSIGNED TO COMMAND ‘command’

Explanation: The indicated task ID was assigned to the indicated command. All future messages related to this command will contain the indicated task ID following the message number.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss
ADR105W  (yttt-pppppp(yy)), COMMAND-END DELIMITER APPEARS WITHIN APOSTROPHES

Explanation: A quoted string contains the optional command delimiter (a semicolon). A closing single quotation mark might be omitted.

System action: The usage is accepted, and the semicolon is treated as a valid character instead of a delimiter. The return code is 4.

Operator response: None.

Application Programmer Response: Check the usage of the semicolon, and correct if necessary.

Source: DFSMSdss

ADR106W  (yttt-pppppp(yy)), TOO MANY RIGHT PARENTHESES FOUND. EXCESS IGNORED

Explanation: Too many closing parentheses were found at the end of the command or following a first-level parameter.

System action: The excess is ignored, and the processing is continued for the command. The return code is 4.

Operator response: None.

Application Programmer Response: Remove the excess parentheses.

Source: DFSMSdss

ADR107E  (yttt-pppppp(yy)), TOO FEW RIGHT PARENTHESES FOUND AT END OF COMMAND

Explanation: Too few closing parentheses were found at the end of the command to properly close the subparameter lists. The system might also issue this message when the continuation character is omitted in a list of subkeywords.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR108I  (yttt-pppppp(yy), date_and_time EOJ ENCOUNTED. ALL TASKS WILL QUIESCE

Explanation: An EOJ command was encountered. A subsequent message, ADR013I, indicates when all tasks are completed.

ADR109I  (yttt-pppppp(yy), date_and_time INITIAL SCAN OF USER CONTROL STATEMENTS COMPLETED

Explanation: All control statements were scanned for correct function name and IF/DO/END balancing.

System action: Processing phase now begins.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR110W  (xxx-pppppp(yy)), WRITE TO OPERATOR MESSAGE HAS BEEN TRUNCATED

Explanation: DSS encountered either a WTO command with a message text of more than 247 characters, or a WTOR command with a message text of more than 114 characters.

System action: The excess is truncated and the WTO or WTOR message is issued. The return code is 4.

Operator response: None.

Application Programmer Response: Shorten the WTO or WTOR message text, or issue multiple commands to accommodate the text.

Source: DFSMSdss

ADR111I  wto-text

Explanation: When a Write-to-Operator (WTO) command is encountered in the SYSIN stream, or when the DFSMSdss Cross Memory Application Interface is unable to use SYSPRINT and an information message is required, DFSMSdss issues the message with a WTO command. The WTO message is prefixed with ADR111I.

When the wto-text is DFSMSDSS SERVER DID NOT RESPOND IN ALLOTTED TIME, the DFSMSdss client application address space could not establish a connection to the DFSMSdss server address space.

When the wto-text is either JOBCAT IS NOT SUPPORTED BY DFSMSDSS SERVER or STEPCAT IS NOT SUPPORTED BY DFSMSDSS SERVER, the DFSMSdss client address space specified a JOBCAT or STEPCAT DD specification that the DFSMSdss server address space ignores.

Note: The ADR111I message is not directed to SYSPRINT. PARM='SDUMP=111' or
PARM='ABEND=111' will not capture a dump when this message occurs.

System action: The system action depends on the text in WTO-text. When the DFSMSdss client application address space is unable to establish a connection to the server, the client application interface returns a nonzero return code.

Operator response: Take action, if necessary, based on the WTO text.

Application Programmer Response: Correct the problem, if necessary, and rerun the application.

Source: DFSMSdss

ADR112A  

ADR112A  

ADR112A wtor-text

Explanation: When a Write-to-Operator with Reply (WTOR) command is encountered in the SYSIN stream, DFSMSdss issues a WTOR message, which is prefixed with ADR112A.

Note: The ADR112A message is not directed to SYSPRINT. PARM='SDUMP=112' or PARM='ABEND=112' will not capture a dump when this message occurs.

System action: The system action depends on the WTO reply.

Operator response: Take action, if necessary, based on the WTO text.

Application Programmer Response: None.

Source: DFSMSdss

ADR112B (ttt)-mmmmm(yy), TOO MANY POSITIONAL PARAMETERS AFTER 'xxxx'

Explanation: Too many positional parameters are specified following the characters xxxx for a parameter list.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Remove the excess parameters from the command, and reissue the command.

Source: DFSMSdss

ADR112C (ttt)-mmmmm(yy), CONSTATE 'xxxx' EXCEEDS CHARACTER LENGTH LIMIT

Explanation: The constant (xxxx) contains more characters than the maximum permitted by the command syntax.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the constant, and reissue the command.

Source: DFSMSdss

ADR112D (ttt)-mmmmm(yy), INCORRECT NUMBER OF CONSTANTS/ENTRIES IN LIST BEGINNING AT 'yyyy'

Explanation: An incorrect number of constants (or entries) was found in the list beginning at yyyy.

System action: The command is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR112E (ttt)-mmmmm(yy), ITEM 'xxxx' DOES NOT ADHERE TO RESTRICTIONS

Explanation: The indicated parameter (xxxx) does not conform to the required naming conventions. For example, a ddname contains invalid characters or a data set name is in error.

System action: The task is not performed. Processing
continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the parameter error, and reissue the command.

Source: DFSMSdss

ADR124E (ttt-mmmmm(yy)), DELIMITER 'xxxx' IS NOT PROPERLY PRECEDED BY A CONSTANT OR KEYWORD

Explanation: A delimiter (xxxx) was found where a subparameter list or data was expected. The delimiter is improperly used. Parentheses might be improperly positioned, or a positional parameter might be missing.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the syntax error, and reissue the command.

Source: DFSMSdss

ADR125E (ttt-mmmmm(yy)), LEFT PARENTHESIS MISSING FOLLOWING KEYWORD 'keyword'

Explanation: An opening parenthesis, which should begin the required subparameter list or value associated with the command keyword, does not follow the keyword.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Check the requirements of the keyword, correct the syntax, and reissue the command.

Source: DFSMSdss

ADR126E (ttt-mmmmm(yy)), RIGHT PARENTHESIS MISSING AFTER 'xxxx'

Explanation: A closing parenthesis was not found where expected, or a subparameter list was not properly delimited.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR127E (ttt-mmmmm(yy)), INVALID PARENTHESIS FOR SPECIFYING REPEATED SUBPARAMETER LIST

Explanation: Parentheses used for delimiting repeated subparameter lists are missing or not matched.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR128E (ttt-mmmmm(yy)), INVALID LEFT PARENTHESIS AFTER 'xxxx'

Explanation: An opening parenthesis that appeared to delimit the positional parameter xxxx was found, but the positional parameter was not a constant or a list of constants.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR129E (ttt-mmmmm(yy)), KEYWORD 'keyword' IS IMPROPER

Explanation: The command contains a misspelled, improperly specified, or inapplicable keyword.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.

Source: DFSMSdss

ADR130E (ttt-mmmmm(yy)), KEYWORD 'keyword' APPEARS TOO OFTEN

Explanation: The keyword appeared too often in the command. A parameter list might be incorrectly specified.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax and reissue the command.
command syntax by removing the keyword, and reissue the command.

**Source:** DFSMSdss

**ADR131E**

(ttt-wwwwwwyy), ABOVE TEXT BYPASSED UNTIL NEXT COMMAND

**Explanation:** An error was encountered during the syntax check of this command, and syntax checking ended. Messages printed before this message indicate the nature of the error.

**System action:** Processing continues with the next control statement. If this task was to be performed, it will not be, and a return code of 8 is set. If the command was being bypassed (see message ADR102I), the return code is not reset by this error.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

**ADR132E**

(ttt-wwwwwwyy), IMPROPER PASSWORD ENCOUNTERED AFTER 'xxxxxxx'

**Explanation:** A password, denoted by a slash (/), was encountered where a password was not allowed; an expected password was missing; or a password longer than 8 characters was specified. This is not a verification of the password but an error in the syntax.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

**ADR133E**

(ttt-wwwwwwyy), TOO MANY REPEATED SUBPARAMETER LISTS APPEAR IN THE COMMAND

**Explanation:** Too many repeated subparameter lists appear in the command.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

**ADR134E**

(ttt-wwwwwwyy), A HEX OR BINARY CONSTANT IS IMPROPERLY SPECIFIED

**Explanation:** A hexadecimal or binary constant is not specified in the correct format: X'hh...hh' or B'bb...bb', respectively.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

**ADR135E**

(ttt-wwwwwwyy), IMPROPER NUMERIC DIGIT FOUND IN 'xxxx'

**Explanation:** The constant (xxxx) contains an invalid character. A decimal number can be specified only with the symbols 0 through 9; a hexadecimal number can be specified only with the symbols 0 through 9 and A through F; and a binary number can be specified only with the symbols 0 and 1.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

**ADR136E**

(ttt-wwwwwwyy), CONSTANT 'xxxx' IS NOT WITHIN VALUE RANGE

**Explanation:** The value of the constant (xxxx) is outside the range of values allowed for the associated parameter.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Check the command syntax for allowed values, correct the error, then reissue the command.

**Source:** DFSMSdss

**ADR137E**

(ttt-wwwwwwyy), TOO MANY CONSTANTS/ENTRIES IN LIST BEGINNING AT 'yyyy'

**Explanation:** Too many constants or entries are specified in the command beginning at yyyy.

**System action:** The command is not performed.
Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

---

ADR138E \((ttt)-mmmmmm(yy), \text{REQUIRED (SUB)}\) PARAMETER OF ‘xxxx’ IS MISSING

**Explanation:** A required parameter or subparameter (xxxx) is missing.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

---

ADR139E \((ttt)-mmmmmm(yy), \text{INCONSISTENT PARAMETERS INVOLVING ‘xxxx’}\)

**Explanation:** Some commands contain parameters defined as mutually exclusive. For such commands, if one parameter is specified, the other parameter is not allowed. xxxx is one of the mutually exclusive parameters specified.

Depending on the keywords and their positions on the command, DFSMSdss might issue the message once for each of the conflicting keyword. Otherwise, DFSMSdss issues the message once when the first conflicting keyword is encountered.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

---

ADR140E \((ttt)-mmmmmm(yy), \text{INVALID ‘BY’ CRITERIA}\)

**Explanation:** A value in the BY keyword is incorrect for the item being tested.

For selection characteristics CREDT, EXPDT, and REFDT, possible errors include:
- Date is not five or seven digits.
- Seven-digit date is less than 1900001 but not 0000000.
- LT operator is specified with an all-zero date.
- GT operator is specified with a never-expire date.
- Optional modifier is not 1–4 digits with optional sign.
- Modifier is specified with a date that cannot be modified (for example, a date of all zeroes or a never-expire date).
- Modified five-digit date is outside range of 1950–2049.

For all selection characteristics, possible errors include:
- Selection characteristic is not valid. It be misspelled.
- Operator is not valid. It be misspelled.
- Operator is not valid for the specified selection characteristic. For example, some selection characteristics require either the EQ or the NE operator.
- Argument that must be numeric is nonnumeric.
- Argument is not valid for the item being tested. For example, you can specify CATLG, DSCHA, and MULTI only with the arguments 0, 1, YES, or NO.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

---

ADR141E \((ttt)-mmmmmm(yy), \text{ERROR IN DATA SET NAME dsname}\)

**Explanation:** A data set name was specified incorrectly for one of the following reasons:
- The length might be greater than 44 characters.
- If the data set name is not in quotation marks, a qualifier might be longer than 8 characters.
- The GDG might be incorrectly specified.
- GDG relative generation filtering was used with RENAME or RENAMEUNCONDITIONAL.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the command syntax and reissue the command.

**Source:** DFSMSdss

---

ADR142I \((ttt)-mmmmmm(yy), \text{KEYWORD keyword HAS BEEN IGNORED}\)

**Explanation:** The keyword does not apply and was ignored for one of the following reasons:
- CONCURRENT—This keyword does not apply in FCNOCOPYTOCOPY processing.
- DEBUG(FRMSG(MIN | SUM | DTL))—This keyword does not apply in FCNOCOPYTOCOPY processing.
- LOGICALNESS—The input data set is created by a logical data set DUMP.
• WORKSIZE—This keyword is no longer required.

System action: The keyword is ignored. The return code is 0.

Operator response: None.

Application Programmer Response: Omit the keyword on future runs.

Source: DFSMSdss

ADR143E  
(ttt-mmmmm(yy), INVALID SYNTAX IN DATA SET SPECIFIED BY DDNAME ddname)

Explanation: Invalid data exists in the data set associated with the DD statement specified by the FILTERDD keyword.

System action: The task ends. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the parameters in error, and rerun the job.

Source: DFSMSdss

ADR144E  
(ttt-mmmmm(yy), INCOMPLETE SPECIFICATION IN DATA SET REFERENCED BY DDNAME ddname)

Explanation: An end-of-file (EOF) condition was encountered in scanning the character string contained in the ddname specified as a PASSWORD, FILTERDD, or EXCLUDE parameter. This condition can be caused by incorrect continuation syntax or by missing records in the input stream.

System action: The task is not performed. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the command syntax, or add the missing records, then resubmit the job.

Source: DFSMSdss

ADR145I  
(ttt-mmmmm(yy), OBSOLETE KEYWORD consolidate SPECIFIED. THE CONSOLIDATE COMMAND WILL BE RUN PRIOR TO DEFRAG)

Explanation: The keyword CONSOLIDATE on the DEFRAG command is no longer used by DFSMSdss. The CONSOLIDATE command will be substituted and run before DEFRAG processing.

System action: The DFSMSdss function runs with the altered option.

Operator response: None.

Application Programmer Response: Verify that CONSOLIDATE produced the expected results. If the job is to be run again in the future, remove CONSOLIDATE from the control statement and use the CONSOLIDATE command to consolidate requested data sets.

Source: DFSMSdss

ADR146I  
(ttt-mmmmm(yy), OBSOLETE KEYWORD keyword1 SPECIFIED. keyword2 WILL BE USED)

Explanation: The keyword keyword1 is no longer used by DFSMSdss. The current keyword is keyword2.

System action: The DFSMSdss function runs with the altered option.

Operator response: None.

Application Programmer Response: Verify that keyword2 produces the expected results. If the job is to be run again in the future, remove keyword1 from the control statement and add keyword2.

Source: DFSMSdss

ADR147W  
(ttt-mmmmm(yy), INSTALLATION EXIT ATTEMPTED TO ALTER OBSOLETE KEYWORD keyword1. REQUEST IGNORED)

Explanation: The installation options exit routine attempted to alter the option or value for the obsolete keyword keyword1. See z/OS DFSMS Installation Exits for details.

System action: DFSMSdss runs with the current option.

Operator response: None.

Application Programmer Response: The installation options exit should be changed to not alter the option or value of the obsolete keyword.

Source: DFSMSdss

ADR148I  
(ttt-mmmmm(yy), MULTIVOLUME DATA SET dsname NOT SELECTED)

Explanation: The data set was not selected for processing because of one of the following conditions:

• One or more volumes of a multivolume data set were not included in the input volume list and SELECTMULTI(ALL) was specified.

• The first volume of a multivolume data set was not included in the input volume list and SELECTMULTI(FIRST) was specified.

System action: The data set is excluded from further processing.

Operator response: None.

Application Programmer Response: If the data set
should have been selected, take one of the following actions and rerun the job:

- Specify SELECTMULTI(FIRST) and include the first volume of the data set in the input volume list. For VSAM data sets, you must include the first volume of the data component in the input volume list.
- Specify SELECTMULTI(ALL) (this is the default if you do not specify SELECTMULTI) and include all volumes of the data set in the input volume list.
- Specify SELECTMULTI(ANY) and include at least one primary or candidate-with-space volume of the data set in the input volume list.
- Do not specify an input volume list.

Source: DFSMSdss

ADR150E (ttt-mmmmm(yy), TASK TERMINATED DUE TO INSUFFICIENT MAIN STORAGE

Explanation: Not enough storage was available to set up the commands in the input stream for the indicated task.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Either increase REGION size or increase the SIZE parameter, or both, then retry the job.

Source: DFSMSdss

ADR151E (ttt-mmmmm(yy), UNABLE TO ALLOCATE DATA SET REFERENCED BY DDNAME ddname

Explanation: An application is using the DFSMSdss cross memory application interface to invoke DFSMSdss and an allocation error occurred during SYSIN processing.

System action: DFSMSdss will not schedule the requested function task for execution.

Operator response: Note associated allocation error messages appearing on the system console log and provide this information to the application programmer.

Application Programmer Response: If the ddname being passed in the SYSIN statement is less than 8 characters, either use 8 character ddnames or leave enough blank space after the ddname to allow DFSMSdss cross memory application interface logic to substitute a unique 8 character system generated ddname. Ask the operator to provide information about any associated allocation error messages appearing on the system console log. See the explanation of any allocation error messages produced.

Source: DFSMSdss

ADR152E (ttt-mmmmm(yy), THE VERSION OF DEFRAG REQUESTED CANNOT BE USED ON THIS VOLUME, rsn

Explanation: The version of DEFRAG requested with the VERSION1 keyword does not support defragmentation of volumes with more than 65520 cylinders.

A previous CONSOLIDATE on this volume was interrupted while processing. VERSION1 DEFRAG cannot be used to perform recovery. Recovery can be performed with DEFRAG without the VERSION1 keyword or by running the CONSOLIDATE command against the volume.

System action: The DFSMSdss function ends.

Operator response: None.

Application Programmer Response: Verify that the specified volume is larger than 65520 cylinders. If so, run the current version of DEFRAG by removing the VERSION1 keyword.

Source: DFSMSdss

ADR169T (ttt-mmmmm(yy), NO RECORDS IN SYSIN STREAM

Explanation: The SYSIN stream was empty.

System action: The job ends. The return code is 12.

Operator response: None.

Application Programmer Response: Ensure that the SYSIN (or acceptable alternative ddname) DD statement refers to a nonempty file, and retry the job.

Source: DFSMSdss

ADR170T (ttt-mmmmm(yy), ERROR OPENING DDNAME ddname

Explanation: The SYSIN (or acceptable alternative ddname) file cannot be opened.

System action: The job ends. The return code is 12.

Operator response: None.

Application Programmer Response: Reestablish the SYSIN file, and resubmit the job.

Source: DFSMSdss

ADR171T (ttt-mmmmm(yy), MAXIMUM NUMBER OF TASKS EXCEEDED

Explanation: The SYSIN stream contains more than 255 tasks.

System action: The job ends. The return code is 12.

Operator response: None.

Application Programmer Response: If necessary,
run multiple job steps to accommodate the number of requested tasks.

**Source:** DFSMSdss

----------

**ADR172T** *(ttt)-mmm/yyyy, ERROR DURING INITIAL SCAN*

**Explanation:** During the initial scan of the control statements, an error was encountered.

**System action:** The job ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Correct the problem as indicated by the previous message, and retry the job.

**Source:** DFSMSdss

----------

**ADR173T** *(ttt)-mmm/yyyy, I/O ERROR WHILE READING ddname, xxxx*

**Explanation:** An I/O error was encountered in reading the SYSIN file (or acceptable alternative ddname). The ddname is followed by the SYNAD information (xxxx) obtained by the SYNADAF macro.

**System action:** The job ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Correct the cause of the error or reestablish the SYSIN file, and retry the job.

**Source:** DFSMSdss

----------

**ADR174T** *(ttt)-mmm/yyyy, REMAINDER OF COMMAND INPUT STREAM WAS IGNORED*

**Explanation:** An error occurred that prohibits further scanning of the command stream. Messages printed before this message indicate the nature of the error.

**System action:** The program ends. The return code is 12. The condition code (MAXCC) is always set to 12 when this situation is encountered.

**Operator response:** None.

**Application Programmer Response:** Correct the error, and resubmit the job.

**Source:** DFSMSdss

----------

**ADR175T** *(ttt)-mmm/yyyy, COMMAND command IS UNKNOWN*

**Explanation:** The command name is not recognized.

**System action:** The program ends. The return code is 12.

**Operator response:** None.

**Source:** DFSMSdss
ADR179T (xxx)-mmmmm(yy), A 'SET' COMMAND IS INVALID

Explanation: An invalid SET command was encountered. You can specify only the system variables PATCH, LASTCC, and MAXCC.

The PATCH values must be hexadecimal digits from X'00' through X'FF'. The PATCH offset must be a hexadecimal value from X'08' through X'0FFF'. Valid examples are SET PATCH 8 = FF and SET PATCH FFF = 42. The command SET PATCH 1000 = FF is invalid because the PATCH value is out of range.

The LASTCC and MAXCC values must be decimal numbers from 0 through 99999. However, a value greater than 16 will be reduced to 16. If the variable LASTCC is specified, a function command must have been previously encountered in the input command stream.

System action: The remainder of the command stream is ignored. The return code is 12.

Operator response: None.

Application Programmer Response: Check the requirements of the SET statement, correct the error, then resubmit the job.

Source: DFSMSdss

ADR182T (ttt)-mmmmm(yy), INPUT STREAM END-OF-FILE FOUND BEFORE END OF COMMAND

Explanation: An end-of-file (EOF) condition was encountered while scanning the command. This condition can be caused by incorrect command-continuation syntax or by missing records in the input stream.

System action: The job ends. The return code is 12.

Operator response: None.

Application Programmer Response: Correct the command syntax, or add the missing records, then resubmit the job.

Source: DFSMSdss

ADR183I (ttt)-mmmmm(yy), THE REPLACE KEYWORD REPLACES THE PURGE KEYWORD FOR A DATA SET RESTORE

Explanation: The REPLACE keyword replaces the PURGE keyword for a data set RESTORE.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR184W (ttt)-mmmmm(yy), RESET IS IGNORED WHEN CONCURRENT IS SPECIFIED

Explanation: You specified both RESET and CONCURRENT with the DUMP command. RESET is ignored, and the data set change indicators will not be reset.

System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: DFSMSdss provides a patch that your installation use to specify that RESET should not be ignored when CONCURRENT is also specified with the DUMP command. See the documentation for this patch in Appendix B of the z/OS DFSMShsm Storage Administration.

Source: DFSMSdss

ADR199E (ttt)mmmmm(yy), UNITADDRESS SPECIFIED INCORRECTLY: device_number

Explanation: The UNITADDRESS is not correctly specified. device_number is the incorrectly specified UNITADDRESS. Either a 3-digit or 4-digit UNITADDRESS (device_number) is required.

System action: The task is not performed. Processing
continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the error and reissue the command.

**Source:** DFSMSdss

---

**ADR201E**  
((ttt)-mmmmm(yy)), VTOC IN ERROR PRIOR TO PROCESSING

**Explanation:** An error occurred in processing the VTOC. The error condition can be caused by one of the following:

- An I/O error occurred. This is usually accompanied by system I/O error messages.
- A logical error occurred during indexed VTOC processing. When extents are relocated on an indexed volume, a recovery environment is set up by DFSMSdss. If DEFRAG ends before completing the relocation, the audit trail left by the recovery routines indicates to a subsequent operation that a mismatch exists between the VTOC index records and the extents.
- A failure occurred during LSPACE(SVC 78) processing.
- The VTOC structure is incompatible. Message ADR210E accompanies this message. More than one of the extents, either data set or free space, points to the same location on the volume.
- A prior DEFRAG or CONSOLIDATE run or a DADSM function ended before updating the VTOC free-space maps.

**System action:** The DEFRAG or CONSOLIDATE function ends. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Do the following when applicable, then rerun the DEFRAG or CONSOLIDATE function:

- If I/O error messages accompany this message, take corrective action recommended at your site for the type of error.
- If message ADR210E accompanies this message, recover by either deleting one of the overlapping data sets or by using AMASPZAP to change the incorrect extent pointer to a correct known value.
- If message ADR226W or ADR229W was issued previously, the volume contain an orphan VTOC entry. Run the IEHKEY/LISTVTOC utility. If there is an orphan entry, correct the VTOC.
- In all other cases, allocate a temporary data set. This invokes DADSM modules to rebuild the free-space map or to correct the mismatch error.
- If a previous DEFRAG was interrupted, leaving the temporary DEFRAG data set (SYS1.DFDSS.DEFRAG.xxxxx.volser.DUMMY) on the volume, and the volume has an indexed VTOC, convert the volume to non-indexed format, rerun the DEFRAG job, and convert the volume back to indexed format.
- If a previous CONSOLIDATE was interrupted, leaving the temporary CONSOLIDATE data set (SYS1.DFDSS.DEFRAG.xxxxx.volser.DUMMY) on the volume, and the volume has an indexed VTOC, convert the volume to non-indexed format, rerun the CONSOLIDATE job, and convert the volume back to indexed format.

**Source:** DFSMSdss

---

**ADR204W**  
((ttt)-mmmmm(yy)), ERROR ENCOUNTERED ON EXTENT nnn OF dsname. EXTENT IS BYPASSED

**Explanation:** An I/O error occurred in processing an extent of the data set for a DEFRAG operation.

**System action:** The extent is not moved. Processing is continued with the next data set extent. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** Use the PRINT command to print the contents of the track or use ICKDSF to recover the data and assign an alternate track. If a system I/O error message accompanies this message, take the appropriate action recommended at your site for the error.

**Source:** DFSMSdss

---

**ADR205I**  
((ttt)-mmmmm(yy)), EXTENT nnn OF DATA SET dsname IS ALLOCATED BY CYLINDER, BUT IT IS NOT ON A CYLINDER BOUNDARY

**Explanation:** The VTOC entry indicates that the data set is either allocated by cylinder or has the round attribute. However, the extent does not begin or end on a cylinder boundary.

**System action:** DEFRAG attempts to relocate the extent so that it begins and ends on a cylinder boundary. If DEFRAG is successful, the VTOC entry remains unchanged. If DEFRAG is unsuccessful, the extent is relocated as though it were originally allocated by tracks, and the VTOC entry is updated accordingly.

If this message is issued because the round bit is set, the round bit is not turned off. In either case, the message can be received on subsequent DEFRAG operations for the same data set.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss
ADR206E  (ttt-mmmmm(yy), I/O ERROR OCCURRED WHILE READING VTOC. FUNCTION IS TERMINATED

Explanation: An I/O error occurred in reading the VTOC.

System action: The function ends. The return code is 8.

Operator response: None.

Application Programmer Response: Use ICKDSF to recover the data, assign an alternate track, and rerun the job.

Source: DFSMSdss

ADR207E  (ttt-mmmmm(yy), ERROR WHILE SETTING FREE SPACE INVALID IN THE VTOC DURING DEFRAG. TASK IS TERMINATED

Explanation: On a nonindexed VTOC, DEFRAG sets the DS4DOSBT bit on and the DS4EFVLD bit off in the VTOC before it starts processing and resets them at the end. This message appears if the setting or resetting cannot be done.

System action: DEFRAG ends. The return code is 8.

Operator response: None.

Application Programmer Response: On a nonindexed VTOC, if the DS4DOSBT bit is on and the DS4EFVLD bit is off, allocate a temporary data set on the volume to allow DADSM to rebuild the free space information, then scratch the temporary data set.

Source: DFSMSdss

ADR208I  (ttt-mmmmm(yy), date_and_time BEGINNING STATISTICS ON volume_serial_number:

Explanation:

| FREE CYLINDERS | cccc |
| FREE TRACKS | tttt |
| FREE EXTENTS | nnnn |
| LARGEST FREE EXTENT (CYL,TRK) | cccc,tttt |
| FRAGMENTATION INDEX | 0.fff |
| PERCENT FREE SPACE | pp |

The DEFRAG function issues this message at the beginning of the task. This message is also issued when the CHECKVTOC keyword is specified for DUMP or COPY. The following values are in decimal:

- cccc: the number of complete free cylinders
- tttt: the number of free tracks in addition to free cylinders
- nnnn: the number of free extents on the volume
- cccc,tttt: the size of the largest free extent in cylinders and additional tracks
- .fff: the fragmentation index. This index can be a value between 0.000 and 1.000, for which a higher value indicates a higher level of fragmentation
- pp: the percentage of free space on the volume

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR209I  (ttt-mmmmm(yy), date_and_time MOVED EXTENT nnn FROM cchh1-cc:hh2 TO cchh3-cc:hh4 FOR dsname

Explanation: The nnnth extent of data set (dsname) was successfully relocated from the original cchh1-cc:hh2 to a new cchh3-cc:hh4. This message gives the date and time the extent was moved.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR210E  (ttt-mmmmm(yy), {FREE SPACE I dsname} AND {FREE SPACE I dsname) OVERLAP FROM CC:HH cchh1 TO CC:HH cchh2

Explanation: The indicated data set names or FREE SPACEs overlap on the volume according to the VTOC. The VTOC is in error.

System action: If this message is issued during DEFRAG processing, then the DEFRAG function ends with a return code of 8. No extents will be moved by DEFRAG. If this message is issued as a result of the CHECKVTOC keyword during DUMP or COPY processing, then the continuation of the DUMP or COPY processing is determined by the CANCELERROR keyword specification.

Operator response: None.

Application Programmer Response: Recover by either deleting one of the overlapping data sets or by using AMASPZAP to change the incorrect extent pointer to a correct value, if known.

Source: DFSMSdss

ADR211I  (ttt-mmmmm(yy), DATA SET dsname (IN USE I NOT MOVEABLE I IN LINKLIST I FAILED AUTHORIZATION CHECK) AND WAS NOT MOVED

Explanation: DEFRAG could not move the data set for the indicated reason. DEFRAG considers a data set to be IN USE when it is unable to obtain an enqueue for the data set. NOT MOVEABLE means an indicator is on
in the VTOC entry for the data set, indicating that the data set was open during a checkpoint or that a PDSE cannot be moved because it appears to be in use on this or some other system in the complex. IN LINKLIST means DEFRA G obtained an enqueue for the data set but the data set is contained within the linklist. FAILED AUTHORIZATION CHECK means authorization checking was performed but failed.

Notes:
1. VSAM data sets that are not cataloged in an ICF catalog will fail the authorization check.
2. The flags DS1CPOIT and DS1DSGU in the VTOC entry of a physical sequential SMS data set indicate a checkpoint was taken while the data set was open.

System action: Processing continues.
Operator response: None.
Application Programmer Response: To move checkpointed data sets, specify the keyword FORCECP and its parameter.
Source: DFSMSdss

ADR212I (ttt-mmmmm(yy)), EXTENT DISTRIBUTION MAP FOR volume_serial_number:

Explanation:

The distribution map indicates the free-space fragmentation before and after the run and the distribution by size of data set extents. The map following this message lists the number of FREE SPACE BEFORE extents (eeee) and the number of FREE SPACE AFTER extents (eeee) for each given size in tracks (ttt), and the number of ALLOCATED extents (eeee). A cumulative percentage of allocated extents is also provided for each of the three categories (n.nnn).

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR220I (ttt-mmmmm(yy)), INTERVAL BEGINS AT CC:HH cc:hh1 AND ENDS AT CC:HH cc:hh2

Explanation: An area of DASD was selected from which a data set extent can be relocated. The interval begins at the first cc:hh1 and ends at the second cc:hh2.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR221E (ttt-mmmmm(yy)), OVERLAP ENCLOSED ON EXTENT nnn OF dsname

Explanation: The nth extent of data set dsname overlaps another data set extent on the volume according to the VTOC. Message ADR210E accompanies this message.

System action: Processing continues. The return code is 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss
ADR226W  \((ttt\text{-}mmmmm\text{(yy)}, C\text{-}H0\text{ RANGE } c\text{:\text{h}1} \text{ TO } c\text{:\text{h}2} \text{ IS UNACCOUNTED FOR IN VTOC)}\)

Explanation: The range \(cch1\) to \(cch2\) is not described in the VTOC. This range is ignored.

System action: Processing continues on the remainder of the volume. The return code is 4.

Operator response: None.

Application Programmer Response: Check VTOC for orphan format 3 DSCB.

Source: DFSMSdss

ADR227E \((ttt\text{-}mmmmm\text{(yy)}, CVAF ERROR ON VOLUME volume_serial_number, CODE \(fc\), \(ec\))\)

Explanation: An error was encountered during a common VTOC access facility (CVAF) call for the volume. The \(fc\) is the CVAF function code, and \(ec\) is the CVAF error code. See the [z/OS DFSMSdip Diagnosis] for an explanation of the error codes.

System action: The function ends. The return code is 8.

Operator response: None.

Application Programmer Response: If the CVAF function code is X'0C' and the CVAF error code is X'00', allocate a temporary data set on the volume to cause DADSM to repair the VTOC; then rerun the job. For other errors, take the appropriate action recommended by CVAF.

Source: DFSMSdss

ADR228W \((ttt\text{-}mmmmm\text{(yy)}, THE DEFRAG FUNCTION COULD NOT FURTHER REDUCE THE FREE SPACE FRAGMENTATION OF THE VOLUME)\)

Explanation: The DEFRAG function determined one of the following:

- The volume was insufficiently fragmented to process the function.
- If there is fragmented free space on the volume, DEFRAG cannot relocate extents with its algorithms to further reduce the fragmentation.
- If there is fragmented free space on the volume and MAXMOVE\((n)\) was specified, DEFRAG cannot further reduce the fragmentation of the volume without relocating more than \(n\) tracks of data.
- DEFRAG not have been able to relocate any extents because they are the type of data set extent which DEFRAG does not process (for example, VVDS, VTOCiX, and so on), or they be extents of data sets for which the requestor does not have read authorization.

If MAXMOVE\((n,p)\) was specified, the system issues message ADR228W when the current pass cannot further DEFRAG the volume. Previous passes have performed some defragmentation of the volume and issued message ADR213I indicating that data set extents were relocated on one or more of the previous passes.

System action: DEFRAG does not further alter the volume. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR229W \((ttt\text{-}mmmmm\text{(yy)}, VOLUME volume_serial_number HAS TRACKS UNACCOUNTED FOR. THE VTOC WILL INDICATE THAT THE FREE SPACE IS INVALID FOLLOWING PROCESSING)\)

Explanation: On a nonindexed VTOC, the DEFRAG function encountered undefined data or free space. This space is not processed. However, the DS4DOSBT bit remains on and the DS4EFVLD bit remains off following the run. After the DEFRAG run, when the DADSM function allocates or scratches a data set on the volume, the free space information will be rebuilt, reclaiming the unaccountable space as free space.

System action: The remainder of the volume is processed. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR230I \((ttt\text{-}mmmmm\text{(yy)}, MAXMOVE VALUE EXCEEDS THE NUMBER OF FREE TRACKS ON THE VOLUME. IT HAS BEEN ADJUSTED TO THE LOWER VALUE OF nnnn TRACKS)\)

Explanation: The MAXMOVE value must be less than or equal to the number of free tracks \((nnnn)\) on the volume being processed. In this case, the value exceeds the number and is adjusted to the lower value.

System action: Processing continues with a MAXMOVE value equal to the number of free tracks on the volume.

Operator response: None.

Application Programmer Response: The MAXMOVE value, if not specified, defaults to the total number of free tracks on the volume.

Source: DFSMSdss
ADR231E (xxx)-mmmmm(yy), ERROR WHILE ACCESSING VVDS FOR DATA SET dsname ON VOLUME volume_serial_number.
OP=operation_code, VVDS
RC=return_code

Explanation: The VVDS is accessed for the specified call during a DUMP, DEFRAG, CONVERTV, data set COPY, or data set RESTORE. The operation code can be:

- 0: Insert a VVR/NVR
- 1: Get a VVR/NVR for update
- 2: Put a VVR/NVR for update
- 3: Generic read of components of a cluster
- 4: Read a VVR/NVR
- 5: Delete a VVR/NVR

The return_code is the return code from the VVDS manager. See the reason code under return_code 50 in message IDC3009I.

System action: If the operation is DEFRAG, the extent is not relocated. If the operation is data set RESTORE, the affected data set is not restored. Other messages identifying the affected data set accompany this message. The return code is set to 8.

Operator response: None.

Application Programmer Response: Take the appropriate action recommended for the reason codes listed under message IDC3009I.

Source: DFSMSdss

ADR235I (ttf)-mmmmm(yy), SEQUENCE c:h1 – c:h2 EXTENT DESCRIPTION

Explanation: This is the message header for ADR235I. This message is issued when TYPRUN=NORUN is specified for DEFRAG or CONSOLIDATE, or when the CHECKVTOC keyword and TYPRUN=NORUN are specified for DUMP or COPY.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss
COPY. One message is issued for each extent on the volume. nnnn is the relative sequence in which the extent was encountered during VTOC analysis, ch1 ch2 is the range the extent occupies on the volume, and eee is the extent number of the data set or free space or unaccounted for extent.

**System action:** Processing continues.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR236W** *(ttt)-mmmnnn(yy)*, VTOC ON VOLUME volume_serial_number DOES NOT CONTAIN ENOUGH FREE DSCBs nnn

**Explanation:** For a DEFRAG, protected data set relocation cannot be done because DEFRAG requires a free DSCB for processing protected data sets. For a DUMP, nnn free DSCBs are required to successfully complete a subsequent RESTORE FULL operation.

**System action:** For DEFRAG, only unprotected data sets are relocated, and the final return code is 4. For DUMP, the DUMP FULL operation continues, and the final return code is 4.

**Operator response:** None.

**Application Programmer Response:** If temporary data sets exist on the volume, you can scratch them. If no temporary data sets or not enough space exists on the volume, you can dump one or more data sets to free a DSCB and rerun the job. If there is enough space on the volume, you can also use ICKDSF REFORMAT EXTVTOC to enlarge the VTOC and then rerun the job.

**Source:** DFSMSdss

---

**ADR237W** *(ttt)-mmmnnn(yy)*, NOT ENOUGH FREE SPACE DSCBS AVAILABLE

**Explanation:** On a nonindexed VTOC, DEFRAG cannot find enough space DSCBs in the VTOC to rebuild the free space information at the end of DEFRAG to reflect the free space on the volume.

**System action:** In the VTOC, the DS4DOSBT bit is left on and the DS4EFVLD bit is left off. The return code is set to 4.

**Operator response:** None.

**Application Programmer Response:** Allocate a temporary data set so DADSM can rebuild the free space information.

**Source:** DFSMSdss

---

**ADR238I** *(ttt)-mmmnnn(yy)*, NO DATA SETS WERE MOVED DURING THIS PASS. PROCESSING CONTINUES

**Explanation:** No data sets could be moved by DEFRAG. This might be due to data sets that are in use, on the link list, or extents too large for the available free space area.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR239W** *(ttt)-mmmnnn(yy)*, FORMAT 3 DSCB POINTER MISSING FOR DATA SET dsname, ONLY FIRST THREE EXTENTS PROCESSED

**Explanation:** The Format 1 DSCB for the data set (dsname) indicates that there are more than three extents for the data set, but the pointer to the Format 3 DSCB for the additional extents is invalid. Only the first three extents of this data set are processed. If there are more than three extents for this data set, then MSGADR226W is also issued.

**System action:** The defrag of the volume continues. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR240W** *(ttt)-mmmnnn(yy)*, INSUFFICIENT FREE SPACE EXTENTS TO PROCESS DEFRAG FUNCTION. TASK IS TERMINATED

**Explanation:** There were less than 2 free space extents on the volume. DEFRAG requires at least 2 free space extents to process. If MAXMOVE(n,p) has been specified, the system might issue this message for each pass that the DEFRAG function runs when the volume has less than two free space extents. The DEFRAG function continues to run until all of the specified passes have been completed because the number of free space extents might change because of the activity on the volume between the DEFRAG passes.

**System action:** DEFRAG ends without altering the volume. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss
ADR241I (ttt-NNNNNN-yyyy), TARGET VTOC [INDEX] BEGINNING AT cc:hh1 AND ENDING AT cc:hh2 IS [BEING USED I OVERLAID]

Explanation: Either the target VTOC or index VTOC in the range cc:hh1 to cc:hh2 is being preserved, or the source VTOC location was used for the target VTOC.
System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR242I (ttt-NNNNNN-yyyy), CHECKVTOC KEYWORD IGNORED. NO INPUT VOLUMES SPECIFIED

Explanation: The CHECKVTOC keyword was specified with the DUMP or COPY command, but no input volumes were specified. No VTOC analysis is performed.
System action: Processing continues.
Operator response: None.
Application Programmer Response: Specify an input volume through the INDDNAME or INDDYNAM keywords.
Source: DFSMSdss

ADR243W (ttt-NNNNNN-yyyy), VTOC ERRORS FOUND ON VOLUME volume_serial_number. PROCESSING CONTINUES

Explanation: The CHECKVTOC keyword was specified with the DUMP or COPY command, and VTOC errors were encountered on the specified volume. Because the CANCELERROR keyword was not specified, the dump or copy operation proceeds.
System action: Processing continues. The return code is 4.
Operator response: None.
Application Programmer Response: See the attention and error messages preceding this message.
Source: DFSMSdss

ADR244E (ttt-NNNNNN-yyyy), PROCESSING BYPASSED DUE TO CANCELERROR KEYWORD AND VTOC ERRORS FOUND ON VOLUME volume_serial_number

Explanation: The CHECKVTOC keyword was specified with the DUMP or COPY command, and VTOC errors were encountered on the specified volume. Because the CANCELERROR keyword is specified, the dump or copy operation is terminated.
System action: Processing ends. The return code is 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR245W (ttt-NNNNNN-yyyy), AN ENQUEUE LOCKOUT CONDITION WAS DETECTED FOR DATA SET dsname {IN CATALOG catalog_name}

Explanation: During DFSMSdss DEFRAG processing on the named data set, an enqueue lockout was detected. This condition can occur when DFSMSdss does a reserve on the VTOC and then performs a catalog management function. A second job has exclusive control of the catalog that DFSMSdss needs while DFSMSdss has control of the VTOC that the second job needs.
System action: The named data set is bypassed and is not moved. Processing continues on the remainder of the volume. The return code is 4.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR246E (ttt-NNNNNN-yyyy), AN ERROR OCCURRED DURING CVAF VTOC ACCESS FOR DATA SET dsname ON VOLUME volume_serial_number, xx-yyyy

Explanation: An error occurred while using one of the CVAF VTOC access macros. xx is the CVAF return code (see z/OS DFSMSdip Advanced Services for a description of these codes); yyyy is the CVSTAT return code (see z/OS DFSMSdip Diagnosis for a description of these codes).
System action: The data set is not processed. Processing continues with the next data set. The return code is 8.
Operator response: None.
Application Programmer Response: Take the action recommended by CVAF.
Source: DFSMSdss

ADR247W (ttt-NNNNNN-yyyy), A PREVIOUS DEFRAG OF VOLUME volser WAS INTERRUPTED WHILE PROCESSING EXTENT nnn OF dsname

Explanation: DEFRAG analysis detected that a prior
DEFRAG was interrupted while it was relocating the indicated data set extent.

System action: DEFRAG cleanup is performed and DEFRAG restarted.

Operator response: None.

Application Programmer Response: Verify the data integrity of the indicated data set.

Source: DFSMSdss

ADR248E  (ttt-mmmm(yyyy), VTOC DADSM INTERRUPT FLAG (DIRF) IS ON

Explanation: The VTOC DIRF flag is on, indicating that the last DADSM request against this volume was prematurely interrupted, leaving the VTOC in a partially updated state.

System action: DEFRAG processing ends.

Operator response: None.

Application Programmer Response: Verify the data integrity of the volume. Correct the DIRF setting before rerunning DEFRAG.

Source: DFSMSdss

ADR250I  (xxx)-mmmm(yyyy), EXTENTS CONSOLIDATED FROM c:h TO c:h FOR data-set-name

Explanation: When a DEFRAG operation consolidates a multi-extent data set as a result of the optional CONSOLIDATE keyword, this message is issued if the parm option TRACE = YES is specified.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR251W  (xxx)-mmmm(yyyy), ORPHAN FORMAT 3 AT DSCB C-H-R c-h-r

Explanation: This message is issued when DEFRAG processing detects an orphaned FORMAT 3 DSCB in the VTOC. Orphan FORMAT 3 DSCBs can occur if the DEFRAG process is interrupted while it is updating the VTOC and releasing FORMAT 3 DSCBs during data set extent consolidation. (A FORMAT 3 DSCB is converted to a FORMAT 0 DSCB.) An orphan FORMAT 3 indicates that either there is no FORMAT 1 DSCB that points to it, or that the orphan is in a chain of FORMAT 3 DSCBs and there is no FORMAT 1 DSCB that points to the chain.

System action: None.

Operator response: None.

Application Programmer Response: Inspect the VTOC to ensure that the orphan FORMAT 3 does not represent a significant performance impact. If there are enough orphan FORMAT 3 DSCBs to make it difficult to obtain FORMAT 0 DSCBs for new allocations, do the following:

- Perform a logical data set dump of all the data sets on the volume.
- Reinitialize the volume.
- Perform a logical restore of the dumped data sets.
- Increase the size of the VTOC, if necessary.

Source: DFSMSdss

ADR252I  (ttt-mmmm(yyyy), DEFAULT PROCESSING OF CHECKPOINT INDICATED DATA SETS MODIFIED BY INSTALLATION PATCH BYTE

Explanation: The installation has set the patch byte at offset 'X43' in ADRPATCH to 'XFF'. This patch byte indicates DEFRAG default processing of checkpoint indicated data sets is modified to relocate extents even if the associated data set VTOC entry has its DS1CPOIT flag set on.

System action: DEFRAG does not issue message ARD211I when it encounters this condition. DEFRAG instead will move any selected extent for a data set, even when the checkpoint indicated flag is set.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR253E  (ttt-mmmm(yyyy), UNABLE TO DETERMINE FREE SPACE ON VOLUME volser

Explanation: DEFRAG is unable to determine the location of free space extents on the volume being processed. The probable cause is that DEFRAG failed to find one or more free space entries in the VTOC. The free space entries are either missing or reside beyond the range of used entries in the VTOC.

System action: DEFRAG processing ends.

Operator response: None.

Application Programmer Response: Determine if any free space entries are missing or reside beyond the range of used entries in the VTOC. If so, correct the problem and rerun DEFRAG. If appropriate free space entries exist and are within the range of used entries in the VTOC, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss
ADR254I (ttt-mmmmm(yy)), DEFAULT PROCESSING OF LINKLIST INDICATED DATA SETS MODIFIED BY INSTALLATION PATCH BYTE

Explanation: The installation has set the dynamic patch byte at offset X'4E' to X'FF'. This dynamic patch byte indicates that DEFRAG default processing of linklist-indicated data sets is modified to cause extent relocation when the associated data set name is found in the linklist table, even though serialization not be obtained on the data set.

System action: DEFRAG will NOT issue message ADR211I when it encounters a linklist-indicated data set. Instead, DEFRAG will move any selected extent for a linklist-indicated data set even if serialization is not obtained.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR255E (ttt-mmmmm(yy)), EXTENT starting_c:h-ending_c:h ON VOLUME volser COULD NOT BE ERASED USING A FAST ERASE METHOD

Explanation: DFSMSdss is unable to erase the source extent using a fast erase technique following successful relocation of the extent during DEFRAG or CONSOLIDATE processing. DFSMSdss does not attempt to erase the source extent using traditional I/O because FASTREPLICATION(REQUIRED) is specified. The extent is either part of an erase-on-scratch data set or the ADMINISTRATOR keyword is specified. This can potentially cause sensitive data to be left at the source location on the volume.

System action: DFSMSdss DEFRAG or CONSOLIDATE processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: See the previously issued messages for an explanation of why DFSMSdss was unable to move an extent. Previous processing has relocated one or more extents.

Source: DFSMSdss

ADR256E (ttt-mmmmm(yy)), AN ERROR OCCURRED WHILE ATTEMPTING TO CONSOLIDATE EXTENTS FOR DATA SET dsname

Explanation: During CONSOLIDATE processing, DFSMSdss was unable to move an extent. Previous processing has relocated one or more extents.

System action: This data set is not consolidated. DFSMSdss processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: See the previously issued messages for an explanation of why CONSOLIDATE was unable to move the extent for the data set.

Source: DFSMSdss

ADR257I CVAFDSM MACRO UNABLE TO DETERMINE THE HIGHEST ALLOCATED DSCB ADDRESS ON VOLUME volume_serial_number,xx-yyyy

Explanation:

xx is a CVAF return code. See z/OS DFSMSdfp Diagnosis for a description of CVAF codes.

yyy is the CVSTAT status code. See z/OS DFSMSdfp Diagnosis for a description of CVSTAT codes.

System action: DFSMSdss processing continues to the end of the VTOC. The return code is 0.

Operator response: None.

Application Programmer Response: Take the action recommended by CVAF.

Source: DFSMSdss

ADR258I (ttt-mmmmm(yy)), THE SPECIFIED MAXTIME HAS EXPIRED. PROCESSING ENDS

Explanation: The keyword MAXTIME (nummins) was coded by the user. The specified amount of time has passed so DFSMSdss will end the function.

System action: The DFSMSdss function quiesces current processing and ends.

Operator response: None.

Application Programmer Response: If more time is needed for processing, remove the MAXTIME keyword or increase the value of nummins.

Source: DFSMSdss
ADR260I  (ttt-mmmmm(yy)), EXTENTS CONSOLIDATED ON volser: nnnnn
Explanation: During CONSOLIDATE processing, nnnnn extents were consolidated on the volume volser.
System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR282I  (ttt-mmmmm(yy)), VOLUME volume_serial_number ON UNIT device_number CANNOT BE INITIALIZED BECAUSE IT IS CURRENTLY IN USE
Explanation: Following a successful DUMP operation, DFSMSdss attempted to invoke ICKDSF to initialize the source volume of the DUMP operation because the FCWITHDRAW keyword was specified and the VTOC tracks were the target of a FlashCopy® relationship. However, it was determined that the ICKDSF INIT function would have failed because DFSMSdss detected that the device is currently in use by someone other than DFSMSdss, so the ICKDSF INIT was not performed. However, an FCWITHDRAW was still issued against the volume as requested.
System action: DFSMSdss processing continues. The return code is 0.
Operator response: None.
Application Programmer Response: The volume may have been in use because of non-DFSMSdss access to data on the volume. In this case, either code VOL=(PRIVATE,SER=xxxxxxx) in the associated DD statement or request the operator to issue a mount command with the USE=PRIVATE subparameter to reduce the possibility of other jobs allocating (or accessing) the volume. The volume can be in use because there might be a user catalog on the volume that is allocated to the catalog address space (CAS). If the ADMINSTRATOR keyword was not specified DFSMSdss possibly invoked CAS to check for authorization to process the data set, which would have caused CAS to allocate the volume that is being processed. Specifying the ADMINSTRATOR keyword can prevent DFSMSdss from invoking CAS to perform authorization checking and causing CAS to allocate the volume.
Source: DFSMSdss

ADR284W  (ttt-mmmmm(yy)), UNEXPECTED RETURN CODE FROM LSPACE MACRO: xxx-yyy, WHILE CALCULATING FREE SPACE ON VOLUME volume_serial_number
Explanation: An unexpected return code was encountered from the LSPACE macro while trying to calculate free space on the indicated volume. The return code and reason code are printed in hexadecimal.
System action: None.
Operator response: None.
Application Programmer Response: See LSPACE return code information in the z/OS DFSMSdfp Diagnosis

ADR285E  (ttt-mmmmm(yy)), DATA SET dsname WAS NOT PROCESSED BECAUSE pre-allocated DATA SET TYPE IS NOT SUPPORTED IN THIS RELEASE, reason_code
Explanation: The data set was not processed because a pre-allocated target data set exists that is not supported in this release. The reason code identifies the data set type:
1 Extended sequential
2 Compressible extended sequential
3 HFS file
Extended format VSAM
Data set with extended attributes
Multivolume extended sequential
Extended addressable VSAM
Integrated catalog facility tape volume catalog
VSAM data set with RLS information
Extended format multi-striped VSAM
Extended format non-keyed VSAM
Extended addressable non-keyed VSAM
Multivolume HFS
Non-SMS PDSE or HFS data set

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Notify the system programmer.

**Source:** DFSMSdss

---

**(ttt)-mmmm(yy), ERROR READING F4 DSCB ON VOLUME volser**

**Explanation:** An error occurred when DFSMSdss attempted to read the F4 DSCB on volume volser.

**System action:** The processing ends. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See accompanying messages, if any, for additional information.

**Source:** DFSMSdss

---

**(ttt)-mmmm(yy), CHECKPOINTED DATA SET dsname IS SELECTED FOR PROCESSING**

**Explanation:** The data set dsname is marked as an SMS checkpointed data set and has been selected for processing.

**System action:** The data set will be processed. The checkpointed designation will be removed from the target data set during RESTORE, COPY, CONVERTV, DEFRAG, and RELEASE.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**(ttt)-mmmm(yy), CORRECT SIZE (IN CYLINDERS) OF VOLUME volser CANNOT BE DETERMINED. VOLUME IS NOT PROCESSED. SIZE FROM DEVTYPE MACRO IS nnnnnn. SIZE FROM RDC DATA IS nnnnnn. SIZE FROM VTOC IS nnnnnn. SIZE FROM VTOC INDEX IS nnnnnn**

**Explanation:** DFSMSdss detected that either the size of the volume in the VTOC does not match the size of the volume in the VTOC index, or a seek in the high cylinder of the volume (as indicated in the VTOC) failed. The seek failure means that the volume is smaller than indicated in the VTOC. The sizes are represented in decimal and include both primary and alternate cylinders. A zero value indicates that the size was not available. (For example, if the volume does not contain a VTOC index, the size from the VTOC index will be zero.)

**System action:** The volume is not processed. Data sets which reside on this volume will not be processed. Processing continues with any other volumes or data sets. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Determine the proper size of the device, correct the problem, and rerun the job. If the size of the volume in the VTOC or VTOC index or both is incorrect, you can use ICKDSF REFORMAT REFVTOC to correct the problem. Additionally, you might need to refresh the operating system's internal control structure for the device using the following DEVSERV operator command:

```
DEVSERV QDASD,device_number,1,VALIDATE
```

where device_number is the device number. If these actions do not resolve the problem, search problem
reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center for programming support.

**Source:** DFSMSdss

---

**ADR301E**

(yyy-mm-mmm), AN ERROR WAS ENCOUNTERED WHILE FILTERING DATA SETS ON VOLUME volume_serial_number. VOLUME WAS NOT PROCESSED

**Explanation:** I/O or logical errors were encountered in accessing the VTOC or VVDS on the specified volume during a data set dump, copy, or convert operation.

**System action:** The specified volume is bypassed. Processing continues with the next volume, if any. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** For I/O errors, follow your site’s recommendations for I/O errors, and resubmit the job. For logical errors encountered in the VVDS, run access method services DIAGNOSE against the indicated volume and correct the problem.

**Source:** DFSMSdss

---

**ADR302E**

(yyy-mm-mmm), INPUT AND OUTPUT DEVICE TYPES DO NOT MATCH. UCB TYPE OF INPUT xxxx1, OUTPUT xxxx2

**Explanation:** The source and target volumes of a PHYSICAL DATA SET, TRACKS, or FULL volume COPY or RESTORE are not of like or similar device types. The devices types (xxxx1 and xxxx2) are given in hexadecimal.

**System action:** The task ends. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Probable user error. Select a matching device type, correct the control statement in error, and rerun the job. If you want to copy to an unlike device, specify on your COPY command. If performing a PHYSICAL DATA SET COPY, unlike device types are not supported.

**Source:** DFSMSdss

---

**ADR303E**

(yyy-mm-mmm), COMMAND NOT SUPPORTED WITH SYSTEM RESIDENCE VOLUME

**Explanation:** A full volume RESTORE of, COPY to, or DEFRAG of the system residence volume is not allowed. The system residence volume was specified for output.

**System action:** The task ends. Processing continues with the next control statement. The return code is 8.

**Source:** DFSMSdss

---

**ADR304E**

(yyy-mm-mmm), ERROR ENCOUNTERED WHILE ACCESSING {VTOC | VVDS} IMAGE OF VOLUME volume_serial_number ON DDNAME ddname, xxxx

**Explanation:** An error (logical or I/O) was encountered in analyzing the image of the VTOC or VVDS on the dumped tape during data set RESTORE processing. The types of possible logical errors can be:

- A non-VTOC or non-VVDS record
- An invalid format of the VVDS
- No data on track
- I/O errors encountered on the track during the DUMP
- An end-of-file (EOF) during the VTOC or VVDS search.

If physical I/O errors were encountered, other I/O error messages precede this message. The xxxx in the message is the SYNAD information passed by the access method routines.

**System action:** The volume is bypassed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Make sure the function completed normally during the DUMP process. If the error is in the VVDS, non-VSAM data sets can be restored when you specify DSORG NE VSAM in the BY criteria. Use a different backup copy to do the RESTORE.

**Source:** DFSMSdss

---

**ADR305E**

(yyy-mm-mmm), UNABLE TO SERIALIZE {VTOC | VVDS} ON VOLUME volume_serial_number

**Explanation:** DFSMSdss failed to get exclusive control of the associated DASD volume through enqueuing of the volume’s VOLID or VVDS during a DUMP/RESTORE/COPY/CONVERT/DEFRAG operation, or a TRACKS or VTOC PRINT operation even after a specified or defaulted number of retries. If the resource is VTOC, DADSM functions might have been performing while DFSMSdss was trying to serialize the use of the DASD volume. If the resource is VVDS, catalog or VSAM functions might have been accessing the VVDS.

**System action:** For all operations except logical DUMP/RESTORE, the function ends with a return code of 8. A logical data set dump with LOGIND or LOGINDY specified also ends with a return code of 8.
ADR306E • ADR308E

Processing continues with the next control statement. For a data set DUMP/RESTORE operation without LOGINDD or LOGINDY specified, the volume is bypassed; a return code of 8 is set, but processing continues on any other volumes.

Operator response: Mount the volume with USE=PRIVATE before rerunning the job.

Application Programmer Response: Either code VOL=(PRIVATE,SER=xxxxxxx) in the associated DD statement or request the operator to issue a mount command for the volume with the USE=PRIVATE subparameter to reduce the possibility of other jobs allocating to (or accessing) the volume. Change the WAIT parameters to increase the WAIT seconds and the retry count. When system activity on the volume is reduced, rerun or resubmit the job.

Source: DFSMSdss

ADR306E (ttt)-mmmm(y), UNABLE TO {COPY | RESTORE} THE VOLUME BECAUSE OUTPUT VOLUME volume_serial_number IS IN USE. TASK IS TERMINATED

Explanation: A FULL volume COPY or RESTORE was attempted on the volume, but another job is using the volume. It is possible that another job is accessing a data set on the volume. The system can also issue this message during a data set COPY when INDD is specified. In this case, the VTOC on the volume was already enqueued.

System action: The task ends. The return code is 8.

Operator response: Mount the volume with USE=PRIVATE before rerunning the job.

Application Programmer Response: Either code VOL=(PRIVATE,SER=xxxxxxx) in the associated DD statement or request the operator to issue a mount command for the volume with the USE=PRIVATE subparameter to reduce the possibility of other jobs allocating to (or accessing) the volume. Change the WAIT parameters to increase the WAIT seconds and the retry count. When system activity on the volume is reduced, rerun or resubmit the job.

The volume could be in use because there might be a user catalog on it that is allocated to the catalog address space (CAS). For more information, see the [z/OS DFSMSdss Storage Administration] under "Restoring Volumes", subheading of "Specifying Output Volumes."

Source: DFSMSdss

ADR308E (ttt)-mmmm(y), ACCESS DENIED FOR VOLUME volume_serial_number

Explanation: One of the following explanations applies:

- The user was unable to obtain the necessary RACF or password access:
  - To the volume during a data set DUMP/COPY/CONVERTV/PRINT/RESTORE operation
  - To the volume during a COMPRESS or RELEASE operation
  - To a data set on the volume for a full or tracks DUMP/RESTORE/COPY/PRINT operation.
- The installation-wide exit routine denied access to the volume.
- The operator denied access to a checkpoint/restart, RACF-protected, or system data set on the volume.
- I/O errors were encountered during checking authorization of the volume, and the operator denied further processing.

Source: DFSMSdss
System action:  The task ends on a full or tracks operation. The volume is bypassed for a data set operation or for a COMPRESS or RELEASE. The return code is 8.

Operator response:  If the programmer has proper authority, reply U to ADR369D or ADR371D.

Application Programmer Response:  Obtain proper access authority, and retry the job.

Source:  DFSMSdss

ADR309E  (ttt)-mmmmmn(yy), SOURCE AND TARGET DEVICE CAPACITIES DO NOT MATCH. CYLINDER CAPACITY OF SOURCE VOLUME nnnnnnn, TARGET VOLUME nnnnnnn

Explanation:  The capacity of the source volume is greater than that of the target volume. The nnnnnn is the highest cylinder number in hexadecimal.

System action:  The task ends. Processing continues with the next control statement. The return code is 8.

Operator response:  None.

Application Programmer Response:  Check whether the source or target volume is:
- An MVS-formatted VM minidisk
- A 3380E (source) and a 3380D (target)
- A 3380K (source) and a 3380E or 3380D (target)
- A 3380E (source) and a 3390-1 (target in 3380 compatibility mode)
- A 3380K (source) and a 3390-1 or -2 (target in 3380 compatibility mode)
- A 3390-2 (source) and a 3390-1 (target)
- A 3390-3 (source) and a 3390-1 or 3390-2 (target)
- A 9345 model 2 (source) and a 9345 model 1 (target)

Such conditions are not allowed on a full volume operation, or if the range falls outside the capacity of the volume on a tracks operation. Select the correct input and output volumes, correct the statement in error, and rerun the job.

Source:  DFSMSdss

ADR311E  (ttt)-mmmmmn(yy), TRACKS OPERATION MUST SPECIFY PURGE TO OVERLAY (TRACK ZERO | VTOC | VVDS | VTOCIX)

Explanation:  The PURGE parameter was not specified for a TRACKS COPY or RESTORE on track 0, the VTOC, the VVDS, or the VTOC index data set.

System action:  The task ends. Processing continues with the next control statement. The return code is 8.

Operator response:  None.

Application Programmer Response:  If you want to overlay any of these, specify the PURGE keyword in the command, and rerun the job.

Source:  DFSMSdss

ADR312W  (ttt)-mmmmmn(yy), DURING A TRACKS OPERATION, THE VTOC OR TRACK 0 WAS OVERLAID

Explanation:  For an attempted TRACKS COPY or RESTORE on the VTOC or track 0, the location and extents of the VTOC on the source and target volumes did not match.

System action:  The VTOC or track 0 is overlaid. The COPY or RESTORE continues. The return code is 4.

Operator response:  None.

Application Programmer Response:  Make sure that the overlay was intended. If not, restore the output volume from a prior backup.

Source:  DFSMSdss

Chapter 3. ADR messages 65
data set. The operator was prompted for the necessary authorization, but the authorization was denied.

**System action:** The task ends. Processing continues with the next control statement. The return code is 8.

**Operator response:**  If you have sufficient authority to overlay track 0 or VTOC, reply U to message ADR345D.

**Application Programmer Response:** Rerun the job, and have the operator allow the VTOC or track 0 to be overlaid.

**Source:** DFSMSdss

---

**ADR314E**

(“ttt-mmmmm(y)y), ERROR ENCLOSED WHILE ACCESSING \(\text{VTOC} \pm \text{VVDS}\) ON \text{volume_serial_number}. PROCESSING CONTINUES

**Explanation:** An I/O error was encountered in dumping the VTOC or VVDS of the specified volume.

**System action:** A return code of 8 or 16 is set on the input or output error, respectively. Processing continues on input errors and ends on output errors. If CANCELERROR is specified, processing ends on input errors but continues for subsequent volumes on a data set DUMP.

**Operator response:** None.

**Application Programmer Response:** For a data set operation, use ICKDSF to recover the bad VTOC or VVDS track and rerun the job. If it is the VVDS, follow the procedure recommended at your site for VVDS errors (run method services DIAGNOSE and take appropriate action). On a data set DUMP, you can recover the logical volumes that were successfully dumped by running a COPYDUMP operation and specifying the volume serial numbers in the LOGICALVOLUME parameter.

**Source:** DFSMSdss

---

**ADR315I**

(“ttt-mmmmm(y)y), REQUIRED CHANNEL COMMANDS NOT SUPPORTED ON VOLUME \text{volume_serial_number}. OPTIMIZE(1) WILL BE USED

**Explanation:** The device does not support the Read Multiple Count, Key, and Data or Read Track channel commands; or I/O errors were encountered in testing whether the Read Multiple Count, Key, and Data and Read Track channel commands are supported on the device. OPTIMIZE(2), OPTIMIZE(3), and OPTIMIZE(4) are applicable only if one of these channel commands is supported. This can also occur if the device can be accessed through multiple control units. Some control units support either channel command and others do not.

**System action:** OPTIMIZE(1) is used to run the DUMP function.

**Operator response:** None.

**Application Programmer Response:** To get the performance advantages, ensure that all control units attached to the device support the Read Multiple Count, Key, and Data or Read Track channel commands.

**Source:** DFSMSdss

---

**ADR316W**

(“ttt-mmmmm(y)y), AN I/O I LOGICAL) ERROR WAS ENCOUNTERED ON THE (VOLUME LABEL TRACK \pm \text{VTOC} \pm \text{VVDS} \pm \text{DATA TRACKS}, AND ONE OR MORE TRACKS WERE NOT PROCESSED

**Explanation:** An error occurred on the specified track or tracks on the source volume and CANCELERROR was not specified. Other messages that precede this message indicate the track or tracks that had the error. CANCELERROR is ignored and this message is issued, for the following types of errors on a DASD volume: equipment check, command reject, intervention required, and busout parity.

**System action:** The tracks that had the errors were not processed. If you are doing a DUMP and the error was on VVDS, a data set RESTORE cannot be done for VSAM data sets. If the error was on the VTOC, a data set RESTORE cannot be done for any data set, but a full or tracks RESTORE is possible. If the error was on the volume label track and track zero is to be copied or restored, correct the error and rerun the job. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** If you are doing a DUMP and the output is intended for a data set RESTORE, correct the error and rerun the job. If it is a logical error on the VVDS, VTOC, or volume label track, do a TRACKS PRINT of the VVDS, VTOC, or volume label track to check their format. Also, if it is the VVDS, run access method services DIAGNOSE on the VVDS to determine the nature of the problem. Correct the error.

**Source:** DFSMSdss

---

**ADR317I**

(“ttt-mmmmm(y)y), THE DEVICE SIZE FIELD IN THE VTOC IS INCORRECT IF VOLUME \text{volume_serial_number} IS NOT A MINIVOLUME. DEVICE SIZE OF \text{nnnnnnn} CYLINDERS WILL BE USED

**Explanation:** If the volume indicated by \text{volume_serial_number} is not a minivolume, the device size field in the VTOC is incorrect.

**System action:** The device size of \text{nnnn} (in hexadecimal) cylinders is used.
ADR318I  (ttt-mmmmm(yy), y TRACKS OUT OF x WERE DUMPED FROM VOLUME volume_serial_number USING NON-OPTIMIZE CHANNEL PROGRAM AFTER ENCOUNTERING TRACK OVERFLOW RECORDS

Explanation:  OPTIMIZE channel programs fail on tracks that have overflow records. An attempt was made to dump x tracks using optimize channel program chain. Of these x tracks, y tracks were dumped using a nonoptimized channel program chain because track overflow records were encountered in using optimize channel programs.
System action:  The y tracks are processed using normal channel programs. This results in performance degradation.
Operator response:  None.
Application Programmer Response:  If the number is large, the names of data sets not marked as track overflow data sets in the VTOC must be specified in the TRACKOVERFLOW keyword if OPTIMIZE(2), (3), or (4) is specified. If ALLDATA or ALLEXCP is specified for a data set, the allocated tracks beyond the end of the used data might have residual track overflow records. If so, do not code ALLDATA or ALLEXCP for these data sets.
Source:  DFSMSdss

ADR319W  (ttt-mmmmm(yy), VOLUME SERIAL NOT CHANGED ON VOLUME volume_serial_number

Explanation:  An I/O error was encountered in trying to read track 0 from the target volume at the end of the COPY or RESTORE. Message ADR348E precedes this message. The rest of the tracks were successfully copied or restored.
System action:  Processing ends. The return code is 4.
Operator response:  None.
Application Programmer Response:  The COPY or RESTORE completed successfully but the volume serial did not change. Use AMASPZAP to update the serial number of the volume, or COPY or RESTORE track 0 again. If an alternate track can be assigned to track 0, use Device Support Facilities to do so. Rerun the job.
Source:  DFSMSdss

ADR320I  (ttt-mmmmm(yy), VOLUME SERIAL volume_serial_number_1 ON UNIT device_number IS CHANGED TO volume_serial_number_2

Explanation:  The volume serial (volume_serial_number_1) was changed to (volume_serial_number_2) upon user's request. The operator is notified of the change.
System action:  None.
Operator response:  None.
Application Programmer Response:  None.
Source:  DFSMSdss

ADR321E  (ttt-mmmmm(yy), DATA SET dsname NOT ON VOLUME volume_serial_number

Explanation:  The requested data set is not on the volume. The system might also issue this message for a data set that is being migrated when DFSMSdss tries to process the data set.
System action:  Processing continues with the next data set. The return code is 8.
Operator response:  None.
Application Programmer Response:  Correct the data set name or locate the correct volume, and rerun the job.
Source:  DFSMSdss

ADR322E  (ttt-mmmmm(yy), DATA SET dsname WAS NOT SELECTED DUE TO DUPLICATE NAME

Explanation:  Two or more data sets with the same name were found. This message can also appear when output volumes are specified and data sets of the same name as an input data set exist on more than one output volume. One of the data sets can be the input data set if the volume on which it resides is in the specified output volume list. Another case this message can appear is while DFSMSdss is filtering, and DFSMShsm processes this data set and changes the catalog entry to "MIGRAT".
System action:  If the data sets with the same names are on input volumes, the data set is not selected. If the data sets with the same names are on output volumes, the cataloged input data set is processed. The return code is 8. Processing continues for other data sets.
Operator response:  None.
ADR323E  (ttff-mmmmm(yy), ACCESS DENIED FOR DATA SET dname ON VOLUME volume_serial_number)

Explanation: The user does not have password or RACF access to the data set, or the operator denied access to the checkpoint/restart or system data set.

System action: The PRINT task ends. Processing continues with the next control statement. The return code is 8.

Operator response: If the user has authorization to access the data set, reply U to message ADR369D or ADR371D.

Application Programmer Response: Acquire authorization to access the data set, and rerun the job.

Source: DFSMSdss

ADR324E  (ttff-mmmmm(yy), THE VOLUME/DATA SET SPECIFIED BY [DDNAME ddname | VOLUME volume_serial_number] HAS BECOME UNUSABLE)

Explanation: A RESTORE, COPY, DUMP or COPYDUMP has not completed successfully, consequently leaving the output volume or data set in questionable condition. For a COPY or RESTORE, the volume serial number defines the device that has become unusable. For a DUMP or COPYDUMP, the DD statement ddname defines the tape or DASD data set that has become unusable. The data set has become unusable because either data set control information was written to the data set and no valid data sets were copied or an error condition left the data set unusable for performing any restores from it. Other messages indicating the cause of the error precede this message.

System action: For RESTORE and COPY, the current task ends with a return code of 16, and processing continues with the next task. For DUMP and COPYDUMP, output is halted to the indicated ddname but continues for other ddnames, provided the installation-wide options exit does not force the DUMP or COPYDUMP function to end if a write error occurs on any of the output copies. If the installation-wide options exit forces such a cancellation, the task ends with a return code of 16, and processing continues with the next task.

Operator response: None.

Application Programmer Response: If this message is accompanied by I/O error messages, take corrective action recommended at your site for such errors and rerun the job. If the error is on the output DASD during a COPY or RESTORE, a rerun might fail during authorization checking of the volume. In this case, initialize the volume offline to clean the volume before rerunning the COPY or RESTORE.

Source: DFSMSdss

ADR325E  (ttff-mmmmm(yy), VOLUME volume_serial_number HAS UNEXPIRED DATA SETS)

Explanation: A full or tracks COPY or RESTORE tried to overlay unexpired data sets.

System action: The task ends. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: If overlay is intended, specify the PURGE option, and rerun the job.

Source: DFSMSdss

ADR326I  (ttff-mmmmm(yy), VOLUME volume_serial_number ON UNIT device_number HAS BEEN INITIALIZED)

Explanation: Following a successful DUMP operation, as designated by the FCWITHDRAW keyword and state of the VTOC tracks, DFSMSdss invoked ICKDSF to initialize the source volume of the DUMP operation.

System action: DFSMSdss processing continues. The return code is 0.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR327W  (xxx)-mmmm(nn), NO DATA SETS PROCESSED FROM [VOLUME volume_serial_number, VOLUME volume_serial_number ON UNIT device_number] CONTAINS AN OUTPUT DATA SET I LOGICAL VOLUME volume_serial_number)

Explanation: One of the following applies:

- A data set DUMP, COPY, CONVERTV, or RESTORE did not select any data sets that matched the filtering criteria.
- The input volume cannot be processed because the selected volume contains an output data set that is used during dump. An S138 abend would result if DFSMSdss attempted to extend the data set.
- The selected data sets cannot be processed because of failure to ENQ or to allocate.
- The selected data sets cannot be processed because of failure to access the protected data sets.
- For a RELEASE, no data sets were selected because none have releasable space.
• For a COMPRESS, no data sets were selected because none are eligible for compression.

System action: Processing continues on the next volume. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR328E (ttt-mmmmm(yy)), ERROR DURING DATA SET SELECTION. VOLUME volume_serial_number IS BYPASSED

Explanation: A data set DUMP, COPY, CONVERT, or RESTORE with filtering failed on the indicated volume during VTOC or VVDS processing. For a RESTORE, the volume_serial_number is the volume serial of the source volume.

System action: Processing continues on the next source volume. The return code is 8.

Operator response: None.

Application Programmer Response: Determine the failure from the previous messages associated with this task ID.

Source: DFSMSdss

ADR331E (ttt-mmmmm(yy)), OUTPUT BLKSIZE nnnn1 FOR DATA SET ON DNAME ddname IS SMALLER THAN INPUT BLKSIZE nnnn2

Explanation: The block size specified in the JCL (or, if not specified, the defaulted block size) for output on DASD is smaller than the block size of the input volume created during the DUMP. This is not allowed. The nnnn1 and nnnn2 are in decimal notation.

System action: The task ends. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Do not specify block size in the JCL, or, if a DASD data set is required, use a DASD that allows a larger block size.

Source: DFSMSdss

ADR330W (ttt-mmmmm(yy)), OUTPUT VOLUME volume_serial_number IN USE. PROCESSING CONTINUED

Explanation: The output volume was in use by other jobs in the system during a tracks COPY or RESTORE. Some of the data sets mapped by these tracks might have been in use while DFSMSdss was processing the volume.

System action: The tracks operation is continued. If the data sets mapped by these tracks were in use, the contents of these tracks are unpredictable. The return code is set to 4.

Operator response: None.

Application Programmer Response: Specify RENAME or RENAMEUNCONDITIONAL old name filtering criteria that do not select VSAM data set names, and rerun the job.

Source: DFSMSdss
ADR333W  \((ttt\-mmmm\(yy\)), DATA SET CHANGE INDICATOR NOT RESET FOR \{dsname I cluster_name componentname\} ON volume_serial_number, (OBTAIN ERROR, error_code I I/O ERROR I CVADFIR ERROR I NOT ENQUEUED)\)

Explanation: DFSMSdss was unable to reset the data set change indicator in the data set's VTOC entry on the specified volume. Either DADSM OBTAIN failed, an I/O error occurred while writing the data set VTOC entry, a CVADFIR error occurred while reading or writing the data set VTOC entry, or the data set was not enqueued by DFSMSdss. error_code is the error code passed by the OBTAIN service.

System action: The data set change indicator is still on for the data set. The return code is 4.

Operator response: None.

Application Programmer Response: Either rerun the job, or use AMASPZAP to reset the data change indicator.

Source: DFSMSdss

ADR335W  \((ttt\-mmmm\(yy\)), DATA SET CHANGE INDICATOR NOT RESET FOR ANY DATA SET ON A VTOC TRACK ON VOLUME volume_serial_number\)

Explanation: An input I/O error was encountered on a VTOC track when the data set change indicator was being reset in the VTOC entries.

System action: The data set change indicator is not reset in any of the VTOC entries on the track. The return code is 4.

Operator response: None.

Application Programmer Response: Wait until the next run to reset the change indicator, or run IEHLIST to list the VTOC and use AMASPZAP to reset the VTOC entries.

Source: DFSMSdss

ADR336I  \((ttt\-mmmm\(yy\)), LOGICAL ERROR WHILE READING VOLUME volume_serial_number, TRACK c:h, CCW operation_code\)

Explanation: An unexpected error was encountered during a read operation that used the Read Multiple Count, Key, and Data or Read Track channel command. Normally, you need not take any action; however, see "Application Programmer Response".

System action: The track is reread using other channel commands.

Operator response: None.

Application Programmer Response: If you get this message too many times in a job, then either the DASD ERP program that retries a temporary data check or DFSMSdss might be in error.

Source: DFSMSdss

ADR337E  \((ttt\-mmmm\(yy\)), THE DUMP DATA SET IS EMPTY\)

Explanation: An attempt has been made to restore from an empty dump data set.

System action: The return code is 8.

Operator response: None.

Application Programmer Response: Rerun the job with a good dump data set.

Source: DFSMSdss

ADR338W  \((ttt\-mmmm\(yy\)), DATA SET CHANGE INDICATOR NOT RESET FOR ANY DATA SET ON VOLUME volume_serial_number\)

Explanation: DFSMSdss was unable to acquire exclusive access of the VTOC on the specified volume for resetting the data set change indicator in the VTOC entries.

System action: The data set change indicator is not reset for any data set on the volume. The return code is 4.

Operator response: None.

Source: DFSMSdss

ADR339W  \((ttt\-mmmm\(yy\)), I/O ERRORS WERE ENCOUNTERED ON THE FOLLOWING DATA SETS DURING PROCESSING FROM volume_serial_number\)

Explanation: A data set DUMP or COPY was specified, but one or more data sets encountered I/O errors. The list of data sets following this message indicates which data sets did not dump or copy successfully because of I/O errors.

System action: If DELETE or RESET options were indicated in the control statements, the data sets indicated in the list are not deleted and the data set change indicator is not reset. The return code is 4.

Operator response: None.

Application Programmer Response: If you attempt a RESTORE for these data sets, you cannot restore the tracks that had the error and the tracks will be cleared.

Source: DFSMSdss
ADR340E  (ttt)-mmmwwww(yy), OUTPUT I/O ERROR ENCOUNTERED ON VOLUME volume_serial_number DURING RESET OF THE DATA SET CHANGE INDICATOR IN THE VTOC

Explanation: A permanent output error was encountered on the input volume while the data set change indicator was being reset during a full DUMP. The output from the DUMP is still usable. An I/O error message indicating the nature of the error precedes this message.

System action: Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: If the I/O error message indicates that the volume is usable, take the same action as in message ADR333W; otherwise, restore the volume.

Source: DFSMSdss

ADR342I  (ttt)-mmmwwww(yy), DATA SET CHANGE INDICATOR HAS BEEN RESET FOR ALL QUALIFIED DATA SETS ON VOLUME volume_serial_number

Explanation: For all VTOC entries that had the indicator on, the data set change indicator was reset during a full volume DUMP.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR343E  (ttt)-mmmwwww(yy), VTOC IS FULL ON THE SINGLE TARGET VOLUME. NO MORE DATA SETS WILL BE PROCESSED

Explanation: DFSMSdss cannot continue to allocate data sets on the volume specified by the user because the volume's VTOC or VTOC index is full.

System action: The job ends. The return code is 8.

Operator response: None.

Application Programmer Response: Use ICKDSF or a similar product to expand the VTOC or VTOC index of the target volume, and rerun the job or specify additional target volumes.

Source: DFSMSdss

ADR344I  (ttt)-mmmwwww(yy), VOLSER ON UCB device_number IS A DUPLICATE. VOLUME MADE UNAVAILABLE

Explanation: A RESTORE or COPY resulted in a duplicate volume serial number in the specified UCB (device_number).

System action: The volume on the UCB is made unavailable to the system. Message ADR320I precedes this message.

Operator response: To make the new volume available to the system, the old volume with this volume serial must be unloaded or varied offline before the new volume is made available to the system.

Application Programmer Response: None.

Source: DFSMSdss

ADR345D  (ttt)-mmmwwww(yy), REQUEST AUTHORIZATION TO OVERLAY {TRACK ZERO | VTOC | VTOC INDEX | VVDS} ON UNIT device_number, job_name, step_name, procedure_name. REPLY U OR T

Explanation: A TRACKS COPY or RESTORE is being attempted on a portion of the VTOC or on track zero.

System action: Processing continues according to the operator's response.

Operator response: A response of R zz, U allows DFSMSdss to overlay track 0 or the VTOC. A response of R zz, T ends the operation, and processing continues with the next function.

Application Programmer Response: Instruct the operator to let DFSMSdss continue processing, and rerun the job.

Source: DFSMSdss

ADR346I  (ttt)-mmmwwww(yy), VTOC INDEX WILL BE DISABLED ON VOLUME volume_serial_number

Explanation: The installation-wide exit requested that the VTOC index not be reconstructed.

System action: The DFSMSdss function continues processing. The SYS1.VTOCIX.volser data set is not reconstructed by ICKDSF.

Operator response: None.

Application Programmer Response: The ICKDSF program can be performed separately from DFSMSdss.

Source: DFSMSdss
ADR347E  (ttf-mmnnnn(yy), PERMANENT I/O ERROR ON DDNAME ddnname, xxxx
Explanation: A permanent I/O error occurred on the indicated DD statement. The ddnname is followed by the SYNAD information passed by EXCP (xxxx).
System action: A DUMP ends with a return code of 16. Continuation of a RESTORE depends on the CANCELERROR option coded by the user. If CANCELERROR is coded, the RESTORE ends with a return code of 16; otherwise, recovery is attempted but results are unpredictable. Processes continues with the next input control statement if a return code of 16 is set.
Operator response: None.
Application Programmer Response: For a DUMP, take appropriate corrective action, and rerun the job. For a RESTORE, use a different version of the backup copy.
Source: DFSMSdss

ADR348E  (xxxy-mmnnnn(yy), PERMANENT [INPUT | OUTPUT] ERROR ON VOLUME volume_serial_number, operation_code, csw, sense, ecb_status [return_code-reason_code]
Explanation: The DASD device contained a permanent I/O error. The cchh, operation_code, csw, sense, and ecb_status are printed in hexadecimal digits. If the track was being read with DFSMSdss I/O routines, only the first eight bytes of sense are printed. If the track was being read as part of a concurrent copy operation, 32 bytes of sense and the system data mover return code (return_code) and reason code (reason_code) are supplied as diagnostic aids. See "System data mover return and reason codes" on page 190 for explanations of the system data mover return and reason codes. DFSMSdss provides these codes in hexadecimal format.
System action: Another message explaining the ending action, if any, follows this message. The return code is 8.
Operator response: None.
Application Programmer Response: Take appropriate action recommended at your site for the error identified by the sense information in the message. For ecb_status of X’42’, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center for programming support.
Source: DFSMSdss

ADR349W  (ttf-mmnnnn(yy), ERROR ENCONTERED WHILE REBUILDING FREE SPACE ON VOLUME volume_serial_number
Explanation: An error occurred when a temporary DFSMSdss data set, SYS1.VTOCIX.DSS.TEMP.volser, was to be allocated.
System action: The free space information in the VTOC of this volume be incorrect.
Operator response: None.
Application Programmer Response: Use the IEHLLIST utility program to determine the VTOC accuracy. Try to allocate a data set on the volume to rebuild the free space information in the VTOC. If there were other DFSMSdss or allocation error messages, you might need to perform the copy or restore job again.
Source: DFSMSdss

ADR350E  (ttf-mmnnnn(yy), {I/O | LOGICAL ERROR) ENCOUNTERED ON {VVDS | VVDS IMAGE} ON volume_serial_number
Explanation: One of the following applies:
• I/O errors were encountered while the VVDS tracks were being read.
• Logical errors were encountered while the VVDS was being scanned for authorization checking on a TRACKS or FULL volume operation.
• Logical errors were encountered while data sets were being selected during a data set DUMP or RESTORE.
System action: If this error occurs during a FULL volume or TRACKS operation while checking authorization, other messages accompany this message. If this error occurs during data set selection, the volume is bypassed. The return code is 8.
Operator response: None.
Application Programmer Response:
• For a logical or physical error during DUMP: Run access method services DIAGNOSE on the volume to determine the problem, and correct it by using the procedure recommended by the z/OS DFSMS Access Method Services for Catalogs manual.
• For a logical or physical error during RESTORE: Use a previous backup copy to restore the desired VSAM data set.
• For a physical I/O error during DUMP: Take the appropriate action recommended at your site, or contact your system programmer.
Source: DFSMSdss
**ADR351E** *(ttt-mmnnn(yy)), UNEXPECTED END OF FILE ON DDNAME ddname*

**Explanation:** An unexpected end-of-file (EOF) was encountered before the normal end of processing. The input used might have been created in a DUMP that abnormally ended.

**System action:** The task ends. The output volume or data sets be unusable. Processing continues with the next control statement. The return code is 8 or 16.

**Operator response:** None.

**Application Programmer Response:** Use a good copy of the backup, and rerun the job.

**Source:** DFSMSdss

---

**ADR352W** *(ttt-mmnnn(yy)), VOLID ON UNIT device_number, THAT HAD VSAM DATA SETS, HAS BEEN CHANGED FROM volume_serial_number_1 TO volume_serial_number_2 DURING A TRACKS OPERATION*

**Explanation:** The output volume contains VSAM data sets. The VOLID was changed on the volume. If the tracks containing these data sets were not copied or restored, these data sets might be inaccessible because of the change in the VOLID.

**System action:** The VOLID was changed. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** If the data sets are inaccessible, reset the VOLID to the original value.

**Source:** DFSMSdss

---

**ADR353I** *(ttt-mmnnn(yy)), THE FOLLOWING DATA SETS WERE SELECTED FROM VOLUME volume_serial_number*

**Explanation:** TYPRUN=NORUN was specified in the EXEC statement parameter, and in data sets, the list of names that follows this message met the filtering criteria on the volume.

**System action:** The data sets are not processed.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR354W** *(ttt-mmnnn(yy)), ERRORS ENCOUNTERED WHILE PROCESSING {VVDS | VTOC} ON VOLUME volume_serial_number*

**Explanation:** Errors were encountered while the VVDS or VTOC were being processed.

**System action:** If the error is on the VTOC, you cannot do a data set RESTORE on VSAM data sets. Only full or tracks RESTORE can be done from the DUMP output. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** Other error messages accompany this message. If you want to do a data set RESTORE from the DUMP output, take the appropriate action and rerun the job.

**Source:** DFSMSdss

---

**ADR355W** *(ttt-mmnnn(yy)), CHANGE VOLID ON UNIT device_number FROM volume_serial_number_1 TO volume_serial_number_2*

**Explanation:** A full COPY or RESTORE onto the volume was done from the source volume without specifying COPYVOLID. The VVDS data set name in the VTOC and the volume serial of the VVR for the VVDS on the output volume were carried over from the input volume. This does not agree with the volume serial of the output volume.

**System action:** The VSAM data sets on the receiving volume cannot be accessed until the volume serial of the receiving volume is changed. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** If you want to access VSAM data sets, use Device Support Facilities to change the volume serial of the receiving volume. Do not rerun the COPY or RESTORE job until the volume serial is changed because authorization checks fail.

**Source:** DFSMSdss

---

**ADR356E** *(ttt-mmnnn(yy)), TASK TERMINATED BY UIM EXIT (nn)*

**Explanation:** The indicated User Interaction Module exit point, nn, ended the related DFSMSdss function before normal completion.

**System action:** The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR358I** *(ttt-mmnnn(yy)), PHYSICAL SPACE NOT RELEASED ON SPACE EFFICIENT VOLUME volume_serial_number DUE TO PATCH BYTE SETTING*

**Explanation:** The DFSMSdss patch byte PBNOINIT at offset X’4D’ in ADRPATCH contains a non-zero value which indicates that DFSMSdss should bypass initializing the DUMP source volume following a successful DUMP operation with FCWITHDRAW.
specified. As a result, the physical space on the space efficient volume remains allocated.

**System action:** DFSMSdss processing continues. The return code is 0.

**Operator response:** None.

**Application Programmer Response:** To release the allocated physical space on the space efficient volume that is the target of a FlashCopy relationship, initialize the volume with ICKDSF. When ICKDSF initializes a space efficient FlashCopy target volume, the relationship will be withdrawn and the physical space will be released.

If bypassing the volume initialization during DUMP FCWITHDRAW operations is not desired, reset the patch byte to X’00’. See [z/OS DFSMSdss Storage Administration] for information on how you can set or change the patch byte value.

**Source:** DFSMSdss

---

**ADR359W** *(ttf-mmmm(yy)), UTILITY PROCESSING FOR DATA SET dsname COMPLETED WITH WARNINGS*

**Explanation:** The utility successfully processed the data set but issued attention messages during processing. These messages are not spooled to SYSPRINT unless the DFSMSdss parameter UTILMSG=YES is specified.

**System action:** Processing continues. Return code is 4.

**Operator response:** None.

**Application Programmer Response:** Specify DFSMSdss parameter UTILMSG=YES, and rerun the job to view utility messages.

**Source:** DFSMSdss

---

**ADR360I** *(ttf-mmmm(yy)), PROCESSING LOCKED USER CATALOG catalog_name*

**Explanation:** The corresponding VVR for the integrated catalog facility user catalog being processed had the lock indicator set on.

**System action:** The function continues processing.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR362T** *(ttf-mmmm(yy)), NO BUFFER AVAILABLE & NONE IN WRITE*

**Explanation:** The DFSMSdss I/O modules cannot find a free buffer. There are outstanding requests for waits or checks.

**System action:** The job ends. The return code is 12.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdss

---

**ADR363E** *(ttf-mmmm(yy)), SOURCE DATA SET dsname IS EMPTY | HAS AN UNSUPPORTED DSORG | IT WILL NOT BE COPIED TO TARGET DATA SET*

**Explanation:** The data set cannot be copied to the pre-allocated target data set for one of the following reasons:

- It is empty.
- It has a BLKSIZE of 0 and the target volume is of unlike device.
- It has an unsupported DSORG and the target volume is of unlike device.

**System action:** The data set was not copied. Processing continues. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** To have the data set copied, do one of the following:

- For an empty data set, use ALLEXCP to force copy of all allocated space in the data set. Make sure that the selected target volume is of like device and that the data set is not being reblocked.
- For a data set with a BLKSIZE = 0, make sure that the selected target volume is of like device.
- For a data set with an unsupported DSORG, make sure that the target volume is of like device. For a data set with an unsupported DSORG going to an unlike target device, specify the PROCESS keyword with the UNDEFINED subkeyword. The specified or chosen target device must have a track capacity equal to or greater than the source.

**Source:** DFSMSdss

---

**ADR364W** *(ttf-mmmm(yy)), TRACK CANNOT BE RESTORED DUE TO DATA CHECK DURING DUMP. C:H c:h, DDNAME ddname*

**Explanation:** An error was encountered on a DASD volume during the DUMP. Because CANCELERROR was not coded, a dummy record was dumped. This record is recognized during the RESTORE.

**System action:** The indicated track (c:h) is not restored. Processing continues for other tracks. The return code is 4.

**Operator response:** None.
ADR365E  (ttt)-mmmm(y), THE CATALOG
      catalog_name SPECIFIED IN
{RECATALOG | INCAT} IS NOT
AVAILABLE. THE (COPY | DUMP |
RESTORE | CONVERTV) TASK IS
TERMINATED

Explanation:  The catalog specified in the
RECATALOG or INCAT parameter does not exist or is
not available on the system.

System action:  Performance of the task ends. The
return code is 8.

Operator response:  None.

Application Programmer Response:  Ensure that the
catalog name is correct and available, and rerun the
job.

Source:  DFSMSdss

ADR366W  (ttt)-mmmm(y), TRACK c:h WRITTEN
TO VOLUME volume_serial_number
WITH INVALID TRACK FORMAT

Explanation:  Track c:h had a track format which was
not valid on the source volume during DUMP or COPY.
It was restored or copied with the same condition to the
indicated target volume. When this track is accessed on
the target volume, the invalid-track-format condition
recurs. Or, a direct data set that could not be accessed
by relative block address (that is, it had a standard user
label or its record format was not fixed or fixed block)
was being copied from a smaller-capacity DASD to a
larger-capacity DASD. A track of data from the
smaller-capacity device could not fit on the track of the
larger-capacity device. This condition can occur when
the data set without fixed or fixed-block record format
has a large maximum block size but the actual blocks
are so small that the track of the larger-capacity device
cannot contain all the smaller blocks because of the
increased inner-block gap size of the larger-capacity
device. This message is issued for each track copied
that will not fit on the track of the larger-capacity device,
and the copy continues. (You can stop the copying of
such data sets by using the CANCELERROR keyword.
See the use of CANCELERROR in the z/OS DFSMSdss:
Storage Administration manual and in message
ADR367E in this manual.)

System action:  Operation continues and the
remaining tracks, if any, are restored. The return code is
4.

Operator response:  None.

Application Programmer Response:  None.

Source:  DFSMSdss

ADR367E  (xxx)-mmmm(y), (R0 COUNT FIELD | INVALID TRACK FORMAT) ERROR ON
(INPUT | OUTPUT) VOLUME
      volume_serial_number cchh
operation_code csw sense cchh sense
[return_code-reason_code]

Explanation:  Either the cchh track had an invalid track
format, or a search ID for R0 on this track failed. If the
track was being read with DFSMSdss I/O routines, only
the first eight bytes of sense are printed. If the track
was being read as part of a concurrent copy operation,
32 bytes of sense and the system data mover return
code (return_code) and reason code (reason_code) are
supplied as diagnostic aids. See “System data mover
return and reason codes” on page 190 for explanations
of the system data mover return and reason codes.
DFSMSdss provides these codes in hexadecimal.

System action:  If the R0 count field error is
encountered on an input volume and CANCELERROR
was specified, the function ends with a return code of
16; otherwise, processing continues and a return code
of 4 is set.

If the invalid-track-format condition was encountered
on an input volume, all the data that DFSMSdss was able
to read from this track is written to the output volume
(COPY and DUMP), and the track is marked as having
an invalid-track-format condition on the output tape
(DUMP only). In this case, the return code is set to 8. If
the invalid-track-format condition was encountered on
an output volume, the track image that DFSMSdss
attempted to write is in error, not the original target
track.

Also, this message is issued instead of ADR366W when
copying direct data sets when an invalid-track-format
error occurs on a write to an output volume if the
keyword CANCELERROR has been specified. The
COPY or RESTORE of the data set receiving the
invalid-track-format error is stopped, and the
DFSMSdss-allocated target data set is deleted.
Because of the concurrent processing of the output
buffers on the WRITEs, as many as three invalid tracks
might be written before processing of the data set can be
ended (that is, the system might issue three
ADR367E messages before ending the copy). The
COPY job continues to process any subsequent data
sets. If a FULL or TRACKS COPY or RESTORE
encounters the invalid-track-format condition, message
ADR367E is issued and the task is ended. No
subsequent tracks are processed.

Operator response:  None.

Application Programmer Response:  If the function
ends because of the R0 count field error, correct the R0
record using Device Support Facilities and rerun the job.
For an invalid-track-format condition, the user needs to
reconstruct the track in error after the RESTORE.

Source:  DFSMSdss
ADR368E  (ttt-wwww(yy), I/O ERROR ON DDNAME dname WHILE (PROCESSING VTOC | ADVANCING TO NEXT TRAILER RECORD) )

Explanation: An I/O error was encountered in processing the VTOC or in bypassing the file for a data set restore. The xxx is the SYNAID information passed by the access method routines.

System action: If the operation was to process the VTOC, the restore ends and no further processing is performed. If the operation was to advance to the next trailer record, the restore continues because the I/O error occurred on a record that was not needed for this restore. The return code is 8.

Operator response: None.

Application Programmer Response: If the operation was to process the VTOC, use a different version of the backup copy. If the operation was to advance to the next trailer record, the restore continues, depending on the response from the operator. A reply of T ends the function with a return code of 8.

Source: DFSMSdss

ADR368E  (ttt-wwww(yy), I/O ERROR ON DDNAME dname WHILE (PROCESSING VTOC | ADVANCING TO NEXT TRAILER RECORD) )

Explanation: An I/O error was encountered in processing the VTOC or in bypassing the file for a data set restore. The xxx is the SYNAID information passed by the access method routines.

System action: If the operation was to process the VTOC, the restore ends and no further processing is performed. If the operation was to advance to the next trailer record, the restore continues because the I/O error occurred on a record that was not needed for this restore. The return code is 8.

Operator response: None.

Application Programmer Response: If the operation was to process the VTOC, use a different version of the backup copy. If the operation was to advance to the next trailer record, the restore continues, depending on the response from the operator. A reply of T ends the function with a return code of 8.

Source: DFSMSdss

ADR369D  (ttt-wwww(yy), AUTHORIZE FOR (READ | WRITE) ACCESS (A CHECKPOINT/RESTART DATA SET | A RACF DATA SET ON NON-RACF SYSTEMIA VVDS | A VTOCIX | ICF VSAM DATA SET ON NON-ICF SYSTEM) ON volume_serial_number, job_name, step_name, DDNAME ddname)

Explanation: The requested authorization is for:

- A checkpoint/restart data set
- A RACF data set on a non-RACF system
- A VVDS or VTOCIX data set
- An integrated catalog facility-cataloged VSAM data set on a nonintegrated catalog facility system.

System action: Processing continues according to the operator action. If the operator replies T, a full or tracks operation ends and, on a data set operation, the data set is not processed. A reply of U authorizes the data set to be processed.

Operator response: Respond R zz,U to cause DFSMSdss to continue processing the data set or volume. Respond R zz,T to end the function and cause processing to continue for the next data set or next control statement.

Application Programmer Response: Instruct the operator to authorize the processing through a reply of U, and rerun the job.

Source: DFSMSdss

ADR370E  (ttt-wwww(yy), INVALID SEQUENCE NUMBER ON DDNAME dname LAST nnnn1 NEXT nnnn2)

Explanation: During a RESTORE, the sequence number of the record read, nnnn2 (in hexadecimal) did not match the previous record processed, nnnn1 (in hexadecimal). If there is an end of volume involved, a tape might have been mounted in the wrong sequence.

System action: Processing continues with the next control statement. If the output volume was updated, a return code of 16 is set; otherwise, a return code of 8 is set.

Operator response: None.

Application Programmer Response: Probable user error. Mount the proper restore tape, or use the correct dump data set.

Source: DFSMSdss

ADR371D  (ttt-wwww(yy), I/O ERROR ON volume_serial_number DURING AUTH CHECKING FOR (INPUT | OUTPUT) ACCESS, job_name, step_name, DDNAME ddname)

Explanation: An I/O error was encountered while the VTOC was accessed for authorization checking.

System action: Processing continues, depending on the response from the operator. A reply of T ends the function with a return code of 8.

Operator response: If the user has authorization to access the volume, reply R zz,U to continue the function. Otherwise, reply R zz,T to end the function.

Application Programmer Response: Instruct the operator to let DFSMSdss continue processing, and rerun the job.

Source: DFSMSdss

ADR372W  (ttt-wwww(yy), ALIAS dsname NOT RESTORED FOR USER CATALOG catalog_name, reason_code)

Explanation: The user catalog alias was not restored for the restored user catalog. The reason code (reason_code) indicates why, as follows:

00 User catalog aliases are not restored when the user catalog is restored to a nonempty pre-allocated target.
04 The user catalog for this alias was not restored successfully.
08 A duplicate name exists in the master catalog for the alias.

Source: DFSMSdss
A catalog error other than duplicate data set name occurred while the alias was being restored.

**System action:** The user catalog alias is not restored. Processing continues with the next data set. The system return code is 4.

**Operator response:** None.

**Application Programmer Response:** The user catalog was restored. To define the alias, do the following according to the reason code:

- **00** Use the IDCAMS DEFINE ALIAS command to define the alias if it does not exist and is desired.

- **04** Other messages indicate why the user catalog was not restored. Correct the problem and rerun the restore.

- **08** If the duplicate name in the master catalog is an alias for the restored user catalog, no action is necessary. If the duplicate name is not an alias, correct the problem. If the alias is required, define it using the IDCAMS DEFINE ALIAS command.

- **12** Determine the error from message ADR497E that precedes this message and correct the problem. Then define the alias using the IDCAMS DEFINE ALIAS command.

**Source:** DFSMSdss

---

**ADR374E**

*(ttt)-mmmm(yy), UNABLE TO OPEN DDNAME ddname, reason_code return_code*

**Explanation:** DFSMSdss was unable to open the indicated data set for the indicated reason code (reason_code). RDJFCB passed the return code (return_code). The possible reason codes are:

- **8** RDJFCB failure.
- **10** Invalid parameters passed in JCL. The following are the probable reasons:
  - SYsin/ SYSOUT data set
  - DISP=MOD coded for the output data set
  - DISP=SHR coded for the output data set
  - BLKSIZE less than 7892 bytes
  - DSORG other than PS
  - BUFNO specified.
- **12** OPEN failure.
- **14** Invalid file format passed in the JCL. One of the following is true:
  - RECFM is not FB or F
  - RECLen is not 80
  - BLKSIZE is not a multiple of the record length.

**System action:** The task ends. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the parameters in error, and rerun the job.

**Source:** DFSMSdss

---

**ADR375E**

*(ttt)-mmmm(yy), DATA SET dsname IS PARTITIONED, BUT HAS NO DIRECTORY. IT CAN ONLY BE {COPIED | RESTORED} TO A LIKE DEVICE*

**Explanation:** The data set is partitioned, but has no directory. It can be copied or restored only to a like device, but no like devices were available or usable.

**System action:** The task fails for that data set. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Rerun the job, ensuring that a like device with sufficient space is available.

**Source:** DFSMSdss

---

**ADR376E**

*(ttt)-mmmm(yy), UNABLE TO ACQUIRE ADDITIONAL STORAGE FOR THE TASK*

**Explanation:** Additional storage was required to continue the function, but it was not available.

**System action:** The task ends. Processing continues.
with the next control statement. The return code is 8. An 
abend 80A might occur during DFSMSdss 
postprocessing.

**Operator response:** None.

**Application Programmer Response:** Provide 
adequate storage by increasing either the REGION size, 
the SIZE parameter, or both, or respecify the filtering 
criteria to reduce the number of data sets for the 
operation. Rerun the job. See the [z/OS DFSMSdss][storage administration] 
under “Storage Administration” for more information about storage estimates.

**Source:** DFSMSdss

ADR377W  
(ttff-mmmmm(yy)), COMMAND IS NOT 
SUPPORTED FOR DATA SET dsname 
ON VOLUME volume_serial_number

**Explanation:** The COPY, DUMP, or data set 
RESTORE command does not support the data set 
organization of the indicated data set. The volume 
indicated is the logical volume during a RESTORE. The 
PRINT command does not support split-cylinder data 
sets or nonintegrated catalog facility VSAM data sets. 
The DUMP command does not support multi-volume 
data sets when they have a standard user label.

**System action:** Processing continues for other data 
sets. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR378I  
(ttff-mmmmm(yy)), THE FOLLOWING 
DATA SETS WERE SUCCESSFULLY 
PROCESSED FROM VOLUME 
volume_serial_number

**Explanation:** A list of data set names follows this 
message. The volume indicated is the logical volume for a 
RESTORE.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR379E  
(ttff-mmmmm(yy)), {OBTAIN ERROR xxxx 
I NO F2/F3 DSCB I NOT F2/F3 DSCB I 
ERROR IN F1 DSCB I ERROR IN F3 
DSCB I TOO MANY EXTENTS I NO 
EXTENTS) [AT C:H c/h] ON VOLUME 
volume_serial_number FOR 
{DSNAME|CLUSTERNAME name 
COMPONENTNAME component_name}

**Explanation:** Errors were encountered when the 
extents for the data set were accessed. The possible 
errors are:

- OBTAIN failed while the extents for the data set were 
  retrieved.
- The VTOC entry indicated that the data set had more 
  than three extents, but the additional extent 
  descriptions could not be located. The VTOC entry 
  for an indexed sequential data set did not include the 
  ISAM-specific information.
- The record retrieved from the VTOC was not of the 
  expected type.
- The description for one of the first three extents had 
  errors.
- The descriptions for extents beyond the third extent 
  had errors.
- The number of extents was more than the number 
  supported (16 for a non-VSAM data set and 123 for a 
  VSAM data set, a PDSE, or an extended format 
  sequential data set).
- The extent information in the VTOC entry is null.
- The primary and/or alternate cylinder information in the 
  VTOC is incorrect.

During a RESTORE, the volume serial is the logical 
volume.

**System action:** For non-VSAM data sets, only the 
retrieved extents are processed. If the error occurred 
during a data set DUMP and the data set is restored 
during a subsequent data set RESTORE, only the 
successfully dumped extents are restored. If the error 
ocurred on a VSAM data set, it is not processed. If the 
error occurred during the BUILDSA operation, the 
BUILDSA task ends. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Use IEHLIST to 
verify the DSCBs for the VTOC. If the VTOC does not 
contain errors, rerun the job to dump the data set. Use 
a prior backup copy of the dump to restore the data set 
if it occurs during a RESTORE.

If the primary and/or alternate cylinder information in the 
VTOC is incorrect, you can use ICKDSF REFORMAT 
REFVTOC to correct them. Additionally, you might need 
to refresh the operating system’s internal control 
structure for the device using the following DEVSERV 
operator command:

DEVSERV QDASD,device_number,1,VALIDATE

where device_number is the device number.

**Source:** DFSMSdss

ADR380E  
(xxx)-mmmmmm(yy), DATA SET dsname 
NOT PROCESSED, {reason_code | 
reason_code-xxx} [INDEX dsname 
VOLUME volser]

**Explanation:** The data set was not copied, restored,
An unmovable/ABSTR data set was not pre-allocated. Either the system does not support allocation of these data sets, or you are attempting physical restore of a nonpre-allocated unmovable/ABSTR data set.

REPLACE or REPLACEUNCONDITIONAL was not specified for the unmovable data set.

There were unmatched extents on input and output for an unmovable/ABSTR data set. The extents of the source unmovable data set are printed.

DADSM was unable to allocate a data set. The xxx indicates DADSM (SVC 32) return codes. See z/OS DFSMSdftp Diagnosis manual for more information.

The dsname of request already exists on this volume; initial allocation was not possible under the given name.

No room was available in the VTOC.

A permanent I/O error or an error returned by CVAF was encountered.

Direct access to the absolute track was unavailable.

The requested quantity was unavailable.

The average record length is greater than 65535 bytes.

The parameter list was invalid.

The JFCB was invalid or a partial DSCB pointer was specified.

The DOS VTOC cannot be converted to an OS VTOC.

No space parameter was given for a new data set, or zero space was requested at absolute track zero.

CYL and CONTIG requests conflict.

The space subparameter was invalid.

User labels were not supported.

DSSIZE=0 and minimum allocation unit is greater than 0.

DSSIZE is not a multiple of the minimum allocation unit.

During a PDS space allocation request, a directory size request was larger than the entire allocation request.

Space request must be ABSTR for a DOS volume.

Overlapping extents were in the VTOC.

Overlapping DOS split-cylinder extents were in the VTOC.

DADSM allocation ended because of possible VTOC errors.

Allocation ended because of DOS stacked pack format.

RACDEF failed; data already was defined.

The user was not authorized to define the data set.

The installation-wide exit rejected the request with a return code of 8.

The installation-wide exit rejected the request with a return code of 4.

RACF was defined with modeling specified; the model was not found.

The authorization check failed.

The block sizes of the target and source data sets do not match. This can be caused by attempting to move a data set created in an N*512 environment to a non-N*512 environment, or vice versa.

The volume sequence number does not match.

DSORG did not match.

There was an error in the rename filter.

The movable data set on the receiving volume is not the same size as the data set on the source volume. The data set is in use and cannot be scratched and reallocated. This might be caused by the initiator holding serialization for the data set because the data set is referenced in a subsequent job step.

The movable data set on the receiving volume is smaller than the data set on the source volume. Failure occurred in the scratch; the data set cannot be scratched and reallocated.

The VVDS calls failed. See return code 50 under message IDC3009I.
The extents mapped by the VTOC and VVDS on DASD do not match the VVDS on the input logical volume.

Retrieving the extents from the VTOC failed. \textit{x}xxx is the obtain error code. See \cite{z/OS DFSMSdftp Diagnosis} for these codes.

Component names do not match. Either the component was redefined since the data set was backed up; or it is a multivolume data set, and the input and output volumes are different volumes of a multivolume data set.

The number of components differs on input and output. Either the component was redefined since the data set was backed up; or it is a multivolume data set, and input and output volumes are different volumes of a multivolume data set.

The beginning RBA for the components does not match on input and output. The input and output volumes are different volumes of a multivolume data set.

Primary/secondary indicators do not match on input and output. The input and output volumes are different volumes of a multivolume data set.

For physical data set processing: the REPLACE, RENAME, or RENAMEUNCONDITIONAL keywords were not specified for the movable non-VSAM data set, or REPLACE was not specified for a VSAM data set.

For logical data set processing, the REPLACE, REPLACEUNCONDITIONAL, RENAME, or RENAMEUNCONDITIONAL keywords were not specified for the data set.

The extents mapped by the VTOC do not match the VVDS on the output volume.

The data set on the output volume is smaller than on the input logical volume. \textit{x}xxx = data component size in tracks (hexadecimal). \textit{yyyy} = index component size in tracks (hexadecimal).

The VVDS, BCS, or VTOCIX cannot be restored or copied to a different volume.

The location of where the unmovable data set is to be allocated is not free, and FORCE is not specified.

The indicated data set is a duplicate data set and exists on more than one input volume.

The pre-allocated target data set was defined with a larger control area (CA) size than the source data set.

DFSMSdss cannot restore data sets with a volume serial of \textit{MIGRAT}.

CVOL cannot be replaced.

Input/output block cannot be built because one or more of the following conditions exists:
\begin{itemize}
  \item Ddname is not found.
  \item Ddname is a SYSIN or SYSPRINT.
  \item Device is not DASD.
  \item Device is not supported.
  \item Incorrect ranges are specified for DASD.
\end{itemize}

The catalog return code was unexpected.

No output volumes were available because one of the following conditions exists:
\begin{itemize}
  \item There are no volumes in the output volume list that fulfill the requirements of the target volumes (that is, same or like device type).
  \item Not all volumes of a pre-allocated multivolume data set are included in the output volume list.
  \item An attempt is made to restore an unmovable data set while output volumes are specified without at least as much space as is required by each corresponding source volume.
  \item The volumes on which the pre-allocated VSAM clusters reside do not match the volumes listed in the catalog entry for the cluster. This can happen, for example, if the pre-allocated cluster is cataloged outside the standard order of search or is not cataloged at all, while another cluster with the same name is cataloged in the standard order of search.
  \item A VSAM data set was pre-allocated on the target volumes, but no catalog entry was found.
\end{itemize}

The volume serials of the
pre-allocated, cataloged multivolume data set do not match those of the first volume.

31 The VSAM data set was pre-allocated on source volumes, but the catalog entry was not found.

32 Space on the output volumes was insufficient to restore the data set.

33 Allocation errors were unexpected.

34 Data set not processed. Catalog entry for an SMS-managed data set was found but there was no corresponding VTOC entry.

35 The VSAM define failed.

36 Processing of an integrated catalog facility user catalog is not supported when input volumes are specified (using one of the INDDNAME, INDYNAM, LOGINDDNAME, or LOGINDYNAM keywords).

37 The new name specified with RENAME or RENAMEUNCONDITIONAL already exists on the volume and the REPLACEUNCONDITIONAL keyword was not specified. The REPLACE keyword cannot be used to replace a data set that is being renamed.

38 The VVR for a component of the data set was found, but no corresponding DSCB was found.

39 RENAME or RENAMEUNCONDITIONAL is not supported for unmovable data sets.

40 A nonexistent catalog is specified in the RECATALOG parameter, but the target data set is not SMS-managed.

41 During physical restore or copy, the target volume is not SMS-managed, but one of the following situations occurs:
   • The ACS routine returned an SMS storage class.
   • The user specified BYPASSACS with STORCLAS.
   • The user specified BYPASSACS without STORCLAS, but the source data set was SMS-managed.
   • The data set is only supported in an SMS environment.

42 The NOPACKING keyword was specified for the data set, but the pre-allocated target was on an unlike device.

43 During physical restore or copy, the target volume is SMS-managed, but one of the following situations occurs:
   • The ACS routine returned NULL storage class.
   • The user specified BYPASSACS with NULLSTORCLAS.
   • The user specified BYPASSACS without NULLSTORCLAS, but the source data set was not SMS-managed.
   • The data set is not supported by SMS.

44 The source component is multivolume, and the pre-allocated target is either a different size or is now single volume.

45 The number of tracks on the pre-allocated target does not match the number of source tracks, and it is not the first part of a multivolume data set.

46 Allocation of resource failed because DFSMSdss used a utility to perform data movement. Processing ends.

47 Locate failed for a component of the VSAM cluster that was named in the message as the data set that was not processed (dsname).

48 The data set must be copied with a utility, but DFSMSdss is unable to use utilities.

49 DFSMSdss is unable to determine the number of blocks per track for the target device because of an invalid source data set block size.

50 The stripe number of the source and target extended format VSAM data sets do not match.

51 The primary VVR of the target data set does not contain extended format information. The pre-allocated target data set cannot be used.

52 The primary VVR of the source data set does not contain extended format information.

53 The requested data set is a PDSE, but SMSX is not currently available or the PDSE cannot be allocated and accessed at this time.

54 The requested data set is a PDSE or an extended sequential data set, but the target volume selected is not SMS-managed. A PDSE or an
extended sequential data set can reside only on SMS-managed volumes.

59 The source data set for the operation is SMS-managed and has extended attributes. Allocation has selected a target volume that is not SMS-managed. Since the data set is not renamed, the requested operation would cause the attributes to be lost.

60 The requested data set is a PDSE, HFS or an extended sequential data set, but there is a pre-allocated target data set that is a different type or has different attributes.

61 The requested data set is a physical sequential data set or partitioned data set (PDS), but there is a pre-allocated target that is an extended sequential data set or a partitioned data set extended (PDSE).

62 An attempt was made to restore an extended sequential data set either to a non-ESCON attached device or to a device whose controller does not support extended sequential data sets.

63 The source data set for the operation is SMS-managed and has extended attributes, and the target data set has the same name as the source but is not SMS-managed. The requested operation would cause the extended attributes to be lost. The pre-allocated data set cannot be used.

64 The source data set has extended attributes, but the target data set does not have extended attributes. The pre-allocated data set cannot be used.

65 The target data set has extended attributes, but the source data set does not have extended attributes. The pre-allocated target cannot be used.

67 The pre-allocated target for the restore of a keyrange data set (KRDS) is currently defined with a different number of keyranges than the source dump.

68 During a restore, one or more keyranges of the pre-allocated target of a KRDS have extents on the overflow volumes.

69 For a pre-allocated KRDS, the VTOC entry was not found on the volume indicated by the catalog entry for the data set.

70 Dynamic allocation failed for DFSMSdss export data set.

71 The SMS indicator in the VTOC entry is off, showing that the data set is not SMS, but the volume is SMS-managed.

72 DFSMSdss does not provide support to perform a logical copy on hierarchical file system (HFS) data sets.

73 Hierarchical file system (HFS) data sets cannot be restored to non-SMS-managed volumes.

74 An attempt was made to restore a compressed data set to a device whose controller does not support compressed data sets.

75 All volumes of a multivolume data set were not included in the input volume list and SELECTMULTI was not specified. A list of volumes associated with the data set be printed after this message as additional information to assist the user.

76 All components of a VSAM data set could not be selected. The missing component and a list of volumes associated with the missing component be printed after this message as additional information to assist the user.

77 The data set would be unusable after a restore because of the relationship between the high allocated RBA of the VSAM source data set and the target data set.

78 The catalog entry for the data set indicates that the data set is NONVSAM, but the F1 DSCB indicates that the data set is VSAM.

80 The pre-allocated data set was unusable because of one of the following conditions:
  • The attributes of the pre-allocated target do not match those of the source data set. The target data set is single volume, and the source data set is multivolume, or vice-versa.
  • The target data set is not cataloged and has never been opened.
Therefore, DFSMSdss cannot determine if it is single volume or multivolume.

- The pre-allocated target VSAM data set is multivolume and the output volumes specified do not include all of the volumes on which the components reside.

An error occurred during CVAF VTOC access for the data set. Message ADR246E accompany this message and provide more information.

An error was detected while attempting to process the sequence set VVR of a VSAM KSDS with an imbedded index.

The data set is pre-allocated on an SMS-managed volume that is disabled.

The current release does not support Large Format Physical Sequential data sets.

The source and target volumes are the same. While processing VSAM data sets during a physical data set copy, renaming of VSAM data sets is not supported, and two VSAM data sets with the same name cannot reside on the same volume. While processing non-VSAM data sets during a physical data set copy and not renaming the non-VSAM data sets, two non-VSAM data sets with the same name cannot reside on the same volume.

System action: The return code is 8. The data set is not processed.

Operator response: None.

Application Programmer Response: Take the following action, depending on the reason code (reason_code):

0 pre-allocate the data set with the size and location of the extents to match those on the source volume, or specify FORCE. Rerun the job.

1 Specify REPLACE or REPLACEUNCONDITIONAL and rerun the job.

2 Copy/Restore of unmovable/ABSTR data sets is allowed only if the size and location of the extents match and the data set is pre-allocated. Initialize a new DASD volume with the VTOC extent matching the input logical volume, do a TRACKS COPY/RESTORE to copy the VTOC and TRACK 0, and do a data set COPY/RESTORE of the failing data set. Use the appropriate utility for the type of data set to move the data set from the scratch volume to the failing volume.

3 Take appropriate action according to the DADSM return code.

4 Acquire adequate authorization (RACF or password). If it is a checkpoint/restart or system data set, instruct the operator to allow the function to continue. You can also change the user authorization exit routine to allow access to the data set. Rerun the job.

5 Copy or restore the data set in the same environment in which it was created.

6 For a multivolume non-VSAM data set, the volume sequence number must match. For a VSAM data set, the beginning RBA of the data set on the volume must match.

7 If it is the same data set, use AMASP2ZAP to modify the DSORG field in VTOC entry. Rerun the job.

8 Correct the RENAME filter specification. Rerun the job.

9 Rerun the job when the data set is not in use or do not reference the data set in the same job as the DFSMSdss step.

10 Scratch the data set and rerun the job.

11 See return code 50 under message IDC3009.

12 Use a different backup copy to restore the data set.

13 Contact your system programmer.

14 If it is not a multivolume data set, delete the data set on DASD and resubmit the job. If it is a multivolume data set and a RESTORE in which the data set is not restored from the correct input logical volume, resubmit the job to restore from the proper logical volume. If it is a COPY, pass the proper input or output volumes and rerun the job.

15 See reason code number 14.

16 See reason code number 14.

17 See reason code number 14.

18 For physical data set processing: specify REPLACE, RENAME, or RENAMEUNCONDITIONAL if it is a non-VSAM data set. Specify REPLACE if it is a VSAM data set.

For logical data set processing, specify REPLACE, REPLACEUNCONDITIONAL, RENAME (RESTORE only), or RENAMEUNCONDITIONAL.
Run the DIAGNOSE command of access method services to determine the error.

Delete the data set and redefine it.

For non-SMS-managed data sets, restore to the correct DASD volume, or use the LVOL parameter to restore from the correct logical volume. For an SMS-managed user catalog, specify the correct DASD volume in the OUTDD/OUTDY parameter, and ensure that the volume is in a Storage Class with the guaranteed space attribute.

Specify FORCE or free the corresponding location on the target volume, and rerun the job.

If it is a multivolume data set, correct the last volume indicator and the volume sequence number fields in the VTOC, or catalog the data set in the proper sequence in the appropriate catalog. Rerun the job.

Specify RENAME or RENAMEUNCONDITIONAL or delete the pre-allocated target data set, and then rerun the job. For physical data set COPY, delete or pre-allocate the target data set with the appropriate sized CA.

Recall the data set and retry the restore operation.

Delete the CVOL from the target volume, then rerun the job.

Take one or more of the appropriate actions listed below, then rerun the job:
- Ensure that a DDNAME statement is present in job step.
- Ensure that the DDNAME is not that of a SYSIN or SYSPRINT.
- Ensure that the device specified is a DASD.
- Ensure that the device is supported on the system.
- Ensure that the correct ranges are specified for DASD.

See message ADR497E, printed before this message, and take the appropriate action.

Take one of the actions listed below; then rerun the job:
- Supply a new choice of output volumes.
- Ensure that the data set is cataloged and the catalog volumes and output volumes on which it is pre-allocated match.
- Restore as a movable data set by specifying the FORCE keyword.
- Supply the name of the catalog in which the pre-allocated cluster resides, by using the RECATALOG keyword. If the pre-allocated target cluster is not cataloged in any catalog, then either catalog it or delete it.
- Ensure that the pre-allocated target data set is cataloged in the standard order of search.

Ensure that the correct target volumes for the multivolume data set are specified in the output DD statements, then rerun the job.

Ensure that the catalog containing this data set is in the standard order of search.

Provide a different choice of output volumes, then rerun the job.

Provide a different choice of output volumes, then rerun the job.

Delete the catalog entry for the failing data set. Full volume dump/restore does not allocate data sets. However, it does restore all of the data tracks as well as the VTOC. Thus, full volume restore can be used to restore cataloged SMS-managed data sets with no corresponding VTOC entries.

Ensure that the new name specified with RENAME or RENAMEUNCONDITIONAL does not already exist on the volume. If the new name already exists, specify REPLACEUNCONDITIONAL or delete the name and specify a new name before retrying the command. REPLACE is ignored if RENAME or RENAMEUNCONDITIONAL is used.

Do not specify input volumes, then rerun the job.

Ensure that the new data set name specified with RENAME or RENAMEUNCONDITIONAL does not already exist on the volume. Specify REPLACEUNCONDITIONAL to replace data set names that match the rename criteria of the RENAME or RENAMEUNCONDITIONAL keywords. REPLACE is ignored if RENAME or RENAMEUNCONDITIONAL is used.

Delete the VVR for the failing component, and rerun the job.

Specify REPLACE or REPLACEUNCONDITIONAL to replace the unmovable data set name under the old name, and rerun the job.

Ensure that the catalog name is correct and available if the target data set is not SMS-managed, and rerun the job.

Specify either an SMS target or a NULLSTORCLAS.

Delete and reallocate the target partitioned data set on a like device, or rerun the job without specifying NOPACKING for the data set.

Specify a non-SMS target.
Delete the data set on DASD, and resubmit the job.

Delete the data set on DASD, and resubmit the job.

Rerun the job when the data set is not in use.

Identify components of the VSAM cluster and ensure that they are named and cataloged correctly.

See preceding error messages (for example ADR476E) for information as to why DFSMSdss is unable to use utilities. Take appropriate action as described for those messages.

Ensure that the source data set has a valid block size or pre-allocate a target data set with a valid block size. Specify the REPLACE or REPLACEUNCONDITIONAL keyword.

Delete the pre-allocated target data set and rerun the restore job.

See the previously issued ADR432E message. Delete the pre-allocated target data set and allow DFSMSdss to allocate the target data set.

See the previously issued ADR432E message. You might need to use a previous backup copy to restore the data set.

Ensure that SMSX is available and that the PDSE can be allocated and accessed on the system. Rerun the job.

Ensure that the target volume for the PDSE or extended sequential data set is SMS-managed, or do not select the PDSE or extended sequential data set.

Either rename the data set and allow the operation to proceed against the non-SMS-managed volume or modify ACS filtering in such a way as to cause the target data set to reside on SMS volumes.

Process the PDSE, HFS, or extended sequential data set using the RENAME or RENAMEUNCONDITIONAL keywords, or rename the pre-allocated target data set, or delete the pre-allocated target data set.

Process the physical sequential data set or PDS using the RENAME/RENAMEUNCONDITIONAL keywords, or rename the pre-allocated target data set, or delete the pre-allocated target data set.

Change the target volume for the restore to a device that is both ESCON-attached and the controller of which supports extended sequential data sets.

Data sets with extended attributes cannot reside on non-SMS managed volumes. Either delete the pre-allocated target or restore with RENAME to a new data set.

Either delete the pre-allocated target and allow the data set to be allocated by DFSMSdss, or restore with RENAME to a new data set.

Either delete the pre-allocated target and allow the data set to be allocated by DFSMSdss, or restore with RENAME to a new data set.

Take one of the following actions:
• Delete and redefine the data set with the proper number of keyranges.
• Delete the pre-allocated target and let DFSMSdss determine the number of keyranges.

Take one of the following actions:
• Delete and redefine the data set. A candidate volume is acceptable in the redefine, but can be retained only if the new definition has a primary extent sufficient to contain the primary and secondary extents, including those on the overflow volumes.
• Delete the pre-allocated target. DFSMSdss restores the data set to the volumes from which it was dumped.

Take one of the following actions:
• Delete and redefine the data set to ensure that the catalog and VTOC entries match.
• Delete the pre-allocated target and let DFSMSdss restore the data set to the volumes from which it was dumped.

Determine the condition that caused the allocation to fail (for example, authorization failure, and so on), correct the error condition, and rerun the job. To bypass the problem, the user must define a generic profile with "HLQ.*"

Correct the VTOC entry and rerun the job.

Use a data set dump and restore or a full volume tracks physical copy to move a hierarchical file system (HFS) data set.

Ensure that the target volume for the HFS data set is SMS-managed, or do not select the HFS data set.

Change the target volume for the restore to a device whose controller supports compressed data sets.

Specify all of the volumes for the data set or specify SELECTMULTI(ANY) and resubmit the job.

Specify all of the volumes for the data set and resubmit the job.

Delete the pre-allocated target, rerun the job, and issue an IDCAMS DEFINE RECATALOG to get the restarted data set cataloged.
Correct the catalog or the F 1 DSCB to correctly indicate the data set is VSAM or NONVSAM.

Take the appropriate action listed below, and rerun the job:
- Ensure that the attributes of the source and the pre-allocated target match.
- Either catalog the pre-allocated target, or open/close the pre-allocated target so that DFSMSdss can determine whether it is single volume or multivolume.
- Specify all the output volumes where the pre-allocated target data set resides and run the job again.

Contact your system programmer.

Use the VARY SMS,VOLUME(xxxxxx),ENABLE command to enable the volume that contains the pre-allocated data set.

Process the Large Format Physical Sequential data set using level z/OS V1R7 or higher.

For VSAM data sets, specify an output volser that is different from the output volser of the input volume. For non-VSAM, specify appropriate RENAMEUNCONDITIONAL criteria or specify an output volser that is different from the input volume's.

Contact your system programmer.

Use the VARY SMS,VOLUME(xxxxxx),ENABLE command to enable the volume that contains the pre-allocated data set.

Process the Large Format Physical Sequential data set using level z/OS V1R7 or higher.

For VSAM data sets, specify an output volser that is different from the output volser of the input volume. For non-VSAM, specify appropriate RENAMEUNCONDITIONAL criteria or specify an output volser that is different from the input volume's.

Contact your system programmer.

Use the VARY SMS,VOLUME(xxxxxx),ENABLE command to enable the volume that contains the pre-allocated data set.

Process the Large Format Physical Sequential data set using level z/OS V1R7 or higher.

For VSAM data sets, specify an output volser that is different from the output volser of the input volume. For non-VSAM, specify appropriate RENAMEUNCONDITIONAL criteria or specify an output volser that is different from the input volume's.

System programmer response: On a RESTORE, dump the VTOC track records on the input that are at the beginning of the file.

Source: DFSMSdss

Explanation: The data set was not selected. This condition can occur for several reasons including:
- The fully qualified data set name did not pass the EXCLUDE, or BY filtering criteria.
- The data set name was specified more than once in the INCLUDE list.
- Logical input volumes were specified during DUMP or COPY, and DFSMSdss was unable to locate the catalog in which the data set resides.
- A VSAM data or index component name was incorrectly specified instead of the cluster name. DFSMSdss only processes VSAM data sets at the cluster name level.
- The data set has been migrated (volser=migrat).
- The data set not exist.
- A migrated or tape data set was not selected by using a partially qualified name and setting the flag to ON at offset X’17’ of ADRPATCH
- A generation data group (GDG) data set was not selected using GDG relative generation filtering.
- An ALIAS-name was specified for the non-VSAM file in the INCLUDE list for the COPY or DUMP.

System action: The data set is not processed. The return code is 4.

Operator response: None.

Application Programmer Response: Rerun the job after doing one of the following:
- Use the proper filtering criteria.
- Do not duplicate data set names in the INCLUDE list.
- Ensure any VSAM data sets to be processed are cataloged in the standard order of search.
- Ensure that VSAM cluster names were specified in the filtering criteria.
- If the data set you want is not cataloged, use the correct volume serial number. If you want to operate on the migrated data set, issue a DFSMShsm RECALL command for the data set.
- Verify that the data set still exists.
- Specify the real name (not the ALIAS) of the non-VSAM file.

Source: DFSMSdss

Explanation: The data sets in the list were not processed. Other messages that precede this message identify the error.

System programmer response: If it is a RESTORE, print the VTOC track records on the dump tape.

Source: DFSMSdss
ADR384E (ttt-mmmmmm(yy)), UNCATALOG FAILED FOR dsname ON volume_serial_number, {return_code | return_code-reason_code}

Explanation: The UNCATALOG operation failed for the indicated data set. The return code (return_code) and reason code (reason_code), if any, are from the system uncatalog operation.

System action: Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: See the CAMLST macro in the z/OS DFSMS Managing Catalogs for an explanation of return and reason codes, and take the appropriate action.

Source: DFSMSdss

ADR385E (ttt-mmmmmm(yy)), CATALOG FAILED FOR dsname ON volume_serial_number, {return_code | return_code-reason_code}

Explanation: The CATALOG operation failed for the indicated data set. The return code from the system catalog operation is given in return_code and the reason code, if any, in reason_code.

System action: Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: If you are using an integrated catalog facility catalog, see message IDC3009I in z/OS MVS System Messages, Vol 6 [GOS-IEA] manual for specific return code and reason code information. For return code 40 or 44, either change the DFSMSdss filtering to reduce the number of selected CVOL-cataloged data sets to fewer than 1455, or increase the region size if you are selecting fewer than 1455 data sets; then rerun the job. See the CAMLST macro in the z/OS DFSMS Managing Catalogs for an explanation of return and reason codes, and take the appropriate action.

If you are using an OS CVOL catalog, see the section on using catalog management macro instructions in z/OS DFSMSdfp Advanced Services for an explanation of return and reason codes, and take the appropriate action.

Source: DFSMSdss

ADR386W (ttt-mmmmmm(yy)), UNIT NAME xxxx OF LOGICAL VOLUME volume_serial_number DOES NOT MATCH ANY OUTPUT VOLUME DEVICE TYPE

Explanation: None of the output DASD volumes matched the device type of the source volume on the input file. The xxxx is the esoteric unit name. This message is also issued if you try to restore to an unlike device from a physical data set dump tape.

System action: Processing continues with the next source volume, if any, on the input file. The return code is 4.

Operator response: None.

Application Programmer Response: Supply the matching output DASD volume, and rerun the job. If you want to restore to an unlike device, use a logical data set dump tape.

Source: DFSMSdss

ADR387E (ttt-mmmmmm(yy)), THE FOLLOWING LOGICAL VOLUMES DID NOT PROCESS FROM DUMP FILE:

Explanation: The user requested a data set RESTORE from the listed logical volumes from the input file, but the logical volumes are not on the input file. A list of volume serials follows the message.

System action: The return code is 8.

Operator response: None.

Application Programmer Response: If no source volume was processed, use the correct RESTORE file or the correct source volume serial numbers, and rerun the job.

Source: DFSMSdss

ADR388W (ttt-mmmmmm(yy)), DATA SET dsname NOT ON ANY VOLUME

Explanation: The requested data sets are not on the source volumes on the input file. Either the wrong input file was used, an incorrect data set name was passed, or all the VSAM data sets or all the non-VSAM data sets were rejected because of the DSORG filtering criteria. This message is printed if fully qualified names are passed and there are no allocated data sets by that name on those volumes.

System action: The return code is 4.

Operator response: None.

Application Programmer Response: Correct the error, and rerun the job.

Source: DFSMSdss
ADR389E (ttf- mmmmm(yy)), INVALID INPUT ON DDNAME ddname, (INPUT DATA SET NOT PRODUCED BY DFDSS OR DFSMSdss | DATA SET RESTORE NOT FEASIBLE FROM TRACKS DUMP | VSAM DATA SET RESTORE NOT FEASIBLE FROM RELEASE | DUMP | ONLY VSAM DATA SETS ON INPUT | ONLY NONVSAM DATA SETS ON INPUT | FULL RESTORE NOT FEASIBLE FROM TRACKS OR DATA SET DUMP | EXPECTED INPUT RECORD NOT FOUND | INPUT VOLUMES MOUNTED OFF SEQUENCE) [RECORD SEQUENCE NUMBER: EXPECTED=nnnnnnn- RECEIVED=m mmmm m m m m]

Explanation:

- INPUT DATA SET NOT PRODUCED BY DFDSS OR DFSMSdss | DATA SET RESTORE NOT FEASIBLE FROM TRACKS DUMP | VSAM DATA SET RESTORE NOT FEASIBLE FROM RELEASE | DUMP | ONLY VSAM DATA SETS ON INPUT | ONLY NONVSAM DATA SETS ON INPUT | FULL RESTORE NOT FEASIBLE FROM TRACKS OR DATA SET DUMP

Either the input is invalid for the type of RESTORE desired or the input was not produced by DFSMSdss. (For example, a dump tape was created using a data set DUMP and you tried to restore it through a full RESTORE. Or a dump tape was produced by DFSMSdss and subsequently copied by a utility other than DFSMSdss COPYDUMP, resulting in an unusable input data set.

- EXPECTED INPUT RECORD NOT FOUND

Record read is not next in sequence. If COPYDUMP is being performed, the input data set have missing records.

- INPUT VOLUMES MOUNTED OFF SEQUENCE

If unlabeled tapes were used, they have been mounted in the wrong sequence.

System action: The task ends. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Take the appropriate action, depending on the error, and rerun the job.

Source: DFSMSdss

ADR390I (ttf- mmmmm(yy)), DATA SET dsname WILL BE SCRATCHED FROM volume_serial_number BECAUSE OF UNMATCHED SIZE. IT WILL BE REALLOCATED

Explanation: Logical COPY processing: The movable source data set's SIZE (in tracks) is not equal to the pre-allocated target data set SIZE. Because REPLACEUNCONDITIONAL and RENAMEUNCONDITIONAL are specified, the target data set is scratched to allocate the extents equal to the source data set.

Physical data set COPY processing: The movable source data set's SIZE (in tracks) is not equal to the pre-allocated target data set SIZE. When invoked through the application programming interface, if the application specifies that it is performing a multivolume recovery of data sets (EI00MVOLRECOV), this portion of the data set is scratched so that the target data set portion can be allocated with extents that have the same size as the source data set.

If the physical data set copy source data set is being copied from the target of a COPY FULL dump conditioned volume, and ALLDATA and ALLEXCP are not specified, the track counts between the source and the target data sets do not match then the system issues this message.

System action: Operation continues. If allocation is feasible on this volume, message ADR396I follows this message. If allocation is not feasible on this volume, message ADR380E or ADR472E or both follow this message.

Operator response: None.

Application Programmer Response: If reallocation fails, pre-allocate the data set with adequate space, and rerun the job.

Source: DFSMSdss

ADR391E (ttf- mmmmm(yy)), RESTORE OF dsname REQUIRES OUTPUT VOLUMES

Explanation: The named data set was not cataloged when dumped. Because neither the dump catalog information nor the original source volumes are available for allocation, the output volumes must be specified to restore the data set.

System action: Processing ends for the data set. The return code is 8.

Operator response: None.

Application Programmer Response: Specify at least one output volume using OUTDD or OUTDYNAM, and rerun the restore.

Source: DFSMSdss

ADR392E (ttf- mmmmm(yy)), dsname1 EXISTS ON volume_serial_number WITH NEWNAME dsname2

Explanation: Allocation of the data set using the name generated from the RENAME parameter (dsname1) was
the new target type is listed as well, and the data set is converted to the new target type.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR396I  (tty-mmwwyy), DATA SET {dsname | CLUSTER cluster_name COMPONENT component_name} ALLOCATED [AS A PDS], IN CATALOG catalog_name, ON VOLUME(S): {volume_serial_number | volume_serial_number_list}

Explanation: The data set has been allocated on the volume or volumes listed. If the data set is a VSAM cluster, the catalog name be listed as well. If the target data set is a PDSE is allocated as a PDS, the new target type is listed as well, and the data set is converted to the new target type.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR397E  (tty-mmwwyy), DATA SET dsname NOT {COPIED | RESTORED}. DATA BLOCKSIZE OF block_size EXCEEDS TARGET DEVICE TRACK CAPACITY OF track_size

Explanation: DFSMSdss allocated or located the target data set on a DASD device with the indicated track capacity (track_size). This was done because the block size of the source data set was larger than the track capacity of the target device. However, during processing, DFSMSdss encountered a data block (block_size) from the source data set that was larger than the track capacity of the target device. The data block cannot be placed on the target device, so the DFSMSdss function fails for the data set.

This situation can occur only when the track capacity of the target device is less than that of the source device. DFSMSdss allocates to such a device only when target volumes of same, like, or larger track capacity are not specified or are specified but do not have space available.

System action: The specified data set is not processed. If DFSMSdss allocated the target data set, it is deleted. The return code is 8.

Operator response: None.

Application Programmer Response: Perform one of the following actions, and rereun the job:
• Provide DFSMSdss with a target DASD device with a track capacity large enough to contain the block size specified in the message, by using OUTDD or OUTDYNAM. Specify only target volumes that have a track capacity larger than the block size specified in the message. This includes volumes of the same or a like device type as the source and any volumes of a device type with a large track capacity. You must also eliminate the REPLACE or REPLACEUNCONDITIONAL keyword if a pre-allocated target is located on a device with a smaller track capacity than the block size indicated in the message.

• pre-allocate a target data set on a volume with a track capacity large enough to contain the block size specified in the message. Specify the volume to DFSMSdss by using OUTDD or OUTDYNAM and use the REPLACE or REPLACEUNCONDITIONAL keyword to force DFSMSdss to use the pre-allocated target. The target device should meet the conditions specified in the preceding solution.

• Specify the REBLOCK keyword. If the source data set can be reblocked and the source data set logical record length is less than the target track capacity, DFSMSdss reblocks the data set as it is copied or restored. Certain data sets cannot be reblocked, so you must use one of the solutions described previously. You can test whether or not the data set can be reblocked by specifying REBLOCK and rerunning. If the function fails again, use one of the preceding solutions.

• If you were performing a COPY, you can update the source VTOC entry to reflect the block size specified in the message by using AMASPZAP if you are authorized to use it. When the job is rerun, DFSMSdss selects a usable target volume based on the updated block size.

Source: DFSMSdss

ADR398W (ttf-mmmmm(yy)), DATA SET dsname BLOCKSIZE OF block_size_1 IS INCORRECT. LARGEST BLOCKSIZE IS block_size_2

Explanation: While performing a COPY or RESTORE of the data set, DFSMSdss encountered at least one data block whose size (block_size_1) exceeded the maximum block size (block_size_2) specified in the VTOC. The data set is copied or restored with the block size intact. The largest block size found is indicated.

System action: Processing continues for the specified data set. The return code is 4.

Operator response: None.

Application Programmer Response: Take appropriate actions to correct this situation.

Source: DFSMSdss

ADR399I (ttf-mmmmm(yy)), NO MESSAGE TEXT FOUND FOR MESSAGE ADRnnn

Explanation: DFSMSdss tried to issue message nnn but no message text was found.

System action: Processing continues.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR401W (ttf-mmmmm(yy)), UNEXPECTED RETURN CODE return_code REASON CODE reason_code FROM UCBLOOK MACRO. VOLUME ON UCB dev IS MADE UNAVAILABLE

Explanation: UCBLOOK macro returned an unexpected return code (return_code) and reason code (reason_code) while DFSMSdss was trying to check for a duplicate volume serial number. See [z/OS MVS System Codes] for the return and reason codes, which are in decimal. dev represents the device number.

System action: Processing continues. Volume on UCB nnn is made unavailable. The return code is 4.

Operator response: None.

Application Programmer Response: This message is not normally expected and indicates a programming or system problem. Ensure that no duplicate volume serial number exists.

Source: DFSMSdss

ADR402E (ttf-mmmmm(yy)), AUTHORIZATION CHECK FAILED FOR dname, [ON VOLUME volume_serial_number,] reason_code [IN CATALOG catalog_name]

Explanation: The authorization check failed for the indicated reason code, (reason_code). The possible reason codes are:

1. The operator specified T to message ADR369D, which denies access to one of the following:
   • A checkpoint/restart data set
   • A RACF data set on a non-RACF system
   • A VVDS or VTOCIX data set or an integrated catalog facility-cataloged VSAM data set on a nonintegrated catalog facility system

   or,
Input/output errors were encountered on the VTOC or VVDS.

2 RACF UPDATE authorization failed for the data set name.

3 RACF authorization checking failed under one of the following circumstances:
   • ALTER to the data set to check if you are authorized to create the data set.
   • DEFINE verification to check if you have CREATE authority.
   • ALTER to the data set to check if you are authorized to delete the data set.
   • ALTER to the data set to check if you are authorized to overwrite a protected data set on the target volume during a FULL or TRACKS operation.

4 RACF READ authorization failed for the data set name.

5 The user authorization exit (ADRUPSWD) rejected the volume serial number.

6 The user authorization exit (ADRUPSWD) rejected the data set name.

7 The password was not supplied for the data set name.

8 READ password was specified, but WRITE password was required.

9 The password was incorrect for the data set name.

10 An error occurred while the PASSWORD data set was being accessed.

11 OPEN failed while verifying the password for the VSAM data set.

12 Duplicate or missing cluster entries for the data set in the VVDS.

14-xxx-yyyy The authorization check failed for the VSAM data set. xxx and yyy are return codes and reason codes from catalog services. See the return or the reason code under message IDC3009I for an explanation. If xxx and yyy are both zeroes, then a previous error occurred that prevented catalog services from completing. A previous “ADR” message describes this error.

15 DFSMSdss requires that the VSAM data set be cataloged to perform authorization checking.

16 The return code from the user authorization exit is invalid.

17 No access to the volume was passed.

18 Unable to acquire storage for catalog authorization checking.

19 A catalog error occurred during catalog authorization checking.

20 RACF UPDATE authorization failed for the data set's catalog.

One of the following occurred:
   • RACF ALTER authorization failed for the data set's catalog.
   • RACF ALTER authorization failed for the source data set, and catalog authorization checking could not be performed because either the data set was not cataloged, or it was cataloged in a CVOL. You need either ALTER to the data set or READ to the data set and ALTER to the catalog when DELETE is specified.

21 Catalog authorization could not be performed because the catalog's volume serial number could not be obtained.

22 Data set authorization could not be performed because the volume serial number of the VSAM data set's catalog could not be obtained.

23 Unable to acquire storage for data set authorization check.

24 The data set's catalog could not be found.

25 A catalog error occurred while attempting to locate the volume serial number of the data set's catalog.

26 DFSMSdss internal error. The catalog name was not available for VSAM data set authorization checking.

27 One of the following conditions occurred:
   • Permanent error while reading the VTOC, VVDS, or the password data set and the operator denied permission to continue
   • Unable to get the storage required
   • Permanent error on the password data set.

**System action:** Other messages indicate the actions
taken for the various conditions. The return code is 8.

**Operator response:** To bypass authorization checking, see ADMIN keyword in the [z/OS DFSMSdip Storage Administration](https://www.ibm.com/support/docview.wss?uid=swg21234151) information.

**Application Programmer Response:** For reason code 14, see return code/reason code under message IDC3009I. For reason code 26, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. For all other reason codes, correct the situation and rerun the job. (For codes 2, 3, 4, 19, and 20, authorization have failed because of other attributes, for example, SECLEVEL).

**Source:** DFSMSdss

---

ADR403E  (ttt-mmmmm(yy)), VOLUME volume_serial_number CANNOT BE PROCESSED DUE TO AN ERROR IN EXPIRATION DATE CHECKING FOR (DATA SET dsname | VSAM COMPONENT component_name) (IN CLUSTER cluster_name),reason_code

**Explanation:** The data set has an unexpired date, or an error was encountered during checking of the expiration date. To bypass expiration date checking, specify the PURGE keyword. The reason codes (reason_code), are:

1. The data set has an unexpired date.
2. Insufficient storage was available to build internal DFSMSdss control blocks.
3. Duplicate or missing cluster entries for the data set in the VVDS, or the VSAM data set is not cataloged.
4. An error occurred in building DFSMSdss internal control blocks.
5. Either the volume has no VVDS or the VSAM cluster is not cataloged in an integrated catalog facility catalog.
6. A catalog error occurred.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Depending on the reason code (reason_code), take the following action:

1. Change the expiration date on the data set or specify the PURGE keyword to overwrite the unexpired data set.
2. Increase the region size and rerun the job or specify the PURGE keyword to bypass expiration date checking.

**Source:** DFSMSdss

---

ADR404E  (ttt-mmmmm(yy)), COMMAND NOT ALLOWED ON AN OPEN CATALOG, CATALOG catalog_name

**Explanation:** A COPY or RESTORE of a catalog is not allowed on an open integrated catalog facility catalog.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Run the job when the catalog is not active on the system.

**Source:** DFSMSdss

---

ADR405E  (ttt-mmmmm(yy)), DYNAMIC ALLOCATION OF (A TEMPORARY DATA SET [ON VOLUME volume_serial_number] | DATA SET data_set_name [ON VOLUME volume_serial_number] | VOLUME volume_serial_number) FAILED. ERROR CODE error_code. INFORMATION CODE information_code. [MESSAGES FOLLOW:]  

**Explanation:** DFSMSdss attempted to dynamically allocate the indicated data set or volume and failed. error_code and information_code are returned by dynamic allocation and listed in the [z/OS MVS Programming: Authorized Assembler Services Guide](https://www.ibm.com/support/docview.wss?uid=swg27013551). Error code X’049C’ can result if the volume is online and not mounted. An undocumented error code can be displayed if an installation-wide validation exit is used to deny allocations for dynamic allocation but fails to get the reason code returned by dynamic allocation. If any additional messages are returned by dynamic allocation, they will follow this message.

**System action:** If the failure was for a volume, the task or volume is bypassed. If the failure was for a data set, the data set is bypassed. The return code is 8.
ADR406E (ttt)-mmmm(yy), dsname CANNOT BE RESTORED FROM ddname

Explanation: The specified data set, dsname, cannot be restored from the logical dump data set assigned by ddname. This situation occurs when you attempt to restore one of the following:

- A CVOL to an unlike device
- A direct data set to an unlike device with a target track capacity smaller than the source track capacity without specifying the FORCE keyword.

System action: The indicated data set is not restored. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the problem indicated by the error and information codes listed in the z/OS MVS Programming: Authorized Assembler Services Guide.

Source: DFSMSdss

ADR407E (ttt)-mmmm(yy), UNABLE TO FIND MODEL VOLSER FOR MODEL ENTITY {mentity | catalog_name}

Explanation: The model entity name (mentity) supplied was not found in the standard catalog search order or is a VSAM data set cataloged in a nonintegrated catalog facility VSAM catalog (catalog_name).

System action: The COPY or RESTORE is ended. The return code is 8.

Operator response: None.

Application Programmer Response: Verify that the spelling is correct for the MENTITY supplied and that it is cataloged in one of the catalogs used in the standard catalog search order; or ensure that the MENTITY is not cataloged in a VSAM catalog. Then rerun the job.

Source: DFSMSdss

ADR408E (ttt)-mmmm(yy), LOCATE FAILED FOR CATALOG catalog_name

Explanation: An error occurred in attempting to locate the volume serial number of the catalog name containing the VSAM model entity (MENTITY) entry.

System action: The COPY or RESTORE is ended. The return code is 8.

ADR409E (ttt)-mmmm(yy), CLUSTER cluster_name HAS PRE DFP310 VVRS WHICH ARE INCOMPATIBLE WITH SMS

Explanation: Cluster was created by a version of DFP before DFP 3.1.0. Therefore, the VVRS for the cluster do not contain all the fields necessary for SMS, even though an SMS subcell was added to the VVRS.

System action: The volume is left in its initial status. The return code is 8.

Operator response: None.

Application Programmer Response: REPRO the data out of the data set, delete the data set, then recreate the data set on DFP version 3.1.0 or later system. If you have a large number of these data sets, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR410E (ttt)-mmmm(yy), DATA SET {dsname | cluster_name COMPONENT component_name} [IN CATALOG catalog_name] ON VOLUME volume_serial_number FAILED Serialization FOR DELETE

Explanation: Copy with DELETE specified requires exclusive access to the data set to be deleted. When you are to rename the data set being copied, either source or target data set being used will cause copy to fail and the system to issue this message. The data set identified in the message represents either the source or target data set that is in use.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Rerun the job when the data set is not in use by other users or increase the WAIT parameters.

Source: DFSMSdss

ADR411W (ttt)-mmmm(yy), DATA SET {dsname | cluster_name COMPONENT component_name} [IN CATALOG catalog_name] ON VOLUME volume_serial_number WAS NOT SERIALIZED ON REQUEST
ADR412E • ADR414E

Explanation: An ENQ(Exclusive), ENQ(Share), or dynamic allocation with DISP=OLD or SHR failed after a specified (or defaulted) number of retries. TOL(ENQF) was specified by the installation-wide exit or by the user.

System action: If you were doing a COPY and DFSMSdss is moving the data itself, the data set is processed without the enqueue, and the return code is 4. If you were doing a COPY and DFSMSdss invokes a utility to move the data, the data set is not processed further, and the return code is 8. If you were doing a data set DUMP, the data set is processed without the enqueue, and the return code is 4. If you specified RESET on the data set dump, the data set is processed, but the data set changed indicator is not reset in the data set's VTOC entry.

Operator response: None.

Application programmer response: None.

Source: DFSMSdss

ADR412E (ttt- mmmm (yy), DATA SET dsname I cluster_name COMPONENT component_name) [IN CATALOG catalog_name] ON VOLUME volume_serial_number FAILED SERIALIZATION

Explanation: An ENQ(Exclusive), ENQ(Share), or dynamic allocation with DISP=OLD or SHR failed after a specified (or defaulted) number of retries. TOLERATE(ENQF) was not specified by the user, or the user specified an operation that does not allow TOL(ENQF), such as logical processing of an HFS data set or a zFS data set. This message is received for an HFS data set or zFS data set if the data set cannot be enqueued and is ineligible for quiesce. An HFS data set or zFS data set is ineligible for quiesce if any of the following is true:

- UNIX System Services is unavailable.
- The data set is unmounted.
- The data set is a target data set.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application programmer response: Rerun the job when the data set is not in use by other users. You can increase the WAIT parameters, and if you are not doing logical processing of an HFS data set or zFS data set and are not using the COMPRESSION command to compress a PDS, you can specify TOL(ENQF). A source HFS data set or zFS data set might receive message ADR412E, even if TOLERATE(ENQFAILURE) is specified.

Source: DFSMSdss

ADR413E (ttt- mmmm (yy), DATA SET dsname ON VOLUME volume_serial_number WAS NOT {DELETED | UNALLOCATED}) {xx I xx-yy : zzz}

Explanation: The data set cannot be scratched, uncataloged, or unallocated through dynamic allocation. The error codes (xx) are:

0 dynamic allocation installation-wide validation routine denied the request. The reason code is zzz.

1 dynamic allocation information error code is yyyy. The reason code is zzz. The codes are explained in z/OS MVS Programming. Authorized Assembler Services Guide

2 IEFAB4C3 was called to release data set integrity but it failed.

3 The "DELETE NVR (non-VSAM record)" function failed for an uncataloged, non-VSAM data set.

4 The delete VVR of a component of an uncataloged AIX failed. The reason for the failure can be found in the preceding ADR497E message.

System action: The return code is 8.

Operator response: None.

Application programmer response: Scratch the data set by other means.

Source: DFSMSdss

ADR414E (ttt- mmmm (yy), DATA SET dsname ON VOLUME volume_serial_number NOT SCRATCHED, {xx I xx-yy, zzz}

Explanation: The data set cannot be scratched. The error codes (xx) are:

0 DEQ on the data set failed.

1 The initiator enqueued the data set.

2 The scratch failed. The yy is the return code or status code. The zzz is the reason code from DADSM SCRATCH, as described in z/OS DFSMSdip Advanced Services

System action: The return code is 8.

Operator response: None.

Application programmer response: Scratch the data set by other means.

Source: DFSMSdss
ADR415W (ttt)-mmmmm(yy), NO DATA SETS WERE COPIED, DUMPED, OR RESTORED FROM (ANY VOLUME | VOLUME volume_serial_number | LOGICALVOLUME volume_serial_number)

Explanation: A data set COPY, data set DUMP, or data set RESTORE did not select any data sets. One of the following applies:
- No data sets matched the filtering criteria.
- Data sets matched the filtering criteria but failed serialization or authorization and were not processed.
- Permanent I/O errors occurred on the output tape during the DUMP process.

System action: If I/O errors occurred on output during DUMP, the return code is set to 16; otherwise, it is set to 4. If there were no I/O errors, and if the failure was on one volume, other volumes will be processed.

Operator response: None.

Application Programmer Response: When input volumes are specified, ensure that all components of a cluster and all pieces of a multivolume data set are contained on the input volumes. Change the filtering criteria or specify different input volumes, then rerun the job.

Source: DFSMSdss

ADR416E (ttt)-mmmmm(yy), DATA SET dsname [IN CATALOG catalog_name] WAS NOT DELETED, reason_code

Explanation: The data set was not deleted. The reason code (reason_code) contains the following attributes:
0 It is a VSAM data set. DFSMSdss does not support DELETE for VSAM data sets during a physical data set dump.
1 I/O or other errors, such as authorization or enqueue failure, occurred on the data set, or no catalog entry was found for the data set.
2 Either the data set is not a single-volume data set, or it cannot be determined if the data set is single volume or multivolume and it is not presently cataloged.
3 The data set was not enqueued by DFSMSdss. The enqueue could be held by the initiator.
4 The data set was not processed. (It is probably an empty data set.)
5 The data set has not expired by the expiration date. If this return code is received for a data set COPY, the dsname appearing in the message is a temporary name that DFSMSdss generated to properly name the data set on the target volume. You must now delete the data set with the temporary name from the source volume.
6 The data set could not be exclusively enqueued. If the data set is an HFS or zFS, it was mounted by another application.

System action: The data set is not deleted. The return code is 8.

Operator response: None.

Application Programmer Response: Delete the data set by other means. For reason code 5, specify PURGE to delete the unexpired data set.

Source: DFSMSdss

ADR417W (ttt)-mmmmm(yy), COPY/RESTORE OF DATA SET dsname IS INCOMPLETE, reason_code

Explanation: The data set was copied or restored. However, errors occurred during processing; or the data tracks were not copied or restored because the VTOC entry could not be reset; or the RACF indicator could not be set for the data set. The reason code, (reason_code) is as follows:
0 The protected data set was copied or restored, but definition of the RACF discrete profile failed.
1 The data set was copied or restored, but the VTOC entry cannot be retrieved for updating.
2 The data set was copied or restored but errors occurred while the VTOC entry was being updated.
3 For physical data set RESTORE, the data set is restored but I/O errors occurred on one or more tracks of the data set (resulting from errors during dump). For logical data set RESTORE and data set COPY, no further data is copied or restored. If the data set was not pre-allocated, it is deleted.
4 A RACF-protected data set was copied or restored to a system that does not support RACF.
5 The data set was not copied or restored because the VTOC entry cannot be retrieved to set the RACF indicator or be updated for the data set.
6 The data set was not copied or restored because errors occurred while the VTOC entry was either being rewritten to reset the RACF indicator or being updated for the data set.
7 The target VSAM data set cannot be protected with a discrete RACF profile because it was not renamed, the target catalog resides on the
same volume as the source catalog, and a
discrete RACF profile already exists for the
source data set.

8 The data set was not restored because a track
overflow record was found in the data set.

9 During restore of an indexed VSAM data set,
DFSMSdss could not obtain the dump record
count stored in the dump data set. Message
ADR788I provides the number of records
processed by restore.

11 Restore of the data set failed because it was
not dumped successfully.

12 Extended attributes were expected but not
found for the source data set.

13 A failure occurred while adding extended
attributes to the target data set.

System action: Processing continues. The return
code is 4.

Operator response: None.

Application Programmer Response: Take the
following action, depending on the reason code
(reason_code):

0 Define the data set to RACF.

1 Use AMASPZAP to reset the relevant fields in
the VTOC entry for the data set, or scratch the
data set and rerun the COPY or RESTORE.

2 See reason code 1.

3 On input errors, restore the data set from a
backup copy. On output errors, take corrective
action recommended in your site, and rerun the
job.

4 Password-protect the data set.

5 Use AMASPZAP to reset the RACF indicator,
and rerun the job.

6 Correct the problem for the system I/O error
message that precedes this message, and
rerun the job.

7 The data set does not have the RACF indicator
set. If the source data set was deleted, define
the target data set to RACF. If the source data
set was not deleted, you can define the target
data set to RACF with a generic profile.
However, in an always call (RACF 1.5 or
greater) environment, the data set is protected
by the discrete RACF profile.

8 Specify REBLOCK(dsname) on the RESTORE
command and rerun the job.

9 Determine if all records are restored. Search
problem reporting databases for a fix for the
problem. If no fix exists, contact the IBM
Support Center.

11 See the messages issued during the dump.

12 Either remove the Extended Attributes indicator
from the Format 1 DCSB or add Extended
Attributes to the data set.

13 See previous message ADR231E for additional
information.

Source: DFSMSdss

ADR418I (ttt)-mmmm(yy), THE FOLLOWING
COMPONENTS FOR CLUSTER
cluster_name ON volume_serial_number
HAVE TO BE CATALOGED IN
CATALOG catalog_name

Explanation: The cluster that did not exist on the
volume was copied or restored to the volume. VTOC
and VVDS entries were created on the volume for the
cluster. If the indicated catalog does not have entries for
the cluster, you must recatalog the cluster before
accessing the data set.

System action: None.

Operator response: None.

Application Programmer Response: Use the access
method services DEFINE RECATALOG command to
recatalog the components and cluster in the indicated
catalog before accessing the data set. See z/OS
DFSMS Access Method Services for Catalogs
for more information.

Source: DFSMSdss

ADR419W (ttt)-mmmm(yy), CLUSTER
cluster_name IN CATALOG
catalog_name ON DASD WITH {INHIBIT
UPDATE | OPEN} INDICATOR WILL BE
COPIED OR RESTORED

Explanation: A fully qualified name was passed for
the data set. It is copied or restored although it has the
indicated condition. The inhibit-update indicator means
that the data set is a read-only copy of a data set.
Open-for-update means that the data set was in the
OPEN status. Either it was not closed correctly or it was
in use by another job on the same processing unit.

System action: If the data set had the inhibit-update
indicator in the VVR, this indicator is left on. If the data
set had the OPEN indicator, this indicator is reset. If the
input copy had the OPEN indicator, this is carried over
to output DASD. The return code is 4.

Operator response: None.

Application Programmer Response: If message
ADR411W accompanies this message, the data set was
in use when the COPY or RESTORE was done. The
data set on the target volume therefore be invalid.
Reprocess the data set without specifying TOL(ENQF).

Source: DFSMSdss
**ADR420E** (ttt)-mmmm(yy), (VVDS | VTOCIX) DATA SET CANNOT BE RESTORED WITH (OTHER VSAM | ANY OTHER) DATA SET(S)

**Explanation:** Restore of the VVDS data set is not allowed with restore of other VSAM data sets from the same logical volume. Restore of the VTOCIX data set is not allowed with restore of other data sets from the same logical volume.

**System action:** The volume is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** If the VVDS data set and other VSAM data sets need to be restored from the same input logical volume, rerun the job by passing two RESTORE commands. Restore the VVDS on the first RESTORE command, and restore other VSAM data sets on the second RESTORE command. If VTOCIX data set and other data sets need to be restored from the same input logical volume, rerun the job by passing two RESTORE commands. Restore the VTOCIX on the first RESTORE command, and restore other data sets on the second RESTORE command.

**Source:** DFSMSdss

---

**ADR442E** (ttt)-mmmm(yy), LOGICAL VOLUME volume_serial_number BYPASSED BECAUSE IT ONLY HAS {VSAM | NON-VSAM} DATA SETS

**Explanation:** The requested type of data sets is not on the logical volume.

**System action:** The volume is bypassed. Data set RESTORE continues with other logical volumes.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR423W** (ttt)-mmmm(yy), SELECTED DATA SET dsname IS A MULTIVOLUME DATA SET

**Explanation:** A fully qualified name was passed in the INCLUDE parameter of a physical data set COPY or a data set DUMP or RESTORE command. This is a multivolume data set. The data set from all of the volumes might not have been processed.

**System action:** The return code is 4.

**Operator response:** None.

**Application Programmer Response:** Make sure that the entire data set from all of the volumes on which it resides was processed. If not, rerun the job by passing the LVOL parameter and corresponding DASD volumes to process the entire data set.

**Source:** DFSMSdss

---

**ADR424E** (ttt)-mmmm(yy), AN ERROR OCCURRED WHILE RETRIEVING {VVDS | VTOCIX} EXTENTS FROM VOLUME volume_serial_number, error_code

**Explanation:** DADSM OBTAIN returned an error code (error_code) while the VVDS or VTOC extents were being retrieved from the indicated volume. See [z/OS DFSMSdfp Advanced Services](https://www.ibm.com/support/knowledgecenter/SSZ37V_2.4.0/dfsmsdfpcom/dfsmsdfp_com.html) for an explanation of the OBTAIN error codes.

**System action:** If it is a data set COPY or DUMP, the volume is bypassed. The command is ended on a data set RESTORE. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Take corrective action for the error, and rerun the job.

**Source:** DFSMSdss
ADR425E (ttf-mmmm{yy}), CONFLICTING BY CRITERIA SPECIFIED

Explanation: Either VSAM and non-VSAM data sets were not wanted or VSAM data set processing was not supported on the system.

System action: The command ends. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the BY criteria in the command, and rerun the job.

Source: DFSMSdss

ADR426W (ttf-mmmm{yy}), EXTENT 1 SIZE OF OUTPUT PARTITIONED DATA SET dsname IS SMALLER THAN EXTENT 1 SIZE OF INPUT

Explanation: The first extent of a target partitioned data set is smaller than the one that existed in the source data set. For partitioned data sets, the directory must be in the first extent. This message is issued because DFSMSdss cannot determine the size of the directory to verify that it can fit in the first allocated extent.

System action: The data set is copied or restored. The return code is 4.

Operator response: None.

Application Programmer Response: Check that the directory is in the first extent. Do this by running IEHIST with the LISTPDS option. If the members cannot be listed, scratch the data set and try to obtain a larger contiguous extent by running DEFRAG, then rerun the copy or restore job.

Source: DFSMSdss

ADR427E (ttf-mmmm{yy}), ERROR IN (VVDS | VVDS IMAGE) ON (VOLUME | LOGICAL VOLUME) volume_serial_number WHILE ACCESSING COMPONENTS OF CLUSTER cluster_name IN CATALOG catalog_name

Explanation: DFSMSdss found errors while retrieving components for the cluster. Some components cannot be located for the cluster in the VVDS or VVDS image, or, if it was a RESTORE, the VVDS was not dumped successfully during a full volume DUMP. Inconsistencies exist in the VVRs, or the VVRs have invalid formats.

System action: The data set is not copied, dumped, or restored. The return code is 8.

Operator response: None.

Application Programmer Response: If it is a RESTORE, use a different backup copy of the data set, and rerun the job. Otherwise, run access method services DIAGNOSE against the data set to determine the nature of the error, and take the action recommended.

Source: DFSMSdss

ADR428E (ttf-mmmm{yy}), VTOC ENTRIES NOT FOUND FOR CLUSTER cluster_name IN CATALOG catalog_name ON (VOLUME volume_serial_number | LOGICAL VOLUME volume_serial_number)

Explanation: VTOC entries are missing for one or more components of the cluster on the volume. For a logical volume, the error is in the source volume and was not detected during DUMP.

System action: The VSAM cluster is not processed. Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: If the error occurs on the source volume of a restore operation (the message specifies "LOGICAL VOLUME"), use a previous backup copy and resubmit the job. Otherwise, run the access method services DIAGNOSE to detect the error and take the recommended actions.

Source: DFSMSdss

ADR429W (ttf-mmmm{yy}), DATA SET dsname WAS RESTORED TO AN SMS-MANAGED VOLUME BUT IT WAS NOT CATALOGED BECAUSE THE CATALOG KEYWORD WAS NOT SPECIFIED

Explanation: The named non-VSAM data set was restored to an SMS-managed volume. Because the catalog keyword was not specified on the RESTORE command, DFSMSdss did not catalog the data set when it was restored.

System action: The data set is restored. The return code is 4.

Operator response: None.

Application Programmer Response: You must catalog the data set before it can be accessed because it is now under SMS management.

Source: DFSMSdss

ADR430E (ttf-mmmm{yy}), ERROR IN CLUSTER cluster_name IN CATALOG catalog_name ON VOLUME volume_serial_number

Explanation: A failure occurred during definition of the cluster components in the VVDS or VTOC during a data set COPY or RESTORE.
**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Run access method services DIAGNOSE on the data set on the volume, and take the appropriate action before rerunning the job.

**Source:** DFSMSdss

---

**ADR431I**  
(xxx)-mmmmm(yy), DATA SET dsname

[IN CATALOG catalog_name] HAS BEEN DELETED

**Explanation:** The data set was either deleted on user request or is being reallocated by DFSMSdss.

**System action:** The data set was deleted from the volume.

**Operator response:** None.

**Application Programmer Response:** If the data set was cataloged and is not being reallocated, it must be uncataloged by using other utilities.

**Source:** DFSMSdss

---

**ADR432E**  
(tttt-mmmmmm(yy), VVR FOR COMPONENT component_name [IN CATALOG catalog_name] IS IN ERROR

**Explanation:** A VVR cell (for example, a data set information cell, AMDSB cell, or volume information cell) cannot be located in the VVR for the component in the VVDS or VVDS image (input to data set RESTORE). The format of the VVR be in error.

**System action:** If possible, DFSMSdss continues to process the data set to which the component belongs. Other messages indicating the affected cluster that is not processed accompany this message. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** If the failure is on a VVDS on DASD, run access method services DIAGNOSE to determine the nature of the error, and take the recommended action. If it is the input to the RESTORE, use a previous backup copy to restore the data set.

**Source:** DFSMSdss

---

**ADR433E**  
(tttt-mmmmmm(yy), LOGICAL ERROR IN BUFFER ON TRACK c:h

**Explanation:** A logical error was discovered in the track data after it had been read into the buffer and before writing it to DASD. The length of the track data does not match the sum of the count, key, and data fields of all records on the track in the buffer. This problem can arise if the track was not reconstructed correctly by DFSMSdss during the RESTORE or if the track was not written correctly during the DUMP or, similarly, during a COPY.

**System action:** The track is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdss

---

**ADR434E**  
(tttt-mmmmmm(yy), DATA SET dsname [IN CATALOG catalog_name] WAS NOT UNCATALOGED, reason_code

**Explanation:** The data set was not uncataloged for one of the following reason codes, (reason_code):

1. It is a VSAM data set. (DFSMSdss does not support UNCATALOG for VSAM.)
2. Either the data set is not a single-volume data set, or it cannot be determined if the data set is single volume or multivolume and it is not presently cataloged.
3. The data set was not enqueued by DFSMSdss.
4. The data set was not processed. It is probably a null data set.
5. It is an SMS-managed data set. UNCATALOG is ignored for SMS-managed data sets.
6. The DELETECATALOGENTRY keyword was specified to uncatalog the phantom catalog entry, but the operation failed. See the preceding ADR497E and IDC3009I for the reason for the failure.
7. The source data set can not be uncataloged because the source volume is dump conditioned and could result in uncataloging a data set that does not actually reside on the volume currently being processed.

**System action:** Processing continues. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Uncatalog the data set by other means.

**Source:** DFSMSdss
ADR435E  (ttt-mmmm(yy), DATA SET dsname WAS NOT CATALOGED)

Explanation: The data set was not cataloged because either the data set is not a single-volume data set, or it cannot be determined whether the data set is a single-volume or multivolume data set, or an attempt to catalog the data set failed (for example, there is a duplicate entry).

System action: Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: Catalog the data set by other means.

Source: DFSMSdss

ADR436E  (ttt-mmmm(yy), LOGICAL ERROR IN BUFFER ON VOLUME volume_serial_number, TRACK c:h)

Explanation: A logical error was found in the track data after it had been read into the buffer and before writing it to tape.

System action: The track is not processed. The command is ended. The return code is 8.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR437E  (ttt-mmmm(yy), CLUSTER cluster_name [IN CATALOG catalog_name] CANNOT BE (OPENED | CLOSED) return_code reason_code)

Explanation: The specified cluster cannot be opened or closed for VSAM I/O processing. VSAM responded with a return code and a reason code after processing had failed.

System action: The indicated data set is not restored. The return code is 8.

Operator response: None.

Application Programmer Response: Use z/OS [DFSMS Macro Instructions for Data Sets] to identify the problems indicated by the return code and the reason code. Take corrective actions, then rerun the job. If the failure was caused by VSAM growing during restore processing, use FREESPACE (0,0) and allow more room for the data set to be restored to. For large VSAM data sets, do not use the NOVALIDATE keyword at dump time.

Source: DFSMSdss

ADR438E  (ttt-mmmm(yy), VSAM I/O FAILED FOR cluster_name return_code reason_code)

Explanation: VSAM I/O processing failed for the specified cluster name. The failure could have been caused by VSAM growing during restore processing. VSAM provided a return code and a reason code after processing had failed.

System action: The indicated data set is not restored. The return code is 8.

Operator response: None.

Application Programmer Response: Use z/OS [DFSMS Macro Instructions for Data Sets] to identify the problems indicated by the return code and the reason code. Take corrective actions, then rerun the job.

Source: DFSMSdss

ADR439E  (xxx)-mmmmm(yy), A pre-allocateD DATA SET [WITH NEW NAME dsname] WAS FOUND FOR DATA SET dsname BUT WAS UNUSABLE, reason_code)

Explanation: DFSMSdss found a pre-allocated data set but determined that it was unusable for the following reason, (reason_code):

04 The pre-allocated cluster type does not match the source cluster type. Either the organization (indexed, numbered, linear) of the clusters, or one of the following cluster attributes, does not match:
   • Extended format
   • Compressible
   • Extended addressable
   • Source is not striped and the pre-allocated target is striped

08 An alternate index (AIX) is defined over the pre-allocated cluster.

12 The source data RECORDSIZE is incompatible with the target CISIZE and control area (CA) size attributes.

16 The pre-allocated target relative key position or key length is not equal to the source cluster values.

20 The pre-allocated keyed VSAM cluster is not empty or REUSABLE.

24 The pre-allocated KSDS KEYRANGES do not match those of the source cluster.

28 The index component of the pre-allocated
target cluster does not have sufficient allocated space for the source index component.

32 At least one data component of the pre-allocated target cluster does not have sufficient allocated space for the corresponding source data component.

40 At least one component of the pre-allocated target cluster spans volumes.

44 An update of the target VTOC entry failed. The target must be updated to make the target data set look empty if a utility does the data transfer.

48 The VSAM data set must be copied with utilities, which requires that both the source and the target data sets be cataloged in the standard order of search. However, because they both have the same name, this is not possible.

52 The pre-allocated, unmovable data set is not on the same or a like device type as the source data set.

56 The pre-allocated DSORG is not equal to the target DSORG.

60 The pre-allocated data set space is insufficient. This occur when a nonpre-allocated partitioned-organized (PO) data set is copied without the ALLDATA keyword, and a second copy is attempted to the data set pre-allocated by the previous copy.

64 The pre-allocated PDS has an insufficient number of directory blocks to contain the source directory.

68 The pre-allocated data set checking could not be completed.

72 The pre-allocated data set extents do not match the source data set extents, and the source is an unmovable data set.

76 The direct data set cannot be pre-allocated to an unlike device type.

80 The pre-allocated data set has no SUL extent.

84 The pre-allocated SUL data set has only one extent.

88 An I/O error was encountered on the directory of the pre-allocated partitioned data set.

92 The data set being restored is a PDS with no directory blocks and cannot be restored to a pre-allocated data set.

95 There is a mismatch between the components of the source data set and the target data set. For example, the source data set only has a data component on the source volume being processed and the target data set has a data and index component or only an index component on its volume, or vice versa.

96 The pre-allocated sphere does not match the source sphere.

97 The stripe attributes of the target and source data sets do not match.

98 The data set is an extended sequential data set (SAM striped).

100 The pre-allocated data set is unusable because the source block size is greater than the target device track capacity.

104 The NOPACKING keyword was specified for the data set, but the pre-allocated target was on an unlike device.

108 The high-used page value (HURPN) of the pre-allocated PDSE cannot be retrieved. DFSMSdss needs the HURPN to calculate the size of the pre-allocated target data set to ensure that it is usable.

112 The control interval size of the target data component is not equal to the source data set.

116 Either the source data set has extended attributes and the target data set does not, or the target data set has extended attributes and the source data set does not.

120 The first extent of the pre-allocated PDS was too small to contain the source directory.

124 The pre-allocated data set is either a tape or migrated data set.

128 The pre-allocated data set is marked as SMS checkpointed and cannot be replaced unless the appropriate FORCECP keyword is specified.

132 The pre-allocated data set is one of many possible target data sets and DFSMSdss is unable to determine which target data set to copy to.

136 The pre-allocated data set is too small and in use. DFSMSdss is unable to scratch and reallocate the target data set.

System action: The specified data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: If the system does not require use of a pre-allocated data set, delete the pre-allocated target. If the system requires use of the pre-allocated data set, correct the problem as indicated by the reason code (reason_code) and rerun the job.

04 Delete and redefine the target cluster, ensuring that the cluster types are the same.
Delete any AIX and PATH associations defined over the target cluster.

Delete and redefine the target cluster using the source cluster RECORDSIZE attributes.

Either delete and redefine the target cluster using the source cluster KEY attributes, or ALTER the target cluster KEY attributes to equal the source.

Delete and redefine the target cluster. If the target is to be copied to repeatedly and is not a key range cluster, specify the REUSE attribute on the DEFINE.

Delete and redefine the target cluster, ensuring that the KEYRANGES(lowkey highkey) for target cluster are equal to the KEYRANGES(lowkey highkey) for the source cluster.

Delete and redefine the target cluster with at least as much primary index space as the source index has, or force the target cluster index to extend to at least as much space as the source index.

Delete and redefine the target cluster with at least as much primary data space as the largest source data component, or force the target cluster data components to extend to at least as much space as the source data components.

Delete and redefine the target cluster, ensuring that no components span volumes (CANDIDATE volumes excepted).

One of the following actions should be taken: delete the target and rerun DFSMSdss, allowing it to perform the allocation; delete the existing target and reallocate a new one, leaving it empty; or use AMASPZAP to alter the target data set VTOC entry to make the data set appear empty.

Do not pre-allocate the data set.

Allocate an unmovable target data set on the same or a like device type, or specify the FORCE keyword.

Ensure that the pre-allocated DSORG is equal to the source DSORG.

Ensure that the amount of space allocated for the pre-allocated data set is sufficient to contain the source data set. If the error is the result of successive copies of a PO data set without the ALLDATA keyword, delete the pre-allocated data set and rerun all copy steps specifying ALLDATA.

Ensure that the number of directory blocks defined for the pre-allocated PDS is sufficient to contain the source directory blocks.

See the previous DFSMSdss message for the probable reason.

Ensure that the pre-allocated data set extents match the source data set extents.

Ensure that the RELBLOCKADDRESS keyword was specified and that the source:
  • Is not a standard user label data set
  • Has a RECFM of fixed or fixed block.

Or scratch and reallocate the target on the same device as the source or on a like device.

Allocate a pre-allocated data set with standard user labels.

Allocate a standard user label data set with more than just the standard user label extent.

Scratch and reallocate the target partitioned data set to either a different location on the target volume or a different target volume.

Scratch the target data set and allow DFSMSdss to allocate it during the restore operation.

Check that the correct input and output volumes were specified for the data set which you intended to copy. If the input and output volumes are correct, delete the data set and let DSS allocate the target data set or pre-allocated the target with the appropriate components on its volumes in the same manner as they exist for the source data set.

Ensure that the pre-allocated sphere’s AIX names, number of AIXs, number of paths, and path names match the source sphere’s AIX names, number of AIXs, number of paths, and path names.

Delete the pre-allocated target data set, and rerun the restore operation.

Move or delete the data set from the volume.

Either reblock the data set or specify a target device that is large enough for the source block size.

Delete and reallocate the target partitioned data set on a like device, or rerun the job without specifying NOPACKING for the data set.

Ensure that the pre-allocated PDSE is usable and accessible.

Delete and redefine the target cluster using the CISIZE attributes of the source cluster.

Rename one of the data sets and retry the operation.

Ensure that the first extent of the pre-allocated PDS is large enough to contain the source directory.
124 If pre-allocated data set is migrated, issue RECALL and rerun the job. Tape data sets are not supported.

128 If the pre-allocated data set should be replaced, specify FORCECP with the appropriate days parameter.

132 Either delete the pre-allocated target data sets with that name until only one data set with that name exists, or narrow your specification of output volumes as to exclude the duplicate target data sets.

136 Either delete the pre-allocated target data set and reallocate it the appropriate size, or rerun the job when the data set is not in use, or do not reference the data set in the same job as the DFSMSdss step.

Source: DFSMSdss

ADR440E (ttt-mmmmm(yy)), UNEXPECTED RETURN CODE FROM external_name: return_code-reason_code, WHILE PROCESSING DATA SET dsname

Explanation: In processing the specified data set, the named external routine was called, and it returned an unexpected return (return_code) or reason code (reason_code). The return code and reason code are printed in hexadecimal.

System action: Processing is ended for the specified data set. The return code is 8.

Operator response: None.

Application Programmer Response: This message is not normally expected and indicates a programming or system problem. Rerun the job with PARM =’ABEND=440’ on the EXEC statement, and a SYSUDUMP DD statement.

If the failing function is REALLOC, the system might also issue message IEC614I for the jobstep. If the system issue message IEC614I, see the z/OS DFSMSdip Diagnosis for an explanation of the failing function’s return code, and to the associated diagnostic information under REALLOC. If you cannot correct the error as indicated in the z/OS DFSMSdip Diagnosis contact your programming support personnel.

Source: DFSMSdss

ADR441W (ttt-mmmmm(yy)), LOGICAL ERROR IN BUFFER ON TRACK c:h

Explanation: A logical error was discovered in the track data after it had been read into the buffer and before writing it to DASD. The length of the track data does not match the sum of the count, key, and data fields of all records on the track in the buffer. This message is issued instead of ADR433E when CANCELERROR is not specified.

ADR442I (ttt-mmmmm(yy), DATA SET dsname pre-allocateD [WITH NEW NAME dsname]], IN CATALOG catalog_name], ON VOLUME(S): {volume_serial_number | volume_serial_number_list}

Explanation: The data set was selected for replacement as a pre-allocated target data set. The target catalog name, if known, is printed. The target volume or optional volume list is always printed with this message.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR443W (ttt-mmmmm(yy)), DUE TO ERRORS, TARGET COMPONENT component_name1 IS NOW NAMED component_name2. CLUSTER cluster_name, CATALOG catalog_name

Explanation: During COPY processing, the target cluster and components can be allocated using generated names. After the COPY, the target cluster name and component names are altered to match the source names. This message indicates that the target cluster name was successfully altered, but the alter for a component failed.

System action: Processing continues with the next data set. Message ADR469W follows this message. The return code is 4. Run access method services LISTCAT against the target catalog to determine the reason for the access method services ALTER failure. You can alter the component name to match the source by using access method services ALTER NEWNAME.

Operator response: None.

Source: DFSMSdss

ADR444E (ttt-mmmmm(yy), DATA SET dsname (IS EMPTY | HAS AN UNSUPPORTED DSORG). IT WILL NOT BE COPIED

Explanation: The data set cannot be copied to an unlike device for one of the following reasons:
It has an unsupported DSORG.
It has a BLKSIZE of 0.
It is empty (the pointer in the VTOC entry that points to the end of the data set is 0) but does not have an end-of-file (EOF) as its first record.

The data set cannot be copied to a like device if it is both:
- Empty and is being reblocked, and
- Its first record is not an EOF record.

**System action:** The data set was not copied. Processing continues. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR445I** *(ttt)-mmmm(yyy), SOURCE VSAM DATA SET dsname [IN CATALOG catalog_name], IS EMPTY*

**Explanation:** The source VSAM data set is empty; therefore the target data set is allocated, but no data movement is performed. If the data set is pre-allocated, the existing data set is deleted then reallocated using the source as the model.

**System action:** Processing continues.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR446E** *(ttt)-mmmm(yyy), DATA SET dsname [IN CATALOG catalog_name] CONTAINS NO DIRECTORY BLOCKS*

**Explanation:** A partitioned data set with no directory block was encountered. This was caused by not specifying at least one directory block at the time the data set was created.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR447I** *(ttt)-mmmm(yyy), VSAM DATA SET dsname [IN CATALOG catalog_name] IS BEING DELETED FROM VOLUME volume_serial_number, reason_code*

**Explanation:** The target VSAM data set will be deleted and reallocated. The reason codes (reason_code) are as follows:

1. You must use VSAM I/O to restore the data set, and the target set is not reusable.
2. The data set organization of the target did not match the source.
3. The CI size of the target did not match the source.
4. The IMBED attribute of the target did not match the source.
5. The KEY length of the target did not match the source.
6. The record length of the target did not match the source.
7. The REPLICATE attribute of the target did not match the source.
8. The SPANNED attribute of the target did not match the source.
9. This component of an AIX which was previously cataloged in **catalog_name** was uncataloged during a restore of its base cluster. This base cluster could not be reallocated and, therefore, this AIX could not be reattached. This component is no longer usable and has been deleted from volume volume_serial_number.

**System action:** The beginning RBA for the components does not match on input and output. The input and output volumes are different volumes of a multivolume data set.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss
on input and output. The input and output volumes are different volumes of a multivolume data set.

The pre-allocated target data set is defined with a larger control area (CA) size than the source data set.

System action: Processing continues. For reason codes 2 and 4 through 8, the source attributes override those of the pre-allocated target.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR448I  
(ttff)-mmmmm(yy), DATA SET dsname DUMPED USING NON-OPTIMIZE CHANNEL PROGRAMS AFTER TRACK OVERFLOW RECORDS WERE ENCOUNTERED

Explanation: The source data set contained track overflow records and OPTIMIZE(2), (3), or (4) was specified for the dump.

System action: The source data set tracks were processed by using nonoptimized channel programs. This results in performance degradation if the data set is not flagged as track overflow in the VTOC entry or is not in the TRACKOVERFLOW keyword list.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR450E  
(ttff)-mmmmm(yy), THE NUMBER OF INPUT AND OUTPUT TRACK RANGES DOES NOT MATCH

Explanation: The number of input track ranges does not correspond to the number of output track ranges. Each input track range requires a corresponding output track range. Each output track range requires a corresponding input track range.

System action: The task is ended. The return code is 8.

Operator response: None.

Application Programmer Response: Specify the same number of input and output track ranges.

Source: DFSMSdss

ADR451W  
(ttff)-mmmmm(yy), CLUSTER cluster_name IN CATALOG catalog_name IS PROCESSED. (text_description)

Explanation: The VSAM data set is processed, but there were unexpected conditions in the cluster. In the message, text_description describes the unexpected conditions. A primary allocation inconsistency was detected. The cluster primary allocation is not an even multiple of the tracks per control area (track/CA) and contain unused tracks. While processing these tracks, records containing invalid data have been added to the cluster.

System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: Ensure that the cluster does not contain more records than expected or correct the primary allocation of the cluster if it is still available.

Source: DFSMSdss
ADR452E  (ttt-mmmmm(yy), [IEHMOVE I IEBCOPY I IEBISAM I IDCAMS I ICKDSF]) UTILITY FAILED WHILE PROCESSING (DATA SET dsname I VOLUME volume_serial_number), [ABEND I RETURN] CODE IS nnn

Explanation: During processing of a DFSMSdss function, a system utility was invoked to process the specified data set or volume. The utility encountered errors, and processing failed.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Take one of the following actions:
- For abending utilities, see z/OS MVS System Codes for an explanation of the abend code. If the abend is caused by insufficient storage (DASD or virtual), you must run the utility itself (not through DFSMSdss), as described in z/OS DFSMSdss Utilities. If IEHMOVE abends with code 0C4, it could be because DFSMSdss called it with a task I/O table (TIOT) referring to more DD statements than IEHMOVE can handle. In this case, change the DFSMSdss filtering to select fewer data sets.
- For IEHMOVE, IEBCOPY, or IEBISAM error return codes, run the job with UTILMSG=ERROR or UTILMSG=YES to propagate the utility's SYSPRINT data set. See z/OS MVS System Messages, Vol 7 (IEB-IEF) and z/OS MVS System Messages, Vol 8 (IEF-IGD) for explanations of the utility messages.
- For IDCAMS error return codes, run the job by specifying the DFSMSdss UTILMSG=YES parameter. See z/OS MVS System Messages, Vol 6 (GOS-IEA) for an explanation of the messages.
- For ICKDSF error return codes, run the job with UTILMSG=ERROR or UTILMSG=YES to propagate the utility's SYSPRINT data set. See the Device Support Facilities (ICKDSF) User's Guide and Reference for an explanation of the messages.

Note: When performing in-place operations, the source data sets have been left unusable by the failure of the job. Check and restore all data sets from backup if necessary.

Source: DFSMSdss

ADR452I  (ttt-mmmmm(yy), THE FOLLOWING DATA SETS WERE SUCCESSFULLY PROCESSED)

Explanation: The list of successfully processed data sets follows this message.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR455W  (ttt-mmmmm(yy), THE FOLLOWING DATA SETS WERE NOT SUCCESSFULLY PROCESSED)

Explanation: The list of data sets that were not successfully processed follows this message.

System action: Processing continues. The return code is set to 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR456I  (ttt-mmmmm(yy), THE NUMBER OF DATA SETS PROCESSED ON VOLUME volume_serial_number IS nnnn)

Explanation: nnnn is the number of data sets successfully processed. For COMPRESS, the data set names follow this message.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR457I  (ttt-mmmmm(yy), THE NUMBER OF TRACKS MADE AVAILABLE ON VOLUME volume_serial_number IS nnnn)

Explanation: RELEASE processing released nnnn tracks.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.
Source: DFSMSdss

ADR458I (ttt-mmmmm(yy), (TOTAL | USED) NUMBER OF TRACKS ON VOLUME volume_serial_number IS nnnn

Explanation: The number, nnnn, indicates either the total number of tracks on the volume or the number of used tracks on the volume after RELEASE processing.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR459E (ttt-mmmmm(yy), ERROR ENCONTERED WHILE FILTERING ON THE CATALOG

Explanation: This message is preceded by message ADR497E or ADR724E. When this message is preceded by ADR497E, see message IDC3009I for an explanation and corrective action. When preceded by ADR724E, see message IGW01zzz for an explanation and corrective action.

System action: The current volume is bypassed. Processing continues with the next volume, if any. The return code is 8.

Operator response: None.

Application Programmer Response: For I/O errors, follow recommendations by your installation for I/O errors, and resubmit the job. For logical errors encountered in the VVDS, run access method services DIAGNOSE against the indicated volume, and take necessary action to correct the problem.

Source: DFSMSdss

ADR460I (ttt-mmmmm(yy), UTILITY GENERATED MESSAGES FOLLOW FOR {DATA SET dsname | VOLUME volume_serial_number})

Explanation: During processing of a DFSMSdss function, a system utility was invoked that generated SYSPRINT data. The utility messages are printed following this message when UTILMSG=YES is specified in the PARM information of the DFSMSdss EXEC statement or when UTILMSG=ERROR is specified and the utility function failed.

System action: The function continues processing.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR461W (ttt-mmmmm(yy), UNMOVABLE DATA SET dsname WITH FOLLOWING EXTENTS CANNOT BE PROCESSED

Explanation: The unmovable data set that has the listed extents cannot be processed. Either the system does not support allocation of unmovable data sets or the extents are not free on the target volume.

System action: The data set is not processed. The return code is set to 4.

Operator response: None.

Application Programmer Response: Either specify FORCE if you want to move the unmovable data set, or free the required extents and rerun the job.

Source: DFSMSdss

ADR462E (ttt-mmmmm(yy), NON-VSAM DATA SET dsname [IN CATALOG catalog_name] IS NOT PROCESSABLE

Explanation: The CVOL catalog entry is not processed because the DELETE subparameter was not specified and the RENAMEUNCONDITIONAL subparameter was specified.

System action: Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: Copy the CVOL catalog, specifying DELETE, and remove the RENAMEUNCONDITIONAL subparameter.

Source: DFSMSdss

ADR463E (ttt-mmmmm(yy), CLUSTER cluster_name WAS NOT {DELETED | DEFINED | ALLOCATED} BECAUSE VOLUME(S) WERE NOT AVAILABLE

Explanation: The allocation of the volumes failed because the volumes are not available. The cluster was not deleted, defined, or allocated.

System action: The return code is 8.

Operator response: None.

Application Programmer Response: Ensure that the volumes where the cluster resides are available.

Source: DFSMSdss

ADR464I (ttt-mmmmm(yy), DATA SET dsname HAS BEEN UNCATALOGED FROM CATALOG catalog_name

Explanation: The named data set was uncataloged at the user’s request.

System action: None.
ADR465I • ADR468E

Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR465I (ttt-mmmmm(yy), DATA SET dsname HAS BEEN CATALOGED IN CATALOG catalog_name)

Explanation: The named data set was cataloged at the user’s request.
System action: Processing of the command is ended. The return code is 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR466I (ttt-mmmmm(yy), ERROR RETURN CODE return_code [diagnostic_information] FROM PARTREL FOR DATA SET {dsname | cluster_name COMPONENT component_name} [IN CATALOG catalog_name] ON VOLUME volume_serial_number)

Explanation: A PARTREL macro was issued to release all unused DASD space from a sequential, partitioned, or extended format VSAM data set, and an unexpected return code (return_code) was received during RELEASE processing. A return code of 8 indicates that a data set was open. Any other return code probably indicates an invalid VTOC or VVDS.
System action: Processing of the command is ended. The return code is 8.
Operator response: None.
Application Programmer Response: Information about PARTREL return codes is in z/OS DFSMSdfp Advanced Services. For extended format VSAM only, return codes not documented in z/OS DFSMSdfp Advanced Services can be found under message IDC3009I in z/OS MVS System Messages, Vol 6 (GOS-IEA). Information about PARTREL diagnostic codes, which accompanies some but not all return codes, is in z/OS DFSMSdfp Diagnosis.
Source: DFSMSdss

ADR467E (ttt-mmmmm(yy), DURING A TARGET TRACKS COPY, THE OUTPUT TRACKS FALL WITHIN THE INPUT TRACK RANGE; AND THE INPUT AND OUTPUT VOLUMES ARE THE SAME)

Explanation: A COPY request was issued with the OUTTRACKS option. The input volume serial number and output volume serial number are the same, and the output tracks overlap the input tracks.
System action: Processing continues. The return code is 8.
Operator response: None.

Application Programmer Response: Take one of the following actions:

- If the RENAMEUNCONDITIONAL subparameter is specified and the new name is not fully qualified, correct the rename criteria to eliminate the mismatch in the resulting data set name levels, or specify a fully qualified name.
- If the REPLACE or REPLACEUNCONDITIONAL keyword is specified and:
  - If the data set is eligible for preallocation, ensure that a qualifying target is available on the target volumes.
  - If the data set is not eligible for preallocation or a REPLACE or REPLACEUNCONDITIONAL operation is not required, determine further action from the following lists.
- If the entry name is a SYS1., page, or swap data set and DELETE is specified, copy the entry specifying RENAMEUNCONDITIONAL(new name) or PROCESS(SYS1).
- If the entry name is a cluster name: (1) copy the cluster by specifying DELETE, (2) copy the cluster by specifying RENAMEUNCONDITIONAL(new name), or (3) copy the cluster by specifying RECAT(catname).
- If the entry name is an alternate index or a user catalog name, copy the alternate index or user catalog, specifying DELETE, and remove the RENAMEUNCONDITIONAL subparameter.
- If the entry name is a user catalog name, do not specify INDDNAME or INDYNAM.
- If CICSVRBACKUP is specified and the entry name is an alternate index, the alternate index is not processed. You want to exclude the alternate index on your COPY command so that this error message is not issued the next time that you submit the job. See z/OS DFSMSdfp Storage Administration for more information about the CICSVRBACKUP keyword on the COPY command.
- The NEWNAMEUNCONDITIONAL keyword specifies that a source data set should be given a new name during dump processing, whether or not the data set exists with the new name.

Source: DFSMSdss

ADR469W (ttt)-mmmm(yy), THE FOLLOWING DATA SETS WERE COPIED, BUT ENCOUNTERED POSTPROCESSING ERRORS

Explanation: After a data set was copied, a postprocessing error was encountered. The error occurred during an attempt to catalog, uncatalog, scratch, correct a VSAM cluster component name, or RACF/password-protect the source or target data set.

System action: Processing continues. The return code is 4.

ADR470W (xxx)-mmmm(yy), NO DATA SETS SELECTED FOR PROCESSING

Explanation: No data sets were selected for processing. The data sets found in the catalog or on the input volumes did not pass INCLUDE, EXCLUDE, or BY filtering or cannot be copied.

System action: Processing continues with the next control statement. The return code is 4.

ADR471E (ttt)-mmmm(yy), DUE TO ERRORS, SOURCE {CLUSTER | COMPONENT} name1 IS NOW NAMED name2. CLUSTER cluster_name, CATALOG catalog_name

Explanation: During COPY processing, the source cluster and components can be renamed in order to allow the COPY target cluster to be altered to the source name. If the target-to-source alter fails, the target data set is deleted, and restoring the source cluster to its original state is attempted. This message is issued for each alter rename failure. The cluster name and catalog name indicate the name and location of the failing data set.

System action: Processing continues with the next data set. Message ADR455E follows this message. The return code is 8.

ADR470W (ttt)-mmmm(yy), NO DATA SETS SELECTED FOR PROCESSING

Explanation: No data sets were selected for processing. The data sets found in the catalog or on the input volumes did not pass INCLUDE, EXCLUDE, or BY filtering or cannot be copied.

System action: Processing continues with the next control statement. The return code is 4.

ADR471E (ttt)-mmmm(yy), DUE TO ERRORS, SOURCE {CLUSTER | COMPONENT} name1 IS NOW NAMED name2. CLUSTER cluster_name, CATALOG catalog_name

Explanation: During COPY processing, the source cluster and components can be renamed in order to allow the COPY target cluster to be altered to the source name. If the target-to-source alter fails, the target data set is deleted, and restoring the source cluster to its original state is attempted. This message is issued for each alter rename failure. The cluster name and catalog name indicate the name and location of the failing data set.

System action: Processing continues with the next data set. Message ADR455E follows this message. The return code is 8.

Operator response: None.

Application Programmer Response: Run access method services DIAGNOSE against the source and target catalogs to determine the reason for the access method services ALTER failures. Restore the original cluster name, using access method services ALTER NEWNAME.

Source: DFSMSdss
ADR472E (xxx)-mmmm(yy), UNABLE TO SELECT A TARGET VOLUME FOR DATA SET dsname [IN CATALOG catalog_name], reason_code

Explanation: DFSMSdss was unable to select a target volume from the available target volumes for one of the following reasons, (reason_code):

04 No target volume has enough space to accommodate the target data set.
08 At least one duplicate data set was encountered on a target volume, and the REPLACE or REPLACEUNCONDITIONAL keyword was not specified. If the duplicate data set is named SYS1.xxxx, you must also specify PROCESS(SYS1). However, DFSMSdss will not replace a SYS1.xxxx data set that is a CVOL, integrated catalog facility user catalog, VVDS, or VTOCIX, regardless of the REPLACE or REPLACEUNCONDITIONAL and PROCESS(SYS1) keywords.

If the target volume did not contain a duplicate data set, this reason code means the target volume did not have enough space for the data set.
12 The data set is non-VSAM and is allocated as either unmovable or absolute track. DFSMSdss was able to select only unlike targets for target allocation and the FORCE keyword was not specified.
16 The data set is non-VSAM and either unmovable or absolute-track-allocated. The FORCE keyword was not specified.

An absolute allocation failure or lack of system support for absolute allocation precludes the use of absolute allocation. An example of this is when there is no indexed VTOC available on the specified volume.
20 A directory read failed for the partitioned data set.
24 An error was encountered while the VVR records for the VSAM data set were being read.
28 Duplicate VTOC entries were encountered on the only or all available target volumes for the VSAM data set.
32 A duplicate entry for the VSAM data set was encountered in the target catalog.
36 An error was encountered during the define of the target VSAM data set.
40 GETMAIN errors were encountered while the internal control blocks for the data set were being built.
44 The data set was a direct data set, and only target devices of smaller track capacity than the source were available. The data set was not specified in the RELBLOCKADDRESS keyword list, or it was specified in RELBLOCKADDRESS, but the data set is not accessed by relative block address (that is, it has a standard user label or its record format is not F or FB).

DFSMSdss does not allocate or attempt to copy the data set.
48 The source data set block size was greater than the track capacity of all volumes DFSMSdss was able to select for allocation. The data set was not indicated as track overflow in the VTOC entry.
52 An indexed VTOC was not available.
56 Not enough space is available in the VTOC on the target volume.
60 The DADSM installation exit (IGGPRE00) rejected the allocation request.
64 No output volume was specified for the COPY function, and the data set is not SMS-managed.
68 Usable space on all the target volumes combined was insufficient to define the target data set.
69 The number of target volumes required for the data set exceeds the number of source volumes.
72 During a non-SMS allocation, no target volumes were available and at least one output volume was not selected because it was SMS-managed.
76 The NOPACKING keyword was specified for the data set, but no space was available or no like devices were specified as targets.
80 No target volume that has device track capacity equal to or greater than the source is available for selection.
84 The data set was a direct data set and the only available target devices were unable to contain the source track's worth of data because of the block size of the data set. For example, if the source device is a D/T3380 and the only available devices are D/T3390S, and the data set's block size is 190 with a key length of 0, then a track on the target cannot contain as much data as a track on the source.

The data set was not specified in the RELBLOCKADDRESS keyword list, or it was specified in the RELBLOCKADDRESS but it was not accessed by a relative block address (that is, it has a standard user label or its
record format is not F or FB). DFSMSdss does not allocate or attempt to copy the data set.

88 During a non-SMS allocation, no usable target volumes were available.

92 During DFSMSdss data set COPY, an attempt was made to copy the data set back to its source volume with DELETE specified, but RENAMEUNCONDITIONAL was not specified.

**System action:** The data set is not copied or restored. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Depending on the reason code, take the following action and rerun the job:

04 Either increase the value for PERCENTUTILIZED, or specify additional target volumes. For VSAM data sets, contiguous space is needed.

08 Specify additional target volumes, delete the duplicate data set, specify REPLACE or REPLACEUNCONDITIONAL, or specify PROCESS(SYS1).

12 Either specify FORCE if the unlike target volumes are desired, or specify additional target volumes of the same device type that the data set currently resides on.

16 Specify target volumes that have indexed VTOCs, specify FORCE, or specify additional target volumes.

20 Ensure that the partitioned data set is usable.

24 Ensure that the cluster and its components are usable.

28 Specify additional target volumes.

32 If a target catalog was specified by using RECATALOG, either delete the existing data set in that catalog, or specify a different catalog. If a target catalog was not specified, the data set is being defined in a catalog set by the MASTERCAT structure. Determine where the duplicate entry exists and delete it.

36 Message ADR497E accompanies this message. Determine the cause of the error and correct it.

40 Increase the region size.

44 Specify target devices of the same or larger track capacity for the direct data set.

48 Specify target devices of the same or larger track capacity for the data set, or use an appropriate system utility to copy the data set.

52 Specify a volume with an indexed VTOC.

56 Enlarge the VTOC on the target volume or specify additional target volumes.

60 Specify additional target volumes.

64 If you expect the target data set to be SMS-managed, ensure the ACS routine assigns a storage class or use the BYPASS ACS and STORCLAS keywords to force the data set to be SMS-managed.

68 Either specify additional target volumes or, if PERCENTUTILIZED was specified, increase the PERCENTUTILIZED value.

69 Specify a list of target volumes with enough space to let DFSMSdss allocate the data set on either an equal or fewer number of volumes than the number of noncandidate source volumes.

72 If you expect the target data set to be SMS-managed, ensure the ACS routine assigns a storage class or use the BYPASS ACS and STORCLAS keywords to force the data set to be SMS-managed.

76 Either rerun the job without specifying NOPACKING for the data set, or rerun the job specifying the same or like devices with enough room to allocate the data set.

80 If the target data set is SMS, make sure that the storage class selected maps to a storage group that has devices with track capacity equal to or greater than the source. If the target data set is non-SMS, specify a target volume that has track capacity equal to or greater than the source.

84 Specify target devices of the same or larger track capacity for the direct data set.

88 If you expect the target data set to be SMS-managed, ensure the ACS routine assigns a storage class or use the BYPASS ACS and STORCLAS keywords to force the data set to be SMS-managed.

92 Choose a target volume different from the data set’s source volumes, or use the RENAMEUNCONDITIONAL keyword to rename the data set.

**Source:** DFSMSdss

---

**ADR473E** *(ttt)-mmmmm(yy), FAILURE WHILE ATTACHING UTILITY MODULE, RC=reason_code*

**Explanation:** DFSMSdss was unable to attach a utility module. The reason codes (reason_code) are documented in the [z/OS MVS Programming: Assembler Services Reference ABE-HSF](https://publib.boulder.ibm.com/infocenter/pfz/v2r2/topic/pfz/psr/abehspw.html).

**System action:** No data sets are processed. The task
ended. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the problem as indicated by reason_code, and rerun the job.

Source: DFSMSdss

ADR474I (ttt-mmmmm(yy)), DATA SET dsname CONSISTS OF n TARGET TRACKS AND m SOURCE TRACKS

Explanation: During logical data set restore, this message is issued for a non-VSAM data set to give the following information:

Source tracks: The number of tracks that were dumped for the source data set.

Target tracks: The number of tracks in a pre-allocated target data set, or if the target is not pre-allocated, the number of tracks that DFSMSdss allocated for the target data set.

For HFS and PDSE data sets when ALLDATA is specified, if DFSMSdss can determine the amount of used space, it will dump only the used space, regardless of the ALLDATA keyword. When the data set is restored, DFSMSdss allocates the target data set with the source data set's total allocation amount. Therefore, the number of source tracks in the ADR474I message be smaller than the number of target tracks. See the explanation for ALLDATA under 'Explanation of DUMP Command Keywords' in the DFSMSdss Storage Administration Reference for more information about HFS and PDSE data sets.

System action: Processing continues. DFSMSdss scratch and reallocate the data set, extend the existing data set, convert an extended format non-VSAM data set to PS format, or fail the restore with additional error processing.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR474E (ttt-mmmmm(yy)), UTILITY PROCESSOR TERMINATED BECAUSE OF SYSPRINT/SYSIN PROCESSING FAILURES

Explanation: Errors in utility SYSPRINT or SYSIN data set processing occurred, causing the utility processor task to end.

System action: Utility processing is ended. The return code is 8.

Operator response: None.

Application Programmer Response: Utility processing occurs during initial job setup. Therefore, this failure or not affect processing within the job. If errors are encountered, rerun the job ensuring that adequate DASD temporary space is available.

Source: DFSMSdss

ADR477E (ttt-mmmmm(yy)), VVDS/VVR/CELL ERRORS ENCOUNTERED FOR CLUSTER cluster_name

Explanation: Data set COPY or RESTORE encountered errors while reading or updating VVDS/VVR/CELL information. The system might issue this message for one of the following reasons:

- An error was encountered processing a VVR. If there was an I/O error, message ADR231E precede this message.
- An error was encountered on a catalog request. Message ADR497E precede this message.
- There be insufficient storage for internal processing. Messages ADR008E, ADR018I, or ADR376E precede this message.

System action: The data set is not copied or restored. Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: Perform the appropriate actions from the following list:

- An error was encountered processing a VVR:
  Run access method services DIAGNOSE against the appropriate VVDS to determine the nature of the error and take the recommended action.
- An error was encountered on a catalog request:
  Using the return and reason codes from message ADR497E, find the corresponding return and reason codes in message IDC3009I and follow the recommended action.
- There be insufficient storage for internal processing:
  Increase the region size and resubmit the request.

Source: DFSMSdss
ADR478W  
(ttt-mmmmm(yy), VSAM CLUSTER  
class_cluster_name NOT DUMPED,  
COMPONENT component_name SIZE IS  
GREATER THAN A SINGLE SOURCE  
VOLUME

Explanation: The VSAM cluster was not dumped  
because it had a multivolume component that was  
larger than an entire source volume. To restore the data  
set, it would be necessary to allocate the component on  
multiple volumes, but the system does not support the  
allocation of VSAM data sets on multiple volumes.

System action: The data set was not dumped.  
Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: Take one of the  
following actions:

- Use DFSMSdss DUMP, specifying the input volumes  
  that contain the VSAM cluster. DFSMSdss RESTORE  
can restore the data set from the dump tape in  
physical dump format.

- Use access method services EXPORT to dump the  
  VSAM cluster. Use access method services IMPORT  
to restore from the EXPORT-created dump tape.

Source: DFSMSdss

ADR479E  
(ttt-mmmmm(yy), LOGICAL DATA SET  
DUMP TAPE DOES NOT CONTAIN  
(VSAM | NON-VSAM) DATA SETS

Explanation: The requested type of data set is not on  
the logically formatted dump tape. Either the BY  
criterion is incorrect or the wrong tape was specified in  
the RESTORE command.

System action: No data sets are restored. Processing  
continues. The return code is 8.

Operator response: None.

Application Programmer Response: Either change  
the BY criterion DSORG or use a different dump tape,  
and rerun the job. For an empty VSAM data set, no  
action is required.

Source: DFSMSdss

ADR480W  
(ttt-mmmmm(yy), THE FOLLOWING  
DATA SETS WERE NOT PROCESSED  
FROM THE LOGICALLY FORMATTED  
DUMP TAPE DUE TO ERRORS:

Explanation: The data sets in the list were not  
processed. The error is identified by other messages  
that precede this message.

System action: The return code is 4.

Operator response: None.

Application Programmer Response: Correct the  
problem according to preceding messages.

Source: DFSMSdss

ADR481E  
(ttt-mmmmm(yy), UNABLE TO ALTER  
VSAM CLUSTER class_cluster_name [IN  
CATALOG catalog_name]

Explanation: The VSAM ALTER NEWNAME failed  
while attempting to alter the source cluster name.

System action: Processing continues. The return  
code is 8.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR482E  
(ttt-mmmmm(yy), I/O ERROR ON  
DDNAME ddname WHILE PROCESSING  
tape_record

Explanation: I/O errors were encountered while the  
indicated type of dump tape record was being read  
during logical data set RESTORE processing.

System action: The data set is bypassed. The return  
code is 8.

Operator response: None.

Application Programmer Response: Use an  
alternate backup copy to restore the data set.

Source: DFSMSdss

ADR483W  
(ttt-mmmmm(yy), DATA SET dsname  
NOT CATALOGED

Explanation: The data set was not cataloged.  
RECATALOG(*) was specified, but the source data set  
was not cataloged.

System action: Processing continues. The return  
code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR484W  
(ttt-mmmmm(yy), COMMAND IS NOT  
SUPPORTED FOR DATA SET dsname  
DURING LOGICAL DATA SET  
PROCESSING

Explanation: Data set RESTORE from a logically  
formatted dump tape does not support the data set  
organization of the indicated data set.

System action: Processing continues for other data  
sets. The return code is 4.

Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR485E (ttff-mmrrmm(yy), CATALOG
catalog_name IS NOT IN
STEPCAT/HOBATCAT/MASTERCAT
STRUCTURE. DATA SET dsname WILL
NOT BE PROCESSED

Explanation: The NONSMS cluster named in the
message required DFSMSdss to use IDCAMS or VSAM
I/O to perform the COPY or RESTORE. This requires
that both the source and target cluster (allocated by
DFSMSdss) be accessible via the catalog structure.

System action: Processing continues with the next
data set. The return code is 8.

Operator response: None.

Application Programmer Response: This data set
cannot be processed by DFSMSdss until it is accessible
through the catalog structure.

Source: DFSMSdss

ADR486I (ttff-mmrrmm(yy), UNMOVABLE DATA
SET dsname RESTORED TO FREE
SPACE

Explanation: The unmovable data set specified in the
message cannot be restored to the cylinder/track
location from which it was dumped. Because FORCE
was specified in the RESTORE command, this data set
was restored to free space.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR487W (ttff-mmrrmm(yy), DATA SET dsname
NOT ON LOGICALLY FORMATTED
DUMP TAPE

Explanation: During a data set RESTORE from a
logically formatted dump tape, the data set was not
found on the tape. Possibly the data set name is
contained in the data set name list at the beginning of
the dump tape, but the data set was not dumped. (This
can occur if the data set could not be serialized at dump
time.) Either the wrong input file was used, an incorrect
data set name was specified, or the data set was
rejected because of the DSORG filtering criteria. This
message is printed if fully qualified names are specified.

System action: Processing continues. The return
code is 4.

Operator response: None.

ADR488E (ttff-mmrrmm(yy), ERROR
ENCOUNTERED WHILE ACCESSING
{VTOC | VVDS} FOR DATA SET dsname
ON VOLUME volume_serial_number ON
DDNAME ddname

Explanation: An inconsistency on the VTOC or VVDS
was encountered during data set RESTORE from a
logically formatted dump tape.

System action: Processing continues for other data
sets. The return code is 8.

Operator response: None.

Application Programmer Response: Use an
alternate backup copy to restore the data set.

Source: DFSMSdss

ADR489I (ttff-mmrrmm(yy), {dsname | cluster_name | component_name} WAS
{SELECTED | RESTORED}

Explanation: After a data set was successfully
restored or after a data set was successfully selected
(when TYPRUN=NORUN), the data set name is printed
for a non-VSAM data set. Component names are
printed for a VSAM data set.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR490W (ttff-mmrrmm(yy), ERROR
{OPENING | READING} UTILITY
SYSPRINT MESSAGES. UTILITY
MESSAGES WILL BE LOST

Explanation: An error occurred either in opening or in
reading the utility SYSPRINT file.

System action: DFSMSdss continues processing for
the task, but utility SYSPRINT messages are lost. The
return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR491E (ttff-mmrrmm(yy), TASK TERMINATED
DUE TO INSUFFICIENT STORAGE FOR
UIM I/O BUFFER AND/OR EXIT
IDENTIFICATION BLOCK

Explanation: If the application interface is used, the
system requires a buffer to pass I/O records to the user interaction module (UIM). If virtual storage cannot be obtained for the buffer or the UIM exit identification block, the related DFSMSdss function is ended.

**System action:** None. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Increase either the SIZE parameter, the region size, or both, and rerun the job.

**Source:** DFSMSdss

### ADR492E (ttt-mmmmmm(yyyy)), ERROR OCCURRED DURING COPY OF CATALOG catalog_name, RC-reason_code.

[EXPORT DATA SET dsname IS ON VOLUME volume_serial_number]

**Explanation:** The catalog was being moved using access method services EXPORT or IMPORT when IDCAMS errors occurred. Corrective action be required to restore the source catalog to a usable condition. The reason code (reason_code) describes the error as follows:

01 An error occurred when the catalog was exported to a temporary sequential data set. The C.O.P.Y is discontinued, and the source catalog remains in usable condition. For this reason code, the second portion of the message is not printed.

02 A failure occurred when the target catalog was imported. The source catalog was deleted and must be recovered by the user.

**System action:** Processing continues with the next COPY. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Ensure that the DFSMSdss parameter option UTILMSG=YES is specified when running jobs that perform catalog moves. All reason codes are accompanied by IDCAMS messages that clarify the remedial actions necessary.

Take the following actions, depending on the reason code:

01 Use the IDCAMS messages as a guide in correcting the error. Rerun the job.

02 Restore the source catalog before attempting to rerun the job. If the catalog was backed up before the C.O.P.Y was attempted, the backup can be used to restore the catalog. Otherwise, the catalog can be restored by importing the catalog from the export data set described in the message. Delete the export data set described in the message before rerunning the job.

**Source:** DFSMSdss

### ADR493E (ttt-mmmmmm(yyyy)), UNCATALOG/DELETE IS NOT ALLOWED FOR DATA SET dsname [IN CATALOG catalog_name]

**Explanation:** Either exclusive control of the data set is not obtained or it is a SYS1. system, page, or swap data set that cannot be uncataloged.

**System action:** Processing continues. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** For exclusive control, either remove the SHARE keyword or ensure exclusive control of the data set, unless the data set is a VTOCIX or a VVDS. For SYS1. system, page, or swap data sets, specify PROCESS(SYS1) to uncatalog or delete the data set.

**Note:** PROCESS(SYS1) does not lift processing restrictions for VTOCIXs and VVDSs.

**Source:** DFSMSdss

### ADR494W (ttt-mmmmmm(yyyy)), {OPEN | CLOSE | I/O) ERROR ON MESSAGE DATA SET FOR TASK. TASK RELATED MESSAGES BE LOST

**Explanation:** An OPEN, CLOSE, or I/O error occurred on a message data set used to store task-related messages.

**System action:** DFSMSdss continues processing for the task, but messages for the task be lost. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

### ADR495E (ttt-mmmmmm(yyyy)), ECB UNEXPECTEDLY POSTED IN MODULE module_name, ECB CONTENTS ARE xxxxxxx

**Explanation:** An ECB related to an attached task was unexpectedly posted.

**System action:** Command processing is ended. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

### ADR496E (ttt-mmmmmm(yyyy)), UNEXPECTED RETURN CODE return_code FROM DETACH ISSUED FROM MODULE module_name

**Explanation:** An attempt to detach a subtask failed.
System action: The return code is 8.

Operator response: None.

Source: DFSMSdss

ADR497E (xxx)-mmmm(yy), A CATALOG ERROR OCCURRED WHILE action_description. RETURN CODE IS return_code, REASON CODE IS {reason_code I NOT PROVIDED}

Explanation: Catalog management module IGG0CLnn returned this return code (return_code) and reason code (reason_code) as the result of a catalog error or an exception condition while DFSMSdss was performing the action described by action_description.

Note: Not all catalog functions provide a reason code on an error return.

The action_description can be any one of the following:
- RENAMING CLUSTER cluster_name1 TO cluster_name2
- RENAMING COMPONENT component_name1 TO component_name2
- RENAMING AIX aix_name1 TO aix_name2
- RACF PROTECTING dsname
- RACF UNPROTECTING dsname
- ALTERING ACCESS TO USER CATALOG catalog_name
- RENAMING DATA SET dsname1 TO dsname2
- CONVERTING CLUSTER cluster_name TO SMS
- CONVERTING CLUSTER cluster_name TO NONSMS
- REMOVING CANDIDATE VOLUMES FROM COMPONENT component_name
- DEFINING CLUSTER cluster_name
- CATALOGING DATA SET dsname
- DEFINING AIX aix_name
- DEFINING PAGESPACE dsname
- DEFINING USER CATALOG catalog_name
- DEFINING PATH path_name TO cluster_name
- DEFINING ALIAS alias_name TO cluster_name
- SEARCHING FOR DATA SETS BEGINNING WITH prefix
- OBTAINING INFORMATION FOR DATA SET dsname
- OBTAINING VOLUME INFORMATION FOR DATA SET dsname
- DETERMINING TARGET CATALOG FOR DATA SET dsname
- DELETING CLUSTER cluster_name
- DELETING DATA SET dsname
- DELETING USER CATALOG catalog_name
- DELETING AIX aix_name
- DELETING PATH path_name
- EXPORTING CATALOG catalog_name
- IMPORTING CATALOG catalog_name
- RECATALOGING CLUSTER cluster_name
- RECATALOGING AIX aix_name
- RECATALOGING DATA SET dsname
- READING CATALOG catalog_name
- ALTERING THE VOLUME LIST FOR DATA SET dsname
- ALTERING LAST BACKUP DATE FOR DATA SET
- DELETING UNCATALOGED VSAM DATA SET component_name
- ALTERING RECALL STATUS FOR CLUSTER cluster_name

Source: DFSMSdss

ADR498E (ttt)-mmmm(yy), DATA SET dsname CANNOT BE COPIED/RESTORED, pre-allocate THE DATA SET WITH nnnnnn TRACKS

Explanation: DFSMSdss cannot determine the amount of space that is required to contain the data set before it performs the COPY/RESTORE function to an unlike device. If the COPY/RESTORE is to a like device, the source and target data sets have differing attributes such as allocation unit or blocking factor.

System action: The data set is not processed. The return code is set to 8.

Operator response: None.

Application Programmer Response: pre-allocate the data set with an allocation of nnnnnn tracks on the volumes that are listed in message ADR396I or ADR442I, or COPY/RESTORE the data set to a like device. Or, if the COPY/RESTORE is to a like device, make sure the source and target data sets have the same attributes, for example, by removing the TGTALLOC option on the COPY or RESTORE command.
ADR499I (ttt)-mmmmm(yy), COMPONENT component_name REQUIRES nnnn1 TRACKS, nnnn2 (BLOCKS | CYLINDERS | TRACKS) REQUESTED

Explanation: DFSMSdss has tried to allocate space of nnnn2 blocks, cylinders or tracks, in order to allocate the component whose size was nnnn1 tracks, when dumped. If the data set is known to be restored with VSAM I/O, the allocation nnnn2 is the size of the primary extent when the data set was dumped. If the data set is a key range data set with secondary extents and is not to be restored with VSAM I/O, the allocation size is the size of the largest key range.

This message accompanies messages ADR472E RC04 and ADR472E RC68 when the probable cause of the failure is insufficient space to allocate the data set.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR501E (xxx)-mmmmm(yy), VOLUME volser IS UNUSABLE, reason_code

Explanation: The volume with the specified volser is unusable. The reason codes (reason_code) are as follows:

1. The target volume is a dump-conditioned volume and a dump-conditioned target volume is not supported for the operation.
2. Renaming criteria is not specified and the source and target volsers are the same. Two data sets with the same name cannot reside on the same volume.

System action: Processing is discontinued for the task. Return code is 8.
Operator response: None.
Application Programmer Response: Take the following action, depending on the reason code (reason_code):

1. Specify a non-dump conditioned volume for the target volume and rerun the job.
2. Either specify rename criteria for the non-VSAM data sets or specify a non-dump conditioned volume for the target volume and rerun the job. Renaming of VSAM data sets is not supported, so if processing VSAM only, you must specify a non-dump conditioned volume for the target volume and rerun the job.

Source: DFSMSdss

ADR510E (xxx)-mmmmm(yy), RSA LABEL RSA_label DOES NOT EXIST

Explanation: The RSA label specified on the RSA keyword does not exist in the ICSF CKDS. If the RSA keyword was not specified on a RESTORE command, the RSA label that the DATA key was encrypted with does not exist in the ICSF CKDS. Therefore the DATA key cannot be decrypted/encrypted and processing cannot continue.

In the message text:

RSA_label
The label of an RSA key in the ICSF PKDS specified on the RSA keyword of a DUMP or RESTORE command.

System action: The DUMP or RESTORE task ends. The return code is 8.
Application Programmer Response: Ensure that there is no typo in the label provided on the RSA keyword. Make sure that the RSA label specified actually exists within ICSF. This can be done by ICSF TSO panels.
Operator response: None

ADR511E (xxx)-mmmmm(yy), RSA ENCRYPTION NOT SUPPORTED ON THIS SYSTEM

Explanation: The necessary hardware needed to perform RSA encryption not be installed on this system. Without the ability to perform RSA encryption, the necessary key management cannot be done.
System action: The DUMP or RESTORE task ends. The return code is 8.

Application Programmer Response: Ensure that the hardware required to perform RSA encryption is installed and enabled on this system. Ensure that ICSF is properly configured to assist in RSA encryption. Then resubmit your job.

Operator response: None.

Source: DFSMSdss

ADR512E (xxx)-mmmmm(yy), ICSF SERVICE FAILED WITH RETURN CODE return_code REASON CODE reason_code

Explanation: An ICSF service returned an unexpected error. See the ICSF Application Programmer’s Guide, Appendix A for explanations of ICSF service return and reason codes.

In the message text:

service
The ICSF service that returned the error.

return_code
The return code received from the ICSF service.

reason_code
The reason code received from the ICSF service.

System action: The DUMP or RESTORE task ends. The return code is 8.

Application Programmer Response: See the ICSF Application Programmer’s Guide for more information about the error and possible corrections.

Operator response: None.

Source: DFSMSdss

ADR514E (xxx)-mmmmm(yy), THE PASSWORD SPECIFIED BY KEYPASSWORD PASSWORD MUST BE BETWEEN 8 AND 32 CHARACTERS

Explanation: The length of the password specified on the KEYPASSWORD has a minimum and maximum length. Passwords that do not meet the length criteria are not be accepted.

In the message text:

password
The password specified on the KEYPASSWORD keyword

System action: The DUMP or RESTORE task ends. The return code is 8.

Application Programmer Response: Ensure that the specified password meets the length requirements and resubmit the job.

Operator response: None.

Source: DFSMSdss

ADR515I (xxx)-mmmmm(yy), ENCRYPTION SERVICES TO BE USED FOR DUMP DATA SET ON VOLSER volser

Explanation: ICSF Encryption Services will be used when writing data during DUMP, or reading data during RESTORE.

In the message text:

volser
The volume serial of the volume where the dump data set resides.

System action: None.

Application Programmer Response: None.

Operator response: None.

Source: DFSMSdss

ADR516E (xxx)-mmmmm(yy), RSA SPECIFIED ON DUMP BUT KEYPASSWORD WAS SPECIFIED ON RESTORE

Explanation: When the dump data set was created, the RSA keyword was specified for key management. On the RESTORE command, the KEYPASSWORD keyword was specified. The two types of key management are not compatible.

System action: The RESTORE task ends. The return code is 8.

Application Programmer Response: Remove the KEYPASSWORD keyword to let the RESTORE task use the original RSA label for key management. Or specify the RSA keyword to specify a different RSA label for the RESTORE task to use when decrypting the
encrypted data key. Then resubmit the job.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR517E** (xxx)-mmmmm(yy), KEYPASSWORD SPECIFIED ON DUMP, BUT NOT ON RESTORE

**Explanation:** When the dump data set was created, the KEYPASSWORD keyword was specified for key management. On the RESTORE command, the KEYPASSWORD keyword was not specified as required.

**System action:** The RESTORE task ends. The return code is 8.

**Application Programmer Response:** Specify the KEYPASSWORD keyword with the original password on the RESTORE command and resubmit the job.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR518I** (xxx)-mmmmm(yy), HOST-BASED ENCRYPTION BYPASSED DUE TO ENCRYPTING TAPE DEVICE

**Explanation:** The KEYPASSWORD or RSA keyword was specified to the DFSMSdss DUMP task, but the output dump data set resides on an encrypting tape device, so host-based encryption will be bypassed.

**System action:** The DUMP task continues.

**Application Programmer Response:** None.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR519E** (xxx)-mmmmm(yy), HARDWARE ENCRYPTION NOT PERFORMED BY ALL OUTPUT DEVICES

**Explanation:** Host-based encryption was requested through the RSA or the KEYPASSWORD keyword, and at least one output device will perform hardware encryption while at least one output device will not perform hardware encryption. To avoid doubly encrypting data, the system only uses the output devices that perform hardware encryption. Refer to message ADR324E for the unused devices for output. The task continues if any applicable output devices exist.

**System action:** The DUMP task continues.

**Application Programmer Response:** If host-based encryption is required, separate the DUMP tasks into different jobs. These jobs contain output devices that will not be used in data encryption. Check the DATACLAS for the output DD definitions to ensure that they do not request the tape device to encrypt the data.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR520I** (ttt)-mmmm(yy), NOT AUTHORIZED TO USE FLASHCOPY FUNCTION ON {COPY|DEFRAG|CONSOLIDATE} FOR {DATA SET dsname | VOLUME volser}

**Explanation:** Proper RACF authority is required as follows:

-FLASHCOPY FUNCTION ON COPY COMMAND – RACF FACILITY class authority to use the FlashCopy feature
-FLASHCOPY FUNCTION ON DEFRAG COMMAND – RACF FACILITY class authority to use the FlashCopy feature
-FLASHCOPY FUNCTION ON CONSOLIDATE COMMAND – RACF FACILITY class authority to use the FlashCopy feature

**System action:** DFSMSdss processing continues. The return code is 0.

**Application Programmer Response:** Acquire the proper RACF authority and rerun the job.

-FLASHCOPY FUNCTION ON COPY COMMAND – You must be permitted READ access to the STGADMIN.ADR.COPY.FLASHCPY profile.
-FLASHCOPY FUNCTION ON DEFRAG COMMAND – You must be permitted READ access to the STGADMIN.ADR.DEFRAG.FLASHCPY profile.
-FLASHCOPY FUNCTION ON CONSOLIDATE COMMAND – You must be permitted READ access to the STGADMIN.ADR.CONSOLID.FLASHCOPY profile.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR556W** (ttt)-mmmm(yy), EXTENDED ATTRIBUTES FOR DATA SET dsname WERE NOT RETAINED DURING {COPY | RESTORE}, rsn

**Explanation:** The data set was copied or restored but some extended attributes were lost for the following reasons (rsn):

1. Vendor attributes from the F9 DSCB of the dumped data set were not retained for the target data set because the volume on which it was placed did not support F8/F9 DSCBs.
2. Vendor attributes from the F9 DSCB of the dumped or copied data set were not retained for the target data set due to problems updating the target’s F9 DSCB.

**System action:** None.

**Source:** DFSMSdss

---
Application Programmer Response:
1. If the extended attributes are desired, rerun the COPY or RESTORE and specify target volumes or an SMS group that supports F8/F9 DSCBs.
2. An error occurred while reading or writing an F9 DSCB. Retry the restore or copy for the data set.

Operator response: None.
Source: DFSMSdss

ADR557I (ttt-mmmmm(yy), THE NUMBER OF TRACKS MADE AVAILABLE IN THE BASE ADDRESSING SPACE ON EXTENDED ADDRESS VOLUME volume_serial_number IS nnn)

Explanation: RELEASE processing released nnn tracks from the base addressing area on the Extended Address Volume.

System action: Processing continues.
Application Programmer Response: None.
Operator response: None.
Source: DFSMSdss

ADR558I (ttt-mmmmm(yy), USED NUMBER OF TRACKS IN THE BASE ADDRESSING SPACE ON EXTENDED ADDRESS VOLUME volume_serial_number IS nnn)

Explanation: The number nnn indicates the number of used tracks in the base addressing space on the Extended Address Volume after RELEASE processing.

System action: Processing continues.
Application Programmer Response: None.
Operator response: None.
Source: DFSMSdss

ADR702E (ttt-mmmmm(yy), JOBCAT/STEPCAT NOT ALLOWED WHEN PROCESSING SMS MANAGED DATA SET dsname)

Explanation: A JOBCAT or STEPCAT DD statement was specified, and one of the data sets being processed was SMS-managed.

System action: Task ends with return code 8.
Operator response: None.
Application Programmer Response: Eliminate JOBCAT/STEPCAT in the JCL and rerun the job.
Source: DFSMSdss

ADR703E (ttt-mmmmm(yy), DATA SET dsname NOT SELECTED DUE TO MISSING NVR)

Explanation: The data set, which is non-VSAM and SMS-managed, was not selected because the non-VSAM volume record (NVR) for it cannot be found.

System action: The data set is not processed. The return code is 8.
Operator response: None.
Application Programmer Response: Run access method services DIAGNOSE for the data set, fix the error, and rerun the job.
Source: DFSMSdss

ADR704E (ttt-mmmmm(yy), DATA SET dsname ORGANIZATION IS NOT SUPPORTED)

Explanation: The following types of data sets are not supported by DFSMSdss in an SMS environment:
- Data set cataloged in more than one catalog
- CVOLs
- Indexed sequential data sets
- Absolute track allocation
- Unmovable data sets
- VTOCIX/VVDS
- Page/swap data sets
- the VIO data set
- Direct data sets with OPTCD=A.

System action: The data set is not processed, and the return code is set to 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR705E (ttt-mmmmm(yy), INVALID {STORAGE CLASS | MANAGEMENT CLASS} NAME {storage_class_name | management_class_name} SPECIFIED)

Explanation: A nonexistent storage class or management class was specified in the STORCLAS or MGMTCLAS keyword.

System action: Task ends with return code 8.
Operator response: None.
Application Programmer Response: Specify a valid storage class/management class and rerun the job.
Source: DFSMSdss

ADR706E (ttt-mmmmm(yy), DUE TO ERRORS, SOURCE DATA SET dsname1 IS NOW NAMED dsname2)

Explanation: During COPY processing, the source data set can be renamed in order to allow allocation of
the SMS-managed target data set. If the target allocation fails, an attempt is made to restore the source data set to its original state. If the ALTER of the source data set fails, this message is issued. The data set name indicates the name of the failing data set.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Run access method services DIAGNOSE against the source catalog to determine the reason for the access method services ALTER failure. Restore the original data set name using access method services ALTER NEWNAME.

Source: DFSMSdss

ADR707E (xxx)-mmmmn(yy), NOT AUTHORIZED TO USE {ADMINISTRATOR | BYPASSACS | CGCREATE | CONCURRENT | CONSOLID | CONVERTV | DEFRAG | DELCATE | FCCGFREEZE | FCSETGTOK | FCTOPPRCPRIMARY | IMPORT | INCAT | MANAGEMENT CLASS | PROCESS(SYS1) | STORAGE CLASS | TOLERATE(ENQF) | PATCH} (KEYWORD | storage_class_name | management_class_name) FOR DATA SET dsname

Explanation: Proper RACF authority is required as follows:

• ADMINISTRATOR keyword—RACF FACILITY class authority to perform DFSMSdss functions as a storage administrator.

• BYPASSACS keyword—RACF FACILITY class authority to bypass ACS.

• CGCREATE keyword—RACF FACILITY class authority to allow I/O activity to resume on volumes previously frozen for FlashCopy Consistency Grouping.

• CONCURRENT keyword—RACF FACILITY class authority to use the concurrent copy feature.

• CONSOLID keyword—RACF FACILITY class authority to defragment volumes.

• CONVERTV keyword—RACF FACILITY class authority to convert volumes.

• DEFRAG keyword—RACF FACILITY class authority to defragment volumes.

• DELCATE keyword—RACF FACILITY class authority to delete phantom catalog entries.

• FCCGFREEZE keyword—RACF FACILITY class authority to freeze volumes for FlashCopy Consistency Grouping.

• FCSETGTOK keyword—RACF FACILITY class authority to allow a space efficient volume to become a FlashCopy target.

• FCTOPPRCPRIMARY keyword—RACF FACILITY class authority to allow a PPRC primary volume to become a FlashCopy target.

• IMPORT keyword—RACF FACILITY class authority to import data sets.

• INCAT keyword—RACF FACILITY class authority for direct catalog call.

• MANAGEMENT CLASS(management_class_name)—RACF authority to use management class management_class_name. The RESOWNER of the data set must have the authority to use the indicated management class (which have been chosen for the data set by the ACS routines or by the user if BYPASSACS was specified for the data set).

• PATCH keyword—RACF FACILITY class authority to dynamically set PATCH bytes.

• PROCESS(SYS1) keyword—RACF FACILITY class authority to remove restrictions on processing of SYS1 system data sets.

• STORAGE CLASS(storage_class_name)—RACF authority to use storage class storage_class_name. The RESOWNER of the data set must have the authority to use the indicated storage class (which have been chosen for the data set by the ACS routines or by the user if BYPASSACS was specified for the data set).

• TOLERATE(ENQF) keyword—RACF FACILITY class authority to process data sets even though shared or exclusive access fails.

System action: Another message will indicate the action taken. The return code is 8.

Operator response: None.

Application Programmer Response: Acquire the proper RACF authority and rerun the job.

• ADMINISTRATOR—FACILITY class must be active, the applicable profile must be defined, you must be permitted READ access to that profile.

• BYPASSACS—You must be permitted READ access to either the STGADMIN.ADR.COPY.BYPASSACS or the STGADMIN.ADR.RESTORE.BYPASSACS profiles.

• CGCREATE—You must be permitted READ access to the STGADMIN.ADR.CGCREATE profile.

• CONCURRENT—You must be permitted READ access to either the STGADMIN.ADR.COPY.CNCURRNT or the STGADMIN.ADR.DUMP.CNCURRNT profiles.

**Source:** DFSMSdss

---

**ADR709E**

(tt-mm-yyyy), AN ERROR OCCURRED IN THE STORAGE MANAGEMENT SUBSYSTEM WHILE action_description. SMS MESSAGES FOLLOW

**Explanation:** An error occurred in the Storage Management Subsystem while DFSMSdss was performing the action described by action_description. Error messages produced by the SMS service in error are printed following this message.

The action_description can be any one of the following:
- **DETERMINING SMS CONSTRUCTS FOR DATA SET dsname1** [WITH NEWNAME dsname2]
- **ALLOCATING DATA SET dsname1** [WITH NEWNAME dsname2]
- **RENAMEING DATA SET dsname1 TO dsname2**
- **SCRATCHING DATA SET dsname2**

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See the messages following this message to determine the actual error and to correct the problem.

**Source:** DFSMSdss

---

**ADR710E**

(tt-mm-yyyy), COPYVOLID [OR DUMPCONDITIONING] IS REQUIRED TO {RESTORE | COPY} INPUT VOLUME volume_serial_number_1 TO OUTPUT VOLUME volume_serial_number_2

**Explanation:** The source volume of a FULL volume COPY or RESTORE is SMS managed. In order to perform this operation, the COPYVOLID keyword must be specified.

**System action:** The function is ended with a return code of 8.

**Operator response:** None.

**Application Programmer Response:** If you want to COPY an SMS-managed volume, specify the COPYVOLID or DUMPCONDITIONING word in the control statement, and rerun the job. If you want to RESTORE an SMS-managed volume, specify the COPYVOLID keyword in the control statement, and rerun the job.

**Source:** DFSMSdss
ADR711I {ttt-mmmmm(yyyy)}, DATA SET dsname1 HAS BEEN ALLOCATED [AS A PDS | AS A PDSE] [WITH NEWNAME dsname2] USING STORCLAS storage_class_name {DATACLAS data_class_name|NO DATACLAS}, AND {MGMTCLAS management_class_name|NO MGMTCLAS}

Explanation: If the RENAME parameter was specified, the data set has been allocated with the new name in the storage class listed. The data class and management class assigned to the data set are also listed, if they exist. If the target data set of a PDS or a PDSE is allocated with a different type than the source, the new target type is listed as well, and the data set is converted to the new target type.

System action: None.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR712W {ttt-mmmmm(yyyy)}, THE CATALOG catalog_name SPECIFIED IN RECATALOG IS NOT AVAILABLE

Explanation: The catalog specified in the RECATALOG parameter does not exist or is not available on the system.

System action: If the target data set is SMS-managed, the RECATALOG parameter is ignored, and the system determines the catalog. If the target data set is not SMS-managed, then message ADR380E is issued, and the task continues with the next data set. The return code is 4.
Operator response: None.
Application Programmer Response: If the target data set is not SMS-managed, ensure that the catalog name is correct and available, then rerun the job.
Source: DFSMSdss

ADR713E {ttt-mmmmm(yyyy)}, UNABLE TO ALLOCATE SMS MANAGED DATA SET dsname BECAUSE NEITHER DELETE NOR RENAMEU WAS SPECIFIED

Explanation: An attempt to copy a cataloged data set into system-managed storage failed because the source data set was not deleted and the target data set was not renamed.

System action: The data set is not copied. The return code is 8.
Operator response: None.
Application Programmer Response: Specify either

ADR714E {ttt-mmmmm(yyyy)}, UNABLE TO RESTORE USER CATALOG catalog_name BECAUSE THE SYSTEM-SELECTED TARGET VOLUME target_volume DOES NOT MATCH THE SOURCE VOLUME source_volume

Explanation: A user catalog must be restored to a volume with the same serial number and device type as the volume from which it was dumped. Because the user catalog is SMS-managed, the target volume is determined by the system.

System action: The user catalog is not restored. The return code is 8.
Operator response: None.
Application Programmer Response: Specify the correct DASD volume in the OUTDD/OUTDY parameter, and ensure that the volume is in a storage class with the guaranteed space attribute.
Source: DFSMSdss

ADR715W {ttt-mmmmm(yyyy)}, UNABLE TO ALTER STATUS OF SMS MANAGED GENERATION DATA SET dsname TO {ACTIVE | ROLLED-OFF}. IT WILL BE LEFT IN DEFERRED STATUS

Explanation: DFSMSdss was attempting to update the status of an SMS-managed generation data set from deferred to either active or rolled-off, but it was unable to do so because of a VVDS manager error. Message ADR231E describing the VVDS manager error precedes this message.

System action: The data set is left in deferred status. The return code is 4.
Operator response: None.
Application Programmer Response: Take the action recommended by message ADR231E. To change the status to active, use the access method services command ALTER ROLLIN.
Source: DFSMSdss

ADR716W {ttt-mmmmm(yyyy)}, UNABLE TO CONVERT USER CATALOG catalog_name (TO | FROM) SMS MANAGEMENT. VOLUME volume_serial_number HAS BEEN PLACED IN INITIAL STATUS

DELETE to delete the source data set or RENAMEUNCONDITIONAL to rename the target data set, then rerun the job. See z/OS DFSMSdfp Storage Administration under the RENAME keyword for the RESTORE command for possible syntax errors.
Source: DFSMSdss
Explanation: DFSMSdss physical data set restore has restored a non-SMS-managed integrated catalog facility user catalog to an SMS-managed volume or an SMS-managed user catalog to a non-SMS-managed volume without performing the appropriate conversion to or from SMS management. To avoid contaminating the volume, it was placed in INITIAL status.

System action: The user catalog is restored, and the output volume is placed in INITIAL status. The return code is 4.

Operator response: None.

Application Programmer Response:
- Connect the user catalog to the master catalog.
- Use the DFSMSdss CONVERTV command to return the volume to its status before the restore. CONVERTV will also perform the appropriate conversion on the user catalog.

Source: DFSMSdss

ADR717E (ttt)-mmmm(yy), SYSTEM SERVICES ERROR OCCURRED WHILE action_description. {RETURN INFORMATION IS version_number-module_name-return_code-reason_code | ABEND CODE IS abend_code} [AND MESSAGES FOLLOW:]

Explanation:
- The system services' version number, module name, return code, and reason code were returned as the result of an error or exception condition while DFSMSdss was performing the action described by action_description.
- If the system services abinded, see z/OS MVS System Codes for an explanation of abend_code.
- DFSMSdss was performing the action described by action_description at the time of the abend.

The action_description can be any one of the following:
- RACF PROTECTING dsname
- RACF UNPROTECTING dsname
- RENAMING DATA SET dsname1 TO dsname2
- OBTAINING INFORMATION FOR DATA SET dsname
- OBTAINING VOLUME INFORMATION FOR DATA SET dsname
- DETERMINING TARGET CATALOG FOR DATA SET dsname
- ALTERING THE CHECKPOINT ATTRIBUTE OF DATA SET dsname
- DUMPING DATA SET dsname
- COPYING DATA SET dsname
- RESTORING DATA SET dsname

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Following this message, see message IGW01zzz (where zzz is the last three digits of reason_code) to determine the actual error and the measures to be taken to correct the problem.

Source: DFSMSdss

ADR718W (ttt)-mmmm(yy), SYSTEM SERVICES ENCOUNTERED A WARNING CONDITION WHILE action_description. RETURN INFORMATION IS version_number-module_name -return_code-reason_code [AND MESSAGES FOLLOW:]

Explanation: The system services' version number, module ID, return code, and reason code were returned as the result of an attention condition while DFSMSdss was performing the action described below by action_description.

Action-description can be any one of the following:
- COPYING DATA SET dsname
- RESTORING DATA SET dsname
- DUMPING DATA SET dsname

System action: Processing continues with the next data set. The return code is 4.

If DFSMSdss allocated a target data set, it will be deleted.

Operator response: None.

Application Programmer Response: See message IGW01zzz to determine the actual error and the measures to be taken to correct the problem.

Source: DFSMSdss

ADR719E (ttt)-mmmm(yy), DATA SET dsname CANNOT BE CONVERTED TO { A PDSE | A PDS }, reason_code

Explanation: The CONVERT keyword with the PDS or PDSE subkeyword was specified in the COPY command for the data set. However, it cannot be converted because of the following reason code (reason_code):

01 The target data set is pre-allocated, and its data set type conflicts with the CONVERT keyword. For example, CONVERT PDSE was specified, but the pre-allocated target data set was not a PDSE.
02 The target volume for the data set is not SMS-managed.

System action: The data set is not processed. The return code is 8.

Operator response: None.
Application Programmer Response: Correct the problem as indicated by the reason code (reason_code) and reprocess the data set:

01 Rename or delete the pre-allocated data set.

02 Specify an SMS-managed target volume or modify the ACS routine to direct the target allocation to an SMS-managed volume.

Source: DFSMSdss

ADR720I (ttt-mmmmm(yyyy)), DATA SET dsname WAS NOT SERIALIZED WHEN IT WAS DUMPED. RECOVERY DATA IS (yyyy.ddd hh:mm:ss.t)

Explanation: The data set was not serialized when it was dumped because the Backup-While-Open (BWO) status in the VVDS indicated that this data set could be dumped without serialization by DFSMSdss if it was already serialized.

The recovery data information for the data set has the following values:

yyyy.ddd The Julian date (year and days).

hh:mm:ss.t The time-stamp in hours, minutes, seconds and tenths of a second.

Recovery data of (***** **:**:**.*) indicates that DFSMSdss could not obtain the recovery data.

System action: Processing continues. If this message was unexpected, the Backup-While-Open (BWO) status have been incorrectly set or left set by an application.

Operator response: None.

Application Programmer Response: Forward recovery be required to use this data set.

ADR721I (ttt-mmmmm(yyyy)), DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number IS BEING PROCESSED AS A BACKUP-WHILE-OPEN DATA SET

Explanation: The normal serialization was not obtained for the data set, but the Backup-While-Open (BWO) status was either 100 or changed to 100 from 110. As a result, the data set was processed even though it was already opened by another application.

System action: Processing continues. If this message was unexpected, the Backup-While-Open (BWO) status have been incorrectly set or left set by an application.

Operator response: None.

Application Programmer Response: None.

ADR722E (ttt-mmmmm(yyyy)), DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number IS UNAVAILABLE AND CANNOT BE PROCESSED - BACKUP-WHILE-OPEN STATUS IS nnn

Explanation: The Backup-While-Open status in the VVDS indicated that this data set is in an unavailable state and cannot be dumped or restored. See Appendix B, “Data Integrity—Serialization”, in z/OS DFSMSdfp Storage Administration for more details about the BWO status indicators.

System action: The data set is not processed. The return code is 8.

Operator response: Rerun the function when the data set becomes available or the BWO status is changed.

Application Programmer Response: Correct the condition that is causing the data set to be unavailable, or change the BWO status.

ADR723W (ttt-mmmmm(yyyy)), PHYSICAL OPERATION: BACKUP-WHILE-OPEN PROCESSING FOR DATA SET dsname WAS NOT PERFORMED

Explanation: Backup-While-Open (BWO) is not supported in physical dump and restore functions.

System action: The data set is dumped or restored, but the contents of the data set are unpredictable. The return code is 4.

Operator response: None.

Application Programmer Response: If this is a dump function, re-process the data set with logical data set dump. If this is a restore function, ensure that the restored data set is usable.

ADR724E (ttt-mmmmm(yyyy)), ERROR DURING function FOR DATA SET dsname IN CATALOG catalog_name], vv-ii-ww-zzz

Explanation: The version number (vv) and module ID (ii), and the CMI (catalog management) return code (ww) and reason code (zzz) were returned by the catalog services as the result of a catalog error or an exception condition.

System action: Command processing is ended. The return code is 8.

Operator response: None.

Application Programmer Response: See message IGW01zzz for specific return code and reason code definitions. If CMI return information is displayed, see IDC3009I for definitions.

Source: DFSMSdss
**ADR725E**  
(ttftp-mmddyy), INTERNAL BUFFERING ERROR ENCOUNTERED FOR DATA SET dsname [IN CATALOG catalog_name] WHILE INTERFACING WITH SYSTEM SERVICES FOR DATA MOVEMENT

Explanation: An error was detected in the I/O buffer table. This is probably an internal error in DFSMSdss.

System action: Processing ends for the data set. Processing continues with the next data set that is not a PDSE. The return code is 8.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

---

**ADR726W**  
(ttftp-mmddyy), DATA SET dsname WAS A BACKUP-WHILE-OPEN DATA SET BUT WAS RESTORED TO A NON-SMS-MANAGED TARGET. RECOVERY DATA IS (yyyy-ddd hh:mm:ss.t)

Explanation: The data set was dumped while it was open and should be restored to an SMS-managed volume.

The recovery data information for the data set has the following values:

- yyyy-ddd: The Julian date (year and days).
- hh:mm:ss.t: The time-stamp in hours, minutes, seconds and tenths of a second.

Recovery data of (**** ****.* **.*.*) indicates that DFSMSdss could not obtain the recovery data.

System action: The data set is restored. The return code is 4.

Operator response: None.

Application Programmer Response: For forward recovery, the data set must be restored as an SMS-managed data set. Select an SMS-managed target volume or modify the ACS routine to direct the allocation to an SMS-managed target volume.

---

**ADR727E**  
(ttftp-mmddyy), DATA SET dsname (IN CATALOG catalog_name) WAS NOT PROCESSED BECAUSE IT IS SMS-MANAGED BUT IT IS NOT CATALOGED IN THE STANDARD ORDER OF SEARCH

Explanation: The data set, which is SMS-managed, was not selected because it was found to be cataloged outside the standard order of search.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Recatalog the data set in the standard order of search and rerun the job.

Source: DFSMSdss

---

**ADR728E**  
(ttftp-mmddyy), THE DUMPED VERSION OF DATA SET dsname IS NOT USEABLE - BACKUP-WHILE-OPEN STATUS IS

Explanation: Either the Backup-While-Open (BWO) status or the data set was changed while the data set was being dumped.

For example, a CI or CA split have occurred, or the data set have been extended. The version of the data set on the dump data set (tape or DASD) is not usable.

A status of "***" indicates that DFSMSdss could not obtain the BWO status bits at the end of the dump. See Appendix B, "Data Integrity—Serialization", in [z/OS DFSMSdss Storage Administration](https://www.ibm.com) for more details about the BWO status indicators.

System action: The return code is 8. Processing continues with the next data set.

Operator response: Rerun the dump when the data set becomes available.

Application Programmer Response: None.

---

**ADR729E**  
(ttftp-mmddyy), UNABLE TO ALLOCATE SUFFICIENT SPACE TO PROCESS DATA SET dsname. IT CANNOT BE COPIED/RESTORED

Explanation: DFSMSdss is unable to allocate sufficient space to contain the data set.

System action: The data set is not copied or restored. The return code is 8.

Operator response: None.

Application Programmer Response: If possible, pre-allocate the target data set with the appropriate amount of space. Otherwise, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

---

**ADR730W**  
(ttftp-mmddyy), CLUSTER cluster_name IS OPEN

Explanation: The specified VSAM cluster is in open-for-update status. This indicate that the data set is truly open for update or that it was not closed properly.
This condition does not prevent the data set from being processed.

If the function this message was issued against was either a data set dump or data set copy, the cluster will be backed up or copied. In addition, if the source was not in the process of being updated and DELETE was specified, the source will be deleted.

Note: The data set be unusable if the source was in the process of being updated.

If the function this message was issued against was data set restore, the backup copy being restored was open at the time of dump. The restored data set or not be usable.

System action: The cluster will be dumped, copied, or restored if it is selected. The return code is 4.

Operator response: None.

Application Programmer Response: For dump or copy, close the cluster and rerun the job if a complete copy is necessary. For restore, use the Access Method Services VERIFY or EXAMINE commands to ensure that the cluster is usable.

Source: DFSMSdss

ADR731W  (ttt-mmmmmm(yy), THE SIZE OF THE BLOCK OF DATA ACTUALLY READ, nnnn1 BYTES, IS NOT A MULTIPLE OF LRECL, nnnn2. DATA SET dsname IS PROCESSED, BUT REBLOCKING IS TERMINATED

Explanation: During a DFSMSdss data set COPY or RESTORE with REBLOCK specified, or when reblocking has been automatically invoked because the source and target block sizes differ, an inconsistency was detected between the size of a block of data actually read from the user’s data set (nnnn1) and the LRECL (nnnn2) obtained from the VTOC entry. For a data set with RECFM=FB to be legitimate, all blocks of data in the data set must be an integer multiple of the LRECL. All blocks do not have to be the same length, but they must all be an integer multiple of the LRECL. One or more blocks of data in the data set named in the message does not meet this criteria.

System action: The data set is processed, but reblock processing is terminated starting with the current block. The return code is 4.

Operator response: None.

Application Programmer Response: Inspect the data set for any LRECL anomalies, and correct any that you find. Retry without specifying REBLOCK, or ensure that the target block size is the same as the source.

Source: DFSMSdss

ADR732E  (ttt-mmmmmm(yy)) DATA SET dsname ON VOLUME volume_serial_number WAS NOT SELECTED BECAUSE IT WAS NOT CATALOGED

Explanation: The VSAM data set specified could not be processed for one or more of the following reasons:

- The data set was not cataloged when the job was run.
- There is no catalog entry for the data set, or one of the components of the data set resides on a volume that is not in the catalog volume list for the component.
- If SELECTMULTI(FIRST) or SELECTMULTI(ANY) was specified, an uncataloged data set was encountered on a volume specified by LOGINDDNAME, LOGINDYNAM, LOGDDNAME, or LOGDYNAM. However, there is a cataloged data set with a duplicate name residing on another volume.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Inspect the catalog for the entry of the VSAM data set listed in the message. If a volume serial number is listed in the message, verify that the number is also listed in the catalog entry for the data set. Correct the corrupted catalog, and use IDCAMS to recatalog the VSAM data set if no catalog entry is found.

Source: DFSMSdss

ADR733I  (ttt-mmmmmm(yy)), DATA SET dsname DOES NOT HAVE A RECORD FORMAT OF FIXED OR FIXED BLOCK | HAS A STANDARD USER LABEL. RELATIVE BLOCK ADDRESS PROCESSING WILL NOT BE USED

Explanation: The keyword RELBLOCKADDRESS was specified, but the data set did not have a record format of fixed or fixed block, or the data set had a standard user label. The data set cannot be processed using relative block address.

System action: Processing continues without the use of relative block address.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss
ADR734I • ADR735W

ADR734I  (ttt)-mmmm(yy), date time
CONCURRENT COPY INITIALIZATION [UN]SUCCESSFUL FOR (VOLUME volume_serial_number | cc_data_sets OF selected_data_sets SELECTED DATA SETS), [SERIALIZATION FOR THIS DATA IS RELEASED IF DFSMSdss HELD IT:] THE INTERMEDIATE RETURN CODE IS return_code

Explanation: The initialization of the concurrent copy session has completed. If the initialization was successful, serialization of the data being dumped or copied with concurrent copy is no longer necessary and it has been released (if DFSMSdss held it). The data is now available for update activity without affecting the dump or copy operation already in progress.

If the concurrent copy initialization was unsuccessful or cc_data_sets is less than selected_data_sets, this message is preceded by one or more ADR735W or ADR737W messages indicating what data was not successfully initialized into the concurrent copy session and why. If you are doing a logical data set operation, this message is also preceded by message ADR801I indicating the number of data sets that passed filtering and are therefore selected for further processing. The return code for this task (ttt) up to this point is return_code. If there were any warning or error messages before this message, the intermediate return code is 4 or 8, respectively.

System action: Processing continues.

Operator response: None.

Application Programmer Response: None.

ADR735W  (ttt)-mmmm(yy), date time USE OF CONCURRENT COPY FAILED [FOR DATA SET dsname ON] VOLUME volume_serial_number, reason_code. SERIALIZATION WILL BE HELD AND CONCURRENT COPY WILL NOT BE USED. DIAGNOSTIC INFORMATION: sdm_rc-sdm_rsn[-reason_code_modifier] sense_data

Explanation: The initialization of the concurrent copy function did not complete successfully for the specified data set or volume. Any serialization obtained by DFSMSdss on the data will be held. The initialization failure is described by reason code, (reason_code):

1 Communications between DFSMSdss and the system data mover function could not be established because the real addresses of one or more UCBs were not available. See the previously issued message ADR821W for more information.

2 The data being dumped or copied does not reside on hardware that supports concurrent copy or SnapShot.

3 The data being dumped or copied does not reside on hardware that supports cache-based concurrent copy.

4 The control unit limit of concurrent copy sessions has already been reached, or the control unit cannot support this operation.

5 The data being dumped or copied does not reside on hardware that supports virtual concurrent copy.

6 The limit of devices participating in the concurrent copy session that are attached to a given control unit has already been reached.

8 The host limit of concurrent copy sessions has already been reached.

10 The system data mover is not available.

12 Concurrent copy or SnapShot initialization for the PDSE or HFS failed. This could have been caused by the data set being extended multiple times during the concurrent copy or SnapShot initialization.

14 Concurrent copy or SnapShot cannot be used because of an error condition. The system data mover return code (sdm_rc) and reason code (sdm_rsn) are supplied as diagnostic aids. For explanations of the codes, see “System data mover return and reason codes” on page 190. DFSMSdss provides these codes in hexadecimal format.

16 SnapShot software support is not available.

The operation will continue as if concurrent copy was not requested for the specified data set or volume. Serialization will be held until the operation is complete.

System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: If you want the concurrent copy feature to be used, you correct the problem by doing the following:

1 Resolve the UCB problem and rerun the job.

2 Ensure that all of the data being dumped or copied resides on hardware that supports concurrent copy or SnapShot.

3 If CONCURRENT(CACHEREQ) or CONCURRENT(CACHEPREF) was specified, ensure that all of the data set being dumped or copied resides on hardware that supports cache-based concurrent copy.

4 If the control unit can support the operation, run the job when the system is less active. Otherwise, ensure that the control unit supports concurrent copy.
6 Reduce the amount of data to be processed in the concurrent copy session, or spread it out across multiple control units.

8 Run the job at a later time when the system is less active.

10 Ensure that the system data mover initializes properly when the system is brought up.

12 Rerun the job at a later time. If the job still fails with the same error message, search problem reporting databases for a fix for the problem. If no fix exists, obtain an ABEND user dump on this message and contact the IBM Support Center.

14 See the “System data mover return and reason codes” on page 190 manual for an explanation of return and reason codes.

16 Install support for SnapShot.

Source: DFSMSdss

Routing Code: 2,4

Descriptor Code: 6

ADR736E  

(tt)-mmmm(yy), AN ERROR CONDITION WAS DETECTED BY THE SYSTEM DATA MOVER. DIAGNOSTIC INFORMATION: return_code-reason_code[-reason_code_modifier]

Explanation: DFSMSdss cannot complete the requested concurrent copy or SnapShot function because of an error condition detected by the System Data Mover. The System Data Mover return code (return_code) and reason code (reason_code) are supplied as diagnostic aids.

System action: Concurrent copy or SnapShot is not used to perform the requested function.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR739E  

ttt)-mmmm(yy), [pre-allocateD | SOURCE] DATA SET cluster_name [IN CATALOG catalog_name] WAS NOT [PROCESSED | UNCATALOGED | USABLE] BECAUSE IT WAS NOT COMPLETELY RECALLED

Explanation: Either the data set was being recalled or a previous recall did not successfully complete. When TYPRUN=NORUN is requested, ADR739E is issued for a DUMP or COPY source data set, but not for a pre-allocated target of a COPY or RESTORE. An incompletely recalled VSAM data set only be detected when it is accessed in the standard order of search.

System action: One of the following occurred:

- NOT PROCESSED means the source data set was not copied, dumped, or released.

This data set will be processed as if concurrent copy were not requested.

System action: The data set is not processed using concurrent copy. The return code is 4.

Operator response: None.

Application Programmer Response: You correct the problem by:

4 Excluding the data set from the concurrent copy operation.

Source: DFSMSdss

ADR737E  

CONCURRENT COPY OPERATION IN PROGRESS FAILED, return_code-reason_code[-reason_code_modifier], sense

Explanation: The concurrent copy operation in process has failed. The System data mover return code (return_code) and reason code (reason_code) and the hardware sense data (sense) are supplied as diagnostic aids. For explanations of the system data mover codes, see “System data mover return and reason codes” on page 190. DFSMSdss provides these codes in hexadecimal format.

System action: All data being dumped or copied with concurrent copy is bypassed. Processing continues for all data being dumped or copied without concurrent copy. The return code is 8.

Operator response: None.

Application Programmer Response: Take the appropriate action to correct the problem and resubmit the job.

Source: DFSMSdss

ADR739W  

(tt)-mmmm(yy), CONCURRENT COPY IS NOT SUPPORTED FOR DATA SET dname, reason_code. THE DATA SET WILL NOT BE PROCESSED USING CONCURRENT COPY

Explanation: The data set named cannot be supported by the concurrent copy function for the following reason, reason_code:

4 The data set must be copied with a utility.
• NOT USABLE means the pre-allocated target data set was found to be unusable because it was incompletely recalled. The COPY or RESTORE of the cluster was not done.

• NOT UNCATALOGED means the pre-allocated target data set could not be uncataloged when the DELETECATALOGENTRY keyword was specified. The RESTORE of the cluster was not done. The system also issues message ADR497E with further details.

The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Issue the HRECALL command for the data set and rerun the job when the data set becomes available.

**Source:** DFSMSdss

---

### ADR740W

```
(yyy-mm-dd), DATA SET dsname IN CATALOG catalog_name HAS BEEN MIGRATED AND IS NO LONGER AVAILABLE FOR SELECTION
```

**Explanation:** The data set was migrated after the DFSMSdss step started. The data set was no longer available to be processed. The system issues this message for data sets that would have been excluded with BY filtering, but BY filtering was not performed because DFSMSdss could not locate the VTOC entry for the data set because it was migrated.

**System action:** The data set is not processed. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** If the data set needs to be processed, recall the data set and rerun the job.

**Source:** DFSMSdss

---

### ADR741E

```
(yyy-mm-dd), AN UNEXPECTED VALUE WAS RETURNED FROM SYSTEM CATALOG SERVICES FOR DATA SET dsname
```

**Explanation:** During an attempt to obtain data set information, a zero value was returned from the system catalog services for an attribute of the specified data set.

**System action:** The data set was not processed. Processing continues with the next data set. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdss

---

### ADR742E

```
(yyy-mm-dd), CLUSTER cluster_name [IN CATALOG catalog_name] WAS NOT PROCESSED BECAUSE IT HAS AN ALLOCATION INCONSISTENCY
```

**Explanation:** The VSAM data set was not processed because either its primary or its secondary allocation amount is not an even multiple of its tracks per control area (tracks/CA). The data set contain unused tracks.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the allocation inconsistency and rerun the job.

**Source:** DFSMSdss

---

### ADR743E

```
(yyy-mm-dd), PROCESSING FOR DATA SET dsname IS TERMINATED DUE TO INSUFFICIENT DIRECTORY SPACE
```

**Explanation:** DFSMSdss cannot process the data set, because there is no room left in the directory to add member information.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** The data set does not conform to standard conventions for a PDS. If the data set must be moved as is, rerun the job by specifying the data set in the NOPACKING keyword list and providing at least one target volume of a like device as the volume on which the data set resides. Use the DFSMSdss PRINT command to print the data set in order to determine the cause of the failure. Review other informational or attention messages that precede this message.

**Source:** DFSMSdss

---

### ADR744W

```
(yyy-mm-dd), NO VALID MEMBERS WERE FOUND FOR PDS dsname. ONLY THE DIRECTORY WILL BE UPDATED
```

**Explanation:** No members were found in the PDS or all members found had invalid starting TTRs. This message is precede by message ADR745W for each member with an invalid start TTR.

**System action:** Only the directory of the data set is processed. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** For a data set with no members, no user action is required. For a data set with all invalid member start TTRs, see message ADR745W for direction.
ADR745W  \((ttt-mmnnn(yy)), \text{STARTING TTR} \ ttttrr \ \text{FOR MEMBER} \ \text{member\_name} \ \text{IN PDS} \ \text{dsname} \ \text{IS INVALID}. \ \text{REASON CODE IS} \ reason\_code\)

**Explanation:** The starting TTR of the named member is invalid for one of the following reasons \((reason\_code)\):

- **04** The TTR points to a record before the end of the directory.
- **08** The TTR points to a record after the end of the data set as determined by the pointer to the last used block in the VTOC entry of the data set.
- **12** The record portion of the TTR points to a block after the last valid block on the indicated track.

**System action:** The member data is not processed. The directory entry for the member is transferred unchanged to the target data set. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** The data set does not conform to standard conventions for a PDS. If the data set must be moved as is, rerun the job by specifying the data set in the NOPACKING keyword list and by providing at least one target volume of a like device as the volume on which the data set resides.

**Source:** DFSMSdss

ADR746W  \((ttt-mmnnn(yy)), \text{END OF DIRECTORY RECORD MISSING FOR PDS} \ \text{dsname}\)

**Explanation:** The PDS specified does not have an end-of-file (EOF) record for the directory or the EOF is not in the correct place.

**System action:** An EOF record is supplied for the directory if the NOPACKING keyword is not specified. Processing continues for this data set. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** The data set does not conform to standard conventions for a PDS. If the data set must be moved as is, rerun the job by specifying the data set in the NOPACKING keyword list and by providing at least one target volume of a like device as the volume on which the data set resides.

**Source:** DFSMSdss

ADR747W  \((ttt-mmnnn(yy)), \text{HIGH MEMBER ENTRY MISSING FOR PDS} \ \text{dsname}\)

**Explanation:** The PDS specified does not have a high member entry \((\text{member\_name} = \text{all X'FF's})\). This entry signifies the position of the last active member in the directory.

**System action:** The high member entry is supplied for the directory if the NOPACKING keyword is not used. Processing continues for this data set. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** The data set does not conform to standard conventions for a PDS. If the data set must be moved as is, rerun the job by specifying the data set in the NOPACKING keyword list and by providing at least one target volume of a like device as the volume on which the data set resides.

**Source:** DFSMSdss
ADR749W  (ttt-mmddyy), END OF FILE RECORD MISSING FOR MEMBER member_name OF PDS dsname AT TTR ttttr

Explanation: During the copy or restore of a PDS, an expected end-of-file (EOF) record for the member specified was not found before the starting TTR of the next member. The directory shows the next member should start at the given TTR.

System action: An end-of-file (EOF) record is supplied for the member at the TTR given. Processing continues with the next member in the data set. The return code is 4.

Operator response: None.

Application Programmer Response: The data set does not conform to standard conventions for a PDS and contain additional errors that cannot be detected by DFSMSdss. If the data set must be moved as is, rerun the job by specifying the data set in the NOPACKING keyword list and by providing at least one target volume of a like device as the volume on which the data set resides.

Source: DFSMSdss

ADR750E  (ttt-mmddyy), PROCESSING FOR DATA SET dsname IS TERMINATED TO PREVENT DELETION OF THE SOURCE DATA SET

Explanation: An invalid condition or structure was detected in the data set during processing. The DELETE keyword was also specified. In order to preserve the source data set and preclude possible data integrity problems, DFSMSdss ends the processing after data movement and deletes the target data set. The invalid condition might be:

- Invalid TTRs detected in the directory or member entry.
- Missing end-of-file (EOF) record for a member.

System action: The specified data set was not copied, and the return code is set to 8. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: Correct the invalid conditions to have the PDS copied.

Source: DFSMSdss

ADR751E  (ttt-mmddyy), (OPEN | WRITE | CLOSE) FAILED WITH RETURN CODE (return_code) FOR data_set IN AN ATTEMPT TO EXTEND THE DATA SET

Explanation: DFSMSdss cannot extend the data because the OPEN, WRITE, or CLOSE failed for the data set.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: See z/OS DFSMS Macro Instructions for Data Sets for an explanation of return codes.

Source: DFSMSdss

ADR752E  (ttt-mmddyy), (OPEN | WRITE | CLOSE) ABENDED WITH ABEND CODE (abend_code) FOR data_set IN AN ATTEMPT TO EXTEND THE DATA SET

Explanation: DFSMSdss cannot extend the data because the OPEN, WRITE, or CLOSE for the data set abnormally ended.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR753E  (ttt-mmddyy), UNABLE TO ESTABLISH ESTAE EXIT

Explanation: DFSMSdss cannot register an ESTAE exit to the system and, therefore, cannot process abends.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR754E  (ttt-mmddyy), DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number CANNOT BE PROCESSED - UNABLE TO CHANGE BACKUP-WHILE-OPEN STATUS FROM nnn1 TO nnn2

Explanation: An error occurred while changing the Backup-While-Open (BWO) status of the target data set to nnn2. See Appendix B, “Data Integrity—Serialization”, in z/OS DFSMSdfp Storage Administration for more details about the Backup-While-Open (BWO) status indicators.

System action: The return code is 8. Processing continues with the next data set.
Operator response: Rerun the function when the data set becomes available.

Application Programmer Response: Correct the condition that is causing the alter Backup-While-Open (BWO) status error.

Source: DFSMSdss

ADR755W (ttt-mmmmm(yy), SOURCE DATA SET source_dsname WAS (GENERICALLY PROTECTED | RACF-INDICATED). THE TARGET DATA SET target_dsname IS GENERICALLY PROTECTED | IS NOT PROTECTED BY ANY PROFILE | IS RACF INDICATED AND BE INACCESSIBLE)

Explanation: For a logical operation, the level of protection for the target data set, (target_dsname) compared to the source data set (source_dsname), indicates that action on the part of the owner of the data set or a security administrator be required to ensure that the target data set is properly protected and accessible.

System action: Processing continues for the specified data set. The return code is 4.

Operator response: None.

Application Programmer Response: Contact your security administrator.

Source: DFSMSdss

ADR756E (ttt-mmmmm(yy), SYS1 DATA SET dsname NOT COPIED BECAUSE PROCESS(SYS1) NOT SPECIFIED

Explanation: The SYS1 data set was not copied because PROCESS(SYS1) was not specified and either DELETE or UNCATALOG were specified.

Note: PROCESS(SYS1) does not lift the processing restrictions for VTOCIXs and VVDSs.

System action: Processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: Specify PROCESS(SYS1) to uncatalog or delete the data set.

Source: DFSMSdss

ADR757E (ttt-mmmmm(yy), DISCRETE PROFILE CREATION FAILED FOR DATA SET dsname, ON VOLUME volume_serial_number THE DATA SET WAS NOT COPIED, return_code1-return_code2,reason_code

Explanation: RACF is unable to define a discrete profile for the target data set. The target data set is deleted and the source data set is left in its original condition. Error codes return_code1-return_code2,reason_code are hexadecimal values which indicate why RACF is unable to complete the define request. return_code1 is the SAF return code, and return_code2,reason_code are the RACF return and reason codes. For descriptions of the error codes, see the return code information under RACROUTE REQUEST=DEFINE in the z/OS Security Server RACROUTE Macro Reference.

System action: The target data set is deleted. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the error indicated by the error codes and rerun the job. This error can occur if the data set is RACF indicated by a discrete profile. Define a discrete profile with the NOSET keyword.

Source: DFSMSdss

ADR758E (ttt-mmmmm(yy), VOLUME CHECKING FAILED FOR DATA SET dsname {IN CATALOG catalog_name}, reason_code

Explanation: The data set was not processed for one of the following reasons (reason_code):

1 The data set was extended onto another volume after the DFSMSdss step started. As a result, the volume information obtained by DFSMSdss was no longer accurate.

2 The data set no longer resides on the volume or volumes it resided on when the DFSMSdss step started. As a result, the volume information obtained by DFSMSdss was no longer accurate.

3 The catalog entry for the data set could not be located. The data set have been uncataloged or moved to a different catalog after the DFSMSdss step started.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Ensure that the data set is not being simultaneously processed by another job, and rerun the job.

Source: DFSMSdss

ADR759W (ttt-mmmmm(yy), DISCRETE PROFILE CREATION FAILED FOR DATA SET dsname, ON VOLUME volume_serial_number. THE DATA SET WAS COPIED OR RESTORED AND IT NOT BE ACCESSIBLE, return_code1-return_code2,reason_code

Chapter 3. ADR messages 133
ADR760W (ttt-mmmmm(yy)), DATA SET dsname WAS NOT DUMPED WITH SPHERE KEYWORD SPECIFIED

Explanation: An attempt to restore a data set at the sphere level that was not dumped at the sphere level failed.

System action: Only the data set will be restored (no other sphere information will be restored). The return code is 4.

Operator response: None.

Application Programmer Response: Rerun the job without specifying SPHERE.

Source: DFSMSdss

ADR761W (ttt-mmmmm(yy)), CLUSTER cluster_name IN CATALOG catalog_name WAS RESTORED WITHOUT SPHERE INFORMATION

Explanation: DFSMSdss tried to restore a VSAM cluster that was dumped as part of a VSAM sphere. The cluster will be restored, but no relationship information will be created. If the cluster is a base cluster, then any existing alternate indexes might have to be rebuilt. Likewise, if the cluster is an alternate index, it might not properly reflect the current state of its base cluster.

System action: The data set is restored. The return code is 4.

Operator response: None.

Application Programmer Response: If the intent was to restore the entire sphere, rerun the job, specifying the SPHERE keyword.

Source: DFSMSdss

ADR762W (ttt-mmmmm(yy)), AIX aix_name OF BASE CLUSTER cluster_name1 ALREADY EXISTS RELATED TO BASE CLUSTER cluster_name2 IN CATALOG catalog_name

Explanation: During DFSMSdss sphere processing in which REPLACE or REPLACEUNCONDITIONAL was specified but the pre-allocated target was not, an alternate index with the same name was found in the target catalog. This alternate index is related to a base cluster that is different from the source base cluster.

System action: The base cluster was successfully processed, but the specified AIX was not processed. Processing continues with the next AIX. The return code is 4.

Operator response: None.

Application Programmer Response: Use access method services commands to DEFINE the AIX with a different name, DEFINE a path, and build (BLDINDEX) the alternate index.

Source: DFSMSdss

ADR763E (ttt-mmmmm(yy)), DATA SETS IN SPHERE OF BASE CLUSTER cluster_name1 [WITH NEWNAME cluster_name2] WERE NOT ALL RENAMED

Explanation: When copying a sphere without specifying DELETE or RECATALOG, you must rename all parts of the sphere. If the target sphere is to be SMS-managed, the data sets must be renamed even if RECATALOG was specified, because RECATALOG is ignored for SMS-managed data sets.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Do one of the following, then rerun the job:

- Specify the DELETE or RECATALOG keyword.
- Add or change the RENAMEUNCONDITIONAL keyword specification to rename all data sets in the sphere.
- The NEWNAMEUNCONDITIONAL keyword specifies that a source data set should be given a new name during dump processing, whether or not the data set exists with the new name.

Source: DFSMSdss

ADR764E (ttt-mmmmm(yy)), DATA SETS IN SPHERE OF BASE CLUSTER cluster_name1 [WITH NEWNAME cluster_name2] WERE DIRECITED TO MORE THAN ONE CATALOG
Explanation: The data sets in the sphere were directed by the standard order of search to more than one catalog. The VSAM base cluster, data and index components, AIXs, AIX components, and path names of a sphere must all resolve to the same catalog.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Ensure that all data sets in the sphere are directed to the same catalog, using one or more of the following techniques:
• Adding or deleting user catalog aliases
• Renaming the data sets with the RENAME or RENAMEUNCONDITIONAL keyword.
• The NEWNAMEUNCONDITIONAL keyword specifies that a source data set should be given a new name during dump processing, whether or not the data set exists with the new name.

Rerun the job.

Source: DFSMSdss

ADR765W (ttt-cccccccc), SPHERE OF BASE CLUSTER cluster_name IN CATALOG catalog_name IS NOT COMPLETE ON THE DUMP TAPE

Explanation: DFSMSdss sphere processing detected that not all of the sphere components are on the dump tape. DFSMSdss is unable to locate all of the alternate indexes related to the named base cluster on the dump tape because of errors encountered when the sphere was dumped. If the sphere was pre-allocated, the existing alternate indexes that were not on the dump tape will not reflect the current state of the restored base cluster and will need to be rebuilt. The named catalog is the source catalog of the sphere.

System action: This error is not detected until after the base cluster of the sphere is processed. All alternate indexes on the dump tape are restored, and processing continues with the next data set. The return code is 4.

Operator response: None.

Application Programmer Response: Take the appropriate action:
• For non-pre-allocated data set RESTORE, check the DFSMSdss messages for the AIXs that were restored, use access method services commands to define the missing AIXs, define paths for them, and build (BLDINDEX) the AIXs.
• For pre-allocated data set RESTORE, check the DFSMSdss messages for the AIXs that were restored, and use the access method services command BLDINDEX to rebuild the existing alternate indexes that were not restored.

Source: DFSMSdss

ADR766E (ttt-cccccccc(yy), CLUSTER cluster_name1 [WITH NEWNAME cluster_name2] CANNOT BE MOVED TO (AN SMS I A NONSMS) TARGET BECAUSE IT IS PART OF (AN SMS I A NONSMS) MANAGED SPHERE [IN A DIFFERENT STORAGE GROUP]

Explanation: When DFSMSdss copies with DELETE between SMS and NONSMS or between different storage groups in SMS, all parts of a VSAM sphere must be included. The system might also issue this message if there is an alternate index associated with the base cluster, but there is no path defined for the alternate index.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Do one or more of the following, then rerun the job:
• Specify RENAMEUNCONDITIONAL or RECATALOG instead of DELETE.
• Specify SPHERE to include all parts of the sphere.
• Specify all parts of the sphere in the data set INCLUDE parameter.

If there is no path defined between the base cluster and the alternate index, use access method services to define a path, and then rerun the job.

Source: DFSMSdss

ADR767I (ttt-cccccccc(yy), date time CONCURRENT COPY INITIALIZATION SUCCESSFUL FOR DATA SET dsname [IN CATALOG catalog_name]. [SERIALIZATION IS RELEASED]

Explanation: The initialization of the concurrent copy session has completed for the indicated data set. Therefore, serialization of the data being dumped or copied with concurrent copy is no longer necessary. The data set is now available for update activity without affecting the dump or copy operation already in progress.

System action: Processing continues.

Operator response: Activity on the data set resume.

Application Programmer Response: Activity on the data set resume.

Source: DFSMSdss

ADR768W (ttt-cccccccc), THE FOLLOWING SPHERE(S) COULD NOT BE COMPLETELY PROCESSED DUE TO ERRORS

Explanation: During DFSMSdss sphere processing,
one or more components of a sphere could not be successfully processed. The message lists the status of each piece of the sphere.

System action: If possible, processing continues with the next sphere component for COPY and RESTORE, or the next data set for DUMP. If the command was DUMP and DELETE was specified, no parts of the sphere are deleted. If the command was DUMP, processing for each individual sphere halts if an error was detected with an AIX. The return code is 4.

Operator response: None.

Application Programmer Response: Check other DFSMSdss messages for the components that failed. After correcting the error conditions, run the job again.

Source: DFSMSdss

ADR769E (ttf-mmmmm(yy), PROCESSING OF DATA SET dsname TERMINATED BY UIM EXIT (nn))

Explanation: The indicated User Interaction Module exit nn has ended processing for the named data set before normal completion. If the SPHERE keyword is specified and the named data set is a base cluster, processing for all related AIXs is also ended.

System action: Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR770W (ttf-mmmmm(yy), AIX aix_name RELATED TO BASE CLUSTER cluster_name WAS NOT TERMINATED AS REQUESTED BY UIM EXIT (nn))

Explanation: The indicated User Interaction Module exit (nn) requested that processing for the named alternate index be ended. The request was denied because the SPHERE keyword was specified and the alternate index is related to the named base cluster that was selected for processing.

System action: Processing continues for the named alternate index. The return code is 4.

Operator response: None.

Application Programmer Response: Take one or more of the following actions:
- Copy only the base cluster by omitting the SPHERE keyword.
- Change the UIM exit so that termination is not attempted for the alternate index.

Source: DFSMSdss

ADR771W (ttf-mmmmm(yy), A DISCRETE PROFILE FOR TARGET DATA SET dsname, ON VOLUME volume_serial_number, (IN CATALOG catalog_name) ALREADY EXISTS)

Explanation: RACF is unable to define a discrete profile for the target data set (dsname) because one is already defined to RACF. The RACF-indicator has been turned on, so the existing discrete profile now protects the target data set.

System action: The target data set is RACF-indicated and the existing discrete profile now protects the data set. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR772W (ttf-mmmmm(yy), UIM EXIT (nn) IS NOT AUTHORIZED TO Bypass SECURITY PROCESSING FOR {DATA SET dsname | VOLUME volser})

Explanation: The indicated User Interaction Module exit (nn) attempted to bypass RACF and security processing for the named data set or volume. The request was denied because the application program was not authorized to bypass security because PASS was specified in the PPT statement in the SCHEDxx parmlib member.

System action: Processing continues with normal security processing for the data set or volume. The return code is 4.

Operator response: None.

Application Programmer Response: Alter the application so that it is authorized to bypass security processing by ensuring that NOPASS is specified, or by changing the UIM exit so that it does not attempt to bypass security processing.

Source: DFSMSdss

ADR773E (ttf-mmmmm(yy), pre-allocated TARGET DATA SET dsname (IN CATALOG catalog_name) ON VOLUME volume_serial_number WAS NOT SCRATCHED AND REALLOCATED AS THE DATA SET WAS NOT SERIALIZED, reason_code)

Explanation: DFSMSdss did not delete and reallocate a pre-allocated target data set because DFSMSdss did not serialize the target data set. DFSMSdss needed to delete and reallocate the pre-allocated target because one or more target data set attributes did not match the source. The reason code, (reason_code) is as follows:
The target KSDS on an unlike device was not reusable.

The CI size of the target did not match the source.

The IMBED attribute of the target did not match the source.

The KEY length of the target did not match the source.

The record length of the target did not match the source.

The REPLICATE attribute of the target did not match the source.

The SPANNED attribute of the target did not match the source.

The size of the target data set was smaller than the size of the source data set.

The source data set is empty.

DFSMSdss probably bypassed serialization because UIM exit 22 requested that serialization be bypassed for the data set.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the problem as indicated by the reason code (reason_code) and reprocess the data set:

04 If the source PDSE is to be copied to the pre-allocated target PDS, specify CONVERT with the PDS subkeyword; otherwise, delete or rename the pre-allocated target PDS.

08 If the source PDS is to be copied to the pre-allocated target PDSE, specify CONVERT with the PDSE subkeyword; otherwise, delete or rename the pre-allocated target PDSE.

12 If the PDSE is to be copied to a non-SMS-managed volume, specify CONVERT with the PDS subkeyword; otherwise, specify an SMS-managed target volume, or modify the ACS routine to direct the target allocation to an SMS-managed volume.

Source: DFSMSdss

ADR778E (xxx)-mmmmm(yy), DATA SET dsname WAS NOT SELECTED BECAUSE THE DATA SET TYPE IS NOT SUPPORTED IN THIS RELEASE, reason_code

Explanation: The data set was not selected for processing because it is a type not supported in this release. The reason_code identifies the data set type:

1 Extended sequential
2 Compressible extended sequential
3 HFS file
4 Extended format VSAM
5 Data set with extended attributes
6 Multivolume extended sequential
7 Extended addressable VSAM data set
8 Integrated catalog facility tape volume catalog
9 VSAM data set with RLS information
10 Extended format multistriped VSAM
11 Extended format non-keyed VSAM
12 Extended addressable non-keyed VSAM
13 Multivolume HFS
14 Non-SMS PDSE or HFS data set
15 Tailored compressible extended-sequential data set
16 Indexed sequential data set
17 The source data set is a Large Format Physical Sequential data set.

System action: Processing of the data set ends. The return code is 8.
Operator response: None.
Application Programmer Response: Process the data set using a level of DFSMS that supports the data set type and attributes.
Source: DFSMSdss

ADR779E (ttt-mmmmm(yy)), DATA SET dsname IS AN LDS WITH DUMMY BLOCKS. IT WILL NOT BE PROCESSED

Explanation: Dummy blocks were detected during logical COPY, DUMP, or RESTORE processing of a VSAM linear data set (LDS), dsname. A dummy block condition exists when there are excess blocks at the end of a control area (CA). DFSMSdss does not support logical processing of VSAM linear data sets with dummy blocks.

System action: Processing continues for other data sets. The return code is 8.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR780I (ttt-mmmmm(yy)), THE INPUT DUMP DATA SET dsname IS IN (FULL VOLUME | TRACKS | TRACKS (CPVOLUME) | PHYSICAL DATA SET | LOGICAL DATA SET) FORMAT AND WAS CREATED BY product_name VERSION version_number RELEASE release_number MODIFICATION LEVEL mod_number [ON yyyy:ddd hh:mm:ss]

Explanation: The dump data set now being processed was created using the indicated format by the indicated level of the indicated product. If available, the time the dump was created is also included in Julian date and time format.
System action: Processing continues.
Operator response: None.
Application Programmer Response: None. For information about logical and physical processing see the z/OS DFSMSdss Storage Administration
Source: DFSMSdss

ADR781I (ttt-mmmmm(yy)), DATA SET dsname [IN CATALOG catalog_name] HAS AN UNDEFINED DSORG. TRACK LEVEL I/O WILL BE USED TO PROCESS THE DATA SET TO AN UNLIKE DEVICE

Explanation: The data set has an undefined data set organization and is being moved to an unlike target device. Track image data movement will be used. This results in an exact track-for-track image of the source data set on the target volume.
System action: Processing continues.
Operator response: None.
Application Programmer Response: None.
Source: DFSMSdss

ADR782W (ttt-mmmmm(yy)), DATA SET dsname HAS AN INVALID DSORG. VSAM PROCESSING IS BYPASSED

Explanation: The VVDS data set has an invalid data set organization, and VSAM processing will not be performed.
System action: Processing continues. The return code is 4.
Operator response: None.
Source: DFSMSdss

ADR783W (ttt-mmmmm(yy)), NO VVR FOR COMPONENT dsname IN VTOC OF VOLUME volume_serial_number

Explanation: A VTOC entry was found to have no matching VVR. Therefore this component is a VSAM orphan.
System action: Processing continues on the next data set. The return code is 4.
Operator response: None.
Application Programmer Response: Delete the orphan VSAM data sets, or recover them from a previous backup.
Source: DFSMSdss

ADR784E (ttt-mmmmm(yy)), DATA SET dsname (IN CATALOG catalog_name) CANNOT BE PROCESSED BECAUSE IT WAS SPECIFIED IN BOTH TTRADDRESS AND RELBLOCKADDRESS

Explanation: The direct data set named in the message is specified in both the TTRADDRESS and the RELBLOCKADDRESS keyword subparameter filtering
lists. The processing specified by these keywords conflict.

**System action:** The data set is not processed, and processing continues with the next data set. The return code is set to 8.

**Operator response:** None.

**Application Programmer Response:** Change the filtering criteria specified in TTTRADDRESS or RELBLOCKADDRESS, or specify only one of the keywords. Rerun the job.

**Source:** DFSMSdss

---

**ADR785E** *(ttt)-mmmm(yy)*, AN ENQUEUE LOCKOUT CONDITION WAS DETECTED FOR DATA SET dsname (IN CATALOG catalog_name)

**Explanation:** During a DFSMSdss job, an enqueue lockout condition was detected while processing the named data set. This can occur when DFSMSdss has done a reserve on the VTOC of a volume and then performs a catalog management function. A second job have exclusive control of the catalog that DFSMSdss needs while DFSMSdss has control of the VTOC that the second job requires. In addition to the above information, if a password request from the system is not responded to within the 90 second timeframe criterion used to detect a lockout condition, the request is canceled and message ADR785E is issued for the data set.

**System action:** The data set is not processed. Processing continues with the next data set. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Wait for the completing job to finish processing, then resubmit the DFSMSdss job. See the [Chapter 3. ADR messages](#) “Appendix D. DFSMSdss Patch Area” for information about altering the duration of the timeout (X'0A').

**Source:** DFSMSdss

---

**ADR786W** *(ttt)-mmmm(yy)*, ERROR DETECTED IN SPANNED RECORD AT RBA relative_byte_address IN CLUSTER cluster_name ON VOLUME volume_serial_number, REASON reason_code

**Explanation:** An error was detected while processing a spanned record. An RBA value of ‘***’ indicates that the RBA is not applicable or that the RBA is not available at the time the error was detected.

*Volume_serial_number* is the volume serial number for the source volume. A volume serial number of ‘******’ indicates that the number is unknown. The possible reason codes are:

1. An unspanned record was found when a spanned record segment was expected. This is similar to the error described by EXAMINE message IDC11730I.
2. Spanned record segment sequence error. This is similar to the error described by EXAMINE message IDC11739I. An intermediate or last segment was expected, but the first segment was found.
3. Spanned record segment sequence error. This is similar to the error described by EXAMINE message IDC11739I. The first segment was expected, but the last segment was found.
4. Spanned record segment sequence error. This is similar to the error described by EXAMINE message IDC11739I. The first segment was expected, but an intermediate segment was found.
5. Spanned record update number error. This is similar to the error described by EXAMINE message IDC11731I. The update number for the last segment was not the same as the update number for the segment(s) processed previously.
6. Spanned record update number error. This is similar to the error described by EXAMINE message IDC11731I. The update number for an intermediate segment was not the same as the update number for the segment(s) processed previously.
7. Spanned record segment sequence error. The end of the data CA has been reached but the last segment of a spanned record has not been found.

**System action:** Processing of this data set continues. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** For logical data set dump, run IDCAMS EXAMINE against the VSAM cluster in question. Take appropriate action to correct the problem and resubmit the job. For logical data set restore, run IDCAMS EXAMINE on the indicated cluster.

**Note:** The spanned record error condition have been lost when the record was written to the target cluster and IDCAMS EXAMINE not reveal any symptoms. Manually check the cluster to determine if data has been lost; if so, you have to recover the cluster from a previous backup version.

**Source:** DFSMSdss

---
ADR787E  (ttt-mm-yy), STRUCTURAL ERROR DETECTED AT RBA relative_byte_address IN CLUSTER cluster_name ON VOLUME volume_serial_number, REASON reason_code

Explanation: An error was detected during the logical dump processing of a VSAM indexed data set. Volume_serial_number is the volume serial number for the source volume. A volume serial number of ‘******’ indicates that the number is unknown. An RBA value of ‘***’ indicates that the RBA is not applicable or that the RBA is not available at the time the error was detected.

The possible reason codes are:

11  A spanned record was found, but VVR indicates that spanned records are not allowed.

12  Index component CI size is invalid. This is similar to the error described by EXAMINE message IDC11760I.

13  The VVR indicates the number of index levels is 0. This is similar to the error described by EXAMINE message IDC11720I.

14  The index component high used relative byte address (RBA) is greater than the high allocated relative byte address (RBA). This is similar to the error described by EXAMINE message IDC11727I.

15  The index component high used relative byte address (RBA) is not a multiple of control interval (CI) size. This is similar to the error described by EXAMINE message IDC11715I.

16  An index control interval (CI) contains a software end-of-file (EOF). This is similar to the error described by EXAMINE message IDC11758I.

17  Index header contains invalid data. This is similar to the error described by EXAMINE message IDC11766I.

18  Index record horizontal pointer points to itself. An index control interval (CI) contains a horizontal pointer specifying the RBA of the control interval itself. This is similar to the error described by EXAMINE message IDC11771I.

19  Invalid length for vertical pointer.

20  Cluster is not eligible to be dumped using the VALIDATE option. The VSAM data set is not indexed.

21  Data component control interval (CI) size is invalid. This is similar to the error described by EXAMINE message IDC11760I.

22  Number of control intervals (CI) per control area (CA) is 0. This is similar to the error described by EXAMINE message IDC11764I.

23  Data component high used relative byte address (RBA) is not equal to the control area (CA) size. For a data set with single level index, the CA size should equal the high used relative byte address (RBA) for the data component. This is similar to the error described by EXAMINE message IDC11718I.

24  Data component high used relative byte address (RBA) is greater than high allocated relative byte address (RBA). This is similar to the error described by EXAMINE message IDC11709I.

25  Data component high used relative byte address (RBA) is not a multiple of the control interval (CI) size. This is similar to the error described by EXAMINE message IDC11710I.

26  Data component high allocated relative byte address (RBA) is not a multiple of the control interval (CI) size. This is similar to the error described by EXAMINE message IDC11712I.

27  Data component high used relative byte address (RBA) is not a multiple of the control area (CA) size. This is similar to the error described by EXAMINE message IDC11765I.

28  Data component key length is greater than the maximum record length. Data component key position or length is invalid. This is similar to the error described by EXAMINE message IDC11761I.

29  Empty control interval (CI) encountered while processing spanned record. This is similar to the error described by EXAMINE message IDC11735I.

30  Software end-of-file (EOF) found in data control interval (CI). This is similar to the error described by EXAMINE message IDC11735I.

31  Horizontal pointer chain loop. This is similar to the error described by EXAMINE message IDC11772I.

32  Data component key sequence error. A key sequence error exists in or between control intervals (CI). This is similar to the error described by EXAMINE message IDC11731I.

33  This reason code also indicate that the free space displacement field for the CI contains a value which is too big.

34  Data component key sequence error. Duplicate consecutive keys found. This is similar to the error described by EXAMINE message IDC11741I.
Sequence set and data control interval (CI) sequence mismatch. This is similar to the error described by EXAMINE message IDC11734I.

The index component high allocated relative byte address (RBA) is not a multiple of control interval (CI) size. This is similar to the error described by EXAMINE message IDC11716I.

The index record contains an invalid index entry.

The data control interval RDF field contains an invalid record length or the record length in RDF field is greater than the maximum record length.

The free space displacement field for the CI contains an erroneous value.

The free space length field for the CI contains an erroneous value.

An empty track is encountered in a data control area (CA) or an index sequence set. See message ADR973E issued before this message for the location of the track reported.

An invalid CI record number was detected. A CI record may be missing.

The system detected a duplicate index entry.

System action: Processing of this data set ends. DFSMSdss processing continues. The return code is 8.

Operator response: None.

Application Programmer Response: If the record count is different from what is expected, determine whether there is any problem with the input data set. If additional information about the data set is required, run IDCAMS EXAMINE against the VSAM cluster in question. In-progress control interval (CI) split generate IDCAMS message IDC11768I. If the dump data set is determined to be unusable, take appropriate action to correct the problem and resubmit the job.

Source: DFSMSdss

ADR788I (ttt-mmmmmm(yy)), PROCESSING COMPLETED FOR CLUSTER cluster_name, record_count RECORD(S) PROCESSED {, REASON reason_code}

Explanation: Processing of the VSAM data set has completed. record_count is the total number of records that are processed for this cluster. DFSMSdss issues this message with DUMP processing and also when the RESTORE record count matches the DUMP count. The reason code is applicable to dump processing. The possible reason codes are:

0  The processing completed successfully.
4  The processing completed. In-progress control interval (CI) splits have been detected and resolved in dump. However, the source data set is not changed.
8  The processing completed. Errors have been detected while processing a spanned record. Message ADR786W accompanies this message.

ADR789W (ttt-mmmmmm(yy)), RESTORE PROCESSING COMPLETED FOR CLUSTER cluster_name, RECORD COUNT DOES NOT MATCH. INPUT RECORD COUNT IS record_count OUTPUT RECORD COUNT IS record_count

Explanation: Restore processing of the data set has completed, but the record count from the input data set does not match the record count from the output data set.

System action: DFSMSdss processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, save the dump data set from which the data set

Source: DFSMSdss
was restored and contact the IBM Support Center for programming support.

Source: DFSMSdss

ADR790W  \(ttt\)-mmmnnn(yy), DATA SET dsname ORGANIZATION IS NOT SUPPORTED IN AN SMS ENVIRONMENT

Explanation: DFSMSdss has detected an invalid SMS data set during a data set COPY or RESTORE operation. DFSMSdss will attempt to allocate the target data set on a non-SMS volume, if one is available, and will continue processing the data set. If a non-SMS volume is not available, DFSMSdss will fail in the allocation. The following types of data sets are not supported by DFSMSdss in an SMS environment:

- Absolute track allocation
- Unmovable data sets
- Direct data sets with OPTCD=A
- Data sets cataloged in more than one catalog
- CVOLs
- VTOCIX/VVDS
- Page/swap data sets
- the VIO data sets

System action: The data set is processed. The return code is 4.

Operator response: None.

Application Programmer Response: If the data set fails during allocation, retry the COPY or RESTORE and supply a non-SMS target volume with the OUTDD or OUTDYNAM keyword.

Source: DFSMSdss

ADR791E  \(ttt\)-mmmnnn(yy), pre-allocated TARGET DATA SET dsname IN CATALOG catalog_name IS INCOMPLETE

Explanation: The pre-allocated target data set in the indicated catalog is incomplete. A part or parts of the data set were not found on the volume pointed to by the catalog entry. The system might issue this message erroneously for non-SMS, non-VSAM data sets with candidate volumes, and for KRDS data sets when OUTDD or OUTDYNAM is specified.

System action: The data set is not processed. Processing continues with the next data set. The return code is 8.

Operator response: None.

Application Programmer Response: Inspect the data set in error, correct any problems, and rerun the job. For non-SMS, non-VSAM data sets with candidate volumes, restore the data set by rerunning the job with the REPLACE or REPLACEUNCONDITIONAL keyword but without the DELETECATALOGENTRY keyword. For KRDS data sets with the OUTDD or OUTDYNAM keyword specified, rerun the job without using OUTDD or OUTDYNAM.

Source: DFSMSdss

ADR792E  \(ttt\)-mmmnnn(yy), DATA SET dsname IS AN INCONSISTENT PDSE AND CANNOT BE RESTORED TO AN UNLIKE DEVICE. IT MUST BE RESTORED TO A unit_type

Explanation: The target volume to which the inconsistent PDSE is restored must be of the same device type as that from which it was dumped \(unit_type\). DFSMSdss cannot restore the data set to a volume of an unlike device type.

System action: The data set is not restored. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: Ensure that the storage group ACS routine selects a storage group containing values of the indicated device type, and that volumes of that device type are available and are selected by the ACS routine.

Source: DFSMSdss

ADR793E  \(ttt\)-mmmnnn(yy), DATA SET dsname ON VOLUME volume_serial_number IS AN INCONSISTENT PDSE AND CANNOT BE \{COPIED | DUMPED | RESTORED\}

Explanation: The data set's PDSE indicators in the VTOC and VVDS do not match. Therefore, the data set is not processed.

System action: The data set is not copied, dumped, or restored. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: For a copy or dump, fix the VVDS or VTOC to reflect whether the data set is a PDSE, and rerun the job. For a restore, see [z/OS DFSMSdss Storage Administration](https://www.ibm.com) under patch area X'12'.

Source: DFSMSdss

ADR794W  \(ttt\)-mmmnnn(yy), DATA SET dsname IS AN INCONSISTENT PDSE AND WILL BE RESTORED AS A \{PDS | PDSE\}

Explanation: The data set being restored is an inconsistent PDSE, and you have indicated to DFSMSdss that the data set is either a PDS or a PDSE. If the data set is a PDSE, you must restore it as a PDSE. If you try to restore it as a PDS, DFSMSdss issues error messages, and the restore fails. If the data set is a PDS, you must restore it as a PDS. If you try to restore it as a PDSE, the restore complete without errors, but the data set will be unusable.

System action: The data set is restored as either a PDS or a PDSE.
Operator response: None.

Application Programmer Response: After the restore, verify that the data set is usable.

Source: DFSMSdss

ADR795E (ttt-wwwwww) (yy), AN UNEXPECTED RETURN CODE (return_code) AND REASON CODE (reason_code) HAS BEEN RECEIVED FROM THE IGWNOTIF MACRO WHILE PROCESSING DATA SET dsname

Explanation: While processing the given PDSE data set, the IGWNOTIF macro was called to invalidate a storage copy of the data set. The failing return and reason codes from the IGWNOTIF macro are listed in hex.

System action: The data set is not processed. The return code is 8. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: See the z/OS DFSMSdfp Diagnosis for an explanation of the listed return and reason codes.

Source: DFSMSdss

ADR796E (ttt-wwwwww) (yy), AN UNEXPECTED RETURN CODE (return_code) AND REASON CODE (reason_code) HAS BEEN RECEIVED FROM THE IGWNOTIF MACRO WHILE PROCESSING VOLUME volume_serial_number

Explanation: When processing the given volume, the IGWNOTIF macro was called to invalidate a storage copy of all PDSE data sets that reside on the specified volume. The failing return and reason codes from the IGWNOTIF macro are listed in hex.

System action: The data set is not processed. The return code is 8.

Operator response: None.

Application Programmer Response: See the z/OS DFSMSdfp Diagnosis for an explanation of the listed return and reason codes.

Source: DFSMSdss

ADR797E (ttt-wwwwww) (yy), CANNOT COPY TRACK 0 WHEN OUTTRACKS IS SPECIFIED

Explanation: Track 0 was selected to be copied during a COPY TRACKS operation, but the OUTTRACKS keyword was also specified.

System action: The job is ended.

ADR798E (ttt-wwwwww) (yy), VVDS EXTENTS DO NOT MATCH VTOC EXTENTS FOR COMPONENT component_name, CLUSTER cluster_name, ON VOLUME volume_serial

Explanation: A mismatch exists between the VTOC and VVDS. Either the number or locations of the extents for this data set as reported in the VVDS do not match the number of locations of extents as reported in the VTOC, or the VVIRF flag is on.

System action: The data set is not dumped.

Operator response: None.

Application Programmer Response: Run access method services DIAGNOSE for the affected data set.

Source: DFSMSdss

ADR799E (ttt-wwwwww) (yy), AN UNEXPECTED ERROR HAS OCCURRED [WHILE PROCESSING {DATA SET dsname | VOLUME volume_serial_number}]

Explanation: DFSMSdss detected an unexpected error during processing. It was possibly an internal error.

System action: If possible, DFSMSdss attempts to continue processing; otherwise, the task ends. The return code is 8.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR801I (ttt-wwwwww) (yy), DATA SET FILTERING IS COMPLETE. selected_data_sets OF total_data_sets DATA SETS WERE SELECTED; serialization_fail FAILED SERIALIZATION AND other_fail FAILED FOR OTHER REASONS

Explanation: The data set filtering is completed. selected_data_sets is the number of data sets that are selected for further processing. No further processing is done on the data sets that are not selected. total_data_sets only reflects data sets that passed all INCLUDE, EXCLUDE, and BY filtering.

serialization_fail is the number of data sets that DFSMSdss could not serialize. An ADR412E message for each of these data sets precedes this message.
other_fail is the number of data sets that were not selected for other reasons (for example, authorization failure). An appropriate message (for example, ADR402E) for each of these data sets precedes this message.

**System action:** Processing continues.

**Operator response:** None.

**Application Programmer Response:** None.

**System programmer response:** None.

**Source:** DFSMSdss

---

ADR802W (ttt-mmmmm(yy)), A CATALOG ERROR OCCURRED WHILE SEARCHING FOR DATA SETS BEGINNING WITH prefix. RETURN SETS WHERE CODE IS return_code, REASON CODE IS reason_code

**Explanation:** Catalog Management module IGG0CLnn returned return_code and reason_code as the result of a catalog error or an exception condition. The catalog problem have occurred as a result of an alias pointing to a catalog that does not exist or is offline. This cause DFSMSdss not to process all data sets that the user intended.

**System action:** DFSMSdss tries to process the list of data sets returned by Catalog Management. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** See message IDC3009I for specific return and reason code information. Check the list of data sets processed to see if any desired data sets were not processed as a result of the Catalog Management problem. If necessary, correct the catalog problem and rerun the DFSMSdss job to process all the desired data sets.

**System programmer response:** None.

**Source:** DFSMSdss

---

ADR805E (ttt-mmmmm(yy)), DEVICE TYPE device_type (nnn), FROM WHICH dsname WAS DUMPED, IS NOT SUPPORTED ON THIS SYSTEM

**Explanation:** The device type device_type that the data set resided on at dump time is not supported on the target system. The nnn represents the UCB device type in hexadecimal.

**System action:** The data set is not restored. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Contact the system programmer to define the device to your I/O configuration. Rerun the restore job.

**System programmer response:** None.

**Source:** DFSMSdss

---

ADR804W (ttt-mmmmm(yy)), EOF FOR DATA SET dsname [IN CATALOG catname] WAS NOT FOUND WHERE EXPECTED. ALL ALLOCATED SPACE WILL BE PROCESSED

**Explanation:** The non-extended format sequential data set did not have an end-of-file record (EOF) where DFSMSdss expected one. Data sets with a track balance equal to a full track must have an EOF as the first record on the track pointed to by the last used block pointer. Data sets with a track balance less than a full track must have an EOF as the first record on the track following the track pointed to by the last used block pointer. This message be printed for data sets that have been allocated and never opened, as well as for data sets that have been opened, written to, and not properly closed (for example, the application or system terminated abnormally before the data set could be closed). This message also be printed if an I/O error occurs while trying to find the EOF.

**System action:** DFSMSdss tries to dump or copy all allocated space for the data set.

**Note:** In order for all the allocated data to be copied or restored, the target device must be a like device. If the data set is copied or restored to an unlike device, only the data up to the last used block pointer will be processed.

The return code is 4.

**Operator response:** None.

**Application Programmer Response:** Determine the cause of the inconsistency and correct it or consider using the ALLDATA or ALLEXCP keyword.

**System programmer response:** None.

**Source:** DFSMSdss

---

ADR806I (ttt-mmmmm(yy)), [VOLUME volser I TRACKS on VOLUME volser I DATA SET data_set_name] [WAS I WERE] COPIED USING A FAST REPLICATION FUNCTION

**Explanation:** DFSMSdss used a fast replication function to "instantly" copy the requested volume, tracks, or data set.

**System action:** Processing continues.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss
**ADR807E**  
(tt)-mmmmmm(yy), UNABLE TO USE DUMPCONDITIONING. THE COPY OPERATION IS TERMINATED

**Explanation:** DFSMSdss is unable to use DUMPCONDITIONING for the specified volumes. The specified target device is larger than the source device and the VTOC is an older format that does not reflect the correct number of alternate cylinders.

**System action:** The task ends. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Rerun the job without the DUMPCONDITIONING keyword, or use the ICKDSF REFORMAT REFVTOC to update the source VTOC.

**Source:** DFSMSdss

---

**ADR808I**  
(tt)-mmmmmm(yy), THE INPUT DUMP DATA SET BEING PROCESSED WAS CREATED FROM A CONDITIONED VOLUME

**Explanation:** This message indicates that the source volume was a conditioned volume, which means that it was created by performing a FULL volume copy that was specified with the DUMPCONDITIONING key word.

**System action:** None.

**Operator response:** None.

**Source:** DFSMSdss

---

**ADR809I**  
(tt)-mmmmmm(yy), ADDITIONAL DIAGNOSTIC DATA FOR PRECEDING MESSAGE:

**Explanation:** This message provides additional diagnostic information related to the preceding error condition.

**System action:** Processing continues.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, be prepared to provide this information to the IBM Support Center if needed.

**System programmer response:** Search problem reporting databases for a fix for the problem. If no fix exists, be prepared to provide this information to the IBM Support Center if needed.

**Source:** DFSMSdss

---

**ADR811E**  
(tt)-mmmmmm(yy), DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number IS ALREADY BEING PROCESSED - BACKUP-WHILE-OPEN STATUS IS nnn

**Explanation:** This data set is already being processed by another program and therefore it be dumped or restored at this time. See Appendix B, “Data Integrity—Serialization”, in z/OS DFSMSdpf Storage Administration for more details about the Backup-While-Open (BWO) status indicators.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** Rerun the function when the data set becomes available or the Backup-While-Open (BWO) status is changed.

**Application Programmer Response:** None.

---

**ADR812I**  
(tt)-mmmmmm(yy), THE BACKUP-WHILE-OPEN STATUS FOR DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number IS BEING CHANGED FROM nnn1 TO nnn2

**Explanation:** The current Backup-While-Open (BWO) status is changed to nnn before the data set is dumped.

See MSGADR720I for an explanation of the BWO status meanings.

**System action:** The data set is processed.

**Operator response:** None.

**Application Programmer Response:** None.

---

**ADR813E**  
(tt)-mmmmmm(yy), UNABLE TO PROCESS DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number FOR BACKUP-WHILE-OPEN. STATUS IS nnn

**Explanation:** While DFSMSdss was dumping data set dsname, update activity occurred to the data set that invalidated the dump. This message is typically issued because a control-interval or control-area split occurred while the data set was being dumped. The status nnn reflects the status at the time that DFSMSdss detected the error and only be useful for debugging purposes.

If the status is 100, this means that the initial status at the start of the dump was 110. When the status is 110, DFSMSdss resets the status to 100 and continues with the Backup-While-Open (BWO) dump. However, in this case, before DFSMSdss completed updating the status to 100, an update occurred that invalidated the dump. DFSMSdss then completed updating the status to 100 and the status remained 100 until DFSMSdss detected that the dump had been invalidated and issued this message.
A status of "****" indicates that DFSMSdss could not obtain the BWO status. See Appendix B, "Data Integrity—Serialization", in z/OS DFSMSdfp Storage Administration for more details about the Backup-While-Open (BWO) status indicators.

System action: The data set is not processed.

Operator response: Rerun the function.

Application Programmer Response: None.

Source: DFSMSdss

ADR814E  

**ttt-mmmmmm(yy)**, AN ATTEMPT WAS MADE TO COPY VOLUME volume_serial_number WITHOUT THE DUMPCONDITIONING KEYWORD

Explanation: The source volume volume_serial_number is a conditioned volume, which means that it was created by performing a FULL volume copy that was specified with DUMPCONDITIONING. In order to copy a volume that is already conditioned, you must specify the DUMPCONDITIONING key word.

System action: The command is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Rerun the job and specify the DUMPCONDITIONING keyword.

Source: DFSMSdss

ADR815W  

**ttt-mmmmmm(yy)**, ANTRQST MACRO FAILED DURING AN FCWITHDRAW REQUEST FOR [DATA SET dsname ON | CLUSTER cluster_name COMPONENT component_name ON] VOLUME volser WITH RETURN CODE return_code AND REASON CODE reason_code RETINFO: ret_info

Explanation: DFSMSdss invokes the ANTRQST macro for an FCWITHDRAW request and ANTRQST fails with the listed hex return code, reason code and return information. If a FlashCopy relationship exists at the time of the FCWITHDRAW request, it is not successfully withdrawn.

System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: See z/OS DFSMSdfp Advanced Services for an explanation of return_code, reason_code, and ret_info.

For a data set operation, determine which tracks the data set resides on and use the TSO FCQUERY command to determine if the FlashCopy relationship still exists. If it does, use the TSO FCWITHDR command to withdraw the tracks. See z/OS DFSMSdfp Advanced Services for more information about FlashCopy TSO commands.

For a volume operation, use the TSO FCQUERY command to determine if the FlashCopy relationship still exists. If it does, use the TSO FCWITHDR command to withdraw the FlashCopy relationships on the entire volume.

Be aware that any FlashCopy relationship established since the COPY or DUMP operation will be affected by the TSO FCWITHDR command.

Source: DFSMSdss

ADR816W  

**ttt-mmmmmm(yy)**, THE FCWITHDRAW KEYWORD WAS SPECIFIED BUT THE FLASHCOPY WITHDRAW WILL NOT BE ISSUED FOR [DATA SET dsname | VOLUME volser | THIS TASK], REASON CODE reason_code

Explanation: The FlashCopy withdraw is not performed because of a failure indicated by the reason code. The possible reason codes (reason_code) are:

1. The dump of the volume or data set is unsuccessful.
   - If the data set is a cluster or an alternate index in a sphere and sphere processing is being done for this data set, the FlashCopy relationship could not be withdrawn because a cluster or an AIX that is part of a sphere was not successfully processed.

2. DFSMSdss cannot obtain storage to perform the withdraw for the data set or volume.

3. DFSMSdss cannot exclusively enqueue on the data set.

System action: The FlashCopy withdraw is not issued. If the volume or data sets were in a FlashCopy relationship, the FlashCopy relationship still exists. The return code is 4.

Operator response: None.

Application Programmer Response: Take the following actions depending on the reason code:

1. Previously issued messages describe the failures that occurred during the dump process. Correct the errors and rerun the dump job, specifying the FCWITHDRAW keyword. If a successful dump cannot be taken and you still want to withdraw the FlashCopy Relationship, use the TSO FCWITHDR command to withdraw the FlashCopy relationship.

2. Provide adequate storage by increasing either the REGION size, the SIZE parameter, or both, or specify the filtering criteria to reduce the number of data sets for operation. Rerun the
job, See z/OS DFSMSdss Storage Administration for more information about storage estimates.

4 Use the TSO FCWITHDR command to withdraw the FlashCopy relationship. See z/OS DFSMS Advanced Copy Services for more information about FlashCopy TSO commands.

Guideline: Be aware that any FlashCopy relationship established since the COPY or DUMP operation is affected by the TSO FCWITHDR command

Source: DFSMSdss

ADR817W  \( (ttt)-mmmmm(yy) \), THE ANTRQST MACRO FAILED DURING AN FCWITHDRAW WITH DDSW=YES REQUEST FOR [EXTENT starting_c:h-ending_c:h | VOLUME volser | DATA SET dsname ON VOLUME volser } WITH RETURN CODE return_code AND REASON CODE reason_code RETINFO: ret_info

Explanation: DFSMSdss invokes the ANTRQST macro for an FCWITHDRAW with DDSW=YES request and ANTRQST fails with listed hex ANTRQST return code, reason code, and return information (ret_info).

For a DEFRAG operation, this error occurs after the successful movement of the extent and the source extent might still be active in a FlashCopy relationship. This might prevent the source extent from being selected as a FlashCopy target.

For a COPY FULL, COPY TRACKS, RESTORE FULL or RESTORE TRACKS operation, free space that is made available because the VTOC on target volume is overlaid might still be active in FlashCopy relationships.

For a COPY DATASET operation, this error occurs after a usable pre-allocated target data set is chosen. The pre-allocated data set might still be active in a data set FlashCopy relationship. This might prevent FlashCopy from being used to copy the data set.

System action: For COPY DATASET operations, if FASTREPLICATION(REQUIRED) is specified, ADR938E is issued if the pre-allocated target data is still active in FlashCopy relationships. If FASTREPLICATION(REQUIRED) was not specified, and no other errors occurred for this particular data set, any existing FlashCopy relationships no longer exist after the copy is completed.

In all cases, processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: See z/OS DFSMS Advanced Copy Services for an explanation of ANTRQST return_code, reason_code, and ret_info.

For DEFRAG operation, use the TSO FCWITHDR command with DDSW=YES to withdraw extents that remained in FlashCopy relationships. See z/OS DFSMS Advanced Copy Services for more information about FlashCopy TSO commands.

For RESTORE and COPY operations, use the TSO FCWITHDR command with DDSW=YES to withdraw the FlashCopy relationships for the volume. Be aware that any FlashCopy relationship established since the COPY or RESTORE operation will be affected by the TSO FCWITHDR command.

For COPY DATASET operations, if FASTREPLICATION(REQUIRED) was specified and a data set received an ADR918I return code 9, and ADR938E, use the TSO FCWITHDR command with DDSW=YES specifying extents, to withdraw the FlashCopy relationships for the data set. If FASTREPLICATION(REQUIRED) was not specified and no ADR938E message was received, then no action is necessary. You might also delete the existing target data set and return the job.

Source: DFSMSdss

ADR818E  \( (ttt)-mmmmm(yy) \), FLASHCOPY WITHDRAW WITH DDSW=YES NOT ISSUED FOR [EXTENT starting_c:h-ending_c:h | DATA SET dsname] BECAUSE DFSMSDSS WAS UNABLE TO OBTAIN STORAGE

Explanation: DFSMSdss did not attempt to invoke the ANTRQST macro for an FCWITHDRAW with DDSW=YES request.

- For a DEFRAG or CONSOLIDATE operation, this error occurs after the successful movement of the extent and the source extent might still be active in a FlashCopy relationship. This might prevent the source extent from being selected as a FlashCopy target.

- For a COPY FULL, COPY TRACKS, RESTORE FULL or RESTORE TRACKS operation, free space that is made available because the VTOC on the target volume is overlaid and might still be active in FlashCopy relationships.

- For a COPY DATASET operation, this error occurs after a usable pre-allocated target data set is chosen. The pre-allocated data set might still be active in a data set FlashCopy relationship. This might prevent FlashCopy from being used to copy the data set.

System action: For COPY DATASET operations, if FASTREPLICATION(REQUIRED) is specified, ADR938E is issued if the pre-allocated target data is still active in FlashCopy relationships. If FASTREPLICATION(REQUIRED) was not specified, and no other errors occurred for this particular data set, any existing FlashCopy relationships no longer exist after the copy is completed.

In all cases, processing continues. The return code is 4.
Operator response: None.

Application Programmer Response: Refer to z/OS DFSMS Advanced Copy Services for an explanation of ANTRQST return_code, reason_code, and ret_info.

For a DEFRAG or CONSOLIDATE operation, use the TSO FCWITHDR command with DDSW=YES to withdraw extents that are in FlashCopy relationships. Refer to z/OS DFSMS Advanced Copy Services for more information on FlashCopy TSO commands.

For RESTORE and COPY operations, use the TSO FCWITHDR command with DDSW=YES to withdraw the FlashCopy relationships for the volume. Be aware that any FlashCopy relationship established after the COPY or RESTORE operation will be affected by the TSO FCWITHDR command.

For COPY DATASET operations, if FASTREPLICATION(REQUIRED) was specified and a data set received an ADR918I return code 9 and ADR938E, use the TSO FCWITHDR command with DDSW=YES specifying extents to withdraw the FlashCopy relationships for the data set. If FASTREPLICATION(REQUIRED) was not specified and no ADR938E message was received, then no action is necessary. You can also delete the existing target data set and rerun the job.

Source: DFSMSdss

ADR819W (ttt-mmmm(yy)), THE ANTRQST MACRO FAILED DURING AN FCWITHDRAW REQUEST FOR VOLUME dsname WITH ACTION=THAW

Explanation: DFSMSdss invokes the ANTRQST macro for an FCWITHDRAW request and ANTRQST failed with the listed return_code and reason_code, and return information (ret_info).

System action: The operation continues. The return code is 4.

Operator response: None.

Application Programmer Response: See the z/OS DFSMS Advanced Copy Services for an explanation of return_code, reason_code, and ret_info.

Source: DFSMSdss

ADR820W (ttt-mmmm(yy)), ATTRIBUTES LOST FOR DATA SET dsname

Explanation: During a data set copy or restore operation, the source data set (dsname) has SMS attributes, but the target data set resides on a non-SMS-managed volume.

System action: The copy or restore is allowed.

However, the attributes do not exist for the target data set. The return code is 4.

Operator response: None.

Application Programmer Response: If the data set is to maintain its attributes, it must reside on SMS-managed volumes. Change the new name for a logical copy; or rename the data set for a restore; or specify STORCLASS(storage-class-name) with BYPASSACS(dsname) so that the target data set resides on SMS-managed volumes. For a physical data set copy, specify an SMS-managed target volume for the output volume.

ADR821W (ttt-mmmm(yy)), UNEXPECTED RETURN CODE return_code REASON CODE reason_code FROM IOSCAPU MACRO FOR VOLUME volume_serial_number AT DEVICE ADDRESS device_addr

Explanation: DFSMSdss issued the IOSCAPU macro to retrieve the pointer to the UCB whose device address is device_addr, and the IOSCAPU macro failed with the listed return_code and reason_code. This message indicates there is a problem with the support for UCBs above the 16MB line. The UCB whose address is device_addr reside above or below the 16MB line.

System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR822W (ttt-mmmm(yy)), EVENT NOTIFICATION event_id NOT ISSUED. UNEXPECTED RETURN CODE return_code REASON CODE reason_code FROM IOSCAPU MACRO FOR VOLUME AT DEVICE ADDRESS device_addr

Explanation: DFSMSdss issued the IOSCAPU macro to retrieve the pointer to the UCB whose device address is device_addr, and the IOSCAPU macro failed with the listed return_code and reason_code. The indicated Event Notification did not occur.

event_id Description
ENFPC003 Vary offline of the device
ENFPC016 Notification of a change in the SMS configuration

If the event_id is ENFPC016, allocation of data sets on the newly restored or copied volume not be allowed until SMS is informed of the configuration change by a SETSMS command.
System action: Processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR823W (ttt)-mmmmm(yy), DDM ATTRIBUTES MISSING FOR DATA SET dsname

Explanation: During a data set dump operation, one or more source data set indicators show that DDM attributes exist for the data set, but the VVR or NVR cell containing the attributes is missing.

System action: The dump operation is allowed. However, the attributes do not exist for the source data set. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR824E (ttt)-mmmmm(yy), NO VOLUMES WERE RETURNED FOR STORAGE GROUP storage_group_name, sms_return_code-sms_reason_code

Explanation: SMS construct access services did not return a volume list for the storage group storage_group_name. sms_return_code and sms_reason_code indicate the failure that SMS detected.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Check to be sure that storage group storage_group_name exists in the SMS configuration and has volumes associated with it.

Source: DFSMSdss

ADR825I (ttt)-mmmmm(yy), THE FOLLOWING VOLUMES WERE ALLOCATED FOR STORGRP storage_group_name

Explanation: The listed volumes were online and ready and were dynamically allocated.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR828E (ttt)-mmmmm(yy), UNEXPECTED RETURN CODE return_code REASON CODE reason_code FROM IOSCAPU MACRO FOR VOLUME volume_serial_number AT DEVICE ADDRESS device_addr

Explanation: DFSMSdss issued the IOSCAPU macro to retrieve the pointer to the UCB whose device address is device_addr, and the IOSCAPU macro failed with the listed return_code and reason_code. This message indicates there is a problem with the support for UCBs above the 16 MB line. The UCB whose address is device_addr reside above or below the 16 MB line.

System action: The task is not performed. Processing continues with the next control statement. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the UCB problem and rerun the job. See z/OS MVS Programming: Assembler Services Reference IAR-XCT for more information regarding the IOSCAPU CAPTOACT macro return and reason codes.

Source: DFSMSdss
ADR829E  (ttt-mmmmm(yy), FCINCREMENTAL | FCINCREMENTALLAST) WAS SPECIFIED BUT INCREMENTAL FLASHCOPY COULD NOT BE ATTEMPTED FROM VOLUME src_volser TO VOLUME tgt_volser

[VOLUME src_volser DOES NOT SUPPORT INCREMENTAL FLASHCOPY]

Explanation: DFSMSdss was unable to establish an Incremental FlashCopy relationship from the specified source volume (src_volser) to the specified target volume (tgt_volser) because one of the following conditions has been detected:

- At least one of the volumes does not support Incremental FlashCopy.
- At least one of the volumes is not eligible to participate in a FlashCopy relationship at this time.
- Proper RACF authority is required to use FlashCopy.

System action: DFSMSdss terminates the copy operation. The return code is 8.

Application Programmer Response: Depending on the detected condition, take the applicable action listed as follows:

- Ensure the FlashCopy V2 and Change Recording features are enabled for the source and target devices.
- Refer to the previously issued message for the reason why the volume is not eligible to participate in a FlashCopy relationship.
- Acquire the proper RACF authority and rerun the job. You must be permitted READ access to the STGADMIN.ADR.COPY.FLASHCPY profile.

Source: DFSMSdss

ADR831E  (ttt-mmmmm(yy), FCINCRVERIFY WAS SPECIFIED BUT VOLUME src_volser AND VOLUME tgt_volser ARE NOT IN AN EXISTING INCREMENTAL FLASHCOPY RELATIONSHIP

Explanation: DFSMSdss was unable to copy the new increment because existing Incremental FlashCopy relationship does not exist between the specified volumes.

System action: DFSMSdss terminates the copy operation. The return code is 8.

Application Programmer Response: Ensure the volumes specified are in an existing Incremental FlashCopy relationship and resubmit the job.

Source: DFSMSdss

ADR832E  (ttt-mmmmm(yy), INCREMENTAL FLASHCOPY COULD NOT BE ATTEMPTED FROM VOLUME src_volser TO VOLUME tgt_volser AT LEAST ONE OF THE VOLUMES COULD NOT PARTICIPATE IN THE INCREMENTAL FLASHCOPY RELATIONSHIP

[VOLUME src_volser IS {NOT IN | THE SOURCE OF | THE TARGET OF} AN EXISTING [NOCOPY] INCREMENTAL FLASHCOPY RELATIONSHIP [ , BUT tgt_volser IS NOT THE PARTNER VOLUME}]

[VOLUME tgt_volser IS {NOT IN | THE SOURCE OF | THE TARGET OF} AN EXISTING [NOCOPY] INCREMENTAL FLASHCOPY RELATIONSHIP[ , BUT src_volser IS NOT THE PARTNER VOLUME}]

Explanation: DFSMSdss was unable to establish an Incremental FlashCopy relationship from the specified source volume (src_volser) to the specified target volume (tgt_volser) because one of the following conditions has been detected, which precludes establishing the new increment:

- Only one of the user-specified volumes is in an existing Incremental FlashCopy relationship. The other volume is not in an Incremental FlashCopy relationship.
- Both user-specified volumes are in an Incremental FlashCopy relationship, but both of them are the source or the target of an Incremental FlashCopy relationship.

Source: DFSMSdss
• The user-specified input and output volumes are source and target volumes in Incremental FlashCopy relationships, but they are not partners in a FlashCopy volume pair.

System action: DFSMSdss terminates the copy task. The return code is 8.

Application Programmer Response: Ensure the volumes are eligible to participate in an Incremental FlashCopy relationship and resubmit the job.

Source: DFSMSdss

ADR833E  

(yyy-mm-tt), INCIDENTAL FLASHCOPY IN REVERSED DIRECTION COULD NOT BE ATTEMPTED BECAUSE PREVIOUS BACKGROUND COPY FROM VOLUME orig_src_volser TO VOLUME orig_tgt_volser IS IN PROGRESS

Explanation: DFSMSdss is unable to copy the new increment because the operation will reverse the Incremental FlashCopy direction while the previous background copy is in progress. If the FCWAIT(numsecs, numretries) keyword is specified, the background copy does not complete within the specified maximum wait time.

System action: DFSMSdss terminates the copy operation. The return code is 8.

Application Programmer Response: Take one of the following actions:
- Allow sufficient wait time by designating appropriate retry interval and retry count in the FCWAIT keyword and resubmit the job.
- Use ICKDSF FLASHCPY QUERY RELATIONS command or TSO FCQUERY command to verify the background copy has completed, and resubmit the DFSMSdss Incremental FlashCopy job.

Source: DFSMSdss

ADR835E  

(yyy-mm-tt), FCCGFREEZE WAS SPECIFIED BUT FLASHCOPY V2 COULD NOT BE USED FOR VOLUME src_volser

[VOLUME src_volser DOES NOT SUPPORT FLASHCOPY V2]  
[VOLUME tgt_volser DOES NOT SUPPORT FLASHCOPY V2]

Explanation: DFSMSdss is unable to perform FlashCopy with Consistency Group because one of the following conditions has been detected:
- At least one of the volumes does not support FlashCopy Consistency Group.
- At least one of the volumes is not eligible to participate in a FlashCopy relationship at this time.
- Proper RACF authority is required to use FlashCopy.

System action: DFSMSdss terminates the copy task. The return code is 8.

Application Programmer Response: Depending on the detected condition, take the applicable action listed as follows:
- Ensure the FlashCopy V2 feature is enabled for the source and target devices.
- Refer to the previously issued message for the reason why the volume is not eligible to participate in a FlashCopy relationship.
- Acquire the proper RACF authority and rerun the job. You must be permitted READ access to the STGADMIN.ADR.COPY.FLASHCPY profile.

Source: DFSMSdss

ADR836E  

(yyy-mm-tt), FCCGVERIFY WAS SPECIFIED BUT FLASHCOPY CONSISTENCY GROUP TIMER COULD NOT BE VERIFIED USING VOLUME volser

Explanation: DFSMSdss is unable to verify FlashCopy Consistency Group timer. The FlashCopy of the group of volumes might not be consistent. Message ADR931W precede this message.

System action: DFSMSdss processing continues. The return code is 8.

Application Programmer Response: See previously issued message for reasons why the FlashCopy Consistency Group timer could not be verified using the specified verification volume. Correct the problem and recopy the consistency group if necessary.
ADR837E  (ttff-mmm(yy)), FLASHCOPY CONSISTENCY GROUP TIMER HAS EXPIRED FOR LSS WHERE VOLUME volser RESIDES

Explanation: The copy of the volumes in the Consistency Group not be consistent because the FlashCopy Consistency Group timer expired before all the volumes can be copied.

System action: DFSMSdss processing continues. The return code is 8.

Application Programmer Response: Ensure you specified the correct verification volume. Determine if the FlashCopy Consistency Group timer value is reasonable. If copying a large number of volumes within one FlashCopy Consistency Group takes too long, consider copying a smaller group of volumes.

Source: DFSMSdss

ADR838I  (ttff-mmm(yy)), FLASHCOPY RELATIONSHIP BETWEEN SOURCE VOLUME src_volser AND TARGET VOLUME tgt_volser HAS BEEN WITHDRAWN

Explanation: Following an Establish FlashCopy failure among volumes in a Consistency Group, DFSMSdss withdrew the no-background copy FlashCopy relationship previously established in the same job step.

System action: DFSMSdss processing continues. The return code is 0.

Application Programmer Response: None.

Source: DFSMSdss

ADR839I  (ttff-mmm(yy)), CGCREATE [FCCGVERIFY] PROCESSING COMPLETED. I/O ACTIVITY HAS RESUMED ON THE FOLLOWING SPECIFIED VOLUMES AND OTHER PREVIOUSLY FROZEN VOLUMES IN THE SAME LOGICAL SUBSYSTEM

Explanation: DFSMSdss issued the Consistency Group Created command to the logical subsystems where the access volumes reside. The list of successfully processed access volumes follow this message.

System action: The CGCREATE operation ends. The return code is 0.

Application Programmer Response: None.

Source: DFSMSdss

ADR840W  (ttff-mmm(yy)), CGCREATE PROCESSING COMPLETED. I/O ACTIVITY HAS RESUMED ON THE FOLLOWING SPECIFIED VOLUMES AND OTHER PREVIOUSLY FROZEN VOLUMES IN THE SAME LOGICAL SUBSYSTEM

[liste of volsters]

Explanation: DFSMSdss have failed to verify the FlashCopy Consistency Group using the specified verification volume. DFSMSdss issued the Consistency Group Created command to the logical subsystems where the specified access volumes reside. If there were volumes frozen for FlashCopy consistency grouping, they have been thawed. The list of successfully processed access volumes follow this message.

System action: The CGCREATE operation ends. The return code is 4.

Application Programmer Response: Refer to any previously issued messages for reasons why FlashCopy Consistency Group was not formed successfully or why verification volume was not processed successfully.

Source: DFSMSdss

ADR841E  (ttff-mmm(yy)), FLASHCOPY FREEZE {WAS NOT ATTEMPTED | FAILED} FROM VOLUME src_volser TO VOLUME tgt_volser DUE TO PREVIOUS ERROR IN THE CONSISTENCY GROUP

Explanation: DFSMSdss terminated the current copy task because at least one of the previous COPY FCCGFREEZE tasks in the consistency group has failed. See previously issued error message associated with the failing copy task for the failing reason.

System action: The current copy operation ends. The return code is 8.

Application Programmer Response: Determine the cause of the error associated with the previous failing copy task. Correct the error and resubmit the job.

Source: DFSMSdss

ADR842E  (ttff-mmm(yy)), FLASHCOPY WITH {[FCGFREEZE] [FCINCREMENTAL | FCINCREMENTALLAST]} OPTION FAILED FROM VOLUME src_volser TO VOLUME tgt_volser

Explanation: DFSMSdss attempted to establish a FlashCopy relationship with the listed options from the specified source volume (src_volser) to the specified target volume (tgt_volser). The FlashCopy attempt encountered an error. The specified FlashCopy options, such as Incremental FlashCopy and FlashCopy Freeze, preclude DFSMSdss from retrying the copy using
traditional data movement methods.

**System action:** DFSMSdss terminates the copy operation. The return code is 8.

**Application Programmer Response:** See the previously issued message for the FlashCopy failure reason. Correct the problem and resubmit the job.

**Source:** DFSMSdss

---

**ADR843E**

(ttll)--mmmm(mmm)(yy), UNABLE TO action_description BECAUSE ANTMAN ADDRESS SPACE IS INACTIVE. TASK IS TERMINATED [THE VOLUMES ARE:]

**Explanation:** DFSMSdss could not complete the action described by `action_description` because the required ANTMAN address space is not active. The `action_description` can be one of the following:

- THAW VOLUMES - DFSMSdss CGCREATE operation attempted to thaw volumes that were previously copied with the FCCGFREEZE option.
- WITHDRAW FLASHCOPY RELATIONSHIP

A list of affected volumes be listed following the ADR843E message.

**System action:** The DFSMSdss operation ends. The return code is 8.

For a CGCREATE operation, I/O activity will automatically resume on the previously frozen volumes when the FlashCopy Consistency Group timer expires.

**Application Programmer Response:** For CGCREATE operation, ensure the ANTMAN address is up and running normally. Resubmit the job if necessary.

**Source:** DFSMSdss

---

**ADR844W**

(ttll)--mmmm(mmm)(yy), FCWAIT WAS SPECIFIED BUT COULD NOT BE COMPLETED DUE TO STIMERM ERROR. FLASHCOPY FROM VOLUME src_volser TO VOLUME tgt_volser WILL BE ATTEMPTED WITHOUT FCWAIT OPTION

**Explanation:** DFSMSdss was unable to complete FCWAIT during an incremental FlashCopy operation.

**System action:** DFSMSdss continues. The return code is 4.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR845E**

(ttll)--mmmm(mmm)(yy), UNEXPECTED RETURN CODE return_code REASON CODE reason_code FROM UCBLOOK MACRO FOR VOLUME volser

**Explanation:** DFSMSdss issued the UCBLOOK macro to retrieve the pointer to the UCB for the listed volume, and the UCBLOOK macro failed with the listed return code and reason code.

**System action:** DFSMSdss processing ends. The return code is 8.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR846E**

(ttll)--mmmm(mmm)(yy), UNABLE TO COPY FROM VOLUME src_volser TO VOLUME tgt_volser DUE TO (FLASHCOPY FREEZE | INCREMENTAL FLASHCOPY | INCREMENTAL FLASHCOPY FREEZE) NOT SUPPORTED FOR PARTIAL VOLUME

**Explanation:** DFSMSdss terminates the COPY task because Incremental FlashCopy and FlashCopy Freeze options are supported for full volume only.

If FCINCREMENTAL, FCINCREMENTAL, or FCCGFREEZE is specified on a COPY TRACKS CPVOLUME command, the operation fails because the extent range described by the TRACKS keyword does not designate a full VM-format volume.

**System action:** The DFSMSdss copy task ends. The return code is 8.

**Application Programmer Response:** Correct the extent range described by the TRACKS keyword to reflect a full VM-format volume and resubmit the job.

**Source:** DFSMSdss

---

**ADR847E**

(ttll)--mmmm(mmm)(yy), {ACCESS | VERIFICATION} VOLUME volser IS NOT SUPPORTED BY CGCREATE COMMAND

**Explanation:** The specified DASD device does not have the FlashCopy Version 2 feature enabled. The CGCREATE command cannot be processed for the specified volume.

**System action:** DFSMSdss processing continues with the next volume. The return code is 8.

**Application Programmer Response:** Ensure a volume that you intended to issue the CGCREATE command for is correctly specified. Correct the error and resubmit the job.

**Source:** DFSMSdss
ADR848W • ADR850I

ADR848W (ttf-mmmmmm(yy)), CGCREATE PROCESSING COMPLETED. THE FOLLOWING ACCESS VOLUMES WERE NOT SUCCESSFULLY PROCESSED [list of volser]

Explanation: DFSMSdss issued the Consistency Group Created command to the logical subsystems where the access volumes reside. The list of volumes that were not processed successfully follows this message.

System action: The CGCREATE operation ends. The return code is 4.

Application Programmer Response: Refer to any previously issued messages for reasons why the access volume failed. Ensure the device support FlashCopy Consistency Group is specified.

Source: DFSMSdss

ADR849E (ttf-mmmmmm(yy)), COPY FROM VOLUME input_volume_serial_number TO VOLUME output_volume_serial_number FAILED BECAUSE THE OUTPUT VOLUME IS A SPACE EFFICIENT VOLUME

Explanation: For a COPY FULL or a COPY TRACKS operation specifying one track range that includes the entire volume, space efficient FlashCopy must be used to perform the full volume copy to a space efficient volume. DFSMSdss was unable to establish a space efficient FlashCopy relationship for one of the following reasons:

• FASTREPLICATION(NONE) was specified. DFSMSdss failed the operation because the keyword prohibits space efficient FlashCopy.
• FCSETGTOK(FAILRELATION) and FCNOCOPY were not specified. Space efficient FlashCopy is not permitted unless both of these keywords are specified.
• At least one of the volumes was not eligible to participate in a space efficient FlashCopy relationship at this time.
• DFSMSdss attempted to establish a space efficient FlashCopy relationship and failed with an error.

System action: DFSMSdss terminates the full volume copy operation. The return code is 8.

Operator response: None.

Application Programmer Response: If you do not intend to copy the data to a space efficient volume, replace the output volume with a fully provisioned volume on the COPY command and resubmit the job. If the space efficient volume is the intended output volume, depending on the detected condition, take the appropriate action listed as follows:

• Ensure FASTREPLICATION(NONE) is not specified.
• Ensure FCSETGTOK(FAILRELATION) and FCNOCOPY are specified.
• Refer to previously issued message for the reason why the volume is not eligible to participate in a space efficient FlashCopy relationship.
• Refer to previously issued message for the FlashCopy failing reason.

Source: DFSMSdss

ADR850I (ttf-mmmmmm(yy), FCTOPPRCPRIMARY {(PRESMIRPREF) | PRESMIRREQ}) COULD NOT BE HONORED FOR (DATA SET dsname | VOLUME volser | THIS task TASK), RETURN CODE dss_return_code

Explanation: summarized_info is:

[ , {number [VOLUME WAS | VOLUMES WERE] REJECTED FOR [QFRVOLS PRESERVE MIRROR VOLUME REASON CODE qfrvols_vrsn | qfrvols_vrsn_text] [QFRVOLS PRESERVE MIRROR EXTENT REASON CODE qfrvols_xrsn | qfrvols_xrsn_text] ]]

detailed_info is:

[ , [VOLUME volser WAS REJECTED FOR [QFRVOLS PRESERVE MIRROR VOLUME REASON CODE qfrvols_vrsn | qfrvols_vrsn_text] [QFRVOLS PRESERVE MIRROR EXTENT REASON CODE qfrvols_xrsn | qfrvols_xrsn_text] ]]

DFSMSdss cannot use the Preserve Mirror function during a FlashCopy to PPRC Primary operation. This message might be issued for diagnostic purposes if the FASTREPLICATION(REQUIRED) or DEBUG(FRMMSG(MINIMAL | SUMMARIZED | DETAILED)) keyword is specified with the FCTOPPRCPRIMARY(PRESMIRPREF) or FCTOPPRCPRIMARY(PRESMIRREQ) keywords. The return code and reason code listed in the message text are hexadecimal values.

If any QFRVOLS reason codes are listed, See the ANTRQST section of z/OS MVS System Messages, Vol 1 (ABA-AOM) for an explanation of the QFRVOLS volume reason codes (qfrvols_vrsn or qfrvols_xrsn). The data set or volume included in the message is referring to the source that is being processed. The possible return codes (dss_return_code) are:

X'3'
One or more of the source devices are not eligible for a preserve mirror operation.

When FASTREPLICATION(REQUIRED) or DEBUG(FRMMSG(SUMMARIZED)) is specified, return code X'3' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes are not eligible. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn).
When DEBUG(FRMSG(DETAILED)) is specified, return code X'3' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was not eligible. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn).

When the FCTOPPRCPRIMARY(PRESMIRREQ) keyword is specified, DFSMSdss cannot use FlashCopy when the target volume is a PPRC Primary. Message ADR918I or ADR709E will be issued if one or more target volumes selected by DFSMSdss is a PPRC Primary.

See the ANTRQST section in z/OS DFSMS Advanced Copy Services for a list of the QFRVOLS volume and extent reason codes.

X'9'
One or more of the target devices are not eligible for a preserve mirror operation.

When FASTREPLICATION(REQUIRED) or DEBUG(FRMSG(SUMMARIZED)) is specified, return code X'9' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes are not eligible. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn).

When DEBUG(FRMSG(DETAILED)) is specified, return code X'9' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was ineligible. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn) or QFRVOLS PRESERVE MIRROR extent reason codes (qfrvols_xrsn).

See the ANTRQST section in z/OS DFSMS Advanced Copy Services for a list of the QFRVOLS volume and extent reason codes.

X'15'
For the SMS allocation, target volumes that are eligible for a Preserve Mirror operation cannot be selected.

When DEBUG(FRMSG(SUMMARIZED | DETAILED)) is specified, return code X'15' is followed by SMS allocation messages that provide summarized information. Detailed information at individual volume level is not available. See the SMS messages for explanations.

System action: DFSMSdss processing continues. The return code is zero.

Operator response: None.

Application Programmer Response: In order for the Preserve Mirror to be used in subsequent operations, take the following action, depending on the return code. The possible actions are:

X'3'
If the FASTREPLICATION(REQUIRED), DEBUG(FRMSG(SUMMARIZED)), or DEBUG(FRMSG(DETAILED)) keyword is specified, this return code X'3' is followed by one or more QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn). See z/OS MVS System Messages, Vol 1 (ABA-AOM) for information about the QFRVOLS volume reason codes.

If you did not receive a reason code following return code X'3' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

You can disregard this message if the target volume is not a PPRC Primary volume.

X'9'
If the FASTREPLICATION(REQUIRED), DEBUG(FRMSG(SUMMARIZED)), or DEBUG(FRMSG(DETAILED)) keyword is specified, this return code X'9' is followed by one or more QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn). See z/OS MVS System Messages, Vol 1 (ABA-AOM) for information about the QFRVOLS volume reason codes.
If you did not receive a reason code following return code X'9' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

**X'14'** If the FASTREPLICATION(REQUIRED), DEBUG(FRMSG(SUMMARIZED)), or DEBUG(FRMSG(DETAILED)) keyword is specified, this return code X'14' is followed by one or more QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn). See [z/OS MVS System Messages, Vol 1 (ABA-AOM)] for information about the QFRVOLS volume reason codes.

If you did not receive a reason code following return code X'14' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

**X'15'** See the SMS allocation messages for an explanation. Correct the problem and resubmit the job. If SMS messages were not issued, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

Source: DFSMSdss

---

**ADR862I** (ttt-mmmmm(yy)), THE REDETERMINE KEYWORD WAS SPECIFIED. ALL DATA SETS WILL BE REPROCESSED

**Explanation:** The REDETERMINE keyword was specified in the SMS job stream. The SMS constructs for all of the data sets will be reset, including those data sets already SMS-managed.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR863I** (ttt-mmmmm(yy)), THE TEST KEYWORD WAS SPECIFIED. NO DATA SETS OR VOLUMES WILL BE CONVERTED

**Explanation:** The TEST keyword was specified in the SMS job stream. Subtasks will run in the NORUN mode.

**System action:** No volumes or data sets will be converted, but volume and data set eligibility checking will be done. The system issues a report indicating whether SMS processing would be successful.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR864E** (ttt-mmmmm(yy)), JOBCAT/STEPCAT IS NOT ALLOWED WHEN CONVERTING VOLUMES TO OR FROM SMS MANAGEMENT. TASK IS TERMINATED

**Explanation:** A JOBCAT or STEPCAT DD statement was encountered. These statements are not allowed in the SMS environment.

**System action:** The task is not performed. Processing continues with the next control statement. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Remove the JOBCAT or STEPCAT DD statement. Use the INCAT keyword if it is necessary to specify an input catalog. Rerun the job.

**Source:** DFSMSdss

---

**ADR865E** (ttt-mmmmm(yy)), THE NUMBER OF DATA SETS PASSING THE INCLUDE/EXCLUDE FILTER CRITERIA IS n WHICH EXCEEDS THE CURRENT FILTER LIST CAPACITY

**Explanation:** The data set filter list capacity is currently 131,070. This message is issued if more than
131,070 data sets pass the INCLUDE/EXCLUDE filter criteria.

**System action:** Dump processing is ended. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Narrow the scope of the INCLUDE/EXCLUDE filter so that it allows no more than 131,070 data sets to meet the criteria.

**Source:** DFSMSdss.

**ADR866I** *(ttf-mmmmm(yy)), UNABLE TO RENAME VTOC INDEX ON VOLUME*

**volume_serial_number, DIAGNOSTIC INFORMATION: dadsm_reason_code**

**Explanation:** DFSMSdss attempted to rename the VTOC index data set on the restored volume but failed. The reason is described by the `dadsm_reason_code`. See the z/OS DFSMSdp Diagnosis for an explanation of the error codes.

**System action:** The function completes. The return code is 0.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss.

**ADR867I** *(ttf-mmmmm(yy)), DATA SET dsname WILL BE DUMPED WITH NEWNAME dsname [IN CATALOG catalog_name] USING STORCLAS storage_class_name {DATACLAS data_class_name INO DATACLAS}, AND [MGMTCLAS management_class_name INO MGMTCLAS]}*

**Explanation:** If the NEWNAME/UNCONDITIONAL parameter was specified, the data set will be placed on the dump tape with the new name listed. If the storage class, data class and management class exist, they are also listed. These come directly from the source data set.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss.

**ADR868I** *(ttf-mmmmm(yy)), THE FOLLOWING DATA SETS ON VOLUME volume_serial_number HAD {"*"} CANDIDATE VOLUMES WHICH WERE {DELETED | CONVERTED TO "*"}*

**Explanation:** During conversion to SMS, non-VSAM data sets with candidate volumes have the candidate volumes converted to nonspecific '*' volumes. During conversion from SMS, both VSAM and non-VSAM data sets have their nonspecific '*' volumes deleted.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss.

**ADR869I** *(ttf-mmmmm(yy), THE FOLLOWING DATA SETS ON VOLUME volume_serial_number WERE NOT CATALOGED IN THE STANDARD ORDER OF SEARCH. THEY {WERE | WILL BE} CATALOGED IN THE NAMED CATALOG dsname CATALOG: new_catalog_name [DELETED FROM: old_catalog_name]***

**Explanation:** Catalog entries were not found for each of the listed data sets in the standard order of search. The listed VSAM data sets were deleted from their original catalog and recataloged in the standard order of search. For non-VSAM data sets, if the INCAT keyword was specified and an entry for the non-VSAM data set was found in one of the catalogs listed with this keyword, then that entry was deleted from this catalog and the data set was recataloged in the standard order of search.

If INCAT was not specified or no entry was found in any of the catalogs listed, then the system assumed that the non-VSAM data set was uncataloged and cataloged it in the named catalog. In this case, the system does not issue the DELETED FROM line.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss.

**ADR870I** *(ttf-mmmmm(yy), PREPARE PROCESSING {WILL BE | WAS} SUCCESSFUL. VOLUME volume_serial_number {WILL NOW BE | IS NOW} IN INITIAL STATUS**

**Explanation:** PREPARE processing for the named volume completed successfully, and the volume is now in INITIAL status. No data sets can be allocated or deleted on the volume. If TEST was specified in the job stream, this message indicates whether the task will be successful if actually run. The volume status is not changed with TEST.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.
ADR871W  (ttt-mmmmm(yy), VOLUME volume_serial_number MUST BE ASSIGNED TO A STORAGE GROUP BEFORE SMS CONVERSION CAN PROCEED

Explanation: This message is issued with a PREPARE task if the named volume is eligible for SMS conversion but is not assigned to an SMS storage group. The volume will be successfully placed in INITIAL status but must be assigned to a storage group before the conversion to SMS management can be completed.

System action: None. The return code is 4.

Operator response: None.

Application Programmer Response: Change the active control data set so that the volume is defined to a storage group before attempting to convert the volume to SMS management.

Source: DFSMSdss

ADR874E  (ttt-mmmmm(yy), VOLUME volume_serial_number IS NOT ELIGIBLE FOR CONVERSION {TO I FROM} SMS MANAGEMENT, reason_code

Explanation: The named volume failed the eligibility requirements for conversion either to or from SMS management. The reason code, (reason_code) for the ineligible volume is one of the following:

04  The volume is not a DASD device.
08  The volume has a nonindexed VTOC.
12  The volume is not defined to an SMS storage group.
16  The volume is in unknown status. The SMS-converted flag is on but the SMS-initial flag is off in the VTOC index map.
20  The volume is in unknown status. The SMS-converted flag is on but the SMS-initial flag is off in VTOC entry.
24  SMS indicators for VTOC index map and VTOC entry do not match.

System action: Conversion of the volume failed. Processing continues with the next volume in the input list. The return code is 8.

Operator response: None.

Application Programmer Response: Take the appropriate action for each reason code:

04  Do not attempt to convert non-DASD volumes to SMS management.
08  Define an index for the VTOC, and rerun the job.
12  Change the ACDS so that the volume is defined to a storage group, and rerun the job.
16  Search problem reporting databases for a fix for the problem. If no fix exists, be prepared to provide this information to the IBM Support Center if needed.
20  Search problem reporting databases for a fix for the problem. If no fix exists, be prepared to provide this information to the IBM Support Center if needed.
24  Search problem reporting databases for a fix for the problem. If no fix exists, be prepared to provide this information to the IBM Support Center if needed.

Source: DFSMSdss
If the data set has any AIXs or PATHs defined for it, these are listed. If any of the AIXs are multivolume, then the volumes on which they reside are listed.

If TEST was specified, the data sets were not actually processed. The message indicates that data sets would be successfully processed if the job was run.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR875E  
(ttty)mmmmyy, VOLUME volume_serial_number IS ALREADY IN CONVERTED STATUS AND REDETERMINE WAS NOT SPECIFIED. SMS PROCESSING (WILL FAIL | FAILED)

**Explanation:** The named volume was already in SMS status, and the REDETERMINE keyword was not specified in the DFSMSdss job stream. Therefore, SMS processing of that volume is ended.

**System action:** Processing continues with the next volume in the input volume list. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR876E  
(ttty)mmmmyy, VOLUME volume_serial_number IS NOT IN INITIAL OR CONVERTED STATUS. NONSMS PROCESSING (WILL FAIL | FAILED)

**Explanation:** Because the named volume was already in non-SMS status, non-SMS processing of the volume is ended.

**System action:** Processing continues with the next volume in the input volume list. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR877E  
(ttty)mmmmyy, THE FOLLOWING DATA SETS ON VOLUME volume_serial_number (WILL BE | WERE) SUCCESSFULLY PROCESSED
text

**Explanation:** Where text is:

dsnamename CATALOG: catname
  [STORCLAS: scname MGMTCLAS: mcname]
  [VOLUMES: vo1001 vo1002 vo1003 . . .]
  [    vo100x vo100y vo100z . . .]
[AIX: aixname]
[PATH: pathname]

The listed data sets were successfully processed either to or from SMS management.

- If the data set is multivolume, the volumes on which the data set resides are listed.

The listed data set (or its associated AIX or PATH) failed conversion either to or from SMS management, where rc is the reason code for the data set failing. If the data set is multivolume and the error occurred on a volume other than the one being processed by CONVERTV at that time, then the volume serial number of this other volume is printed. If a multivolume data set fails conversion because one of the other volumes that the data set is on is ineligible for SMS processing, then this reason is printed after the volume serial number. If the error occurred in a catalog call, then the catalog function code, catalog reason code, catalog module ID, and parmlist reason code are printed. See IDC3009I for an explanation of the error, where:

IDC3009I return_code = ADR878E
catalog_reason_code IDC3009I reason_code = ADR878E parmlist_reason_code IDC3009I module_ID = ADR878E catlg module_ID

If the error occurred in a VVR REQUEST function call, then the VVR function code that failed and the VVDS manager reason code are printed. See message IDC3009I under return code 50 for an explanation of the VVDS manager reason code.

If the error occurred in an SMPM CFpurge function invocation, then the SMPM CFpurge return codes and
The reason codes are:

02 The data set is not supported in an SMS environment (ABSTR, unmovable, model DSCB, CVOL, nonintegrated catalog facility VSAM catalog, or nonintegrated catalog facility VSAM data set).

03 The data set is not supported in a non-SMS environment (PDSE, HFS or extended format data set).

04 The data set is an uncataloged GDS.

05 The data set has extended attributes. Data sets with extended attributes cannot reside on non-SMS volumes.

06 The data set is a cataloged GDS, but it is not cataloged in the standard order of search.

08 The data set is a GDS with nonspecific volumes.

10 The data set is a GDS with candidate volumes.

12 ACS routines did not return SMS constructs for the data set.

14 A null storage class was returned for the data set.

16 The storage class definition cannot be retrieved for the data set.

18 The data set is multivolume, extents for the data set exist on volume volser, volume volser was not specified in the volume list, and SELECTMULTI(ALL) was specified (or defaulted to).

20 The data set is multivolume, volume volser is the first volume of the data set (for VSAM, volume volser is the first volume of the data component), volume volser was not specified in the volume list, and SELECTMULTI-FIRST was specified.

22 The data set is multivolume and has extents on volumes volume_serial_number that are in different storage groups.

24 The data set has candidate volumes volume_serial_number that are in different storage groups.

26 The data set is multivolume and has extents on volumes volume_serial_number that are ineligible for conversion for the reasons given. (See message ADR874E for volume reason code.)

28 The data set has candidate volumes volume_serial_number that are ineligible for conversion for the reasons given. (See message ADR874E for volume reason code.)

30 The data set is multivolume and is not cataloged.

32 The data set is not cataloged in the standard search order, and the CATALOG keyword was not specified.

34 The data set is not cataloged in the standard search order, and a duplicate entry was found in another catalog.

36 The data set is not cataloged in the standard search order, and a duplicate entry was found in a standard order of search catalog.

38 The VSAM base cluster is in a sphere where all data sets are not convertible to SMS management.

40 The catalog to which the AIX’s sphere is directed is different from the catalog to which the AIX’s related base cluster is directed. All components must be in the same catalog.

42 The catalog to which the path’s sphere is directed is different from the catalog to which the path’s related base cluster is directed. All components must be in the same catalog.

44 ALTER failed during an attempt to update the catalog entry for the data set.

46 DELETE NOSCRATCH failed during an attempt to delete the catalog entry for the data set.

48 DEFINE RECATALOG failed during an attempt to recatalog the data set.

49 DEFINE ALIAS failed during an attempt to define the aliases for the data set.

50 DEFINE CATALOG failed during an attempt to catalog the data set.

52 CATALOG NAME LOCATE failed during an attempt to determine where the data set should be cataloged according to standard order of search.

54 DEFINE PATH failed during an attempt to define a path.

56 LOCATE failed.

58 The VSAM base cluster is in a sphere that includes data sets with catalog errors.

60 Read non-VSAM volume record (NVR) failed in the VVDS manager.

62 Get for update of non-VSAM volume record (NVR) failed in the VVDS manager.

64 Put for update of non-VSAM volume record (NVR) failed in the VVDS manager.
Delete of non-VSAM volume record (NVR) failed in the VVDS manager.

Insert of non-VSAM volume record (NVR) failed in the VVDS manager.

Read VSAM volume record (VVR) failed in the VVDS manager.

Get for update of VSAM volume record (VVR) failed in the VVDS manager.

Put of VSAM volume record (VVR) failed in the VVDS manager.

The VSAM base cluster is in a sphere that includes data sets with VVR errors.

Read of the VTOC failed during an attempt to update the SMS indicator for the data set.

Rewrite of the VTOC failed during an attempt to update the SMS indicator for the data set.

The VSAM base cluster is in a sphere that includes data sets with VTOC entry update errors.

The VSAM component does not have a corresponding VTOC entry.

The non-VSAM data set is SMS-managed, but its NVR cannot be found.

Storage class authorization for the data set failed.

Management class authorization for the data set failed.

Both storage class and management class authorization for the data set failed.

DFSMSdss invoked the SMPM CFPurge function to purge the data in the coupling facility caches for the data set. The SMPM CFPurge function returned the listed return and reason codes.

Unable to get extent information from the VTOC.

Data set is HFS file.

The data set failed enqueue.

The data set is an extended sequential data set (SAM striped).

Extended format VSAM data set.

The data set has RLS information associated with it, and therefore is not supported in this release.

The data set is marked as checkpointed.

A component of the VSAM base cluster or alternate index has more than 255 extents, which requires System Managed Storage (SMS).

System action: Processing continues with the next data set. The volume will not be successfully converted to or from SMS management. The return code is 8.

Operator response: None.

Application Programmer Response:

02-10 Move or delete the data set from the volume.

12 Update ACS routines to return SMS constructs for the data set.

14-16 Verify ACS routines to ensure that the data set is defined to a storage class.

18 Take one of the following actions and rerun the job:
   • Specify SELECTMULTI(FIRST) and include the first volume of the data set in the input volume list. For VSAM data sets, you must include the first volume of the data component in the input volume list.
   • Specify SELECTMULTI(ALL) (this is the default if you do not specify SELECTMULTI) and include all volumes of the data set in the input volume list.
   • Specify SELECTMULTI(ANY) and include at least one primary or candidate-with-space volume of the data set in the input volume list.
   • Move or delete the data set off the volume you are trying to convert.

20 Take one of the following actions and rerun the job:
   • Specify SELECTMULTI(FIRST) and include the first volume of the data set in the input volume list. For VSAM data sets, you must include the first volume of the data component in the input volume list.
   • Specify SELECTMULTI(ALL)(this is the default if you do not specify SELECTMULTI) and include all volumes of the data set in the input volume list.
   • Specify SELECTMULTI(ANY) and include at least one primary or candidate-with-space volume of the data set in the input volume list.
   • Move or delete the data set off the volume you are trying to convert.

22 Change your active control data set so that all the volumes that the data set resides on are defined to the same storage group.

24 (1) Delete the candidate volumes from the data set's catalog entry, or (2) change your ACDS so that all the candidate volumes are defined to the same storage group as the volumes on which the data set resides.

26-28 See message ADR874E for required action.
(1) Catalog the data set, or (2) move or delete the data set from the volumes that you are trying to convert.

(1) Specify the CATALOG keyword, or (2) recatalog the data set into the standard order of search.

(1) Catalog the data set into the standard order of search, or (2) rename the data set, or (3) move or delete the data set from the volumes that you are trying to convert.

(1) Rename the data set, or (2) move or delete the data set from the volumes that you are trying to convert.

(1) Rename the base cluster, the data or index component, AIX, AIX data or index component, or PATH to be directed to the same catalog as the VSAM base cluster, or (2) delete or add catalog aliases so all parts of the sphere are alias-directed to the same catalog.

Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Make sure that the RESOWNER of the data set is authorized to use the storage or management class derived for the data set, or (2) update the ACS routines to select a different storage or management class for the data set.

See the z/OS DFSMSdss Diagnosis for an explanation of the listed return and reason codes.

See previous error message associated with the data set for specific action.

Move the data set to another SMS volume.

Ensure that no other jobs are accessing data sets on volumes to be converted, and then rerun the CONVERTV job.

Move or delete the data set from the volume

Move the data set to another SMS volume.

Rerun the job on a system running DFSMS/MVS Version 1 Release 3 or higher.

Confirm that the checkpointed data set is no longer required for a restart, specify FORCECP with the appropriate days parameter and rerun the job.

1. Move the data set to another SMS volume.
2. Delete the data set from the volumes that you are trying to convert.

Source: DFSMSdss

ADR879I  (ttt-mmmmm{yy}), THE FOLLOWING DATA SETS ON VOLUME volume_serial_number WERE ALREADY IN (NON-)SMS STATUS

Explanation:

dname CATALOG: catname
[STORCLAS: scname MGMTCLAS: mcname]
[VOLUMES: vol001 vol002 vol003 . . . ]
[AIX: aixname]
(PATH: pathname)

The listed data sets were not processed because they were already in the desired SMS status.

• The data sets are cataloged in the named catalog.

• If the task was conversion to SMS management, the storage and management classes in which the data set is defined are listed.

• Asterisks (*) shown in the place of storage and management class names indicate that no primary VVR was found for the cluster.

• Dashes (-) shown in the place of storage and management class names indicate incorrectly converted old format VVRs. See message ADR409E.

• If the data set is multivolume, the volumes on which the data set resides are listed.

• If the data set has any AIXs or PATHs defined for it, these are listed. If any of the AIXs are multivolume, then the volumes on which they reside are listed.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR880I  (ttt-mmmmm{yy}), VOLUME volume_serial_number IS EMPTY. NO DATA SETS WERE CONVERTED

Explanation: Data set conversion was not required because the named volume did not have any data sets defined on it.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss
**ADR881I** *(ttt-,mmmmm(yy)), VOLUME volume_serial_number CONTAINS THE FOLLOWING TEMPORARY DATA SETS dsname*

**Explanation:** The named volume contains the temporary data sets listed.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR882W** *(ttt-,mmmmm(yy)), THE FOLLOWING DATA SETS ON VOLUME volume_serial_number (WILL NOT BE I WERE NOT) SUCCESSFULLY PROCESSED, BUT WERE ALREADY IN {NON}SMS STATUS dsname*

**Explanation:**

An error was found while the listed data set (or its associated AIX or PATH) was being processed, but the data set was already converted, so this error will not affect the volume being successfully converted. rc is the reason code for the data set's failing. See message ADR878E for a full explanation of the data set error information returned and the reason codes.

**System action:** Processing continues with the next data set. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** See message ADR878E.

**Source:** DFSMSdss

---

**ADR885I** *(ttt-,mmmmm(yy)), VOLUME volume_serial_number (WILL BE I HAS BEEN) SUCCESSFULLY CONVERTED {TO|FROM} SMS MANAGEMENT*

**Explanation:** All data sets on the named volume were successfully converted to either SMS or non-SMS status. The SMS flags in the VTOC entry and the VTOC index map for the volume were successfully updated to the appropriate status. If TEST was specified, this message indicates that processing would have been successful if the job had actually been run. No changes occur to the volume under TEST.

**System action:** Processing continues with the next volume in the input volume list.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

---

**ADR886E** *(ttt-,mmmmm(yy)), DATA SETS EXIST ON VOLUME volume_serial_number WHICH ARE NOT CONVERTIBLE (TO | FROM) SMS MANAGEMENT. THE VOLUME {WILL BE I WAS} (PLACED | LEFT) IN INITIAL STATUS*

**Explanation:** The named volume failed SMS/non-SMS conversion because of data sets that cannot be converted existing on the volume. The volume is left in INITIAL status at the end of processing. If TEST was specified, this message indicates that processing would have failed if the job had actually been run. No changes occur to the volume under TEST.

**System action:** Processing continues with the next volume in the input volume list. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Appropriate responses are:

- For SMS processing, the problem can be solved by one of the following:
  - Adding the CATALOG, INCAT, SELECTMULTI(FIRST), or SELECTMULTI(ANY) keywords to the DFSMSdss job stream, and rerunning the SMS job.
  - Running a non-SMS job to place the volume back in non-SMS status, deleting or moving the data sets that caused the processing to fail, and rerunning the SMS job.
- For non-SMS processing, the problem can be solved by one of the following:
  - Adding the SELECTMULTI(FIRST) or SELECTMULTI(ANY) keyword to the DFSMSdss job stream, and rerunning the job.
  - Running an SMS job to place the volume back in SMS status, deleting or moving the data sets that caused the processing to fail, and rerunning the non-SMS job.

**ADR888I**

EXTENT starting_c:h-ending_c:h ON VOLUME volume_serial_number AND WORKING SPACE DATA SET flashcopy_wsds_name ON DEVICE device_number [SENSE DATA: vcc_sense_data]

Explanation: DFSMSdss attempted to process the data set or volume using virtual concurrent copy, and the system data mover failed with the listed diagnostic information for one or more extents. System data mover attempted to retry with cache-based concurrent copy initialization. This message might be issued for an error that occurred when FlashCopy and a working-space data set were used to accomplish virtual concurrent copy.

In the message text:

return_code1
The return code of the overall virtual concurrent copy from the system data mover.

reason_code1
The reason code of the overall virtual concurrent copy from the system data mover.

return_code2
The return code of the virtual concurrent copy from the system data mover for the first failing extent.

reason_code2
The reason code of the virtual concurrent copy from the system data mover for the first failing extent.

starting_c:h-ending_c:h
The extent range of the first failing source extent.

flashcopy_wsds_name
The lowest level qualifier, FCWKnnnn, of the working-space data set that encountered the error.

device_number
The device number of the volume where the failing working-space data set resides.

vcc_sense_data
The sense data from the system data mover. Sense data is not printed if it contains all zeros. The format is: ios_status,csw,8_word_sense.

System action: DFSMSdss processing continues. The return code is 0.

Operator response: None.

Application Programmer Response: See the “System Data Mover Return and Reason Codes” on page xxx.

Source: DFSMSdss
vcc_sense_data
The sense data from the system data mover. Sense data is not printed if it contains all zeros. The format is: ios_status,csw,8_word_sense.

After all of the volumes in the CONVERTV job are processed and individual volume and data set processing messages are printed, DFSMSdss issues this report summary message, which lists all of the volumes and their final status. If conversion of a volume failed, the reason for failure is also indicated.

System action: None.
Operator response: None.
Application Programmer Response: If any of the volumes failed processing, see that volume's specific processing messages to determine the reason for failure and corrective action for the error.
Source: DFSMSdss

ADR893I (ttt-mmmmmm(yy), THE FOLLOWING VOLUMES CONTAIN PIECES OF MULTIVOLUME DATA SETS WHICH WERE PROCESSED DURING THE CONVERTV TASK, THE VOLUMES ARE IN THE INDICATED STATUS)

Explanation:

<table>
<thead>
<tr>
<th>volser</th>
<th>SMS</th>
<th>INITIAL</th>
<th>NONSMS</th>
<th>UNKNOWN</th>
</tr>
</thead>
</table>

Some data sets processed during the CONVERTV job were multivolume and had extents on volumes not in the input volume list. For SMS processing, the SMS status of these volumes is not altered. For non-SMS processing, the volumes are set to INITIAL if at least one data set with extents on those volumes was successfully processed.
Note: If this message is issued, the user have pieces of SMS-managed data sets on non-SMS volumes. These volumes must also be converted to SMS management.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR894E (ttt-mmmmmm(yy)), ERRORS OCCURRED WHILE TRYING TO PLACE THE FOLLOWING VOLUMES IN INITIAL STATUS

volser - reason_code

Explanation: Some data sets processed during the NONSMS CONVERTV job were multivolume and had extents on volumes not in the input volume list. An error occurred in trying to set the SMS status of these listed volumes to INITIAL. See message ADR891E for the explanation of the reason code.

System action: None. The return code is 8.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR898D (ttt-mmmmmm(yy)), PRINT VVDS FOR VOLUME volser, REPLY U TO CONTINUE

Explanation: To gather further documentation, perform an IDCAMS PRINT or a DFSMSdss PRINT of the VVDS for the requested Volume.

System action: Processing continues upon response from the operator.

Operator response: If a print of the VVDS for the volume has been obtained as well as other documentation such as a dump of the CATALOG and DFSMSdss address spaces, reply U to allow the DFSMSdss job to continue processing.

Application Programmer Response: Instruct the operator to gather the appropriate documentation and to let DFSMSdss continue processing.

Source: DFSMSdss

ADR901E (ttt-mmmmmm(yy)), COPY OF EXTENDED SEQUENTIAL DATA SET dsname FAILED

Explanation: The requested function could not be completed. Message ADR910E, which follows, explains the reason for the failure.

System action: The data set is not processed. The return code is set to 8.

Operator response: None.

Application Programmer Response: See message ADR910E for the reason for the failure.

Source: DFSMSdss

ADR902I (ttt-mmmmmm(yy)), COPY OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL. SIZE OF INPUT DATA SET PROCESSED WAS nnnn1. SIZE OF OUTPUT DATA SET PROCESSED WAS nnnn2

Explanation: The specified data set (dsname) was copied successfully. The sizes specify the number of user bytes (nnnn1) copied from the source and the number of user bytes (nnnn2) placed on the target.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR903I (ttt-mmmmmm(yy)), DUMP OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL. SIZE OF DATA SET DUMPED WAS nnnn

Explanation: The specified data set dsname was dumped successfully. The size nnnn specifies the number of user bytes dumped from the source.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR904I (ttt-mmmmmm(yy)), DUMP OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL

Explanation: The specified data set dsname was dumped successfully.

System action: None.

Operator response: None.

Application Programmer Response: None.
ADR905E  (ttt)-mmmmdmmm(yy), DUMP OF EXTENDED SEQUENTIAL DATA SET dsname FAILED

**Explanation:** The requested function could not be completed. ADR910E, which follows, explains the reason for the failure.

**System action:** The data set is not processed. The return code is set to 8.

**Operator response:** None.

**Application Programmer Response:** See message ADR910E for the reason for the failure.

**Source:** DFSMSdss

ADR906I  (ttt)-mmmmdmmm(yy), RESTORE OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL. SIZE OF DATA SET RESTORED WAS nnnn

**Explanation:** The specified data set dsname was restored successfully. The size nnnn specifies the number of user bytes restored.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR907I  (ttt)-mmmmdmmm(yy), RESTORE OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL

**Explanation:** The specified data set dsname was restored successfully.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR908E  (ttt)-mmmmdmmm(yy), RESTORE OF EXTENDED SEQUENTIAL DATA SET dsname FAILED

**Explanation:** The requested function could not be completed. Message ADR910E, which follows, explains the reason for the failure.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See message ADR910E for the reason for the failure.

**Source:** DFSMSdss

ADR909E  (ttt)-mmmmdmmm(yy), AN ERROR WAS ENCOUNTERED. RETURN CODE = return_code, REASON CODE = reason_code

**Explanation:** The requested function for an extended sequential data set was completed. However, an error condition was encountered. The reason and return codes can be found in the table in message ADR910E.

**System action:** The data set was successfully processed, but a minor error was encountered during the data set processing.

**Operator response:** None.

**Application Programmer Response:** Use the return and reason code table in message ADR910E to identify the error.

**Source:** DFSMSdss

ADR910E  (ttt)-mmmmdmmm(yy), AN ERROR WAS ENCOUNTERED DURING {operation} PROCESSING. RETURN CODE = crrrrrrr, REASON CODE = bbbbbb {, SENSE DATA = ios_status, csw_status, sense_data}

**Explanation:** The requested function for processing an extended sequential data set received an error during processing. The reason for the failure is identified by the return code (crrrrrrr) The failure occurred during the operation specified by {operation}

The return code format is crrrrrrr, where c is the component area that reported the failure, and rrrrr is the return code. In some cases, a reason code will be supplied for additional diagnostic information, when applicable.

If sense data exists for the failure, the ios status, csw status, and sense data will be included to aid in problem determination. If sense data does not exist, this part of the message will not be included.

The operation field contains the operation being processed. The following are valid values for operation:

- **Initialization** An error occurred during the process of obtaining storage, initializing the parameter list, and so forth.
- **Open Source** An error occurred during the process performed to open the source data set.
- **Open Target** An error occurred during the process performed to open the target data set.
- **Data Movement** An error occurred during the data movement process.
Close Source  An error occurred during the process performed to close the source data set.

Close Target  An error occurred during the process performed to close the target data set.

Cleanup     A failure occurred during the process of cleaning up data areas, storage, or related items required to process the request.

Example: The following example message indicates that the data set being processed has failed while reading or writing data for the requested data set. (001)-PSEC(M01), An error was encountered during data movement processing. Return code = 500005E3, Reason code = 00000008

The failing component area is indicated by the 5 in the leftmost position of the return code. The failure is a return code X'5E3' and a reason code of 8.

To determine the cause of the failure, find the value of the component (5, in this example), and then locate the failing return code or the failing reason code, or both, in the following lists:

Return Code   Explanation
00xxxxxxx     Component Value = 0

Values for xxxxxx

100 (X'64')  An error has been encountered during SVM processing while attempting to close a "pipe".

101 (X'65')  An error has been encountered during SVM processing while attempting to free a buffer.

102 (X'66')  An error was encountered during execution of an MVS LOAD macro for entry SVMXHOTT.

103 (X'67')  An error was encountered during execution of an MVS DELETE macro for entry SVMXHOTT.

200 (X'C8')  An environmental error has been encountered during SVM processing. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

201 (X'C9')  An environmental error has been encountered during SVM "asynchronous" processing. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

202 (X'CA')  An environmental error has been encountered while trying to read data from an SVM pipe. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

203 (X'CB')  An environmental error has been encountered while using the SVM "allocate" service. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

204 (X'CC')  An environmental error has been encountered while using the SVM "open pipe" service. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

205 (X'CD')  An environmental error has been encountered while using the SVM
“write pipe” service. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

206 (X'CE')
An error has been encountered during execution of an MVS LOAD macro for entry SVMXHOTL.

207 (X'CF')
An error has been encountered during execution of an MVS DELETE macro for entry SVMXHOTL.

208 (X'D0')
An error has been encountered during execution of an MVS LOAD macro for entry SVMXHOTU.

209 (X'D1')
An error has been encountered during execution of an MVS DELETE macro for entry SVMXHOTU.

210 (X'D2')
An error has been encountered during execution of an SDM Dataspace Create request.

211 (X'D3')
An error has been encountered during execution of an SDM Dataspace request.

3xxxxxx
Component Value = 3 The system data mover (SDM) reported an error. See Table 1 on page 190

4xxxxxx
Component Value = 4 Extended format I/O routine reported the error. See z/OS DFSMSdfp Diagnosis for the return and reason codes.

5xxxxxx
Component Value = 5 An internal error has occurred. If the error cannot be determined, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Values for xxxxxx

1500 (X'00005DC')
A buffer sequence error has occurred internally. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1501 (X'00005DD')
An invalid buffer sequence error has been detected. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1502 (X'00005DE')
An internal error has been detected in ANTRPSE. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1503 (X'00005DF')
An external error has been detected in ANTRPSE. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1504 (X'00005E0')
An invalid buffer sequence error has been detected in ANTRPSE. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1505 (X'00005E1')
An external error has been detected in ANTRPSE. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1506 (X'00005E2')
An internal error has been detected by the internal exit. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

1507 (X'00005E3')
A failing condition has been detected during I/O processing. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

9xxxxxx
Component Value = 9 An ABEND occurred while processing the request. The system ABEND code is contained in xxxxxx. Check the system abend code explanation to determine if the condition can be corrected.

System action: If an ABEND occurred during data movement for a dump operation, processing ends and the return code is 16. For all other cases, the data set is not processed, processing continues with the next data set, and the return code is 8.

Operator response: None.

Application Programmer Response: If the cause cannot be corrected, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss
ADR912I \( (ttt\)-mmmm(nn)(yy)), COPY OF EXTENDED SEQUENTIAL DATA SET dsname WAS SUCCESSFUL

Explanation: The specified data set dsname was copied successfully.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR913E \( (ttt\)-mmmm(nn)(yy)), EXTENDED FORMAT DATA SET dsname ORGANIZATION IS NOT SUPPORTED OUTSIDE AN SMS ENVIRONMENT

Explanation: The data set being processed has a data set organization that is only supported by an SMS environment.

System action: Processing continues. This data set is not processed.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR915W \( (ttt\)-mmmm(nn)(yy)), AN ERROR OCCURRED IN SMS WHILE ALLOCATING DATA SET dsname1

[WITH NEW NAME dsname2], ALLOCATION AS NON-EXTENDED WILL BE ATTEMPTED. SMS MESSAGES FOLLOW

Explanation: An error occurred in the Storage Management Subsystem while allocating the extended format data set. SMS messages are printed following this message. DFSMSdss will attempt to allocate the data set as non-extended format.

System action: Processing of the data set continues. The return code is 4.

Operator response: None.

Application Programmer Response: See the SMS messages following this message to determine the reason for the allocation failure. Correct the problem if the allocation failure is not expected.

Source: DFSMSdss

ADR916W \( (xxx\)-mmmm(nn)(yy)), FOR VOLUME volume_serial_number THE DEVICE SIZE IN THE VTOC, calculated_vtoc_size, IS LARGER THAN THE DEVICE SIZE FROM RDC, rdc_size. THE DEVICE SIZE FROM RDC WILL BE USED

Explanation: DFSMSdss determined, from the VTOC information, a volume size that is larger than the RDC volume size for the given device. The sizes, in decimal, represent the number of primary cylinders for the device. DFSMSdss will process the volume using the RDC value instead of the value determined from the VTOC.

System action: Processing for the volume continues. The return code is 4.

Operator response: None.

Application Programmer Response: Determine the proper size of the device, correct the problem, and rerun the job. If the size of the volume in the VTOC, the VTOC index, or both, is incorrect, you can use ICKDSF REFORMAT REVTOTC to correct the problem. Additionally, you might need to refresh the operation system's internal control structure for the device. Use the following DEVSCREEN operator command:

DEVSCREEN QDASD,ccuu,1,VALIDATE

In the above example, ccuu is the device number. If these actions do not resolve the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center for programming support.

Source: DFSMSdss

ADR917E \( (xxx\)-mmmm(nn)(yy)), DATA SET dsname WAS NOT (DUMPED | RESTORED) BECAUSE IT COULD NOT BE ALLOCATED

Explanation: DFSMSdss attempted to dynamically allocate data set dsname, and the allocation failed. The reason for the failure is contained in the previous ADR405E message.

System action: The data set is not processed. The return code is 8. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR918I \( (ttt\)-mmmm(nn)(yy)), FAST REPLICATION COULD NOT BE USED FOR (DATA SET dsname | VOLUME volser | THIS task TASK), RETURN CODE dss_return_code

{summarized_info | detailed_info}

Explanation: summarized_info is:

\[ \{, \text{number} \ | \text{VOLUME WAS} \ | \text{VOLUMES WERE} \ | \text{REJECTED FOR} \ | \text{VOLUME REASON CODE} \ | \text{vrvolts_vrsn} \ | \text{vrvolts_vrsn_text} \]
### DFSMSdss Cannot Use a Fast Replication Method

DFSMSdss cannot use a fast replication method. The system might issue this message for diagnostic purposes if the DEBUG(FRMSG(MIN | SUM | DTL)) or the FASTREPLICATION(REQ) keyword is specified. The return code and reason code listed in the message text are hex values.

If any QFRVOLS reason codes are listed, see the ANTRQST section in [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/knowledgecenter/SSS7X8_7.1.0/com.ibm.zos.bks.fas.cdfse.pdf) for an explanation of the QFRVOLS volume or extent reason codes (qfrvols_vrsn or qfrvols_xrsn). The possible return codes (dss_return_code) and reason codes (dss_reason_code) are:

- **X'1'** The source device is not capable of fast replication.
- **X'2'** The target device is not capable of fast replication.
- **X'3'** One or more of the source devices are not eligible for fast replication at this time.

When DEBUG(FRMSG(SUMMARIZED)) is specified, return code X'3' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes are not eligible. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn) and extent reason codes (qfrvols_xrsn).

When DEBUG(FRMSG(DETAILED)) is specified, return code X'9' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was ineligible. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn) and extent reason codes (qfrvols_xrsn).

### Fast Replication (None) Specified

FASTREPLICATION(NONE) is specified for this task.

### One or More Target Devices are Not Eligible for Fast Replication

One or more target devices are not eligible for fast replication at this time.

When DEBUG(FRMSG(SUMMARIZED)) is specified, return code X'9' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes are not eligible. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn) and extent reason codes (qfrvols_xrsn).

When DEBUG(FRMSG(DETAILED)) is specified, return code X'9' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was ineligible. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn) and extent reason codes (qfrvols_xrsn).

### Source Data Set is a Multi-Layered VSAM Data Set

The source data set is a multi-layered VSAM data set, for which DFSMSdss must invoke a utility to move the data.

### Cluster is Part of a Sphere and Another Cluster in the Same Sphere Cannot be Processed Using Fast Replication

The cluster is part of a sphere and another cluster in the same sphere cannot be processed using fast replication.

### Data Set is a PDS and NOPACK is Not Specified

The data set is a PDS and NOPACK is not specified.

### A Failure Occurs While Attempting to Register a Session with the System Data Mover (SDM)

A failure occurs while attempting to register a session with the System Data Mover (SDM).

### The ANTRQST Macro Fails While Trying to Determine If the Source or Target Volumes Are Eligible For Fast Replication

The ANTRQST macro fails while trying to determine if the source or target volumes are eligible for fast replication.

### The Volume Does Not Support Data Set Fast Replication

The volume does not support data set fast replication.

### The Data Set Is Being Reblocked

The data set is being reblocked.

### The Source Data Set Stripe Count Does Not Match the Target Data Set Stripe Count

The source data set stripe count does not match the target data set stripe count.

### The Data Set Is a Single-Striped Multivolume Data Set

The data set is a single-striped multivolume data set.

### The Direct Access Data Set Is Being Processed Block By Block

The direct access data set is being processed block by block.
For the non-SMS allocation, target volumes that support fast replication cannot be selected.

When DEBUG(FRMSG(SUMMARIZED)) is specified, return code X'14' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes failed selection. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn), QFRVOLS extent reason codes (qfrvols_xrsn), or DFSMSdss reason codes (dss_reason_code).

When DEBUG(FRMSG(DETAILED)) is specified, return code X'14' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was ineligible. The reason codes include SDM QFRVOLS volume reason codes (qfrvols_vrsn), QFRVOLS extent reason codes (qfrvols_xrsn), or DFSMSdss reason codes (dss_reason_code).

See the ANTRQST section in z/OS DFSMS Advanced Copy Services for a list of the QFRVOLS volume and extent reason codes. The possible DFSMSdss reason codes (dss_reason_code) are:

X'1' The target volume does not have enough space to accommodate the target data set.

X'2' There are no free DSCBs in the VTOC.

X'3' The volume is SMS-managed.

X'4' The LSPACE macro was issued for the volume to determine whether enough free space existed on the volume. The LSPACE macro failed.

X'5' The source data set resides on the volume and the data set is not being renamed.

X'6' One of the following conditions occurred when DFSMSdss attempted to allocate the data set:
  • Duplicate data set exists on the volume
  • If the volume did not have a duplicate data set, this reason code indicates that the volume does not contain enough free space to accommodate the data set. For an ISAM data set, the matching space in the target was not available.

X'7' One of the following conditions occurred when DFSMSdss attempted to allocate the data set:
  • The data set is unmovable.
  • Either an absolute track allocation (ABSTR) failed or the lack of system support for absolute track allocation precluded the use of absolute track allocation.

X'8' DFSMSdss attempted to allocate the data set on the volume, but a DADSM failure occurred.

X'9' An indexed VTOC does not exist on the volume. The REALLOC macro was issued for an absolute track allocation. The REALLOC macro failed because ALLOC=ABS is not supported on OS VTOCs.

X'15' For the SMS allocation, target volumes that allow fast replication to be used cannot be selected.

When DEBUG(FRMSG(SUMMARIZED | DETAILED)) is specified, return code X'15' is followed by SMS allocation messages which provide summarized information. Detailed information at individual volume level is not available. See the SMS messages for explanations.

X'16' The ANTRQST macro fails while trying to determine if the device is capable of fast replication.

X'17' The data set is a PDS that you are converting to a PDSE, or vice versa, which requires a utility to be used by DFSMSdss.

X'19' The data set is a catalog BCS data set which requires a utility to be used by DFSMSdss.

X'1A' The data set is a VSAM data set with key ranges and is extended, which requires a utility to be used by DFSMSdss.

X'1B' The data set is a KSDS that has imbedded indexes, which requires a utility to be used by DFSMSdss.

X'1C' Multiple volumes are required for the target data set, but multivolume allocation cannot be used. Therefore, the data set must be extended during the copy, which requires a utility to be used by DFSMSdss.

X'1D' The CA size of the target data set is different from that of the source data set, which requires a utility to be used by DFSMSdss.

X'1E' The block size of the target data component is different from that of the source data component, which requires a utility to be used by DFSMSdss.

X'1F' The blocks per track for the target data
component is different from that of the source data component, which requires a utility to be used by DFSMSdss.

X'20' The blocks per track for the target index component is different from that of the source index component, which requires a utility to be used by DFSMSdss.

X'21' The block size of the target index component is different from that of the source index component, which requires a utility to be used by DFSMSdss.

X'22' The data set is an indexed VSAM data set with an imbedded index, TGTALLOC (CYL) was specified, and the source did not use cylinder allocation, which requires a utility to be used by DFSMSdss.

X'23' Sufficient space cannot be allocated for the target multi-striped VSAM data set. Therefore, the target data set must be extended during the copy process, which requires a utility to be used by DFSMSdss.

X'24' The target data set is smaller than the source data set because of an internal error.

X'25' The volume has insufficient available FlashCopy relationships to complete the task.

X'26' The source index is full and the target data set index can not be allocated the same size, which requires a utility to be used by DFSMSdss.

X'27' FCTOPPRCPRIMARY(PRESMIRREQ) was specified, but there were insufficient Preserve Mirror eligible volumes specified in the output volume list on which to allocate the target data set. DFSMSdss could not use Fast Replication to perform the operation without causing one or more PPRC pairs to go into 'duplex pending' status.

When FASTREPLICATION(REQUIRED) or DEBUG(FRMSG(SUMMARIZED | DETAILED)) is specified, return code X'27' is followed by summarized volume information that consists of reason codes that indicate why one or more volumes failed selection. For each reason code issued, the number of volumes failing for that reason is provided. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn) or QFRVOLS PRESERVE MIRROR extent reason codes (qfrvols_xrsn).

When DEBUG(FRMSG(DETAILED)) is specified, return code X'27' is followed by detailed information that lists each volume that was considered, along with a reason code indicating why that volume was ineligible. The reason codes include SDM QFRVOLS PRESERVE MIRROR volume reason codes (qfrvols_vrsn) or QFRVOLS PRESERVE MIRROR extent reason codes (qfrvols_xrsn).

Refers to the ANTRQST section in z/OS DFSMS Advanced Copy Services for a list of the QFRVOLS volume and extent reason codes.

System action: DFSMSdss processing continues. The return code is zero.

Operator response: None.

Application Programmer Response: In order for fast replication to be used in subsequent operations, take the following action, depending on the return code. The possible actions are:

X'1' Move the source data sets to volumes that support fast replication.

X'2' Choose target devices that support fast replication.

X'3' If the FASTREPLICATION(REQUIRED) or DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword is specified, this return code X'3' is followed by one or more QFRVOLS volume reason codes (qfrvols_vrsn) or extent reason codes (qfrvols_xrsn). See z/OS DFSMS Advanced Services for information about the QFRVOLS volume and extent reason codes.

If you did not receive a reason code following return code X'3' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

X'4' See the previously issued ADR932W message and correct the problem.

X'5' Install the IXFP software.

X'7' Remove the FASTREPLICATION(NONE) keyword and rerun the job.

X'9' If the FASTREPLICATION(REQUIRED) or DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword was specified, this return code X'9' is followed by one or more QFRVOLS volume reason codes (qfrvols_vrsn) or extent reason codes (qfrvols_xrsn). See the ANTRQST section in the z/OS DFSMS Advanced Copy Services for information about the QFRVOLS volume and extent reason codes.

If you did not receive a reason code following return code X'9' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

X'A' None. Fast replication cannot be used.

X'B' Refer to the previously issued ADR918I
message for the base cluster and/or any alternate indexes in the sphere and resolve the problems.

X'C'
Specify NOPACK.

X'D'
See the previously issued ADR936W message and resolve the problem.

X'E'
See the previously issued ADR932W message and resolve the problem.

X'F'
Move the data to a volume that supports data set fast replication.

X'10'
Remove the REBLOCK keyword if specified.

X'11'
For storage classes without guaranteed space, copy the data set to a storage class with the same Sustained Data Rate (SDR) as the source storage class. For storage classes with guaranteed space, specify output volumes, the number of which is equal to the number of stripes of the source data set.

X'12'
None. Fast replication cannot be used.

X'13'
Remove the AUTORELBLOCKADDRESS or the RELBLOCKADDRESS keyword.

X'14'
If you did not receive a reason code following return code X'14' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

X'15'
See the SMS allocation messages for an explanation. Correct the problem and resubmit the job. If SMS messages were not issued, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

X'16'
See the previously issued ADR932W message and resolve the problem.

X'17'
Specify a volume that has free space on the matching tracks.

X'18'
Correct the DADSM failure and resubmit the job.

X'19'
Specify a volume with an indexed VTOC.

X'1A'
None. Fast replication cannot be used.

X'1B'
None. Fast replication cannot be used.

X'1C'
If possible, copy the data set to a single volume that contains enough space to contain the entire source data set.

X'1D'
None. Fast replication cannot be used.

X'1E'
None. Fast replication cannot be used.

X'1F'
None. Fast replication cannot be used.

X'20'
None. Fast replication cannot be used.

X'21'
None. Fast replication cannot be used.

X'22'
Remove the TGTALLOC(CYL) keyword.

X'23'
Ensure that the target volumes contain sufficient space so that the target data set does not need to be extended during the copy process.

X'24'
Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

X'25'
Rerun the job when there are fewer active relationships on the volume. Use the TSO FCQUERY command to find out how many relationships are active. See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/docview.wss?uid=swg21329769) for more information about FlashCopy TSO commands.

X'26'
The source and target indexes must be allocated the same size in order to use a fast replication method. Try adding a keyword TGTALLOC(SRC) or using a pre-allocated data set. Once the data set is copied with IDCAMS, subsequent copies of the target data set by DFSMSdss should not require the use of IDCAMS.

X'27'
If the FASTREPLICATION(REQUIRED) or DEBUG(FRMSG(SUMMARIZED | DETAILED))
If you did not receive a reason code following return code X'27' and would like to have more information, specify the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword in the JCL and rerun the job.

For a DEFRAG or CONSOLIDATE operation, specify a volume that is eligible for Preserve Mirror, or specify FCTOPPRCPRIMARY(PRESMIRPREF) keyword, or specify the FASTREPLICATION(PREFERRED) keyword.

For a Physical COPY FULL, TRACKS, or DATASET operation, specify an output volume that is eligible for Preserve Mirror, or specify FCTOPPRCPRIMARY(PRESMIRPREF) keyword, or specify the FASTREPLICATION(PREFERRED) keyword.

For a Logical DATASET COPY operation, specify a sufficient number of output volumes that are eligible for Preserve Mirror, or specify FCTOPPRCPRIMARY(PRESMIRPREF) keyword, or specify the FASTREPLICATION(PREFERRED) keyword.

Source: DFSMSdss

ADR919W (xxx)-mmmm(yy), DATA SET dsname CREATE DATE IS A FUTURE DATE AND IS BEING RESET

Explanation: The data set to be restored contains a create date that is greater than the current date.

System action: The restored data set creation date is reset to the current date. The return code is 4.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR920I (tffy-mmmmm(yy)), FAST REPLICATION COULD NOT BE USED TO COPY THE VTOC TRACKS FOR volser, REASON CODE reason_code

Explanation: DFSMSdss cannot use a fast replication method to copy the VTOC tracks. This message is issued during physical full volume or tracks copy operations. When DFSMSdss needs to rebuild the VTOC during copy, you must use a traditional data movement method for VTOC tracks. The possible reason codes for reason_code are:

X'1' The source VTOC is in an old VTOC format. Therefore, you must preserve some of the information in the target VTOC.

X'2' The number of cylinders on the target volume do not match the number on the source volume, so you must rebuild the free space information in the VTOC.

X'3' You must copy the first track of the VTOC on the volume using manual I/O because of a COPY TRACKS operation that includes all or part of the VTOC on the source volume, and/or overlays all or part of the VTOC on the target volume.

System action: DFSMSdss processing continues. The return code is zero.

Operator response: None.

Application Programmer Response: See the reason code provided in this message for an explanation of why DFSMSdss cannot use fast replication to copy all the VTOC tracks. Take the following actions according to the reason code (reason_code):

X'1' Update the old VTOC format for the source volume and rerun the job.

X'2' Choose a target volume that has the same number of cylinders as the source.

X'3' Ensure that the track range does not include the VTOC and/or does not overlay the VTOC on the target volume.

Source: DFSMSdss

ADR922E (xxx)-mmmm(yy), AN ERROR CONDITION WAS DETECTED WHILE PROCESSING CLUSTER cluster_name ON VOLUME volume_serial, RETURN CODE=sdm_return_code, REASON CODE=sdm_reason_code

Explanation: DFSMSdss cannot complete the operation for the cluster cluster_name because an error condition was detected by the system data mover during processing of volume volume_serial. The system data mover return code (sdm_return_code) and reason code (sdm_reason_code) are supplied as diagnostic information.

System action: The data set is not processed. Processing continues with the next data set. The return code is 8.

Application Programmer Response: Notify the system programmer.
System programmer response: For explanations of the return and reason codes, see "System data mover return and reason codes" on page 190. DFSMSdss provides these codes in hexadecimal.

Source: DFSMSdss

ADR923W (ttt-mmmm(yy)), AN ERROR CONDITION WAS DETECTED AFTER PROCESSING CLUSTER cluster_name, REASON CODE=reason_code

Explanation: DFSMSdss successfully processed the cluster cluster_name but encountered an error during post-processing that might eventually adversely affect the DFSMSdss job or the overall system. The reason_code explanation is:

1. An error was encountered freeing storage that was obtained for the processing of this cluster.
2. SDM termination did not complete successfully.

System action: The data set is processed. The return code is 4.

Application Programmer Response: Notify the system programmer.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdss

ADR927E (ttt-mmmm(yy)), CICSVRBACKUP FAILED FOR DATA SET dsname, REASON=reason_code

Explanation: The CICSVRBACKUP keyword was specified on the data set COPY or logical data set DUMP command. DFSMSdss attempted to notify the CICSVR server address space that a CICSVR backup of the VSAM base cluster completed successfully. The notification failed with one of the following hexadecimal reason codes (reason_code).

The reason codes are as follows:

X'11170'
DFSMSdss could not acquire storage for CICSVR Backup Notification parameter list. CICSVR was not notified of the backup.

X'11171'
DFSMSdss could not locate a VVR cell for a CICSVR Backup Notification parameter. CICSVR was notified of the backup.

other reason code
CICSVR reason code describing the CICSVR Backup Notification failure.

System action: Processing of this data set ends. DFSMSdss processing continues. The return code is 8.

Application Programmer Response: If you did not intend to create data set backups for use by CICSVR, remove the CICSVRBACKUP keyword and resubmit the job. Otherwise, correct the problem as indicated by one of the following reason codes (reason_code), and reprocess the data set:

X'11170'
See previously issued ADR376E message.

X'11171'
See previously issued ADR432E message.

erother reason code
Ensure that the CICSVR server address space is active. The minimum required CICSVR release is Version 3 Release 1. See the "CICSVR return codes and reason codes in non-CICSVR messages" section of the CICSVR V3R1 Messages and Problem Determination manual for an explanation of the reason code.

Source: DFSMSdss

ADR928I (ttt-mmmm(yy)), CICSVRBACKUP WAS SUCCESSFUL FOR DATA SET dsname

Explanation: The CICSVRBACKUP keyword was specified on the data set COPY or logical data set DUMP command. Therefore, DFSMSdss notified the CICSVR server address space that a CICSVR backup of the VSAM base cluster completed successfully. The notification was successful.

System action: Processing continues.

Application Programmer Response: None.

Source: DFSMSdss

ADR931W (ttt-mmmm(yy)), THE ANTRQST MACRO FAILED DURING AN FCQUERY REQUEST FOR VOLUME volser WITH RETURN CODE return_code AND REASON CODE reason_code RETINFO: ret_info

Explanation: DFSMSdss invokes the ANTRQST macro for an FCQUERY request and ANTRQST fails with the listed hex return code, reason code, and return information (ret_info).

System action: For a COPY operation, if FCINCREMENTAL or FCINCREMENTALLAST is specified, this error precludes the use of Incremental FlashCopy. If FCCGFREEZE is specified, this error precludes the use of FlashCopy Consistency Group for the copy operation. The operation continues. The return code is 4.

For a CGCREATE operation, DFSMSdss could not verify the state of the FlashCopy Consistency Group. The operation continues. The return code is 4.

Operator response: None.
ADR932W  (ttt)-mmmm(yy), THE ANTRQST MACRO FAILED DURING A QFRVOLS REQUEST FOR [DATA SET dsname | EXTENT starting_c:h-ending_c:h | VOLUME volser] WITH RETURN CODE return_code AND REASON CODE reason_code

Explanation: DFSMSdss invokes the ANTRQST macro for a QFRVOLS request and ANTRQST fails with the listed hex return code, reason code, and return information (ret_info).

System action: This error precludes the use of fast replication techniques, such as FlashCopy or SnapShot, for the operation. The operation continues, using traditional data movement methods, when fast replication is not required. The return code is 4.

Operator response: None.

Application Programmer Response: See z/OS DFSMS Advanced Copy Services for an explanation of return_code, reason_code, and ret_info.

Source: DFSMSdss

ADR935W  (ttt)-mmmm(yy), A FAILURE OCCURRED WHILE ATTEMPTING TO PERFORM FAST REPLICATION FOR [DATA SET dsname | VOLUME volume_serial_number]. DIAGNOSTIC INFORMATION: return_code-reason_code

Explanation: DFSMSdss attempted to process the data set or volume using a fast replication method, such as SnapShot or FlashCopy, and the System Data Mover failed with diagnostic information.

System action: If you specified CONCURRENT, DFSMSdss will attempt concurrent copy initialization. If you did not specify CONCURRENT, the operation continues using traditional data movement methods. The return code is 4.

Operator response: None.

Application Programmer Response: See z/OS DFSMS Advanced Copy Services for an explanation of return_code and reason_code.

Source: DFSMSdss

ADR936W  (xxx)-mmmm(yy), A FAILURE OCCURRED while attempting to register a session with the system data mover. DIAGNOSTIC INFORMATION: sdm_rd-sdm_rsn[-reason_code_modifier]

Explanation: DFSMSdss attempted to register a session with the system data mover and the system
data mover failed with the listed diagnostic information. This condition precludes the use of fast replication methods, such as SnapShot, for the operation.

**System action:** The operation continues by using traditional data movement methods. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** See "System data mover return and reason codes" on page 190 for an explanation of the system data mover return code (sdm_rc) and reason code (sdm_rsn). DFSMSdss provides these codes in hexadecimal format.

**Source:** DFSMSdss

---

**ADR937W** *(xxx)-mmmmm(yy), A FAILURE OCCURRED WHILE TERMINATING A SESSION WITH THE SYSTEM DATA MOVER. DIAGNOSTIC INFORMATION: sdm_rc-sdm_rsn[reason_code_modifier]*

**Explanation:** DFSMSdss attempted to end a session with the system data mover, and the system data mover failed with the listed diagnostic information.

**System action:** This is a postprocessing failure, which means that it occurred after the operation had completed, and while DFSMSdss was in the process of freeing up resources and terminating. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** See "System data mover return and reason codes" on page 190 for an explanation of the system data mover return code (sdm_rc) and reason code (sdm_rsn). DFSMSdss provides these codes in hexadecimal format.

**Source:** DFSMSdss

---

**ADR938E** *(ttt-mmmm-yyyy)*,

**FASTREPLICATION(REQUIRED) WAS SPECIFIED BUT FAST replication COULD NOT BE USED FOR {DATA SET dsname | EXTENT starting_c:h-ending_c:h | VOLUME volser | THIS task TASK}*

**Explanation:** The FASTREPLICATION(REQUIRED) keyword is specified, but the use of fast replication fails.

**System action:** Processing of this data set, extent or volume ends because you specify that fast replication is required. See previously issued messages for details regarding the fast replication failure.

For DEFRAg, if ADR946I is issued before this message, DFSMSdss attempts to use data set fast replication to process the rest of the extents on the volume. If ADR945W is issued before this message, DFSMSdss terminates the DEFRAg task. The return code is 8.

For full volume COPY and tracks COPY operations, the task is terminated. The return code is 8.

For data set COPY, processing of this data set ends; DFSMSdss processing continues with the next data set. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See the previously issued message for reasons why you cannot use fast replication. If you cannot use fast replication, remove the FASTREPLICATION(REQUIRED) keyword and resubmit the job. This will allow DFSMSdss to perform the task using another data movement method.

**Source:** DFSMSdss

---

**ADR939E** CONCURRENT((ANYREQUIRED | CACHEREQUIRED | VIRTUALREQUIRED)) WAS SPECIFIED BUT [VIRTUAL] CONCURRENT COPY COULD NOT BE USED FOR {DATA SET dsname | VOLUME volume_serial_number | THIS task TASK}*

**Explanation:** The use of virtual, cache-based, or both concurrent copy methods failed.

**System action:** Processing of this data set or volume ends because you specified that virtual, cache-based, or any of the concurrent copy methods must be used. See previously issued messages for details regarding the concurrent copy initialization failure.

For full volume COPY, tracks COPY, full volume DUMP, and tracks DUMP operations, the task is terminated. The return code is 8.

For data set COPY and DUMP, if the cause of the failure prevents any data sets from being processed with concurrent copy, the task is terminated. Otherwise, processing of this data set ends; DFSMSdss processing continues with the next data set. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See the previously issued message for reasons why you could not use virtual or cache-based concurrent copy. If retrying with a standard data movement method is desired following virtual or cache-based concurrent copy failure, specify CONCURRENT(ANYPREFERRED | VIRTUALPREFERRED | CACHEPREFERRED). If concurrent copy cannot be attempted, do not specify the CONCURRENT keyword. See z/OS DFSMSdfp Storage Administration for more information on the CONCURRENT keyword.

**Source:** DFSMSdss
### ADR940I

*(ttt-mmmmm(yy)) DATA SET dsname BEING RESTORED WAS PROCESSED AS AN OPEN DATA SET WHEN IT WAS DUMPED*

**Explanation:** The data set was dumped as an open data set at the request of a database application, such as Information Management System (IMS™), through a UIM exit request (EI22BWOE). System-level enqueues for serialization were not obtained by DFSMSdss when the data set was dumped.

**System action:** None.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

### ADR941E

*(ttt-mmmmm(yy)) DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number CANNOT BE PROCESSED BECAUSE IT IS ALREADY BEING PROCESSED AS AN OPEN DATA SET*

**Explanation:** The data set cannot be processed as an open data set because it is already being processed as an open data set.

**System action:** The data set is not processed, the return code is 8, and processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

### ADR942E

*(ttt-mmmmm(yy)) DUMPED VERSION OF DATA SET dsname IS NOT USABLE BECAUSE OF UPDATE ACTIVITY WHILE IT WAS BEING PROCESSED AS AN OPEN DATA SET*

**Explanation:** The data set was dumped as an open data set at the request of a database application, such as Information Management System (IMS™), through the application programming interface. System-level enqueues for serialization were not obtained by DFSMSdss when the data set was dumped. During the dump process, the data set was altered in a manner that indicates the dumped version of the data set on the dump tape is unusable and must be discarded.

**System action:** The return code is 8. Processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss

### ADR943E

*(ttt-mmmmm(yy)) DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number REQUIRES VALIDATE TO BE PROCESSED AS AN OPEN DATA SET*

**Explanation:** DFSMSdss was requested to dump the data set as an open data set by a database application, such as Information Management System (IMS™), through the application programming interface. But the data set is an indexed VSAM data set, and VALIDATE is required to dump that type of data set as an open data set.

**System action:** The data set is not processed, the return code is 8, and processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** You must change the data base application to specify VALIDATE rather than NOVALIDATE.

**Source:** DFSMSdss

### ADR944E

*(ttt-mmmmm(yy)) DATA SET dsname IN CATALOG catalog_name ON VOLUME volume_serial_number CANNOT BE PROCESSED BECAUSE IT WAS UPDATED DURING [CONCURRENT COPY INITIALIZATION | THE FAST REPlication INITIALIZATION | TRADITIONAL I/O]*

**Logical Data Set Dump**

The data set was updated while it was being prepared for concurrent copy initialization. Because of the update activity, you cannot dump the data set.

**Logical Data Set Copy**

The data set was updated while it was being copied either using a fast replication function, concurrent copy initialization, or traditional I/O. Because of the update activity, you cannot copy the data set.

**System action:** The return code is 8. Processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** None.

**Source:** DFSMSdss
ADR945W (ttt)-mmmm(yyyy), A FAILURE OCCURRED WHILE ATTEMPTING TO PERFORM FLASHCOPY FROM EXTENT src_starting_c:h-src_ending_c:h TO EXTENT tgt_starting_c:h-tgt_ending_c:h. DIAGNOSTIC INFORMATION: return_code-reason_code-[reason_code_modifier]

Explanation: DFSMSdss attempts to process the extent using FlashCopy and the System Data Mover (SDM) fails with listed diagnostic information.

System action: DFSMSdss attempts to move this extent using traditional data movement methods unless FASTREPLICATION(REQUIRED) is specified. DFSMSdss DEFRAG operation continues and FlashCopy will be attempted for the rest of the extents. The return code is 4. If the system also issues ADR938E, the DEFRAG task terminates.

Operator response: None.

Application Programmer Response: See "System data mover return and reason codes" on page 190 following DFSMSdss messages in z/OS MVS System Messages, Vol 1 (ABA-AOM) for an explanation of return_code and reason_code.

Source: DFSMSdss

ADR947I (ttt)-mmmm(yyyy), FAST REPLICATION COULD NOT BE USED FOR VOLUME src_volser BECAUSE THE SOURCE AND TARGET DEVICES DO NOT PROVIDE COMPATIBLE FAST REPPLICATION FUNCTIONS

[detailed_text]

Explanation: detailed_text is: [VOLUME src_volser SUPPORTS fast_replication_function1
VOLUME tgt_volser SUPPORTS fast_replication_function2]

DFSMSdss cannot use a fast replication method for the full or tracks copy operation because the devices do not provide compatible fast replication functions. For example, the source device is SnapShot capable, but the target device is FlashCopy capable, or vice versa. The system might issue this message for diagnostic purposes if the DEBUG(FRMSG(MIN | SUM | DTL)) or the FASTREPLICATION(REQ) keyword is specified.

When the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword is specified, [detailed_text] contains a list of volumes and their fast replication capability.

System action: The operation continues. The return code is zero.

Operator response: None.

Application Programmer Response: Ensure that the source and target volumes support the same type of fast replication method.

Source: DFSMSdss

ADR946I (ttt)-mmmm(yyyy), A FAILURE OCCURRED WHILE ATTEMPTING TO PERFORM FLASHCOPY FROM EXTENT src_starting_c:h-src_ending_c:h TO EXTENT tgt_starting_c:h-tgt_ending_c:h. DIAGNOSTIC INFORMATION: return_code-reason_code-[reason_code_modifier]

Explanation: DFSMSdss attempts to process the extent using FlashCopy and the System Data Mover (SDM) fails with listed diagnostic information. The system might issue this message for diagnostic purposes if the DEBUG(FRMSG(MIN | SUM | DTL)) or the FASTREPLICATION(REQ) keyword is specified.

System action: DFSMSdss attempts to move this extent using traditional data movement methods unless FASTREPLICATION(REQUIRED) is specified. DFSMSdss DEFRAG operation continues and FlashCopy will be attempted for the rest of the extents. The return code is zero.

Operator response: None.

Application Programmer Response: See "System data mover return and reason codes" on page 190 following DFSMSdss messages in z/OS MVS System Messages, Vol 1 (ABA-AOM) for an explanation of return_code and reason_code.

Source: DFSMSdss

ADR948I (ttt)-mmmm(yyyy), FAST REPLICATION COULD NOT BE USED FOR DATA SET src_dsnname BECAUSE THE (SOURCE | TARGET) DEVICES DO NOT PROVIDE COMPATIBLE DATA SET FAST REPlication FUNCTIONS

[summarized_text | detailed_text]

Explanation: summarized_text is: [number (VOLUME | VOLUMES) [SUPPORTS [SUPPORT] data_set_fast_replication_function | [DOES | DO] NOT SUPPORT ANY TYPE OF DATA SET FAST REPLICATION] [ ...]]

detailed_text is: [VOLUME src_volser [SUPPORTS data_set_fast_replication_function | DOES NOT SUPPORT ANY TYPE OF DATA SET FAST REPLICATION] [ ...]]

DFSMSdss cannot use a fast replication method for the data set copy operation because one or more volumes where the source data set or pre-allocated target data set resides do not provide compatible data set fast replication functions. For example, one volume supports SnapShot while other volumes support data set FlashCopy. The system might issue this message for
diagnostic purposes if the DEBUG(FRMSG(MIN | SUM | DTL)) or the FASTREPLICATION(REQ) keyword is specified.

When the DEBUG(FRMSG(SUMMARIZED)) keyword is specified, the [summarized_text] follows the message. It lists the number of volumes and their fast replication capabilities.

When the DEBUG(FRMSG(DETAILED)) keyword is specified, the [detailed_text] follows the message. It provides a list of volumes and their fast replication capabilities.

System action: The operation continues. The return code is zero.

Operator response: None.

Application Programmer Response: In order for fast replication to be used, all volumes that the data set resides on must support the same type of fast replication method. If you must use fast replication for this data set, move it to volumes that support the same type of fast replication method.

Source: DFSMSdss

ADR949I  (ttt)-mmmmmm(yy), FAST REPLIATION COULD NOT BE USED FOR VOLUME src_volser BECAUSE ONE OR MORE VOLUMES DO NOT SUPPORT DATA SET FAST REPLICATION ]

[detailed_text]

Explanation: detailed_text is:
[VOLUMEsrc_volser DOES NOT SUPPORT DATA SET FLASHCOPY]
[VOLUMEtgt_volser DOES NOT SUPPORT DATA SET FLASHCOPY]

DFSMSdss cannot use a fast replication method for the tracks copy operation because at least one of the volumes does not support data set FlashCopy. The system might issue this message for diagnostic purposes if the DEBUG(FRMSG(MIN | SUM | DTL)) or the FASTREPLICATION(REQ) keyword is specified.

When the DEBUG(FRMSG(SUMMARIZED | DETAILED)) keyword is specified, the volumes that do not support data set FlashCopy are listed in the [detailed_text].

System action: The operation continues. The return code is zero.

Operator response: None.

Application Programmer Response: Ensure that both the source and target volumes support data set FlashCopy.

Source: DFSMSdss

ADR950W  (ttt)-mmmmmm(yy), DURING THE CONVERSION TO NON-SMS, RETAINED LOCKS IN THE COUPLING FACILITY (WERE|WOULD HAVE BEEN) PURGED FOR THE FOLLOWING DATA SETS ON VOLUME volume_serial_number

Explanation: Retained locks in the coupling facility were detected for the listed data sets during conversion from SMS. Retained locks indicate that the cluster is part of a recoverable sphere that was accessed with RLS protocols and that there are pending CICS RLS backouts for the cluster. These locks cannot be preserved during conversion from SMS.

System action: If TYPRUN=NORUN was not specified and TEST was not specified, then the locks were purged as a result of conversion from SMS. If you specified TYPRUN=NORUN or TEST, the locks were not purged.

Processing for the volume continues. The return code is 4.

Operator response: None.

Application Programmer Response: If TYPRUN=NORUN or TEST was specified, then run the pending CICS RLS backouts before actually converting the volume from SMS.

If neither TYPRUN=NORUN nor TEST was specified and the conversion was not intended, the cluster must be converted back to SMS for RLS access, including the respecification of the values of the LOG and LOGSTREAMID parameters. Since locks protecting pending CICS backouts were lost during the conversion, special CICS procedures are required to handle the disposition of CICS online backouts. Please see the description of the SHCDS FDELETEUNBOUNDLOCKS command in the DFSMS Access Method Services for Catalogs manual and the CICS Recovery and Restart Guide to correctly dispose of the pending CICS online backouts.

Source: DFSMSdss

ADR951W  (ttt)-mmmmmm(yy), CLUSTER cluster_name IS MARKED RECOVERY REQUIRED

Explanation: The specified VSAM cluster has been marked "recovery required" by the application that owns it, and therefore, might be unusable.

If the message was issued during a data set dump or data set copy operation, then the data set being backed up or copied was marked recovery required. If the message was issued during a data set restore operation, then the back up copy being restored was marked recovery required at the time of the back up.

System action: The data set is processed. The return code is 4.
ADR952E  •  ADR956E

Operator response:  None.

Application Programmer Response:  For data set copy and data set dump, you might need to rerun the dump/copy, following a forward recovery of the data set. For data set restore, the target might need to be forward recovered, or you might need to rerun the restore, using a different back up version.

Source:  DFSMSdss

ADR952E  \((ttty-mmmmm{yy})\), THE IDAQDMP MACRO FAILED DURING QUIESCE PROCESSING FOR CLUSTER \(cluster\_name\) WITH RETURN CODE \((return\_code)\) AND REASON CODE \((reason\_code)\)

Explanation:  DFSMSdss issued the IDAQDMP macro to perform quiesce processing for the VSAM data set. The IDAQDMP macro returned the listed failing return and reason codes. If error data was returned by the IDAQDMP macro, message ADR957I follows this message.

System action:  The data set is not processed. The return code is 8.

Operator response:  None.

Application Programmer Response:  See the z/OS DFSMSdip Diagnosis for an explanation of the listed return and reason codes.

Source:  DFSMSdss

ADR955W  \((ttty-mmmmm{yy})\), AS A RESULT OF CONVERSION TO NON-SMS, THE RECOVERY REQUIRED STATUS (WILL BE I WAS) LOST FOR THE FOLLOWING DATA SETS ON VOLUME \(volume\_serial\_number\)

Explanation:  The listed data sets were marked as recovery required. Upon conversion of a data set to non-SMS, the recovery required status of the data set is lost. The recovery required status indicates that the data sets not be usable.

System action:  None. The return code is 4.

Operator response:  None.

Application Programmer Response:  If TYPRUN=NORUN and TEST were not specified, a back up copy of the data set might need to be restored. If either TYPRUN=NORUN or TEST was specified, the data set might need to be forward recovered before being converted from SMS management.

Source:  DFSMSdss

ADR956E  \((ttty-mmmmm{yy})\), CONNECTION TO THE SMSVSAM SERVER WAS LOST WHILE PROCESSING DATA SET \(dsname\) USING RECORD LEVEL SHARING ACCESS

Explanation:  While processing the data set using
record level sharing access, the connection to the SMSVSAM server was lost.

**System action:** For COPY operations, the data set is not processed.

For DUMP, the failure not have been detected until after the data set was dumped. In this case, the dumped version of the data set is not usable. If the error was detected before the data set was dumped, then the data set is not processed.

The return code is 8.

**Operator response:** Verify that the SMSVSAM server is available and rerun the job.

**Application Programmer Response:** None.

**Source:** DFSMSdss

ADR957I (ttt-mmmmm(yy)), IDAQDMP ERROR DATA FOR CLUSTER cluster_name IS error_data

**Explanation:** Either message ADR952E or ADR953E precedes this message, indicating that the IDAQDMP macro failed. The listed error data was returned by the IDAQDMP macro.

**System action:** See the system action for the preceding ADR952E or ADR953E message.

**Operator response:** None.

**Application Programmer Response:** See the application programmer response for the preceding ADR952E or ADR953E message.

**Source:** DFSMSdss

ADR958E (ttt-mmmmm(yy)), THE SMPM CFPURGE FUNCTION FAILED FOR CLUSTER cluster_name WITH RETURN CODE (return_code) AND REASON CODE (reason_code)

**Explanation:** DFSMSdss invoked the SMPM CF Purge function to purge the data in the coupling facility caches for the VSAM data set. The SMPM CF Purge function returned the listed failing return and reason codes.

**System action:** The data set is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See the z/OS DFSMSdfp Diagnosis for an explanation of the listed return and reason codes.

**Source:** DFSMSdss

ADR959E (ttt-mmmmm(yy)), THE SMPM CFPURGE FUNCTION FAILED FOR VOLUME volume_serial_number WITH RETURN CODE (return_code) AND REASON CODE (reason_code)

**Explanation:** DFSMSdss invoked the SMPM CF Purge function to purge the data in the coupling facility caches for the volume. The SMPM CF Purge function returned the listed failing return and reason codes.

**System action:** The volume is not processed. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** See the z/OS DFSMSdfp Diagnosis for an explanation of the listed return and reason codes.

**Source:** DFSMSdss

ADR960E (ttt-mmmmm(yy)), THE BPX1QSE | BPX1UQS PROGRAM FAILED DURING QUIESCE | UNQUIESCE PROCESSING FOR DATA SET dsname WITH RETURN CODE return_code AND REASON CODE reason_code

**Explanation:** If the operation is QUIESCE, the source data set could not be serialized. Before the quiesce attempt, a request for a shared SYSZDSN enqueue of the data set failed. This message can be received if a source HFS data set is unmounted while DFSMSdss is attempting to serialize the data set.

If the operation is UNQUIESCE, serialization for the data set was lost while the data set was being processed.

**System action:** If the operation is QUIESCE, the source data set is not processed.

If the operation is UNQUIESCE, the target data set is not usable.

Processing continues with the next data set, if any. The DFSMSdss return code is 8.

**Application Programmer Response:** See the z/OS UNIX System Services Programming: Assembler Callable Services Reference for an explanation of the return and reason codes. Correct the reported problem and rerun the job.

**Source:** DFSMSdss

ADR961W (ttt-mmmmm(yy)), THE HIGH RELATIVE PAGE NUMBER COULD NOT BE DETERMINED FOR DATA SET dsname

**Explanation:** DFSMSdss was unable to read the high relative page number due to I/O errors. Therefore, DFSMSdss was unable to determine how much of the data set was actually used. If this error occurs during a
logical DUMP or a COPY, all of the allocated space for
the data set will be dumped or copied. If this error
occurs during RESTORE processing, to a target device
that has a different track capacity than the source
device, there can be allocation problems because of
residual data. It is therefore a good idea to restore the
data set to a like device. If this error occurs during
RELEASE processing, no space is released because
the amount of releasable space cannot be determined.

System action: The return code is 4.

Application Programmer Response: Determine the
cause of the read error and correct it.

Source: DFSMSdss

ADR962I (ttt)-mmmmmm(yy), CLUSTER
cluster_name WAS DUMPED AS A
BACKUP-WHILE-OPEN DATA SET
USING RECORD LEVEL SHARING
ACCESS. LOCAL TIMESTAMP IS:
yyyyddd hh:mm:ss.t GMT TIMESTAMP
IS: yyyyddd hh:mm:ss.t

Explanation: DFSMSdss dumped the data set using
record level sharing (RLS) access. Updates to the data
set were quiesced while the data set was being
dumped. The time of the dump is listed in both local (to
the system that performed the dump) and GMT formats.

The timestamps have the following values:

yyyy.ddd     The Julian date (year and days).
hh:mm:ss.t    The time in hours, minutes, seconds,
and tenths of a second.

System action: None.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss

ADR963I (ttt)-mmmmmm(yy), CLUSTER
cluster_name WAS DUMPED USING
RECORD LEVEL SHARING ACCESS.
LOCAL TIMESTAMP IS: yyyyddd
hh:mm:ss.t GMT TIMESTAMP IS:
yyyyddd hh:mm:ss.t

Explanation: DFSMSdss dumped the data set using
record level sharing (RLS) access. Updates to the data
set were not quiesced while the data set was being
dumped. The time of the dump is listed in both local (to
the system that performed the dump) and GMT formats.

The timestamps have the following values:

yyyy.ddd     The Julian date (year and days).
hh:mm:ss.t    The time in hours, minutes, seconds,
and tenths of a second.

System action: None.

ADR964E (ttt)-mmmmmm(yy), A TIME OUT
OCURRED DURING QUIESCE
PROCESSING FOR CLUSTER
cluster_name.

Explanation: DFSMSdss issued the IDAQDMP macro
to perform quiesce processing for the VSAM data set. A
time out condition occurred before the IDAQDMP macro
returned.

The amount of time DFSMSdss waits for an RLS
quiesce request to complete is controlled by the
specification of the DSSTIMEOUT parameter of the
IGDSMSxx PARMLIB member.

System action: The data set is not processed. The
return code is 8.

Operator response: None.

Application Programmer Response: Increase the
RLS quiesce timeout value specified by the
DSSTIMEOUT parameter of the IGDSMSxx PARMLIB
member and rerun the job. If the problem persists,
search problem reporting databases for a fix for the
problem. If no fix exists, contact the IBM Support
Center.

Source: DFSMSdss

ADR965E (ttt)-mmmmmm(yy), DATA SET dsname IN
CATALOG catname CANNOT BE
COPIED AND DELETED BECAUSE IT
IS OPEN IN RLS MODE

Explanation: The data set is opened for record level
sharing (RLS) access and therefore cannot be copied
and deleted.

System action: The data set is not copied or deleted.
Processing continues with the next data set, if any. The
return code is 8.

Operator response: None.

Application Programmer Response: Close the data
set, making sure there are no lost or retained locks (see
the application programmer response for message
ADR966E), and rerun the job.

Source: DFSMSdss

ADR966E (ttt)-mmmmmm(yy), DATA SET dsname IN
CATALOG catname CANNOT BE
COPIED AND DELETED BECAUSE IT
HAS LOCKS ASSOCIATED WITH IT

Explanation: The data set was previously opened for
record level sharing (RLS) access, has lost or retained
locks associated with it, and therefore cannot be copied and deleted.

**System action:** The data set is not copied or deleted. Processing continues with the next data set, if any. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Run the pending CICS RLS backouts and then rerun the DFSMSdss job.

**Source:** DFSMSdss

---

**ADR968W**  
(ttff-mmmmm(yy), DATA SET dsname IN CATALOG catname WILL BE DUMPED BUT CANNOT BE DELETED BECAUSE IT IS OPEN IN RLS MODE)

**Explanation:** The data set is opened for record level sharing (RLS) access and therefore cannot be deleted.

**System action:** The data set is opened for record level sharing (RLS) access and therefore cannot be deleted. Processing continues with the next data set, if any. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** Close the data set, making sure there are no lost or retained locks (see the application programmer response for message ADR968W), and rerun the job.

**Source:** DFSMSdss

**ADR970E**  
(ttff-mmmmm(yy), MISSING CI(S) WITHIN SEQUENCE SET IN CLUSTER cluster_name, number_of_index_records CI(S) PROCESSED IN SEQUENCE SET, number_of_data_control_areas CA(S) FOUND IN DATA COMPONENT)

**Explanation:** An error was detected during the logical dump processing of an indexed VSAM data set. All data in the indexed VSAM data set not have been dumped.

**System action:** Processing of this data set ends. DFSMSdss processing continues. The return code is 8.

**Operator response:** None.

**Application Programmer Response:** Run IDCAMS EXAMINE against the VSAM cluster in question. Correct the problem and resubmit the job.

**Source:** DFSMSdss

---

**ADR971E**  
(ttff-mmmmm(yy), LOGICAL {DUMP I RESTORE I COPY) FOR CLUSTER cluster_name IN CATALOG catalog_name} FAILED, reason_code)

**Explanation:** The command could not be processed. The reason codes are:

01 A logical DUMP was requested for an extended format VSAM data set, and NOVALIDATE was requested. You must use VALIDATE to dump an extended format VSAM data set.

02 The source data set is an extended format VSAM data set, and the target data set could not be allocated as a extended format VSAM data set. If the source is an extended format VSAM data set, the target must be an extended format VSAM data set. If the source is compressed, the target must also be compressed.

03 The source data set is an extended format VSAM compressed KSDS, and the target data set could not be allocated as a extended format VSAM compressed KSDS. If the source is an extended format compressed VSAM KSDS, the target must be an extended format compressed VSAM KSDS.
**ADR973E** • **ADR976W**

<tbody>
<tr>
<td>04</td>
<td>A logical COPY was requested for an extended format VSAM data set and DFSMSdss could not enqueue on the data set name. DFSMSdss requires IDCAMS to copy the data set. A logical COPY using IDCAMS cannot be performed on an extended format VSAM data set that is open for update. The TOLERATE keyword is not supported.</td>
</tr>
<tr>
<td>05</td>
<td>A logical COPY was requested for an extended format VSAM data set, and the catalog indicates that a VERIFY is required. Run IDCAMS VERIFY.</td>
</tr>
<tr>
<td>06</td>
<td>An error occurred while attempting to update the VVR VSAM extended format cell during the target allocation. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.</td>
</tr>
<tr>
<td>07</td>
<td>The source data set is an extended addressable VSAM KSDS and the target data set could not be allocated as an extended addressable VSAM KSDS data set. If the source is an extended addressable VSAM KSDS data set, then the target must be an extended addressable VSAM KSDS data set. System action: DFSMSdss ends processing for the current data set. The return code is 8. Operator response: None. Application Programmer Response: Correct the problem described by the reason code and re-submit the DFSMSdss request. Source: DFSMSdss</td>
</tr>
</tbody>
</table>

**ADR973E** *(ttt)-mmmmm(yy), EMPTY TRACK ENCLOSED WHILE PROCESSING CLUSTER cluster_name ON VOLUME volser, TRACK c:h*  
**Explanation:** During logical data set dump of the VSAM cluster using VALIDATE, an empty track was encountered in a data CA or an index sequence set where valid data was expected. The track reported was located on volume volser, track cchh. This message is issued once for each unexpected empty track.  
**System action:** DFSMSdss ends processing for the current data set. The return code is 8.  
**Operator response:** None.  
**Application Programmer Response:** Check the track reported. Run IDCAMS EXAMINE against the VSAM cluster. Take appropriate action to correct the problem and resubmit the job.  
**Source:** DFSMSdss

**ADR974I** *(ttt)-mmmmm(yy), MISSING CI(S) WITHIN SEQUENCE SET IN CLUSTER cluster_name, number_of_index_records. CI(S) PROCESSED IN SEQUENCE SET, number_of_data_control_areas CA(S) FOUND IN DATA COMPONENT*  
**Explanation:** All data in the indexed VSAM data set not have been dumped. When a keyed VSAM data set is logically dumped with DFSMSdss using the VALIDATE option, a check is performed to determine if there are data control areas (CAs) without corresponding index control intervals (CIs). If there are missing index control intervals, ADR974I is issued. Your installation has specified a DFSMSdss patch byte to produce this message instead of ADR970E. You need to verify that all data in this data set was dumped.  
**System action:** Processing of this data set continues. DFSMSdss processing continues. The return code is 0.  
**Operator response:** None.  
**Application Programmer Response:** Run IDCAMS EXAMINE against the VSAM cluster in question. Determine if the problem was a result of an incomplete control area split. If this is not the case, correct the data set and resubmit the job. See the z/OS DFSMSdss Storage Administration for information about the DFSMSdss patch area.  
**Source:** DFSMSdss

**ADR975E** *(xxx)-mmmmm(yy), MMSRV CONNECT FAILED FOR DATA SET dsname WITH RETURN CODE return_code AND REASON CODE reason_code*  
**Explanation:** DFSMSdss issued an MMSRV CONNECT for the data set, and it failed with the listed return and reason codes.  
**System action:** The data set is not processed. The return code is 8. Processing continues with the next data set.  
**Operator response:** None.  
**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.  
**Source:** DFSMSdss

**ADR976W** *(xxx)-mmmmm(yy), MMSRV DISCONNECT FAILED FOR DATA SET dsname WITH RETURN CODE return_code AND REASON CODE reason_code*  
**Explanation:** DFSMSdss issued an MMSRV DISCONNECT for the data set, and it failed with the listed return and reason codes.  
**System action:** The data set is not processed. The
return code is 4. Processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdss

### ADR977E

(yyy-mm.mm), MMCNVT CI LOCATE FAILED FOR DATA SET dsnname WITH RETURN CODE return_code

**Explanation:** DFSMSdss issued an MMCNVT CI LOCATE for the data set, and it failed with the listed return codes.

**System action:** The data set is not processed. The return code is 8. Processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdss

### ADR978W

(yyy-mm.mm), READ DEVICE CHARACTERISTICS COMMAND FOR VOLUME volume_serial_number FAILED. THE DEVICE SIZE IN THE VTOC, calculate_vtoc_size WILL BE USED

**Explanation:** The READ DEVICE CHARACTERISTICS command issued by DFSMSdss for the given volume volume_serial_number failed. The volume size that DFSMSdss calculated from the VTOC information calculate_vtoc_size will be used. The size is represented in decimal and is the number of primary cylinders for the device.

**System action:** Processing for the volume continues. The return code is 4.

**Operator response:** None.

**Application Programmer Response:** See the IOS message for description of the specific error and take appropriate action.

**Source:** DFSMSdss

### ADR979E

INVALID RECORD DESCRIPTOR WORD ENCOUNTERED WHILE REBLOCKING DATA SET dsnname

**Explanation:** During a DFSMSdss logical data set RESTORE, or a logical data set COPY that was reblocking a variable-length physical sequential data set, a logical record in the data set had a Record Descriptor Word (RDW) that indicated a zero record length.

**System action:** The data set is not processed. The return code is 8. Processing continues with the next data set.

**Operator response:** None.

**Application Programmer Response:** To restore the data set, rerun the RESTORE without reblocking and adhere to the following rules:
1. Do not specify the REBLOCK keyword on the DFSMSdss RESTORE command.
2. Do not invoke reblocking with the installation reblock exit routine supplied by DFSMSdss (ADRREBLK).
3. If the data set is a system reblockable data set, restore it to a like device so that it will not be blocked.

**Source:** DFSMSdss

### ADR980E

(yyy-mm.mm), The BPX1PCT PROGRAM FAILED DURING (QUIESCE | UNQUIESCE) PROCESSING FOR DATA SET dsnname WITH RETURN CODE return_code AND REASON CODE reason_code

**Explanation:** If the operation is QUIESCE, the source data set could not be serialized. This message can be received if a source zFS data set is unmounted while DFSMSdss is attempting to serialize the data set.

If the operation is UNQUIESCE, serialization for the data set was lost while the data set was being processed.

**System action:** If the operation is QUIESCE, the data set is not processed. If the operation is UNQUIESCE, the target data set is not usable.

Processing continues with the next data set, if any. The DFSMSdss return code is 8.

**Operator response:** None.

**Application Programmer Response:** Correct the reported problem and rerun the job. For additional information about the return and reason codes, see z/OS UNIX System Services Programming: Assembler Callable Services Reference.

**Source:** DFSMSdss

### ADR982I

DIRECTORY CREATION FAILED FOR DATA SET dsnname. DIAGNOSTIC INFORMATION: pdse_rc-pdse_rsn

**Explanation:** Following a fast replication failure, DFSMSdss attempted to re-build the target PDSE directory to ensure the target PDSE can be reused. Directory creation failed with the listed diagnostic information.
ADR983E • ADR993E

System action: DFSMSdss processing continues. The return code is 0.

Operator response: None.

Application Programmer Response: See z/OS DFSMSdip Diagnosis for description of the PDSE return and reason codes. DFSMSdss provides these codes in hexadecimal format.

ADR983E DATA SET dsname CANNOT BE COPIED USING SYSTEM SERVICES FOLLOWING FAST REPLICATION ERROR

Explanation: Following fast replication failure, DFSMSdss was unable to copy the PDSE using a traditional data movement method by invoking IGWFAMS because of the target PDSE being unusable.

System action: DFSMSdss processing of the current PDSE fails. Processing continues with the next data set.

Operator response: None.

Application Programmer Response: Determine why fast replication failed. Correct the problem and resubmit the job. If fast replication is not desirable, specify FASTREPLICATION(NONE) and resubmit the job.

ADR985W (xxx)-mmmmm(yy), MISSING CI(S) WITHIN SEQUENCE SET IN CLUSTER cluster_name, number_of_index_records CI(S) PROCESSED IN SEQUENCE SET, number_of_data_control_areas CA(S) FOUND IN DATA COMPONENT

Explanation: All data in the indexed VSAM data set not have been dumped. When a keyed VSAM data set is logically dumped with DFSMSdss using validate option, a check is performed to determine if there are data control areas(CAs) without corresponding index control intervals (CIs). If there are missing index control intervals, ADR985W is issued. Your installation has specified a DFSMSdss patch byte to produce this message instead of ADR970E. You need to verify that all data in this data set was dumped.

Source: DFSMSdss

System action: Processing of this data set continues. DFSMSdss processing continues. The return code is 4.

Operator response: None.

Application Programmer Response: Run IDCAMS EXAMINE against the VSAM cluster in question. Determine if the problem was a result of an incomplete control area split. If this is not the case, correct the data set and resubmit the job. See the z/OS DFSMSdss Storage Administration for information about the DFSMSdss patch area.

ADR990E (ttt)-mmmmm(yy), INSUFFICIENT ACCESS AUTHORITY TO CREATE COREIMAGE FOR IPLING FROM DASD VOLUME volser

Explanation: To use IPL(DASD) with the BUILDSA command, you must either use the ADMINISTRATOR keyword or you must have DASDVOL access at the UPDATE level to the DASD volume.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: If you are authorized, use the ADMINISTRATOR keyword with the BUILDSA command. Otherwise, see your security administrator or storage administrator to obtain the required access authority to use IPL(DASD).

Source: DFSMSdss

ADR992E (ttt)-mmmmm(yy), OUTPUT IPL DATA SET NOT PROPERLY DEFINED

Explanation: The output data set is not properly defined. The data set must be a physical sequential data set with record format and block size as indicated in the BUILDSA command description. If the output device performs hardware encryption, it cannot be used as an IPL device.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: See the BUILDSA command description for the attributes necessary for the data set. Redefine the data set and rerun the job.

Source: DFSMSdss

ADR993E (ttt)-mmmmm(yy), ALLOCATION OF SYS1.ADR.SAIPLD.Vvolser FAILED. DADM RETURN CODE IS return_code. DADM DIAGNOSTIC INFORMATION IS diagnostic_information

Explanation: Allocation of the Stand-Alone Services restore core image data set failed. The DASD return code and diagnostic information is listed.

System action: The BUILDSA task ends. The return code is 8.

Operator response: None.

Application Programmer Response: See the z/OS DFSMSdip Diagnosis for an explanation of the DADSM return code and diagnostic information.

Source: DFSMSdss
ADR994E (ttt-mmnnn(yyyy)), ERROR PROCESSING DATA SET, DDNAME nnnnnnnn

Explanation: An error occurred while processing the data set with the ddname indicated.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the cause of the problem and rerun the job.

Source: DFSMSdss

ADR995E (ttt-mmnnn(yyyy)), UNABLE TO OPEN DATA SET, DDNAME ddname

Explanation: The data set could not be opened.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: Correct the cause of the problem and rerun the job.

Source: DFSMSdss

ADR996E (ttt-mmnnn(yyyy)), BLDL FAILED, BLDL RTNCODE = nnnn, RSNCODE = nnnn, DDNAME nnnnnnnn

Explanation: BLDL failed during BUILDSA processing. RTNCODE and RSNCODE are the return and reason codes from BLDL.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: See the BLDL macro in z/OS DFSMS Macro Instructions for Data Sets for the description of the return and reason codes. If the ddname indicates the input data set and the return code = 0004, with reason code 0000, a possible cause is a module missing from the input data set.

Source: DFSMSdss

ADR997E (ttt-mmnnn(yyyy)), IEWL UTILITY FAILED, (RETURN | ABEND) CODE IS nnn

Explanation: During processing of a DFSMSdss function, the IEWL utility encountered errors, and processing failed.

System action: BUILDSA processing ends. The return code is 8.

Operator response: None.

Application Programmer Response: Take one of the following actions:

• For abends, see z/OS MVS System Codes for an explanation of the abend code.
• For error return codes, run the job and specify the DFSMSdss UTILMSG=YES parameter. See z/OS MVS System Messages, Vol 6 (GOS-IEA) for an explanation of the utility messages.

Source: DFSMSdss

ADR998I (ttt-mmnnn(yyyy)), UTILITY GENERATED MESSAGES FOLLOW

Explanation: During processing of a DFSMSdss function, a system utility was invoked that generates SYSPRINT data. The utility messages are printed following this message when UTILMSG=YES, or UTILMSG=ERROR is specified in the PARM information of the DFSMSdss EXEC statement.

System action: The function continues processing.

Operator response: None.

Application Programmer Response: None.

Source: DFSMSdss
System data mover return and reason codes

If the System Data Mover detects an error condition during a DFSMSdss operation, DFSMSdss might issue one of the following messages, which will include System Data Mover diagnostic information, such as SDM service return and reason codes or hardware sense information, to help identify the condition that occurred:

- ADR735W
- ADR736E
- ADR738E
- ADR934W
- ADR935W
- ADR936W
- ADR937W
- ADR945W
- ADR946I

Return codes indicate the general types of conditions and might be coupled with reason codes that further qualify these conditions. Table 1 describes these codes. For any codes that you cannot find in the following table, contact IBM ESS hardware support structure for help.

See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for more information.

### Table 1. Reason Codes

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (X'00')</td>
<td>The request to the service completed without error.</td>
</tr>
<tr>
<td>2 (X'02')</td>
<td>The asynchronous request to the service started without error.</td>
</tr>
<tr>
<td>4 (X'04')</td>
<td>Reason codes 1 (X'01') through 43 (X'2B') are internal DFSMSdss/DFSMSdfp errors and should be reported to your IBM service center.</td>
</tr>
</tbody>
</table>
Table 1. Reason Codes (continued)

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 (X'08')</td>
<td>The requested operation failed. The reason codes specified below explain the error:</td>
</tr>
<tr>
<td>2 (X'02')</td>
<td>A request to establish a dual copy session is rejected because the secondary device has a concurrent copy session active.</td>
</tr>
<tr>
<td>3 (X'03')</td>
<td>A request to establish a concurrent copy session has failed because the device is in track emulation mode.</td>
</tr>
<tr>
<td>4 (X'04')</td>
<td>The requested control unit does not have any concurrent copy sessions available. The number of concurrent copy sessions is model dependent information that can be obtained from the appropriate controller documentation.</td>
</tr>
<tr>
<td>5 (X'05')</td>
<td>This is an internal DFSMSdss/DFSMSdfp error that should be reported to your IBM service center.</td>
</tr>
<tr>
<td>6 (X'06')</td>
<td>The concurrent copy session is not active on the device. This be caused by the following:</td>
</tr>
<tr>
<td></td>
<td>• The session has been terminated by the storage controller. This be a normal condition if storage controller cache thresholds or session limits have been exceeded.</td>
</tr>
<tr>
<td></td>
<td>• The session has been terminated by the System Data Mover in response to an error condition. Look for entries in LOGREC with the string 'CC SESSION TERMINATION'. These records include a termination reason code following the text 'SDM SERVL RSN'.</td>
</tr>
<tr>
<td></td>
<td>• The session identifier is invalid. This is an internal DFSMSdss/DFSMSdfp error that should be reported to your IBM service center.</td>
</tr>
<tr>
<td>7 (X'07')</td>
<td>This is an internal DFSMSdss/DFSMSdfp error that should be reported to your IBM service center.</td>
</tr>
<tr>
<td>8 (X'08')</td>
<td>The concurrent copy session is not active. This be because:</td>
</tr>
<tr>
<td></td>
<td>• A concurrent copy session was never started.</td>
</tr>
<tr>
<td></td>
<td>• The session have been terminated. This be a normal condition if concurrent copy jobs have been canceled.</td>
</tr>
<tr>
<td></td>
<td>• The System Data Mover terminated and was restarted. On termination all existing sessions are terminated.</td>
</tr>
<tr>
<td>9 (X'09')</td>
<td>This is an internal DFSMSdss/DFSMSdfp error that should be reported to your IBM service center.</td>
</tr>
<tr>
<td>10 (X'0A')</td>
<td>The system data mover has been terminated (by a Cancel ANTMAIN) and has restarted. Active sessions at the time of the cancel receive this error.</td>
</tr>
<tr>
<td>Return Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>

<td>6020 (X'1784')</td>
<td>An error has occurred while loading module ANTUGOFR. Verify that the module exits in SYS1.LINKLIB and that it is available to the data mover.</td>
</tr>
<tr>
<td>6021 (X'1785')</td>
<td>For an XRC session, an OPEN error occurred while obtaining the format-3 DSCB for the journal, control, or state data set because of an error reading the VTOC for the volume. The data set be cataloged but either does not exist on the volume indicated by the catalog, or an I/O error occurred while XRC attempted to read the VTOC. Determine why the error has occurred, correct the error, and reissue the XSTART, XRECOVER, or XADVANCE command to restart the session. For a SnapShot function, an error occurred while obtaining format-3 DSCB for a working space data set.</td>
</tr>
<tr>
<td>6022 (X'1786')</td>
<td>An error has occurred while obtaining format-4 DSCB for a working space data set. The reason code is set to the return code from the OBTAIN macro.</td>
</tr>
<tr>
<td>6023-6032 (X'1787'-X'1790')</td>
<td>These are Internal SDM errors.</td>
</tr>
<tr>
<td>6033 (X'1791')</td>
<td>A SnapShot operation failed. See SDM reason codes from IXFP errors on page 200 for an explanation of the associated reason code. This can be a DFSMSdss internal error, an SDM internal error, a IXFP internal error, or a configuration error.</td>
</tr>
<tr>
<td>6034 (X'1792')</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>6035 (X'1793')</td>
<td>A QUERY DEVICE operation failed. The reason code is described in SDM reason codes from IXFP errors on page 200. This can be a DFSMSdss internal error, an SDM internal error, an IXFP internal error, or a configuration error.</td>
</tr>
<tr>
<td>6036-6050 (X'1794'- X'17A2')</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>6051 (X'17A3')</td>
<td>AOM error reading track data from a working-space data set.</td>
</tr>
<tr>
<td>6144 (X'1800')</td>
<td>All working-space data set space on the RVA subsystem containing the source data set is currently in use by other SnapShot requests. Allocate one or more additional working-space data sets on the RVA subsystem according to the allocation guidelines for working-space data sets, then resubmit the failing job.</td>
</tr>
<tr>
<td>6145 (X'1801')</td>
<td>Insufficient working-space data set was available on the RVA subsystem that contains the source data set to satisfy the SnapShot request. Resubmit the failing job after another DFSMSdss job using concurrent copy (CC) on the source RVA releases the working-space data set space, or increase the working-space data set space and resubmit the failing job.</td>
</tr>
<tr>
<td>6146 (X'1802')</td>
<td>The SnapShot operation failed because not enough working space was available to the ANTMAN system data mover address space. The space was not available because of an allocation or ENQUEUE conflict with the working space data sets (WSDS) within SYS1.ANTMAIN.System.SNAPn. This problem can occur when a WSDS is allocated during the time that the DFSMSdss job is attempting to use it. To prevent this condition, pre-allocate the WSDS or allocate it during a different job.</td>

</table>
Table 1. Reason Codes (continued)

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>7705 (X'1E19')</td>
<td>A FlashCopy operation failed because of an ESS detected problem. The following diagnostic information contains error reason codes generated by the ESS in response to an internal SDM request. These reason codes are shown and generally displayed in HEX format.</td>
</tr>
<tr>
<td>(X'0804fnrs')</td>
<td>- The first digit (Format) of sense byte 7</td>
</tr>
<tr>
<td>(X'0000')</td>
<td>No sense information is available. The ESS was unable to complete an establish request because of the request being canceled by system Missing Interrupt Handler (MIH) processing. An AOMSSDS record is logged in LOGREC for the timeout condition.</td>
</tr>
<tr>
<td>(X'0900')</td>
<td>The ESS was undergoing internal recovery procedures at the time the command was received. Retry the operation.</td>
</tr>
<tr>
<td>(X'0F82')</td>
<td>The number of resources (caches) is insufficient for establishing the Flashcopy relationships you need.</td>
</tr>
<tr>
<td>(X'0F85')</td>
<td>FlashCopy target device in conflict with Copy Services status (XRC or PPRC).</td>
</tr>
<tr>
<td>(X'0F86')</td>
<td>FlashCopy establish failed because the required license feature is not installed or enabled on the storage subsystem.</td>
</tr>
<tr>
<td>(X'0F87')</td>
<td>FlashCopy target in use by another copy operation.</td>
</tr>
<tr>
<td>(X'0F89')</td>
<td>FlashCopy establish specified a preserve mirror operation and there is a condition that prevents the operation from being successful. The ADR message that was issued includes a modifier that explains this condition:</td>
</tr>
<tr>
<td>(X'0F89')</td>
<td>- The specified source volume is not a PPRC primary.</td>
</tr>
<tr>
<td>(X'02')</td>
<td>The secondary volume to the specified source volume and the secondary volume to the specified target volume are not in the same storage facility image (SFI).</td>
</tr>
<tr>
<td>(X'03')</td>
<td>The PPRC relationship for the specified source volume is not full duplex.</td>
</tr>
<tr>
<td>(X'04')</td>
<td>The PPRC relationship for the specified target volume is not full duplex.</td>
</tr>
<tr>
<td>(X'05')</td>
<td>The secondary control unit does not have the necessary microcode installed.</td>
</tr>
<tr>
<td>(X'06')</td>
<td>The inband flashcopy command was not successful at the secondary control unit because a preserve mirror relationship already existed.</td>
</tr>
<tr>
<td>(X'07')</td>
<td>An error was detected sending a command to the secondary control unit.</td>
</tr>
<tr>
<td>(X'08')</td>
<td>An attempt to take an increment using preserve mirror and the existing relationship is not a preserve mirror relation.</td>
</tr>
<tr>
<td>Return Code</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>7705 (X'1E19')</td>
<td>A FlashCopy operation failed because of an ESS detected problem. The following diagnostic information contains error reason codes generated by the ESS in response to an internal SDM request. These reason codes are shown and generally displayed in HEX format.</td>
</tr>
<tr>
<td>(X'0F92')</td>
<td>FlashCopy establish or withdraw specified a target that has other operations in progress that prevent the command from succeeding. The ADR message that was issued includes a modifier that explains this condition:</td>
</tr>
<tr>
<td>X'01'</td>
<td>The specified target has a PPRC cascading Failover/Failback operation in progress.</td>
</tr>
<tr>
<td>X'02'</td>
<td>The specified target volume's PPRC relationship has incremental resync change recording active.</td>
</tr>
<tr>
<td>(X'0F9C')</td>
<td>FlashCopy establish resource shortage.</td>
</tr>
<tr>
<td>(X'0F9D')</td>
<td>FlashCopy establish request would cause a device to have more than the maximum number of FlashCopy relationships.</td>
</tr>
<tr>
<td>(X'0FA6')</td>
<td>FlashCopy establish request would cause a source track to have more than the maximum number of targets.</td>
</tr>
<tr>
<td>(X'0FA7')</td>
<td>FlashCopy establish source track is an active target track. This is likely because of a conflict with an existing FlashCopy relationship.</td>
</tr>
<tr>
<td>(X'0FA8')</td>
<td>FlashCopy withdraw request would cause a device to have more than the maximum number of FlashCopy relationships.</td>
</tr>
<tr>
<td>(X'0FAB')</td>
<td>FlashCopy V1 establish is requested on a device with active FlashCopy V2 relationships.</td>
</tr>
<tr>
<td>(X'0FAE')</td>
<td>FlashCopy establish target track is an active target track. This be because of a conflict with an existing FlashCopy relationship, or because of the ESS completing an establish request after system Missing Interrupt Handler (MIH) processing is initiated.</td>
</tr>
<tr>
<td>(X'0FAC')</td>
<td>FlashCopy establish target track is an active source track. This is likely because of a conflict with an existing FlashCopy relationship. This is a normal condition during DFSMSdss DEFRAG processing.</td>
</tr>
<tr>
<td>(X'0FB4')</td>
<td>FlashCopy establish request would reverse the direction of the existing FlashCopy relation. The direction cannot be reversed at this time. This be due to previous physical background copy still in progress.</td>
</tr>
<tr>
<td>(X'0FB7')</td>
<td>FlashCopy establish request VM minidisk mode conflict.</td>
</tr>
<tr>
<td>(X'0FBB')</td>
<td>FlashCopy withdraw using the DDSW option was requested for a volume containing a full-volume source FlashCopy relationship. The withdraw will be performed without DDSW processing.</td>
</tr>
<tr>
<td>(X'F005')</td>
<td>The ESS was undergoing internal recovery procedures at the time the command was received. Retry the operation.</td>
</tr>
<tr>
<td>7707 (X'1E1B')</td>
<td>For a FlashCopy Request, the AOM component detected a subsystem I/O error. The error occurred at the secondary for a Preserve Mirror operation. See return code 7705 for any additional information.</td>
</tr>
</tbody>
</table>
### SDM reason codes from IXFP errors

The following error reason codes are generated by IXFP in response to SDM requests for IXFP services. These reason codes are hexadecimal values.

#### Table 2. IXFP Reason Codes

<table>
<thead>
<tr>
<th>Hex Value</th>
<th>Reason Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000001, 00000002</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>00000003</td>
<td>IXFP subsystem not found. Activate the IXFP subsystem and resubmit the failing job.</td>
</tr>
<tr>
<td>00000004</td>
<td>Device is not write enabled. Determine if this is the intended volume. If the volume is correct, use IXFP to change the volume status to write enabled and resubmit the failing job.</td>
</tr>
<tr>
<td>00000005 to 00000007</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>00000008</td>
<td>Specified device number, volume serial number, or UCB address of a device identifies a device that cannot be found on an RVA. The device be offline or there be an IXFP problem. Determine if the device is correctly configured to IXFP.</td>
</tr>
<tr>
<td>00000009</td>
<td>Specified device does not reside on a RAMAC® Virtual Array.</td>
</tr>
<tr>
<td>0000000A, 0000000B</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>0000000C</td>
<td>A mismatch exists between the service levels of IXFP and SDM. Check the IXFP and SDM service levels and install maintenance as required.</td>
</tr>
<tr>
<td>0000000D to 00000011</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>00000012, 00000013</td>
<td>IXFP subsystem not found. Activate the IXFP subsystem and resubmit the failing job. This is an IXFP-related problem if that subsystem is active.</td>
</tr>
<tr>
<td>00000014</td>
<td>Internal SDM error.</td>
</tr>
<tr>
<td>00000015</td>
<td>Internal IXFP error.</td>

ADRY011E • ADRY501I

**ADRY011E**  I/O ERROR -- error-type, device_number, command, csw, sense

**Explanation:** An I/O error of the error-type indicated has occurred on the device at address device_number. The message prints the failing command, the contents of the channel status word (csw), and the results of a sense operation against the device.

**System action:** DFSMSdss Stand-Alone Services ends.

**Operator response:** Notify the system programmer.

**System programmer response:** Save the job output. Run the AMDSADMP service aid to dump the contents of real storage to tape. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ADRY501I**  SUPPLY TODAY’S DATE, REPLY

```
' mm/dd/yy
```

**Explanation:** This message requests that operator either include the date as part of the output title line or omit the date by pressing the Enter key.

To bypass this message, set the CPU time and date before IPLing DFSMSdss Stand-Alone Services.

**System action:** Either the date appears in the title line of the output listing, or blanks are substituted if a date has not been supplied.

**Operator response:** To include the date in the title line of the output listing, respond with the month, day, and year. To omit the date, press the Enter key.

**System programmer response:** None.

**ADRY016E**  SUPPLY TIME OF DAY, REPLY

```
' hh:mm:ss
```

**Explanation:** This message requests that operator either include the time of day as part of the output title line or omit the time by pressing the Enter key.

To bypass this message, set the CPU time and date before IPLing DFSMSdss Stand-Alone Services.

**System action:** Either the time of day appears in the title line of the output listing, or blanks are substituted if a time of day has not been specified.

**Operator response:** To include the time of day in the title line of the output listing, specify the hour, minute, and second. To omit the time of day, press the Enter key.

**System programmer response:** None.

**ADRY012E**  INTERVENTION REQUIRED,

```
 device_number
```

**Explanation:** The device shown is not in the READY state.

**System action:** DFSMSdss Stand-Alone Services waits for correction of the problem.

**Operator response:** Ensure that the device is in a READY state.

**System programmer response:** None.

**ADRY013E**  CONSOLE READ FAILED, REENTER LAST LINE

**Explanation:** An I/O error occurred while a line entered at the console was being read.

**System action:** DFSMSdss Stand-Alone Services waits for the line to be reentered.

**Operator response:** Reenter the line.

**System programmer response:** None. Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

**ADRY501I**  device_number DUMP DATA SET IS NOT A SUPPORTED FORMAT

**Explanation:** The dump data set on the device at address device_number does not pertain to this job. The DFSMSdss Stand-Alone Services program does not support the format of the dump data set. The dump data set was not created by this product, or have been created by an incompatible release, or the volume mounted on the tape drive be mounted in the wrong sequence.

**System action:** Message ADRY509D is issued to the operator console to allow the operator to continue or terminate.

**Operator response:** Probable user error. To continue, reply Y to ADRY509D and mount the correct tape. To terminate, reply N to ADRY509D.

**System programmer response:** None.
ADRY502I  device_number WRONG TAPE MOUNTED

Explanation: The tape on the tape device at address device_number does not pertain to this job. An incorrect tape was mounted or the volume be mounted in the wrong sequence.

System action: Message ADRY509D is issued to the operator console to allow the operator to continue or terminate.

Operator response: Probable user error. To continue, reply Y to ADRY509D and mount the correct tape. To terminate, reply N to ADRY509D.

System programmer response: None.

ADRY503E  device_number DUMP DATA SET IS NOT A FULL VOLUME DUMP

Explanation: The dump data set on the device at address device_number is not compatible with the function specified. The system is attempting a full volume restore from a tracks or physical data set dump. To perform a full volume restore, the dump data set must be a full volume dump. The dump data set was created with either encryption or hardware assisted compression.

System action: Message ADRY509D is issued to the operator console to allow the operator to continue or terminate.

Operator response: Probable user error. To continue, reply Y to ADRY509D and mount the correct tape. To terminate, reply N to ADRY509D.

Note: If a tracks or physical data set DUMP is the correct dump data set, then refer to the STARTTRK and ENDTRK parameters of the RESTORE command for details on how to specify the range to be restored. Then reply N to message ADRY509D to end, and rerun the job with parameters specifying the range of tracks to restore.

System programmer response: None.

ADRY504I  device_number LOGICAL DUMP NOT VALID FOR THIS FUNCTION

Explanation: The dump data set on the device at address device_number is not valid for this job. A RESTORE is being attempted from a logical data set DUMP.

System action: Message ADRY509D is issued to the operator console to allow the operator to continue or terminate.

Operator response: Probable user error. To continue, reply Y to ADRY509D and mount the correct tape. To terminate, reply N to ADRY509D.

System programmer response: None.

ADRY505A  device_number WAITING FOR MOUNT OF PROPER TAPE

Explanation: The system is waiting for a tape to be mounted and the tape device at address device_number to be readied. This message is issued after prior messages have indicated that the wrong tape was mounted.

System action: The system waits for a ready indication from the tape device.

Operator response: If the tape is being automatically mounted (for example, from an automatic cartridge loader), then no action is necessary. If the tape is being manually mounted, then mount the tape and make the tape drive ready.

System programmer response: None.

ADRY506I  device_number TAPE READY DETECTED, PROCESS CONTINUING

Explanation: The system was waiting for the tape device at address device_number to be readied, and has now detected that the tape device has become ready.

System action: Processing continues.

Operator response: None.

System programmer response: None.

ADRY509D  DO YOU WISH TO CONTINUE? REPLY Y OR N

Explanation: A previous message was issued indicating an error (for example, the wrong tape was mounted). The operator be able to correct the problem and resume processing (rather than rerunning the job).

System action: The system waits for the operator response. If the response is Y, subsequent messages be issued to indicate the operator action required to resume processing. If the response is N, processing ends.

Operator response: Probable user error. To continue, reply Y to ADRY509D, and then take action indicated by subsequent messages. To terminate, reply N to ADRY509D.

System programmer response: None.

ADRY510I  device_number END OF TAPE

Explanation: The end of the tape has been reached. If additional tapes are to be mounted, subsequent messages will indicate any necessary action.

System action: Processing continues.

Operator response: None.
System programmer response: None.

```
ADRY511A  device_number WAITING FOR MOUNT OF NEXT TAPE

Explanation: The system is waiting for the next tape in the sequence to be mounted and for the tape device at address device_number to be readied.

System action: The system waits for a ready indication from the tape device.

Operator response: If the next tape is automatically mounted (for example, from an automatic cartridge loader), then no action is necessary. If the next tape is to be manually mounted, then mount the tape and make the tape drive ready.

System programmer response: None.
```

```
ADRY512I  device_number MOUNTING TAPE VOLSER: ttttt

Explanation: The system is in the process of mounting the tape with volser ttttt. This message is issued when the tape volsers are specified and the tape is in a tape library.

System action: The system mounts the tape.

Operator response: None.

System programmer response: None.
```

```
ADRY513I  device_number DUMP DATA SET RESIDES ON AN ENCRYPTED TAPE

Explanation: The DFSMSdss dump data set resides on a tape that was encrypted by an encrypting tape drive. DFSMSdss stand-alone restore operation cannot decrypt that encrypted data.

System action: Message ADRY509D is issued to the operator console to allow the operator to continue or stop.

Operator response: Probable user error. To continue, reply Y ADRY509D to mount an applicable tape. To stop, reply N to ADRY509D.

System programmer response: None.
```

```
ADRY821A  device_number INTERVENTION REQUIRED

Explanation: Manual intervention is required on the specified device. The device not be in the READY state.

System action: DFSMSdss Stand-Alone Services waits until the problem is corrected.

Operator response: Ensure that the device is in a READY state.

System programmer response: None.
```

```
ADRY822I  device_number INTERVENTION CLEARED, PROCESS CONTINUING

Explanation: The system has detected that the device at address device_number is no longer in an intervention required condition.

System action: Processing continues.

Operator response: None.

System programmer response: None.
```

```
ADRY823A  device_number LIBRARY INTERVENTION REQUIRED

Explanation: Intervention is required at the library.

System action: DFSMSdss Stand-Alone Services waits until the problem is corrected.

Operator response: Take the appropriate action to resolve the problem. Refer to your tape library operator’s guide problem determination procedures for information on handling error conditions.

System programmer response: None.
```

```
ADRY833A  device_number INTERVENTION REQUIRED - RELOAD CARTRIDGE

Explanation: Manual intervention is required on the specified device. The cartridge not be inserted correctly, or the tape not be threaded correctly.

System action: DFSMSdss Stand-Alone Services waits until the problem is corrected.

System programmer response: None.
```

```
ADRY834A  device_number INTERVENTION REQUIRED - UNLOAD CARTRIDGE

Explanation: Manual intervention is required on the specified device. The drive not be able to unload the cartridge, and the tape need to be manually unloaded.

System action: DFSMSdss Stand-Alone Services waits until the problem is corrected.

System programmer response: None.
```
Messages received at the output printer

**ADRY0001I**  FUNCTION COMPLETED, HIGHEST CONDITION CODE WAS  \( nn \ hh:mm:ss \ mm/dd/yy \)

**Explanation:** A command has been processed. The value \( nn \) is the last condition code (LASTCC) generated during processing. \( hh:mm:ss \) and \( mm/dd/yy \) are the hours, minutes, seconds and month, day, year respectively of the time and date of the message.

**Note:** The LASTCC value is the highest condition code found in the messages printed during command processing.

**System action:** LASTCC is set to \( nn \). MAXCC is set to \( nn \) if \( nn \) is greater than the current value of MAXCC.

**Operator response:** None.

**System programmer response:** None.

**ADRY0002I**  PROCESSING COMPLETE. MAXIMUM CONDITION CODE WAS  \( nn \)

**Explanation:** This message is issued upon completion of a DFSMSdss Stand-Alone Services job step. The highest condition code (MAXCC) set during the job step is printed (see message ADRY0001I).

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

**ADRY0204I**  PRECEDING COMMAND BYPASSED DUE TO CONDITION CODES

**Explanation:** The specified IF-THEN-ELSE command sequence caused the command to be bypassed. When an IF-THEN-ELSE command sequence is specified, either the THEN or the ELSE clause is processed. The clause that is not processed is bypassed.

**System action:** The bypassed portion of the command sequence is checked for syntax errors but is not processed. DFSMSdss Stand-Alone Services processing continues.

**Operator response:** None.

**System programmer response:** None.

**ADRY0206I**  IMPROPERLY PLACED COMMA HAS BEEN FOUND AND IGNORED

**Explanation:** The command contained a redundant comma, which is ignored.

**Note:** Positional parameters cannot be omitted by the use of commas. Leading positional parameters cannot be omitted.

**System action:** Command processing continues.

**Operator response:** None.

**System programmer response:** Correct the syntax error to prevent the message from recurring.

**ADRY0222I**  WARNING: COMMAND-END DELIMITER APPEARS WITHIN APOSTROPHES

**Explanation:** There is a semicolon (the optional command delimiter) inside a quoted string. A closing single quotation mark have been omitted.

**System action:** The usage is accepted, and the semicolon is treated as a valid character instead of a delimiter.

**Operator response:** None.

**System programmer response:** Check the usage of the semicolon, and correct if necessary.

**ADRY0233I**  TOO MANY RIGHT PARENTHESES FOUND. EXCESS IGNORED

**Explanation:** There are too many closing parentheses at the end of the command or following a first-level parameter.

**System action:** The excess is ignored, and command processing continues.

**Operator response:** None.

**System programmer response:** Remove the excess parentheses.

**ADRY0500I**  NEXT TRACK TO WRITE: TRACK C:H = X'cccCCCC:H' \( hh:mm:ss \ mm/dd/yy \)

**Explanation:** This message is issued at intervals during a full RESTORE, to give an indication of how far processing has progressed. It is for information only. \( hh:mm:ss \) and \( mm/dd/yy \) are the hours, minutes, seconds and month, day, year respectively of the time and date of the message.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.

**ADRY0501I**  device_number VOLUME PROCESSING AS MINIDISK

**Explanation:** The DASD volume was determined to be a minivolume.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None.
ADRY0700I device_number TRACK C:H = X'cccCCCC:H'
Explanation: XX'cccCCCC:H' is the normalized hexadecimal address.
System action: System action is determined by the previously issued message.
Operator response: None.
System programmer response: Refer to the description of the previous message that was issued to determine the appropriate response.

ADRY0701I device_number TRACK CCHH = NOT AVAILABLE
Explanation: A previous message indicated that an I/O error occurred. The error be specific to a single track, but the track could not be determined from the sense bytes.
System action: System action is determined by the previously issued message.
Operator response: None.
System programmer response: Refer to the description of the previously issued message to determine the appropriate response.

ADRY1110I device_number UNABLE TO CLOSE VOLUME
Explanation: An error has occurred that prevents the volume from being closed properly. The close does cleanup actions to free the device on completion of processing.
System action: The command probably did not complete successfully because the volume did not close.
Operator response: None.
System programmer response: Examine the previous messages to determine if any other errors occurred that have prevented the volume from being closed properly.

ADRY1500W INVALID TRACK FORMAT DETECTED DURING DUMP TRACK C:H = X'cccCCCC:H'
Explanation: An invalid track format condition was detected for the track during DUMP processing. When this track is accessed on the target volume, the invalid track format condition will recur.
System action: Operation continues and the remaining tracks, if any, are restored.
Operator response: None.
System programmer response: Determine and correct the reason for the invalid track format condition.

ADRY1501W device_number ALTERNATE TRACK INFORMATION IN VTOC BE INVALID
Explanation: An error occurred while the alternate tracks were being scanned to determine the information for updating the VTOC.
System action: Restore processing continues, but the alternate track information in the VTOC not be valid. Error messages (for example, I/O errors or channel errors) will not cause the RESTORE command to terminate if the errors occurred while the alternate tracks were being scanned.
Operator response: None.
System programmer response: Examine previous messages to determine the cause of the error, and take the action indicated by the previous messages.

ADRY1524W ENDING CYLINDER EXCEEDS THE VOLUME LIMITS
Explanation: The specified ending cylinder is higher than the last cylinder on the volume.
System action: The ending cylinder is set to the last cylinder on the volume and processing continues.
Operator response: None.
System programmer response: Verify that the specification was correct for the volume to be restored.

ADRY1525W ENDING HEAD EXCEEDS THE VOLUME LIMITS
Explanation: The specified ending head is higher than the last head on a cylinder for this volume.
System action: The ending head is set to the last head on the specified cylinder and processing continues.
Operator response: None.
System programmer response: Verify that the specification was correct for the volume to be restored.

ADRY1640I device_number TAPE DRIVE IS NOT IN A TAPE LIBRARY
Explanation: The TAPEVOLSER parameter was specified, but the tape drive at the specified device address is not in a tape library.
Note: The TAPEVOLSER parameter is not required, and should not be specified when the tape drive is not in a tape library.
System action: DFSMSdss Stand-Alone Services will attempt to continue. The volseres are ignored. The tape
volumes must be mounted by the operator on the specified drive.

Operator response:  Mount the tape volumes when required.

System programmer response:  None.

ADRY1710I  device_number I/O ERROR OCCURRED ON DEVICE

Explanation:  An I/O error occurred at device address device_number. Information following the message describes the nature of the I/O error.

System action:  Command processing continues. Command processing eventually ends.

Operator response:  None.

System programmer response:  Make sure the problem is caused by the device. Correct the device problem, and retry the command.

ADRY1711I  SIM INFORMATION:
CCUU=设备地址, errortype, severity,  
MT=设备地址, SER=设备地址,  
REFCODE=设备地址, VOLSER=设备地址, C:H =  
X'ccccCCCC:H', BLOCK=xxx  
xxxxx,REPEATED  
SIM=设备地址

Explanation:  This message contains information from a service information message (SIM). The CCHH or BLOCK fields are printed only when they are applicable to the error type. When other fields are not applicable to the error type, N/A is printed in the variable portion of the message. The DASD model number appears in bits 3-5 of the MT field.

System action:  Command processing continues.

Operator response:  None.

System programmer response:  See IBM 9340 Direct Access Storage Subsystems Reference for further information regarding SIMs.

ADRY2500I  TRACK NOT RESTORED DUE TO I/O ERROR DURING DUMP TRACK C:H =  
X'ccccCCCC:H'

Explanation:  An I/O error was encountered in reading the track during DUMP processing.

System action:  The track is not written, the operation continues, and the remaining tracks, if any, are restored.

Operator response:  None.

System programmer response:  Verify that the track is not necessary.

ADRY2765I  device_number INVALID TRACK FORMAT

Explanation:  A track format condition that is not valid was detected while attempting to write data on the specified track. This usually indicates that data has been written to the track beyond the track capacity. It is generally a user error. Information following the message pertains to the error.

System action:  DFSMSdss Stand-Alone Services continues with the next track.

Operator response:  None.

System programmer response:  Determine which data set contains the specified track. Determine how, when, and where the data on the specified track was originally written, prior to being dumped, in order to find how the invalid track condition occurred. If ADRY1500I was previously issued, this error was also detected during the dump operation.

Begin recovery of the data on the track using your installation’s procedures. Then inspect the failing track by specifying the NOPRESERVE parameter.

ADRY2766I  device_number DATA CHECK

Explanation:  A data check occurred on the specified device. Information following the message describes the nature of the I/O error.

System action:  The function ends.

Operator response:  None.

System programmer response:  Determine the cause of the data check. Rerun the job after the problem is resolved.

ADRY2950I  INVALID FORMAT STRUCTURE

Explanation:  An element of one of the static text structures is incorrect. There is probably a program error.

System action:  The request to print a line is ignored. Command processing continues, but no output is printed.

Operator response:  None.

System programmer response:  Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

ADRY2951I  OUTPUT COLUMN SPECIFIED OUT OF RANGE

Explanation:  An output column specification is outside the allowed print line width (for example, the specification is beyond column 120). There is probably a program error.
ADRY2952I EXCESSIVE FIELD LENGTH FOR BD OR PU CONV

Explanation: A binary-to-decimal or packed-to-unpacked conversion length was specified greater than 15. There is probably a program error.

System action: A default value of 15 is used, and command processing continues.

Operator response: None.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

ADRY2953I A REDO SUB-STRUCTURE IS NESTED

Explanation: A redo structure cannot be defined within a set of structures to be redone. There is probably a program error.

System action: The current redo operation ends. All structures are treated only once.

Operator response: None.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

ADRY2954I STATIC TEXT ENTRY REQUESTED NOT IN MODULE

Explanation: A request for a specific static text entry in a specified static text module could not be resolved. Either the static text index is incorrect, or the programmer has neglected to enter a message into the static text module. There is probably a program error.

System action: The request is ignored and command processing continues.

Operator response: None.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

ADRY2955I INVALID PACKED DECIMAL FIELD

Explanation: A conversion request for packed-to-unpacked decimal encountered a digit that is not in the range of 0 to 9. There is probably a program error.

System action: Conversion stops for the current request. Command processing continues without the packed-to-unpacked conversion.

Operator response: None.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

ADRY3003I FUNCTION TERMINATED. CONDITION CODE IS nn hh:mm:ss mm/dd/yy

Explanation: A command has encountered an abnormal ending error condition during processing. The value nn is the last condition code (LASTCC) generated during command processing. Messages printed just prior to this message indicate the nature of the error.

Note that the LASTCC value is the highest condition code found in the messages printed during command processing.

hh:mm:ss and mm/dd/yy are the hours, minutes and seconds, and month, day, and year, respectively, of the time and date of the message.

System action: DFSMSdss Stand-Alone Services continues with the next command. LASTCC is set to nn; MAXCC is set to nn if nn is greater than the current value of MAXCC.

Operator response: None.

System programmer response: Correct the cause of the error, and reissue the command.

ADRY3004I FUNCTION TERMINATED. INSUFFICIENT MAIN STORAGE

Explanation: The size of storage is too small.

System action: The function ends.

Operator response: None.

System programmer response: Increase the storage size and reissue the command.

ADRY3115I UNABLE TO READ DASD VOLUME LABEL

Explanation: An I/O error occurred while Stand-Alone Services was attempting to read the DASD volume label to verify the volume serial number.

System action: The function ends.

Operator response: None.
System programmer response: Either issue the command again specifying the NOVERIFY parameter, or reinitialize the volume. Save the job output and contact your hardware service representative.

**ADRY3116I** VERIFICATION FAILED: VOLSER SPECIFIED DOES NOT MATCH TARGET. TARGET VOLSER=vvvvv

Explanation: The VERIFY parameter was specified, but the specified volume serial number does not match the volume serial number vvvvv found in the volume label of the target volume.

System action: The function ends.

Operator response: None.

System programmer response: Ensure that the correct volume is specified. Either correct the volume serial number specified in the command, or specify the NOVERIFY parameter.

**ADRY3117I** INVALID VOLUME LABEL

Explanation: The DASD volume does not have a valid volume label for use on an MVS system (containing the VOL1 identifier).

System action: The function ends.

Operator response: None.

System programmer response: Ensure that the correct volume is specified.

**ADRY3118I** UNABLE TO READ VTOC

Explanation: An error occurred while Stand-Alone Services was attempting to read the DASD VTOC.

System action: The function ends.

Operator response: None.

System programmer response: Verify that a valid VTOC pointer exists in the volume label and that a valid VTOC exists on the volume. Either issue the command again specifying the NOVERIFY parameter, or reinitialize the volume.

**ADRY3123I** device_number INVALID UNIT ADDRESS SPECIFIED

Explanation: The device numbers specified do not exist in the system I/O configuration.

System action: The function ends.

Operator response: None.

System programmer response: Correct the value substituted for device_number and issue the command again.

**ADRY3124I** device_number UNABLE TO OPEN VOLUME

Explanation: The volume that was specified cannot be opened for several possible reasons:
- The device number is not valid.
- There are I/O errors associated with the volume.

System action: The function ends.

Operator response: None.

System programmer response: Determine the status of the volume by examining previous messages. Search problem reporting databases for a fix for the problem. If no fix exists, save the job output and contact the IBM Support Center.

**ADRY3145I** NO STORAGE AVAILABLE

Explanation: Dynamic acquisition of storage for work areas and control blocks failed.

System action: Command processing ends.

Operator response: Increase main storage size.

**ADRY3150I** INVALID DEVICE TYPE PARAMETER: xxxx

Explanation: The specified device type xxxx is not a valid parameter.

System action: The function ends.

Operator response: None.

System programmer response: Examine the command description to determine the valid device types for the specified command. Correct the parameters, and run the job again.

**ADRY3154I** device_number TAPE LIBRARY NOT SUPPORTED IN 370 MODE

Explanation: The specified tape drive exists in a tape library. Tape library functions are not supported in 370 mode.

System action: The function ends.

Operator response: Run the job from a drive that is not in a tape library.

System programmer response: None.

**ADRY3200I** TOO MANY POSITIONAL PARAMETERS AFTER xxxx

Explanation: A parameter list has too many specified positional parameters following the characters xxxx.

System action: The function ends.

Operator response: None.

System programmer response: Remove the excess
parameters and issue the command again.

ADR3201I  CONSTANT xxx EXCEEDS LENGTH LIMIT
Explanation: The constant xxx contains more characters than the maximum permitted by the command syntax.
System action: The function ends.
Operator response: None.
System programmer response: Correct the constant and issue the command again.

ADR3202I  ABOVE TEXT BYPASSED UNTIL NEXT COMMAND. CONDITION CODE IS 12
Explanation: There is a syntax error in the command. The remainder of the command is ignored.
Messages printed just prior to this message indicate the nature of the error.
System action: The function ends.
Operator response: None.
System programmer response: Correct the syntax error, and issue the command again.

ADR3203I  ITEM xxx DOES NOT ADHERE TO RESTRICTIONS
Explanation: An indicated parameter does not conform to required naming conventions. For example, a parameter be misspelled.
System action: The function ends.
Operator response: None.
System programmer response: Correct the parameter error and issue the command again.

ADR3205I  DELIMITER xxx IS NOT PROPERLY PRECEDED BY A CONSTANT OR KEYWORD
Explanation: A delimiter was found where either a subparameter list or data was expected.
The delimiter is improperly used because either parentheses were improperly positioned, or a positional parameter was missing.
System action: The function ends.
Operator response: None.
System programmer response: Correct the syntax error, and issue the command again.

ADR3207I  REMAINDER OF COMMAND INPUT STREAM IGNORED
Explanation: An error has occurred that prohibits further scanning of the command stream. Messages issued just prior to this message indicate the nature of the error.
Note: Condition code (MAXCC) is always set to 16 when this situation is encountered.
System action: Command processing ends.
Operator response: None.
System programmer response: Correct the error, and issue the command again.

ADR3208I  LEFT PARENTHESES MISSING FOLLOWING KEYWORD xxx
Explanation: The keyword xxx is not followed by the opening parenthesis. A left parenthesis must begin the required subparameter list or value associated with the command keyword.
System action: The function ends.
Operator response: None.
System programmer response: Check the requirements of the keyword, correct the syntax, and issue the command again.

ADR3209I  RIGHT PARENTHESES MISSING AFTER xxx
Explanation: A closing parenthesis was not found where expected. A subparameter list was possibly not properly delimited.
System action: The function ends.
Operator response: None.
System programmer response: Correct the command syntax and reissue the command.

ADR3210I  INVALID PARENTHESES FOR SPECIFYING REPEATED SUBPARAMETER LIST
Explanation: Parentheses that delimit repeated subparameter lists are either missing or not matched.
System action: The function ends.
Operator response: None.
System programmer response: Correct the command syntax and reissue the command.
ADRY3211I  KEYWORD  xxxx  IS  IMPROPER
Explanation:  The  command  contains  a  misspelled, improperly specified, or inapplicable keyword.
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax and reissue the command.

ADRY3212I  INVALID  LEFT  PARENTHESIS  AFTER  xxxx
Explanation:  There is an opening parenthesis that appears to delimit the positional parameter xxxx, but the positional parameter specified is not a constant or a list of constants.
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax and reissue the command.

ADRY3213I  KEYWORD  xxxx  APPEARS  TOO  OFTEN
Explanation:  The keyword xxxx appears too often in the command. A parameter list be incorrectly specified.
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax by removing the keyword, and issue the command again.

ADRY3214I  HEX  OR  BINARY  CONSTANT  SPECIFIED  IMPROPERLY
Explanation:  A hexadecimal or binary constant is not specified in the correct format: X'hh...hh' or B'bb...bb', respectively.
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax and reissue the command.

ADRY3216I  ABOVE  TEXT  BYPASSED  UNTIL  NEXT  COMMAND
Explanation:  Syntax checking of this command found an error. Syntax checking ended. Messages issued just prior to this message indicate the nature of the error.
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax and reissue the command.

ADRY3217I  PASSWORD  IMPROPER  AFTER  xxxx
Explanation:  A password, denoted by a slash (/), was encountered where a password is not allowed.
System action:  The function ends.
Operator response:  None.
System programmer response:  Remove the password from the parameter and issue the command again.

ADRY3218I  TOO  MANY  REPEATED  SUBPARAMETER  LISTS  APPEAR
Explanation:  More repeated subparameter lists are specified than are allowed for this command.
System action:  The function ends.
Operator response:  None.
System programmer response:  Check the command syntax, correct the error, and issue the command again.

ADRY3219I  VERB  NAME  xxxx  UNKNOWN
Explanation:  The verb xxxx is not recognized as a command.
System action:  The function ends.
Operator response:  None.
System programmer response:  Reissue the command with the correct command name.

ADRY3220I  IMPROPER  NUMERIC  DIGIT  FOUND  IN  xxxx
Explanation:  The constant xxxx contains an invalid character:
  • Decimal numbers can only be specified with the symbols 0 through 9
  • Hexadecimal numbers can only be specified with the symbols 0 through 9 and A through F
  • Binary numbers can only be specified with the symbols 0 and 1
System action:  The function ends.
Operator response:  None.
System programmer response:  Correct the command syntax error and issue the command again.

ADRY3221I  CONSTANT  xxxx  NOT  WITHIN  VALUE  RANGE
Explanation:  The value of the constant xxxx is outside the range of values allowed for the associated parameter.
System action:  The function ends.
Operator response: None.
System programmer response: Check the command syntax for allowed values, correct the error, and issue the command again.

ADR3223I TOO MANY CONSTANTS IN LIST BEGINNING AT xxxx
Explanation: The command contains too many specified constants beginning at the characters xxxx.
System action: The function ends.
Operator response: None.
System programmer response: Correct the command syntax and reissue the command.

ADR3225I REQUIRED (SUB)PARAMETER OF xxxx IS MISSING
Explanation: A required parameter or subparameter, identified by xxxx, is missing.
System action: The function ends.
Operator response: None.
System programmer response: Add the missing parameter and issue the command again.

ADR3226I INCONSISTENT PARAMETERS INVOLVING xxxx
Explanation: Some commands contain parameters that are defined as mutually exclusive. (If one parameter is specified, the other parameter is not allowed.)
System action: The function ends.
Operator response: None.
System programmer response: Correct the command syntax and reissue the command.

ADR3301I **RECORD xxxx NOT WRITTEN. LENGTH INVALID
Explanation: The record xxxx was not written for one of the following reasons:

- Record length was greater than LRECL of the output data set.
- Record length was less than the LRECL of the output data set and RECFM was F (fixed).

Note: xxxx is the first five bytes of the record in hexadecimal format.
System action: DFSMSdss Stand-Alone Services continues processing until four such errors occur. After four errors, the command continues to run, but no further records are written to the output data set.
Operator response: None.
System programmer response: Save the job output and contact your software service representative.

ADR3302I **SYSTEM UNABLE TO OPEN
Explanation: See the associated messages for the cause of the error.
System action: The function ends.
Operator response: None.
System programmer response: Search problem reporting databases for a fix for the problem. If no fix
exists, save the job output and contact the IBM Support Center.

ADRYS3315I *RECORD SIZE GREATER THAN 32767 NOT SUPPORTED

Explanation: The system cannot process a logical record whose size is greater than 32,767 bytes.

System action: The function ends. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Specify a LRECL length that is less than 32,767 bytes.

ADRYS3321I *OPEN/CLOSE ERROR

Explanation: The OPEN/CLOSE processing detected an error while either opening or closing a SYSIN or SYSPRINT data set.

System action: The function ends.

Operator response: None.

System programmer response: Correct the error and issue the command again.

ADRYS3501I device_number DUMP DATA SET IS NOT A SUPPORTED FORMAT

Explanation: The dump data set on the device at address device_number does not pertain to this job. The DFSMSdss Stand-Alone Services program does not support the format of the dump data set. The dump data set was not created by this product, or have been created by an incompatible release, or the tape volser have been specified in the wrong sequence. This message is issued when the nature of the error or the devices being used or both do not lend themselves to resume processing without respecification of parameters and rerunning the job.

System action: The function ends.

Operator response: Probable user error. Correct the parameters and rerun the job.

System programmer response: None.

ADRYS3502I device_number WRONG TAPE

Explanation: The tape on the tape device at address device_number does not pertain to this job. The tape volser have been specified in the wrong sequence. This message is issued when the nature of the error or the devices being used or both do not lend themselves to resume processing without respecification of parameters and rerunning the job.

System action: The function ends.

Operator response: Probable user error. Correct the parameters and rerun the job.

System programmer response: None.

ADRYS3503I device_number DUMP DATA SET IS NOT A FULL VOLUME DUMP

Explanation: The dump data set on the device at address device_number is not compatible with the function specified. A full volume RESTORE is being attempted from a tracks or physical data set DUMP. To perform a full volume RESTORE, the dump data set must be a full volume DUMP. This message is issued when the nature of the error or the devices being used or both do not lend themselves to resume processing without respecification of parameters and rerunning the job.

System action: The function ends.

Operator response: Probable user error. Correct the parameters and rerun the job.

Note: If a tracks or physical data set DUMP is the correct dump data set, then refer to the RESTORE command STARTTRK and ENDTRK parameters for details on how to specify the range to be restored.

System programmer response: None.

ADRYS3504I device_number LOGICAL DUMP NOT VALID FOR THIS FUNCTION

Explanation: The dump data set on the device at address device_number is not valid for this job. A RESTORE is being attempted from a logical data set DUMP. This message is issued when the nature of the error or the devices being used or both do not lend themselves to resume processing without respecification of parameters and rerunning the job.

System action: The function ends.

Operator response: Probable user error. Use a physical dump data set for the RESTORE.

System programmer response: None.

ADRYS3520I ATTEMPT TO RESTORE TO WRONG DEVICE

Explanation: There was an attempt to restore data to a device type other than the type from which it was dumped.

System action: The function ends.

Operator response: None.

System programmer response: Probable user error. Correct the parameters to reflect the device from which the data was dumped, and rerun the job.
Explanation: The number of cylinders on the target DASD volume is less than the number of cylinders dumped from the original input volume. The output cylinders is the hexadecimal value for the number of cylinders on the target volume. The input cylinders is the hexadecimal value for the number of cylinders on the volume that was dumped.

System action: The function ends.

Operator response: None.

System programmer response: Supply an appropriate volume that matches the input for a full volume RESTORE, and rerun the job.

Explanation: The specified starting track is higher than the specified ending track for the range to be restored.

System action: The function ends.

Operator response: None.

System programmer response: Correct the parameters so that the start of the range is prior to the end of the range, and rerun the job.

Explanation: The specified starting track is not within the valid limits of the volume. For example, the starting cylinder is higher than the last cylinder on the volume, or the starting head is higher than the last head on a cylinder for this volume.

System action: The function ends.

Operator response: None.

System programmer response: Correct the parameters so that the range of tracks to be restored is within the limits of the target volume, and rerun the job.

Explanation: The restore tape has a missing, incorrect, or extra record. There was probably an error during DUMP.

System action: The function is terminated.

Operator response: None.

System programmer response: None.

Explanation: The tape with volser tttttt is in use. This message is only issued if the TAPEVOLSER parameter was specified indicating that DFSMSdss Stand-Alone Services was trying to locate the dump data set. This could be due to an I/O error that occurred, or if the FILE parameter was specified, the file not exist on the tape.

System action: The function ends.

Operator response: None.

System programmer response: Verify that the correct tape is mounted, the file specification is correct, and the tape contains valid data.
Services should mount the tape volume in the tape library.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the tape volume serial number is specified correctly and rerun the job when the volume is not in use.

**ADRY3631I  ttttt LIBRARY VOLUME RESERVED**

**Explanation:** The tape with volser ttttt is reserved.

This message is only issued if the TAPEVOLSER parameter was specified indicating that DFSMSdss Stand-Alone Services should mount the tape volume in the tape library.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the tape volume serial number is specified correctly and is not a reserved volume.

**ADRY3632I  ttttt VOLUME NOT IN LIBRARY**

**Explanation:** The tape with volser ttttt is not found in the tape library. This message is only issued if the TAPEVOLSER parameter was specified indicating that DFSMSdss Stand-Alone Services should mount the tape volume in the tape library.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the tape volume serial number is specified correctly and rerun the job specifying a tape volume that is in the library.

**ADRY3633I  device_number TAPE DRIVE CANNOT BE ACCESSED IN LIBRARY**

**Explanation:** The TAPEVOLSER parameter was specified, but the drive is not online or cannot be accessed in the library.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the drive is online in the library. Assistance of a hardware service representative be necessary to resolve the cause of the problem.

**ADRY3634I  ttttt LIBRARY VOLUME NOT AVAILABLE**

**Explanation:** The tape with volser ttttt is not currently available. There are several possible reasons why the volume is not available:

- The volume is queued for demount or being demounted
- The volume is misplaced, has an unreadable label, was ejected or queued for eject, was previously mounted, or is being mounted or queued for mounting by another job
- The volume was mounted from the library manager console via the Stand-Alone Services Setup window, and the TAPEVOLSER parameter was specified. The TAPEVOLSER parameter should not be specified when the tape is mounted from the library manager console via the Stand-Alone Services Setup window.

This message is only issued if the TAPEVOLSER parameter was specified indicating that DFSMSdss Stand-Alone Services should mount the tape volume in the tape library.

**System action:** The function ends.

**Operator response:** If the volume was not mounted from the library manager console via the Stand-Alone Services Setup window, then either: rerun the job without specifying the TAPEVOLSER parameter, or demount the volume via the library manager console Stand-Alone Services Setup window and rerun the job with the TAPEVOLSER parameter to let DFSMSdss Stand-Alone Services mount the volume(s).

If the volume was not mounted from the library manager console via the Stand-Alone Services Setup window, then verify that the tape volume serial number is specified correctly and rerun the job when the volume is available.

**System programmer response:** None.

**ADRY3650I  device_number LIBRARY ATTACHMENT FACILITY EQUIPMENT CHECK**

**Explanation:** The Library attachment facility failed. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.

**ADRY3651I  device_number LIBRARY MANAGER OFFLINE**

**Explanation:** The library manager is not online to the subsystem. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None

**System programmer response:** Refer to your tape library operator’s guide problem determination
procedures for information on handling error conditions.

**ADRY3652I device_number CONTROL UNIT AND LIBRARY MANAGER INCOMPATIBILITY**

**Explanation:** The microcode levels of the control unit and library manager are not compatible. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Save the job output and contact your hardware service representative.

**ADRY3653I device_number LIBRARY VISION SYSTEM NOT-OPERATIONAL**

**Explanation:** The library vision system has failed. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Save the job output and contact your hardware service representative.

**ADRY3654I device_number LIBRARY MANAGER EQUIPMENT CHECK**

**Explanation:** The library manager is not operational. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
**Operator response:** Refer to your tape library operator’s guide problem determination procedures for information on handling error conditions.
**System programmer response:** None.

**ADRY3655I device_number LIBRARY EQUIPMENT CHECK**

**Explanation:** A hardware failure has occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Save the job output and contact your hardware service representative.

**ADRY3656I device_number LIBRARY DEVICE FAILURE**

**Explanation:** A device in the library has failed. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Refer to your tape library operator’s guide problem determination procedures for information on handling error conditions.

**ADRY3657I device_number LIBRARY ENVIRONMENTAL ALERT**

**Explanation:** An environmental alert condition has been detected by the library. Information following the message pertains to the error.

**System action:** The function ends.
**Operator response:** Refer to your tape library operator’s guide problem determination procedures for information on handling environmental alert conditions.
**System programmer response:** See operator response.

**ADRY3658I ttttt LIBRARY VOLUME MANUALLY EJECTED**

**Explanation:** The tape with volser ttttt has been manually ejected.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Verify that the tape volume serial number is specified correctly.

**ADRY3659I device_number LIBRARY NOT CAPABLE - MANUAL MODE**

**Explanation:** A request has been made to a library that is in manual mode, but the request requires that the library be in automated mode. Information following the message describes the nature of the error.

**System action:** The function ends.
**Operator response:** Rerun the job when the library is in automated mode.
**System programmer response:** None.

**ADRY3660I ttttt LIBRARY VOLUME INACCESSIBLE**

**Explanation:** The tape with volser ttttt cannot be accessed by the cartridge accessor. Information following the message pertains to the error.

**System action:** The function ends.
**Operator response:** None.
**System programmer response:** Refer to your tape library operator’s guide problem determination procedures for information on handling error conditions.
**ADRY3661I device_number LIBRARY DRIVE SETUP IN STAND-ALONE MODE**

**Explanation:** The TAPEVOLSER parameter was specified for a drive that has been setup in Stand-Alone Services mode from the library manager console via the Stand-Alone Services Setup window.

This message is only issued if the TAPEVOLSER parameter was specified indicating that DFSMSdss Stand-Alone Services should mount the tape volume in the tape library.

**System action:** The function ends.

**Operator response:** Verify that the correct tape drive address is specified.

If an incorrect tape drive address was specified, then correct the parameters and rerun the job.

If the correct tape drive address was specified, then do one of the following:
- Rerun the job without specifying the TAPEVOLSER parameter, and mount the volumes from the library manager console Stand-Alone Services Setup window.
- Take the drive out of Stand-Alone Services mode from the library manager console Stand-Alone Services Setup window and rerun the job with the TAPEVOLSER parameter to let DFSMSdss Stand-Alone Services mount the volume(s). For this option, the tape volumes must reside in the tape library.

**System programmer response:** None

---

**ADRY3702I OPERATOR DID NOT READY DEVICE**

**Explanation:** When prompted by message ADRY004D to make a device ready, the operator requested that command processing end.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** None.

---

**ADRY3711I device_number CHANNEL CONTROL CHECK**

**Explanation:** An unrecoverable channel error occurred. Information following the message pertains to the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.

---

**ADRY3717I device_number UNRECOGNIZED I/O ERROR TYPE**

**Explanation:** An I/O error has occurred. However, the error cannot be recognized for the specified device type. Information following the message describes the nature of the I/O error.

**System action:** DFSMSdss Stand-Alone Services has performed a retry, but the error still persists. A hardware error is suspected.

**System programmer response:** Examine the error information. Assistance of a hardware service representative be required to interpret the error information and to aid in correcting the cause of the error.

---

**ADRY3730I device_number UNSUPPORTED DEVICE TYPE SENSEID = +00 xxxxxxxx xxxxxxxx xxxxxxxx**

**Explanation:** Either the device type at the specified address could not be determined, or the device type is not supported. The sense ID information from sense ID CCW X’E4’ is printed starting at offset +00. If the sense ID CCW is not supported by the device, this information contain zeros. See the appropriate device manual for the format of the sense ID information.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the device is a supported device. Then verify that the device address and type (when required) are specified correctly.

---

**ADRY3762I device_number NO RECORD FOUND**

**Explanation:** A ‘no record found’ condition occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** If the VERIFY parameter was specified, and other messages indicate that the error occurred while reading the volume label or VTOC, then verify that a valid volume label and VTOC exist on the volume. If not, then rerun the job specifying the NOVERIFY parameter. Otherwise, save the job output and contact your service representative.

---

**ADRY3763I device_number END OF CYLINDER**

**Explanation:** An end-of-cylinder condition occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.
Operator response: None.
System programmer response: Save the job output and contact your service representative.

ADRYS764I  device_number FILE PROTECTED
Explanation: A file protect condition occurred. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your service representative.

ADRYS770I  device_number UNABLE TO RESERVE DEVICE
Explanation: The device could not be reserved by DFSMSdss Stand-Alone Services because of an I/O error or because the device be reserved on another path or by another system.
System action: The function ends.
Operator response: None.
System programmer response: Examine the previous messages to determine if an I/O error occurred. If the device is reserved on another path or by another system, rerun the job when the device is available.

ADRYS771I  device_number UNABLE TO ASSIGN TAPE DRIVE
Explanation: The tape drive could not be assigned by DFSMSdss Stand-Alone Services because of an I/O error or because the drive is assigned elsewhere.
System action: The function ends.

ADRYS772I  device_number UNABLE TO UNASSIGN TAPE DRIVE
Explanation: The tape drive was not able to be unassigned.
System action: The function ends.
Operator response: None.
System programmer response: Examine previous messages to determine if an I/O error occurred and contact your hardware service representative.

ADRYS773I  device_number UNABLE TO UNASSIGN TAPE DRIVE
Explanation: DFSMSdss Stand-Alone Services was unable to recover from an I/O error. The prior message will contain information pertaining to the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADRYS815I  device_number I/O ERROR RECOVERY UNSUCCESSFUL
Explanation: DFSMSdss Stand-Alone Services has exhausted all of its retries for an I/O error condition.
System action: The function ends.
Operator response: None.
System programmer response: Examine the error information to determine the cause of the error. Save the job output and contact your hardware service representative.

ADRYS816I  device_number RETRY LIMIT EXCEEDED
Explanation: An incorrect length record condition occurred on the specified device. Information following the message describes the nature of the I/O error.
System action: The function ends.
Chapter 4. ADRY messages

Operator response: None.

System programmer response: Save the job output and contact your service representative.

ADR3819I device_number PROGRAM CHECK
Explanation: This indicates a probable program error because of an incorrect CCW.
System action: DFSMSdss Stand-Alone Services ends.
Operator response: Notify the system programmer.
System programmer response: Save the job output. Run the AMDSADMP service aid to dump the contents of real storage to tape. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ADR3820I device_number PROTECTION CHECK
Explanation: A protection check occurred.
System action: The function ends.
Operator response: Rerun the job.
System programmer response: None.

ADR3822I device_number EQUIPMENT CHECK
Explanation: An equipment check I/O error occurred. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADR3823I device_number DATA CHECK
Explanation: A data check occurred on the specified device. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Determine the cause of the data check. Rerun the job after the problem is resolved.

ADR3824I device_number COMMAND REJECT
Explanation: The specified device rejected the CCW. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.

ADR3825I device_number FUNCTION INCOMPATIBLE
Explanation: A requested function cannot be performed due to the state of the subsystem. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: None.

ADR3826I device_number FORMAT INCOMPATIBLE
Explanation: The device is not compatible with the format of the tape.
System action: The function ends.
Operator response: Load the tape in a drive that is compatible with the tape format.
System programmer response: None.

ADR3827I device_number TENSION LOSS
Explanation: An error occurred that caused the drive to lose tape tension. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADR3828I device_number UNLOAD ERROR
Explanation: The tape drive was unable to unload a cartridge. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADR3829I device_number OVERRUN
Explanation: An overrun occurred on the specified device. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
**System programmer response:** Save the job output and contact your hardware service representative.

---

**ADR3830I** device_number DRIVE ASSIGNED ELSEWHERE

**Explanation:** The tape drive is assigned on another channel path. It be in use on another system. Information following the message pertains to the error.

**System action:** The function ends.

**Operator response:** Rerun the job with a different tape drive or when the tape drive is not assigned elsewhere.

**System programmer response:** None.

---

**ADR3831I** device_number DRIVE OFFLINE

**Explanation:** The drive is not online in the subsystem. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** Ensure the drive is online in the subsystem and rerun the job.

**System programmer response:** None.

---

**ADR3832I** device_number BUS OUT CHECK

**Explanation:** A bus out check occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.

---

**ADR3833I** device_number CONTROL UNIT ERP FAILED

**Explanation:** The control unit was unsuccessful in recovering a failure. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.

---

**ADR3834I** device_number INTERFACE CONTROL CHECK

**Explanation:** An interface control check occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.
ADRY3839I  device_number CHANNEL DATA CHECK
Explanation: A channel data check occurred. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADRY3840I  device_number CHAINING CHECK
Explanation: A chaining check occurred. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADRY3841I  device_number CHANNEL INTERFACE ERROR
Explanation: A channel interface error occurred. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Save the job output and contact your hardware service representative.

ADRY3842I  device_number PHYSICAL END OF TAPE
Explanation: The physical end of the tape was reached. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: Verify that the correct tape is being used, and that the parameters were specified correctly. If the FILE parameter was specified, verify that the specified file exists on the tape.

ADRY3843I  device_number TAPE LENGTH CHECK
Explanation: The tape length in the cartridge is too short. The error occurs when the leader block is replaced. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: None.
System programmer response: None.

ADRY3844I  device_number TAPE VOID
Explanation: No data is found on the tape. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: Verify that the proper tape is mounted, and that the tape contains data. If the FILE parameter was specified, verify that the file specified exists on the tape and contains data.

ADRY3845I  device_number FILE PROTECTED
Explanation: A write operation was attempted on a tape that is write-protected. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: Verify that the proper tape is mounted, and make it non-write-protected to write on it.

ADRY3846I  device_number TAPE LENGTH VIOLATION
Explanation: A tape was mounted that exceeds the length of an IBM Enhanced Capacity Cartridge System tape. Probable user error. Information following the message describes the nature of the I/O error.
System action: The function ends.
Operator response: Verify that the correct tape is being used.
System programmer response: None.

ADRY3847I  device_number END OF DATA
Explanation: An end-of-data condition occurred. Information following the message describes the nature of the I/O error. There are several possible reasons for this error:
• The volume not have been closed properly when it was written
• If the FILE parameter was specified, the file not exist on the tape or contain invalid data.
System action: The function ends.
Operator response: None.
System programmer response: Verify that the correct tape is being used and contains valid data. If the FILE parameter was specified, verify that the file exists on the tape and contains valid data.

ADRY3848I  device_number RECORD SEQUENCE ERROR
Explanation: A record sequence error occurred on the tape. Information following the message describes the nature of the I/O error. This message could indicate a
possible media problem. Or if the FILE parameter was specified, the file not exist on the tape or contain invalid data.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Determine if a media problem exists. If the FILE parameter was specified, verify that the file exists on the tape and contains valid data.

---

**ADRY3849I device_number CONTROL UNIT AND DRIVE INCOMPATIBLE**

**Explanation:** An incompatibility exists between the control unit and the drive. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your hardware service representative.

---

**ADRY3850I device_number CONFIGURATION ERROR**

**Explanation:** A command attempted to use a facility that is not installed in the I/O subsystem. For example: the device not be installed, the device not be compatible with the I/O subsystem, or the library and I/O subsystem not be compatible. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the proper device is being used and that the features exist in the subsystem for the function being performed. Assistance of a hardware service representative be necessary to resolve the problem.

---

**ADRY3851I device_number PROTECTION EXCEPTION**

**Explanation:** An error occurred while Stand-Alone Services was trying to execute a command. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Save the job output and contact your service representative.

---

**ADRY3852I device_number END OF VOLUME**

**Explanation:** An end of volume condition occurred. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Determine if a media problem exists. If the FILE parameter was specified, verify that the file exists on the tape and contains valid data.

---

**ADRY3853I device_number BLOCK NOT FOUND**

**Explanation:** The device was unable to find a specified block. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Verify that the correct tape is being used and contains valid data. If the FILE parameter was specified, verify that the file exists on the tape and contains valid data.

---

**ADRY3854I device_number READ ERROR**

**Explanation:** An unrecoverable error occurred while Stand-Alone Services was attempting to read a data block or tape mark. Information following the message describes the nature of the I/O error. This message could indicate a possible media problem. Or if the FILE parameter was specified, the file not exist on the tape or contain invalid data.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** Determine if a media problem exists. If the FILE parameter was specified, verify that the file exists on the tape and contains valid data.

---

**ADRY3855I device_number VOLUME IS NOT FORMATTED**

**Explanation:** A read command was issued to a volume that has not been formatted for read-type operations. The tape be blank or be written in a format that the device does not support or does not recognize. Information following the message describes the nature of the I/O error.

**System action:** The function ends.

**Operator response:** None.

**System programmer response:** None.
ADRY3856I  *device_number* POSITIONING LOST

Explanation: An error occurred that caused the tape positioning to be lost. Information following the message describes the nature of the I/O error.

System action: The function ends.

Operator response: None.

System programmer response: Save the job output and contact your hardware service representative.

ADRY3857I  *device_number* READ LENGTH ERROR

Explanation: A read was issued for a length not supported by the device. Information following the message describes the nature of the I/O error.

System action: The function ends.

Operator response: Verify that the correct tape is mounted and is mounted on a drive that supports the tape.

System programmer response: None.

ADRY3858I  *device_number* UNSUPPORTED MEDIUM

Explanation: The device does not support the tape that is mounted. Information following the message describes the nature of the I/O error.

System action: The function ends.

Operator response: Verify that the correct tape is mounted and is mounted on a drive that supports the tape.

System programmer response: None.

ADRY3859I  *device_number* MEDIUM LENGTH ERROR

Explanation: A length error occurred. Information following the message describes the nature of the I/O error.

System action: The function ends.

Operator response: Verify that the tape is mounted in a compatible drive.

System programmer response: None.

ADRY3995I  *device_number* INTERNAL ERROR, DIAGNOSTIC INFORMATION FOLLOWS:

Explanation: An internal error was detected.

System action: Processing ends.

Operator response: None.

System programmer response: Probable program error. Run the AMDSADMP service aid to dump the contents of real storage to tape. Search problem reporting databases for a fix for the problem. If no fix exists, save the output and contact the IBM Support Center.

ADRY4227I  AN “ELSE” COMMAND APPEARS IMPROPERLY

Explanation: The command contains an ELSE clause without a corresponding IF statement.

System action: The remainder of the command is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Correct the command syntax, and issue the command again.

ADRY4228I  AN “END” COMMAND IS INVALID

Explanation: An END statement does not have a matching DO statement.

System action: The remainder of the command is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Correct the DO-END sequence and issue the command again.

ADRY4229I  ‘IF’ COMMAND HAS INVALID RELATIONAL EXPRESSION

Explanation: The IF-THEN-ELSE statement sequence is incorrect.

Only the system variables LASTCC and MAXCC can be specified. All values must be decimal numbers from 0 through 99999.

System action: The remainder of the command stream is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Check the requirements of the IF-THEN-ELSE statement sequence and correct the error. Issue the command again.

ADRY4230I  ‘SET’ COMMAND HAS INVALID ASSIGNMENT EXPRESSION

Explanation: The syntax of a SET statement is not valid. Only the system variables LASTCC and MAXCC can be assigned values. All values must be decimal numbers from 0 through 99999.

System action: The remainder of the command stream is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.
System programmer response: Check the syntax requirements of the SET statement and correct the error. Issue the command again.

**ADRY4232I** IMPROPER OR MISSING “THEN” KEYWORD

Explanation: The THEN clause of the IF-THEN-ELSE command sequence is either missing or is misspelled.

System action: The remainder of the command stream is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Correct the error and issue the command again.

**ADRY4236I** INPUT STREAM END-OF-FILE FOUND BEFORE END OF COMMAND

Explanation: An end-of-file condition was encountered while scanning the command. This could be caused by either incorrect command-continuation syntax or missing records in the input stream.

System action: The function ends.

Operator response: None.

System programmer response: Either correct the command syntax, or add the missing records. Issue the command again.

**ADRY4237I** TOO MANY LEVELS OF “IF” COMMAND NESTING

Explanation: More than ten IF statements have been nested.

System action: The remainder of the command stream is ignored. DFSMSdss Stand-Alone Services continues with the next command.

Operator response: None.

System programmer response: Restructure the command stream to avoid the excessive nesting and issue the command again.

**ADRY4990I** MODULE NOT FOUND: xxxxxxxx

Explanation: The indicated module could not be located. This could be due to an error when DFSMSdss Stand-Alone Services was created or due to a program error.

System action: Processing ends.

Operator response: Notify the system programmer.

System programmer response: Examine the data set that was used as input to the BUILDSA command when the DFSMSdss Stand-Alone Services was created. Ensure that the specified module is included and that it is not corrupted. Rerun the BUILDSA command to create a new Stand-Alone Services program and then rerun the Stand-Alone Services. If the module exists and is not corrupted, then run the AMDSADMP service aid to dump the contents of real storage to tape. Search problem reporting databases for a fix for the problem. If no fix exists, save the output and contact the IBM Support Center.

**ADRY4999I** UABORT CODE nn

Explanation: An abnormal end error caused the DFSMSdss Stand-Alone Services processor to abort. This situation is usually caused by hardware, program, or system errors. The message appears in the output listing.

Code nn indicates the nature of the error.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>

<td>A U-macro argument is not valid.</td>
</tr>
</tbody>
</table>

System action: DFSMSdss Stand-Alone Services ends.

Operator response: Notify the system programmer.

System programmer response: Save the job output. Run the AMDSADMP service aid to dump the contents of real storage to tape. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Chapter 5. ADY messages

ADY001I  THE DAE PARAMETER RECORD IN MEMBER mem HAS A SYNTAX ERROR
ERROR = prm: text

Explanation: While processing a SET DAE operator command, dump analysis and elimination (DAE) encountered an error in a parameter in the ADYSETxx parmlib member.

In the message text:
  mem  The parmlib member name.
  prm  The parameter in error.
  text One of the following:

  A COMMA IS MISSING
  An expected comma was not found.

  A LEFT PARENTHESIS IS EXPECTED
  The value following the keyword was not preceded by a left parentheses, as required.

  A RIGHT PARENTHESIS IS EXPECTED
  The value following the keyword was not followed by a right parentheses, as required.

  DAE= MUST BE THE FIRST KEYWORD
  The first text that is not a comment was not DAE=, as required.

  NOTIFY COUNT IS NOT VALID (MUST BE 1-9999)
  The NOTIFY parameter does not have a value of 1 through 9999 for the number of dumps.

  NOTIFY INTERVAL IS NOT VALID (MUST BE 1-9999)
  The NOTIFY parameter does not specify a time interval of 1 through 9999 minutes.

  THIS DATA SET NAME IS NOT VALID
  The data set name value provided for the DSN keyword was longer than 20 characters.

  THIS IS NOT A VALID KEYWORD
  The keyword is not one of the keyword parameters defined for DAE.

  THIS KEYWORD VALUE WAS SPECIFIED MORE THAN ONCE
  One of the following has occurred:
  The SYSMDUMP or SVCDUMP keyword specified one of the following values more than once:
  • MATCH
  • SUPPRESS
  • SUPPRESSALL
  • UPDATE
  • NOTIFY (for the SVCDUMP keyword)

  The GLOBAL or SHARE keyword specified one of the following values more than once:
  • DSN
  • OPTIONS

  THIS IS NOT A VALID KEYWORD VALUE
  One of the following has occurred:
  The SYSMDUMP or SVCDUMP keyword contained a value other than the following:
  • MATCH
  • SUPPRESS
  • SUPPRESSALL
  • UPDATE

  The GLOBAL or SHARE keyword contained a value other than the following:
  • DSN
  • OPTIONS

  THE SUPPRESS AND SUPPRESSALL KEYWORD VALUES ARE MUTUALLY EXCLUSIVE
  Both SUPPRESS and SUPPRESSALL keyword values were specified with either the SVCDUMP or SYSMDUMP keyword. Only one be specified.

  THIS RECORD NUMBER IS NOT VALID
  The value was not a decimal number of 1 to 4 digits.

System action: The system does not process the SET DAE command.

Operator response: Select a different ADYSETxx parmlib member and enter the SET DAE command.

System programmer response: Correct the error in the ADYSETxx parmlib member. Ask the operator to enter the SET DAE command again.

Source: Dump analysis and elimination (DAE)

Detecting Module: ADYSETP
Routing Code: 2
Descriptor Code: 4

© Copyright IBM Corp. 1988, 2009
Explanation: While processing a SET DAE operator command, dump analysis and elimination (DAE) encountered an error in a parameter in the ADYSETxx parmlib member.

In the message text:

mem The parmlib member name.
text One of the following:

AN SVCDUMP OR SYSMDUMP KEYWORD MUST BE USED WITH THE GLOBAL(OPTIONS) KEYWORD
GLOBAL(OPTIONS) was used without specifying an SVCDUMP or an SYSMDUMP keyword or both with value(s) to share with other DAE instances.

GLOBALSTOP INVALID BECAUSE SHARE(DSN) WAS NOT SPECIFIED WHEN DAE WAS STARTED
DAE=STOP,GLOBALSTOP was issued on a system that is not able to share the DAE data set. This environment makes the parameter incorrect. One of the following conditions is causing the problem:
1. DAE is active, but the previous ADYSETty member did not specify the SHARE(DSN) parameter.
2. DAE is not active. DAE is either stopped, or it was never started.

AN SVCDUMP OR SYSMDUMP KEYWORD SPECIFICATION WAS INCOMPLETE
An SVCDUMP or SYSMDUMP keyword specification does not have at least one value, or a right parenthesis did not follow the value(s) specified.

EITHER THE START OR STOP KEYWORD MUST BE SPECIFIED
The ADYSETxx member did not specify either START or STOP. One of these keywords is required.

GLOBAL(OPTIONS) CANNOT BE SPECIFIED WITHOUT SHARE(OPTIONS)
SHARE(OPTIONS) is required when GLOBAL(OPTIONS) is specified.

SHARE(OPTIONS) CANNOT BE SPECIFIED WITHOUT SHARE(DSN)
SHARE(DSN) is required when SHARE(OPTIONS) is specified.

THE DSN KEYWORD MUST BE USED WITH THE GLOBAL(DSN) KEYWORD
When GLOBAL(DSN) is used, the DSN keyword is required to specify the data set name.

THE GLOBAL KEYWORD CANNOT BE SPECIFIED WITHOUT SHARE(DSN)
SHARE(DSN) is required to use the GLOBAL keyword.

THE NOTIFY KEYWORD IS ONLY VALID FOR SVCDUMP
The ADYSETxx parmlib member contains a NOTIFY keyword on other than the SVCDUMP statement.

THE NOTIFY KEYWORD MUST BE USED WITH THE UPDATE KEYWORD
The ADYSETxx parmlib member does not contain an UPDATE keyword, which is a corequisite.

THE NOTIFY KEYWORD WAS SPECIFIED MORE THAN ONCE
The ADYSETxx parmlib member contains more than one NOTIFY keyword.

THE RECORD COULD NOT BE PARSED
An unexpected error occurred while DAE was parsing the ADYSETxx member.

THE RECORD HAS AN INCORRECT USE OF COMMENT DELIMITERS
DAE allows two types of comment delimiters. An "" in column 1 of a record indicates that the entire record is a comment. All characters, including other delimiters, are ignored. The second type of comment delimiter allows the combination of "/" and "*/" to denote the start and end of comment text. A likely cause of this error is that an ending comment delimiter "/" was not found.

THE RECORDS|SHARE|GLOBAL|DSN KEYWORD SPECIFICATION WAS INCOMPLETE
The indicated keyword parameter was specified without a required option enclosed in parentheses.

THE RECORDS|SVCDUMP|SYSMDUMP|STOP|SHARE|GLOBAL|DSN|GLOBALSTOP KEYWORD WAS SPECIFIED MORE THAN ONCE
The specified keyword appeared more than once.

THE START AND STOP KEYWORDS NOT BE SPECIFIED IN THE SAME RECORD
The ADYSETxx member specified both START and STOP. Only one can be specified.
THE START KEYWORD SPECIFICATION IS INCOMPLETE
START was specified without a following keyword.

System action: The system does not process the SET DAE command.

Operator response: Select a different ADYSETxx parmlib member and enter the SET DAE command.

System programmer response: Correct the error in the ADYSETxx parmlib member. Request the operator to enter the SET DAE command again.

**ADY010E** THE DAE START TRANSACTION FAILED **text**

**Explanation:** The ADYSETPxx parmlib member specified in a SET DAE operator command requested that dump analysis and elimination (DAE) stop itself, then start with changed parameters. The start failed.

In the message, **text** is one of the following:

**STORAGE WAS NOT FREED FROM PREVIOUS SYMPTOM QUEUES. A NEW QUEUE CANNOT BE BUILT** The cell pools that were obtained for a previous start could not be deleted. If the number of cell pools that are not freed reaches a threshold, DAE cannot be started until the system is initialized again.

**MODULE ADYDFLT COULD NOT BE LOADED** The system could not load a required DAE module.

**THE OPEN FOR dsname FAILED** The DAE data set could not be opened.

In the message text:

```
*dsname*  The data set name.
```

**ALLOCATION FOR dsname FAILED RETURN CODE = return-code ERROR CODE = error-code REASON CODE = reason-code**

The DAE data set could not be allocated. The return, error, and reason codes describe the dynamic allocation error; see [Interpreting DYNALLOC Return Codes](https://www.ibm.com/docs/en/zos-v1r10?topic=performance-system-messages) and [Interpreting Information Reason Codes from DYNALLOC](https://www.ibm.com/docs/en/zos-v1r10?topic=performance-system-messages) for an explanation of return and reason codes for SVC 99. These codes are missing if the allocation ended abnormally.

In the message text:

```
*dsname*  The data set name.
*return-code*  The return code.
*errc*  The error code.
*reason-code*  The reason code.
```

**I/O ERROR OCCURRED WHILE READING dsname SYNAD DATA = yyy**

An I/O error occurred while reading the DAE data set.

In the message text:

```
*dsname*  The data set name.
```

---

**ADY011E** UPDATING dsname HAS TERMINATED **[text]**

**Explanation:** In the message text:

```
*dsname*  The data set name.
```
text is one of the following:

**THE OPEN FAILED**

The DAE data set could not be opened.

**I/O ERROR OCCURRED WHILE READING THE DATA SET**

An I/O error occurred while reading the DAE data set.

**I/O ERROR OCCURRED WHILE WRITING TO THE DATA SET SYNAD DATA = \( yyy \)**

An I/O error occurred while writing to the DAE data set.

\( yyy \) The SYNAD data returned from the error. SYNAD is a subparameter of the AMP parameter on the DD statement used to define a data set. See the SYNADAF macro of the Data Facility Product (DFP) for information about the SYNAD data.

Dump analysis and elimination (DAE) could not update the DAE data set.

**System action:** DAE does not update the DAE data set. Because temporary records are kept in virtual storage, DAE continues processing. Without UPDATE, DAE writes no permanent records.

When DAE is stopped or started, DAE regresses to its record of dumps from the data set as previously updated.

**Operator response:** Notify the system programmer.

**System programmer response:** Correct the error. Restart DAE so that the DAE data set can be updated.

**ADY013I**

DAE COULD NOT FREE \( nnn \) BYTES OF \textit{text} COMMON STORAGE

**Explanation:** \textit{text} is one of the following:

- \text{FIXED}
- \text{PAGEABLE}

Processing for a DAE STOP command could not free cell pool storage occupied by the symptom queue.

In the message text:

- \( nnn \) The number of bytes of storage.
- \text{FIXED} The cell pool storage was from fixed common storage.
- \text{PAGEABLE} The cell pool storage was from pageable common storage.

**System action:** DAE abandons the cell pool storage from either the fixed system queue area (SQA) or from the pageable common service area (CSA). When the number of cell pools that are not freed reaches a threshold, DAE cannot be started again.

**System programmer response:** None.

**Source:** Dump analysis and elimination (DAE)

**Detecting Module:** ADYTRNS

**Routing Code:** 2

**Descriptor Code:** 4

---

**ADY014E**

DAE INITIALIZATION FAILED. \textit{text}

**Explanation:** \textit{text} is one of the following:

- \text{THE ESTAE COULD NOT BE ESTABLISHED}
- \text{MODULE ADYMSG COULD NOT BE LOADED}
- \text{MODULE ADYIO COULD NOT BE LOADED}

Dump analysis and elimination (DAE) could not be initialized because of an unrecoverable problem.

In the message text:

**THE ESTAE COULD NOT BE ESTABLISHED**

DAE could not establish a recovery environment.
MODULE ADYMSG COULD NOT BE LOADED
The system could not load a required DAE module.

MODULE ADYIO COULD NOT BE LOADED
The system could not load a required DAE module.

System action: DAE will not be available in the system until the system is initialized again.

Operator response: Notify the system programmer.

System programmer response: Correct the problem.

To reestablish DAE processing, ask the operator to IPL the system. If DAE is not automatically started during system initialization, the operator should enter a SET DAE command.

If the problem recurs, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ADY016E DATA SET ndsn, DOES NOT MATCH THE CURRENT SHARED DAE DATA SET: odsn

Explanation: While processing a SET DAE operator command or while starting the system, dump analysis and elimination (DAE) detected that the data set name specified in the parmlib member did not match the name of the data set currently shared in the sysplex.

In the message text:

ndsn The new data set name specified with the DSN keyword.

odsn The data set currently being shared in the sysplex.

System action: The system does not start DAE.

Operator response: Notify the system programmer.

System programmer response: Do one of the following to correct the parmlib member used to start DAE:
  • To share data set ndsn, specify the correct data set name on the DSN parameter.
  • To share data set odsn, remove the DSN parameter.
  • To change the data set currently being shared in the sysplex, add the GLOBAL(DSN) parameter.

See [Statements/parameters for ADYSETxx](#) for more information about the ADYSETxx parmlib member parameters.

Descriptor Code: N/A

ADYH011E  This system is in a sysplex but SHARE(DSN) is not in effect.

Explanation: CHECK(IBMDAE,DAE_SUPPRESSING) found that this system is in a sysplex but SHARE(DSN) is not in effect. This option is recommended because it specifies DAE to suppress a duplicate of a previous dump from any system when all systems in the sysplex share a common DAE data set.

System action: N/A
Operator response: Report this problem to the system programmer.

System programmer response: For a sysplex, IBM recommends that you use a shared SYS1.PARMLIB to apply the same ADYSETxx parameter values in each system. If your installation does not share a SYS1.PARMLIB, make the ADYSETxx and IEACMDxx members in the SYS1.PARMLIB for each system identical. A shared ADYSETxx or identical ADYSETxx member should specify SHARE(DSN) to share the DAE data set. Here is an example of the ADYSETxx member with SHARE(DSN) specified:

DAE=START, RECORDS(400),
SVCDUMP(MATCH, SUPPRESSALL, UPDATE, NOTIFY(3,30)),
SYSMDUMP(MATCH, UPDATE),
SHARE(DSN, OPTIONS),
DSN(SYS1.DAESHARE)

Problem determination: N/A

Source: Dump analysis and elimination (DAE)

Reference Documentation: For additional information on configuring DAE, see “Planning for DAE dump suppression” in [z/OS MVS Diagnosis: Tools and Service Aids](http://www.ibm.com/support/docview.pl?rs=417&uid=swg27005513). For additional information on syntax for ADYSETxx, see “Chapter 3. ADYSETxx (dump suppression)” in [z/OS MVS Initialization and Tuning Reference](http://www.ibm.com/support/docview.pl?rs=417&uid=swg27005513).

How to use SET command to change the DAE parameters: “SET Command” in [z/OS MVS System Commands](http://www.ibm.com/support/docview.pl?rs=417&uid=swg27005513).

Automation: N/A

## Chapter 7. AHL messages

### AHLo01A  INVALID KEYWORD. RESPECIFY PARAMETERS OR REPLY U

*Explanation:* A keyword specified on the START command for the generalized trace facility (GTF) is not correct.

*System action:* GTF initialization does not continue until the operator responds to these messages.

*Operator response:* Respecify all parameters, or reply U to request default values.

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLSCAN

### AHLo02A  INVALID DELIMITER. RESPECIFY PARAMETERS OR REPLY U

*Explanation:* The START command parameters for the generalized trace facility (GTF) have been punctuated incorrectly.

*System action:* GTF initialization does not continue until the operator responds to this message.

*Operator response:* Respecify all parameters, or reply U to request default values.

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLSCAN

### AHLo03A  INVALID OPERAND. RESPECIFY PARAMETERS OR REPLY U

*Explanation:* An operand in the START command for the generalized trace facility (GTF) was specified incorrectly.

*System action:* GTF initialization does not continue until the operator responds to this message.

*Operator response:* Respecify all parameters, or reply U to request default values.

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLSCAN

### AHLo04A  KEYWORD(S) REPEATED. RESPECIFY PARAMETERS OR REPLY U

*Explanation:* In the START command for the generalized trace facility (GTF), a keyword is repeated.

*System action:* GTF initialization does not continue until the operator responds to this message.

*Operator response:* Respecify all parameters, or reply U to request default values.

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLSCAN

### AHLo05I  GTF TERMINATING. MUST RUN AS SYS TASK FROM CONSOLE

*Explanation:* The generalized trace facility (GTF) must run as a system task. The program properties table (PPT) indicated that GTF was started as a problem program. This situation was probably caused by starting GTF from the card reader.

*System action:* The system abnormally ends GTF.

*Operator response:* After the system programmer has fixed the PPT, restart GTF from the system console as described in [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/docs/en/zos?topic=generalized-trace).

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLTMON, AHLGTFI

### AHLo06I  GTF ACKNOWLEDGES STOP COMMAND

*Explanation:* The operator entered the STOP command for the generalized trace facility (GTF).

*System action:* The system ends GTF.

*Source:* Generalized trace facility (GTF)

*Detecting Module:* AHLTMON, AHLGTFI

### AHLo07I  GTF TERMINATING ON ERROR CONDITION

*Explanation:* The generalized trace facility (GTF) is ending because it has detected an error condition. If message AHLo31I has not been issued, then the ending condition is usually a programming logic error and the system write an SVC dump. If message AHLo31I has been issued, then either a message with additional information about the error precedes AHLo07I or a dump is written.

*System action:* The system abnormally ends GTF, issues other messages, and request an SVC dump.

*Operator response:* If message AHLo31I has been issued, restart GTF.

*System programmer response:* If message AHLo31I has not been issued, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump, if available.
Source: Generalized trace facility (GTF)

**AHL008A** INCORRECT BUF VALUE. RESPECIFY PARAMETERS OR REPLY U

Explanation: The value specified for the BUF keyword on the START GTF command is not correct.

System action: GTF initialization does not continue until the operator responds to the message.

Operator response: Respecify all parameters, or reply U to request default values. The allowable value range for the BUF keyword is 10 to 225 (decimal).

Source: Generalized trace facility (GTF)

**AHL009A** INCORRECT BLOK VALUE. RESPECIFY PARAMETERS OR REPLY U

Explanation: On the START GTF command, an incorrect value was specified for the BLOK keyword. The value was outside the allowable range of 1 to 99999 (decimal).

System action: GTF initialization does not continue until the operator responds to this message.

Operator response: Respond in one of the following ways:
- Respecify all parameters, making sure that the value for BLOK is in the range from 1 to 99999 (decimal).
- Reply U to request default values.

Source: Generalized trace facility (GTF)

**AHL010I** area AT ADDRESS realaddr IS NOT VALID

Explanation: The generalized trace facility (GTF) could not trace a storage area associated with a zHPF channel program, because GTF could not translate the real address of the storage area or could not access the storage area.

In the message text:

area The storage area being accessed. It can be one of the following:

- **TCW** Transport control word
- **TCAH** Transport command area header
- **DCW** Device command word
- **DCWCTL** Control data for a device command word
- **TCAT** Transport command area trailer
- **TSB** Transport status block
- **TIDAW** Transport indirect address word
- **DATA** Input or output data buffers

System action: GTF issues this message to the GTF output data set as a trace record. GTF continues processing.

System programmer response: Check the logrec data set for GTF errors.

Source: Generalized trace facility (GTF)

**AHL013I** GTF ACTIVE FROM A PREVIOUS START COMMAND

Explanation: The operator entered a START command for the generalized trace facility (GTF), but GTF is already active.

System action: The system ignores the second request to start GTF. The GTF that was previously started remains active.

Source: Generalized trace facility (GTF)

**AHL015I** {STAE|ESTAE} REQUEST UNSUCCESSFUL

Explanation: The recovery environment requested by the generalized trace facility (GTF) was not established.

System action: The system abnormally ends GTF.

System programmer response: Ensure that the region size is adequate for GTF.

Source: Generalized trace facility (GTF)

**AHL016I** GTF INITIALIZATION UNSUCCESSFUL

Explanation: Initialization of the generalized trace facility (GTF) failed. A previous message indicates the exact cause of the problem.

System action: The system abnormally ends GTF.

Operator response: See the previous message.

Source: Generalized trace facility (GTF)

**AHL018A** GTF UNABLE TO INITIALIZE ON ALL CPUS, REPLY U OR END

Explanation: Initialization of the generalized trace facility (GTF) has failed. GTF could not initialize the control register, register 8, of one or more active
processors. Continued tracing result in incomplete trace information being collected.

Possibly GTF could not initialize register 8 because the processor was stopped. Refer to message AHL133I for processors that were not initialized.

**System action:** GTF initialization or completion does not continue until the operator responds to this message.

**Operator response:** Reply U to continue GTF initialization or END to begin GTF completion.

**System programmer response:** If all processors are running, collect all printed output and output data sets related to the problem. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTMON

---

AHL019I  SETEVENT SERVICE FAILED, RETURN CODE =return-code

**Explanation:** Initialization of the generalized trace facility (GTF) failed. The return code in the message text gives the reason:

18X  The GTF routine that monitors events to be traced is ending.

20X  A GTF routine was not in the link pack area (LPA). GTF issues message IEA950I to identify the missing module.

**System action:** The system abnormally ends GTF.

**Operator response:** If the return code is 18X and GTF is active and does not end, stop GTF.

**System programmer response:** Collect all printed output and output data sets related to the problem. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTFI

---

AHL020I  RSMGR SERVICE FAILED. RETURN CODE =return-code

**Explanation:** The generalized trace facility (GTF) attempted to establish a resource manager to monitor the GTF address space, but failed.

In the message text:

`return-code`  The return code from the resource manager service.

**System action:** The system abnormally ends GTF.

**Operator response:** Record this message and notify the system programmer.

**System programmer response:** Collect all printed output and output data sets related to the problem. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWTASK

---

AHL021I  ESTAE REQUEST FOR AHLWTASK UNSUCCESSFUL

**Explanation:** The recovery environment requested by the generalized trace facility (GTF) was not established.

**System action:** The system abnormally ends GTF and issues other messages.

**System programmer response:** Look at the messages in the job log. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWTASK

---

AHL024I  UNALLOWABLE BUF VALUE. MINIMAL DEFAULT 10 IS ASSIGNED

**Explanation:** The BUF parameter on the START command for the generalized trace facility (GTF) is incorrect. The BUF parameter specified a buffer value less than the minimum allowed.

**System action:** GTF initialization continues with a default value of 10 buffers.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI2

---

AHL025I  UNALLOWABLE BUF VALUE. MAXIMUM DEFAULT 255 IS ASSIGNED

**Explanation:** The BUF parameter on the START command for the generalized trace facility (GTF) specified a value greater than 255.

**System action:** GTF initialization continues with a default value of 255 buffers.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

AHL026I  INSUFFICIENT STORAGE FOR AHLWTASK INITIALIZATION

**Explanation:** Initialization of the generalized trace facility (GTF) failed. The system queue area (SQA) is not large enough.

**System action:** The system abnormally ends GTF.

**System programmer response:** Ensure that there is
sufficient SQA storage for GTF. Restart GTF.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWTASK

AHL030I INSUFFICIENT CSA FOR GTF

Explanation: An attempt by the generalized trace facility (GTF) to obtain common storage area (CSA) storage has failed.

System action: The system abnormally ends GTF.

Operator response: Record this message and contact the system programmer.

System programmer response: Modify the GTF BLOK keyword in the JCL to limit the amount of common storage area (CSA) storage that GTF will use for the collection of trace entries.

Source: Generalized trace facility (GTF)

Detecting Module: AHLGTFI2

AHL031I GTF INITIALIZATION COMPLETE

Explanation: Initialization of the generalized trace facility (GTF) completed successfully.

System action: GTF continues processing.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTMON

AHL032I INSUFFICIENT ADDRESS SPACE FOR GTF

Explanation: During initialization of the generalized trace facility (GTF), a GETMAIN instruction for subpool 0-127 failed.

System action: The system abnormally ends GTF.

System programmer response: Make the necessary space available to GTF and restart.

Source: Generalized trace facility (GTF)

Detecting Module: AHLGTFI2

AHL033I INSUFFICIENT SQA FOR GTF

Explanation: During initialization of the generalized trace facility (GTF), a GETMAIN for buffers in the system queue area (SQA) failed.

System action: The system abnormally ends GTF.

System programmer response: Make the necessary space available to GTF and restart.

Source: Generalized trace facility (GTF)

Detecting Module: AHLGTFI2

AHL034I GTF BUFFER MANAGER TERMINATING ON ERROR CONDITION

Explanation: During generalized trace facility (GTF) initialization, a GTF recovery routine was invoked for reasons other than alternate CPU recovery (ACR).

System action: The system abnormally ends GTF.

System programmer response: Examine SVC dumps provided by GTF and other problem determination information to determine the reason why the recovery routine was entered.

Source: Generalized trace facility (GTF)

Detecting Module: AHLBFMGR

AHL035I GTF TRACE [WRITER] UNABLE TO LOAD nnnnnnnnn

Explanation: A LOAD instruction issued during generalized trace facility (GTF) processing failed.

In the message text:

nnnnnnnnnn Name of module that could not be loaded.

System action: The system abnormally ends GTF.

System programmer response: Determine why the module named in the message text (nnnnnnnnn) could not be loaded and correct the condition.

Source: Generalized trace facility (GTF)

Detecting Module: AHLGTFI2

AHL036I GTF DATA FLOW BLOCKED. FIX {FAILED|ATTEMPTED}

Explanation: The generalized trace facility (GTF) has detected an error in a common storage area (CSA) that GTF uses to copy trace data and is attempting to correct it.

Note: GTF completion be indefinitely delayed. If this happens, there will be no impact to the system outside GTF.

System action: The system abnormally ends GTF.

System programmer response: A single occurrence of this message needs no action; however, repeated occurrences indicates a problem. Examine the SVC dump provided and determine why the use count of the GTFBLOKs is not going to zero.

Source: Generalized trace facility (GTF)

Detecting Module: AHLBFMGR
AHL037I  GTF BUFFER MANAGER UNABLE TO ESTABLISH ESTAE

Explanation: The recovery environment requested by the generalized trace facility (GTF) was not established.

System action: The system abnormally ends GTF.

System programmer response: Restart GTF and if the problem recurs, examine the SVC dump and determine why the ESTAE request failed.

Source: Generalized trace facility (GTF)

Detecting Module: AHLBFMGR

AHL038I  GTF WRITER UNABLE TO OPEN IEFDRER

Explanation: During generalized trace facility (GTF) processing, the system attempted to open a data set, but failed.

System action: The system abnormally ends GTF.

System programmer response: Verify that a valid trace data set was specified and restart GTF. If the problem recurs, determine why the data set cannot be opened or try another trace data set.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWWRIT

AHL039I  IEFDRER DD STATEMENT MISSING

Explanation: The IEFDRER DD statement did not correctly specify a device for the generalized trace facility (GTF) trace data set.

System action: The system abnormally ends GTF.

System programmer response: Ensure that a valid IEFDRER DD statement was specified in the GTF procedure when starting GTF.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWWRIT, AHLCWRIT, AHLGTFI

AHL040I  NOT A LEGAL FORM OF THE MACRO. CHECK THE MF =

Explanation: During generalized trace facility (GTF) processing, an incorrect parameter was specified on the MF keyword of the GTRACE macro. L (for the list form) and E (for the execute form) are the only correct parameters.

System action: The system does not expand the macro.

Application Programmer Response: Correct the MF keyword, specifying a valid parameter (L or E). Rerun the job.

Source: Generalized trace facility (GTF)

Detecting Module: GTRACE

AHL041I  LNG = KEYWORD MISSING

Explanation: The GTRACE macro could not be fully expanded because the LNG keyword is not specified. If the standard form of the GTRACE macro is being used, the LNG keyword must be specified with a valid parameter.

System action: The system partially expands the macro; expansion stops following detection of the omission.

Application Programmer Response: Correct the GTRACE macro, specifying the LNG keyword with a valid parameter. A valid parameter is any decimal integer in the range 1 to 256. Rerun the job.

Source: Generalized trace facility (GTF)

Detecting Module: GTRACE

AHL042I  PAGEIN= KEYWORD MISSPECIFIED

Explanation: In the GTRACE macro, the PAGEIN keyword was specified incorrectly. Valid values are YES and NO.

Application Programmer Response: Change the PAGEIN parameter on the GTRACE macro to a valid value.

Source: Generalized trace facility (GTF)

Detecting Module: GTRACE

AHL044I  DATA= KEYWORD MISSING

Explanation: In the GTRACE macro, the DATA keyword is not specified. If the standard form of the GTRACE macro is being used, the DATA keyword must be specified with a valid parameter.

System action: The system partially expands the macro; expansion stops following detection of the error.

Application Programmer Response: Correct the GTRACE macro, specifying the DATA keyword with a valid parameter. Valid parameters are a register number in parentheses or an A-type address constant. Rerun the job.

Source: Generalized trace facility (GTF)

Detecting Module: GTRACE

AHL045I  MF= E, PARAMETER SPECIFICATION MISSING

Explanation: In the GTRACE macro, the parameter specification for the MF keyword is incomplete. If the execute form of the GTRACE macro is being used, the address of the parameter list must be included as part of the MF operand.
**AHLO48 • AHLO61**

**System action:** The system does not expand the macro.

**System programmer response:** Correct the GTRACE macro, specifying the address of the parameter list as part of the MF operand. Specify the address observing the syntax rules governing address specification for an RX-type instruction, or one of the general registers 1-12, previously loaded with the address. For example, if the address of the parameter list is in register 1, MF=(E,(1)) should be specified. Rerun the job.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** GTRACE

---

**AHLO48**

**ID= KEYWORD MISSING**

**Explanation:** In the GTRACE macro, the ID keyword is not specified. The ID keyword must be specified for either form (standard or execute) of the GTRACE macro.

**System action:** The system partially expands the macro; expansion stops following detection of the error.

**System programmer response:** Correct the GTRACE macro, specifying the ID keyword with the appropriate value. Rerun the job.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** GTRACE

---

**AHLO52**

**INSUFFICIENT KEYWORD PARAMETERS**

**Explanation:** In the HOOK macro, the EID keyword is not specified. This keyword must be included.

**System action:** The system does not expand the macro.

**System programmer response:** Correct the HOOK macro, specifying the EID keyword with a valid symbolic value. Rerun the job.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** HOOK

---

**AHLO53**

**INVALID TYPE= KEYWORD**

**Explanation:** In the HOOK macro, a parameter other than P, BP, BPN, T, or BT is specified for the TYPE keyword.

**System action:** The system does not expand the macro.

**System programmer response:** Correct the TYPE keyword, specifying a valid value. Rerun the job.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** HOOK

---

**AHLO55**

**INVALID EID= KEYWORD**

**Explanation:** In the HOOK macro, an incorrect value is specified for the EID keyword.

**System action:** The system does not expand the macro.

**System programmer response:** Correct the EID keyword, specifying a valid symbolic value. Rerun the job.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** HOOK

---

**AHLO57**

**ECB KEYWORD MISSING**

**Explanation:** In the AHLREAD macro, the ECB keyword is missing.

**System action:** Code the missing ECB keyword on the macro and recompile.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLREAD

---

**AHLO58**

**DATA AREA KEYWORD MISSING**

**Explanation:** In the AHLREAD macro, the DATA AREA keyword is missing.

**System action:** Code the missing DATA AREA keyword on the macro and recompile.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLREAD

---

**AHLO60**

**NO NAME OPTION SPECIFIED ON STANDARD FORM**

**Explanation:** On the SETEVENT macro, a full set of options must be specified on standard form of the macro. The name field is missing on this invocation.

**System action:** Correct the macro and recompile. The macro generates no code.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** SETEVENT

---

**AHLO61**

**NO MCQE ADDRESS SPECIFIED**

**Explanation:** The MCQE address returned by SETEVENT service on the first invocation of the SETEVENT macro must be specified on all later invocations of this macro. If this is the first invocation, this address must be zero.

**System action:** Correct the macro and recompile. The macro generates no code.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** SETEVENT
AHL062  SOME EID TYPE SPECIFIED WITH FREE OR ACTIVAT

Explanation: On the SETEVENT macro, FREE and ACTIVAT are related on the entire MCQE chain. Therefore, single EIDs or classes of EIDs be specified with these two actions.

System programmer response: Correct the macro and recompile. The macro generates no code.

Source: Generalized trace facility (GTF)
Detecting Module: SETEVENT

AHL063  NO ACTION SPECIFIED ON STANDARD FORM

Explanation: On the SETEVENT macro, a full set of options must be specified on the STANDARD form. The ACTION option is missing.

System programmer response: Correct the macro and recompile. The macro generates no code.

Source: Generalized trace facility (GTF)
Detecting Module: SETEVENT

AHL064  NO EIDAD OR CLASSAD SPECIFIED ON STANDARD FORM

Explanation: On the SETEVENT macro, a full set of options must be specified on the STANDARD form. Both EIDAD and CLASSAD are missing. At least one of these must be specified.

System programmer response: Correct the macro and recompile. The macro generates no code.

Source: Generalized trace facility (GTF)
Detecting Module: SETEVENT

AHL065  ACTION OPTION INVALID

Explanation: On the SETEVENT macro, the contents of the ACTION field is not one of the valid options.

System programmer response: Correct the macro and recompile. The macro generates no code.

Source: Generalized trace facility (GTF)
Detecting Module: SETEVENT

AHL066  NO ADDRESS SPECIFIED WITH MF (E) OR MF (M)

Explanation: When the execute form of the SETEVENT macro is used, the address of the parameter list to be filled in must be provided. This is missing on this invocation.

System programmer response: Correct the macro and recompile. The macro generates no code.
the GTF procedure, is allocated to a tape or DASD.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI

---

**AHL071I** LOAD FAILED FOR MODULE `mod`, `yyy`

**Explanation:** During generalized trace facility (GTF) initialization, a LOAD macro issued for the specified module failed.

In the message text:

- `mod` Name of module that could not be loaded.
- `yyy` Abend code associated with this message.
- `return-code` Reason code issued with the abend.

**System action:** The system abnormally ends GTF.

**Operator response:** Restart GTF.

**System programmer response:** Refer to *z/OS MVS System Codes* for an explanation of the abend code and the reason code.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI

---

**AHL074A** INCORRECT SADMP VALUE. REENTER ALL PARAMETERS OR REPLY U

**Explanation:** The value specified for the SADMP keyword on the START GTF command is not correct.

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** The correct range for the stand-alone dump keyword is zero to 2048M-400K. Reenter all parameters, or reply U to request all default values.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL075A** INCORRECT SDUMP VALUE. REENTER ALL PARAMETERS OR REPLY U

**Explanation:** The value specified for the SVC dump keyword on the START GTF command is not correct.

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** The correct range for the SVC dump keyword is zero to the maximum amount specified by the stand-alone dump keyword. Reenter all parameters, or reply U to request all default values.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL076A** INCORRECT ABDUMP VALUE. REENTER ALL PARAMETERS OR REPLY U

**Explanation:** The value specified for the abend dump keyword on the START GTF command is not correct.

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** The correct range for the SVC dump keyword is zero to the maximum amount specified by the stand-alone dump keyword. Reenter all parameters, or reply U to request all default values.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL077A** THE BUF KEYWORD IS NO LONGER VALID, IT WILL BE IGNORED

**Explanation:** In the EXEC statement of the cataloged procedure for the generalized trace facility (GTF), or in the START command for GTF, TIME=NO was specified.

**System action:** GTF initialization continues with default values.

**Operator response:** Use the stand-alone dump, SVC dump, or abend dump keyword instead of BUF. Tell your system programmer that BUF is no longer acceptable, and to replace any BUF keywords for START GTF.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL078A** INCORRECT SIZE VALUE. REENTER ALL PARAMETERS OR REPLY U

**Explanation:** The value specified for the size keyword on the START GTF command is not correct.

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** The correct range for the size keyword is 1M to 2046M. Reenter all parameters, or reply U to request all default values. The default value is 4M.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL079I** GTF NO LONGER ACCEPTS 'TIME=NO'. GTF WILL CONTINUE WITH TIME STAMPS IN ALL OUTPUT RECORDS.

**Explanation:** In the EXEC statement of the cataloged procedure for the generalized trace facility (GTF), or in the START command for GTF, TIME=NO was specified in the GTF parameters.

**System action:** GTF initialization continues. GTF
disregards TIME=NO and puts time stamps in all output records.

**Operator response:** When starting GTF, do not specify TIME=NO.

**System programmer response:** Remove any TIME=NO specifications from the JCL statements in the cataloged procedures for GTF.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSCAN

---

**AHL080I** GTF STORAGE USED FOR GTF DATA:

**Explanation:** Where text is:

- GTFBLOCK STORAGE ccccK BYTES
- GTFBLOCK STORAGE ccccK BYTES (BLOK=xxxx)
- PRIVATE STORAGE ppppK BYTES (SIZE=xxxx)
- SADMP HISTORY ssssk BYTES (SADMP=xxxx)
- SDUMP HISTORY vvvvk BYTES (SDUMP=xxxx)
- ABEND DUMP DATA aaaaK BYTES (ABDUMP=xxxx)

For holding generalized trace facility (GTF) data, GTF has obtained common storage and storage associated with the GTF address space. GTF will ensure that the specified amount of most recent data appears in a stand-alone dump, an SVC dump, or an ABEND or SNAP dump. These amounts have been specified by the BLOK, SIZE, SADMP, SDUMP, or ABDUMP GTF parameters; or GTF have used defaults.

In the message text:

- ccccK The number of bytes GTF has obtained from common storage.
- ppppK The number of bytes GTF has obtained from the GTF address space.
- ssssk The number of most recent bytes that will appear in a stand-alone dump.
- vvvvk The number of most recent bytes that will appear in an SVC dump.
- aaaaK The number of most recent bytes that will appear in an ABEND or SNAP dump.
- xxxx The specified or default values.

**System action:** GTF processing continues.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI2

---

**AHL082I** DYNALLOC INFORMATION RETRIEVAL FOR GTF OUTPUT DATA SETS FAILED - RETURN CODE=return-code, REASON CODE=reason-code.

**Explanation:** The generalized trace facility (GTF) has attempted to locate its output data sets by using the information retrieval service of dynamic allocation (SVC 99), but the DYNALLOC macro has failed.

- return-code The return code from the DYNALLOC macro.
- reason-code Reason code from the DYNALLOC macro.

**System action:** The system issues message AHL016I and ends GTF execution.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI2

---

**AHL085I** DYNALLOC INFORMATION RETRIEVAL FOR GTF OUTPUT DATA SETS FAILED - RETURN CODE=return-code, REASON CODE=reason-code.

**Explanation:** The JCL for the generalized trace facility (GTF) does not contain a usable DD statement for an output GTF data set. The ddname for an output GTF data set must either be IEFRDER or begin with the prefix GTFOUT. The ddname is incorrect or the specified data set is not acceptable to BSAM or the data set is one of the following: DUMMY data set, terminal allocation, SYSIN or SYSOUT data set.

The data organization specified on the DD DCB parameters must satisfy one of the following conditions:

- It is a conventional sequential data set on tape or DASD with DSORG of either PS (physical sequential) or PSU (physical sequential that contains location-dependent information).
- It is a VSAM data set.

**System action:** The system issues message AHL016I and ends GTF processing.

**System programmer response:** Ensure that the JCL for GTF contains at least one DD statement for a GTF data set. Restart GTF.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI2

---

Chapter 7. AHL messages 245
Operator response: Record this message and notify the system programmer.

System programmer response: Examine the return and reason codes specified in the message and see z/OS MVS Programming: Assembler Services Guide for the DYNALLOC macro return and reason codes.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTSCN

AHL091I THE SPECIFIED BLOK VALUE OF value IS TOO SMALL. GTF WILL USE THE MINIMUM VALUE OF 40K.

Explanation: The specified BLOK value is insufficient for the generalized trace facility (GTF) processing to work.

In the message text:
value The BLOK value.

System action: GTF continues, but it will use a minimum default value of 40 kilobytes for its BLOK storage.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTSCN

AHL100A SPECIFY TRACE OPTIONS

Detecting Module: AHLTSCN

Explanation: The generalized trace facility (GTF) issues this message to request that you enter trace options.

Detecting Module: Generalized trace facility (GTF)

System action: GTF initialization does not continue until the operator responds to this message.

Operator response: Enter REPLY id,'TRACE=option, option,...,option' to enter the trace options your installation needs.

Detecting Module: AHLTSCN

AHL101A SPECIFY TRACE EVENT KEYWORDS-

keywd=,...,keywd=

Explanation: The generalized trace facility (GTF) issues this message to request that you enter the trace event keywords that correspond to the trace options specified in response to message AHL100A. Enter only the trace event keywords that appear in the message.

Detecting Module: AHLTSCN
text. The keywords and their corresponding trace options are:

- **IO=** IOP, SYSP
- **SSCH=** SSCHP, SIOP, SYSP
- **SIO=** SIOP, SSCHP, SYSP
- **SVC=** SVCP, SYSP
- **PI=** PIP, SYSP
- **CCW=** CCWP
- **ASID=** ASIDP
- **JOBNAME=** JOBNAMEP
- **USR=** USRP

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** To complete each keyword in the message text, enter:

```
R id,'keyword=(value,...,value), ..., keyword=(value,...,value)'
```

---

**AHL102A**  
**CONTINUE TRACE DEFINITION OR REPLY END**

**Detecting Module:** AHLT103

**Explanation:** The generalized trace facility (GTF) issues this message to allow the operator to continue or end the trace definition.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF initialization does not continue until the operator responds to this message.

**Operator response:** To continue or end the trace definition. To continue the trace definition, enter:

```
R id,'keyword=(value,...,value), ..., keyword=(value,...,value)'
```

To end the trace definition, enter:

```
R id,'END'
```

---

**AHL104A**  
**TRACE= KEYWORD NOT SPECIFIED**

**Detecting Module:** AHLTSCP

**Explanation:** For the generalized trace facility (GTF), the response to message AHL100A or the control statements in the GTF parmlib member did not specify the TRACE keyword. TRACE is a required keyword.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source. If NOPROMPT is in effect, GTF terminates.

**Operator response:** If GTF has not terminated, enter REPLY id,'TRACE=option,option,...,option' to enter the TRACE keyword. If GTF has terminated, restart GTF and supply the TRACE keyword. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, specify the TRACE keyword on a control statement in the GTF parmlib member and restart GTF.

---

**AHL105A**  
**SYNTAX ERROR. IMPROPER DELIMITER**

**Detecting Module:** AHLTSCP

**Explanation:** For the generalized trace facility (GTF), a response to message AHL100A, AHL101A, or AHL102A, or a control statement in the GTF parmlib member, contains incorrect punctuation.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source. If NOPROMPT is in effect, GTF terminates.

**Operator response:** If GTF has not terminated, reply to this message to correct the punctuation error. If GTF
has terminated, restart GTF and supply correct information. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, correct the punctuation error in the GTF parmlib member and restart GTF.

---

**AHL106A**  NO OPTIONS SPECIFIED

**Detecting Module:**  AHLTSCNL

**Explanation:** The generalized trace facility (GTF) did not detect any TRACE options in the response to message AHL100A or in any control statement provided in the GTF parmlib member. Either a blank separates the TRACE keyword from its options, or no options follow the TRACE keyword.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source. If NOPROMPT is in effect, GTF terminates.

**Operator response:** If GTF has not terminated, enter `REPLY id,'TRACE=option,option,...,option'` to enter the TRACE options. If GTF has terminated, restart GTF and supply the TRACE options. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, specify the TRACE options on a control statement in the GTF parmlib member and restart GTF.

---

**AHL107A**  SYNTAX ERROR. MISSING COMMA

**Detecting Module:**  AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL100A, AHL101A, or AHL102A, or a control statement in the GTF parmlib member, is missing a required comma.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, supply the missing comma. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, supply the missing comma in the GTF parmlib member and restart GTF.

---

**AHL108A**  INVALID OPTION SPECIFIED -- opt

**Detecting Module:**  AHLTSCN

**Explanation:** For the generalized trace facility (GTF), the response to message AHL100A or the control statements in the GTF parmlib member contained an incorrect option.

In the message text:

```
opt    The incorrect option.
```

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source. If NOPROMPT is in effect, GTF terminates.

**Operator response:** If GTF has not terminated, enter `REPLY id,'TRACE=option,option,...,option'` to correct the option. If GTF has terminated, restart GTF and supply the correct options. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, specify the correct option on a control statement in the GTF parmlib member and restart GTF.

---

**AHL109A**  INVALID DEVICE SPECIFIED -- dev

**Detecting Module:**  AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified an incorrect device number in one of the following parameters:

```
IO=
SSCH=
SIO=
IO=SSCH=
IO=SIO=
```

In the message text:

```
dev    The device number.
```

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, correct the device number and enter all options on the
line again. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, correct the device number in the GTF parmlib member and restart GTF.

### AHL110A  INVALID EVENT KEYWORD SPECIFIED

**Detecting Module:** AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified an incorrect event keyword.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, correct the event keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, supply the correct keyword in the GTF parmlib member and restart GTF.

### AHL111A  UNBALANCED PARENTHESIS IN KEYWORD keywd

**Detecting Module:** AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, contained an unbalanced parenthesis for keyword `keywd`.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, supply the missing parenthesis in the GTF parmlib member and restart GTF.

**System programmer response:** If a GTF control statement caused the error, supply the missing parenthesis in the GTF parmlib member and restart GTF.

### AHL112A  UNALLOWABLE KEYWORD FOR THE PROMPTING SEQUENCE -- keywd

**Detecting Module:** AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, contained a keyword (`keywd`) that was not specified in the TRACE options used to start the generalized trace facility (GTF).

**In the message text:**

`keywd` Keyword is not allowed for the prompting sequence.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, specify only options noted in message AHL101A and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, correct the error in the GTF parmlib member and restart GTF.

### AHL113A  LMT ERROR. EXCEEDED 256 DEVICES FOR IO=

**Detecting Module:** AHLTPMT

**Explanation:** For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified more than 256 device numbers for the IO keyword.

**Detecting Module:** Generalized trace facility (GTF)

**System action:** GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:** In your reply to this message, supply the IO keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:** If a GTF control statement caused the error, correct the error in the GTF parmlib member and restart GTF.
statement caused the error, correct the IO keyword in the GTF parmlib member and restart GTF.

**AHL114A**  
**LMT ERROR. EXCEEDED 256 DEVICES FOR SSCH=**

Detecting Module:  AHLTPMT

Explanation:  For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified more than 256 device numbers for the SSCH or SIO keyword.

Detecting Module:  Generalized trace facility (GTF)

System action:  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response:  In your reply to this message, correct the SSCH or SIO keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

System programmer response:  If a GTF control statement caused the error, correct the SSCH or SIO keyword in the GTF parmlib member and restart GTF.

**AHL115A**  
**INVALID INTERRUPT CODE SPECIFIED**

Detecting Module:  AHLTPMT

Explanation:  For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified an incorrect interruption code for the PI keyword.

Detecting Module:  Generalized trace facility (GTF)

System action:  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response:  In your reply to this message, correct the interruption code in the PI keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

System programmer response:  If a GTF control statement caused the error, correct the interruption code in the PI keyword in the GTF parmlib member and restart GTF.

**AHL116A**  
**INVALID {SVC|USR} NUMBER SPECIFIED**

Detecting Module:  AHLTPMT

Explanation:  For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified an incorrect value for the SVC or USR keyword. If SVC appears in the message text, an SVC number specified in the SVC keyword is greater than 255. If USR (user) appears in the message text, a user event number specified in the USR keyword is less than X'000' or greater than X'FFF'.

Detecting Module:  Generalized trace facility (GTF)

System action:  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response:  In your reply to this message, correct the SVC or USR keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

System programmer response:  If a GTF control statement caused the error, correct the SVC or USR keyword in the GTF parmlib member and restart GTF.

**AHL117A**  
**LMT ERROR. EXCEEDED 50 {SVC|USR|PI} NUMBERS**

Detecting Module:  AHLTPMT

Explanation:  For the generalized trace facility (GTF), a response to message AHL101A or AHL102A, or a control statement in the GTF parmlib member, specified too many prompting values. Depending on the message text, one of the following is true:

SVC  The number of SVCs specified is greater than 50.

USR  The number of USRs specified is greater than 50.

PI  The number of PIs specified is greater than 50.

Detecting Module:  Generalized trace facility (GTF)

System action:  GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response:  In your reply to this message, correct the number of prompting values and enter all options on the line again. If the error is in the GTF
parmlib member, notify the system programmer.

System programmer response: If a GTF control statement caused the error, correct the number of prompting values in the GTF parmlib member and restart GTF.

AHL118I  ERROR IN AHLTxxxx  yyyy [zzzzzzING] DISABLED.  TIME=hh.mm.ss [DUMP ATTEMPT {SUCCESSFUL|UNSUCCESSFUL}]

Explanation: An error has occurred in the generalized trace facility (GTF) module AHLTxxxx while attempting to gather data for event yyyy.

In the message text:

AHLTxxxx  Module in which error occurred.

yyyy  Event for which GTF was gathering data when error occurred.

zzzzzzING  Specifies whether it is the tracing or the filtering which has been disabled. If filtering has been disabled, all events of type yyyy will be traced.

For module AHLTDIR, the error occurred while attempting to save trace data for ABDUMP/SNAP or SVCDUMP.

In the message text:

zzzzzzING  Indicates ABDUMPing for ABDUMP/SNAP or SDUMPing for SVCDUMP.

yyyy  Indicates TRT.

This message also indicates whether or not GTF's attempt to take an SVC dump to record the error was successful.

System programmer response: Stop GTF. Specify EXT mode, DEBUG=YES, and the same trace options specified for GTF. Enter the IPCS GTFTRACE subcommand. The input for GTFTRACE is the trace data set.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTDIR

AHL121I  TRACE OPTION INPUT INDICATED FROM MEMBER memname of PDS dsname

Explanation: The user has indicated that the trace options for the generalized trace facility (GTF) are to be provided by a member of the specified data set.

In the message text:

memname  The name of the member.

dname  The name of the data set.
System action: GTF will receive trace options from the trace option data set specified and not from the system console.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCTL1

AHL122I MEMBER NOT SPECIFIED. TRACE OPTION DATASET IGNORED.

Explanation: During initialization of the generalized trace facility (GTF), a member name was not found on the DD statement for the trace option data set.

System action: The trace option data set is not used to supply trace options to GTF.

Operator response: Trace options must be entered by way of the master console.

System programmer response: Include a valid member name in the trace option data set DD statement.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCTL1

AHL126A RESPECIFY TRACE OPTIONS OR REPLY U

Detecting Module: AHLTCTL1

Explanation: During initialization, the generalized trace facility (GTF) issues this message to allow you to accept or reject the trace options GTF will use. Message AHL103I lists the trace options GTF will use.

System action: The system continues processing, but GTF initialization does not continue until you respond to this message.

Operator response: If the trace options listed in message AHL103I are not correct for your installation, specify the trace options again, beginning with TRACE. If the trace options are correct, reply U to continue initialization.

System programmer response: Use the message in the job stream list to identify the error. Correct the error in the GTF parmlib member and restart GTF.

AHL123I MEMBER memname NOT FOUND. TRACE OPTION DATASET IGNORED.

Explanation: During initialization of the generalized trace facility (GTF), the member indicated on the DD statement for the trace option data set was not found in that data set.

In the message text:

memname

The name of the member.

System action: The trace option data set will not be used to supply trace options to GTF.

Operator response: Trace options must be entered by way of the master console.

System programmer response: Include a valid member name in the trace option data set DD statement.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCTL1

AHL124I GTF TRACE OPTION DATASET INPUT ERROR

Detecting Module: AHLTSCN

AHLTPMT

Explanation: During initialization, the generalized trace facility (GTF) found an error in the trace options specified in the trace option data set, the GTF parmlib member.

Detecting Module: Generalized trace facility (GTF)

System action: GTF ignores the trace options specified in the GTF parmlib data set and issues an operator message to describe the error.

Operator response: To correct the error, respond to the message that describes the error and enter trace options through the master console. Notify the system programmer.

System programmer response: Use the message in the job stream list to identify the error. Correct the error in the GTF parmlib member and restart GTF.

AHL125A ILLEGAL SPECIFICATION OF TRACE OPTIONS

Detecting Module: Generalized trace facility (GTF)

Explanation: During initialization, the generalized trace facility (GTF) detected that at least one qualifier trace option was specified without the option it qualifies. The qualifier options are ASIDP, CCW, CCWP, JOBNAMEP, PCI, and TRC. These options cannot stand alone; they can only qualify other trace options.

Detecting Module: Generalized trace facility (GTF)

System action: GTF ignores all options on the line in the response or control statement that contains the error. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response: In your reply to this message, enter the trace options again, correcting the problem with the qualifier options. If you are unable to resolve the error, or if the error is in the GTF parmlib member, notify the system programmer.

System programmer response: If you can resolve the error, correct the operator response or GTF control statement that caused the error, then restart GTF. If
these actions do not solve the problem, obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**AHL127I** GTF TRACE OPTION DATASET I/O ERROR -- text

**Explanation:** The generalized trace facility (GTF) detected an I/O error while reading the trace option data set.

In the message text:

- **text** Describes the error: device number, I/O operation, error condition, and access method used.

**System action:** The trace options specified on the trace option data set are disregarded.

**Operator response:** Enter the trace options from the master console.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTCTL1

---

**AHL128I** GTF ENTRY POINT mod NOT FOUND

**Explanation:** A generalized trace facility (GTF) module was not found.

In the message text:

- **mod** The module that could not be loaded.

**System action:** The system abnormally ends GTF.

**System programmer response:** Use the linkage editor to put the missing GTF module mod into the system. Restart GTF.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI

---

**AHL129I** BDL/I O ERROR LOADING GTF ENTRY POINT mod

**Explanation:** The generalized trace facility (GTF) could not continue initialization because of an input/output error encountered during the loading of a module.

In the message text:

- **mod** The module that could not be loaded.

**System action:** GTF abnormally ends.

**Operator response:** Correct the input/output error. Restart GTF.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI

---

**AHL130I** INSUFFICIENT STORAGE FOR TRACE INITIALIZATION

**Explanation:** During initialization of the generalized trace facility (GTF), a shortage of virtual storage caused initialization to abnormally end.

**System action:** The system abnormally ends GTF.

**Operator response:** Increase the region size and restart GTF.

**Note:** Make sure that the buffer space is not too large.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLGTFI

---

**AHL131I** GTF TRACE OPTION DATASET ERROR DURING OPEN -- nnn

**Explanation:** During initialization of the generalized trace facility (GTF), an error occurred while the trace option data set was being opened.

In the message text:

- **nnn** The system completion code.

**System action:** Trace options will not be supplied to the GTF by the trace option data set.

**Operator response:** All options must be specified from the master console.

**System programmer response:** See the system programmer response for completion code nnn.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTCTL1

---

**AHL132I** MC ROUTING FACILITY TERMINATING ON ERROR CONDITION

**Explanation:** The system encountered an unrecoverable error while attempting to handle monitor call processing.

**System action:** The system attempts to end GTF. The system issues other messages which indicate the exact problem.

**Operator response:** If GTF is active, and does not end, the operator should stop it.

**System programmer response:** Look at the messages in the job log. Collect all printed output and output data sets related to the problem. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLSETEV

---
AHL133I  SETEVENT UNABLE TO INITIALIZE
CPU xxx FOR yyyyyyy

Explanation: Initialization of a processor failed.
In the message text:

xxx The processor that could not be initialized.

yyyyyy Component attempting to initialize the processor.

System action: All other active processors are initialized.

System programmer response: Collect all printed output and output data sets related to the problem. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Generalized trace facility (GTF)

Detecting Module: AHLSETEV

AHL135A  INVALID EVENT SPECIFIED FOR
KEYWORD keywd

Detecting Module: AHLTPMT

Explanation: For the generalized trace facility (GTF), the response to message AHL101A or AHL102A, or the control statements in the GTF parmlib member, specified an event that is not valid for the keyword shown in the message.

In the message text:

keywd The keyword.

Detecting Module: Generalized trace facility (GTF)

System action: GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response: In reply to this message, correct the event for the keyword and enter all options on the line again. If the error is in the GTF parmlib member, notify the system programmer.

System programmer response: If a GTF control statement caused the error, correct the control statement in the GTF parmlib member to specify the correct keyword event, then restart GTF.

AHL136I  INVALID RESPONSE TO MSG AHL125A

Explanation: During GTF initialization, the operator did not reply TRACE=option,option,... or U in response to message AHL125A.

System action: The system reissues message AHL125A.

Operator response: Enter correct reply to message AHL125A.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCTL1

AHL138I  SIO TRACE OPTION REPLACED BY
SSCH TRACE OPTION

Explanation: During generalized trace facility (GTF) initialization, GTF received a request to trace start input/output (SIO) events. In MVS/XA™, the start subchannel (SSCH) event replaced the SIO event. To maintain compatibility with MVS/370 procedures, GTF accepts the SIO request and treats it as a SSCH trace option request.

System action: GTF initialization continues.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTSCN

AHL140D  RESPECIFY VALUE FOR INVALID
PARAMETER parm

Detecting Module: AHLTPMT

Explanation: For the generalized trace facility (GTF), a response to message AHL100A, AHL101A, or AHL102A, or a control statement in the GTF parmlib member, contains a parameter has an incorrect value.

In the message text:

parm One of the following:

CCWN The value of CCWN (the number of CCWs traced) is greater than 512.

DATA The value of DATA (the number of data bytes traced) is greater than 32767.

PCITAB The value of PCITAB (the size of program controlled interrupt table) is 0 or greater than 9.

Detecting Module: Generalized trace facility (GTF)

System action: GTF does not accept the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

Operator response: In reply to this message, correct the parameter value. If the error is in the GTF parmlib member, notify the system programmer.

System programmer response: If a GTF control statement caused the error, correct the parameter value in the GTF parmlib member and restart GTF.
**AHL141D**  \(\text{INVALID VALUE SPECIFIED FOR CCW KEYWORD, RESPECIFY PARAMETERS}\)

**Detecting Module:**  AHLTPMT

**Explanation:**  For the generalized trace facility (GTF), a response to message AHL100A, AHL101A, or AHL102A, or a control statement in the GTF parmlib member, contains an incorrect value. GTF issues this message for misspellings, missing commas, duplicate entries, incorrect parameter values, and the like.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all the job names and values on the response or control statement. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:**  In reply to this message, correct the error and enter the line again. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:**  If a GTF control statement caused the error, correct the control statement in the GTF parmlib member and restart GTF.

**AHL142D**  \(\text{A SPECIFIED JOBNAME IS INVALID, RESPECIFY PARAMETERS}\)

**Detecting Module:**  AHLTPMT

**Explanation:**  For the generalized trace facility (GTF), the response to message AHL100A or AHL102A, or the control statements in the GTF parmlib member, specified an incorrect job name for the JOBNAME parameter. The job name is incorrect because it contains an unacceptable character or too many characters. A valid job name is 1 to 8 characters. The characters must be alphabetic (A to Z), numeric (1 to 9 and 0), or national (#, @, and $). The first character of the job name must be alphabetic or national.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all the job names that the operator specified in response to message AHL101A or AHL102A. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:**  If you are entering the control statements through the system console, correct the job name error and respecify the jobnames. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:**  If a GTF control statement caused the error, correct the control statement in the GTF parmlib member and restart GTF.

**AHL143D**  \(\text{MORE THAN FIVE \{ASIDS|JOBNAMES\} SPECIFIED, RESPECIFY PARAMETERS}\)

**Detecting Module:**  AHLTPMT

**Explanation:**  For the generalized trace facility (GTF), the response to message AHL101A or AHL102A, or the control statements in the GTF parmlib member, specified more than 5 job names for the JOBNAME parameter or more than 5 address space identifiers for the ASID parameter.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all job names or address space identifiers (ASIDs) specified in response to AHL101A or AHL102A. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:**  If you are entering the control statements through the system console, enter the response again, specifying the correct number of job names or address space identifiers. If the error is in the GTF parmlib member, notify the system programmer.

**System programmer response:**  If a GTF control statement caused the error, correct the control statement in the GTF parmlib member and restart GTF.

**AHL144D**  \(\text{A SPECIFIED ASID IS INVALID, RESPECIFY PARAMETERS}\)

**Detecting Module:**  AHLTPMT

**Explanation:**  For the generalized trace facility (GTF), the response to message AHL100A or AHL102A, or the control statements in the GTF parmlib member, specified an incorrect address space identifier for the ASID parameter. The ASID is not valid because of one of the following conditions:

- The ASID value contains a character that is not a valid hexadecimal character.
- The value of the ASID is greater than the largest valid ASID value. The system initialization parameter, MAXUSER, defines the largest valid ASID value.
- The ASID is 0.

**Detecting Module:**  Generalized trace facility (GTF)

**System action:**  GTF ignores all the address space identifiers that the operator specified in response to message AHL101A or AHL102A. The system continues processing, but GTF initialization does not continue until the error is corrected. If the error occurred in the GTF parmlib member, the system issues message AHL124I to identify the error source.

**Operator response:**  If you are entering the control statements through the system console, correct the ASID error and respecify the address space identifiers. If the error is in the GTF parmlib member, notify the system programmer.
AHL145I • AHL148I

System programmer response: If a GTF control statement caused the error, correct the control statement in the GTF parmlib member and restart GTF.

AHL145I   ERROR IN JOBNAME OR ASID FILTERING, GTF TERMINATED
Explanation: An unrecoverable error occurred during initialization of the generalized trace facility (GTF).
System action: The system abnormally ends GTF and attempts to take an SVC dump.
Operator response: If you wish, start GTF again without JOBNAME filtering or ASID filtering.
System programmer response: Obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Source: Generalized trace facility (GTF)
Detecting Module: AHLTSELF

AHL146I   THE EXPECTED CCW AT SCSW-8 WAS NOT FOUND DURING THE CCW SCAN, TRACING WAS FORCED
Explanation: During tracing of an input/output (I/O) interrupt by the generalized trace facility (GTF), GTF traced from the beginning of the channel program to find the channel command word (CCW) pointed to by SCSW-8 (channel status word). GTF could not find the CCW. This happen if:
• A program controlled interrupt (PCI) disabled interrupt exit (DIE) modified the channel program.
• GTF traced the number of CCWs that the number of CCWs traced (CCWN) specified before finding SCSW-8.
System action: GTF traces the CCW pointed to by SCSW-8. GTF also traces the data that certain fields of the CCW pointed to by SCSW-8 reference. These fields are the data address and count fields. For further information on these fields and the data they reference, see the CCW section in Principles of Operation
Usually, when GTF issues this message, GTF cannot trace the entire channel program. GTF cannot tell if the traced CCW (the one pointed to by SCSW-8), is using the command code of a previous CCW. In other words, GTF cannot tell if the CCW is part of a data chain.
Thus, the CCW command code be incorrect. Because GTF cannot check the CCW command code, the I/O operation not transfer data.
System programmer response: Obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Source: Generalized trace facility (GTF)
Detecting Module: AHLTCCWG

AHL147I   ERROR IN RECORD COUNT, THERE BE LOST EVENTS
Explanation: During initialization of the generalized trace facility (GTF), a record was detected out of sequence during record formatting. The system places all channel command word (CCW) trace records into sequence. The user should scan the GTF output for a GTF lost event record.
System action: GTF continues processing.
Source: Generalized trace facility (GTF)
Detecting Module: AMDSYS07

AHL148I   THE ADDRESS OF THE CHANNEL PROGRAM IS NOT VALID. THE CHANNEL PROGRAM CANNOT BE TRACED.
Explanation: During tracing of a channel program, GTF encountered one of the following problems with the real address of the beginning of the channel program:
• The generalized trace facility (GTF) could not translate the real address into a valid virtual address.
• GTF translated the real address into a virtual address but could not translate the virtual address back to the same real address.
• The real address is not the address of a double word boundary.
• On an end-of-sense-information interrupt, the channel command word (CCW) address (the real address), for non-zHPF channel programs, or the transport control word (TCW) address, for zHPF channel programs, in the subchannel status word (SCSW) is zero.

You can find the real address of the beginning of the channel program either in the operation request block (ORB), the program controlled interrupt (PCI) table, the SCSW, or the I/O supervisor block (IOSB).
System action: GTF issues this message to the GTF trace data set as a GTF trace record. GTF writes the contents of the IOSB to the GTF trace data set. If an error recovery program (ERP) work area is present, the system writes the ERP work area to the GTF trace data set. GTF continues processing.
System programmer response: If the condition persists:
• Examine the start subchannel (SSCH) record associated with the missing CCW or TCW chain for an incorrect CCW or TCW.
• Examine the IOSB that GTF wrote to the GTF trace data set.
• Examine the logrec data set for errors in GTF modules.
Source: Generalized trace facility (GTF)
Detecting Module: AHLTCCWG, AHLTFCXG
AHL149I  CHANNEL PROGRAM NOT COMPLETED WITHIN SPECIFIED XXXX [CCWS|DCWS]

Explanation: During initialization of the generalized trace facility (GTF), GTF could not trace the entire channel program.

In the message text:

xxxx  The value of the number of channel command words (CCWs) or device command words (DCWs) traced (CCWN) keyword specified at GTF initialization time. If CCWN is not specified at GTF initialization time, xxxx is 50, the default value.

System action: GTF issues this message to the trace data set as a trace record. GTF continues processing.

GTF has traced xxxx CCWs or DCWs, which it writes to the GTF output data set. GTF also writes the input/output supervisor block (IOSB) to the GTF output data set. If an error recovery program (ERP) work area is present, GTF writes the ERP work area to the GTF output data set.

System programmer response: Increase the value of the CCWN keyword if you want to see more of the channel program.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCCWG, AHLTFCXG

AHL150I  THE PCI TABLE IS FULL. TRACE USES THE ADDRESS IN IOSB AS THE CHANNEL PROGRAM START.

Explanation: A program controlled interrupt (PCI) occurred. There is no entry in the PCI table for this interrupt and there is no empty slot to make an entry for this interrupt.

System action: GTF issues this message to the GTF output data set as a trace record.

System programmer response: Increase the size of the PCI table by increasing the value of PCITAB, a CCW keyword.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCCWG

AHL151I  THE ADDRESS OF THE CCW IS NOT VALID. THERE IS A BREAK IN THE CCW CHAIN.

Explanation: The generalized trace facility (GTF) attempted to trace a channel command word (CCW).

One of the following is true about the real address of the CCW:

• GTF could not translate the real address into a valid virtual address.

• GTF translated the real address into a virtual address but then could not translate the virtual address back to the same real address.

• The boundary of the storage location containing the real address is not a double word boundary.

System action: GTF issues this message to the GTF output data set as a trace record.

GTF places 8 bytes (a double word) of zeroes in the slot reserved for the CCW. GTF places the incorrect real address in the field that normally contains the CCW address. GTF writes the I/O supervisor block (IOSB) to the GTF output data set. If an error recovery program (ERP) is present, GTF writes the ERP to the GTF output data set. GTF continues processing.

System programmer response: Obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCCWG

AHL152I  DATA COULD NOT BE TRACED

Explanation: The generalized trace facility (GTF) could not trace the data associated with the current channel command word (CCW). This is because GTF could not translate the real address of the data to a virtual address or translate the virtual address back to a real address.

System action: GTF issues this message to the GTF output data set as a trace record.

GTF writes the input/output supervisor block (IOSB) to the GTF output data set. If an error recovery program (ERP) work area is present, GTF writes the ERP work area to the GTF output data set. GTF continues processing.

System programmer response: This message occur frequently while GTF traces the I/O activity of a paging data set. If this message occurs frequently for I/O that is not paging I/O, check logrec data set for GTF errors.

Source: Generalized trace facility (GTF)

Detecting Module: AHLTCCWG

AHL153I  UNABLE TO OBTAIN SENSE INFORMATION ON AN END-OF-SENSE I/O INTERRUPT

Explanation: The generalized trace facility (GTF) cannot trace the sense information because of one of the following:

• The address of the sense bytes is zero.

• CSW-8 (channel status word) does not point to a sense channel command word (CCW).

System action: GTF issues this message to the GTF output data set as a trace record.
GTF traces the CCW and writes the input/output supervisor block (IOSB) to the GTF output data set. If an error recovery program (ERP) is present, GTF writes it to the GTF output data set. GTF continues processing, but ends this channel program trace.

**System programmer response:** Obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTCCWG

---

**AHL154I** 
**ON AN I/O INTERRUPT, THE SCSW CONTAINS AN INVALID ADDRESS. TRACING CONTINUES AS FAR AS POSSIBLE.**

**Explanation:** The channel command word (CCW) address in the subchannel status word (SCSW) is not valid because of one of the following:

- The generalized trace facility (GTF) could not translate the real address of the last CCW into a valid virtual address.
- GTF translated the real address of the last CCW into a virtual address but could not translate the virtual address back to the same real address.
- The CCW address is not the address of a double word.
- The CCW address is zero. This occurs when there is a simulated interrupt after a missing interrupt is detected.

**System action:** GTF issues this message to the GTF output data set as a trace record. GTF traces the channel program, as long as it finds valid CCWs or until it traces the maximum number of CCWs as specified by the CCWN parameter. GTF writes the IOSB to the GTF output data set. If an error recovery program (ERP) work area is present, GTF writes it to the GTF output data set.

**System programmer response:** Obtain the SYSOUT output for the job. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLTCCWG

---

**AHL904I** 
**THE FOLLOWING TRACE DATASETS CONTAIN TRACE DATA:**

**Explanation:** The specified block size for a generalized trace facility (GTF) data set is less than the minimum block size of 4096 bytes.

In the message text:

- **blocksize** The block size.
- **dsname** The name of the data set.

**System action:** Trace writer initialization will continue if there are other data sets to use; if there are none, the trace writer initialization ends.

**System programmer response:** Make sure that the data sets you specify for GTF output have a blocksize of at least 4096.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL902I** 
**INSUFFICIENT ADDRESS SPACE FOR TRACE WRITER.**

**Explanation:** During trace writer initialization, a GETMAIN for subpool 0-127 failed.

**System action:** Trace writer initialization will be ended.

**Operator response:** Record the message and notify the system programmer.

**System programmer response:** Make the necessary address space available and restart.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL903I** 
**TRKCALC UNSUCCESSFUL, ddname DD STATEMENT INVALID**

**Explanation:** During trace writer initialization, an incorrect DD statement caused initialization to fail.

In the message text:

- **ddname** The incorrect ddname.

**System action:** Trace writer initialization ends.

**Operator response:** Record the message and notify the system programmer.

**System programmer response:** Ensure that the DD statement for the specified **ddname** is valid.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL901I** 
**BLOCK SIZE blocksize IS TOO SMALL. TRACE WRITER WILL NOT USE DATA SET: dsname**

**Explanation:** The specified block size for a generalized trace facility (GTF) data set is less than the minimum block size of 4096 bytes.

In the message text:

- **blocksize** The block size.
- **dsname** The name of the data set.

**System action:** Trace writer initialization will continue if there are other data sets to use; if there are none, the trace writer initialization ends.

**System programmer response:** Make sure that the data sets you specify for GTF output have a blocksize of at least 4096.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL902I** 
**INSUFFICIENT ADDRESS SPACE FOR TRACE WRITER.**

**Explanation:** During trace writer initialization, a GETMAIN for subpool 0-127 failed.

**System action:** Trace writer initialization will be ended.

**Operator response:** Record the message and notify the system programmer.

**System programmer response:** Make the necessary address space available and restart.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL903I** 
**TRKCALC UNSUCCESSFUL, ddname DD STATEMENT INVALID**

**Explanation:** During trace writer initialization, an incorrect DD statement caused initialization to fail.

In the message text:

- **ddname** The incorrect ddname.

**System action:** Trace writer initialization ends.

**Operator response:** Record the message and notify the system programmer.

**System programmer response:** Ensure that the DD statement for the specified **ddname** is valid.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

**AHL903I** 
**TRKCALC UNSUCCESSFUL, ddname DD STATEMENT INVALID**

**Explanation:** During trace writer initialization, an incorrect DD statement caused initialization to fail.

In the message text:

- **ddname** The incorrect ddname.

**System action:** Trace writer initialization ends.

**Operator response:** Record the message and notify the system programmer.

**System programmer response:** Ensure that the DD statement for the specified **ddname** is valid.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL904I** 
**THE FOLLOWING TRACE DATASETS CONTAIN TRACE DATA:**

**Explanation:** The specified block size for a generalized trace facility (GTF) data set is less than the minimum block size of 4096 bytes.

In the message text:

- **blocksize** The block size.
- **dsname** The name of the data set.

**System action:** Trace writer initialization will continue if there are other data sets to use; if there are none, the trace writer initialization ends.

**System programmer response:** Make sure that the data sets you specify for GTF output have a blocksize of at least 4096.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT
**AHL905I** ddname DD STATEMENT HAS INVALID DEVICE TYPE

**Explanation:** During trace writer initialization, the trace data set defined by a DD statement in the generalized trace facility (GTF) procedure is allocated with an incorrect device type. It must be allocated to a tape or direct access storage device (DASD).

In the message text:
- *ddname* The incorrect ddname.

**System action:** Trace writer initialization will continue processing the remaining trace data sets. If none of the trace data sets are valid the trace writer will end; otherwise, the trace writer will continue processing using the valid trace data sets to contain the trace data.

**Operator response:** Record message and notify system programmer.

**System programmer response:** Ensure that the trace data set, as defined by the ddname DD statement in the GTF procedure, is allocated to a tape or direct access storage device (DASD).

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWRITE

---

**AHL906I** THE OUTPUT BLOCK SIZE OF blksize WILL BE USED FOR OUTPUT DATA SETS: dsname1...dsname16

**Explanation:** This lists the output data sets that will be used by the trace writer and the single block size that will be used for each one.

In the message text:
- *blksize* The output block size.
- *dsname1...dsname16* The name(s) of the data set(s).

**System action:** Trace writer initialization continues.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL908I** OUTPUT DATA SETS SPECIFIED ON BOTH DASD AND TAPE. TRACE WRITER WILL USE ONLY DASD.

**Explanation:** The JCL for the generalized trace facility (GTF) contains DD statements for multiple output data sets, but some data sets are on direct access devices (DASD) and some are on magnetic tape. This is not supported by the trace writer.

**System action:** The trace writer will continue and use only the data sets on DASD, ignoring the tape data sets.

**System programmer response:** Remove either the DASD or the tape allocations from the JCL.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT

---

**AHL909I** DEVTYPE UNSUCCESSFUL, ddname DD STATEMENT INVALID

**Explanation:** During trace writer initialization, an incorrect DD statement caused processing of a trace data set to fail.

In the message text:
- *ddname* The ddname.

**System action:** Trace writer initialization will continue processing the remaining trace data sets. If none of the trace data sets are valid the trace writer will end; otherwise, the trace writer will continue processing using valid trace data sets.

**Source:** Generalized trace facility (GTF)

**Detecting Module:** AHLWINIT
the valid trace data sets to contain the trace data.

Operator response: Record the message and notify the system programmer.

System programmer response: Ensure that the DD statement for the specified DDNAME is valid.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWINIT

---

AHL910I I/O ERROR PROCESSING DATA SET
dsnamedsnamedsnamedsnamedsnamedsnamedsnamedsnamedsnamedsnamedsnamedsnamed

Explanation: The trace writer has detected an input/output error while writing to a data set.

In the message text:

dsnamedname

The name of the data set.

System action: Refer to possible preceding system messages describing the problem.

Trace writer processing will continue as long as there are additional trace data sets still available. If all trace data sets are exhausted, then trace writer processing will end.

Operator response: Record the message and notify the system programmer.

System programmer response: Verify that a valid trace data set has been specified for use and restart GTF. If the problem recurs, examine data set in error, or use alternative data set. The data set in error contain valid trace data; however, the results of post processing this trace data are unpredictable.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWINIT

---

AHL920I TRACE WRITER TERMINATING ON ERROR CONDITION

Explanation: The trace writer has detected an unrecoverable error during processing and therefore must end.

System action: The trace writer will quiesce all outstanding processing and close all data sets prior to ending.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Generalized trace facility (GTF)

Detecting Module: AHLWRITE

---

AHL911I I/O ERROR - ABEND CODE abc, RETURN CODE return-code, DATA SET dsnamedsnamedsnamedsnamed

Explanation: The trace writer has detected an input/output error during OPEN/CLOSE/EOV processing for a data set.

In the message text:

abc ascending code.

return-code The return code.

dsnamedname

The name of the data set.

System action: Trace writer processing will continue as long as there are additional trace data sets still available. If all trace data sets are exhausted, then trace writer processing will end.

Operator response: Record the message and notify the system programmer.

System programmer response: Verify that a valid
Chapter 8. AIR system messages

This chapter contains system messages that begin with the AIR prefix.

| AIR001I | PFA INITIALIZATION COMPLETE |
| Explanation: | The Predictive Failure Analysis server is active. |
| System action: | The system continues processing |
| Operator response: | None. |
| System programmer response: | None. |
| Detecting Module: | AIRAMINI |
| Routing Code: | 1, 2 |
| Descriptor Code: | 12 |

| AIR002I | STOP PFA REQUEST RECEIVED |
| Explanation: | The PFA server has received a STOP command. |
| System action: | PFA server terminates normally. |
| System programmer response: | None. |
| Detecting Module: | AIRAMINI |
| Routing Code: | 1, 2 |
| Descriptor Code: | 12 |

| AIR003I | PFA UNABLE TO REGISTER ELEMENT |
| element with ARM. RC= returncode RSN= returncode |
| Explanation: | PFA is unable to register with ARM. |
| System action: | PFA initialization continues without ARM support. |
| Operator response: | Notify the system programmer. |
| System programmer response: | Examine the message provided by the operator and determine the cause of the error. |
| Detecting Module: | AIRAMINI |
| Routing Code: | 1, 2 |
| Descriptor Code: | 12 |

| AIR004I | PFA TERMINATING ABNORMALLY, CODE= termcode |
| Explanation: | The PFA server has detected an error condition that requires the server be terminated. |
| System action: | The PFA server terminates abnormally. |
| Operator response: | Notify the system programmer. |
| System programmer response: | Collect all related error data and call IBM Support. |
| Detecting Module: | AIRAMINI |
| Routing Code: | 1, 2 |
| Descriptor Code: | 12 |

| AIR005I | PFA TERMINATING DUE TO FAILURE OF TASK |
| Explanation: | A task critical to PFA operation has failed and cannot be reinstated. |
| System action: | PFA terminates. An ABEND and dump can accompany this message. The Automatic Restart Manager (ARM) will, if possible, restart PFA |
| Operator response: | Capture the dump, if one is issued. Notify your system programmer. If PFA does not restart automatically, use the START command to restart PFA. |
| System programmer response: | Review the dump and LOGREC to identify the original error. Provide this information to your IBM Support Center. |
| AIRAMETX | Routing Code: 2, 10 |
| Descriptor Code: | 4 |

| AIR006I | HZSADDCK MACRO CALL FOR ELEMENT FAILED RC= returncode RSN= returncode |
| Explanation: | PFA is not able to register a required check. |
| System action: | | |
| Operator response: | | |
| System programmer response: | Examine the message provided by the operator and determine the cause of the error. |
| Detecting Module: | AIRAMINI |
| Routing Code: | 1, 2 |
| Descriptor Code: | 12 |
The **Hzsaddck return code**.

The **Hzsaddck reason code**.

**System action:** PFA terminates. An ABEND and dump can accompany this message. The Automatic Restart Manager (ARM) will, if possible, restart PFA.

**Operator response:** Capture the dump, if one is issued. Notify your system programmer. If PFA does not restart automatically, use the `START` command to restart PFA.

**System programmer response:** Review the dump and LOGREC to identify the original error. Provide this information to your IBM Support Center.

---

**Detecting Module:** AIRAMCHK
**Routing Code:** 2, 10
**Descriptor Code:** 4

**Air007i** PFA Check Common Storage Usage Was Unable to Build Security Context

**Explanation:** PFA common storage usage health check failed when it issued a z/OS UNIX System Services call to establish the security context need for common storage usage check.

**System action:** PFA terminates the common storage usage check.

**Operator response:** The user id failed when it issued BPX1LG.

**System programmer response:** Determine why BPX1LG failed.

**Detecting Module:** AIRAMETX
**Routing Code:** 2, 10
**Descriptor Code:** 4

---

**Air008i** PFA Check Common Storage Usage Had a Problem with BPX1PGN. Errno= `errno` Errnojr= `errnojr`

**Explanation:** PFA common storage usage check failed when it issued a z/OS UNIX System Services call to establish the security context need for common storage usage check.

**In the message text:**

`errno`

The z/OS UNIX errno.

`errnojr`

The z/OS UNIX errnojr.

**System action:** PFA terminates the common storage usage check.

---

**Air009i** PFA Check Common Storage Usage Was Unable to Build Security Context

**Explanation:** PFA common storage usage check failed when it issued a z/OS UNIX System Services call to establish the security context need for common storage usage check.

**System action:** PFA terminates the common storage usage check.

**Operator response:** The user id failed when it tried to build security context.

**System programmer response:** Determine why security context build failed.

**Detecting Module:** AIRAMETX
**Routing Code:** 2, 10
**Descriptor Code:** 4

---

**Air010i** PFA Check Common Storage Usage Was Unable to Open Log File, Errno= `errno` Errnojr= `errnojr` Filename= `path_name`

**Explanation:** A file critical to PFA operation could not be opened. The file is placed in a directory used to hold data used by the common storage usage check.

**In the message text:**

`errno`

The z/OS UNIX errno.

`errnojr`

The z/OS UNIX errnojr.

`path_name`

The file name.

**System action:** PFA terminates the common storage usage check.

**Operator response:** Use the `errno` and `errnojr` to determine why the file could not be opened using the filename and directory specified. Check the home directory for the user id associated with the PFA started task.
System programmer response: Use the errno and errnojr to determine why the file could not be opened using the filename and directory specified. Check the home directory for the user id associated with the PFA started task.

Problem determination: For errno and errnojr descriptions, see [z/OS UNIX System Services Messages and Codes](#).

Detecting Module: AIRAMETX
Routing Code: 2, 10
Descriptor Code: 4

---

AIR011I HZSADDCK MACRO CALL FOR element FAILED. HEALTH CHECKER NOT ACTIVE.

Explanation: PFA is not able to register a required check.

System action: PFA waits for IBM Health Checker for z/OS to start.

Operator response: Start IBM Health Checker for z/OS, if desired. Or stop PFA.

System programmer response: Determine why IBM Health Checker for z/OS did not start.

Problem determination: For more information about IBM Health Checker for z/OS, see [IBM Health Checker for z/OS: User's Guide](#).

Detecting Module: AIRAMCHK
Routing Code: 2, 10
Descriptor Code: 4

---

AIR012I OMVS NOT INITIALIZED. PFA CANNOT START.

Explanation: PFA is not able to start when OMVS has not been initialized.

System action: PFA does not start.

Operator response: Start OMVS and then restart PFA.

System programmer response: Determine why OMVS is not initialized.

Detecting Module: AIRAMINI
Routing Code: 2, 10
Descriptor Code: 4

---

AIR014I THE PFA ADDRESS SPACE WAS PREVIOUSLY STARTED. ONLY ONE PFA ADDRESS SPACE IS ALLOWED.

Explanation: Multiple PFA address spaces cannot be started.

System action: Subsequent requests to start PFA are not allowed.

Operator response: None.

System programmer response: None.

Detecting Module: AIRAMINI
Routing Code: 2
Descriptor Code: 4

---

AIR015I THE KEYWORD element WAS FOUND WHICH IS NOT SUPPORTED, NOT ALLOWED IN THIS CONTEXT, OR NOT ALLOWED IN THIS POSITION.

Explanation: The keyword is either not supported or not allowed with the other parameters specified.

In the message text:

- element
  - The keyword name.

System action: The command is not processed.

Operator response: Specify valid combinations of keywords on the command and try the command again.

System programmer response: Specify valid combinations of keywords on the command and try the command again.

Detecting Module: AIRAMINI
Routing Code: 2
Descriptor Code: 4

---

AIR016I A CHECK WITH NAME name | generic name WAS NOT FOUND.

Explanation: There are no PFA checks registered with the name or generic name specified.

In the message text:

- name
  - The check name specified.
- generic name
  - The generic check name specified.

System action: No checks could be displayed.

Operator response: Specify a check name or generic check name that matches a check registered by PFA and try the request again.

System programmer response: Specify a check name or generic check name that matches a check registered by PFA and try the request again.

Detecting Module: AIRAMINI
Routing Code: 2
Descriptor Code: 4

---
AIR019I  PFA UNABLE TO DEREGISTER element
WITH ARM RC=returncode
RSN=returncode

Explanation: PFA is unable to deregister with ARM.
In the message text:

- element: The element name.
- RC=returncode: The IXCARM return code.
- RSN=returncode: The IXCARM reason code.

System action: PFA continues to process STOP command. The Automatic Restart Manager (ARM) will, if possible, restart PFA after PFA stops.
Operator response: Cancel PFA or stop PFA until ARM no longer, restarts PFA.
System programmer response: Examine the message provided by the operator and determine the cause of the error.
Problem determination: For the IXCARM return and reason codes, see z/OS MVS Programming: Sysplex Services Reference.

Detecting Module: AIRAMINI, AIRAMMSG
Routing Code: 1, 2
Descriptor Code: 12

AIR020I  THE MODELINT PARAMETER MUST BE AT LEAST FOUR TIMES LARGER THAN THE COLLECTINT PARAMETER

Explanation: The MODELINT parameter was too small. The MODELINT parameter must be at least four times larger than the COLLECTINT parameter.
System action: The command is not processed and the check is disabled.
Operator response: Specify a value for the MODELINT parameter that is at least four times larger than the COLLECTINT parameter and try the command again.
System programmer response: Specify valid combinations of keywords on the command and try the command again.

Detecting Module: AIRHMCHK, AIRAMMSG
Routing Code: 2
Descriptor Code: 4

AIR021I  HZSCHECK MACRO CALL FOR element FAILED. RC=return code RSN=return code THE CHECK WAS DELETED.

Explanation: The call to HZSCHECK failed.
In the message text:

- element: The check name.
- RC=return code: The HZSCHECK return code.
- RSN=return code: The HZSCHECK reason code.

System action: The check was deleted. An ABEND and dump might accompany this message.
Operator response: Capture the dump, if one is issued. Notify your system programmer. In order to restart the check, PFA must be restarted.
System programmer response: Review the dump and LOGREC to identify the original error. Provide this information to your IBM Support representative.

Detecting Module: AIRHMCHK, AIRAMMSG
Routing Code: 2, 10
Descriptor Code: 4

AIR022I  REQUEST TO INVOKE MODELING FAILED FOR CHECK NAME=element UNIX SIGNAL RECEIVED=signalvalue EXIT VALUE=exitvalue

Explanation: The process used to perform modelling has failed.
In the message text:

- element: The check name.
- signalvalue: The signal returned by process used by modeling.
- exitvalue: The exit value returned from modeling code.

System action: The modeling did not complete successfully. The modeling will rerun at the next interval.
System programmer response: Review the signal and exit value. The signal value is the standard z/OS UNIX signal value.

Table 3. Exit values and meaning

<table>
<thead>
<tr>
<th>Exit value</th>
<th>Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Incorrect JAVAPATH statement in INI file.</td>
</tr>
<tr>
<td>4</td>
<td>Unable to read INI file.</td>
</tr>
</tbody>
</table>
Table 3. Exit values and meaning (continued)

<table>
<thead>
<tr>
<th>Exit value</th>
<th>Header</th>
</tr>
</thead>
<tbody>
<tr>

<td>Incorrect LIBPATH statement in INI file.</td>
</tr>
<tr>
<td>12</td>
<td>Unable to start JVM. See the system_name.launcher.log file.</td>
</tr>
<tr>
<td>16</td>
<td>Unexpected error on JNI statement. Contact your IBM Support representative.</td>
</tr>
</tbody>
</table>

Problem determination: See the topic on updating the JAVA path in z/OS Problem Management for the correct values.

Detecting Module: AIRHLJVM, AIRAMMSG

Routing Code: 2, 10

Descriptor Code: 4

---

AIR502I MAPREQ MACRO WAS INVOKED FROM UNAUTHORIZED CODE

Explanation: MAPREQ can not be processed because the requester lacks sufficient authority.

System action: MAPREQ terminated.

System programmer response: Install the code that invoked the MAPREQ macro in an authorized library.

Detecting Module: AIRMAPR

Routing Code: 11

Descriptor Code: 4

---

AIR503I MAPREQ MACRO WILL NOT RUN BECAUSE OF INSUFFICIENT SMS CAPABILITY

Explanation: MAPREQ can not be processed because the system lacks sufficient SMS capability.

In the message text:

System action: MAPREQ terminated.

System programmer response: Install a level of SMS code that is needed by the MAPREQ macro.

Detecting Module: AIRMAPR

Routing Code: 11

Descriptor Code: 4

---

AIR504I UNABLE TO CLOSE OUTPUT FILE FOR MAPREQ REQUEST FILE NAME = file-name ERRNO = errno ERRNOJR = errnojr

Explanation: MAPREQ was unable to close the z/OS UNIX file used to hold the output.

In the messages text:

file-name
The file name being used.

errno
The file name being closed failed with errno.

errnojr
The file name being closed failed with errnojr.

System action: Request was terminated.

Operator response: Notify the job submitter that the job failed.

User response: Correct the name of the z/OS UNIX system file and rerun.

System programmer response: Determine why MAPREQ was unable to close the z/OS UNIX file based on errno and errnojr.

Problem determination: For errno and errnojr descriptions, see z/OS UNIX System Services Messages and Codes.

Detecting Module: AIRMAPR

Routing Code: 11

Descriptor Code: 4
Routing Code: 11
Descriptor Code: 4

**AIR505I MAPREQ MACRO WAS UNABLE TO OPEN THE TRACE FILE SPECIFIED**

Explanation: MAPREQ can not be processed because the trace file specified can not be opened.

System action: MAPREQ terminated.

System programmer response: Update the JCL for the job that invoked MAPREQ macro to correctly specify the trace file.

Detecting Module: AIRMAPR
Routing Code: 11
Descriptor Code: 4

**AIR506I MAPREQ WAS UNABLE TO ESTABLISH AN ESTAE**

Explanation: MAPREQ can not be processed because an ESTAE can not be established.

System action: MAPREQ terminated.

System programmer response: Rerun the job that invoked MAPREQ, if it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMAPR
Routing Code: 11
Descriptor Code: 4

**AIR507I MAPREQ MACRO WAS UNABLE TO ESTABLISH AN ESTAE**

Explanation: MAPREQ can not be processed because the trace file specified can not be opened.

System action: MAPREQ terminated.

System programmer response: Rerun the job that invoked MAPREQ, if it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR508I CSVINFO issued by MAPREQ failed**

RETURN CODE = return_code REASON CODE = reason_code

Explanation: CSVINFO request issued by MAPREQ failed.

In the message text:

| return_code | Reason code from CSVINFO. |
| reason_code | Reason code from CSVINFO. |

System action: Request was terminated.

Operator response: Notify the job submitter that the job failed.

System programmer response: Determine why MAPREQ was unable to successfully issue CSVINFO using the return code and reason code return by CSVINFO.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR509I CSVINFO issued by MAPREQ FAILED INSUFFICIENT SPACE**

RETURN CODE = return_code REASON CODE = reason_code

Explanation: CSVINFO request issued by MAPREQ failed with insufficient space to contain list of all modules in LPA.

In the message text:

| return_code | Return code from CSVINFO. |
| reason_code | Reason code from CSVINFO. |

System action: Request ends before all modules were extracted from LPA.

Operator response: Notify the job submitter that the job failed.

System programmer response: Determine why MAPREQ was unable to successfully issue CSVINFO, insufficient space to hold all of the modules being extracted by CSVINFO.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR510I MAPREQ MACRO FAILED BECAUSE CSVINFO RETURNED NO ENTRIES FOR LPA**

Explanation: MAPREQ failed because CSVINFO returned no entries implying that LPA contains no modules.

System action: MAPREQ terminated.

System programmer response: Rerun the job that invoked MAPREQ, if it continues to fail, search problem reporting databases for a fix for the problem. If no fix
exists, contact the IBM Support Center.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR511I** MAPREQ MACRO FAILED INSUFFICIENT SPACE FOR ALL MODULES CONTAINED IN LPA

Explanation: MAPREQ failed because CSVINFO returned more modules contained in LPA than can be contained in MAPREQ tables.

System action: MAPREQ terminated, only portion of data returned.

System programmer response: Rerun the job that invoked MAPREQ. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR512I** UNABLE TO WRITE TO OUTPUT FILE FOR MAPREQ REQUEST FILE NAME = file-name ERRNO = errno ERRNOJR = errnojr

Explanation: MAPREQ failed because it was unable to write to the z/OS UNIX file used to hold the output.

In the messages text:

- **file-name**: The file name being used.
- **errno**: The write to file name failed with errno.
- **errnojr**: The write to file name failed with errnojr.

System action: Request was terminated.

Operator response: Notify the job submitter that the job failed.

User response: Correct the name of the z/OS UNIX system file and rerun.

System programmer response: Determine why MAPREQ was unable to create a Common area data space based on return code and reason code.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

**AIR513I** MAPREQ MACRO WAS UNABLE TO ESTABLISH AN ESTAE

Explanation: MAPREQ can not be processed because an ESTAE can not be established.

System action: MAPREQ terminated.

System programmer response: Rerun the job that invoked MAPREQ. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMPVT
Routing Code: 11
Descriptor Code: 4

**AIR514I** UNABLE TO CREATE A COMMON AREA DATA SPACE NEED BY MAPREQ, DSPSERV RETURN CODE = return_code REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to create the Common area data space.

In the message text:

- **return_code**: Return code from DSPSERV.
- **reason_code**: Reason code from DSPSERV.

System action: Request was terminated.

Operator response: Notify the job submitter that the job failed.

System programmer response: Determine why MAPREQ was unable to create a Common area data space based on return code and reason code.

Detecting Module: AIRMPVT
Routing Code: 11
Descriptor Code: 4

**AIR515I** UNABLE TO ADD COMMON AREA DATA SPACE NEED BY MAPREQ, ALESERV, DSPSERV RETURN CODE = return_code STOKEN = stoken

Explanation: MAPREQ failed because it was unable to add the common area data space to PASN.

In the message text:

- **return_code**: Return code from DSPSERV.
- **stoken**: The DSPSERV STOKEN.

System action: Request was terminated.
Operator response: Notify the job submitter that the job failed.

System programmer response: Determine why MAPREQ was unable to add a common area data space based on return code and STOKEN.

Detecting Module: AIRMPVT
Routing Code: 11
Descriptor Code: 4

AIR516I MAPREQ WAS UNABLE TO PROCESS A REQUEST TO EXTRACT INFORMATION FOR ADDRESS SPACE
= address_space TIMER INTERVAL = timer_interval

Explanation: MAPREQ failed because it was unable to process a request to extract information from an address space within a reasonable amount of time.

In the message text:

address_space
The address space id.

timer_interval
Timer interval.

System action: Request was terminated.

System programmer response: Determine why MAPREQ was unable to process a request to extract information from an address space.

Detecting Module: AIRMLPA
Routing Code: 11
Descriptor Code: 4

AIR517I MAPREQ WAS UNABLE TO PROCESS A REQUEST TO EXTRACT INFORMATION FOR ADDRESS SPACE, ASID = address_space ADDRESS SPACE NOT ACTIVE

Explanation: MAPREQ failed because it was unable to process a request to extract information from an address space because the address space is no longer active.

In the message text:

address_space
The address space id.

System action: Address space was skipped.

User response: Rerun the request with the correct list of address spaces.

System programmer response: None.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4

AIR518I MAPREQ WAS UNABLE TO PROCESS A REQUEST TO EXTRACT INFORMATION FOR ADDRESS SPACE
ASID = address_space RETURN CODE = return_code

Explanation: MAPREQ failed because it was unable to process a request to extract information from an address space. See return code for details.

In the message text:

address_space
Address space id.

return_code
Internal return code.

System action: MAPREQ request was terminated.

Operator response: Notify the job submitter that the job failed.

System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4

AIR519I MAPREQ SKIPPED REQUESTED ADDRESS SPACE INSUFFICIENT SPACE FOR ALL MODULES CONTAINED IN ADDRESS SPACE, ASID = address_space

Explanation: MAPREQ failed because CSVINFO returned more modules contained in address space than can be contained in MAPREQ tables. MAPREQ tries to process next address space.

In the message text:

address_space
Address space id.

System action: MAPREQ skips address space, only portion of data returned.

System programmer response: Rerun the job that invoked MAPREQ, if it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4
AIR520I MAPREQ MACRO FAILED BECAUSE CSVINFO RETURNED NO ENTRIES FOR ADDRESS SPACE, ASID=
address_space

Explanation: MAPREQ failed because CSVINFO returned no entries implying that the address space contains no modules.

In the message text:
address_space
Address space id.

System action: MAPREQ skips address space, only portion of data returned.

User response: Reissue MAPREQ request for the address spaces containing executable modules.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4

AIR521I MAPREQ WAS UNABLE TO PROCESS A REQUEST TO EXTRACT INFORMATION FOR ADDRESS SPACE, ASID = address_space, SYNCHCOMP VALUE = synchcomp, SYNCHCODE = synchcode, SYNCHRSN = synchrsn

Explanation: MAPREQ failed because it was unable to process a request to extract information from an address space. See return code for details.

In the message text:
address_space
Address space id.
synchcomp
SYNCHCOMP value code.
synchcode
SYNCHCODE value.
synchrsn
SYNCHRSN value.

System action: None.

System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4

AIR522I MAPREQ failed because CSVINFO for, ASID = address_space, RETURN CODE = return_code

Explanation: MAPREQ failed because CSVINFO returned a none zero return code.

In the message text:
address_space
Address space id.
return_code
CSVINFO return code.

System action: MAPREQ terminates.

System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4
AIR524I MAPREQ MACRO FAILED BECAUSE ATTACHX FAILED
Explanation: MAPREQ failed because ATTACHX failed. Unable to create subtask to process modules loaded into private storage.
System action: MAPREQ terminated.
System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Detecting Module: AIRMRVA
Routing Code: 11
Descriptor Code: 4

AIR525I MAPREQ MACRO FAILED INSUFFICIENT SPACE FOR ALL ENTRY POINTS CONTAINED IN THE NUCLEUS
Explanation: MAPREQ failed because number of entry points in nucleus can not be contained in MAPREQ tables.
System action: MAPREQ terminated, only portion of data returned.
System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Detecting Module: AIRMNUC
Routing Code: 11
Descriptor Code: 4

AIR526I MAPREQ MACRO FAILED RETURN CODE = return_code, REASON CODE = reason_code
Explanation: MAPREQ failed because CSVINFO returned a non-zero return code.
In the message text:
return_code
Return code.
reason_code
Reason code.
System action: MAPREQ terminates.
System programmer response: Rerun the program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Problem determination: For CSVINFO return and reason codes, see z/OS MVS Programming: Assembler Services Reference ABE-HSF.
Detecting Module: AIRMRVA

Routing Code: 11
Descriptor Code: 4

AIR550I MAPREQ WAS UNABLE TO ALLOCATE OUTPUT DATASET FOR BINDER DATA (STARTD) START DIALOG RETURN CODE = return_code, REASON CODE = reason_code
Explanation: MAPREQ was unable to allocate a data set or sysout to hold the information generated by IEWBIND request.
In the message text:
return_code
Return code.
reason_code
Reason code.
System action: MAPREQ terminates.
System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Detecting Module: AIRBIND
Routing Code: 11
Descriptor Code: 4

AIR551I MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND START DIALOG (STARTD) RETURN CODE = return_code, REASON CODE = reason_code
Explanation: MAPREQ failed because it was unable to execute the IEWBIND START DIALOG (STARTD) request.
In the message text:
return_code
Return code.
reason_code
Reason code.
System action: MAPREQ terminates.
System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Detecting Module: AIRBIND
Routing Code: 11
Descriptor Code: 4
AIR552I  MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND CREATE WORKAREA (CREATEW) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEWBIND CREATE WORKAREA (CREATEW) request.

In the message text:

return_code
Return code.

reason_code
Reason code.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRBIND
Routing Code: 11
Descriptor Code: 4

AIR553I  MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND RESET WORKAREA (RESETW) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEWBIND RESET WORKAREA (RESETW) request.

In the message text:

return_code
Return code.

reason_code
Reason code.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRBIND
Routing Code: 11
Descriptor Code: 4

AIR554I  MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND DELETE WORKAREA (DELETEW) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEWBIND DELETE WORKAREA (DELETEW) request.

In the message text:

return_code
Return code.

reason_code
Reason code.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRBIND
Routing Code: 11
Descriptor Code: 4

AIR555I  MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND START DIALOG (STOPD) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEWBIND START DIALOG (STOPD) request.

In the message text:

return_code
Return code.

reason_code
Reason code.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMCSTA
Routing Code: 11
Descriptor Code: 4

AIR556I  MAPREQ FAILED WHEN EXECUTING THE BINDER IEWBIND RETURN NAME (GETN) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEWBIND GET NAME (GETN) request.

In the message text:

return_code
Return code.

reason_code
Reason code.
System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMCSTA
Routing Code: 11
Descriptor Code: 4

AIR557I MAPREQ FAILED WHEN EXECUTING THE BINDER IEBIND GET ENTRY (GETE) RETURN CODE = return_code, REASON CODE = reason_code

Explanation: MAPREQ failed because it was unable to execute the IEBIND GET ENTRY (GETE) request.

In the message text:

return_code
Return code.
reason_code
Reason code.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMCSTA, AIRMCSTB
Routing Code: 11
Descriptor Code: 4

AIR558I MAPREQ FAILED INCONSTITENT ADDRESSES BETWEEN MODULE AND CSECT DATASET NAME = dataset_name, MEMBER NAME = member_name module_address csect_address

Explanation: MAPREQ failed because the addresses extracted using the CSECT data exceeded the address returned by CSVINFO.

In the message text:

dataset_name
Data set containing module.

member_name
Member name for which CSECT data is extracted.

module_address
Address of end of module.

csect_address
Address of end of CSECT.

System action: MAPREQ terminates.

System programmer response: Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: AIRMCSTA, AIRMCSTB
Routing Code: 11
Descriptor Code: 4

AIR560I MAPREQ FAILED WHEN EXECUTING THE BINDER IEBIND RETURN CODE = return_code, REASON CODE = reason_code PATHNAME = path_name

Explanation: MAPREQ failed because it was unable to execute the IEBIND INCLUDE (INCLUDE) request.

In the message text:

return_code
Return code.
reason_code
Reason code.

path_name
Path name.

System action: MAPREQ request skips processing specified executable.

System programmer response: Re-run program that
issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Detecting Module:** AIRMCSTB

**Routing Code:** 11

**Descriptor Code:** 4

**AIR561I** MAPREQ FAILED WHEN EXECUTING THE BINDER IEBBIND RETURN CODE = return_code, REASON CODE = reason_code DATASET NAME = dataset_name MEMBER NAME = member_name

**Explanation:** MAPREQ failed because it was unable to execute the IEBBIND INCLUDE (INCLUDE) request.

In the message text:

- `return_code`
  Return code.
- `reason_code`
  Reason code.
- `dataset_name`
  Data set name.
- `member_name`
  Member name.

**System action:** MAPREQ request skips processing specified executable.

**System programmer response:** Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Detecting Module:** AIRMCSTB

**Routing Code:** 11

**Descriptor Code:** 4

**AIR562I** MAPREQ FAILED WHEN EXECUTING THE BINDER IEBBIND INCORRECT ESD TYPE RETURNED, ESD TYPE = esd_type

**Explanation:** MAPREQ failed because it received incorrect information from an IEBBIND request.

In the message text:

- `esd_type`
  ESD type.

**System action:** MAPREQ request terminates.

**System programmer response:** Re-run program that issued the request. If it continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Detecting Module:** AIRMCSTB

**Routing Code:** 11

**Descriptor Code:** 4

**AIR563I** MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION PATHNAME WAS TOO LONG, LENGTH= pathname_length, PATHNAME = path_name

**Explanation:** MAPREQ failed because it was unable to process the CSECT information because the path name was too long.

In the message text:

- `pathname_length`
  Path name length.
- `path_name`
  Path name.

**System action:** MAPREQ request terminates.

**System programmer response:** Re-run program that issued the request and avoid requesting information on the failing CSECT or move the CSECT to a path name or filename that is less than 255 characters.

**Detecting Module:** AIRMCSTB

**Routing Code:** 11

**Descriptor Code:** 4

**AIR564I** MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION WAS TOO LONG CVAFFILT FAILED, VOLSER= volser, RETURN CODE= return_code CVSTAT= cvstat

**Explanation:** MAPREQ failed because it was unable to process the CSECT information because CVAFFILT failed.

In the message text:

- `volser`
  Failing volser.
- `return_code`
  Return code.
- `cvstat`
  CVSTAT

**System action:** MAPREQ request terminates.

**System programmer response:** Re-run program that issued the request and avoid requesting information on the failing CSECT or correct the reason that CVAFFILT was unable to process the VTOC.

**Detecting Module:** AIRMCSTB

**Routing Code:** 11

**Descriptor Code:** 4
AIR565I MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION CVAFFILT FAILED, VOLSER= volser, RETURN CODE= return_code CVSTAT= cvstat

Explanation: MAPREQ failed. It was unable to process the CSECT information because CVAFFILT(RESUME) failed.

In the message text:

volser
    Failing volser.

return_code
    Return code.

cvstat
    CVSTAT

System action: MAPREQ request terminates.

System programmer response: Re-run program that issued the request and avoid requesting information on the failing CSECT or correct the reason that CVAFFILT was unable to process the VTOC.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR566I MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION CVAFFILT FAILED, VOLSER= volser, RETURN CODE= return_code CVSTAT= cvstat

Explanation: MAPREQ failed. It was unable to process the CSECT information because it was unable to find the data set that contained the module.

In the message text:

volser
    Failing volser.

 executable
    Name of module.

System action: MAPREQ request skips processing this request.

System programmer response: Re-run program that issued the request and avoid requesting information on the failing CSECT.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR567I MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION FAILED, DATASET NAME= dataset_name VOLSER= volser S99ERROR= S99ERROR REASON CODE= reason_code

Explanation: MAPREQ failed. It was unable to process the CSECT information because it could not allocate the data set which contained the module.

In the message text:

volser
    Failing volser.

 S99ERROR
    S99ERROR.

reason_code
    Reason code.

System action: MAPREQ request skips processing this request.

System programmer response: Re-run program that issued the request and avoid requesting information on the failing CSECT.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4
AIR569I MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION DYNALLOC FAILED, S99ERROR=S99ERROR REASON CODE= reason_code PATHNAME= pathname

Explanation: MAPREQ failed because it was unable to process the CSECT information because it was unable to allocate the executable in the z/OS UNIX file system that contained the module.

In the message text:
S99ERROR
S99ERROR.

reason_code
Reason code.

pathname
Path name.

System action: MAPREQ request skips processing this request.

System programmer response: Re-run program that issued the request and avoid requesting information on the failing CSECT.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR601I MAPREQ MACRO OPTION WAS INCONSISTENT: NO EXECUTABLE IN PRIVATE WAS SELECTED, BUT SOME OR ALL CURRENT WAS ALSO SPECIFIED.

Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR570I MAPREQ WAS UNABLE TO EXTRACT CSECT INFORMATION DYNALLOC FAILED, S99ERROR=S99ERROR REASON CODE= reason_code

Explanation: MAPREQ failed because it was unable to process the CSECT information because it was unable to allocate the executable in the z/OS UNIX file system that contained the module.

In the message text:
S99ERROR
S99ERROR.

reason_code
Reason code.

System action: MAPREQ request skips processing this request.

System programmer response: Re-run program that issued the request and avoid requesting information on the failing CSECT.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR602I MAPREQ MACRO OPTION WAS INCONSISTENT: NO EXECUTABLE IN PRIVATE WAS SELECTED, BUT SOME OR CURRENT WAS ALSO SPECIFIED.

Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR603I MAPREQ MACRO OPTION WAS INCONSISTENT: NO EXECUTABLE IN PRIVATE WAS SELECTED, BUT SOME WAS ALSO SPECIFIED.

Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR604I MAPREQ MACRO OPTION WAS INCONSISTENT: ADDRESS OF EXECUTABLE FOR SOME ADDRESS SPACES WAS SPECIFIED, BUT LIST OF ADDRESS SPACES WAS NOT USABLE (JOBNAME OR ASID).
Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR605I MAPREQ MACRO OPTION WAS INCONSISTENT: ADDRESS OF EXECUTABLE FOR SOME ADDRESS SPACES WAS SPECIFIED, BUT LIST OF ADDRESS SPACES WAS NOT USABLE (ASID).

Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR606I MAPREQ MACRO OPTION WAS INCONSISTENT: ADDRESS OF EXECUTABLE FOR SOME ADDRESS SPACES WAS SPECIFIED, BUT LIST OF ADDRESS SPACES WAS NOT USABLE (JOBNAME).

Explanation: MAPREQ can not be processed because an incorrect combination of options was requested.

System action: MAPREQ terminated.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMCST
Routing Code: 11
Descriptor Code: 4

AIR615I MAPREQ MACRO OPTIONS REQUESTED A DUPLICATE ADDRESS SPACE. JOBNAME = job_name

Explanation: MAPREQ can not process the job name requested because it duplicated an already processed address space.

In the messages text:
job_name
Duplicate job name.

System action: MAPREQ skips processing duplicate address space.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMSET
Routing Code: 11
Descriptor Code: 4

AIR616I MAPREQ MACRO OPTIONS REQUESTED A JOB NAME WHICH WAS NOT FOUND. JOBNAME = job_name

Explanation: MAPREQ can not process the job name requested because it was not for a currently active address space.

In the messages text:
job_name
Duplicate job name.

System action: MAPREQ skips processing job name request that was not found.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMSET
Routing Code: 11
Descriptor Code: 4

AIR617I MAPREQ MACRO OPTIONS REQUESTED A DUPLICATE ADDRESS SPACE. ASID = asid

Explanation: MAPREQ can not process the job name requested because it duplicated an already processed address space.

In the messages text:
asid
Duplicate address space id.

System action: MAPREQ skips processing the duplicate address space.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMSET
Routing Code: 11
Descriptor Code: 4
AIR618I  MAPREQ MACRO OPTIONS REQUESTED AN ADDRESS SPACE WHICH WAS NOT FOUND. ASID = asid

Explanation: MAPREQ can not process the job name requested because it was not for a currently active address space.

In the messages text:

asid

the address space that was not found.

System action: MAPREQ skips processing the job name request that was not found.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMSET

Routing Code: 11

Descriptor Code: 4

AIR619I  MAPREQ MACRO REQUEST WAS INCONSISTENT BOTH OPTION AND DATAONLY KEYWORDS WERE SPECIFIED ASID = asid

Explanation: MAPREQ can not process the request because both the DATAONLY and OPTIONS keyword were specified.

System action: MAPREQ stops processing because of inconsistent keywords.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMREQ

Routing Code: 11

Descriptor Code: 4

AIR620I  MAPREQ MACRO LENGTH OF OUTPUT FILENAME IS ZERO

Explanation: MAPREQ can not process the job name requested because it was not for a currently active address space.

In the messages text:

System action: MAPREQ stops processing the job name request because the output file name length is zero.

System programmer response: Correct request and reissue MAPREQ request.

Detecting Module: AIRMREQ

Routing Code: 11

Descriptor Code: 4
Chapter 9. AMA messages

AMA100I  AMASPZAP PROCESSING COMPLETED

Explanation: This message occurs when SPZAP processing ends normally. It should be noted, however, that normal ending can occur despite prior failure in the processing of control statements.

System action: The job step ends.

System programmer response: Check the SYSPRINT output to ensure that all control statement operations completed successfully.

Source: SPZAP
Detecting Module: AMASZIOR
Routing Code: 2
Descriptor Code: 5

AMA101I  SYSLIB I/O ERROR ddd, opr, err, access-method

Explanation: An I/O error occurred when the data set defined in the SYSLIB DD statement was being accessed.

In the message text:

ddd The device address.
opr The operation in process.
err The error type.
access-method The access method in use.

System action: The job step ends.

System programmer response: If VERIFY and REP control statements were part of the input stream for SPZAP, bypass either the record or control section being inspected and/or modified, and carefully check the printed output to ensure that any modifications were performed correctly. If all the modifications requested have not been performed, rerun the SPZAP program to make the necessary modifications.

Source: SPZAP
Detecting Module: AMASZIOR
Routing Code: 2
Descriptor Code: 5

AMA102I  SYSLIB DD SPECIFICATION ERROR

Explanation: The data set defined in the SYSLIB DD statement does not contain the member name or physical record defined in a control statement, or the NAME statement identifies a member of a partitioned data set (PDS) that is not a load module created by the linkage editor.

System action: Subsequent VERIFY, REP, and SETSSI statements are ignored until a successful NAME or CCHHR operation is performed.

System programmer response: Correct the member name or address in the control statement or correct the DSNAME in the SYSLIB DD statement, and rerun the job. If the CONSOLE option is being utilized, the job need not be rerun; the corrected statement can be reentered in response to message AMA116A. If the volume table of contents (VTOC) is being opened for update, make sure that SPZAP resides in SYS.LINKLIB or SYS1.LPALIB with an access code of 1.

Source: SPZAP
Detecting Module: AMASZIOR
Routing Code: 2
Descriptor Code: 5

AMA103I  CSECT ABSENT - ALL CSECTS FOLLOW

Explanation: A control section name defined in a control statement cannot be found in the specified member.

System action: All control sections of the load module are dumped. Subsequent VERIFY or REP statements are ignored until a NAME or CCHHR statement is read.

System programmer response: Correct the control section parameter in the control statement, and rerun the job. If the CONSOLE option is being utilized, the job need not be rerun; the corrected statement can be reentered in response to message AMA116A.

Source: SPZAP
Detecting Module: AMASZIOR
Routing Code: 2
Descriptor Code: 5

AMA104I  VERIFY REJECT - SET NO GO SWITCH

Explanation: The data contained in the VERIFY statement did not agree with the data at the specified location.

System action: A dump of the text portion of the control section or the entire data record is printed in SYSPRINT listing. Processing continues, but all REP and SETSSI statements that follow the rejected VERIFY statement are ignored until another NAME or CCHHR statement is encountered. However, any VERIFY statements that are detected will be processed.
AMA105I  INVALID CARD OR NO GO SWITCH SET

Explanation:  This message indicates that the requested operation cannot be performed. Either:

- The operation name or one (or more) of the parameters is not valid. For example, a parameter value might contain characters other than valid hexadecimal characters.
- An error occurred on a previous operation preventing the current operation.

System action:  If an error occurred processing a NAME or CCHHR statement in an earlier operation, no VERIFY or REP operations will be performed until a NAME, CCHHR, DUMP, DUMPT, ABSDUMP, or ABSDUMPT statement is processed successfully. If the error occurred in a previous VERIFY or REP statement, only REP statements will be bypassed until a NAME or CCHHR statement is performed successfully.

System programmer response:  Correct the control statement in error, then rerun the job.

Source:  SPZAP
Detecting Module:  AMASPZAP
Routing Code:  2
Descriptor Code:  5

AMA107I  DS AREA NOT INCLUDED IN TEXT

Explanation:  A VERIFY or REP operation was attempted, and the base value specified in a BASE statement was greater than the offset value specified in a corresponding VERIFY or REP statement.

System action:  The SPZAP program dumps the data in the control section being modified or inspected and continues processing subsequent control statements. However, any REP statements pertaining to the same NAME or CCHHR statement will be ignored.

System programmer response:  If a REP operation was being performed on a control section when the error occurred, check the offset and data parameters.

If the offset is within the limits of the control section, but the number of bytes specified exceeds the end of the control section, the portion of data that fell within the control section will have been modified before the error was detected. Restore the data to its original form, correct the number of bytes specified in the REP statement, and perform the REP operation again.

If the offset in the REP statement exceeded the limits of the control section, then no data will have been modified. In this case, correct the offset specified in the REP statement and perform the REP operation again.

If a VERIFY operation was being performed on a control section or data record, or if a REP operation was being performed on a data record at the time the error was detected, no data will have been modified. Correct the offset or number of bytes specified in the control statement (whichever was in error), and perform the operation again.

AMA109I  ERROR - ODD NUMBER DIGITS - IGNORED
Explanation:  This message occurs if the patch data, verify data or data offset specified in a VERIFY or REP control statement is not represented as an even number of hexadecimal digits.
System action:  If the error results from an incorrect VERIFY statement, any REP statements that follow are ignored until a subsequent NAME, CCHHR, DUMP, Dumpt, ABSDUMP, or ABSDUMPT command is entered. If the error is detected in a REP statement, only that particular statement is ignored.
System programmer response:  Make sure that an even number of hexadecimal digits is specified in the offset and data parameters in the VERIFY or REP statement, and rerun the job.

AMA110I  NO DIRECTORY SSI - SETSSI IGNORED
Explanation:  A SETSSI statement has been entered for a member which does not contain SSI information in its directory entry.
System action:  No SSI information is stored; processing continues with the next control statement.
System programmer response:  To create the SSI in the directory entry for the member:
  • If a member of a load module library, re-link-edit the load module, including a SETSSI control statement.
  • If a member of a macro or symbolic library, use the IEBUPDTE utility program, specifying SSI information in the ADD, REPL, CHANGE or REPRO control statement.

AMA115I  SYSIN I/O ERROR  ddd,opr,err, access-method

Explanation:  An I/O error that could not be corrected occurred when SPZAP attempted to read a control statement from the SYSIN data set.

In the message text:

dd  The device address.
opr  The operation in process.
er  The error type.
access-method  The access method in use.

System action:  Processing ends immediately. Control statements read from the SYSIN data set before the error was encountered will have been processed.

System programmer response:  If the error condition is a wrong length record, check the blocksize specified for the SYSIN data set to be sure that it is equal to the actual size of the records in the SYSIN data set. For other error conditions, check the SYSIN DD statement for correct specifications.

AMA121I  CCHHR UPDATE BY jobname ON volser,cchhr,dsname

Explanation:  SPZAP has modified a data set on a direct access device (DASD) by use of the CCHHR and REP statements.  This message is automatically given as security audit information.

In the message text:
jobname  The name of the job which performed the CCHHR update.
volser  The volume serial number of the direct access device containing the modified data set.
cchhr  The device record address of the record that was modified.
dsname  The name of the modified data set.

If SPZAP input is from the system console and both CCHHR and REP statements have been processed, then this message will appear immediately after the next CCHHR, NAME, DUMP, AESDUMP, END, or incorrect statement entered.

System action:  Normal processing continues.

Operator response:  Save the information as recommended by your installation.

Detecting Module: AMASZIOR
Routing Code: 2
Descriptor Code: 5

AMA135I  NO CORE TO DUMP ALL OF member
Explanation: SPZAP processing tried to dump all of the load modules identified in the message text, but there was not enough storage available to build an internal CSECT table. SPZAP tries to dump an entire load module in response to one of the following:
- A DUMP control statement that specifies ALL for the CSECT parameter.
- A DUMP control statement that specifies an incorrect CSECT name.
- A NAME control statement that specifies an incorrect CSECT name.
In the message text:

**member**

The name of the load module.

**System action:** The SPZAP program ignores the control statement that caused the dump request. If the control statement was a NAME statement, SPZAP ignores any associated VER or REP statements. SPZAP continues processing any subsequent control statements.

**System programmer response:** Correct any incorrect CSECT names on the control statements and rerun the job, specifying a larger region size.

**Source:** SPZAP

**Detecting Module:** AMASPZAP

**Routing Code:** 2

**Descriptor Code:** 5

---

**AMA136I**

**FIRST 32K BYTES OF RECORD DUMPED**

**Explanation:** During ABSDUMP processing, SPZAP encountered a record that is at least 32,767 bytes long. SPZAP cannot determine whether the record is exactly 32,767 bytes long or if the record exceeds that length. The dump displays the first 32,767 bytes of the record.

**System action:** ABSDUMP processing continues.

**System programmer response:** If you want a dump of the entire record, enter a CCHHR statement for the address of the record and then intentionally fail a VERIFY request on some data in the first 32 kilobytes of the record. The system will issue message AMA104I and dump the entire record.

**UNABLE TO COMPLETE OPERATION DUE TO BINDER ERROR, FUNCTION = \( \textit{function\_name} \), RC = \( \textit{return\_code} \), RSN = \( \textit{reason\_code} \)**

**Explanation:** The binder function indicated in the message failed. The return code and reason code of failed function are displayed.

The severity is 16.

**System action:** Subsequent VERIFY, REP, SETSSI statements are ignored until a successful NAME or CCHHR operation is encountered.

**User response:** Report any non-user errors.

**System programmer response:** Check for the binder-related problem.

**Source:** IGWSPZAP

---

**AMA142I**

**A SECTION NAME MUST BE SUPPLIED FOR A PROGRAM OBJECT**

**Explanation:** A control section name is not supplied in a control statement to perform REP on a program object.

The severity is 08.

**System action:** Subsequent VERIFY, REP, SETSSI statements are ignored until a NAME or CCHHR statement is encountered.

**User response:** Provide correct control section name in the control statement.
System programmer response: Execute AMBLIST Service Aids or other program to determine control section names in a program object.

Source: IGWSPZAP

AMA143I IDRDATA IGNORED

Explanation: This message indicates that the user specified IDRDATA is ignored because the REP operation was not successfully performed.

The severity is 00.

System action: The IDRDATA statement is ignored. The system continues processing.

User response: Correct the REP statement.

System programmer response: Check for presence and successful completion of REP statement preceding IDRDATA statement.

Source: IGWSPZAP

AMA144I COMMAND OUT OF PROPER SEQUENCE

Explanation: This message indicates that the requested operation cannot be performed due to absence of a required operation prior to this operation.

It be received when BASE statement is not immediately preceded by a NAME statement or when BASE statement is invalid for the kind of data set being processed.

The severity is 08.

System action: The statement is ignored.

User response: Correct the prior failing statement.

System programmer response: Check for presence of a required VERIFY, REP, NAME, CCHHR or other statement prior to this statement.

Source: IGWSPZAP

AMA145I SETSSI ERROR. NO-GO SWITCH SET

Explanation: The SSI information in SETSSI statement had more or less than the required eight hex digits.

The severity is 08.

System action: Message AMA125I is issued for the previous successful REP statement. REP, SETSSI, IDRDATA which follow are inhibited until the next NAME or CCHHR statement.

User response: Correct the SSI information in the SETSSI statement.

System programmer response: Check the length and the content of SSI information in the SETSSI statement.

Source: IGWSPZAP

AMA148I MEMBER DOES NOT CONTAIN REQUESTED SECTION

Explanation: The CSECT name specified on the previous NAME statement was not found in the requested member.

The severity is 8.

System action: A dump of the entire member is printed. Subsequent VERIFY, REP, and SETSSI statements are ignored until a NAME or CCHHR control statement is encountered.

User response: Check the dump output and change the CSECT name or member name, whichever is appropriate, in the failing control statement.

Source: IGWSPZAP

AMA149I OFFSET TO SECTION IS GREATER THAN SIZE OF BLOCK READ INTO BUFFER

Explanation: The offset of the CSECT being dump is beyond the record length of the data set.

The severity is 08.

System action: The program continues processing subsequent control statements.

User response: Correct the control section of the load module.

System programmer response: Dump the specific control section or the entire load module using DUMP(T) statement to verify the load module. Run AMBLIST Service Aid or other utility program to validate the load module.

Source: IGWSPZAP

AMA150I SYSLIB CONTAINS NO MEMBERS.

Explanation: The data set defined in the SYSLIB DD statement is empty.

The severity is 04.

System action: Subsequent statements are ignored until a CCHHR statement is encountered.

User response: Correct SYSLIB DD statement and resubmit the job.

System programmer response: Verify that the data set contain members by running IEHLIST program with LISTPDS control statement or other utility programs.

Source: IGWSPZAP

Chapter 9. AMA messages 287
AMA151I  MEMBER NOT FOUND IN SYSLIB.

**Explanation:** The data set defined in the SYSLIB DD statement does not contain the member name defined in a control statement.

The severity is 04.

**System action:** Subsequent VERIFY, REP, and SETSSI statements are ignored until a NAME or CCHHR statement is encountered.

**User response:** Correct the member name in the control statement or correct the DSNAME in the SYSLIB DD statement, and rerun the job.

**System programmer response:** Verify that the member does exist in the specified library.

**Source:** IGWSPZAP

AMA152I  NO TEXT DATA FOR REQUESTED CLASS FOR THIS SECTION.

**Explanation:** The program management binder class-name associated with this DUMP or DUMPT request contained no data. The severity is 8.

**System action:** Processing continues with the next CSECT, if any.

**User response:** This is a normal condition if the dump request specified a class-name that is valid but happens to contain no data in the CSECT indicated. It is also possible that the class-name requested did not exist in the member or CSECT indicated.

**System programmer response:** Check SYSLIB data set.

**Source:** IGWSPZAP

AMA153I  WARNING! MULTI-VOLUME DATASET FOR SYSLIB IS NOT SUPPORTED

**Explanation:** Only the data from the first volume of the multi-volume non-pdse load module for SYSLIB will be displayed using DUMP(T) or ABSDUMP(T) command.

The severity is 08.

**System action:** The program continues with normal processing.

**User response:** None

**System programmer response:** Check for number of volumes allocated for the SYSLIB data set.

**Source:** IGWSPZAP

AMA154T  BUFFER SPACE NOT AVAILABLE - INCREASE REGION SIZE

**Explanation:** The IGWSPZAP or binder was unable to obtain necessary GETMAIN storage.

The severity is 16.

**System action:** The job or the step specifying the region size is terminated.

**User response:** Increase the region size and resubmit the job.

**System programmer response:** Verify that the specified IGWSPZAP REGION value is at least set to the value recommended in [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/support/knowledgecenter/ST40WM_1.8.1/com.ibm.zos.v1r11.mvsbooks.zip/diag435/preface.html).

**Source:** IGWSPZAP
AMA160I  PREVIOUS LINE CONTINUED, BUT END-OF-FILE ENCOUNTERED

Explanation: A control statement contained an non-blank character in column 72, but there were no more records in the SYSIN data set.

The severity is 4.

System action: Processing of this control statement will be terminated and IGWSPZAP will terminate normally.

User response: Change the last statement to remove the non-blank value in column 72. If the statement was to be continued, supply the continued statement and resubmit the job.

Source: IGWSPZAP

AMA161I  INVALID HEX DATA, NO GO SWITCH SET

Explanation: A field containing hexadecimal data on the card either:

1. Started or ended with a comma (",")
2. Contained two successive commas (",,")
3. Contained a character other than 0 through 9 and A through F

The severity is 8.

System action: Processing of this control statement will be terminated.

User response: Change the control statement to supply a valid hexadecimal string.

Source: IGWSPZAP

AMA162I  HEX DATA IS LONGER THAN MAXIMUM, NO GO SWITCH SET

Explanation: A field containing hexadecimal data on the control statement exceeded 71 characters, including any embedded commas.

The severity is 8.

System action: Processing of this control statement will be terminated.

User response: Change the control statement to supply a valid hexadecimal string less than 72 characters in length.

Source: IGWSPZAP

AMA163I  PREVIOUS GROUP ENDED, ASSOCIATED MESSAGES FOLLOW:

Explanation: A control statement that begins a new group has been encountered (NAME, DUMP, DUMPT, CCHHR, end-of-file, or an invalid statement) and the previous control statement group needs to complete processing. Any messages associated with this processing will be listed following this message. The most common message is AMA125I.

System action: Processing continues normally.

User response: None - this message is simply to indicate that any messages that follow should be associated with the control statement group just ended, not for the control statement this message immediately follows. Message AMA164I will be displayed after the last message for the previous group.

Source: IGWSPZAP

AMA164I  END OF MESSAGES FOR PREVIOUS GROUP

Explanation: After the last message is written for the completion of processing of a previous group, this message is displayed. It indicates any messages from this point on refer to the processing of the group whose control statement precedes message AMA163I.

System action: Processing continues normally.

User response: None - this message indicates that any messages that follow are associated with the processing of the control statement group that starts with the statement before message AMA163I.

Source: IGWSPZAP

AMA165I  UPDATE PERFORMED ON SIGNED MODULE

Explanation: The target module is signed (PMAR_SIGNED set in the directory attributes). Zapping of such a module results in the fact that the digital signature no longer matches with the module. Thus the module is no longer usable if the digital signature verification (SIGVER) failure is set to cause Contents Supervision to fail the load.

System action: Processing continues.

User response: To continue to use this module, change the SIGVER segment of the RACF PROGRAM class profile that protects this program to specify FAILLOAD(NEVER).

Source: IGWSPZAP
AMA500E  INVALID PARAMETER - input parameter
Explanation: The AMATERSE program was invoked with the specified input parameter that is not a valid option for invoking AMATERSE. An accompanying message AMA501I is issued to display the valid options.
System action: The AMATERSE program ends.
User response: See the accompanying message AMA501I for valid options. Supply a valid parameter and rerun AMATERSE.
System programmer response: None.
Source: AMATERSE
Detecting Module: AMATERSE
Routing Code: N/A
Descriptor Code: N/A

AMA501I  VALID PARAMETERS ARE: SPACK, PACK, OR UNPACK.
Explanation: The valid parameters for invoking AMATERSE are displayed. This message is issued with message AMA500E.
System action: None.
User response: None.
System programmer response: None.
Source: AMATERSE
Detecting Module: AMATERSE
Routing Code: N/A
Descriptor Code: N/A

AMA502E  TWO OR MORE DDNAMES ARE THE SAME:
Explanation: The AMATERSE program was invoked with the same ddnames allocated to two or more INPUT, OUTPUT, or SYSPRINT data sets. An accompanying message AMA503I is issued to display the ddnames.
System action: The AMATERSE program ends.
User response: Change the duplicate ddnames. The ddname for an INPUT, OUTPUT or SYSPRINT data set should be unique.
System programmer response: None.
Source: AMATERSE
Detecting Module: AMATERSE
Routing Code: N/A

Descriptor Code: N/A
AMA506I  storarea ATTEMPT TO GET:
attemptedlen OBTAINED: obtainedlen AT:
startaddr

Explanation:  This message is displayed with the AMA505E message to show more details of the failed request for storage.

In the message text:

storarea  
The storage where the request failed, which is one of the following area:

   WORKSTOR  
   Buffer for work area

   INBUF  
   Buffer to read records from input data set

   OUTBUF  
   Buffer to write records to output data set

attemptedlen  
The storage length requested.

obtained-len  
The storage length obtained.

startaddr  
The address from which the obtained storage started.

System action:  None.

User response:  Use the length information to determine the region size.

System programmer response:  None.

AMA561E  OUTPUT DATASET SPECIFIED IS UNSUPPORTED.

Explanation:  The output data set specified for the UNPACK option is not a sequential or partitioned data set.

System action:  AMATERSE processing ends.

User response:  Allocate the output data set with the same characteristics as the original packed data set and rerun AMATERSE.

System programmer response:  None.

Source:  AMATERSE

Detecting Module:  AMADECS

Routing Code:  N/A

Descriptor Code:  N/A

AMA559E  ORIGINAL UNTERSED DATASET WAS SEQUENTIAL - OUTPUT DATASET IS PDS.

Explanation:  The output data set specified for UNPACK operation is a partitioned data set. However, the original data set compressed with PACK or UNPACK is a sequential data set. The output data set must have the same characteristics as the original data set.

System action:  AMATERSE processing ends.

User response:  Allocate the output data set as sequential and rerun AMATERSE.

System programmer response:  None.

Source:  AMATERSE

Detecting Module:  AMADECS

Routing Code:  N/A

Descriptor Code:  N/A

AMA562E  THE LRECL OF THE INPUT DATASET HAS TO BE 1024

Explanation:  The input data set specified for the UNPACK option has a record length other than 1024. For UNPACK, the record length of the input data set must be 1024.

System action:  AMATERSE processing ends.

User response:  Supply an input data set with the record length 1024.

System programmer response:  None.

Source:  AMATERSE

Detecting Module:  AMADECS

Routing Code:  N/A

Descriptor Code:  N/A

AMA563E  THE RECORD FORMAT OF THE INPUT DATASET HAS TO BE FIXED OR FIXED BLOCKED

Explanation:  The input data set specified for the UNPACK option has an unsupported record format. For UNPACK, the record format of the input data set must be fixed or fixed blocked.

System action:  AMATERSE processing ends.

User response:  Supply an input packed data set with the correct record format.

System programmer response:  None.

Source:  AMATERSE

Detecting Module:  AMADECS
AMA564E THIS IS NOT A RECOGNIZABLE TERSED DATASET.

Explanation: The input data set specified for the UNPACK option is not compressed with PACK or SPACK. This message is also displayed with message AMA557E, AMA562E or AMA563E.

System action: AMATERSE processing ends.

User response: See the user response for message AMA557E, AMA562E, or AMA563E if any of them is issued with this message. Otherwise, compress the original data set with the PACK or SPACK option and rerun AMATERSE UNPACK.

Source: AMATERSE

Detecting Module: AMADECS

Routing Code: N/A

Descriptor Code: N/A

AMA565E UNABLE TO LOAD THE UNTERSED PDS

Explanation: AMATERSE encountered an error while loading the partitioned data set from the temporary data set. This message is also displayed with message AMA575E, AMA576E, AMA577E, AMA578E or AMA579E.

System action: AMATERSE processing ends.

User response: See the user response for message AMA575E, AMA576E, AMA577E, AMA578E or AMA579E if any of them is issued with this message. Otherwise, increase the region size if you invoke AMATERSE from a JCL job, or allocate the temporary data set with sufficient space if you invoke AMATERSE from another program. Then rerun AMATERSE.

System programmer response: None.

Chapter 10. AMB messages

AMB101I  ESD CONTAINS INVALID DATA

Explanation: A list service aid encountered either an incorrect ESD type or an incorrect ESDID.

System action: If the LISTOBJ function of AMBLIST is being used, the incorrect control statement is printed and processing continues. Otherwise, processing ends for this operation.

System programmer response: Recompile the modules, and rerun the job. If the problem occurred during processing of LISTOBJ, run the LISTIDR function of AMBLIST to determine which compiler processed the module. If the problem occurred during processing of LISTLOAD, run the LISTIDR function of AMBLIST to determine which linkage editor produced the load module.

Source: List service aids
Detecting Module: HMBLKKXF
Routing Code: Note 11
Descriptor Code: -

AMB102I  INVALID [LOAD/OBJECT] RECORD

Explanation: A list service aid detected an undefined record type in the load/object records. For object records, byte positions do not contain any of the following types: ESD, SYM, TXT, RLD, or END. For load module records, the hexadecimal code in the first byte of the record is incorrect or undefined.

System action: If the record in question is from an object module, it will be printed. Processing will continue. If the record in question is from a load module, processing will end for the current control statement and resume with the next.

System programmer response: List the load module using the IEBPTPCH data utility specifying PRINT TOTCONV=XE to determine the nature of the faulty record. If it has been incorrectly modified, restore it to its correct format.

Run the list service aid program to obtain IDR listings for the module and for all programs which have modified it.

Source: List service aids
Detecting Module: HMBLKKOBJ
Routing Code: Note 11
Descriptor Code: -

AMB103I  RLD POINTER INVALID

Explanation: A list service aid encountered an incorrect R or P pointer in the relocation dictionary (RLD).

System action: Processing ends for this operation and continues with the next control statement.

System programmer response: Link-edit the program again and rerun the job.

Run the LISTOBJ function to determine which linkage editor or language translator produced the bad R or P pointer. Run LISTIDR for IDR data, showing if SPZAP has been run for the module, when and what translators were used, and other user supplied data.

Source: List service aids
Detecting Module: HMBLKKXF
Routing Code: Note 11
Descriptor Code: -

AMB104I  TABLE OVERFLOW, ENLARGE REGION SIZE AND RERUN

Explanation: The list service aids table capacities were exceeded because the partition size was insufficient.

System action: The operation ends; processing continues with the next control statement.

System programmer response: Enlarge the partition size, and rerun the job.

Run the IEBPTPCH utility program specifying PRINT TOTCONV=XE to list the module being processed by the list service aid.

**Detecting Module:** HMBLKCTL

---

**AMB165I** LONG NAME FOUND AND IGNORED NAME: member_name

**Explanation:** Either a primary or alias name longer that is supported on this level of DFSMS system has been encountered and ignored by DIRECTORY SERVICES. This is most likely an PDSE program object library where some were created on a DFSMS 1.3 or later system that contains long primary or alias name.

**System action:** Processing continues.

**User response:** Make sure the length of the listed member name (primary or alias) is within limit on this level of DFSMS system, and this is a version one program object.

**System programmer response:** If the problem recurs and the program is not in error, search problem data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** AMBLIST

**Detecting Module:** HMBLKCTL

---

**AMB166I** PDS MEMBER NAME LONGER THAN 8 CHARACTERS: load_module_name

**Explanation:** Member name or alias name exceeds the 8 bytes limitation for a PDS load module. Up to 8 characters member name or alias name is printed.

**System action:** Processing terminates for this operation and continues with the next control statement. (The AMBLIST return code is 8.)

**User response:** If the member name is too long, shorten the name specified and rerun the job.

**Source:** AMBLIST

**Detecting Module:** HMBLKCTL

---

**AMB167I** INSUFFICIENT STORAGE TO PROCESS THIS PDSE PROGRAM LIBRARY - INCREASE REGION SIZE FOR module_id

**Explanation:** The AMBLIST PDSE buffer space was exceeded because the region size was insufficient.

**System action:** Processing terminates for this operation and continues with the next control statement. (The AMBLIST return code is 8.)

**User response:** Verify that the specified AMBLIST REGION value is at least set to the value recommended in [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com). Increase the region size and rerun the job.

**Source:** AMBLIST

**Detecting Module:** HMBLKCTL, HMBLBDLM, HMBLBIDR, HMBLBXRF

---

**AMB168I** AMBLIST LOGIC ERROR

**Explanation:** While processing the text data, a possible logic error is encountered, either in the BINDER GETD function call or AMBLIST. Since one of the two components has encountered more text data than the actual section length.

**System action:** Processing terminates for this operation and continues with the next control statement. (The AMBLIST return code is 8.)

**User response:** Contact your system programmer.

**System programmer response:** If the problem recurs and the program is not in error, search problem data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the module name and the output from the failing job.

**Source:** AMBLIST

**Detecting Module:** HMBLBDLM
**Explanation:** An ESD record was found that did not contain a valid ESD type. A dump of the ESD entry in error follows the message.

**System action:** Processing of the ESD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 8.)

**User response:** Examine the output dump of the ESD entry in error, and verify the ESD type. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM

**Explanation:** An ESD record was found that did not contain a valid ESD status. A dump of the ESD entry in error follows the message.

**System action:** Processing of the ESD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

**User response:** Examine the output dump of the ESD entry in error, and verify the ESD status. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM

**Explanation:** An ESD record was found that did not contain a valid ESD autocall. A dump of the ESD entry in error follows the message.

**System action:** Processing of the ESD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

**User response:** Examine the output dump of the ESD entry in error, and verify the ESD autocall. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM

**Explanation:** An ESD record was found that did not contain a valid ESD AMODE. A dump of the ESD entry in error follows the message.

**System action:** Processing of the ESD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

**User response:** Examine the output dump of the ESD entry in error, and verify the ESD AMODE. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM

**Explanation:** An RLD record was found that did not contain a valid RLD adcon direction. A dump of the RLD entry in error follows the message.

**System action:** Processing of the RLD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

**User response:** Examine the output dump of the RLD entry in error, and verify the RLD adcon direction. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM

**Explanation:** An RLD record was found that did not contain a valid RLD type. A dump of the RLD entry in error follows the message.

**System action:** Processing of the RLD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

**User response:** Examine the output dump of the RLD entry in error, and verify the RLD type. Rerun the job after appropriate correction.

**Source:** AMBLIST

**Detecting Module:** HMBLBLDM
AMB176I  INVALID RLD ADCON LENGTH. DUMP OF ESD ENTRY FOLLOWS.

Explanation: An RLD record was found that did not contain a valid RLD adcon length. A dump of the RLD entry in error follows the message.

System action: Processing of the RLD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

User response: Examine the output dump of the RLD entry in error, and verify the RLD adcon length. Rerun the job after appropriate correction.

Source: AMBLIST
Detecting Module: HMBLBLDM

AMB177I  INVALID RLD ADCON BOUNDARY. DUMP OF ESD ENTRY FOLLOWS.

Explanation: An RLD record was found that did not contain a valid RLD adcon boundary. A dump of the RLD entry in error follows the message.

System action: Processing of the RLD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

User response: Examine the output dump of the RLD entry in error, and verify the RLD adcon boundary. Rerun the job after appropriate correction.

Source: AMBLIST
Detecting Module: HMBLBLDM

AMB178I  INVALID RLD ADCON STATUS. DUMP OF ESD ENTRY FOLLOWS.

Explanation: An RLD record was found that did not contain a valid RLD adcon status. A dump of the RLD entry in error follows the message.

System action: Processing of the RLD operation terminates. Processing continues with the next operation. (The AMBLIST return code is 4.)

User response: Examine the output dump of the RLD entry in error, and verify the RLD adcon status. Rerun the job after appropriate correction.

Source: AMBLIST
Detecting Module: HMBLBLDM

AMB179I  BINDER ENDD ERROR. RETURN CODE = return_code, REASON CODE = reason_code

Explanation: AMBLIST has detected a failure from the binder END DIALOG function, with the indicated program management return and reason codes.

System action: Processing terminates for this operation and continues with the next control statement.

System programmer response: If the problem recurs and the program is not in error, search problem data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the return and reason code.

Source: AMBLIST
Detecting Module: HMBLKCTL

AMB181I  GOFF HEADER RECORD EXPECTED.

Explanation: The first record in a GOFF module is not a module header record.

System action: Formatting of the object module terminates.

User response: The object module is invalid. Recreate the object module or obtain a new copy.

Source: AMBLIST
Detecting Module: HMBLBOBJ

AMB182I  INVALID RDW LENGTH.

Explanation: For a recfm V or VB GOFF object module, the length of the returned data was less than that in the record descriptor word (RDW).

System action: Formatting of the object module terminates.

User response: The object module is invalid. Recreate the object module or obtain a new copy.

Source: Binder
Detecting Module: HMBLBOBJ

AMB183I  GOFF CONTINUATION RECORD EXPECTED.

Explanation: The symbol name (ESD name or entry point name) on the last record was incomplete, but the current record is not a continuation record.

System action: Formatting of the object module terminates.

User response: The object module is invalid. Recreate the object module or obtain a new copy.

Source: AMBLIST
Detecting Module: HMBLBOBJ
**AMB185I**  
**GOFF CONTINUATION RECORD NOT EXPECTED.**  

**Explanation:** The current record indicates that a continuation record is expected, but all the data (according to the data length field) has been processed.  
**System action:** Formatting of the object module terminates.  
**User response:** The object module is invalid. Recreate the object module or obtain a new copy.  
**Source:** AMBLIST  
**Detecting Module:** HMBLBOBJ

**AMB186I**  
**INVALID TEXT TYPE IN GOFF RECORD.**  

**Explanation:** The text record style field in a GOFF TEXT record contains an invalid value.  
**System action:** Formatting of the object module terminates.  
**User response:** The object module is invalid. Recreate the object module or obtain a new copy.  
**Source:** AMBLIST

**AMB2004**  
**Either a UNIX pathname or MVS data set names can be specified, but not both.**  

**Explanation:** Both a UNIX path name and an MVS data set name were specified as files. The amlist
The `amblist` command also allows a UNIX path name to be specified, in which case it must be the only file specified.

**User response:** Enter the `amblist` command again and specify either a single UNIX path name, or one or more data set names.

**Source:** AMBLIST

---

**AMBU2009** Unable to open the file `%%s`, ERRNO=%d, ERRNOJR=%X hex: %s.

**Explanation:** The `amblist` command was not able to open the specified file. The file is always a path name. This error can be caused by incorrectly typing the name of the file.

The ERRNO (error code) and ERRNOJR (reason code) identify the problem, and the text immediately following the colon (:) is the text for that error code.

**User response:** Enter the `amblist` command again with the correctly specified file.

If the reason for the error is not obvious, see the ERRNOJR (reason code) explanation in [z/OS UNIX System Services Messages and Codes](https://publib.boulder.ibm.com/infocenter/pfz/ic/).

Export the environment variable `_BPXK_JOBLOG` to ensure that all messages, including those from the binder, are written. For example:

```
export _BPXK_JOBLOG=2
```

**Source:** AMBLIST

**Detecting Module:** HMBUCMD

---

**AMBU2010** Unable to allocate to the data definition name `%%s`, the file `%%s`, RC=%d (%X hex).

**Explanation:** Dynamic allocation or concatenation failed for the specified data definition name (DDname) and the specified file. The file can be either a path name or a data set name. This error can be caused by incorrect spelling or formatting of the file name. This message is usually preceded by an IKJ-prefixed message from dynamic allocation.

If the file is a data set, it must be preceded by the characters. Unless single quotation marks surround the name, the data set name will be prefixed by the login userid.

When entering a data set name in the shell, it might be necessary to use escape characters (such as double quotation marks) surrounding the whole name. An example of an MVS data set specification is:

```
"'//sys1.linklib'"
```
Chapter 11. AMD messages

Note: Other SADMP Messages
Stand-alone dump also issues messages in the output listing of the assembly of the AMDSADMP macro and on the 3480 or 3490 magnetic tape display. See MNOTES from the AMDSADMP macro in z/OS MVS Diagnosis: Tools and Service Aids for more information.

<table>
<thead>
<tr>
<th>AMD001A</th>
<th>SPECIFY OUTPUT DEVICE ADDRESS (nnn)</th>

**Detecting Module:** AMDSABRA, AMDSATER, AMDSAT80

**Routing Code:** -

**Descriptor Code:** -

**AMD005I** text

**Explanation:** Where text is:

- **DUMPING OF**
  - {REAL STORAGE NOW IN PROGRESS.}
  - {PAGE FRAME TABLE COMPLETED.}
  - {REAL STORAGE FOR MINIMAL ASIDs COMPLETED.}
  - {REAL STORAGE FOR SUMMARY ASIDs COMPLETED.}
  - {REAL STORAGE FOR SWAPPED-IN ASIDs COMPLETED.}
  - {IN-USE REAL STORAGE COMPLETED.}
  - {REAL STORAGE SUSPENDED.}
  - {REAL STORAGE RESUMED.}
  - {AVAILABLE REAL STORAGE COMPLETED.}
  - {REAL STORAGE COMPLETED.}

In the message text:

**REAL STORAGE NOW IN PROGRESS**

The stand-alone dump (SADMP) program has started the dumping of central storage.

**PAGE FRAME TABLE COMPLETED**

Indicates that the stand-alone dump program has completed dumping of the page frame table.

**REAL STORAGE FOR MINIMAL ASIDs COMPLETED**

Indicates that the real storage of ASIDs 1 through 4 and common storage has been dumped.

**REAL STORAGE FOR SUMMARY ASIDs COMPLETED**

Indicates that the real storage for a set of selected system address spaces (like consoles and catalog) and the current primary, secondary, and home spaces of the actively executing work on all of the processors has been dumped.

**REAL STORAGE FOR SWAPPED-IN ASIDs COMPLETED**

Indicates that the real storage of the ASIDs that were swapped in at the time of dump has been dumped. This includes all the address spaces that were swapped-in, but not dumped as minimal or summary ASIDs.

**IN-USE REAL STORAGE COMPLETED**

Indicates that all other allocated storage in the system has been dumped.

**AMD010I** PROCESSING ASID=asid

ASCB=address JOBNAME=jobname

**Explanation:** The stand-alone dump program will attempt to dump selected paged out data. The system issues this message for each address space that is dumped.

In the message text:

**asid** The address space.

**jobname**

The name of the job. If both ASCB fields (ASCBJBNI and ASCBJBNS) are zero or the first character of the job name is not A through Z, $, #, or *, the system contains a job name of *UNKNOWN.

**address**

The address of the address space control block (ASCB).

**System action:** The stand-alone dump program continues to dump the address space.

This message appears in the message log, but does not appear on the operator console.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAMDM

**Routing Code:** -

**Descriptor Code:** -
If the device is a 2305 Model 2 direct access device (supported pre-MVS/ESA SP™ 5.2), make sure that the intervention required condition has been satisfied by doing the following:
1. Ready the device
2. Activating the STOP function on the device
3. Activating the START function

If stand-alone dump cannot be restarted, reIPL stand-alone dump. To restart or the reIPL stand-alone dump, see [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/support/knowledgecenter/).
The control block could not be obtained from the stand-alone dump work file or the system paging devices because:
- An I/O error occurred on the device; in this case, message AMD033I also appears.
- I/O failed to initiate.
- The operator replied I to message AMD012D for a device on which intervention was required.
- The virtual address is not defined on external storage.
- An incorrect or unavailable control block was required to page in the control block; in this case, message AMD018I precedes this message.

**LOOP IN**

The control block is on a chain that is too long.

**Operator response:** Notify the system programmer.

**System programmer response:** When using IPCS to format the dump, specify the VERBEXIT SADMPMSG subcommand to see the stand-alone dump message log. Use the diagnostic information in this message to help determine the cause of the operating system failure.

**AMD025I**

**GTF DUMP BYPASSED**

**Explanation:** The stand-alone dump program could not dump the generalized trace facility (GTF) trace because of control block errors.

**System action:** The stand-alone dump program continues processing with the next address space. No GTF trace is dumped.

**System programmer response:** See message AMD018I.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAGTF

**Routing Code:** -

**Descriptor Code:** -

---

**AMD029D**

**REPLY W TO WAIT AFTER NEXT FULL SCREEN, ELSE REPLY N; REPLY=**

**Explanation:** The stand-alone dump program issues this message when the operator console screen fills with messages.

**System action:** The stand-alone dump program stops running to give the operator time to read and record any...
necessary messages. Processing does not continue until the operator replies to the message.

**Operator response:** Notify the system programmer if error messages appear. Then reply to this message:

**REPLY=W or press the ENTER key**
Reply W or press the ENTER key to indicate end of block. This tells the stand-alone dump program to clear the screen and continue processing. When the screen is filled again, the dump program reissues message AMD029D.

Use this reply to provide the time needed to copy the stand-alone dump messages.

**REPLY=N**
Reply N to tell the stand-alone dump program to clear the screen and continue processing. Processing continues uninterrupted from that point, no matter how many times the screen fills. Once N is entered, SADMP does not issue AMD029D again unless the number of output devices used in the stand-alone dump exceeds the number of lines on the console. If this occurs, AMD104I causes AMD029D to be reissued, allowing the operator to record all the SADMP volumes used during the stand-alone dump.

**System programmer response:** If you want the stand-alone dump messages before you format the dump, ask the operator to reply W and copy all error messages.

**AMD032I**

### I/O ERROR ON dev CMD = cmd STATUS = stat COND = err

**Explanation:** During processing of a stand-alone dump, a permanent I/O error occurred.

In the message text:

- **dev** The device number of the device on which the error occurred.
- **CMD=cmd** The channel command that was being run.
- **STATUS=stat** The status bits, if applicable, or NONE, if not applicable.
- **COND=err** The type of error for which the stand-alone dump program was attempting recovery; it is one of the following:
  - For channel path errors:
    - CHAINING CHECK
    - CHANNEL CONTROL CHECK
    - CHANNEL DATA CHECK
    - INCORRECT LENGTH
    - INTERFACE CONTROL CHECK
    - PCI
    - CHANNEL PROGRAM CHECK
    - CHANNEL PROTECTION CHECK
  - For device or control unit errors:
    - ATTENTION
    - BUSY
    - CONTROL UNIT END
    - STATUS MODIFIER

---

  ALLEGIANCE RESET
  COMMAND REJECT
  CONFIGURATION ERROR
  PROTECTION EXCEPTION
  WRITE PROTECTED
  WRITE LENGTH ERROR
  READ-ONLY FORMAT
  BEGINNING OF PARTITION
  END OF PARTITION
  END OF DATA ENCOUNTERED
Note: If an error occurs such that message AMD033I is required and the 3590 message code in sense byte 6 does not apply to any of the above conditions, then message AMD033I is issued with COND=DEVICE MESSAGE CODE IS IN SENSE BYTE 6.

- For special errors:
  - ERROR IN ERROR RECOVERY - While attempting to recover from the error indicated by the status and sense bytes, a second error occurred from which recovery was impossible.
  - ERROR ON SENSE COMMAND - An error occurred while the system was reading the sense bytes.
  - UNKNOWN - The error indicated by the status and sense bytes is unexpected. No recovery exists.
  - UNUSED - The stand-alone dump program generated an incorrect message.

System action: The stand-alone dump program does not complete the I/O operation successfully. The dump program also issue message AMD034I. If the I/O error is a permanent error on the output device, stand-alone dump issues message AMD098A.

Operator response: If the error is WRITE INHIBITED and message AMD014A follows, turn the write inhibit switch of the device to the write position. If message AMD098A is issued, see the operator response for AMD098A.

For all other errors, fix the problem, if possible.

Source: Stand-alone dump (SADMP)

<table>
<thead>
<tr>
<th>AMD034I</th>
<th>SENSE = sens</th>
</tr>
</thead>
</table>
**Explanation:** This message shows up to 32 sense bytes for the error described in message AMD033I. If the device in error has less sense information, the extra bytes are not displayed.

In the message text:
- sens The sense information.

**System action:** The stand-alone dump program does not complete the I/O operation successfully. If the I/O error is a permanent error on the output device, stand-alone dump issues message AMD098A.

**Operator response:** If the error is WRITE INHIBITED and message AMD014A follows, turn the write inhibit switch of the device to the write position. If message AMD098A is issued, see the operator response for AMD098A.

For all other errors, fix the problem, if possible.

Source: Stand-alone dump (SADMP)

<table>
<thead>
<tr>
<th>AMD035I</th>
<th>ddname FILE CANNOT BE OPENED</th>
</tr>
</thead>
</table>
**Explanation:** The stand-alone dump program could not open the data set specified on a DD statement for the following reasons:
- The system has probably improperly allocated the data set.
- The data set is in error.

**System action:** The stand-alone dump program stops initializing the volume.

**System programmer response:** Check the availability of the data set that the DD statement requires.

Source: Stand-alone dump (SADMP)

**Explanation:** The stand-alone dump component cannot obtain enough virtual storage to generate a stand-alone dump program.

**System action:** The stand-alone dump component does not initialize a residence volume.

**System programmer response:** Rerun the stand-alone dump initialization job with an increased region size.

**Source:** Stand-alone dump (SADMP)

---

**Explanation:** The stand-alone dump component successfully generated a stand-alone dump program.

**Source:** Stand-alone dump (SADMP)

---

**Explanation:** The output tape, mounted in response to a request by the stand-alone dump component, has a label. Stand-alone dump is requesting the disposition of the tape.

In the message text:

- volser: The volume serial number.

**System action:** The stand-alone dump component waits for the reply.

**Operator response:** Do one of the following:
- Reply USE to write over the label.
- Reply UNLOAD to dismount the tape without writing on it. The system will prompt for another tape.

**Source:** Stand-alone dump (SADMP)

---

**Explanation:** The device number of the dump output device specified by the caller is in error. The device number has one of the following errors:
- It contains incorrect characters
- It is the console
- It is the IPL device
- Its device cannot be reached by stand-alone dump (SADMP)

In the message text:

- devn: The device number specified on the AMDSADMP OUTPUT keyword or specified by the operator.
- return-code: The associated hex reason code
The associated reason hex codes are:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>The device number specified is syntactically incorrect.</td>
</tr>
<tr>
<td>20</td>
<td>The device number specified is the SADMP IPL or console device, or the device number specified is not connected to the system.</td>
</tr>
<tr>
<td>30</td>
<td>The device number specified is an unsupported output device type.</td>
</tr>
<tr>
<td>40</td>
<td>The output DASD device number specified has a corrupted volume label.</td>
</tr>
<tr>
<td>50</td>
<td>The output DASD device number specified failed on the first attempt to perform a write I/O operation.</td>
</tr>
</tbody>
</table>

**System action:** The SADMP program continues by issuing AMD001A to prompt the operator again to specify a new device number.

**Operator response:** Specify a valid device number in response to system message AMD001A. Typical actions for the specific hex reason code in AMD048I are given as follows:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Correct the specification of the device number. Reply to AMD001A with a valid device number.</td>
</tr>
<tr>
<td>20</td>
<td>Verify that the device is not the SADMP IPL or console device. Verify that the device is connected to the system that SADMP is running on. Reply to AMD001A with a different SADMP supported tape or DASD device.</td>
</tr>
<tr>
<td>30</td>
<td>Verify that the device number is a supported tape or DASD device. Reply to AMD001A with a different SADMP supported tape or DASD device.</td>
</tr>
<tr>
<td>40</td>
<td>Reply to AMD001A with a different SADMP supported tape or DASD device.</td>
</tr>
<tr>
<td>50</td>
<td>Verify that the output DASD device is not write protected. If it is, disable the write protection and reply to message AMD001A with the same device number. Otherwise, reply to message AMD001A with a different SADMP supported tape or DASD device.</td>
</tr>

**AMD059I** ENTER 'DUMP' OR 'SET' WITH OPTIONS, 'LIST' OR 'END'.

**Explanation:** The stand-alone dump program is prompting the operator.

**System action:** The stand-alone dump program waits for a response.

**Operator response:** The operator should respond with one of the following:

1. DUMP `dto`
   - Where dump tailoring options `dto` specify storage to be dumped. The response must be contained on a single line. After it is entered, the operator is prompted again and enter another line.

2. SET MINASID(`minimum`)
   - Where `minimum` is either all address spaces, ALL, or physically swapped-in address spaces, PHYSIN.
     - Specify ALL to diagnose hangs, enabled waits, and performance problems. If ALL is specified, the minimum dump includes certain system-related storage ranges in all address spaces. This dump provides enough first-failure data to debug most system problems. Because of the large amount of data dumped, the time for the dump be excessive.
     - Specify PHYSIN to diagnose coded waits, loops, and spin loops. If PHYSIN is specified, the minimum dump includes storage in address spaces that are physically swapped-in. This dump takes less time. Because of the storage not in the dump, the dump not contain enough first-failure data to diagnose the system problem. If this is the case, recreate the system problem, and request MINASID with ALL.

When in doubt, ALL is the better choice.

3. LIST
   - The stand-alone dump program writes on the console all the dump options accumulated up to now (message AMD067I). Prompting continues.

4. END
   - The stand-alone dump program stops prompting the operator and begins dump processing. The operator can no longer respond with dump options.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAPMT

**Routing Code:** -

**Descriptor Code:** -

**AMD065A**  
Enter text to be substituted for the text in error.

**Explanation:** The stand-alone dump component considers the text above the asterisk (*) to be in error. Responding to this message with """" will be treated as a null response in order that a null response can be entered from the system console.

**System action:** The stand-alone dump component ignores the text above the asterisk.

**Operator response:** Enter the text that you want to substitute for the text in error. The substitution text be any length up to a full line, or null.

The text entered replaces only the text above the asterisk. This means that the stand-alone dump program retains the text without an asterisk beneath it. The response is inserted in place of the text with an asterisk beneath it.

For example, if the following appears in the message text:

...IN ASODL(...

*****

Enter the substitution text,

ASID

The result is as follows:

...IN ASID(...

For a null response, the dump program inserts no text. The text without an asterisk beneath it becomes joined together.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAPMT

**Routing Code:** -

**Descriptor Code:** -
AMDSADMP ERROR, CODE=sssee, PSW=psw COMPDATA(AMDSA00n)

Explanation: One of the following occurred:

- The stand-alone dump program (SADMP) detected an error.
- System restart - ss is X'1C' and ee X'13'. If system restart was performed after the original SADMP completed, then AMDSA000 is displayed in the message text.

In the message text:

ss  The stand-alone dump SVC number of the CSECT in error.

ee  The reason code associated with the error.

psw The program status word (PSW) at the time of error.

AMDSA000
The stand-alone dump program was not able to take a dump for this error because the output device is unusable or has not yet been initialized.

AMDSA001 - AMDSA005
The stand-alone dump program dumped all the storage that it used to the output device.

System action: Depending on the cause of this message, one of the following occurs:

- If SADMP detected an error and if the message text contains:
  - AMDSA000, then the system could not take a dump because the device was bad. They system enters stand-alone wait state X'4Fssee'.
  - AMDSA001 - AMDSA005, then SADMP takes as many as five self-dumps to the output device and attempts to continue. If the error persists, the system enters stand-alone dump wait state X'4F0D02', which means that SADMP requested more than five self-dumps.
- If a system restart occurred, SADMP attempts to take a self-dump, and the system reloads an enabled wait PSW with reason code X'3E0000', indicating that SADMP is waiting for an external or console I/O interrupt.

Operator response: Depending on the cause of this message, do the following:

- If SADMP detected an error and if:
  - AMDSA000 is issued in the message text, record the PSW of the target CPU on which SADMP was executing. Also, record all messages that are still available at the console.
  - Wait state X'4F0D02' is loaded (meaning that SADMP requested more than five self-dumps), attempt a system restart using a different output device.

AMD068I MVS VIRTUAL STORAGE CANNOT BE DUMPED. (INVALID cb|NO STORAGE FOR SGT)

Explanation: The stand-alone dump (SADMP) program determined that virtual storage could not be dumped because a control block was incorrect or because contiguous storage for a segment table could not be found.

In the message text:

INVALID cb Indicates which control block is incorrect.

NO STORAGE FOR SGT The system could not find storage for the segment table.

System action: The SADMP program ends.

Operator response: Ensure that a STORE STATUS function is performed before or as part of the IPL of the SADMP program. Also ensure that the operating system is fully initialized. Both of these are necessary to dump virtual storage.
Try to relPLe the SADMP program, if possible. See *MVS Diagnosis: Tools and Service Aids* for information on running the SADMP. If the problem persists, notify the system programmer.

**System programmer response:** If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**AMD075I  EXTENDED STORAGE ERROR SUMMARY, (ASID=asid|ALL ADDRESS SPACES)**

<table>
<thead>
<tr>
<th>text</th>
</tr>
</thead>
<tbody>
<tr>
<td>sssssss  SUCCESSFUL PAGE-IN OPERATIONS</td>
</tr>
<tr>
<td>dddddd  DATA ERRORS</td>
</tr>
<tr>
<td>bbbbbbb  BLOCKS NOT AVAILABLE</td>
</tr>
<tr>
<td>uuuuuuu  UNEXPECTED ERRORS</td>
</tr>
</tbody>
</table>

While using expanded (extended) storage, the stand-alone dump program detected at least one error.

In the message text:

**ssssss** The number of page-in operations that set condition code 0.

**ddddd** The number of page-in operations that set condition code 1.

**bbbbbb** The number of page-in operations that set condition code 3.

**uuuuuu** The number of times the page-in operation did not run because of a system control block error or an internal error in the stand-alone dump program.

**ASID=asid**

The error occurred while stand-alone dump was trying to read a page of data for an address space. The statistics in the message are totals for that address space.

**ALL ADDRESS SPACES**

An error occurred for at least one address space. The statistics are totals for all address spaces.

The error is probably in an MVS control block.

**Operator response:** Notify the system programmer.

**System programmer response:** When using IPCS to format the dump, specify the VERBEXIT SADMPMSG subcommand to see the stand-alone dump message log.

**Source:** Stand-alone dump (SADMP)

**AMD080I** A TOTAL OF number AMD079I MESSAGES HAVE BEEN SUPPRESSED

**Explanation:** The stand-alone dump program received one or more unexpected return codes. For each unexpected code, the dump program issued an AMD079I message to indicate the error and the code, and an accompanying AMD076I message indicated the data space being processed. One or more of the AMD079I messages were suppressed to decrease the number of messages displayed.

AMD080I appear many times during the processing of one data space; the last AMD080I message issued represents the total number of AMD079I messages that were suppressed during the processing for that data space.

In the message text:

- *number* The number of messages suppressed.

**System action:** The stand-alone dump program continues processing until all of the pages in the requested data space have been processed. As more messages are suppressed, message AMD080I appears less frequently.

**Operator response:** Notify the system programmer.

**System programmer response:** When using IPCS to
format the dump, specify the VERBEXIT SADMPMSG subcommand to see the stand-alone dump message log.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSADSD

**Routing Code:** -

**Descriptor Code:** -

**AMD081I** ASID asid NOT DUMPED, PHYSICALLY SWAPPED-OUT (JOBNAME=jobname).

**Explanation:** The stand-alone dump program detected that an address space was physically swapped-out at the time of the dump. This address space was not requested by either the dump specifications used to generate the stand-alone dump program, or the dump options specified for the stand-alone dump.

In the message text:

- **asid** The address space identifier.
- **jobname** The job associated with the address space.

**System action:** The stand-alone dump program stops processing the current address space, and begins processing the next address space.

This message appears in the message log, but does not appear on the operator console.

**AMD083I** AMSDADMP: STAND-ALONE DUMP {INITIALIZED|RESTARTED}. IPLDEV: dddd LOADPARM: ppppppppp

**Explanation:** This message indicates the current status of the stand-alone dump (SADMP) program.

In the message text:

- **INITIALIZED** The SADMP program has been IPLed.
- **RESTARTED** The SADMP program has been restarted.
- **ddd** The device number of the SADMP IPL device.
- **pppppppp** The load parameter for the IPL of SADMP.

**System action:** The SADMP program continues.

**Operator response:** None.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAICN

**Routing Code:** -

**Descriptor Code:** -

**AMD085I** STORE STATUS DATA IS MISSING OR INVALID FOR PROCESSOR cpuid

**Explanation:** The system wrote a dump, but the STORE STATUS for a central processor is missing or incorrect. The dump written by the system not have the correct central processor status needed to diagnose the problem.

In the message text:

- **cpuid** The identifier of the central processor that has just been IPLed.

**System action:** The SADMP program dumps the central processor status record for processor cpuid using the data that was found in the area reserved for the STORE STATUS function. The SADMP program continues to dump central storage but not be able to
dump any virtual storage. IPCS not be able to display virtual storage.

**Operator response:** Determine if the STORE STATUS function was performed for the processor on which the SADMP program was IPLed. Ensure that the STORE STATUS function is performed only once after MVS has been stopped, and only for the processor that will be IPLed using SADMP. See [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/docs/en/zos-mvs) and [z/OS Problem Management](https://www.ibm.com/docs/en/zos-problem-management) for information on running the SADMP program and the STORE STATUS function.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSACPU

**Routing Code:** -

**Descriptor Code:** -

---

**AMD086I**

**ALL OF STORAGE CONTAINED BINARY ZEROES. THERE IS NO DATA TO DUMP.**

**Explanation:** The stand-alone dump (SADMP) program checked for nonzero storage to dump and found that all of central storage was cleared to binary zeroes prior to the loading of the SADMP program.

**Note:** The following areas in storage are overlaid as part of the IPL for the SADMP program:
- The IPL bootstrap channel command words (CCW)
- The IPL subchannel identifier (ID)
- The processor store status area

The SADMP program does not consider these areas when determining if there is any nonzero data to be dumped.

**System action:** The SADMP program ends by loading wait state code X'3E', reason code X'0100'.

**Operator response:** Determine if the LOAD option was requested without the CLEAR option on the STORE STATUS function. The SADMP program should be IPLed by using a LOAD option that does not clear storage if a dump of storage is desired. If the SADMP program has been IPLed to verify that storage was intentionally cleared to zeroes, this message indicates that the storage has been successfully cleared. See [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/docs/en/zos-mvs) and [z/OS Problem Management](https://www.ibm.com/docs/en/zos-problem-management) for information on running the SADMP program and the STORE STATUS function.

**Source:** Stand-alone dump (SADMP)

**AMD087I**

**DUMP OF A PREVIOUS STAND-ALONE DUMP PROGRAM NOW IN PROGRESS|COMPLETE**

**Explanation:** The stand-alone dump (SADMP) program checked for the existence of a previous initial program load (IPL) of the SADMP program and has detected data that was used by the previous dump.

In the message text:

**IN PROGRESS**

The SADMP program has started dumping the storage that was being used by the previous IPL of the SADMP program.

**COMPLETE**

The SADMP has finished dumping the storage that was being used by the previous IPL of the SADMP program.

**System action:** If status is **IN PROGRESS**, the
SADMP program dumps the storage that was in-use by the previous dump.

If status is COMPLETE the SADMP program issues message AMD088D to give the operator the choice of ending the dump or attempting to continue dumping.

**Operator response:** Determine if the LOAD option was requested on the STORE STATUS function more than once for the SADMP program. If the SADMP program is IPLed into a system where it has been running, only the storage being used by the previous SADMP program will be dumped. See [z/OS MVS Diagnosis: Tools and Service Aids](https://pubsConnell.com/zos/5146) and [z/OS Problem Management](https://pubsConnell.com/zos/5146) for information on running the SADMP program and the STORE STATUS function.

If additional storage is needed to diagnose a problem with the system being dumped, reply U to message AMD088D to dump central storage.

**AMD089I**  DUMP TERMINATED DUE TO reason

**Explanation:** reason is one of the following:

OPERATOR REQUEST
EXTERNAL KEY

The stand-alone dump (SADMP) program has loaded a wait state code due to reason, which is one of the following:

---

**AMD090I**  UNABLE TO CONTINUE USING THE SYSTEM CONSOLE

**Explanation:** The stand-alone dump (SADMP) program used the system console to communicate with the operator, but the SADMP program is unable to continue to use the system console in that way.

**System action:** The SADMP program continues but communicates with the operator through SADMP wait state codes rather than through the console.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAICN

**Routing Code:** -

**Descriptor Code:** -

---

**AMD091I**  dev volser dsname IS NOT USABLE; DATA SET IS NOT FOUND.

**Explanation:** A direct access storage device (DASD) was specified, but a search of the volume table of contents (VTOC) did not locate the predefined dump data set.

In the message text:

- **dev** The output device number.
- **volser** The output device volume serial number.
- **dsname** The output data set name.

**System action:** The dump program issues message AMD001A to prompt the operator for an output device.

**Operator response:** Notify the system programmer. When the output data set is properly allocated, specify one of the following in response to message AMD001A:

- The device number of a DASD that contains an allocated dump data set
- The device number of a tape device

**System programmer response:** Verify the definition
of the output dump data set. AMDSADD is the utility that defines the dump output data set.

See [z/OS MVS Diagnosis: Tools and Service Aids](http://www.ibm.com/support/docview.wss?rs=102&context=ATMCAAA45OD1&dc=DB2&doc=bb16447) for more information about the AMDSADD utility.

This message be issued as a result of the dump data set being migrated or moved to a different volume. The necessary steps should be taken to insure that the SADMP dump data sets are not placed into a migrated state or moved to a different volume. Furthermore, the dump data sets must also be exempt from any space management processing that will release unused space.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAIDD

**Routing Code:** -

**Descriptor Code:** -

---

**AMD092I**  
`dev volser dsname IS NOT USABLE; DATA SET IS NOT VALID. REASON CODE=reason-code`

**Explanation:** The predefined dump data set on the specified device failed validity checking.

In the message text:

- `dev` The output device number.
- `volser` The output device volume serial number.
- `dsname` The output data set name.
- `reason-code` The associated hexadecimal reason code.

**01** Data set contains only one track. The dump data set must be a single extended data set that is allocated in cylinders.

**02** Data set is compressed. SADMP program cannot dump to a compressed data set.

**03** Incorrect block size. The following block sizes are valid:
  - A BLKSIZE of 20800 for a 3380 or 9345 DASD.
  - A BLKSIZE of 24960 for a 3390 DASD.

**04** Incorrect record length. SADMP data set should be allocated with LRECL=4160.

**05** I/O error when reading the data set. Unable to read the first record in the output dump data set.

**06** DSNAME mismatch. The `dsname` you specified does not match the `dsname` in the dump group record.

**07** Volume serial number mismatch. The volume serial number in the data set label does not match the volume serial number in the dump group record.

**08** Device number mismatch. The device number you specified does not match the device number in the dump group record. If the data set has been moved to another device with a different device number, use AMDSADD CLEAR to fix the data set.

**09** Incorrect volume count. The number of volumes spanned by the data set is either 0 or greater than 32. SADMP supports up to 32 volumes.

**0A** Dump group header mismatch. The dump group header on the first volume does not match the dump group header on the subsequent volumes.

**0B** Unusable dump group record. The dump data set does not contain a valid dump group record on one or more of the volumes.

**System action:** The dump program issues message AMD001A to prompt the operator for an output device.

**Operator response:** Specify one of the following in response to message AMD001A:
- The device number of a DASD that contains a predefined and initialized output dump data set
- The device number of a tape device

**System programmer response:** Verify the definition of the output dump data set. AMDSADD is the utility that defines the output dump data set.

See [z/OS MVS Diagnosis: Tools and Service Aids](http://www.ibm.com/support/docview.wss?rs=102&context=ATMCAAA45OD1&dc=DB2&doc=bb16447) for more information about the AMDSADD utility.

**Source:** Stand-alone dump (SADMP)

**Descriptor Code:** -

---

**AMD094I**  
`dev volser dsname IS VALID, HOWEVER, IT ALREADY CONTAIN DATA FROM A PREVIOUS DUMP. THE INSTALLATION CHOSE TO ALWAYS REUSE THE DUMP DATA SET.

**Explanation:** The predefined output dump data set passed validity checks, however, the first record in the data set does not match the record written by the stand-alone dump REXX utility, AMDSADDD. Since REUSED=ALWAYS was specified on the AMDSADMP macro, stand-alone dump reuses the output dump data set.

In the message text:

- **dev** The output device number.
- **volser** The output device volume serial number.

**System action:** The dump program reuses the data set and continues dumping.

**System programmer response:** Note that the output data set was reused. The existing data in the dump data set has been lost.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSAI DD

**Routing Code:** -

**Descriptor Code:** -

---

**AMD096A**  
`dev volser dsname IS VALID, HOWEVER, IT ALREADY CONTAIN DATA FROM A PREVIOUS DUMP. mm/dd/yyyy hh:mm:ss TITLE:title of the previous dump REPLY 'R' TO REUSE OR 'U' TO USE ANOTHER DATA SET.

**Explanation:** The predefined output dump data set passed validity checks, however, the first record in the data set does not match the record written by the
stand-alone dump utility, AMDSADDD.

In the message text:

**dev**  The output device number.

**volser**  The output device volume serial number.

**dsname**  The output data set name.

**System action:**  If the operator replies 'R', SADMP reuses the output dump data set and continues dumping. If the operator replies 'U', SADMP issues message AMD001A to prompt for an output device.

**Operator response:**  Reply 'R' if the output dump data set should be reused. Note that the existing data in the dump data set will be lost.

Reply 'U' if the output dump data set on the specified output device should not be reused.

**Source:**  Stand-alone dump (SADMP)

**Detecting Module:**  AMDSAIDD

**Routing Code:**  -

**Descriptor Code:**  -

---

**AMD098A**  **REPLY 'R' TO RESTART THE DUMP OR 'T' TO TERMINATE**

**Explanation:**  A permanent error has occurred on the output device. The operator is prompted to either restart the dump from the beginning with no loss of data, or to end the dump.

**Note:**  Because this message is issued as a result of a permanent I/O error on the output device, take a restarted dump on a different output device.

**System action:**  If the operator replies 'R', the SADMP program restarts. Message AMD083I will be issued, followed by message AMD001A.

If the operator replies 'T', the SADMP program ends and loads wait state code X'4F', with reason code X'ss01' or X'ssF1'.

**Operator response:**  Reply 'R' to restart the SADMP program with no loss of data. Reply 'T' to end the dump. If 'T' is specified, the operator can still perform a manual restart of the SADMP program. See [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/support/knowledgecenter/en/STXKQY_2.4.0/com.ibm.zos.v2r4.ezkl.doc/zos_floorplan_zos.html) for more information about restarting the SADMP program.

**AMD099I**  **dev volser dsname IS FULL. TO CONTINUE DUMPING, SPECIFY ANOTHER OUTPUT DEVICE.**

**Explanation:**  The dumping program has filled the output DASD dump data set.

In the message text:

**dev**  The output device number.

**volser**  The output device volume serial number.

**dsname**  The output data set name.

**System action:**  The system issues AMD001A to request an output device to continue the dump.

**Operator response:**  Reply to AMD001A with an output device to continue the dump. The additional output device can be any SADMP supported DASD or tape device. If continuing to a DASD device, you cannot use a dump data set that had been previously used during the taking of this dump.

**System programmer response:**  To avoid this message, use a larger number of cylinders when predefining or reallocating the output dump data set using the AMDSADDD REXX utility.

**Source:**  Stand-alone dump (SADMP)

**Detecting Module:**  AMDSAEDR

**Routing Code:**  -

**Descriptor Code:**  -

---

**AMD100I**  **PAGING DEVICE dev volser CANNOT BE USED. IT IS AN OUTPUT DEVICE.**

**Explanation:**  While attempting to access virtual storage currently paged out, the SADMP program found that a paging device is the current output device.

In the message text:

**dev**  The paging device number.

**volser**  The paging device volume serial number.

**System action:**  Because stand-alone dump cannot operate if the output dump data set resides on the paging device, the SADMP program continues dumping accessible virtual storage. No further data is dumped from this paging device.

**Operator response:**  To get a complete dump, you can restart the SADMP program with the output directed to a device that is not a paging device.

**System programmer response:**  Ensure that the stand-alone dump DASD output data sets used for dumping are not on any devices which contain paging or swapping data sets used by the system.

**OUTPUT DEVICE**

*dev* *volser* *dsname*

**SENSE ID DATA:**

*b0* *cutype* *cumodel*

*devtype* *devmodel* **BLOCKSIZE:**

*blocksize*

**Explanation:** This message displays information about the output device.

In the message text:

- **dev** The device number of the output data set.
- **volser** If the output device is a DASD, the volume serial number of the output device. If the output device is a tape, then blanks.
- **dsname** If the output device is DASD, the output dump data set name. If the output device is tape, this field is blank.
- **blocksize** The block size of the output data set.
- **b0** Sense id byte 0.
- **cutype** The control unit type (sense id bytes 1 and 2).
- **cumodel** The control unit model (sense id byte 3).
- **devtype** The device type (sense id bytes 4 and 5).
- **devmodel** The device model (sense id byte 6).

**Note:** For output devices that do not support the sense id command, stand-alone dump will display '3803' for the *cutype* and '3420' for the *devtype*. All other sense id data fields are zero.

**System action:** The SADMP program continues.

**Operator response:** None.

**Source:** Stand-alone dump (SADMP)

**AMD104I**

*text*

**Explanation:** *text* represents one line of data displayed for each output device and/or dump data set used during this dump:

**DEVICE** **VOLUME USED** **DATA SET NAME**

*nnn* *dev* *volser* *amt* *dsname*

In the message text:

- **nnn** The sequence number of the data set.
- **dev** The output device number.
- **volser** If the output device is a DASD, the volume serial number. If the output device is a tape, *TAPE* appears.

**System action:** The SADMP program continues. This message appears in the message log, but does not appear on the operator console.
If the output device is a DASD, the percentage of space in the data set which was used for this dump. If the output device is a tape, the number of tape volumes used.

If the output device is a DASD, the output dump data set name. If the output device is a tape, N/A appears.

**Operator response:** If the output device is a tape, save the tape. If the output device is a DASD, notify the system programmer. Record this information for use by the system programmer.

**System programmer response:** If the dump is contained on one device and/or dump data set, copy the dump to another data set. If the output device is a DASD, use the REXX utility AMDSADDD to clear the output dump data set.

If the dump is contained on more than one device and/or dump data set, use this information to assist in copying multiple dump data sets into one dump data set for IPCS viewing. See [z/OS MVS Diagnosis: Tools and Service Aids](https://www.ibm.com/support/knowledgecenter/SSEPGU_1.7.0/com.ibm.mvs.doc/.zz930197.html) for more information about copying multiple output data sets.

**AMD105I** DEVICE dev: WAITING FOR CONTROL UNIT TO RECOVER

**Explanation:** Stand-alone dump attempted input/output to a DASD whose control unit is in an extended busy condition. This busy condition might last for several minutes.

In the message text:

- **dev** The output device number.

**System action:** The system will queue and periodically retry the I/O to device dev until the control unit accepts the request. The system issues AMD105I periodically while the busy condition persists.

**Operator response:** None.

**Source:** Stand-alone dump (SADMP)

**Detecting Module:** AMDSADER

**Routing Code:** -

---

**AMD106I** MODESET FAILURE. [message_text]

**Explanation:** Stand-alone dump (SADMP) detected an error while trying to issue the MODESET command to a 3590 tape drive.

In the message text:

**message_text** Additional message text defined as follows:

- **DEVICE FEATURES COULD NOT BE DETERMINED**
  
  SADMP attempts to reset all of the tape drive’s control pages to their default values in order to insure that a previous user has not left the drive in an incompatible state for SADMP. This message text is used to indicate that the I/O to reset the device’s control pages to their default values has failed.

- **DATA COMPACTION NOT BE SET ON**
  
  The user has requested that data compaction be used during SADMP processing (via the COMPACT= option of the AMDSADMP macro). This message text indicates that the I/O done to explicitly set the data compaction feature on has failed. Depending on the tape drive’s default setting for data compaction, SADMP not use data compaction during the dumping process.

- **DATA COMPACTION NOT BE SET OFF**
  
  The user has requested that data compaction not be used during SADMP processing (via the COMPACT= option of the AMDSADMP macro). This message text indicates that the I/O done to explicitly set the data compaction feature off has failed. Depending on the tape drive’s default setting for data compaction, SADMP use data compaction during the dumping process.

**System action:** The system action depends on the message text:

- **DEVICE FEATURES COULD NOT BE DETERMINED**
  
  SADMP issues message AMD001A to prompt the operator for a new output device. This action is taken because the device features might be in a state that would cause unpredictable results during SADMP processing.

- **DATA COMPACTION NOT BE SET ON**
  
  SADMP continues processing using the specified tape device.

- **DATA COMPACTION NOT BE SET OFF**
  
  SADMP continues processing using the specified tape device.

**Operator response:** The operator response depends on the message text:
DEVICE FEATURES COULD NOT BE DETERMINED
   Reply to message AMD001A with another valid tape or DASD device.

DATA COMPACTION NOT BE SET ON
   To insure data compaction is used, perform a system restart of the SADMP program and select another valid tape device.

DATA COMPACTION NOT BE SET OFF
   To insure data compaction is not used, perform a system restart of the SADMP program and select another valid tape device.

Chapter 12. AMS messages

AMS001D  REPLY “S” FOR A SCHEDULED IPL OR “U” FOR AN UNSCHEDULED IPL.

Explanation: This message is displayed when a system IPL is performed.

System action: The system waits a maximum of one hour for an operator response, and then continues processing.

Operator response: Reply S if the outage was scheduled or U if it was unscheduled. If you reply U, the system displays message AMS002D.

Source: System Availability Management (SAM)

AMS002D  ENTER THE REASON FOR THE SYSTEM OUTAGE.

Explanation: The system displays this message after the operator replied U in response to message AMS001D.

System action: The system waits for a maximum of one hour for an operator response, and then continues processing.

Operator response: Enter a brief description of 45 characters or less describing the cause of the system outage. The response will be recorded in the Info/Management database.

Source: System Availability Management (SAM)

AMS003D  ENTER REASON FOR CANCELLING JOB jjj.

Explanation: The operator cancelled job jjj; the availability of this application is being tracked.

System action: The system waits a maximum of one hour for an operator response, and then continues processing.

Operator response: Enter a description of the reason why the operator cancelled the application. The description cannot exceed 45 characters; it will be recorded in the Info/Management data base.

Source: System Availability Management (SAM)

AMS004D  INVALID RESPONSE - REPLY “S” OR “U”.

Explanation: The reply to message AMS001D is not correct.

System action: The system reissues message AMS001D.

Operator response: You can only enter S for a scheduled outage or U for an unscheduled outage.

Source: System Availability Management (SAM)

AMS009E  WORK DATA SET IS FULL.

Explanation: AMSCOL issues this message when a record cannot be written because there is no space available. The system suspends the recording of abnormal endings until the situation is cleared.

System action: The system abnormally ends the collector; the collector will not be automatically restarted.

Operator response: Run either AMSSIN or AMSDIN to obtain the records in the data set and free the space occupied by them.

Source: System Availability Management (SAM)

AMS010I  ALERT CREATED FOR xxxxxxxx.

ON mm/dd/yy AT hh:mm
ON SYSTEM sysid.

Explanation: A record was written into Info/Management for xxxxxxxx, where xxxxxxxx is one of the following:
• STALL for a system stall condition.
• IPL for a system IPL.
• The name of an application that is being tracked.
• the date mm/dd/yy
• the time hh:mm
• the System Management Facilities (SMF) system ID sysid

System action: The system continues processing.

System programmer response: None.

Source: System Availability Management (SAM)

AMS018I  proiname IS ALREADY ACTIVE - START REJECTED

Explanation: A start command was issued for the collector when the collector was already active on the system. If the currently active collector completed initialization, proiname will contain the name of the procedure that started it.

System action: The system ends the started task.

Operator response: None.

System programmer response: None.

Source: System Availability Management (SAM)

AMS019I  WORK DATA SET IS OVER 80 PERCENT FULL

© Copyright IBM Corp. 1988, 2009
Explanation: This message is issued from AMSCOL when it has detected that less than 20 percent free space is left in the work data set.

System action: Processing continues

Operator response: Run either AMSSIN or AMSDIN to obtain the records on the data set and to free the space occupied by them.

Source: System Availability Management (SAM)
Chapter 13. ANT messages

This section contains DFSMS system data mover (SDM) messages (all begin with ANT) and error return codes, and includes extended remote copy (XRC), peer-to-peer remote copy (PPRC), FlashCopy, concurrent copy, and snapshot functions. SDM messages that begin with **ANTP** are PPRC messages, and are listed in "PPRC ANT messages" on page 475. Messages that begin with **ANTF** are FlashCopy messages, and are listed in "Enterprise storage server FlashCopy messages" on page 443.

The SDM messages in this section are organized according to the numerical portion of the message.

**ANTB0001E** XRC ADDRESS SPACE COULD NOT BE CREATED

**Explanation:** In response to an XSTART command or automatic XRC restart operation, the creation of a new XRC address space has failed.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are inactive.

**System programmer response:** Determine the number of active address spaces. If the address space limit for the installation has been reached, you must increase the limit to support XRC. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and generate an SVC dump of the ANTAS000 address space.

**ANTT0009I** USER userid IS NOT AUTHORIZED TO ISSUE THE XRC cmdname COMMAND

**Explanation:** The cmdname command was issued by user userid, and RACF (or the product providing resource control) has determined that this user is not authorized to use this command. If userid is “UNKNOWN”, a batch job was used to invoke the cmdname command, and the JOB card did not specify a user ID.

**Source:** Extended remote copy (XRC).

**System action:** The command is rejected.

**System programmer response:** Contact your system administrator if authorization is required. See Z/OS DFSMS Advanced Copy Services for command authorization details. If userid is “UNKNOWN”, specify an authorized user ID on the JOB card and resubmit the batch job.

**ANTT0010I** cmdname COMMAND PARSE ERROR. REQUIRED SESSIONTYPE KEYWORD IS NOT SPECIFIED

**Explanation:** The SESSIONTYPE keyword is not specified on the cmdname command. This is a required keyword that must be specified as SESSIONTYPE(XRC) or SESSIONTYPE(MIGRATE).

**Source:** Extended remote copy (XRC).

**System action:** The command is rejected.

**System programmer response:** Reenter the command, specifying SESSIONTYPE(XRC) or SESSIONTYPE(MIGRATE). If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0011I** cmdname COMMAND PARSE ERROR. REQUIRED VOLUME KEYWORD IS NOT SPECIFIED

**Explanation:** The VOLUME keyword is not specified on the cmdname command. The VOLUME keyword is a required parameter.

**Source:** Extended remote copy (XRC).

**System action:** The command is rejected.

**System programmer response:** Reenter the command, specifying the VOLUME keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0012I** cmdname COMMAND PARSE ERROR. INVALID OR NO PRIMARY VOLUME SPECIFIED

**Explanation:** One of the following has occurred for the cmdname command:
- No primary volume is specified
- The volume specified is invalid

**Source:** Extended remote copy (XRC).

**System action:** The command is rejected.

**System programmer response:** Reenter the command, specifying the proper primary volume with the VOLUME keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0013I** cmdname COMMAND PARSE ERROR. INVALID OR NO SECONDARY VOLUME SPECIFIED

**Explanation:** One of the following has occurred for the cmdname command:
- No secondary volume is specified
• The volume specified is invalid

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, specifying the proper secondary volume with the VOLUME keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0014I cmdname COMMAND PARSE ERROR.  
ERRORLEVEL KEYWORD INVALID VALUE

Explanation: The optional ERRORLEVEL keyword is specified with an invalid value on the cmdname command.

Source: Extended remote copy (XRC).

System action: Command is rejected.

System programmer response: Reenter the command either without the ERRORLEVEL keyword or with a valid ERRORLEVEL value. If the command was issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0015I cmdname COMMAND PARSE ERROR.  
REQUIRED ERRORLEVEL KEYWORD VALUE IS MISSNG OR INCORRECT

Explanation: The ERRORLEVEL keyword is not specified on the cmdname command. The ERRORLEVEL keyword is a required parameter.

Source: Extended remote copy (XRC).

System action: Command is rejected.

System programmer response: Reenter the command, specifying the ERRORLEVEL keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0016I cmdname COMMAND PARSE ERROR.  
VOLUME KEYWORD HAS EXCEEDED THE MAXIMUM VALUE OF 50 PAIRS

Explanation: The cmdname command is entered with the VOLUME keyword containing more parameters than the command supports. Only 50 volume pairs (100 volumes) per command are supported.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, specifying the SESSIONTYPE parameter as SESSIONTYPE(XRC) or SESSIONTYPE(MIGRATE). If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.
Source:   Extended remote copy (XRC).
System action:   The command is rejected.
System programmer response:   Enter multiple cmdname commands to enable XRC to process more than 50 volume pairs. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0021I   cmdname COMMAND PARSE ERROR.
VOLUME KEYWORD HAS EXCEEDED THE MAXIMUM VALUE OF 100 VOLUMES

Explanation:   The cmdname command is entered with the VOLUME keyword containing more parameters than the command supports. Only 100 volumes per command are supported.
Source:   Extended remote copy (XRC).
System action:   The command is rejected.
System programmer response:   Enter multiple cmdname commands to enable XRC to process more than 100 volumes. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0022A   XEND REQUEST ISSUED. CONTINUE REQUEST? (YES/NO)

Explanation:   This is a prompt for confirmation that you want the XEND command to continue. The XEND command ends an XRC session. The command requires a confirmation because ending a session ends all XRC processing.
Source:   Extended remote copy (XRC).
System action:   The command is canceled unless YES is specified.
System programmer response:   Confirm the command with a YES response. Any other response cancels the command. Abbreviations of YES are not acceptable. If you are issuing the XEND command from a CLIST or REXX EXEC, place the response on the stack before running the EXEC.

ANTT0025A   XDELPAIR REQUEST ISSUED. CONTINUE REQUEST? (YES/NO)

Explanation:   This is a prompt for confirmation that you want the XDELPAIR command to continue. The XDELPAIR command deletes the volume pair or pairs associated with the specified primary volume or volumes from an XRC session.
Source:   Extended remote copy (XRC).
System action:   The command is canceled unless YES is specified.
System programmer response:   Confirm the command with a YES response. Any other response cancels the command. Abbreviations of YES are not acceptable. If you are issuing the XDELPAIR command from a CLIST or REXX EXEC, place the confirmation on the stack before running the EXEC. You can also reissue the command with the NOVERIFY keyword to bypass this confirmation.

ANTT0026I   XDELPAIR REQUEST CANCELED

Explanation:   The XDELPAIR command is canceled because of a non-YES response to the ANTT0025A prompt message.
Source:   Extended remote copy (XRC).
System action:   The command is canceled.
System programmer response:   To delete the volume or volumes, reenter the XDELPAIR command and respond YES to the ANTT0025A prompt message. Abbreviations of YES are not acceptable. If you are issuing the XDELPAIR command from a CLIST or REXX EXEC, place the confirmation on the stack before running the EXEC.
ANTT0027I  XRC  cmdname  COMMAND HAS NOT BEEN DEFINED AS A TSO AUTHORIZED COMMAND

Explanation: The cmdname command is not an authorized TSO command. The command name must be added to the appropriate IKJTSOxx parmlib member under the AUTHCMD NAMES parameter.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Contact your system administrator if authorization is required. See [DFSMS Advanced Copy Services](https://www.ibm.com/support/knowledgecenter/SS5P9A_5.2.0/com.ibm.doc.mvsclustersclusters.doc/topics/zos_dfcscopy.html) for command authorization details.

The system administrator must:

1. Update the IKJTSOxx member of SYS1.PARMLIB, specifying the cmdname command with the AUTHCMD NAMES parameter.
2. Issue the TSO command PARMLIB UPDATE(xx) to activate the new IKJTSOxx member.

ANTT0028A  XSUSPEND REQUEST ISSUED. CONTINUE REQUEST? (YES/NO)

Explanation: This is a prompt for confirmation that you want the XSUSPEND command to continue. The XSUSPEND command suspends the specified volume or volumes, or the XRC session. The command requires a confirmation to place either the specified volumes or XRC session in a suspended state.

Source: Extended remote copy (XRC).

System action: The command is canceled unless YES is specified.

System programmer response: Confirm the command with a YES response. Any other response cancels the command. Abbreviations of YES are not acceptable. If you are issuing the XSUSPEND command from a CLIST or REXX EXEC, place the response on the stack before running the EXEC.

ANTT0029I  XSUSPEND REQUEST CANCELED

Explanation: The XSUSPEND command is canceled because of a non-YES response to the ANTT0028A prompt message.

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: To suspend volumes or the XRC session, reenter the XSUSPEND command and respond YES to the ANTT0028A prompt message. Abbreviations of YES are not acceptable. If you are issuing the XSUSPEND command from a CLIST or REXX EXEC, place the response on the stack before running the EXEC.

ANTT0030I  cmdname COMMAND PARSE ERROR. MEMBER NAME IS NOT ALLOWED

Explanation: The FlashCopy command specified a device device_number which is either in a storage subsystem that does not support FlashCopy, or the source and target devices are not in the same logical subsystem within the ESS.

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Correct the error and reenter the command. If you are issuing the command from a CLIST or REXX EXEC, correct the error and rerun the EXEC.

ANTT0031I  cmdname COMMAND PARSE ERROR. KEYWORD1 KEYWORD2

Explanation: The FlashCopy FCWITHDR command was issued and the device_number (either SDEVN or TDEVN device) was not in a FlashCopy relationship at the time the command was issued.

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Correct the error and reenter the command. If you are issuing the command from a CLIST or REXX EXEC, correct the error and rerun the EXEC.

ANTT0032I  cmdname COMMAND PARSE ERROR. KEYWORD keyword1 MUTUALLY EXCLUSIVE WITH KEYWORD keyword2

Explanation: The cmdname command is specified with keywords keyword1 and keyword2, which are mutually exclusive. Select only one of the keywords.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, selecting the desired keyword option. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0033I  cmdname COMMAND PARSE ERROR. THE VALUE FOR KEYWORD keyword HAS AN INVALID FORMAT

Explanation: The cmdname command failed because of a command parse error. The format specified for the keyword keyword is invalid.
Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Correct the error and reenter the command. If you are issuing the command from a CLIST or REXX EXEC, correct the error and rerun the EXEC.

**ANTT0034I** cmdname COMMAND PARSE ERROR. THE VALUE FOR KEYWORD keyword HAS AN INVALID NUMERICAL VALUE

Explanation: The cmdname command failed because of a command parse error. The value specified for keyword keyword is specified with an invalid value. For example, this error is issued if an invalid ATTIME value is specified on the XDELPAR, XEND, or XSUSPEND command. The ATTIME parameters must fall into the following ranges:
- Year – Between the current year and 2041
- Day – Between 1 and 365 (366 if the year is a valid leap year)
- Hours – Between 0 and 23
- Minutes – Between 0 and 59
- Seconds – Between 0 and 59
- Other values – Must be valid decimal digits (0–9)

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Correct the error and reenter the command. If you are issuing the command from a CLIST or REXX EXEC, correct the error and rerun the EXEC.

**ANTT0035I** cmdname COMMAND PARSE ERROR. THE VALUE FOR KEYWORD keyword IS INVALID

Explanation: The cmdname command failed because of a command parse error. A required value for keyword keyword is either not specified or was specified with an incorrect value.

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Correct the error and reenter the command. If you are issuing the command from a CLIST or REXX EXEC, correct the error and rerun the EXEC.

**ANTT0036I** cmdname COMMAND PARSE ERROR. THE VALUE FOR KEYWORD keyword IS NOT BETWEEN value1 AND value2

Explanation: The value specified for the keyword keyword for the cmdname command is out of range. Valid values must be between value1 and value2.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command specifying a proper hexadecimal value. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0037I** cmdname COMMAND PARSE ERROR. AT LEAST ONE KEYWORD MUST BE ENTERED

Explanation: The cmdname command failed because at least one keyword must be specified with the command.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command with the desired keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0038I** XSUSPEND COMMAND PARSE ERROR. KEYWORD TIMEOUT OR KEYWORD CANCEL MUST BE ENTERED

Explanation: The XSUSPEND command failed because of a command parse error. You must specify either the TIMEOUT or the CANCEL keyword.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command with the desired keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTT0039I** cmdname COMMAND PARSE ERROR. THE VALUE FOR KEYWORD keyword IS AN INVALID HEXADECIMAL NUMBER

Explanation: The cmdname command failed because of a parsing error. The value specified for the keyword given by keyword is not a valid hexadecimal number.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command specifying a proper hexadecimal value. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.
ANTT0040I  cmdname COMMAND PARSE ERROR.  
keyword1 KEYWORD Requires  
keyword2 KEYWORD OR keyword3  
KEYWORD

Explanation: The cmdname command failed because of a parsing error. When keyword1 is specified, keyword2 or keyword3 must also be specified.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command specifying a proper hexadecimal value. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0041I  cmdname COMMAND PARSE ERROR.  
keyword KEYWORD Has Exceeded  
The Maximum Value of number VALUES

Explanation: The cmdname command failed because of a parsing error. The number of values supplied in a list to the keyword keyword has exceeded the maximum number of values allowed in the list. The value in number is the maximum number of values allowed in the list.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Specify the correct number of values in the list, then reenter the command.

ANTT0042W  XADDPAIR SUSPENDED COMMAND PARSE ERROR.  
ADDITIONAL KEYWORDS WILL BE IGNORED

Explanation: The XADDPAIR SUSPENDED command only accepts the keyword MSGROUTEID. Another keyword, or other keywords, have been entered and XRC has ignored them.

Source: Extended remote copy (XRC).

System action: The command is accepted.

System programmer response: One or more messages will follow that give information about the resulting action.

ANTT0043I  cmdname COMMAND PARSE ERROR.  
keyword KEYWORD IS REQUIRED

Source: Extended remote copy (XRC).

Explanation: The cmdname command failed because of a parsing error. The keyword KEYWORD is required with the command.

System action: The command is rejected.

System programmer response: Provide the required keyword and reenter the command.

ANTT0047I  cmdname COMMAND PARSE ERROR.  
RESERVED SESSION ID SPECIFIED FOR MSESSION KEYWORD

Explanation: The cmdname command is specified with the reserved identifier of ALL on the MSESSION keyword.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, specifying a session identifier other than ALL on the MSESSION keyword. If the command was issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0048I  cmdname COMMAND PARSE ERROR.  
REQUIRED MSESSION KEYWORD VALUE IS MISSING OR INCORRECT

Explanation: The cmdname command is specified with a missing or invalid session for the MSESSION keyword. A valid session is required on the MSESSION keyword for this command.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, specifying a valid session for the MSESSION keyword. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0049I  cmdname COMMAND PARSE ERROR.  
MULTIPLE MUTUALLY EXCLUSIVE KEYWORDS SPECIFIED, keywords

Explanation: More than one of the mutually exclusive keywords for the command were specified.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command, selecting the desired keyword option. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0050A  XCOUPLE option REQUEST ISSUED.  
CONTINUE REQUEST? (YES/NO)

Explanation: This is a prompt for confirmation that you want the XCOUPLE command with the option option to continue. The command requires a confirmation.
Source: Extended remote copy (XRC).

System action: The command is canceled unless YES is specified.

System programmer response: Confirm the command with a YES response. Any other response cancels the command. Abbreviations of YES are not acceptable. If you are issuing the command from a CLIST or REXX EXEC, place the confirmation on the stack before running the EXEC. You can also reissue the command with the NOVERIFY keyword to bypass this confirmation.

ANTT0051I XCOUPLE option REQUEST CANCELED

Explanation: The XCOUPLE command with option option is canceled because of a non-YES response to the ANTT0050A prompt message.

Source: Extended remote copy (XRC).

System action: The command is canceled.

System programmer response: Reenter the XCOUPLE option command and respond YES to the ANTT0050A prompt message. Abbreviations of YES are not acceptable. If you are issuing the XCOUPLE command from a CLIST or REXX EXEC, place the response on the stack before running the EXEC.

ANTT0052I cmdname COMMAND PARSE ERROR.

Explanation: The cmdname command failed because of a parsing error. When keyword1 is specified, keyword2 must also be specified.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command specifying keyword2. If the command has been issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTT0060I cmdname COMMAND PARSE ERROR.

Explanation: The cmdname command failed because of a parsing error. The keyword specified is mutually exclusive with the other keywords specified.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Reenter the command specifying valid keyword combinations.
**ANTT0099I**  
**cmdname** COMMAND ACCEPTED  
**Explanation:** The *cmdname* command is accepted.  
**Source:** Extended remote copy (XRC).  
**System action:** The command is accepted.

**System programmer response:** Additional XRC messages normally follow this message. If no additional XRC messages are received at the system console log or the user ID specified with the MSGROUTEID parameter on the command, the command can still be queued in the XRC control function awaiting processing. If ANTASnnn is in the process of ending or reinitializing, it is possible that no other messages are issued.

To determine if XRC is operational, issue a DISPLAY A,ANTASnnn command and verify that the system processor time is incrementing for the address space. If the processor time is not increasing or if additional processing for the command is not indicated, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center.

**ANTI1000I**  
**Explanation:** This message displays if a parmlib syntax error is detected. It shows the category and its parameters.  
**System programmer response:** Correct the syntax errors and reinvoke parameter library support.  
**Source:** Extended remote copy (XRC).  

**ANTI1001E**  
**Explanation:** This message accompanies ANTI1000I and displays the error that was found by the RMM/TSO parsing routines.  
**System action:** Parameters are not accepted.  
**System programmer response:** Make the needed corrections and reinvoke parameter library support.  
**Source:** Extended remote copy (XRC).  

**ANTI1002E**  
**DATA SET x...x NOT FOUND**  
**Explanation:** Parameter library support was invoked using library x...x, but the partitioned data set was not found.  
**System action:** Parameters are not accepted.  
**System programmer response:** Specify the correct library name.  
**Source:** Extended remote copy (XRC).

**ANTI1003E**  
**MEMBER x...x NOT FOUND IN DATA SET y...y**  
**Explanation:** Parameter library support was invoked using library y...y, but member x...x was not found.  
**System action:** Parameters are not accepted.  
**System programmer response:** Specify the correct member name.  
**Source:** Extended remote copy (XRC).  

**ANTI1004E**  
**CATEGORY x...x NOT DEFINED**  
**Explanation:** Parameter library support does not recognize category x...x.  
**System action:** Parameters are not accepted.  
**System programmer response:** Specify a category that has been defined.  
**Source:** Extended remote copy (XRC).  

**ANTI1005E**  
**CATEGORY x...x PARSE ERROR. KEYWORD y...y MISSING**  
**Explanation:** Category x...x requires keyword parameter y...y, but it is missing.  
**System action:** Parameters are not accepted.  
**System programmer response:** Add keyword parameter y...y to the category.  
**Source:** Extended remote copy (XRC).  

**ANTI1006E**  
**DATA SET x...x NOT y...y**  
**Explanation:** Parameter library data set x...x does not meet the required specifications. y...y describes what these specifications are.  
**System action:** Parameters are not accepted.  
**System programmer response:** Specify a library that has the required specification.  
**Source:** Extended remote copy (XRC).  

**ANTI1007E**  
**ERROR(S) FOUND IN MEMBER x...x OF DATA SET y...y**  
**Explanation:** Parameter library support was invoked and errors were found.  
**System action:** Parameters are not accepted.  
**System programmer response:** Fix the errors and reinvoke parameter library support.  
**Source:** Extended remote copy (XRC).
ANTI1026I  VALUE FOR x...x NOT APPLIED

Explanation:  Keyword parameter x...x cannot be applied unless it resides in a specified location.  For example, keyword HLQ cannot be applied unless it is found in member ANTXIN00 in data set SYS1.PARMLIB at XSTART time.

System action:  Parameters are not accepted.

System programmer response:  Place the parameter in the correct location.

Source:  Extended remote copy (XRC).

ANTI1027E  ERROR(S) ENCOUNTERED IN ACCESSING MEMBER x...x OF DATA SET y...y

Explanation:  Extended remote copy (XRC) is unable to access member x...x.  For example, data set y...y is allocated for exclusive use by another program, and it prevents XRC from allocating y...y.

System action:  Parameters are not accepted.

System programmer response:  Correct the problems specified in previous messages and reinvoke parmlib support.

Source:  Extended remote copy (XRC).

ANTI1029E  CANNOT DETERMINE CHARACTERISTICS OF DATA SET x...x

Explanation:  Unable to access data set x...x.  As a result, extended remote copy cannot check data set organization.

System action:  Parameters are not accepted.

System programmer response:  Correct the errors specified in previous messages and reinvoke parmlib support.

Source:  Extended remote copy (XRC).

ANTI1030E  ERROR(S) PROCESSING MEMBER

membername OF DATA SET dsname, RC=rc REAS=reas

Explanation:  Address space ANTAS000 encountered an error processing the XRC parmlib parameters found in the member membername of data set dsname.  The error is described by the return code rc and reason code reas.  The XRC parmlib parameters that were checked for errors are only those that apply to the STARTUP and NAMES parameters.

System action:  Processing continues.

System programmer response:  Correct the error(s) for the STARTUP and NAMES parameters specified in the member membername.  Defaults for these parameters will have been applied.  This member and its parameters are also accessed when you issue the XRC XSTART command to start an XRC session.  The XSTART command will fail if these errors still exist in the member.

Source:  Extended remote copy (XRC).

ANTI1031E  PARAMETER parm DOES NOT HAVE ENOUGH VALUES

Explanation:  During XRC XSTART processing, the XRC parmlib parameter parm was found to not contain the appropriate amount of values.  Message ANTI1007E indicates the data set name and member in which the parameter in error was found.

System action:  XSTART command is failed.

System programmer response:  Correct the parameter in error, and resubmit the XSTART command.

Source:  Extended remote copy (XRC).

ANTI1033E  PARAMETERS parms1 REQUIRE PARAMETER parms2

Explanation:  If the parameters specified by parms1 are specified, parms2 is a required parameter.

System action:  PARMLIB values are not applied.  If this occurs during an XSTART operation, XSTART fails and the session is not started.  If this occurs during an XSET operation, the new values are not applied.

System programmer response:  Correct the parameters and issue the XSTART command again if needed.

Source:  Extended remote copy (XRC).

ANTI1036E  RANGE VALUE value1:value2 FOR KEYWORD keyword IS INVALID

Explanation:  The range specified by value1 and value2 is not valid for the given keyword.

System action:  PARMLIB values are not applied.  If this occurs during an XSTART operation, XSTART fails and the session is not started.  If this occurs during an XSET operation, the new values are not applied.

System programmer response:  Correct the parameters and issue the XSTART command again if needed.

Source:  Extended remote copy (XRC).

ANTI1037E  VALUE FOR keyword MUST CONTAIN value1

Explanation:  If the given keyword is specified, the respective value must contain the value specified in value1.

System action:  PARMLIB values are not applied.  If this occurs during an XSTART operation, XSTART fails
and the session is not started. If this occurs during an XSET operation, the new values are not applied.

**System programmer response:** Correct the parameters and issue the XSTART command again if needed.

**Source:** Extended remote copy (XRC).

---

**ANTI1038E**  
**PARAMETER(S) parm1 REQUIRED FOR MODE (mode)**

**Explanation:** If mode is specified, parm1 is a required parameter.

**System action:** PARMLIB values are not applied. If this occurs during an XSTART operation, XSTART fails and the session is not started. If this occurs during an XSET operation, the new values are not applied.

**System programmer response:** Correct the parameters and issue the XSTART command again if needed.

**Source:** Extended remote copy (XRC).

---

**ANTI2000E**  
**UNABLE TO CREATE**

**address_space_name**

**ADDRESS SPACE. ASCRE RC=return_code REAS=reason_code**

**Explanation:** The MVS address space create service (ASCRE) has failed to create the **address_space_name** address space for XRC. ASCRE fails with return code return_code and reason code reason_code.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are inactive.

**System programmer response:** See the appropriate MVS system codes manual for an explanation of the return code. If necessary, increase the system limit on resource managers. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

---

**ANTI2003E**  
**UNABLE TO CREATE ENTRY TABLE. ETCRE ABEND=abend_code**

**Explanation:** XRC has called the MVS entry table create service (ETCRE) which abnormally ends with code abend_code.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are inactive.

**System programmer response:** See the appropriate MVS system codes manual for an explanation of the abend code. You might need to increase the number of slots in the system function table reserved for linkage indexes. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

---

**ANTI20001E**  
**UNABLE TO ADD RESOURCE MANAGER. RESMGR RC=return_code**

**Explanation:** The MVS resource manager service (RESMGR) has failed to create a resource manager for XRC. RESMGR fails with return code return_code.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are inactive.

**System programmer response:** See the appropriate MVS system codes manual for an explanation of the return code. If necessary, increase the system limit on resource managers. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.
ANTU2004E UNABLE TO CONNECT ENTRY TABLE.  
ETCON ABEND=abend_code

Explanation: XRC has called the MVS entry table 
connect service (ETCON) but abnormally ends with 
code abend_code.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See the appropriate 
MVS system codes manual for an explanation of the 
abend code. If the problem persists, search the problem 
reporting databases for a solution. If no solution exists, 
contact the IBM Support Center. Provide the system log 
and SVC dumps of the ANTAS000 and any ANTASnnn 
address spaces that are active. To determine which 
address spaces are active, enter the console command 
DISPLAY A,ANTAS*. If an XRC error is indicated in the 
system log, also provide pertinent SYS1.LOGREC 
information.

ANTU2005E UNABLE TO SET AUTHORIZATION.  
AXRES ABEND=abend_code

Explanation: XRC has called the MVS reserve 
authorization service (AXRES) which abnormally ends 
with code abend_code.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See the appropriate 
MVS system codes manual for an explanation of the 
abend code. If the problem persists, search the problem 
reporting databases for a solution. If no solution exists, 
contact the IBM Support Center. Provide the system log 
and SVC dumps of the ANTAS000 and any ANTASnnn 
address spaces that are active. To determine which 
address spaces are active, enter the console command 
DISPLAY A,ANTAS*. If an XRC error is indicated in the 
system log, also provide pertinent SYS1.LOGREC 
information.

ANTU2006E UNABLE TO GET SMS STATUS.  
SSREQ ABEND=abend_code

Explanation: XRC has called the SMS status service 
(SSREQ) which abnormally ends with code 
abend_code.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See the appropriate 
MVS system codes manual for an explanation of the 
abend code. If the problem persists, search the problem 
reporting databases for a solution. If no solution exists, 
contact the IBM Support Center. Provide the system log 
and SVC dumps of the ANTAS000 and any ANTASnnn 
address spaces that are active. To determine which 
address spaces are active, enter the console command 
 Display A,ANTAS*. If an XRC error is indicated in the 
system log, also provide pertinent SYS1.LOGREC 
information.

ANTU2007E UNABLE TO ADD RESOURCE 
MANAGER. RESMGR 
ABEND=abend_code

Explanation: XRC has called the MVS add resource 
manager service (RESMGR) which abnormally ends 
with code abend_code.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See the appropriate 
MVS system codes manual for an explanation of the 
abend code. If the problem persists, search the problem 
reporting databases for a solution. If no solution exists, 
contact the IBM Support Center. Provide the system log 
and SVC dumps of the ANTAS000 and any ANTASnnn 
address spaces that are active. To determine which 
address spaces are active, enter the console command 
 DISPLAY A,ANTAS*. If an XRC error is indicated in the 
system log, also provide pertinent SYS1.LOGREC 
information.

ANTU2008I INITIATING CANCEL FOR 
  address_space_name ASID 
  address_space_identifier

Explanation: The system data mover has previously 
detected a fatal error condition that prevents further 
processing and is now terminating its address space.

Source: Extended remote copy (XRC).

System action: The system data mover issues a 
cancel system command to terminate its address space.

If a command was being processed for the session at 
the time of cancel, the control address space will not 
process another command for the session for up to 10 
minutes.

System programmer response: Look for preceding 
messages that identify the fatal error, correct the 
condition, and restart the XRC session.

If subsequent commands issued to the session appear 
to hang, recycle the control address space by issuing 
the command CANCEL ANTAS000.

ANTU2100I MSGID msgid DETECTED

Explanation: XRC has detected that message msgid 
 is to be issued and that a dump should be taken of the 
address space. Messages ANTU2101I through 
ANTU2105I will be issued before the dump being taken.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: None.
ANTU2101I GPR-3 GPR0 GPR1 GPR2 GPR3
Explanation: XRC has detected that the message indicated in message ANTU2100I is to be issued, and that a dump is to be taken of the address space. GPR0 through GPR3 are the general purpose registers 0 through 3 at the time of this detection.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: None.

ANTU2102I GPR4-7 GPR4 GPR5 GPR6 GPR7
Explanation: XRC has detected that the message indicated in message ANTU2100I is to be issued, and that a dump is to be taken of the address space. GPR4 through GPR7 are the general purpose registers 4 through 7 at the time of this detection.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: None.

ANTU2103I GPR8-11 GPR8 GPR9 GPR10 GPR11
Explanation: XRC has detected that the message indicated in message ANTU2100I is to be issued, and that a dump is to be taken of the address space. GPR8 through GPR11 are the general purpose registers 8 through 11 at the time of this detection.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: None.

ANTU2104I GPR12-15 GPR12 GPR13 GPR14 GPR15
Explanation: XRC has detected that the message indicated in message ANTU2100I is to be issued, and that a dump is to be taken of the address space. GPR12 through GPR15 are the general purpose registers 12 through 15 at the time of this detection.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: None.

ANTU2105I DUMP BEING TAKEN FOR MSGID msgsid
Explanation: XRC has detected that the message msgsid is to be issued, and that a dump is being taken of the address space.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: None.

ANTU2500E ABEND OCCURRED IN MODULE mod_name AT OFFSET offset, ABEND CODE=abend_code
Explanation: XRC detected an abend with abend code abend_code at offset offset in module mod_name.
Source: Extended remote copy (XRC), concurrent copy, or a striping function.
System action: XRC functions are inactive.
System programmer response: See the appropriate MVS system codes manual for an explanation of the abend code. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log, the XRC dump generated when the abend occurred, and pertinent abend information from SYS1.LOGREC. The system log includes messages ANTU2500E through ANTU2512E issued when the abend occurred. Ensure that XRC ends by canceling the ANTAS000 and the associated ANTASnnn address space. After you have canceled these address spaces, ANTAS000 automatically restarts. When message ANTB8001I is received, restart XRC operations by entering an XSTART command.

ANTU2501E PSW AT TIME OF ABEND = psw
Explanation: XRC detected the abend at PSW psw. This message is preceded by message ANTU2500E.
Source: Extended remote copy (XRC), concurrent copy, or a striping function.
System action: XRC functions are inactive.
System programmer response: See message ANTU2500E.

ANTU2502E GENERAL PURPOSE REGISTERS AT TIME OF ABEND ARE AS FOLLOWS:
Explanation: XRC detected an abend. The contents of the general purpose registers at the time of the abend are specified immediately following this message in messages ANTU2503E through ANTU2506E. This message is preceded by messages ANTU2500E and ANTU2501E.
Source: Extended remote copy (XRC), concurrent copy, or a striping function.
System action: XRC functions are inactive.
System programmer response: See message ANTU2500E.
**ANTU2503E GPR0–3 gpr0 gpr1 gpr2 gpr3**

**Explanation:** XRC detected an abend. The contents of general purpose registers 0 through 3 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2502E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2504E GPR4–7 gpr4 gpr5 gpr6 gpr7**

**Explanation:** XRC detected an abend. The contents of general purpose registers 4 through 7 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2503E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2505E GPR8–11 gpr8 gpr9 gpr10 gpr11**

**Explanation:** XRC detected an abend. The contents of general purpose registers 8 through 11 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2504E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2506E GPR12–15 gpr12 gpr13 gpr14 gpr15**

**Explanation:** XRC detected an abend. The contents of general purpose registers 12 through 15 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2505E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2507E ACCESS REGISTERS AT TIME OF ABEND ARE AS FOLLOWS:**

**Explanation:** XRC detected an abend. The contents of the access registers at the time of the abend are specified in messages ANTU2508E through ANTU2511E immediately following this message. This message is preceded by messages ANTU2500E through ANTU2506E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2508E AR0–3 ar0 ar1 ar2 ar3**

**Explanation:** XRC detected an abend. The contents of access registers 0 through 3 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2507E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2509E AR4–7 ar4 ar5 ar6 ar7**

**Explanation:** XRC detected an abend. The contents of access registers 4 through 7 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2508E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.

**ANTU2510E AR8–11 ar8 ar9 ar10 ar11**

**Explanation:** XRC detected an abend. The contents of access registers 8 through 11 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2509E.

**Source:** Extended remote copy (XRC), concurrent copy, or a striping function.

**System action:** XRC functions are inactive.

**System programmer response:** See message ANTU2500E.
ANTU2511E  AR12–15  ar12 ar13 ar14 ar15
Explanation:  XRC detected an abend. The contents of access registers 12 through 15 at the time of the abend are specified in this message. This message is preceded by messages ANTU2500E through ANTU2510E.
Source:  Extended remote copy (XRC), concurrent copy, or a striping function.
System action:  XRC functions are inactive.
System programmer response:  See message ANTU2500E.

ANTU2512E  abending module identifier
Explanation:  XRC detected an abend in the module identifier abending module identifier. This message is preceded by message ANTU2500E.
Source:  Extended remote copy (XRC), concurrent copy, or a striping function.
System action:  XRC functions are inactive.
System programmer response:  See message ANTU2500E.

ANTU2513I  information HAS BEEN COPIED TO DATA SET dataset_name
Explanation:  The command information specified by information has been successfully written to the data set specified by dataset_name.
Source:  Extended remote copy (XRC).
System action:  XRC functions are active.
System programmer response:  If the command has been accepted and this message has not been issued at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTU2514W  UNABLE TO COPY information TO DATA SET dataset_name
Explanation:  The request, indicated by information, for output to data set dataset_name has failed. The return code given by return_code and reason code given by reason_code indicate the reason for the failure.
Source:  Extended remote copy (XRC).
System action:  XRC functions are active.
System programmer response:  See System data mover return codes” on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command.

ANTU2515I  xquery_type HAS BEEN RETURNED TO THE API
Explanation:  An XRC request was submitted via the ANTRQST application programming interface (API). XQUERY output for the request was returned in the MESSAGES area. xquery_type indicates the type of XQUERY output being returned.
Source:  Extended remote copy (XRC).
System action:  XRC functions are active.
System programmer response:  See Advanced Copy Services for an explanation of xquery_type output being returned to the API.

ANTX5000E  device_number, serial_number, failing_CCW_command_code, failing_CCW_position, CCW_data_area, full_error_description
Explanation:  The XRC function encountered an I/O error. The message text provides the following information:
- device_number – The device number to which the I/O is directed. If the device is associated with a utility volume, the error can be a storage control error.
- serial_number – The volume serial number, if available, of the device that encountered the I/O error.
- failing_CCW_command_code – The channel command word (CCW) code that encounters the I/O error.
- failing_CCW_position – The position in the channel program chain on which the error occurs. If the error occurs at the first CCW in the chain (a Define Extent), the path to the storage control or device can have been dropped. This can indicate an operations error because of the storage path being removed.
- CCW_data_area – The parameter list data area of the failing CCW.
- full_error_description – A brief description of the cause of the I/O error based on the sense data. The descriptions are as follows:
  - STORAGE_CONTROL_SESSION_NUMBER NOT_ACTIVE – This indicates a dropped XRC session resulting from an error that ended the storage control session. The error can occur when the update-handling capability of XRC is exceeded by the update rate to the storage control. In this case, examine the number and configuration of volumes managed by XRC to determine the cause of the high update rate to the storage control. If this error persists, the XRC environment can require reconfiguration. This error can also occur if the timeout interval has expired.
  - STORAGE_CONTROL_SESSION_NUMBER NOT_ACTIVE_ON_PATH_xx – This indicates that the path group ID used by XRC in sending
requests to a storage control is physically unavailable. xx indicates the channel path ID associated with the path group ID that is physically unavailable. Ensure that device_number is online (or at least one other device associated with this channel path), and then vary the channel path xx offline and then vary the channel path back online. This will make available the path group ID needed by XRC. Issue the MVS MODIFY command of PATHS to list the channel paths currently associated with the device number device_number.

- NONVOLATILE_STORAGE_NOTAVAILABLE – This indicates that nonvolatile storage has been altered. Issue the DEVSEVR MVS operator command to determine the status of nonvolatile storage. Do not disable nonvolatile storage for storage controls that have an active XRC session. Correct the problem by re-enabling nonvolatile storage and issuing the XADDPAIR command to add the volume or volumes behind the affected storage control to the XRC session.

- CACHE_NOTAVAILABLE – This indicates that cache has been disabled. Issue the DEVSEVR MVS operator command to determine the status of cache storage. Cache storage should not be disabled for storage controls that have an active XRC session. Correct the problem by re-enabling cache for the storage control and issuing the XADDPAIR command to add the volume or volumes behind the affected storage control to the XRC session.

- TOO_MANY_STORAGE_CONTROL_SESSIONNUMBERS – This indicates that either the maximum number of XRC sessions on the storage control (from multiple MVS hosts) has been exceeded or that the maximum number of concurrent copy and remote copy sessions on the storage control has been exceeded. The LISTSESS diagnostic command can be used to determine which sessions are active on a storage control. See [Advanced Copy](DFSMS Advanced Copy) for a description of the LISTSESS command. Reduce the number of active sessions on the affected storage control and issue the XADDPAIR command to add the volume or volumes behind the affected storage control to the XRC session.

- DEVICE_NOTPARTOFANYXRCSESSION – This indicates a dropped XRC session resulting from an operations error that produced a reset notification. This error can also indicate that an error has occurred in the storage control cache or that the cache is disabled, causing any knowledge of this device as part of an XRC session to be lost. Issue the DEVSEVR MVS operator command to determine the status of cache storage. Correct the problem by re-enabling cache for the storage control and issuing the XADDPAIR command to add the volume or volumes behind the affected storage control to the XRC session.

- PATH_GROUP_NOT_ESTABLISHED – This indicates a dropped XRC session resulting from an operations error that produced a reset notification. This error can also indicate that an error has occurred in the storage control cache or that the cache is disabled, causing any knowledge of this device as part of an XRC session to be lost. Issue the DEVSEVR MVS operator command to determine the status of cache storage. Correct the problem by re-enabling cache for the storage control and issuing the XADDPAIR command to add the volume or volumes behind the affected storage control to the XRC session.

- XRC_SESSION_ALREADY_ACTIVE _FORDEVICE – This indicates that another MVS system already has an active XRC session on the specified device, or that the device is active in a session that has been suspended. Only one XRC session can be active per device.

- XRC_SESSIONDEVICE_SUSPENDED – This indicates that an XRC session or device is suspended on an ESS storage control unit. The error can occur on a session level when the update-handling capability of XRC is exceeded by the update rate to the storage control. Examine the number and configuration of volumes managed by XRC to determine the cause of the high update rate to the storage control. If this error persists, the XRC environment can require reconfiguration. This error can also occur if the timeout interval has expired. This error message can occur by command, at device or volume level.

- INVALIDCOMMAND – This is due to issuing an XRC command to a storage control that does not have XRC capability.

- INVALIDCOMMANDSEQUENCE – This is either due to an internal error or because an XRC command has been issued to a storage control that does not have XRC capability.

- CCW_COUNT_LESS_THAN_REQUIRED – This is due to an internal error.

- INVALIDPARAMETER – This is either due to an internal error or because an XRC command has been issued to a storage control that does not have XRC capability.

- STORAGE_CONTROL_SESSION_NUMBER_ ZERO_OR_ALREADY_USED – This is due to an internal error.

- STORAGE_CONTROL_CACHE_ALREADY_ BEING_READ – This is due to an internal error.

Source: Extended remote copy (XRC).

System action: The XRC action taken is based upon the ERRORLEVEL specified on the XSTART command, as follows:
- If ERRORLEVEL(SESSION) is specified, XRC suspends all active volumes on any I/O error. Correct the error and restart the XRC session. The session is suspended only if the volume is in a duplex state at the time of the error. Errors before a volume reaching duplex state do not affect the session.
- If ERRORLEVEL(VOLUME) is specified, the scope of the error determines the action taken. If the error occurs for a single primary or secondary volume, only the affected volume pair is removed from the session. If the error impacts a storage control, all volume pairs using that storage control are removed from the session. Certain errors have the potential to end the XRC session.
- If ERRORLEVEL(group_name) is specified, XRC suspends all volumes that belong to the specified group. Correct the error and add the volume pairs back into the session.

**System programmer response:** If the problem is an environmental or hardware error, then correct the error and restart the session or volumes. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTA5000 and any ANTA5nnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. In addition, provide any SYS1.LOGREC information indicating the I/O error encountered. For some errors, a GTF trace can be required to determine the cause of the problem.

ANTX5001E device_number, abbreviated_error_description, failing_CCW_command_code, failing_CCW_position, IOS_completion_code, subchannel_status, sense_data, serial_number, full_error_description

**Explanation:** When the XRC function encounters an I/O error, the message text provides the following information:
- device_number – The device to which the I/O is directed. If the device is associated with a primary XRC volume, then the error can be a storage control error.
- abbreviated_error_description – A short error code describing the type of error based on the sense information. The valid codes are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOC</td>
<td>Bus out parity check</td>
</tr>
<tr>
<td>CMD</td>
<td>Command reject</td>
</tr>
<tr>

</tr>
<tr>
<td>WRI</td>
<td>Write operation</td>
</tr>
</tbody>
</table>

- full_error_description – A brief description of the cause of the I/O operation fails.

**Source:** Extended remote copy (XRC).

**System action:** The XRC action taken is based upon the type of error and the ERRORLEVEL specified on the XSTART command as follows:
- If ERRORLEVEL(SESSION) is selected, XRC will suspend all active volumes in the session on any I/O error. Correct the error and restart the XRC session. The session is suspended only if the volume is in a duplex state at the time of the error. Errors before a volume reaching duplex state do not affect the session. If the session is a coupled, interlocked session, the error also causes volumes to be suspended in all other sessions coupled to the same master session.
- If ERRORLEVEL(VOLUME) is selected, the scope of the error determines the action taken. If the error occurs for a single primary or secondary volume, only the affected volume pair will be removed from the session. If the error impacts a storage control, all volume pairs using that storage control will be removed from the session. Certain errors have the potential to end the XRC session.
ANTX5002E  •  ANTX5009W

- If ERRORLEVEL(group_name) is specified, XRC suspends all volumes that belong to the specified group. Correct the error and add the volume pairs back into the session.

**System programmer response:** If the problem is an environmental or hardware error, correct the error and restart the failing XRC function. If the problem persists, search problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTA500 and any ANTA5nnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. In addition, provide any SYS1.LOGREC information indicating the I/O error encountered.

In any case, XRC processing for the impacted volume or volumes has ended. Correct the error and restart the session or volumes.

**ANTX5002E**  

device_number, serial_number,  
SERVRETCC_from_AOM,  
SERVREASC_from_AOM,  
SERVFRC_from_AOM,  
SERVABCC_from_AOM

**Explanation:** XRC has detected an error when requesting a service from the Asynchronous Operations Manager (AOM) function. The message provides the device number to which the I/O is directed (if the device is associated with a primary XRC volume, the error can be a storage control error), the volume serial number of the device that encounters the I/O error, the return code SERVRETCC_from_AOM, the reason code SERVREASC_from_AOM, the functional code SERVFRC_from_AOM, and the abend code SERVABCC_from_AOM received from AOM. If the device is offline or unavailable, the volume serial number is reported as "******".

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are inactive.

**System programmer response:** See "System data mover return codes" on page 499 for an explanation of the return codes. You can have specified an incorrect master session high-level qualifier on the XQUERY command. Correct the error and reenter the command. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTA500 and any ANTA5nnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information. Based on the return and reason codes, XRC cannot be processing normally. In this case, end and restart the XRC session. If the session fails to end properly, cancel the ANTA500 and ANTA5nnn address spaces. After you cancel these address spaces, ANTA500 automatically restarts. When message ANTB80011 is received, restart XRC operations by entering an XSTART command.

**ANTX5009W**  
UNABLE TO RECOVER A SUSPENDED STORAGE CONTROL SESSION NUMBER

**Explanation:** XRC detects a suspended storage control session that cannot be recovered. XRC continues normal operations.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See "System data mover return codes" on page 499 for an explanation of the return codes. You can have specified an incorrect master session high-level qualifier on the XQUERY command. Correct the error and reenter the command. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTA500 and any ANTA5nnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.
ANTB5010E XRC CONTROL INITIALIZATION FAILURE. RC=return_code REAS=reason_code

Explanation: The XRC control address space initialization has failed with return code return_code and reason code reason_code.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See “System mover return codes” on page 499 for an explanation of the return codes. Based on the error, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

ANTX5011E XRC SESSION(session_id) ENCORENDED AN ERROR WHILE PROCESSING voltype VOLUME(volser), RC=return_code REAS=reason_code

Explanation: XRC has encountered an error while processing volume volser for the volume type specified with voltype, in session session_id. voltype can be PRIMARY, SECONDARY, or RECOVERY. The processing ends with return code return_code and reason code reason_code.

Source: Extended remote copy (XRC).

System action: XRC functions are active. If the voltype is PRIMARY or SECONDARY, the volume remains suspended. The session remains active.

System programmer response: XRC can issue this message during a session restart or recovery process if the volume is offline. See Table 4 on page 500 for an explanation of the return and reason codes. Based on the error, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

ANTX5014E SYNADAF message

Explanation: XRC has encountered an I/O error. The output from the SYNADAF macro is provided with this message.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Macro Instructions for Data Sets for a description of the SYNADAF macro and its associated output. Correct the error. If the error persists, search problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

ANTX5020E ERROR DETECTED FOR DEVICE device_number UNDER CONTROLLER SESSION session_number FOR XRC SESSION(session_id), REAS=reason_code

Explanation: An error is detected for device device_number running under XRC session session_id. The XRC session has been active under storage control session session_number. The reason code for the error is given by reason_code, as follows:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>The number of entries in the cache has exceeded the supported limit. The current limit is 16K entries.</td>
</tr>
</tbody>
</table>
4 The subsystem storage cache is overcommitted. The XRC session is canceled.

5 The storage control has encountered an internal error. The XRC session is canceled.

Source: Extended remote copy (XRC).

System action: XRC functions for volumes under this storage control are ended.

System programmer response: This error can occur as a result of several configuration problems, as follows:

- Verify that the journal and control data sets are set up correctly. See z/OS DFSMS Advanced Copy Services for additional details.
- Verify that secondary volume I/O activity can be supported by the configuration. Verify that the secondary volumes are attached to storage controls with sufficient NVS, and that DASD fast write is active.
- Verify that the storage control cache size is adequate to support the primary volume update rate.
- Verify that the host configuration can support the XRC activity. You might need to allocate more expanded storage to support the XRC work load.

If all configuration conditions appear to be correct, search problem reporting data bases for a solution for the problem. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

**ANTS5100E** XRC ENCOUNTERED AN ERROR PROCESSING XSTART COMMAND FOR SESSION(session_id), WITH HLQ (hlq), RC=return_code REAS=reason_code

Explanation: The XSTART command for session session_id using the high-level qualifier of hlq has failed with return code return_code and reason code reason_code.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: The XSTART command has encountered an error condition during processing. See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error, and reenter the command if necessary. Sometimes the command continues to process when the error condition is corrected. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center. After collecting this information, it can be possible to restart XRC by canceling the ANTAS000 and ANTASnnn address spaces. After you cancel these address spaces, ANTAS000 automatically restarts. When message ANTB8001I is received, start XRC operations by entering an XSTART command.

The ANTS5100E message can also be received as a result of an internal XSTART command, which was caused by a MODIFY ANTASnnn,RESTART command. The ANTASnnn address space had not yet ended. Reissue the XSTART command after the ANTASnnn address space has ended.

**ANTX5101E** XRC SESSION(session_id) ENCOUNTERED AN ERROR PROCESSING cmdname (option) FOR VOLUME PAIR(primary_volser,secondary_volser), RC=return_code REAS=reason_code

Explanation: XRC has encountered an error while attempting to process the command specified by cmdname using option option for volume pair primary_volser and secondary_volser in session session_id. The command processing ended with return code return_code and reason code reason_code. The status of the volume pair is unknown.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center. Based on the return and reason codes, the processing of this volume can have not completed normally. Though the volume is no longer being copied, it can not be possible to add this volume to the XRC session in the future without first suspending the active session and restarting the session.

**ANTR5102E** command FAILED FOR SESSION(session_id) WITH HLQ (hlq), RC = return_code REAS = reason_code

Explanation: The command command for session session_id using the high-level-qualifier of hlq has failed with return code return_code and reason code reason_code. This message is issued during XRC recovery processing.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error, and reenter the command if necessary. Sometimes the command continues to process when the error condition is corrected. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center. After collecting this information, it can be possible to restart XRC by canceling the ANTAS000 and ANTASnnn address spaces. After you cancel these address spaces, ANTAS000 automatically restarts. When message ANTB8001I is received, start XRC operations by entering an XSTART command.

The ANTR5102E message can also be received as a result of an internal XSTART command, which was caused by a MODIFY ANTASnnn,RESTART command. The ANTASnnn address space had not yet ended. Reissue the XSTART command after the ANTASnnn address space has ended.
mover return codes" on page 499 for an explanation of the return and reason codes and perform the action indicated by the return code and reason code. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center.

**ANTX5103E** XRC ENCOUNTED AN ERROR PROCESSING cmdname (option) FOR SESSION(session_id), RC=return_code REAS=reason_code

**Explanation:** XRC has encountered an error while attempting to process the command cmdname with option option for session session_id. This message does not necessarily mean that the function has failed to complete. The return code given by return_code and the reason code given by reason_code indicate the nature of the error.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions can be active or inactive based on the command.

**System programmer response:** See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command. This message can be the result of an internally-generated XRC command. In this case, perform the tasks indicated by the return and reason codes. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center. Based on the return and reason codes, the cleanup of this session can have not completed normally. After collecting any diagnostic information, cancel the ANTSnnn address space before you start a new XRC session.

**ANTX5104E** XRC SESSION(session_id) ENCOUNTED AN ERROR PROCESSING VOLUME(error_volser) IN VOLUME PAIR (primary_volser,secondary_volser), RC=return_code REAS=reason_code

**Explanation:** XRC has encountered an error for volume error_volser while processing the volume pair primary_volser and secondary_volser in session session_id. The processing for the volume pair ended with return code return_code and reason code reason_code. The volume pair is suspended from the session.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center.

Based on the return and reason codes, the processing of this volume pair can have not completed normally. You can add back the suspended volume pair into the XRC session after you have corrected the error. If this is not possible, you can be forced to suspend the active session or cancel the ANTSnnn address space and restart the session before you add the volume. Based on the error, the volume pair can require a full synchronization.

**ANTX5105E** XRC SESSION(session_id) ENCOUNTED AN ERROR, RC=return_code REAS=reason_code

**Explanation:** XRC has encountered an error in session session_id. The processing ended with return code return_code and reason code reason_code.

**Source:** Extended remote copy (XRC).

**System action:** XRC session is suspended.

**System programmer response:** Follow the specific actions recommended by the return and reason codes. Usually, you can correct the error and restart the session. If this message is accompanied by message ANTS5100E, see the error codes within the ANTS5100E message instead of the error codes issued by this message. See "System data mover return codes" on page 499 for an explanation of the return and reason codes. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center. Based on the return and reason codes, any of the following can be true:

- The session can have been suspended.
- The session can have been restarted by command.
- Some volume pairs can require a complete synchronization.
- XRC can not be processing normally.

If this is not a restart, gather diagnostic information and then cancel ANTSnnn if you wish to restart the XRC session.

**ANTX5106E** XRC SESSION(session_id) DETECTED A error_type ERROR, REAS=reason_code

**Explanation:** The XRC software for session session_id has detected an environmental error. The error_type field specifies the likely cause. The reason that is indicated by reason_code provides the reason for the error.

For some of the errors (as indicated below), diagnostic information for the error is placed in SYS1.LOGREC. If a X'9C4' abend is produced with this message, the
reason code \textit{reason\_code} is the same as reported in Register 15 for a 'X'9C4' abend code.

\textit{error\_type} can be one of the following:

- SOFTWARE – If the XRCTRAP function is set to ON, XRC generates a dump to the SYS1.DUMP data set to capture relevant debugging information. For these errors the system log contains relevant diagnostics.
- LIC – The storage control can have generated a diagnostic state save. If a state save was not generated, you should ensure that the SCTRAP function is active. This is done by issuing the system console command MODIFY ANTAS000,SCTRAP ON. For these errors, the system log contains relevant diagnostics.
- HARDWARE – Relevant diagnostics are provided in the system log and in SYS1.LOGREC.
- STATE\_DATASET – An error occurs when XRC is writing to the state data set. Relevant diagnostics, with associated IEC or IOS error messages, are provided in SYS1.LOGREC and in the system log.
- CONTROL\_DATASET – An error occurs when XRC is writing to the control data set. Relevant diagnostics, with associated IEC or IOS error messages, are provided in SYS1.LOGREC and in the system log.

\textbf{Source:} Extended remote copy (XRC).

\textbf{System action:} XRC functions are active.

\textbf{System programmer response:} See \textit{"System data mover return codes" on page 499} for an explanation of the return codes. Correct the error. Provide all information generated for the particular error type, the system log, and SVC dump of the ANTASnnn address space. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center.

Based on the return and reason codes, the XRC session or a set of volumes behind one or more storage controls can have been suspended. Correct the problem which caused the failure. You can add the volumes back into the session. If this fails, you might need to suspend the XRC session, restart the session, and after a successful restart, add the volumes back into the session.

\textbf{Explanation:} The \texttt{XADDPAIR} command for the volume pair indicated by \texttt{primary\_volser} and \texttt{secondary\_volser} in session \texttt{session\_id} failed with return code \texttt{return\_code} and reason code \texttt{reason\_code}. The specified volume pair is not added to the session.

\textbf{Source:} Extended remote copy (XRC).

\textbf{System action:} XRC functions are active.

\textbf{System programmer response:} XRC activity is suspended on the specified volume pair, but continues on other volume pairs in the session. See \textit{"System data mover return codes" on page 499} for an explanation of the return and reason codes. Correct the error. Search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center if an XRC error is indicated in the system log.

\textbf{ANTX5108E XRC SESSION(session\_id) ENCOUNTERED AN ERROR PROCESSING AN} \texttt{VOLUME LIST (first\_volume\_in\_list,..., last\_volume\_in\_list)}, \texttt{RC=return\_code REAS=reason\_code}

\textbf{Explanation:} The XRC session \texttt{session\_id} has encountered an error while attempting to process the command specified by \texttt{cmdname} using option \texttt{option} for a list of volumes. The failing volume list is identified by \texttt{first\_volume\_in\_list} and \texttt{last\_volume\_in\_list}. The return code is given by \texttt{return\_code} and the reason code by \texttt{reason\_code}. This message can be preceded by \texttt{ANTX5101E} messages that identify the reason the error has occurred for one of the volumes in the list. The volume list is not processed.

\textbf{Source:} Extended remote copy (XRC).

\textbf{System action:} XRC functions are active.

\textbf{System programmer response:} This error occurs when an \texttt{XDELPAIR} or \texttt{XSUSPEND} command is issued and one of the volumes in the list fails to process. See previous \texttt{ANTX5101E} messages for the reason the failure occurred. See \textit{"System data mover return codes" on page 499} for an explanation of the return and reason codes.

Correct the error and reenter the command. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dump of the ANTASnnn address space. You can obtain the dump by issuing MODIFY ANTASnnn,DUMP. If an XRC error is indicated in the system log, provide pertinent SYS1.LOGREC information.

\textbf{ANTV5109E XRC ENCOUNTERED AN ERROR PROCESSING XSUSPEND FOR SESSION(session\_id), RC=return\_code REAS=reason\_code}

\textbf{Explanation:} XRC has encountered an error while attempting to process an XSUSPEND command for the session \texttt{session\_id}. This message does not necessarily mean that the function has failed to complete. The return code given by \texttt{return\_code} and the reason code given by \texttt{reason\_code} indicate the nature of the error.

\textbf{Source:} Extended remote copy (XRC).
System action: XRC functions are inactive.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command. After this error, issue CANCEL ANTAGnn and issue the XSTART command to restart the session. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center.

Based on the return and reason codes, the cleanup of this session can have not completed normally. After collecting any diagnostic information, cancel the ANTASnnn address space before you start a new XRC session.

**ANTS5110E** XRC RESTART FOR SESSION(session_id) FAILED FOR STORAGE CONTROL ssid, REAS=reason_code

Explanation: The XSTART command for session session_id attempted restarting processing of record updates for the storage control specified by ssid, and the restart operation has failed for the reason indicated by reason_code. If multiple SCSESSIONs exist for the storage control, this message can be issued for each session, based on the scope of the error.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command. After this error, issue CANCEL ANTAGnn and issue the XSTART command to restart the session. If an XRC error is indicated in the system log, search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center if an XRC error is indicated in the system log.

Based on the return and reason codes, the suspension of this volume pair can not have completed normally. Though the volume pair is no longer being copied, it can not be possible to add this volume pair to the XRC session in the future without first suspending the ANTAGnnn address space and restarting the session.

**ANTS5112E** XRC SESSION(session_id) ENCOUNTED AN ERROR PROCESSING STORAGE CONTROL ssid, RC=return_code REAS=reason_code

Explanation: XRC has encountered an error while processing the storage control identified by ssid, in session session_id. The processing ended with return code return_code and reason code reason_code. If multiple SCSESSIONs exist for the storage control, this message can be issued for each session, based on the scope of the error.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error. Search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center if an XRC error is indicated in the system log.

Based on the return and reason codes, the processing of volumes behind the specified storage control can not be processing normally. After gathering diagnostic information, suspend and restart the XRC session. If the session fails to suspend properly, cancel the ANTAGnnn address space. When you receive message ANTB8001I, restart XRC operations by entering an XSTART command.

**ANTS5113E** XRC ERROR SUSPENDING VOLUME PAIR(primary_volser,secondary_volser) FOR SESSION(session_id), RC=return_code REAS=reason_code

Explanation: The suspension of the volume pair primary_volser and secondary_volser in session session_id failed with return code return_code and reason code reason_code.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error. Search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center if an XRC error is indicated in the system log.

Based on the return and reason codes, the suspension of this volume pair can not have completed normally. Though the volume pair is no longer being copied, it can not be possible to add this volume pair to the XRC session in the future without first suspending the ANTAGnnn address space and restarting the session.

**ANTS5113E** PENDING ACTION FOR cmdname(option) CANCELED FOR VOLUME PAIR(primary_volser,secondary_volser) FOR SESSION(session_id)

Explanation: The pending action for cmdname option has been canceled for the volume pair indicated by primary_volser and secondary_volser in session session_id. This message is issued when an error occurs that causes XRC not to be able to process the command at the specified time.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See the previous XRC message to determine the reason the pending action has been canceled. To re-enable XRC functions
for the volume pair, correct the error and issue an XADDPAIR command to resynchronize the volume pair in the session.

**ANTX5114W PENDING ACTION FOR cmdname(option) CANCELED FOR SESSION(session_id)**

**Explanation:** The pending action for cmdname option has been canceled for the session session_id. This message is issued when an error occurs that causes XRC not to be able to process the command at the specified time. It can also occur if the last volume pair in the session has been either deleted or suspended by an XRC command or an XRC error.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See the previous XRC message to determine the action to take.

**ANTX5115E XSET (option(value)) FAILED FOR SESSION(session_id) RC = return_code REAS = reason_code**

**Explanation:** The XSET keyword option with value value has been specified for session session_id. The value specified is invalid. The reason for the error is identified by the specified return code and reason code.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** As a result of the error, the function requested by the XSET command is not performed. The most likely cause is that an invalid value has been specified for the option. Correct the error and reissue the command. If you issued the command and this message has not been displayed, you were cancelled as a result of a master cancel command, or the IMMEDIATE option. If the command was canceled as a result of a master cancel command, reissue the command with the IMMEDIATE option. If the command was canceled and this message has not been displayed, the most likely cause is that an invalid device_number has been specified. The storage control session has been canceled; all XRC volume pairs associated with this storage control session must be reinitialized. XRC will automatically initiate a request to dump the ANTASnnn address space.

**Reason** | **Description**
--- | ---
3 | The number of entries in the cache has exceeded the supported limit, which is 16K entries. The data mover has not read from the storage control for at least the timeout interval specified. The storage control session has been canceled; all XRC volume pairs associated with this storage control must be reinitialized. XRC will automatically initiate a request to dump the ANTASnnn address space.

**ANTX5116E XSET FAILED FOR SESSION(session_id), RC = return_code REAS = reason_code**

**Explanation:** The XSET command has failed for session session_id with return code return_code and reason code reason_code.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This error can occur as a result of several configuration problems, as follows:

**ANTX5117E XRC VOLUME INITIALIZATION ENCOUNTERED A PHYSICAL VOLUME ERROR ON VOLUME(volser) AT CCCCCCH OF ccccccCH**

**Explanation:** The XRC volume synchronization or resynchronization function has encountered a physical I/O error while initializing volume volser at the CCHH specified by cchh.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** Run the ICKDSF utility program to analyze the error at the specified CCHH on the volume experiencing the error. You might need to issue an XDELPAIR command to remove the volume from the session before running ICKDSF. Correct the error and issue the XADDPAIR command to add the volume pair to the session.

**ANTX5118E ERROR DETECTED FOR DEVICE device_number UNDER STORAGE CONTROL SESSION session_number FOR XRC SESSION(session_id), REAS=reason_code**

**Explanation:** An error is detected for device device_number running under XRC session session_id. The XRC session has been active under storage control session session_number. The reason code for the error is given by reason_code, as follows:

**Reason** | **Description**
--- | ---
3 | The storage control has encountered an internal error. The XRC session is canceled.
• Verify that the journal and control data sets are set up correctly. See z/OS DFSMS Advanced Copy Services for additional details.

• Verify that secondary volume I/O activity can be supported by the configuration. Verify that the secondary volumes are attached to storage controls with sufficient NVS, and that DASD fast write is active.

• Verify that the storage control cache size is adequate to support the primary volume update rate.

• Verify that the host configuration can support the XRC activity. You might need to allocate more expanded storage to support the XRC work load.

If all configuration conditions appear to be correct, search problem reporting data bases for a solution for the problem. If no solution exists, contact the IBM Support Center. Provide the console log and a dump of the ANTASnnn address space at the time when the error occurs.

ANTX5119E XRC SESSION(session_id) ENCOUNTERED AN ERROR PROCESSING STORAGE CONTROL

ssid SESSION session_number, RC=return_code, REAS=reason_code

Explanation: The XRC session identified by session_id has encountered an error while it processed the storage control session specified by ssid in session session_number. The processing ended with the specified return code and reason code. If multiple storage control sessions exist for the storage control, you might receive a message for each session that is based on the scope of the error. All volume pairs having primary devices on the indicated storage control will be suspended.

Following an error that suspends all volumes, reader activity pauses while device suspension is completed. During this period, storage control sessions with significant residual counts might be suspended by either the system data mover or the storage subsystem. The completion of these suspensions might take several minutes after the ANTX8120I for “all volumes suspended” message. Message ANTX5119E with RC=647 and message ANTV8107I for the associated XRCUTL volume accompany the suspensions.

Source: Extended remote copy (XRC).
System action: XRC functions are active.

System programmer response: See “System data mover return codes” on page 499 in this document for an explanation of the return and reason codes. Correct the error. Search problem reporting databases for a fix for the problem. If no fix exists, provide pertinent SYS1.LOGREC information to the IBM Support Center if an XRC error is indicated in the system log.

Based on the return and reason codes, volumes that are attached to the specified storage control can not be processing normally. Gather diagnostic information: if volume pairs were suspended, add the suspended volume pairs back into the XRC session after you have corrected the error. If this is not possible, you can be forced to suspend the active session or cancel the particular ANTASnnn address space, restart the session, and reissue the XADDPAIR command for all volumes that are associated with the reported session. This will require a full-volume synchronization of these volumes.

ANTX5120W XRC SESSION(session_id) STATUS FOR STORAGE CONTROL ssid, SESSION session_number CANNOT BE DETERMINED

Explanation: XRC has not been able to reestablish the session specified by session_number on storage control ssid and in XRC session session_id. If multiple storage control sessions exist for the storage control, you can receive a message for each session based on the state of the storage control.

Source: Extended remote copy (XRC).
System action: XRC functions are active.

System programmer response: This condition can or can not be a problem. The data mover is currently unable to communicate with the storage control and cannot determine if the specified session is active or not. This condition can be due to a loss of a path from the data mover system to the specified storage control. If this is the case, restore the path to resolve the situation and allow data mover activity on the storage control to continue normally. If paths are active and this message has been received, a GTF trace of data mover I/O to the storage control can be required to diagnose the problem. Search problem reporting databases for a fix for the problem. If no fix exists, provide the GTF trace, SYSLOG, and any associated LOGREC information to IBM for problem diagnosis.

ANTX5121E XSET TIMEOUT(value) SSID(ssid)

SCSESSION(session) FAILED FOR SESSION(session_id), RC=return_code, REAS=reason_code

Explanation: An XSET command with the specified TIMEOUT, SSID, and SCSESSION values has failed for session session_id. See the specified return code and reason code for additional information.

Source: Extended remote copy (XRC).
System action: XRC functions are active.

System programmer response: As a result of the error, the function requested by the XSET command is not performed. The most likely cause is that an invalid value has been specified for the option. Correct the error and reissue the command.
ANTA5122E  XADDPAIR SUSPENDED FAILED FOR
SESSION(session_id), RC=return_code
    REAS=reason_code

Explanation: The XADDPAIR SUSPENDED command
    was received for XRC session session_id. The reason
    that the command failed is indicated by the return code
    and reason code.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: The function has
    requested that all suspended volumes be added back to
    the session. Correct the error and reissue the
    command. If the problem persists, Search problem
    reporting databases for a fix for the problem. If no fix
    exists, issue a MODIFY command to dump the
    ANTASnnn address space and provide pertinent system
    log information to the IBM Support Center.

ANTA5123W  I/O REQUEST FOR DEVICE
    device_number HAS TIMED OUT,
    FUNC= function_code

Explanation: I/O for device device_number did not
    complete in the allotted time. This message can result
    when a storage control session has a large enough
    number of updated records in cache that it cannot
    process a read or a write I/O without affecting the
    application, or if there are no paths available to the
    device. If XRC is running in a channel extender
    environment, this error can indicate that an extended
    line-outage condition has occurred.

The I/O can be a read or a write command, either from
    primary volumes or to secondary volumes. The reason
    for the error, by function_code, is as follows:

<table>
<thead>
<tr>
<th>function_code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Creating a storage control session</td>
</tr>
<tr>
<td>2</td>
<td>Adding a volume to a storage control session</td>
</tr>
<tr>
<td>3</td>
<td>Reading tracks during volume</td>
</tr>
<tr>
<td>4</td>
<td>Writing tracks during volume</td>
</tr>
<tr>
<td>5</td>
<td>Reading updated records from a storage control session</td>
</tr>
<tr>
<td>6</td>
<td>Writing updated records to a secondary volume</td>
</tr>
<tr>
<td>7</td>
<td>Removing a volume from a storage control session</td>
</tr>
<tr>
<td>8</td>
<td>Ending a storage control session</td>
</tr>
<tr>
<td>9</td>
<td>Retrieving storage control session information</td>
</tr>
<tr>
<td>10</td>
<td>Suspending a volume</td>
</tr>
<tr>
<td>11 – 15</td>
<td>Retrieving storage control session information</td>
</tr>
<tr>
<td>17</td>
<td>Retrieving storage control session information</td>
</tr>
<tr>
<td>18</td>
<td>Retrieving storage control session bitmap for a device</td>
</tr>
<tr>
<td>20</td>
<td>Adding a volume to a storage control session</td>
</tr>
<tr>
<td>21</td>
<td>Changing device blocking threshold.</td>
</tr>
<tr>
<td>22</td>
<td>I/O timeout retrieving write pacing information</td>
</tr>
</tbody>
</table>

Source: Extended remote copy (XRC).

System action: The operation that is doing the I/O is
    failed. If the I/O is associated with data movement, XRC
    can suspend volumes as a result. XQUERY report data
    fields can also contain asterisks for data that could not
    be retrieved from the storage control.

System programmer response: Use the DEVSERV
    command to determine and correct the cause of the
    delay to XRC I/O operations.

ANTA5124W  I/O REQUEST FOR DEVICE
    device_number STORAGE CONTROL
    ssid SESSION session_number HAS TIMED OUT, FUNC= function_code

Explanation: I/O for device device_number on storage
    control ssid storage control session session_number did
    not complete in the allotted time. This message can result
    when a storage control session has a large enough number of updated records in cache that it
    cannot process a read or a write I/O without affecting the application. If XRC is running in a channel extender
    environment, this error can indicate that an extended
    line-outage condition has occurred. The I/O can be a
    read or a write command, either from primary volumes
    or to secondary volumes. The reason for the error, by
    function_code, is as follows:

<table>
<thead>
<tr>
<th>function_code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Creating a storage control session</td>
</tr>
<tr>
<td>2</td>
<td>Adding a volume to a storage control session</td>
</tr>
<tr>
<td>3</td>
<td>Reading tracks during volume</td>
</tr>
<tr>
<td>4</td>
<td>Writing tracks during volume</td>
</tr>
<tr>
<td>5</td>
<td>Reading updated records from a storage control session</td>
</tr>
<tr>
<td>6</td>
<td>Writing updated records to a secondary volume</td>
</tr>
</tbody>
</table>
Removing a volume from a storage control session

Ending a storage control session

Retrieving storage control session information

Suspending a volume

Retrieving storage control session information

Changing device blocking threshold

Retrieving storage control session information

Source: Extended remote copy (XRC).

System action: The operation that is doing the I/O is failed. If the I/O is associated with data movement, XRC can suspend volumes as a result. XQUERY report data fields can also contain asterisks for data that could not be retrieved from the storage control.

System programmer response: Use the DEVSEVR command to determine and correct the cause of the delay to XRC I/O operations. If function_code is 8, it can be necessary to use the TERMESSSS operation to end storage control session session_number.

`ANTX5125E XSET(option1(value1) option2(value2)) FAILED FOR SESSION(session_id), RC=return_code REAS=reason_code`  
Explanation: The XSET keywords option1 and option2 with values value1 and value2, respectively, have been specified for session session_id. The values that are specified are invalid. The reason for the error is identified by the specified return code and reason code.

System action: Correct the parameters and re-execute the command.

Source: Extended remote copy (XRC).

`ANTX5126E XSET DVCBLOCK(setting) VOLUME(volume) ENCOUNTERED AN ERROR FOR SESSION(session_name), RC=return_code REAS=reason_code`  
Explanation: The XSET command was issued specifying the DVCBLOCK parameter setting of setting. The indicated device blocking setting was not applied to the specified volume in session session_name because an error was encountered processing the request. The return code return_code and reason code reason_code indicate the error that occurred.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See [System data mover return codes” on page 499](#) in this document for an explanation of the error that was encountered.

Correct the error and reenter the command.

`ANTX5127E XSET REFRESHSP SSID(ssid) FAILED FOR SESSION(session_id), RC=return_code, REAS=reason_code`  
Explanation: The data mover was unable to refresh the attributes of the specified storage controller.

Source: Extended remote copy (XRC).

System action: Storage controller attribute information remains unchanged. The data mover will continue processing any additional controllers requested on the command.

System programmer response: See [System data mover return codes” on page 499](#) for an explanation of the return and reason codes. Correct the error and retry the command.

`ANTX5129E XRC SESSION(session_id) ERROR ASSOCIATING SWAP VOLUME(swapped) SCSESSION(sid) WITH PRIMARY VOLUME(volser) SCSESSION(sid) RC=rc REAS=reas`  
Explanation: The primary volume, volser, cannot be associated with swap device number, swapped, because the scid of the primary is not available for the swapdev.

System action: Determine which SCID is required using XQUERY VOLUME(volser) SWAP, and then use this in the command F ANTAS000, LISTDVCBS swapped dev scid to determine if you can terminate that session. If not, you will need to delete the volume and re-add so that SDM will register an unused SCID from the primary to the swapdev.

Source: Extended remote copy (XRC).

`ANTX5130W XRC SESSION(session_id) XDELPAR ERROR REMOVING XRC SESSION FROM SWAP VOLUME(swapped) SCSESSION(sid) ASSOCIATED WITH PRIMARY VOLUME(volser) SCSESSION(sid) RC=rc REAS=reas`  
Explanation: XRC was unable to remove the indicated swap volume from the indicated storage controller session. This might cause impact to applications or prevent the volume from being used for XRC or other copy services, depending on the status of the volume.

The swapdev is specified by a string with one of the following formats:

- Serial:LSS:SSID:CCA, where serial is the storage controller serial number, LSS is the logical subsystem, SSID is the subsystem ID, and CCA is the device number of the volume within the LSS.
- DEVNUM:nnnn, where nnnn is the device number of the volume.
ANTX5131W XSWAP OPERATION ON XRC
SESSION(session_id) WILL REQUIRE FULL RESYNCHRONIZATION FOR nnnnn VOLUMES

Explanation: If a HyperSwap™ was performed, some volumes in the XRC session might require full resynchronization.

System action: XRC functions are active.

System programmer response: Determine if the HyperSwap operation should proceed despite the effects of having to fully resynchronize some volumes. This action might be predetermined and embedded in the Geographically Dispersed Parallel Sysplex® (GDPS®) setup. For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

Source: Extended remote copy (XRC).

ANTX5132W XRC SESSION(session_id)
ENCOUNTERED AN ERROR REPLICATING A BITMAP OPERATION FROM PRIMARY VOLUME(volser) TO SWAP VOLUME(swapdev) RC=rc REAS=reas

Explanation: A bitmap operation, which is triggered by reaching the threshold specified by the ChangedTracks or DelayTime parameter, was unable to be mirrored to the swap volume.

System action: XRC functions are active. If a HyperSwap operation occurred, one or more volumes require full resynchronization from the swap volume to the remote volume.

System programmer response: Using information pertaining to the reported return code, determine and perform the actions necessary to restore the ability to mirror bitmap operations. If incremental resynchronization is required by local operations, refrain from using the HyperSwap function if possible until the problem is corrected.

Source: Extended remote copy (XRC).

ANTX5133E XSWAP operation OPERATION ON XRC SESSION(session_id) DETECTED ERROR FOR STORAGE CONTROL(ssid) SCSESSION(sid), RC=rc REAS=reas

Explanation: A GDPS function resulted in this operation being performed. The XSWAP operation detected an error. Refer to the return code description and for more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

System action: The XRC command had an error with using a device number as input.

Source: Extended remote copy (XRC).
ANTX5138W ALLOWENHANCEDREADER(NO) IN EFFECT FOR XRC SESSION(session_id) WITH SCSESSION IN ENHANCED MODE

Explanation: The current value of the AllowEnhancedReader parameter is NO, the former value was YES, and at least one SCSESSION in enhanced multiple reader mode existed. The effect of this parameter change will turn off the enhanced multiple reader function.

Source: Extended remote copy (XRC).

System action: XSTART completes successfully.

System programmer response: If the change of AllowEnhancedReader from YES to NO is correct, follow the procedure in [z/OS DFSMS Advanced Copy Services] for the enhanced multiple reader disablement before continuing with volume resynchronization through the XADDPAIR command. If the parameter change is incorrect, issue the XSUSPEND command with TIMEOUT parameter, update the PARMLIB, and issue XSTART command again.

ANTX5139E XSWAP PERFORM FAILED FOR XRC SESSION(session_id) BECAUSE XRC IS NOT SUSPENDED RC=rc REAS=reas

Explanation: A GDPS function resulted in this operation being attempted. The XSWAP operation detected an error. Refer to the return code description and for more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

System action: The XSWAP operation is not performed.

System programmer response: For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

Source: Extended remote copy (XRC).

ANTX5140E XSET UTILITY(FLOAT) FAILED BECAUSE FLOATING UTILITIES NOT ALLOWED FOR XRC SESSION(session_id)

Explanation: The XRC session is in a condition that does not allow floating utilities to be used.

System action: XRC functions remain active, and the UTILITY parameter is not updated.

System programmer response: If multiple parameters were specified on the command, reissue the command without the FLOAT parameter.

Source: Extended remote copy (XRC).

ANTX5150E XRC SESSION(session_id) HAS STALLED, REASON=reason

Explanation: The XRC session identified by session_id has stopped moving data, for the reason indicated.

Reason Description
1. Data mover is waiting for currently allocated buffers to become available, and wait limit has been exceeded.
2. Data mover is waiting for newly allocated buffers to become available, and wait limit has been exceeded.

Source: Extended remote copy (XRC).

System action: The XRC data mover address space is dumped, and then cancelled. An additional dump might also be produced with title COMPON=VSM,COMPID=SC1CH,ISSUER=IGVGVRGN, ABEND=C78.

System programmer response: Look into SYSLOG for preceding ANTX8117I messages to determine the source of delay.

- If delay is detected at journal or secondary data set, look for problems with the secondary disk subsystem. Delay at journal might also be a symptom of journal data sets being allocated with an insufficient number of cylinders.
- If delay is detected at buffers, the cause might be that ReaderPacingWindow, ReadPacingLimit, and MaxTracksRead parmlib values are too high relative to the TotalBuffers value and the number of readers in the session.
- If the root cause of the delay is not apparent, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSLOG and ISSUER=ANTXBEAR SVC dump.

Following this error, you can restart the XRC session and add suspended volumes again according to normal operating procedures.

ANTX5151E cmdname COMMAND OPTION(option) IS NO LONGER SUPPORTED

Explanation: The indicated XRC command no longer supports the indicated option.

System action: The command is not processed.

System programmer response: Remove the command option or replace it with a supported option, and reissue the command.

Source: Extended remote copy (XRC).
ANTC5400E  XCOUPLE  option FAILED FOR XRC
  entity(name) MSESSION(msession_id)  
  MHLQ(mhlq), RC=return_code  
  REAS=reason_code

Explanation: The XCOUPLE command with option failed with return code return_code and reason code reason_code for master session msession_id with master high-level qualifier of mhlq. If the values of msession_id or mhlq cannot be determined (for example, for XCOUPLE DELETE when the session is not coupled), the items with asterisks (*) indicate that the values are not known.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

ANTC5402E  XRC SESSION(session_id) DETECTED ERROR IN MSESSION(msession_id),  
  RC=return_code REAS=reason_code

Explanation: The XRC logical session that is specified by session_id detected an error while XRC attempted to shut down coupling to master session msession_id. The return code return_code and reason code reason_code indicate the error that occurred.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See Table 4 on page 500 for an explanation of the return and reason codes.

ANTC5403E  XRC entity(name) DETECTED SHUTDOWN ERROR IN MSESSION(msession_id),  
  RC=return_code REAS=reason_code

Explanation: In the message text:

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

ANTC5405E  XRC MSESSION(msession_id) command  
  COMMAND FAILED, RC=return_code  
  REAS=reason_code

Explanation: An error occurred while XRC attempted to coordinate the processing of command command, and it was not possible to determine which XRC session was responsible for the error. The master session msession_id level command is not processed. The return code return_code and reason code reason_code indicate the error that occurred.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

ANTC5406E  XRC MSESSION(msession_id) command  
  COMMAND FAILED, ERROR IN SESSION(session_id), RC=return_code  
  REAS=reason_code

Explanation: An error occurred while XRC attempted to coordinate processing of command command, and it was possible to determine that XRC session session_id was responsible for the error. The master session level command for msession_id is not processed for the XRC session session_id. This message appears on the system from which the command originated. The return code return_code and reason code reason_code indicate the error that occurred.
ANTC5407E  XRC SESSION(session_id) ENCOUNTERED ERROR PROCESSING command COMMAND FOR MSESSION(msession_id), RC=return_code REAS=reason_code

Explanation: The XRC logical session that is specified by session_id detected an error while XRC attempted to process a master session level command for the master session msession_id. This message appears on the system where the XRC session is running. The return code return_code and reason code reason_code indicate the error that occurred.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

ANTC5408W  XRC entity(name) MSESSION(msession_id) INFORMATION NOT REMOVED FROM DATA SET dstype, RC=return_code REAS=reason_code

Explanation: In the message text:
- entity This indicates what kind of XRC entity the message refers to. The valid values are:
  - SESSION The message refers to an XRC session.
  - CLUSTER The message refers to a XRC cluster.

While processing an XCOUPLE DELETE or XCOUPLE PURGE command, the XCOUPLE-related information for XRC session session_id in master session msession_id could not be removed from the data set data setname.

If the MASTER data set is indicated, the XRC session is now able to process independently of the master session, but other XRC sessions that are associated with the master session can not be aware that the session should no longer be associated with the master session.

If the STATE data set is indicated, other XRC sessions can now operate without requiring that this session be active. This XRC session cannot operate until the associated STATE data set indicates that the session is not part of an XCOUPLE session.

The return code return_code and reason code reason_code indicate why the information in the data set could not be removed.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the MASTER data set is indicated in the message, to ensure other sessions are not affected, follow the procedure in "Removing Extraneous Session Information from the MASTER Data Set," z/OS DFSMS Advanced Copy Services. If the STATE data set is indicated in the message, follow the procedure in "Removing Extraneous Session Information from the STATE Data Set," z/OS DFSMS Advanced Copy Services to permit this XRC session to operate correctly. See Table 4 on page 500 for an explanation of the return and reason codes.

ANTC5409W  XRC MSESSION(msession_id) command COMMAND CANCELED BY SESSION(session_id)

Explanation: The command command sent to the coupled session session_id by the master session msession_id was canceled. This message can be issued as a result of an error occurring for this session or another session associated with the master session msession_id. To determine which session encountered an error, issue the XQUERY msession_id MASTER command. The XQUERY report will indicate a volume status of ERR for the sessions that encountered an error. This message can also be issued if one of the coupled sessions in the master session has the last active volume pair in the session suspended by either command or error, and if the last volume pair for the session was deleted by the XDELPAIR command. In this case, the XQUERY report will indicate a volume status of AVS or NOV.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the XQUERY report indicates a volume status of ERR, see the system log on the system which was processing the sessions that encountered the error for additional error messages.

ANTC5410E  XCOUPLE RELEASE COMMAND FAILED FOR XRC MSESSION(msession_id) MHLQ(mhlq), RC=return_code REAS=reason_code

Explanation: An error occurred while XRC attempted to process the XCOUPLE RELEASE command for the master session msession_id whose master high-level qualifier is mhlq. This message appears on the system...
where the command was entered. The return code return_code and reason code reason_code indicate the error that occurred.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

### ANTC5411E XADDPAIR SUSPENDED COMMAND FAILED FOR XRC SESSION (session_id), RC=return_code REAS=reason_code

**Explanation:** An error occurred while XRC attempted to process the XADDPAIR SUSPENDED command for the XRC session session_id. The return code return_code and reason code reason_code indicate the error that occurred.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See Table 4 on page 500 for an explanation of the return and reason codes. Correct the error and reenter the command.

### ANTC5412E UNABLE TO START CLUSTER MANAGER FOR MSESSION(msession_id) MHLQ(master_hlq), RC=return_code REAS=reason_code

**Explanation:** During startup, the XRC control address space could not start the ANTCCLNNN address space to manage cluster communication with the specified master session and master high level qualifier.

**Source:** Extended remote copy (XRC)

**System action:** If sessions were previously coupled from this system while the cluster manager was active, the system will report a COUPLING_TIMEOUT condition for this cluster in the associated master session.

**System programmer response:** See "Return and Reason Codes for the ASCRE macro" in SA22-7609 for an explanation of the return and reason codes. Correct the error and issue command F ANTS000,CREFRESH to reinitiate cluster setup processing.

### ANTC5415E CLUSTER ERROR FOR MSESSION(msession_id) MHLQ(master_hlq), RC=return_code REAS=reason_code

**Explanation:** The Cluster Manager address space (ANTCLNNN) detected a condition that renders it unable to maintain a clustered session with the specified master session id and master high level qualifier

**Source:** Extended remote copy (XRC)

**System action:** If sessions were previously coupled from this system while the cluster manager was active, the system will report a COUPLING_TIMEOUT condition for this cluster in the associated master session.

**System programmer response:** See "System data mover return and reason codes" on page 190 for an explanation of the return and reason codes. Correct the error and issue command F ANTS000,CREFRESH to reinitiate cluster setup processing.

### ANTS5419W CLUSTER MONITORING DISABLED FOR SYSTEM(cluster_id) MSESSION(master_id) MHLQ(master_hlq), RC=retcode REAS=reason

**Explanation:** The XRC Cluster Manager address space (ANTCLNNN) could not access the Cluster Monitor Data Set.

**Source:** Extended remote copy (XRC)

**System action:** XRC Cluster Monitor address space stops recording monitor data.

**System programmer response:** Restore access to Cluster Monitor Data Set, then issue F ANTCCLNNN,STARTMON command to resume monitor data recording.

### ANTC5420W CLUSTERING FOR SYSTEM(cluster_id) MSESSION(master_id) MHLQ(master_hlq) CANNOT BE change_requested RC=retcode REAS=reason

**Explanation:** The XRC Control Address space (ANTAS000) could not disable or enable clustering, because of existing coupled XRC sessions. The change_requested field might be either ENABLE or DISABLE depending on the type of change requested.

**Source:** Extended remote copy (XRC)

**System action:** Cluster status remains unchanged.

**System programmer response:** See "System data mover return and reason codes" on page 190 for an explanation of the return code, which describes the specific condition impeding the status change. Check the ANTXIN00 Parmlib member for incorrect ClusterMSession and MHLQ values. If they correctly reflect the desired configuration, issue XCOUPLE DELETE or XCOUPLE PURGE commands for all XRC sessions previously coupled through the cluster, or coupled to the master session currently specified in ClusterMSession. Then issue command F ANTS000,CREFRESH to reinitiate cluster setup processing.
ANTC5421E UNABLE TO TERMINATE CLUSTER(CNAME)

Explanation: During F ANTAS000,CREFRESH processing for a request to disable clustering, the cluster address space (ANTCLnnn) did not terminate within the expected time.

Source: Extended remote copy (XRC)

System action: The cluster address space might still be active.

System programmer response: If the ANTCLnnn address space terminates itself after this message, no further action is required. If it remains active, you can use the CANCEL command to deactivate it.

ANTC5422W CLUSTER MONITORING DISABLED FOR SESSION(sessionid)
CLUSTER(clusterid) MSESSION(msessionid) MHLQ(mhlg), RC=rc REAS=reas

Explanation: An error occurred and caused the cluster clusterid to stop collecting monitor data for the XRC session sessionid. The cluster clusterid associated with the master session msessionid with high level qualifier mhlg is no longer combining the XRC session monitor data with the accumulated cluster monitor data. Refer to the return code rc and reason code reas to determine the cause of the error. The individual XRC session’s monitor data continues to be collected for the XRC session in the XRC session’s state data set.

Source: Extended remote copy (XRC)

System action: Cluster monitoring for the indicated session is no longer active. XRC functions are active.

System programmer response: See System data mover return codes” on page 499 for an explanation of the return and reason codes, and the description of how to correct the problem. Based on the return and reason codes, the indicated XRC session can no longer be active, and restarting the XRC session will reactivate cluster monitoring for the XRC session when XRC session is recoupled through the indicated cluster session.

ANTM6000I SNAPSHOT WORKING SPACE DATA SETS BEING REFRESHED

Explanation: SDM is creating the list of cataloged working space data sets that DFSMSdss will use for snapshot operations. The names of these data sets must meet the naming convention specified in DFSMSdss Storage Administration.

Source: System data mover (SDM).

System action: Snapshot operations that require use of working space data sets are delayed until message ANTM6001I is issued.

System programmer response: If any DFSMSdss jobs have received message ADR736E with return code 1805, resubmit the job after message ANTM6001I is issued.

ANTM6001I wscont SNAPSHOT WORKING SPACE DATA SETS REFRESHED

Explanation: SDM has finished creating the list of working space data sets to be used for snapshot requests. wscont represents the number of working space data sets that SDM was able to find in the catalog.

Source: System data mover (SDM).

System action: Operations continue for snapshot operations requiring working space data sets.

System programmer response: If any DFSMSdss jobs have received message ADR736E with return code 1805, resubmit the job after message ANTM6001I is issued.

Detecting Module: System data mover (SDM).

ANTM6002W ERROR REFRESHING SNAPSHOT WORKING SPACE DATA SETS - RC=rc REAS=reas

Explanation: SDM has encountered an error while creating the list of working space data sets that will be used for snapshot requests.

Source: System data mover (SDM).

System action: DFSMSdss jobs that use snapshot can receive message ADR736E until this error is corrected. See the associated return and reason code reported with ADR736E to determine if this is the cause of the error.

System programmer response: See the action in the indicated return and reason codes.

ANTM6003E SNAPSHOT READ ERROR ON DEVICE=device VOLSER=volser RC=retcode REAS=reascode CSW=cswdata SENSE=sense

Explanation: SDM has encountered an error when reading from a snapshot working-space data set located on device device with serial number volser. If the cswdata and the sense fields contain asterisks, the problem is an internal data mover error. The return and reason code indicate the specific error and the action to be taken.

Source: System data mover (SDM).

System action: The snapshot request has failed. An SDM error record has been written to SYS1.LOGREC.

System programmer response: Take action based on the return code, reason code, and sense information.
**ANTM6004I  FLASHCOPY WORKING SPACE DATA SETS BEING REFRESHED**

**Explanation:** Using FlashCopy as the point in time mechanism, SDM is creating the list of cataloged data sets of working space that DFSMsdss will use for Virtual Concurrent Copy (VCC). The names of these data sets must meet the naming convention specified in [DFSMS Advanced Copy Services](https://www.ibm.com). System data mover (SDM).

**System action:** VCC operations requiring working space data sets may be delayed until message ANTM6005I is issued.

**System programmer response:** If any DFSMsdss jobs have received message ADR736E with return code 1805, resubmit the job after message ANTM6005I is issued.

**Source:** System data mover (SDM).

**ANTM6005I  wscnt USABLE FLASHCOPY WORKING SPACE DATA SETS DISCOVERED**

**Explanation:** SDM has finished creating the list of cataloged working space data sets that DFSMsdss will use for Virtual Concurrent Copy (VCC) operations using FlashCopy as the point in time mechanism. \( wscnt \) represents the number of working space data sets that SDM was able to find in the catalog.

**System action:** VCC operations continue.

**System programmer response:** If any DFSMsdss jobs have received message ADR736E with return code 1805, resubmit the job.

**Source:** System data mover (SDM).

**ANTM6006W  ERROR REFRESHING FLASHCOPY WORKING SPACE DATA SETS – RC=rc REAS=reas**

**Explanation:** SDM has encountered an error while creating the list of working space data sets that will be used for Virtual Concurrent Copy (VCC) operations using FlashCopy as the point in time mechanism.

**System action:** DFSMsdss jobs that use VCC with FlashCopy as the point in time mechanism might receive message ADR736E until this error is corrected. Refer to the associated return and reason code reported with ADR736E to determine if this is the source of the error. Operations may continue successfully on working space data sets which are not affected by this error.

**System programmer response:** Refer to the action for the indicated return and reason code.

**Source:** System data mover (SDM).

**ANTM6007E  ERROR PROCESSING FLASHCOPY WORKING SPACE DATA SET: dsname - RC=rc REAS=reas**

**Explanation:** SDM has encountered an error while validating the availability of \( dsname \) for use as a working space data set.

**System action:** DFSMsdss jobs that use VCC with FlashCopy as the point in time mechanism might receive message ADR736E until this error is corrected. See the associated return and reason code reported with ADR736E to determine if this is the source of the error. Operations can continue successfully on working space data sets that are not affected by this error.

**System programmer response:** See the action for the indicated return and reason code.

**Source:** System data mover (SDM).

**ANTM6013E  ERROR READING FROM VCC WORKING SPACE ON DEVICE=device VOLSER=volser RC=retcode REAS=reascode CSW=cswdata SENSE=sense**

**Explanation:** SDM has encountered an error when reading from a FlashCopy working space data set located on device \( device \) with serial number \( volser \). If the \( cswdata \) and \( sense \) fields contain asterisks, the problem is an internal data mover error. The return and reason code indicate the specific error and action to be taken.

**System action:** The VCC operation fails. An error record may be written to SYS1.LOGREC.

**System programmer response:** Take action based on the return code, reason code, and sense information.

**Source:** System data mover (SDM).

**ANTM6015I  WORKING SPACE DATASET wdsname HAS BEEN RELEASED**

**Explanation:** In response to a RELEASEWS command, ANTMAIN has released serialization on the named working space data set. This allows other operations on the data set to be performed.

**System action:** VCC operations continue, but this data set is not used for working space. If insufficient space is available in other working space data sets, jobs using VCC might fail. The data set remains unused until the MODIFY ANTMAIN,REFRESHWS command is issued to re-enable usage, the ANTMAIN address space is restarted, or an IPL is performed on the system.

**System programmer response:** If message ADR736E occurs with a return code indicating insufficient space is available, allocate additional working space data sets or restore access to the data set that was released. Then use the REFRESHWS
modify command to enable the data sets for use by ANTMMAIN.

**Source:** System data mover (SDM).

---

**ANTM6016I** WORKING SPACE DATA SET wdsname RELEASE IS DEFERRED

**Explanation:** Release of the specified working space data set was requested by the RELEASEWS command, but the data set is in use. The release operation is deferred until all jobs using the data set for VCC operations have ended.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**System programmer response:** If message ADR736E occurs with a return code indicating insufficient space is available, allocate additional working space data sets, or restore access to the data set that was released. Then use the REFRESHWS modify command to enable the data sets for use by ANTMMAIN.

**Source:** System data mover (SDM).

---

**ANTM6017I** WORKING SPACE DATA SET LLQ llq WAS NOT FOUND

**Explanation:** Release of the specified working space data set was requested by the RELEASEWS command, but the data set was not discovered by ANTMMAIN.

**System action:** VCC operations continue.

**System programmer response:** Check the RELEASEWS command input. If necessary, reissue the command with a correct LLQ value.

**Source:** System data mover (SDM).

---

**ANTM6018W** ERROR RELEASING WORKING SPACE DATA SET dsname RC=rc REAS=reas

**Explanation:** Release of the specified working space data set was not successful.

**System action:** VCC operations continue.

**System programmer response:** See the return and reason code description for actions to take.

**Source:** System data mover (SDM).

---

**ANTM6020I** LISTWS filertype OUTPUT - nnn

**Explanation:** This is a query output header message. filertype indicates which the filter option was used to generate the report. The valid values are listed in the documentation for MODIFY ANTMMAIN,LISTWS in the Advanced Copy Services book. nnn indicates the current version of the query, and can be used to match automation to message levels.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**Source:** System data mover (SDM).

---

**ANTM6021I** COMPATIBLE WITH VOLUMES (volser, volser...)

**Explanation:** This is a query output header message. This message appears only when the LISTWS command input specified a list of volume serials to match to. This message indicates that the remainder of the report shows only working space data sets on volumes compatible with the listed VOLSERs. If more than (insert a number here) VOLSERs were requested for filtering, this line might appear multiple times.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**Source:** System data mover (SDM).

---

**ANTM6022I** WSDS PREFIX prefix

**Explanation:** This is a query output header message. This message shows the high level qualifiers of the data sets used on this system.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**Source:** System data mover (SDM).

---

**ANTM6023I** NAME STATUS JOBS RC DS CYL FREE CYL FLAGS

**Explanation:** This is a query output header message.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**Source:** System data mover (SDM).

---

**ANTM6024I** — — — —

**Explanation:** This is a query output header message.

**System action:** VCC operations continue. Additional messages are displayed to the console and syslog.

**Source:** System data mover (SDM).
ANTM6025I  nnnnnnn  sssss  jjjj  rcrc  ddddddd  aaaaaaaaa  ffffffff

Explanation: This is a query output header message.
In the message text:

nnnnnn  Low level qualifier of the data set name (not including DATA for VSAM data sets).

ssssss  The status of this data set.
• INUSE data set is in use by at least one job.
• INUSE* data set is in use by at least one job, and is pending for release as requested by the RELEASEWS command.
• FREE data set is not in use by any job.
• REL data set has been released by RELEASEWS and is not available for use until the REFRESHWS command has been used.
• ERROR an error has occurred on this data set. See the rcrc and reas columns for information relating to the error.

jjjj  The number of jobs using this data set.

rcrc  The return code describing the error encountered with the data set, or 0 if no errors were encountered.

ddddddd  The number of cylinders allocated for the data set. A value of "NOTAVAIL" indicates that the number of cylinders has not been determined.

aaaaaaaa  The number of cylinders in the dataset currently available for use by VCC operations. A value of "NOTAVAIL" indicates that the number of cylinders has not been determined.

fffffff  8 hexadecimal digits of internal debugging information.

System action: VCC operations continue. Additional messages are displayed to the console and syslog.

System programmer response: If the status shows ERROR, See the return and reason code for actions to make the data set usable.

Source: System data mover (SDM).

ANTM6026E  LISTWS COMMAND FAILED - RC=rc  REAS=reas

Explanation: The LISTWS command encountered an error.

System action: VCC operations continue.

System programmer response: See documentation for the return and reason codes.

Source: System data mover (SDM).

ANTM6997I  USING aaaaa OF bbbbbb PET. HWM ccccc AT yyyy.ddd hh:mm:ss

Explanation: The message is a response to the FANTMAIN,PETINFO command, and displays information about the System Data Mover (SDM) pause element token table.

In the message text:

aaaaa  Indicates the number of entries currently in use.

bbbb  Indicates the maximum number of entries allowed in the table.

cccc  Indicates the high water mark for table usage.

yyyy.ddd hh:mm:ss  Indicates the local date and time when the HWM was reached.

System action: System processing continues.

System programmer response: If HWM indicates that the table entry demand is reaching the table limit, you can increase the size of the table. See z/OS DFSMS Advanced Copy Services for instructions on modifying PET table size.

Source: DFSMS System Data Mover.

ANTM6998E  PET TABLE IS INVALID

Explanation: The message is a response to the FANTMAIN,PETINFO command, and indicates that a problem exists with the SDM pause element token table.

System action: Failures are observed when you run DFSMSdss with Concurrent Copy, Fast Replication or extended-format data sets, as well as in applications that use the ANTRQST application programming interface.

System programmer response: Issue a FANTMAIN,DUMP command to capture a diagnostic dump. Cancel the ANTMAIN address space. It should automatically restart and reallocate the table. Search problem reporting databases for a fix for the problem. If no fix exists, report the problem to the IBM Support Center.

Source: System data mover (SDM).
ANTM6999E PET TABLE INITIALIZATION FAILED, RC=return_code

Explanation: During ANTM680 address space startup, an error occurred when creating the SDM pause element token table.

System action: Failures are observed when you run DFSMSdss with Concurrent Copy, Fast Replication or extended-format data sets, as well as in applications that use the ANTRQST application programming interface.

System programmer response: If return_code is 6307, there might be insufficient ECSA available to allocate the table. Either increase the system ECSA, or reduce the size of the table. See z/OS DFSMS Advanced Copy Services for instructions on modifying PET table size. For other errors, search problem reporting databases for a fix for the problem. If no fix exists, report the problem to the IBM Support Center.

Source: DFSMS System Data Mover.

ANTB8001I XRC INITIALIZATION STARTED

Explanation: Initialization of the XRC control function has started. XRC functions are inactive until XRC initialization is complete. Message ANTB8001I will be issued when XRC initialization is complete.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: If XRC initialization starts but never completes, an initialization error has occurred. Search problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAB000 and any ANTASnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. If an XRC error is indicated in the system log, also provide pertinent SYS1.LOGREC information.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: None.

ANTE8008I XRC SESSION(session_id) INACTIVE DUE TO ERROR, CONSISTENCY_GROUP TIME(figsize)

Explanation: An error occurred which caused the XRC session session_id to end. All volumes except suspended volumes in the session are consistent up to the reported time of timestamp.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: See previous XRC messages to determine the cause of the error. The previous messages also contain the consistency time for suspended volumes.

Source: Extended remote copy (XRC).
**ANTI8023I**  
**function INITIALIZATION STARTED FOR XRC VOLUME PAIR**  
(\texttt{primary\_volser},\texttt{secondary\_volser})\footnote{Extended remote copy (XRC).}

**Explanation:** Volume synchronization or resynchronization of volume pair \texttt{primary\_volser} and \texttt{secondary\_volser} has started. XRC attempts to vary the secondary volume serial number given by \texttt{secondary\_volser} offline from the system that the XRC data mover is running on. Do not access the secondary volume during the copy process.

The secondary volume is varied online after volume synchronization or resynchronization has completed.

\texttt{function} identifies the type of initialization that will be performed. The functions are described below:

**FULL** Indicates that the entire volume will be initialized.

**RESYNC** Indicates that only tracks changed on the primary volume since the pair became suspended will be initialized. All tracks which were not copied will be copied to the secondary volume if the volume pair did not reach the duplex state when the volume pair was suspended.

**QUICK** Indicates that only tracks on the primary volume that are allocated at the time the initialization starts will be initialized. See \texttt{DFSMS Advanced Copy Services} \cite{DFSMS} for additional information about this value.

**Note:** The XRC initialization function can end abnormally as a result of the secondary volume not being online. In this case, the secondary volume needs to be varied online before issuing the XADDPAIR command specifying the secondary volume serial number.

**Source:** Extended remote copy (XRC).  

**System action:** XRC functions are active.  

**System programmer response:** None.

**ANTD8025I**  
**XDELPAIR COMPLETE FOR VOLUME PAIR**  
(\texttt{primary\_volser},\texttt{secondary\_volser})\footnote{Extended remote copy (XRC).}  
**FOR SESSION** (\texttt{session\_id}), **WITH CONSISTENCY_GROUP**  
**TIME** (\texttt{timestamp}) **AND STATUS OF**  
\texttt{status}\footnote{Extended remote copy (XRC).}

**Explanation:** The volume pair \texttt{primary\_volser} and \texttt{secondary\_volser} is successfully removed from session \texttt{session\_id}. The volume is consistent up to the reported time \texttt{timestamp}. The current XRC volume pair status is indicated by \texttt{status}.

**Source:** Extended remote copy (XRC).  

**System action:** XRC functions are active.  

**System programmer response:** If the XDELPAIR has not been explicitly entered by a user, this message can result from an error reported by a previous message. View the system log for message ANTX0511E to determine why the volume pair has been deleted, correct the error, and enter an XADDPAIR for the deleted volume pair to place the volume back into the XRC session. If the command is accepted and this message has not been issued at the system console log or at the user ID at the MSGROUTEID parameter, see message ANTT0099I.

**ANT8024I**  
**XRC VOLUME PAIR**  
(\texttt{primary\_volser},\texttt{secondary\_volser}) **IN DUPLEX STATUS AT TIME OF**  
\texttt{data\_mover\_host\_time}\footnote{Extended remote copy (XRC).}

**Explanation:** The XRC volume synchronization or resynchronization function has completed for the specified \texttt{primary\_volser},\texttt{secondary\_volser} at the data mover host system time of \texttt{data\_mover\_host\_time}. The volume status has changed from copy pending state to duplex state.

**Source:** Extended remote copy (XRC).
### ANT8027I • PRIMARY VOLSER volser1 HAS CHANGED TO volser2

**Explanation:** XRC has detected a volume label change for the XRC primary volume volser1. The new volume label is now volser2.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The volume initialization of the pair is performed using the FULLCOPY option. No action is required.

### ANTX8030W XRC ENCOUNTED USER DATA WITH NO TIMESTAMP ON VOLUME(volser) AT CCCCCHH OF cccCCCCH. THE NUMBER OF TRACKS WITH NO TIMESTAMP = tracks

**Explanation:** User data updates without timestamps have been made to the primary XRC volume volser. The CCHH being updated is cchh. The number of tracks updated is tracks. XRC places the non-timestamped updates on the secondary volume. Be aware that, without a timestamp on the record, applications that do dependent record updates on multiple volumes attached to different storage controls can experience temporary data out-of-synchronization situations.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message is issued periodically if a significant number of non-timestamped updates are made. The message can be issued if:

- Application systems making updates to XRC-managed volumes do not provide timestamp support. Timestamp support can be missing from non-MVS systems.
- Application programs making updates to XRC-managed volumes bypass the standard MVS IOS interfaces to perform their I/O operation. In this case, change the application programs to provide timestamp support.
- A system paging volume is being managed by the XRC data mover. The paging subsystem uses certain functions that bypass normal I/O timestamping, which then causes the ANTX8030W message to be issued for volumes containing system paging data sets. All data has been properly applied to the secondary volumes, and this message can be ignored.

If all data updates are correctly timestamped and the problem persists, search problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and a GTF trace of related system and XRC activity to the volume or volumes that encounter the error.

### ANTX8032W ALL XRC JOURNALS FULL, WAITING FOR SECONDARY UPDATES TO FREE JOURNAL SPACE

**Explanation:** The XRC journal data sets are full. Processing of additional primary updates cannot occur until journal space is released. This condition can occur as a result of peak load processing.

**Source:** Extended remote copy (XRC).

**System action:** Primary updates are not journaled until the full journal condition is relieved and message ANTX8033I is received.

**System programmer response:** This message means that updates to secondary volumes have fallen behind updates to primary volumes. If ERRORLEVEL(SESSION) is specified, all XRC volume pairs can have become suspended from the session. If ERRORLEVEL(VOLUME) or ERRORLEVEL(group_name) is specified, one or more sets of volumes can have become suspended.

This error can be due to a configuration problem where secondary processing cannot keep up with primary processing. In this case, verify that the journal data sets are large enough. If necessary, increase the size of the existing journal data sets, make them striped, or allocate more journal data sets. Ensure that secondary volumes are properly configured to minimize channel path and device contention, and are attached to storage controls with fast write active.

See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support) for additional details. If all configuration conditions appear
to be correct, search problem reporting data bases for a solution for the problem. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*.

**ANTX8033I**  
**XRC JOURNAL FULL CONDITION RELIEVED**

Explanation: The condition detected by ANTX8032I has been alleviated. Normal XRC copy operations continue.

Source: Extended remote copy (XRC).

System action: XRC copy operations continue.

System programmer response: None.

**ANTX8034W**  
**XRC SESSION(session_id) COULD NOT DELETE STATE DATA SET MEMBER membername**

Explanation: XRC attempted to delete the state data set member membername for the session session_id, but the member was not deleted.

Source: Extended remote copy (XRC).

System action: XRC copy operations continue.

System programmer response: Delete the specified member from the associated state data set for the specified session.

**ANTX8035I**  
**device_number STORAGE CONTROL STATE SAVE REQUESTED**

Explanation: XRC has detected that a storage control diagnostic state save should be taken. device_number is the device that will be used to send the request to the storage control. The state save will not actually be taken unless flag SCTRAP is on.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTX8036I**  
**device_number STORAGE CONTROL STATE SAVE status**

Explanation: XRC detected that a storage control diagnostic state save was requested via device device_number. The status of the request is indicated by status:

- **SCHEDULED**: The storage control diagnostic state save has been sent to storage control.
- **SUPPRESSED**: The storage control diagnostic state save request was not sent because a previous state save was requested within a 24 hour period.

**NOT_ALLOWED**

The storage control diagnostic state save was not sent because either the SCTRAP or the SCTRAP2 values were set to NO.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the status indicates SUPPRESSED, you can reset the timestamp for the appropriate storage control by specifying either RESET or RESET2 on the MVS MODIFY command. If the status indicates NOT_ALLOWED, you can change the value of SCTRAP or SCTRAP2 by specifying YES on the appropriate MVS MODIFY command. Refer to Appendix A in the z/OS DFSMS Advanced Copy Services for details on the use of these MVS MODIFY command options.

**ANTX8050I**  
**XRC SESSION(session_id) NOT ACTIVE. ISSUE XSTART COMMAND**

Explanation: An extended remote copy (XRC) command has been issued for session session_id, but the session is not active.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: Enter an XSTART command to start an XRC session and reenter this command. If an XRC session is currently ending, wait for the session to end and then issue the XSTART command. If the session fails to end within five minutes, issue MODIFY ANTASnnn,DUMP and then cancel the ANTASnnn address space. If the problem persists, search problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*.

**ANTX8051I**  
**NO ACTIVE XRC SESSIONS. ISSUE XSTART COMMAND**

Explanation: The XQUERY or XEND command has been entered with the reserved session name ALL. There are no active XRC sessions.

Source: Extended remote copy (XRC).

System action: XRC functions are inactive.

System programmer response: Enter the XSTART command to start an XRC session.
ANTX8052I UCB PINNED BY ANT COMPONENT
DF117

Explanation: The device defined by the UCB is currently in use by the system data mover function.
Source: Extended remote copy (XRC).
System action: XRC or concurrent copy function is active.
System programmer response: The device is active as a primary volume or a secondary volume in an XRC session. To reconfigure the volume for an XRC session:
- Issue an XDELPAIR command for the volume (or for the corresponding primary volume if this is a secondary volume) to remove the device from the session.
- Complete the reconfiguration.
- Issue the XADDPAIR command, with the default copy option, to return the volume pair to XRC control.

ANTX8054W XRC STATE DATA SET FULL FOR SESSION(sessionid), MONITOR DISABLED

Explanation: XRC attempts to write XRC monitor data to the state data set for session sessionid, but a data set full condition was detected for the state data set. The gathering of XRC monitor data has been disabled. The setting for the console command CTFLG MONITOR is set to OFF.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: Allocate another named state data set, which is larger than your current state data set, and reissue the appropriate XSUSPEND commands to suspend your sessions. Copy your current state data set to the new state data set. Rename the current state data set to another unique name, then rename the new state data set to the old state data set name. Issue the XSTART command and appropriate XADD commands to resume your session. To ensure that you have allocated sufficient space for XRC monitor data, issue the console command F ANTAS001,CTFLG MONITOR ON. If XRC processing is successful with the new state data set, you can delete the old state data set.

ANTX8057I XSTART COMPLETE FOR XRC SESSION(session_id) WITH SESSIONTYPE (session_type), ERRORLEVEL (error_level), HLQ (hlq). SESSION NOW state

Explanation: The XSTART command for the XRC session session_id has completed successfully. Either a new session has been started or a previously suspended session is now restarted. The SESSIONTYPE indicated by session_type,

ERRORLEVEL indicated by error_level, and the high-level-qualifier indicated by hlq are those specified or defaulted from the XSTART command. The session status is active. The state variable indicates ACTIVE for a new session or RESTARTED for a restart of a suspended session.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: You can issue XADDPAIR commands to resynchronize or add volumes to the session. If the command has been accepted, and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTA8101I XADDPAIR COMPLETE FOR VOLUME PAIR(primary_volser,secondary_volser) FOR SESSION(session_id) WITH ERRORLEVEL(error_level), SCSESSION(storage_control_session)

Explanation: The XADDPAIR command has completed successfully. The volume pair primary_volser and secondary_volser is added to session session_id with the ERRORLEVEL indicated by error_level and primary storage control session of storage_control_session. If an SCSESSION value was not specified, the default storage_control_session value of "--" is assigned. Use the XQUERY command to determine the status of the volume pair.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTR8102I command COMPLETED FOR SESSION(session_id) AT RECOVERED CONSISTENCY_GROUP TIME(timestamp)

Explanation: The recovery command command has completed successfully for session session_id. The recovered consistency_group time reported is the time timestamp for a coupled or non-coupled session that is suspended or ended by command. All volumes in duplex status are consistent up to the specified timestamp. Each remaining volume is consistent up to the consistency time that is reported by previous messages.

However, for a coupled session that was not ended or suspended by an XRC command, the recovered consistency_group time reported is the timestamp for the last known update for the session when the following conditions exist:
Extended remote copy (XRC).

System action:  XRC functions are inactive.

System programmer response:  If the command has been accepted, and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

Explanation:  An XDELPAIR command was issued with the option \texttt{option}. The volume pair primary_volser and secondary_volser is successfully removed from session \texttt{session_id}. The volume is consistent up to the reported time \texttt{timestamp}. The status of the volume pair is given by \texttt{status} at the time the pair was removed from the session. If the volume pair never reached duplex state or the primary volume is a utility volume, the consistency time is reported as \texttt{NO\_TIME\_AVAILABLE}. The status is the same as reported by an XQUERY report.

Source:  Extended remote copy (XRC).

System action:  XRC functions are active.

System programmer response:  This message reports the completion of the XDELPAIR requested by the user. Any error that occurred while deleting the volume pair was reported by a previous error message. After a volume pair has been deleted it can be placed back into the XRC session by a subsequent XADDPAIR command. If the command is accepted and this message has not been issued at the system console log or at the user ID at the MSGROUTEID parameter, see message ANTT0099I.

Explanation:  The session \texttt{session_id} was successfully ended by the option requested by \texttt{option}. All secondary volumes are consistent up to the reported time \texttt{timestamp}. The session is inactive and is no longer maintaining a record of storage control updates.

Source:  Extended remote copy (XRC).

System action:  XRC functions are inactive.

System programmer response:  This message
reports the completion of the XEND function requested by the user. If an error occurs while processing the XEND request, it was reported by a previous error message. If an XEND function should have occurred and has not, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. You can force a session to end by canceling the ANTASnnn address space and deleting the state data set associated with the session.

**ANTV8107I**  
**SUSPEND COMPLETE FOR VOLUME**  
PAIR(primary_volser,secondary_volser)  
FOR SESSION(session_id) AT  
CONSISTENCY_GROUP  
TIME(timestamp)  

**Explanation:**  
The XRC volume pair indicated by primary_volser and secondary_volser has been suspended from the XRC session indicated by session_id. The secondary volume is consistent up to the time indicated by timestamp. Data is no longer being copied for this pair.  

**Source:**  
Extended remote copy (XRC).  

**System action:**  
XRC functions are active.  

**System programmer response:**  
See the previous XRC message to determine why the volume pair was suspended. To re-enable XRC functions for the volume pair, correct the error and issue an XADDPAIR command to resynchronize the volume pair in the session.

This message will also be issued if an error is encountered for a volume pair during XADVANCE or XRECOVER processing even though the volume pair was in a suspended state when the XADVANCE function started.

**ANTV8108I**  
command STARTED FOR  
SESSION(session_id) AT STARTING  
CONSISTENCY_GROUP  
TIME(timestamp), HLQ (hlq)  

**Explanation:**  
The command command has started for session session_id using the high-level qualifier of hlq. The starting consistency_group time reported is the consistency time indicated in the ANTE8106I or ANTV8110I message for a coupled or non-coupled session that is suspended or ended by command. All volumes in duplex status are consistent up to the indicated time given by timestamp. If possible, the command function attempts to recover data from the journal data sets to bring volumes to a later consistency time.

However, for a coupled session that was not ended or suspended by an XRC command, the starting consistency_group time reported is the timestamp for the last known update for the session when the following conditions exist:

- session status is non-interlocked
- no updates were occurring when the session ended (session idle)

**Note:**  
If the above conditions exist, the consistency time reported can be earlier than the Master Recovery Time or the last session consistency time indicated in an XQUERY report.

If the session is a coupled session, message ANTR8405I will also be issued.

**Source:**  
Extended remote copy (XRC).

**System action:**  
XRC functions are active.

**System programmer response:**  
If you receive this message, XRC has begun to apply updates from the journal data sets to the secondary volumes. If the command is XRECOVER, the secondary volumes are clipped as part of the recovery process. If the command is XADVANCE, the volumes are not clipped. If the command has been accepted and this message has not been displayed either at the system console log or at the user ID that is specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTV8109I**  
XSUSPEND(option) COMPLETE FOR VOLUME  
PAIR(primary_volser,secondary_volser)  
FOR SESSION(session_id) AT  
CONSISTENCY_GROUP  
TIME(timestamp) AND STATUS status

**Explanation:**  
The volume pair indicated by primary_volser and secondary_volser is suspended for session session_id with option option. All data on the secondary volume is consistent up to the consistency time timestamp reported. The status of the volume pair is given by status at the time the pair was suspended.

**Source:**  
Extended remote copy (XRC).

**System action:**  
XRC functions are active.

**System programmer response:**  
If the XSUSPEND command has not been explicitly entered by a user, this message can result from an error reported by a previous message. View the system log for previous error messages to determine why the volume pair has been suspended, correct the error, and enter the XADDPAIR command for the suspended volume pair to place the volume pair back into the XRC session. If the command is accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.
ANTV8110I  XUSPEND(option) COMPLETE FOR SESSION(session_id) AT CONSISTENCY_GROUP TIME(timestamp), TIMEOUT(timeout).
SESSION NOW SUSPENDED

Explanation: The XRC session session_id has been suspended by option option. The session is suspended. All secondary volumes are consistent up to the reported consistency time of timestamp. The timeout interval for the storage controls is timeout.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: The session can be suspended by an explicit XUSPEND command or by an error detected by the data mover. The session can be restarted by an XSTART command followed by XADDPAIR commands for the suspended volume pairs.

ANTV8111I  PENDING cmdname(option) CANCELED FOR VOLUME PAIR(primary_volser,secondary_volser) FOR SESSION(session_id)

Explanation: A CANCEL request was specified for the pending command cmdname and option option. The pending command for volume pair primary_volser and secondary_volser in session session_id has been canceled.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted, and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTV8112I  PENDING cmdname(option) CANCELED FOR SESSION(session_id)

Explanation: A cancel was requested for the pending command cmdname and option option. The pending command for session session_id has been canceled.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If you issued a cancel command, the command has been accepted, and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I. If the pending command was canceled as a result of a master cancel command, reference the Advanced Copy Services "Extended Remote Copy TSO Command Descriptions," to determine the action to take.

ANTV8113I  XSET(option(value)) ACCEPTED FOR SESSION(session_id)

Explanation: The XSET option option with value value has been accepted for the session. The value specified takes effect with the start of the next function using this setting.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted, and this message has not been displayed either at the system console log or at the user ID specified with the MSGROUTEID parameter, see message ANTT0099I.

ANTV8114I  XUSPEND COMPLETE FOR SESSION(session_id) AT CONSISTENCY_GROUP TIME(timeout), TIMEOUT(current_storage_control).
SESSION NOW SUSPENDED

Explanation: The XRC session session_id has been suspended. All secondary volumes are consistent up to the reported consistency time of timeout. The timeout value for the storage controls at the time of the error is current_storage_control. This time can be the default timeout value that is set in the storage control, or it can have been set with an XSET command.

Source: Extended remote copy (XRC).
System action: XRC functions are suspended.
System programmer response: The session was suspended by an internal error detected by the data mover. See other messages for the cause of the error. Correct the error and restart the session by issuing an XSTART command followed by XADDPAIR commands for the suspended volume pairs. If an XUSUSPEND function should have occurred but has not, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*.

ANTV8115I  XUSUSPEND(option) ACCEPTED FOR SESSION(session_id) AT TARGET CONSISTENCY_GROUP TIME(timeout)

Explanation: The XUSUSPEND command with option option has been accepted for the session session_id. The command completes the processing of updates to the XRC secondary volumes through the target consistency time of timestamp and a storage control timeout interval of timeout. Successful completion of the command is reported by message ANTV8109I.
**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted, and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I. If an XSUSPEND function should have occurred but has not, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dumps of the ANTAS000 and any ANTASnnn address spaces that are active. To determine which address spaces are active, enter the console command DISPLAY A,ANTAS*. You can obtain the dump by issuing MODIFY ANTASnnn,DUMP.

ANTD8116I XDELP AIR(option) COMPLETE FOR UTILITY VOLUME(primary_volser) FOR SESSION(session_id)

**Explanation:** An XDELP AIR command was issued with the option option. The utility volume primary_volser is successfully removed from session session_id.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message reports the completion of the XDELP AIR command requested by the user. Any errors that occurred while deleting the volume were reported by a previous error message. You can place a deleted volume back into the XRC session with a subsequent XADDPAIR command. If the command is accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTX8117I XRC SESSION(session_id) DELAY DETECTED AT function; SESSION CONSISTENCY DELAY(delay_time)

**Explanation:** The data mover for session session_id has detected a delay in mainline data mover processing. The source of the delay is indicated by the specified function. The functions are described below:

**Note:** The indicated function can not necessarily be the only source of the delay, but it is likely the cause of most of the delay.

**PRIMARY(ssid:scid)**

The indicated XRC session detected a delay while reading updates from the primary storage controls. If XRC was able to identify the storage control (ssid) and storage control session number (scid) that caused the delay, it will also report them on this message.

**JOURNAL**

The indicated XRC session detected a delay while processing XRC journal records for updates made to primary volumes in the session.

**SECONDARY(volser)**

The indicated XRC session detected a delay while writing to secondary volumes for updates made to primary volumes in the sessions. If XRC is able to identify the XRC secondary volume serial number (volser) that is causing the delay, the volume serial number will be reported on this message.

**MASTER(msession_id:lsession_id)**

The indicated XRC session detected a delay in processing coupled sessions associated with the indicated master session name (msession_id). If XRC was able to identify the logical session that caused the delay, it reports the logical session name (lsession_id) on this message.

**BUFFERS**

The indicated XRC session detected a delay because of insufficient availability of data mover buffers. Typically, this condition will be associated with transient delays in other areas (Journal, Master, or Secondary). Configuration of additional memory buffers can provide relief from such delays.

The delay for the session is indicated by delay time delay_time, given in hours, minutes, seconds, and hundredths of seconds (hh:mm:ss.hh).

A delay_time value of ********** indicates that session delay could not be determined, due to the inability to obtain information about a storage control session. This is typically reported as a delay at PRIMARY, along with an SSID and storage control session ID. It may be associated with the abnormal termination of a storage control session, or with the loss of connectivity to the primary storage subsystem.

More commonly, the ********** value will be associated with an I/O timeout that occurred while querying an active storage control session. If such I/O timeouts persist, it may indicate a problem with the channels or network that connects the data mover to the primary storage subsystem. If, however, you determine that the timeouts are normal for your environment, you may consider increasing the timeout value. See the description of the IOTIMING MiscLow parameter in [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/docs/en/zos/2.4.0?topic=handbookdfsmsadvancedcopyservices).

This message can indicate a temporary peak in application activity on the primary storage control, possibly as a result of volume synchronization or resynchronization activity on that storage control. This message can be repeated periodically until the condition is relieved, as indicated by the ANTX8118I message.

**Source:** Extended remote copy (XRC).
System action: XRC functions are active.

System programmer response: This message reports a condition, but does not indicate an error. If the delay condition continues for a long period of time, the application can be impacted if primary storage control cache capability is exceeded. When this message states that the primary rate exceeds the specified function, ensure that the DASD fast write option is on for the volumes associated with the function. If volume synchronization or resynchronization activity is present on any primary storage control, you can want to issue an XSUSPEND command to suspend the volume pairs that are being added until the application update rate on the primary storage controls has returned to normal.

**ANTX8118I**

XRC SESSION(session_id) DELAY RELIEVED AT function; SESSION CONSISTENCY DELAY(delay_time)

**Explanation:** The data mover for XRC session session_id has determined that the processing delay indicated by a previous ANTX8117I message has been relieved. The relieved function is indicated by function. The consistency delay is shown by delay_time.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None.

**ANTX8119W**

XRC UNABLE TO TERMINATE STORAGE CONTROL SESSION session_number USING DEVICE dddd ON STORAGE CONTROL cccc

**Explanation:** An XSTART command has been issued to restart an XRC session. During command processing, the data mover has issued I/O to storage control cccc from device dddd in order to clean up a previously-ended storage control session session_number. The data mover was unable to cleanup the storage control session.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This is a warning condition indicating that this session has not been properly cleaned up, and can become a stalled session. If a subsequent XADDPAIR command fails as a result of this condition, take immediate action to cleanup the stalled session. If the XSTART and XADDPAIR commands are able to proceed using another storage control session, there is no immediate problem to be addressed. In either case, the procedure to cleanup a stalled storage control session is as follows:

1. Issue a MODIFY ANTAS000,LISTSESS dddd command to determine the status of storage control sessions associated with the specified device.

2. Issue a MODIFY ANTAS000,LISTDVCS dddd ss command to determine which devices belong to the storage control session.

3. Issue a MODIFY ANTAS000,TERMSESS dddd ss command to end the session.

**Notes:**

1. The device used to end the stalled session must be owned by the stalled storage control session, or the TERMSESS operation fails. (The LISTDVCS report shows which devices are owned by the storage control.)

2. The device used to end the session is different than the device reported by this ANTX8119W message.

**ANTX8120I**

count VOLUMES IN SESSION(session_id) ARE NOW status

**Explanation:** The number of volumes in session session_id, given by count, are in the state indicated by status. This message can be issued for the following reasons:

- An error associated with at least one ERRORLEVEL(SESSION) volume has occurred, and has caused all of the volumes in the session to be suspended. The word ALL appears in the count field.

- XRC has completed volume synchronization on the last volume pair to be synchronized, and all volume pairs now have a status of duplex. The number of volume pairs in duplex is given by count.

- The last active volume in the session was suspended by an error or by command.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The message indicates the state of all session volumes. This message can be used by automation functions to initiate copies of secondary volumes.

**ANTX8121I**

VOLUME INITIALIZATION RESTARTED FOR XRC VOLUME PAIR (primary_volser,secondary_volser)

**Explanation:** Volume synchronization or resynchronization of volume pair primary_volser and secondary_volser has been automatically restarted. This message follows a suspension of the volume pair because of a recoverable error.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None.
**ANTA8122W VOLUME PAIR(primary_volser,secondary_volser) WILL NOT BE ASSOCIATED WITH SCSESSION(storage_control_session)**

**Explanation:** The XADDPAIR command specified an SCSESSION value that is not the one currently assigned to the volume pair specified by primary_volser and secondary_volser. The data mover will perform the resynchronization of the volume pair using the assigned SCSESSION value. See the ANTA8101I or ANTA8004I message for this volume pair for the currently assigned SCSESSION value.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None required. If you want to change the SCSESSION value currently assigned to the volume pair, you must issue an XDELP air command to remove the volume pair from its current SCSESSION, then issue an XADDPAIR command to assign it the desired SCSESSION value.

**ANTA8123I XSET TIMEOUT(value) SSID(ssid) SCSESSION(session) ACCEPTED FOR SESSION(session_id)**

**Explanation:** The XSET command has been accepted for session session_id. The command was specified with the associated TIMEOUT, SSID, and SCSESSION values.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The function requested by the XSET command has been accepted by the system. If you issued the command and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTA8124I XADDPAIR SUSPENDED COMPLETED FOR SESSION(session_id)**

**Explanation:** In XRC session session_id, an XADDPAIR SUSPENDED command was issued. The command has completed its processing.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The XADDPAIR SUSPENDED command has added all volumes back to the session, and scheduled the volumes for volume initialization.

**ANTA8126I XADDPAIR SUSPENDED COMPLETED - NO SUSPENDED VOLUMES IN SESSION(session_id)**

**Explanation:** The XADDPAIR SUSPENDED command was received for XRC session session_id. There are no suspended volumes in the session.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The function has requested that all suspended volumes be added back to the session. The session has no suspended volumes. Issue the XQUERY command to determine the status of all volumes in the XRC session. The suspended volume count should be zero. If it is not zero, search problem reporting databases for a fix for the problem. If no fix exists, issue a MODIFY command to dump the ANTASnmm address space and provide pertinent system log information to the IBM Support Center.

**ANTA8130I XSET(parm1(parm1_value) parm2(parm2_value)) ACCEPTED FOR SESSION(session_id)**

**Explanation:** The XSET command was issued with parm1 and its value of parm1_value, and parm2 and its value of parm2_value for session session_id. The command was accepted. Reference section "PARMLIB Parameters" in z/OS DFSMS Advanced Copy Services to determine when the specified values take effect.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified with the MSGROUTEID parameter, see message ANTT0099I.

**ANTA8131I XSET DVCBLOCK(setting) VOLUME(ALL) ACCEPTED FOR COUNT VOLUMES IN SESSION(session_name)**

**Explanation:** The XSET command was issued specifying the DVCBLOCK parameter setting of setting. The indicated device blocking setting will be applied to count volumes in the specified XRC logical session session_name. The volume count includes suspended and pending volumes.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If you issued the command and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I. The volume count does not include XRC utility volumes nor volumes for which an error was
The XSET command was issued specifying the DVCBLOCK parameter setting of setting.

**Explanation:** The XSET command was issued specifying the DVCBLOCK parameter setting of setting.

**System action:** XRC functions are active.

**System programmer response:** If you issued the command and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I. Also, this message will not be issued for all XRC utility volumes (XRCUTL).

**Source:** Extended remote copy (XRC).

**System action:** XRC processing continues, but the DVCBLOCK setting remains what it was previously.

**System programmer response:** For DVCBLOCK(ON), ensure that the device blocking function has been installed on the storage subsystem. For DVCBLOCK(WPx), ensure that the Write Pacing function has been installed on the storage subsystem, then issue an XSET command with the REFRESH parameter and retry the XSET DVCBLOCK command.

**Source:** Extended remote copy (XRC).

**System action:** XRECOVER processing continues.

**System programmer response:** None.

**Source:** Extended remote copy (XRC).

**System action:** Depending on storage control type, the storage control session is either suspended or terminated. The associated reader task of the data mover is ended, and updates are no longer retrieved from the primary storage control cache.

**System programmer response:** See previous XRC messages to determine the reason for the storage control session error or I/O error on the utility volume. When the cause of the error is resolved, issue the XADDPAIR command for the utility volume to restart the reader task and reactivate the storage control session.

**Source:** Extended remote copy (XRC).

**System action:** XRC processing continues, but no write pacing will occur on volume.

**System programmer response:** If write pacing is
Using REFRESH

Using REFRESH implies that the user guarantees that the data on the new secondary device(s) are valid.

Note that SDM does not do any checking to ensure that the XSET PARMLIB command, and retry the command.

Apply the changes using PARMLIB to include VOLINIT

System

Source: Extended remote copy (XRC).

System action: New capabilities, such as Write Pacing, will now be recognized for volumes associated with this storage controller.

System programmer response: Look for additional messages ANTX8138I, ANTX8139W, or ANTX5127E for other controllers processed by the REFRESH command.

Controller Attributes Updated for SSID(ssid) in Session(session_id)

Explanation: In response to an XSET REFRESH command, the data mover has refreshed the attributes of the specified storage controller.

Source: Extended remote copy (XRC).

System action: New capabilities, such as Write Pacing, will now be recognized for volumes associated with this storage controller.

System programmer response: Look for additional messages ANTX8138I, ANTX8139W, or ANTX5127E for other controllers processed by the REFRESH command.

Controller Attributes Unchanged for SSID(ssid) in Session(session_id)

Explanation: In response to an XSET REFRESH command, the data mover has checked the attributes of the specified storage controller, and found no changes.

Source: Extended remote copy (XRC).

System action: No change in capabilities will be recognized for volumes associated with this storage controller.

System programmer response: If this SSID was previously processed with a REFRESH, this message is to be expected. However, if a change in capabilities was expected, ensure that the correct SSID was specified on the command, if so, check the Licensed Internal Code on the storage controller to ensure it has been correctly updated.

XSET REFRESHs Ignored for Session(session_id), Update ENABLEREFRESHs in PARMLIB.

Explanation: The XSET REFRESH command was ignored because either VOLINIT ENABLEREFRESH was specified as NO in PARMLIB, or VOLINIT ENABLEREFRESH was not specified in PARMLIB.

Source: Extended remote copy (XRC).

System action: The command is rejected.

System programmer response: Update the PARMLIB to include VOLINIT ENABLEREFRESH(YES). Apply the changes using the XSET PARMLIB command, and retry the command.

Note that SDM does not do any checking to ensure that the data on the new secondary device(s) are valid. Using REFRESH implies that the user guarantees that the data on the new secondary device(s) are an exact copy of the data on the previously existing secondary device(s). If the data is not an exact copy, then SDM cannot guarantee secondary data consistency and unpredictable results can occur. When in doubt, avoid use of REFRESH and instead use XDELPAIR and XADDPAIR for any relocated secondary volume(s).

XSET REFRESHs Updated number Volumes in Session(session_id)

Explanation: The XSET REFRESH command found new location information for the specified number of secondary volume(s). XRC's internal control data has been updated with this new location information.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: The system programmer can now issue XADDPAIR, and resynchronization will proceed with the secondary volume(s) in their new locations.

Note that SDM does not do any checking to ensure that the data on the new secondary device(s) are valid. Using REFRESH implies that the user guarantees that the data on the new secondary device(s) are an exact copy of the data on the previously existing secondary device(s). If the data is not an exact copy, SDM cannot guarantee secondary data consistency and unpredictable results can occur. When in doubt, avoid use of REFRESH and instead use XDELPAIR and XADDPAIR for any relocated secondary volume(s).

XSET REFRESHs Failed for Pair(primary_volser, secondary_volser) in Session(session_id), RC=return_code REAS=reason_code

Explanation: The secondary_volser was not updated for the primary_volser secondary_volser pair in session session_id. The return_code and reason_code indicate the reason for the failure.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. Correct the error and reenter the command.

XADDPARi WAITING FOR Session(session_id) TO PROCESS Pre-Suspend Updates

Explanation: XADDPARi for a suspended volume is delayed because of the existence of unprocessed updates that occurred before the volume suspension

Source: Extended remote copy (XRC).
System action: The system data mover waits 15 seconds for processing to proceed, and then checks again. If no progress is detected, the XADDPAIR fails with message ANTA5107E return code 353. Otherwise, if pre-suspend updates still remain to be processed, another wait cycle will occur.

System programmer response: If XADDPAIR fails, wait until session delay is relieved before resubmitting the XADDPAIR command.

**ANTX8144I**

XRC SESSION(session_id) OPERATING MODE(mode) IS NOW ACTIVE

Explanation: The XRC session identified by session_id is now using the operating mode identified by mode. The values for mode are defined in the description of the XSTART command in GDPS Metro/zGlobal Mirror: Planning and Implementation Guide, order number ZG24-1757.

System action: XRC functions are active.

System programmer response: No action required unless the specified operating mode is incorrect for the specified session. If the operating mode is incorrect for this session, issue the XSUSPEND command to suspend the session or issue the XEND command to end the session, and then issue the XSTART command with the MODE parameter specifying the correct operating mode.

Source: Extended remote copy (XRC).

**ANTX8145I**

XRC SESSION(session_id) OPERATING MODE(mode) IS NOW INACTIVE

Explanation: The XRC session identified by session_id was previously using the operating mode identified by mode, but that mode is now inactive. The values for mode are defined in the description of the XSTART command in GDPS Metro/zGlobal Mirror: Planning and Implementation Guide, order number ZG24-1757.

System action: XRC functions are active.

System programmer response: No action required unless deactivating the specified operating mode is incorrect for the specified session. If the operating mode should be active for this session, issue the XSUSPEND command to suspend the session or issue the XEND command to end the session, and then issue the XSTART command with the MODE parameter specifying the correct operating mode.

Source: Extended remote copy (XRC).

**ANTX8147I**

XRC SESSION(session_id)
VOLUME(volser) MODE(mode) IS ASSOCIATED WITH SWAP
VOLUME(swapdev)

Explanation: The volume identified by volser in XRC session session_id using mode mode is associated with the swap volume identified by swapdev. For MODE(HYPER-PPRC), the swap volume is a PPRC secondary device associated with the XRC primary device.

System action: XRC functions are active.

System programmer response: No action required if this is the correct correspondence between the specified volume and swap volume. If the correspondence is incorrect, refer to the description of MODE in z/OS DFSMS OAM Planning, Installation, and Storage Administration Guide for corrective action.

Source: Extended remote copy (XRC).

**ANTX8148I**

XSWAP OPERATION ON XRC SESSION(session_id) WILL PERMIT INCREMENTAL RESYNCHRONIZATION FOR ALL VOLUMES

Explanation: If a HyperSwap was performed, all swap volumes can be resynchronized with their corresponding remote volumes using an incremental operation instead of a full operation.

System action: XRC functions are active.

System programmer response: A HyperSwap can be performed without requiring full resynchronization.

Source: Extended remote copy (XRC).

**ANTX8149I**

XSWAP OPERATION ON XRC SESSION(session_id) REQUIRES FULL RESYNCHRONIZATION OF VOLUME PAIR(pvolser,svolser) RC=rc REAS=reas

Explanation: If a HyperSwap was performed, the specified volume pair will require full resynchronization to bring the remote volume into sync.

System action: XRC functions are active.

System programmer response: A HyperSwap can be performed without requiring full resynchronization.

Source: Extended remote copy (XRC).

**ANTX8150I**

XRC SESSION(session_id) VERIFICATION STARTING, REASON=xxxxxxx

Explanation: A mirror status verification will be started for one of the following reasons:

- SCHEDULE - XRC PARMLIB VerifyInterval has expired.
- FAILBACK - Primary storage subsystem cluster failback is detected.
- REVERIFY - Trying verification again because of timeout while obtaining device information on prior verification.
• vvvvv - Volume serial of the duplex primary storage subsystem showing evidence that mirroring might have been interrupted.

**Source:** Extended remote copy (XRC).

**System action:** Mirror status verification continues.

**System programmer response:** Look for subsequent ANTX8151I, ANTX8152W, or ANTX8153W messages.

---

**ANTX8151I**  XRC SESSION(session_id) VERIFICATION OK

**Explanation:** Mirror status verification has completed, and no exceptions have been found. An exception is defined when a non-XRCUTL volume that is not in duplex status, or a duplex volume that shows unexpected device status in the primary storage subsystem. This message can also be received for a session that currently contains no volumes.

**Source:** Extended remote copy (XRC).

**System action:** Mirror status verification completed.

**System programmer response:** None.

---

**ANTX8152W**  XRC SESSION(session_id) VERIFICATION FOUND nnnnn EXCEPTION(S)

**Explanation:** Mirror status verification has detected one or more non-XRCUTL volumes that are not in duplex status, or duplex volumes that show unexpected device status in the primary storage subsystem.

**Source:** Extended remote copy (XRC).

**System action:** Mirror status verification completed. Volumes might have been suspended during verification.

**System programmer response:** Look for ANTX5104E, ANTX5001E, ANTX5002E, or ANTX5003E messages that might have occurred during verification. Look for subsequent ANTX8153W message to determine if the XADDPAIR command is required to return volumes to duplex state. You may issue XQUERY command with ACTIVITY parameter to display volume status.

---

**ANTX8153W**  XRC SESSION(session_id) NEEDS XADDPAIR

**Explanation:** Mirror status verification has found exceptions that will not be scheduled for AUTO_READD processing.

**Source:** Extended remote copy (XRC).

**System action:** Mirror status verification completed.

**System programmer response:** You may issue XQUERY command with ACTIVITY parameter to display volume status. To return suspended volumes to duplex status, issue XADDPAIR commands.

---

**ANTX8155I**  XSUSPEND VOLUME(ALL) FOR XRC SESSION(session_id) HAS FINISHED

**Explanation:** An XSUSPEND VOLUME(ALL) was issued to session session_id. All volumes in XRC session session_id have been suspended.

**System action:** XRC volumes are suspended.

**Source:** Extended remote copy (XRC).

---

**ANTA8156I**  XRC SESSION(sessname) SSID(ssid) SCSESSION(scsn) SCID(scid) IS NOW USING scsnmode MODE

**Explanation:** The identified ssid, scsn, scid within XRC session sessname is now in the indicated scsnmode. The possible values for scsnmode are:

- SINGLE
- ENHANCED

**Source:** Extended remote copy (XRC).

**System action:** XRC reads updates from the indicated SSID using the indicated scsnmode.

**System programmer response:** If the mode change is expected, no action required.

---

**ANTA8157I**  XRC SESSION(sessname) SSID(ssid) AUXILIARY SCID(scid) IS NOW ASSOCIATED WITH SCSESSION(scsn)

**Explanation:** The identified SSID is now associated with the indicated SCSN.

**Source:** Extended remote copy (XRC).

**System action:** XRC reads updates from the indicated SSID using the indicated SCID.

**System programmer response:** If the additional SCID is expected, no action required.

---

**ANTA8158I**  XSWAP PERFORM ON SESSION(session_id) HAS SWAPPED ALL VOLUMES FOR STORAGE CONTROL(ssid)

**Explanation:** An XSWAP PERFORM was issued for the session as identified by session_id. The primary and swap volumes associated with the storage control identified by ssid have been inverted and the volume roles are switched. The original primary is now the swap volume, and the original swap volume is now the primary.

**System action:** XRC volume state is updated.

**Source:** Extended remote copy (XRC).
ANTX8159I XSWAP PERFORM ON SESSION(session_id) HAS FINISHED SUCCESSFULLY

Explanation: The XRC session session_id has been swapped by XSWAP PERFORM. The session is swapped. The primary and swap volumes associated with the storage control identified by ssid have been inverted and the volume roles are switched. The original primary is now the swap volume, and the original swap volume is now the primary.

System action: XRC volume state is updated.

Source: Extended remote copy (XRC).

ANTX8160I XRC SESSION(session_id) SWAP TRANSLATED FROM SSID(oldssid) TO SSID(newssid)

Explanation: XRC has updated the identity of the swap devices that were on the old Subsystem Identifier (SSID) to reflect their new location on the new SSID.

System action: The XRC configuration is updated.

Source: Extended remote copy (XRC).

ANTX8161I XRC TERMINATED ALL SWAP VOLUMES ON SESSION(session_id) SSID(ssid) SCSESSION(sid)

Explanation: The XRC session is transitioning from MODE(HYPER-PPRC) to MODE(NORMAL). The XRC sessions on the SWAP volumes were terminated.

System action: SWAP device sessions are removed.

System programmer response: If the MODE change is expected, no action is required. If the MODE change is unexpected, it might be because of an unintended GDPS configuration change. For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704. The XRC sessions on the former SWAP devices might be removed by a MODIFY ANTAS000,TERMSESS command from a system with connectivity.

Source: Extended remote copy (XRC).

ANTX8172I XRC XSWAP SUSSWAP SUSPENDED ALL SWAP VOLUMES ON SESSION(session_id) SSID(ssid) SCID(scid)

Explanation: XRC sessions on the current SWAP devices are now suspended.

System action: The XRC configuration is updated.

System programmer response: Refer to the return code description for the reason why the swap volumes could not be suspended. Correct the condition. For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

Source: Extended remote copy (XRC).

ANTX8173W XRC XSWAP SUSSWAP UNABLE TO SUSPEND ALL SWAP VOLUMES ON SESSION(session_id) SSID(ssid) SCID(scid) RC=rc REAS=reas

Explanation: XRC sessions might still be active (not suspended) on some SWAP volumes. This might interfere with the ability to resync PPRC.

System action: XRC operations continue.

System programmer response: Refer to the return code description for the reason why the swap volumes could not be suspended. Correct the condition. For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

Source: Extended remote copy (XRC).

ANTX8174W XRC XSWAP PREPARE FOR XRC SESSION(session_id) FOUND NO ACTIVE SSIDS

Explanation: The XSWAP PREPARE function could not be processed on this session because all of the storage control sessions are not available.

System action: The PREPARE function is not executed.

System programmer response: For more information about the GDPS, see GDPS/XRC VvRr Installation and Customization Guide, order number ZG24-6704.

Source: Extended remote copy (XRC).
Chapter 13. ANT messages 403

Extended remote copy (XRC).

System action: XRC reads updates from the indicated SSID using the indicated SCID.

System programmer response:
- If the selected mode is as expected, no action is required.
- If the selected mode is not as expected because of incorrect PARMLIB settings, update the settings and apply the change.

The identified auxiliary SCID was created.

System action: XRC reads updates from the indicated SSID using the indicated SCID.

System programmer response: If an auxiliary session is as expected, no action is required.

The XADDPAIR command with SUSPENDED option was issued to a XRC session with the AllowEnhancedReader(YES) parameter set. SCIDs that are on at least one storage control that supports the enhanced multiple reader function, have not been converted to the enhanced mode.

The XADDPAIR command is rejected. Suspended volumes remain suspended.

System programmer response:
- If AllowEnhancedReader(YES) is the desired setting, follow the procedure in z/OS DFSMS Advanced Copy Services to convert the volume configuration to enhanced multiple reader mode, and issue the XADDPAIR SUSPENDED command again.
- If AllowEnhancedReader(NO) is the desired state, change PARMLIB, activate the state through the XSET command, and issue the XADDPAIR command again.

A TSO user or the system data mover issued an XQUERY command for session session_id. addrspace_name identifies the name of the address space where the session that is identified by session_id is being processed.
When addspace_name is ANTAS000, the report displays default environment values plus any overrides from the ANTXIN00 parmlib member.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for examples of XQUERY command output. If the command has been accepted and this message has not displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

### ANTQ8201I XQUERY report_type REPORT COMPLETE FOR SESSION (session_id)

**Explanation:** This message is issued upon completion of all XQUERY reports. The message concludes the XQUERY report for the session session_id. The report_type identifies the type of report given.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

### ANTQ8202I XQUERY report_type REPORT - level_number

**Explanation:** An XQUERY command has been issued. The type of report requested is shown as report_type. The level_number gives the level of the report. Different report_types have different level_numbers.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

### ANTQ8203I header_line

**Explanation:** The header_line is a standard header line for various reports. It provides separation between the header and detail information.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

### ANTQ8204I NO VOLUMES MEET REQUESTED SPECIFICATION

**Explanation:** A qualification was requested for a volume list report. There are no volumes which meet the requested qualifications.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** An XQUERY command was issued with specified options and no volumes in the session met the criteria. Issue an XQUERY VOLUME(ALL) command to obtain complete volume status.

---

### ANTQ8205I number_volumes OF total_volumes VOLUMES MEET REQUESTED SPECIFICATION

**Explanation:** A qualification request was made for a volume list report. number_volumes is the number of volumes that met the qualifications. total_volumes reports the total number of valid volumes in the list that the user requested to be considered.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None.

---

### ANTQ8206I number_volumes VOLUME(S) MEET REQUESTED SPECIFICATION

**Explanation:** This message specifies the number of volumes that meet the selection criteria specified on the XQUERY command. Volumes which are not part of an XRC session are not included in the reported volume count.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted with specified options and no volumes in the session met the criteria. Issue an XQUERY VOLUME(ALL) command to obtain complete volume status.

---

### ANTQ8207I MONITOR INTERVAL STATISTICS AS OF timestamp UTC

**Explanation:** This message is one of a set generated in response to an XQUERY VOLUME PACE command. It is displayed if the session contains volumes associated with storage subsystems that are write pacing capable. For these volumes, the displayed statistics are taken from a recently completed XRC
monitor interval. This message displays the completion
timestamp (yyyy.ddd hh:mm:ss) of that interval.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None.

---

**ANTQ8211I**  PRIM SEC ERROR SYNCH

**Explanation:** This message provides the XQUERY command volume report header information. It is associated with messages ANTQ8212I and ANTQ8213I. The details of the fields are provided in message ANTQ213I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8212I**  VOL VOL LEVEL % STA CMD OP

------TIMESTAMP------

**Explanation:** This message provides the XQUERY command volume report header information. This header message is associated with ANTQ8211I and ANTQ8213I. The details of the fields are provided by ANTQ213I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8213I**  prim_vol sec_vol errorlevel synch_% sta cmd op timestamp

**Explanation:** This message provides the output associated with the header lines produced by messages ANTQ8211I and ANTQ8212I for the XQUERY command requesting a volume report.

**prim_vol** – The primary volume serial being reported.

**sec_vol** – The secondary volume serial being reported.

**errorlevel** – The error level for the primary and secondary volume pair. For each volume pair reported, the error level is either explicitly specified on a previous XADDPAIR command, or defaulted from the XSTART command for the session. The valid values in this field are:

- VOLUME – Volume-level recovery
- SESSION – Session-level recovery
- (group_name) – Group-level recovery
- (blank) – No error level for the volume (such as a utility volume)

**synch_%** – Provides the approximate percentage of the volume pair that has completed synchronization or resynchronization. For example, a volume pair that is reported with synch_% of 80% means that 80% of the data on the secondary volume is synchronized with the primary volume at the reported session consistency time. Thus, 20% of the data must be copied in order to place the volume pair in a fully synchronized state.

This field can contain any of the following:

- **nn** – Where **nn** ranges from 00 to 99. This is the approximate percentage of the volume pair that is synchronized. If **nn** is 00, the volume synchronization process can not yet have started. If the percentage does not change as expected on subsequent XQUERY commands, it can be because the storage control has exceeded its internal threshold value and has temporarily stopped the copy activity. When the activity level again falls below the threshold value (default of X’500’), the storage control resumes processing the volume copy.

- **--** – A synch percentage cannot be determined because of one of the following conditions:
  - There was a prior suspension before the volume pair reached duplex
  - None of the volume pairs in this session were updated since the pair reached duplex
  - A previously canceled session was restarted and the consistency time for previously duplex volume pairs (which are now suspended because of a restart of the session) cannot be determined.

- **(blank)** – The volume pair is in duplex or seqcheck state. The volume pair is completely synchronized and consistent as of the reported session consistency time.

- **“--”** – The field is not applicable to this volume pair.

**sta** – The current status information associated with the volume pair. The valid status states are:

- **cpy** – Copy. Volume synchronization or resynchronization is paused because the residual count indicated on message...
ANTQ8218I has exceeded the update threshold value of X’500’ for a primary storage control in the session. When the residual count goes below X’500’, the volume synchronization or resynchronization will resume for the volume and the volume status will be changed to CPY.

- **CPY** – Copy. Volume pair being synchronized or re-synchronized.
- **DUP** – Duplex. Volume pair in duplex state at time of report.
- **NIS** – Not in session. Volume pair is not part of the session.
- **pnd** – Pending. The pending volume synchronization or resynchronization is paused because the residual count indicated on message ANTQ8218I has exceeded the update threshold value of X’500’ for a primary storage control in the session. When the residual count goes below X’500’, the pending volume synchronization or resynchronization will resume for the volume and the volume status will be changed to PND.
- **PND** – Pending. Volume pair waiting to be synchronized or re-synchronized.
- **RCV** – Recovered. Volume pair has been successfully recovered.
- **RST** – Restarted. Volume pair is scheduled for resynchronization because of a recoverable error.
- **SUS** – Suspended. Volume pair is suspended.
- **SEQ** – Seqcheck. Volume pair can be inconsistent relative to other volume pairs on different storage controls.
- **UTL** – Utility volume. Volume is used as a path to the storage control.
- ***** – Blocked. An asterisk appended to the value in the sta field indicates that the specified primary volume is currently being blocked. Request a detail volume report for additional information about the blocking status.

**cmd** – The latest pending command issued for the volume pair. The pending command is not executed until the time specified in the timestamp field is reached. This field can contain any of the following:
- (blank) – No pending command for the volume pair.
- **DEL** – Pending XDELPAIR command for the volume pair.
- **SUS** – Pending XSUSPEND command for the volume pair.

**op** – The keyword option selected when the cmd was issued for this volume pair. This field can contain any of the following:
- (blank) – No pending time for the volume pair.
- **AT** – Pending ATTIME time for the volume pair.
- **DR** – Pending DRAIN time for the volume pair.
- **IM** – Pending IMMEDIATE time for the volume pair.

**timestamp** – The time associated with the volume pair. The interpretation of the timestamp field is based upon a combination of the status and command fields described below. The timestamp is always a universal time, coordinated (UTC) format associated with the application systems connected to the primary storage controls. The field is not a data mover system timestamp. The timestamp field can be any of the following:
- (blank) – There are no outstanding commands pending for the volume pair. If the volume pair is in DUP state, the volume pair is consistent up to the session-specified timestamp reported in message ANTQ8231I.
- (timestamp) – The timestamp reported is given in UTC format. If the volume pair has a status of SUS, the data on the suspended volume pair is consistent up to the time reported. If the volume pair has a pending command (indicated by a command in the cmd field), the timestamp reported is the target time for the pending command.
- **NO_TIME_AVAILABLE** – A consistency time for this suspended volume pair cannot be determined because of one of the following reasons:
  - There was a prior suspension before the volume pair reached duplex
  - None of the volume pairs in this session has been updated since the pair reached duplex
  - A previously canceled session was restarted and the consistency time for previously duplex volume pairs (which are now suspended because of restart of the session) cannot be determined.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The information reported by the XQUERY command is provided for the volumes requested by the command. It is point-in-time information based on the volume status at the time the command processes the volume. See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/docview.wss?uid=swg21427256) for examples of XQUERY.
command output. If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8214I** NO ACTIVE VOLUMES

**Explanation:** There are no active volumes in the session. The presence of this message indicates that there is no ANTT8235I message issued for the XQUERY report.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The information reported by the XQUERY command is provided for the volumes requested by the command. See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output. If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8216I** PRIM SEC ERROR SYNCH RES THD SC

**Explanation:** This message provides the header information for an XQUERY command volume detail report. It is associated with messages ANTT8217I and ANTT8218I. The details of the message are provided in message ANTT8218I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8217I** VOL VOL LEVEL % STA CMD OP CNT CNT SSID SN ID

**Explanation:** This message provides the header information for an XQUERY command volume detail report. It is associated with messages ANTT8216I and ANTT8218I. The details of the message are provided in message ANTT8218I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.
System programmer response: None.

ANTQ8219I PRIM SEC SC SC RES THD RES WRT PACE

Explanation: This message provides the header information for the XQUERY VOLUME_PACE report. Message ANTQ8218I provides details for each volume.

See message ANTQ8213I for an explanation of the prim_vol, sec_vol, and sta fields.

The above fields can display asterisks if the data mover has not yet completed a monitor interval, or if storage control information could not be determined.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8220I VOL VOL STA SSID SN ID CNT CNT RATE RATE MS

Explanation: This message provides the header information for an XQUERY command volume detail report. It is associated with messages ANTQ8216I and ANTQ8218I. The details of the message are provided in message ANTQ8218I.

See message ANTQ8218I for an explanation of the ssid, sc sn, sc id, res cnt, and thd cnt fields.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8221I prim_vol sec_vol sta pssid pcsn pscid residual_cnt threshold_cnt res_rate wrt_rate pace_ms

Explanation: This message provides the output associated with the header lines produced by messages ANTQ8216I and ANTQ8217I for the XQUERY command requesting a volume detail report.

See message ANTQ8213I for an explanation of the prim_vol, sec_vol, and sta fields.

residual_cnt –
The number of updated records for this device that the data mover has yet to read from the primary storage control for this volume. The residual count can display asterisks if there was either an I/O error while retrieving storage control information, or I/O required more than the allotted time to complete.

threshold_cnt –
The current blocking threshold count or write pacing level for the primary volume. If this field is blank, the device blocking LIC is not installed on the primary storage control. If this field is zero, the volume was added to the session with the DONOTBLOCK keyword specified. threshold_cnt can display asterisks if there was either an I/O error while retrieving storage control information, or I/O required more than the allotted time to complete. For a write pacing-enabled volume, threshold_cnt displays the write pacing residual count, followed by a colon (:) and the pacing level indicator (1-F).

If the status of the volume is either SUS (suspended) or PND (pending), threshold_cnt is the value that will be applied when volume initialization begins, assuming that the session’s WrtPacingResidualCnt and Write Pacing Level or DeviceBlockingThreshold remain unchanged. For volumes in SUS or PND status whose pacing or blocking attributes will be changed once volume copy starts, a plus sign (+) will precede the threshold_cnt field. To determine the actual values that will be in effect, use an XQUERY volume detail report on the volume in question.

res_rate
The number of record sets created per second for this volume during the monitor interval. The value is displayed in hexadecimal, for volumes on controllers that support the Write Pacing function. Volumes on other controllers that are not write pacing capable display blanks in this field.

wrt_rate
The number of write channel programs completed per second for this volume during the monitor interval. The value is displayed in hexadecimal, for volumes on controllers that support the Write Pacing function. Volumes on other controllers that are not write pacing capable display blanks in this field.

pace_ms
PACE MS indicates the average pacing milliseconds injected per write channel program during the monitor interval. The value is displayed in decimal, for volumes that have Write Pacing enabled. Other volumes display blanks in this field.

Note that write pacing delay is injected per recordset, and a write channel program may create several recordsets, the displayed value can (and likely will) be higher than the nominal per-recordset pacing value for the WPn level assigned to the volume.
The storage subsystem identifier for the primary volume.

The logical session name of the primary storage control session.

The storage control session identifier for the primary volume. The storage control session identifier can display asterisks if there was either an I/O error while retrieving storage control information, or I/O required more than the allotted time to complete.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** None.

---

**ANTQ8222I PRIM SEC ERROR XRC**

**Explanation:** This message provides the XRC command volume report header information. It is associated with messages ANTQ8223I and ANTQ8224I. The details of the fields are provided in message ANTQ8224I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8223I VOL VOL LEVEL CYLS STA ---------TIMESTAMP---------**

**Explanation:** This message provides the XRC command volume report header information. The details of the fields are provided in message ANTQ8224I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8224I prim_vol sec_vol errorlevel xrc_cyls sta timestamp**

**Explanation:** This message provides mirroring volume status details.

**prim_vol** – The primary volume serial being reported.

**sec_vol** – The secondary volume serial being reported.

**errorlevel** – The error level for the primary and secondary volume pair. For each volume pair reported, the error level is either explicitly specified on a previous XADDPAIR command, or defaulted from the XSTART command for the session. The valid values in this field are:

- **VOLUME** – Volume-level recovery
- **SESSION** – Session-level recovery
- **(group_name)** – Group-level recovery
- **(blank)** – No error level for the volume (such as a utility volume)

**xrc_cyls** – Primary volume size (cylinders) for duplex volumes value might be followed by a question mark (?) if device status cannot be retrieved from the primary storage subsystem.

**sta** – The current status information associated with the volume pair. The valid status states are:

- **CPY** – Copy. Volume pair being synchronized or re-synchronized.
- **DUP** – Duplex. Volume pair in duplex state at time of report. If followed by a question mark (?), volume pair did not complete the checking and can be rechecked by issuing the XQUERY again.
- **PND** – Pending. Volume pair waiting to be synchronized or re-synchronized.
- **RCV** – Recovered. Volume pair has been successfully recovered.
- **RST** – Restarted. Volume pair is scheduled for resynchronization because of a recoverable error.
- **SUS** – Suspended. Volume pair is suspended by command. If followed by an asterisk (*), volume pair is suspended because of errors.
- **SEQ** – Seqcheck. Volume pair can be inconsistent relative to other volume pairs on different storage controls.
- **UTL** – Utility volume. Volume is used as a path to the storage control.

**timestamp** – Always specified the UTC timestamp to which the data on the secondary volume is consistent.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The information reported by the XQUERY command is provided for the volumes requested by the command. It is point-in-time information based on the volume status at the time the command processes the volume. See [Z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/pages/zos-advanced-copy-services) for examples of XQUERY command output. If the command has been accepted
and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8231I**  DATA CONSISTENT(timestamp)  system_status

**Explanation:** This message provides the summary information for the XQUERY command for the summary and volume reports.

The **timestamp** reports the consistency time for volumes in the XRC session at the time the report is given. The **timestamp** specifies the universal time, coordinated from the application system. XRC generates this time from the updates received from the application system. Data on the secondary volumes was consistent up to this timestamp. This timestamp is not changed if the application system is not performing updates to any primary volumes managed by XRC.

The reported timestamp does not apply to volumes in either a pending or a suspended state. Volumes in a pending state are currently processing a synchronization function and do not become consistent until the copy operation has completed. Volumes that are in a suspended state have their consistency time reported in a separate message.

**system_status** is reported as follows:

- **DELAY(hh:mm:ss.hh)** – This is the current delay between the last application I/O to a primary storage control and the update made by the data mover to a secondary target volume. **DELAY(hh:mm:ss.hh)** provides an approximation of the time delay between the primary and secondary volumes. This is reported in hours, minutes, seconds, and hundredths of a second.
- **IDLE(hh:mm:ss.t)** – This status is reported when all updates have been applied to the secondary volumes and all primary storage controls have no pending updates. This field is reported in hours, minutes, seconds, and tenths of a second, and wraps to zero after 18 hours, 59 minutes, and 59 seconds. Updates to unsuspended volumes reset the idle indication. An XDELPAIR or XSUSPEND command with an ATTIME or DRAIN option specified also resets the idle time.
- ********* – This status is reported when the XQUERY function is unable to determine the status of the primary storage controls. This can occur if the primary storage controls are inaccessible.
- **(blank)** – This field is not applicable for an XRECOVER report and is reported as blanks when issued during an XRECOVER.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See z/OS DFSMS [Advanced Copy Services](https://publib.boulder.ibm.com/infocenter/zos/v1r11/pow/zosadvancedc.html) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8232I**  SESSIONTYPE(session_type)  ERRORLEVEL(error_level)  HLQ(hlg)

**Explanation:** This message provides additional summary information for the XQUERY command for the summary and volume reports. The **SESSIONTYPE** field reports the **session_type** specified on the last XSTART command for this session.

The **ERRORLEVEL** field reports the error level currently in effect for the session. All volumes in the session that were not assigned an error level with the XADDPAIR command receive this error level assignment. The **HLQ** field reports the high-level-qualifier hlg in effect for the session, as was specified on the XSTART command.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See z/OS DFSMS [Advanced Copy Services](https://publib.boulder.ibm.com/infocenter/zos/v1r11/pow/zosadvancedc.html) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8233I**  DEFAULT TIMEOUT(timeout)

**Explanation:** This message provides the summary information for the XQUERY command. It is issued for the summary and volume reports. The default timeout **timeout** field specifies the session timeout interval. This value is assigned to storage controls when their session is initialized. The time value is given in hours, minutes, and seconds. If the default timeout is used for each storage control, this field is reported as STORAGE_CONTROL_DEFAULT.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See z/OS DFSMS [Advanced Copy Services](https://publib.boulder.ibm.com/infocenter/zos/v1r11/pow/zosadvancedc.html) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8234I**  PND cmdlevel CMD = command keyword(timestamp)

**Explanation:** This message provides the summary information for the XQUERY command. It is issued for the summary and volume reports. **cmdlevel** indicates that either the MASTER or SESSION command command **keyword** is pending. **command** can be either XSUSPEND or XEND. **keyword** specifies the option associated with the command. It can be either ATTIME or DRAIN. **timestamp** is a universal time, coordinated
(UTC). The pending command will be executed when this time is reached.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed either at the system console log or at the user ID displayed by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8235I**

**Explanation:** This message provides a status summary as part of the XQUERY summary, volume, storage control, and configuration reports. The reported fields are as follows:

- `tttt` – The total number of volumes reported
- `dddd` – The number of volumes in duplex state
- `uuuu` – The number of utility volumes that are not in any other state
- `ssss` – The number of volumes in suspended state
- `pppp` – The number of volumes in pending state
- `cccc` – The number of volumes in seqchk state

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at either the system console log or at the user ID displayed by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8236I**

**Explanation:** This message summarizes the timeout interval for the pending XSUSPEND command. It is only issued for a pending XSUSPEND(session) command. The timeout interval is used for all storage controls when the XRC session is suspended. It is given in hours, minutes, and seconds. If the default timeout is used for each storage control, this field is reported as STORAGE_CONTROL_DEFAULT.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8237I**

**Explanation:** This message is provided as part of the XQUERY volume report that is issued by the XRECOVER command. It provides a status summary of all the volumes in the XRC session. The reported fields are:

- `tttt` – The total number of volumes reported
- `dddd` – The number of recovered duplex volumes
- `pppp` – The number of volumes in pending state
- `ssss` – The number of volumes in suspended state

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8238I**

**Explanation:** This message, part of an XQUERY report, provides a status summary of all volumes in the XRC session. The report fields are as follows:

- `tttt` – The total number of volumes reported
- `dddd` – The number of volumes in duplex state
- `iii` – The number of volumes in initial copy or resynchronization state
- `pppp` – The number of volumes in pending state
- `ssss` – The number of volumes in suspended state
- `cccc` – The number of volumes in seqchk state

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**Chapter 13. ANT messages**

411
(PAV) aliases as utility devices. Note that the PAV count is not included in the TOTAL volume count.

ANTQ8239I  TOTAL=tttt DUP=dddd CPY=iii PND=pppp SUS=ssss

Explanation: This message is provided as part of the XQUERY report that is issued by the XRECOVER command. It provides a status summary of all the volumes in the XRC session. The report fields are as follows:

- tttt – The total number of volumes reported
- dddd – The number of volumes in duplex state
- iii – The number of volumes in initial copy or resynchronization state
- pppp – The number of volumes in pending state
- ssss – The number of volumes in suspended state

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8240I  DATA EXPOSURE(delta_time)

Explanation: The value for delta_time provides an approximation of the time difference (potentially nonrecoverable data) between data written to the primary volumes and data secured on the journal data set. If the delta_time is zero, all data written to primary volumes for the session has been secured on the journal data set. delta_time will be NO_TIME_AVAILABLE or ***** until a session receives a time reference from a primary application update.

Note: This message appears only for SESSIONTYPE(XRC) sessions, for a session which has at least one volume pair in DUP (duplex) status.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See [z/OS DFSMS Advanced Copy Services] for examples of XQUERY command output. If the command was accepted and this message was not displayed on either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8241I  SC SC S RES UTIL CURRENT

Explanation: This message provides the header information for the output of the XQUERY command for a storage control report. It is associated with header message ANTQ8242I and detail message ANTQ8243I.

The explanation is provided with the ANTQ8243I detail message.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8242I  SSID SN ID T CNT VOL TIMEOUT --STORAGE CONTROL TIME--

Explanation: This message provides the header information for the output of the XQUERY command for a storage control report. It is associated with header message ANTQ8241I and detail message ANTQ8243I. The explanation is provided with the ANTQ8243I detail message.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8243I  ssid scsn scid status residual_count utility_volume timeout storage_control_time

Explanation: This message provides the report details for the output of the XQUERY command for a storage control report. It is associated with header messages ANTQ8241I and ANTQ8242I. The report shows the status of the storage control sessions within an XRC session.

- ssid – Identifies the storage subsystem ID associated with the specified storage control session.
- scsn – Identifies the storage control session name assigned by the user.
- scid – Identifies the session ID assigned by the storage control to the storage control session. If it cannot be determined it is reported as “***”.
- status – Provides the status of the storage control session when the command was issued. Optimal performance is indicated when the field is blank (session is active). The status can be one of the following:
  - (blank) – Active
  - B – One or more devices on this primary storage control has exceeded the maximum number of record sets that are allowed for a storage control session.
• D – One or more devices on this primary storage control is being blocked.
• E – I/O error obtaining status from the storage control
• L – Long busy condition
• N – Storage control session is not found
• Q – Quiesced
• R – Utility device is reserved by this system
• S – Suspended session
• T – Storage control session has timed out
• U – Unable to determine utility volume for the storage control
• & – Utility device is reserved by another system
• 1 – Record update I/O has 1 storage control path blocked
• 2 – Record update I/O has 2 storage control paths blocked
• 3 – Record update I/O has 3 storage control paths blocked
• 4 – Record update I/O has 4 storage control paths blocked

residual_count –
Specifies the number of pending record updates in the storage control at the time the command was issued. It indicates how many records exist in the storage control buffers for the XRC session.

utility_volume –
Identifies the volume serial number of the volume being used by the data mover as a utility device path for the storage control identified by the storage subsystem ID. This field can be “******” if the utility volume is either offline or cannot be determined. If this is a temporary condition (caused by a concurrent XDELPAR or XSUSPEND command), reissue the command to report a new utility volume, if one exists. For a session using Enhanced Multi-Reader, multiple instances of ANTQ8243I can appear in the STORAGECONTROL DETAIL report for the same SSID and SC SN values, one for each storage control session in the enhanced multi-reader group. In that report, an indicator of the multi-reader state will appear between the RES CNT and UTIL VOL columns. In the STORAGECONTROL (without DETAIL) report, a single ANTQ8243I appears for the primary session of the enhanced multi-reader group, without the additional indicator column.

The volume serial number can have one of the following characters in front of the serial number:
• An asterisk (*) indicates that the storage control session scsn for the storage subsystem ssid has the fixed utility device of utility_volume.
• An 's' indicates that XRC has detected that the utility_volume was previously a fixed utility device but the current storage control status indicates that the device is now a floating utility device.
• An 'h' indicates that XRC has detected that the utility_volume was previously a floating utility device but the current storage control status indicates that the device is now a fixed utility device.
• A 'p' indicates that this line in the XQUERY output describes an auxiliary storage control session ID of an enhanced multi-reader session group. Auxiliary session IDs might be added and deleted as needed, although volumes in the enhanced multi-reader group are suspended.
• A blank indicates that both the software and the storage control have the same floating utility volume setting.

timeout –
Specifies the current timeout interval for the storage control. For a quiesced storage control, it is the time remaining before the storage control ends the active session.

storage_control_time –
Specifies the timestamp of the current record being processed by the storage control.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

ANTQ8245I  NO STORAGE CONTROL SESSIONS

Explanation: There are no storage control sessions active.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: The XQUERY report has provided the requested information. If the command has been accepted and neither this message nor a message providing storage control information has been displayed at either the system console log or at the user
ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8246I**  MSESSION(msession_id) MHLQ(mhlq)
COUPLED(status)

**Explanation:** The XRC coupled session associated with the master session msession_id with the master high-level qualifier of mhlq has the coupled status of status. msession_id identifies the master session name. mhlq identifies the master session high level qualifier name. These fields can be **** if the master session is either offline or cannot be determined. The following provides an explanation of each status:

**Status:** **Explanation:**

INTERLOCKED  Session can be recovered to a consistent time with other coupled sessions.

NON-INTERLOCKED  Session cannot be recovered to a consistent time with other coupled sessions.

COUPLE FAILED  Previously coupled local session is no longer actively coupled with master session.

HOLD  Master session is protected from actions which would cause the master recoverable time to be jeopardized. This status is entered for one of the following reasons:

- An error was detected for ERRORLEVEL(SESSION) interlocked session.
- The first XRECOVER command for a coupled session associated with the master session was started.
- The condition indicated on message ANTC8402I was detected for a coupled session.
- The first session was started after all coupled sessions were made inactive because of a system IPL or the address spaces were canceled.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message is issued for a non-interlocked session if all of the following are true:

- An update has been made to at least one active volume in the session and the update has been journaled (that is, the session has a journal time).
- At least one update has been applied for the session to secondary volumes (that is, a session consistency time exists).
- The session does not indicate the volume status of AVS, ERR, or SYM on message ANTQ8304I.

You might need to take special steps to achieve interlock status for this session. In order for a session to become interlocked, both of the following conditions must be met (issue the XQUERY MASTER command to determine these conditions):

- No interlocked session associated with the master session must have a session status of END, SUS, or UNK.
- The master session must not be in HOLD status.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message is issued for a non-interlocked session if all of the following are true:

- An update has been made to at least one active volume in the session and the update has been journaled (that is, the session has a journal time).
- At least one update has been applied for the session to secondary volumes (that is, a session consistency time exists).
- The session does not indicate the volume status of AVS, ERR, or SYM on message ANTQ8304I.

**Explanation:** This message indicates that the coupled XRC session indicated on message ANTQ8200I is currently interlocked with the other coupled sessions associated with the master session indicated on message ANTQ8246I. The timestamp represents the amount of time that this local session requires to be interlocked with the other coupled interlocked local sessions. If the timestamp is within 10 seconds (ahead or behind) of the master journal timestamp, the coupled data mover sessions will achieve interlock status by temporarily halting updates on the sessions that are ahead. Updates will be resumed when interlock status is achieved.

The timestamp value will have one of the following definitions:

+aa:aa:aa:aaaaa
  The consistency time of this session is ahead of the master journal time for other coupled sessions, which would prevent it from being recovered to a consistent time with those sessions. The time shown is the difference between the session consistency time and the master journal time.

-bb:bb:bb:bbbb
  The journal time of this session is behind the master journal time for other coupled sessions, which would prevent it from being recovered to a consistent time with those sessions. The time shown is the difference between the session journal time and the master journal time.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message is issued for a non-interlocked session if all of the following are true:

- An update has been made to at least one active volume in the session and the update has been journaled (that is, the session has a journal time).
- At least one update has been applied for the session to secondary volumes (that is, a session consistency time exists).
- The session does not indicate the volume status of AVS, ERR, or SYM on message ANTQ8304I.

You might need to take special steps to achieve interlock status for this session. In order for a session to become interlocked, both of the following conditions must be met (issue the XQUERY MASTER command to determine these conditions):

- No interlocked session associated with the master session must have a session status of END, SUS, or UNK.
- The master session must not be in HOLD status.

See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/knowledgecenter/SSSTQG_1.5.0/com.ibm.zos.v1r5.mvs/advanced_copy_services_member.html) for examples of XQUERY command output. See previously issued ANT error messages and their associated return
codes and reason codes to determine the appropriate actions that allow you to get a session into interlock status.

**ANTQ8251I**  
**NAME VALUE NAME VALUE**

**Explanation:** This message provides the header information for the output of the XQUERY ENVIRONMENT(PARM) reports. The explanation is provided with the ANTQ8253I detail message.

**System action:** Information only.

**System programmer response:** Place the parameter in the correct location.

**Source:** Extended remote copy (XRC).

**ANTQ8252I**  
**NAME STATUS NAME STATUS NAME STATUS**

**Explanation:** This message provides the header information for the output of the XQUERY ENVIRONMENT(FLAG) report. The explanation is provided with the ANTQ8254I detail message.

**System action:** Information only.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for more information about ENVIRONMENTAL FLAGS.

**Source:** Extended remote copy (XRC).

**ANTQ8253I**  
**name value name value**

**Explanation:**

name is the name of the PARMLIB entry and value is the current value associated with the name. See z/OS DFSMS Advanced Copy Services for more information about PARMLIB entries and a detailed explanation for the PARMLIB entry name and the possible values.

The XQUERY ENV(PARM) report includes the values for SecondaryDeviceRange, SecondaryVolserPattern and NumberReaderTasks.

If there are no secondary device ranges, the value for SecondaryDeviceRange displays '(none)'. If there are any secondary device ranges, the value displays '(below)'. In this case the list of secondary device ranges is displayed below the other parameter values.

If there are no secondary VOLSER patterns, the value for SecondaryVolserPattern displays '(none)'. If there is only one secondary VOLSER pattern, the value displays the pattern. If there are multiple secondary VOLSER patterns, the value shows '(below)'. In this case the list of secondary VOLSER patterns is displayed below the other parameter values.

The default pattern for NumberReaderTasks is '".0'. However, if multiple patterns are specified for NumberReaderTasks, the value shows '(below)’, in which case the list of reader task patterns is displayed below the other parameter values.

**System action:** Information only.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for more information about PARMLIB entries.

**Source:** Extended remote copy (XRC).

**ANTQ8254I**  
**name status name status name status**

**Explanation:** name is the name of a flag, and status is the status of the flag (ON or OFF).

**System action:** Information only.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for more information about PARMLIB entries.

**Source:** Extended remote copy (XRC).

**ANTQ8255I**  
**ssid scsn scid status lss serial_number lic_level features**

**Explanation:** This message provides the report details for the output of the XQUERY command for a storage control features report. It is associated with header messages ANTQ8256I and ANTQ8257I. The report shows the status of the storage control sessions within an XRC session.

**ssid** – Identifies the storage subsystem ID associated with the specified storage control session.

**scsn** – Identifies the storage control session name assigned by the user.

**scid** – Identifies the session ID assigned by the storage control to the storage control session. If it cannot be determined it is reported as "**".

**status** – Provides the status of the storage control session when the command was issued. Optimal performance is indicated when the field is blank (session is active). The status can be one of the following:
- (blank) – Active
- B – One or more devices on this primary storage control has exceeded the maximum number of record sets that are allowed for a storage control session.
- D – One or more devices on this primary storage control is being blocked.
- E – I/O error obtaining status from the storage control
- L – Long busy condition
- N – Storage control session is not found
- Q – Quiesced
- R – Utility device is reserved by this system
- S – Suspended session
- T – Storage control session has timed out
- U – Unable to determine utility volume for the storage control
- & – Utility device is reserved by another system

**Source:** Extended remote copy (XRC).
• 1 – Record update I/O has 1 storage control path blocked
• 2 – Record update I/O has 2 storage control paths blocked
• 3 – Record update I/O has 3 storage control paths blocked
• 4 – Record update I/O has 4 storage control paths blocked

*lss* – Identifies the logical subsystem the session ID is contained in.

*serial_number* – Specifies the serial number of the storage control.

*lic_level* – Specifies the licensed internal code (microcode) level.

*features* – Specifies capability and enablement status of selected functions.

'-' = microcode not capable

'Y' = function enabled

'N' = function disabled

*FU* Fixed Utility (microcode and software function)

*D* Device Blocking

*W* Write Pacing

*SL* Suspend On Long Busy (microcode and software function)

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**Explanation:** This message provides the header information for the output of the XQUERY command for a storage control features report. It is associated with header message ANTQ8256I and detail message ANTQ8255I. The explanation is provided with the ANTQ8255I detail message.

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**Source:** Extended remote copy (XRC).

---

**ANTQ8261I**

**HLQ(***hlq***)** SCTRAP(***sctrap***) TIMEOUT(***timeout_value***)

**Explanation:** This message provides information for the output of the XQUERY command for a “set” report. This message reports the following values:

*hlq* – Reports either the high-level-qualifier(***hlq***) that was issued on the XSTART command or the default HLQ if none was specified. The HLQ is used by the data mover to allocate the journal, state, and control data sets.

*sctrap* – Specifies whether or not a storage control LIC dump should be forced by the software if an LIC-related error occurs. YES generates an LIC dump (if required) on error. NO does not generate an LIC dump on error. This function is only valid for storage controls that support the option to dump the LIC.

*timeout_value* – Reports the timeout interval presently being used for storage controls. The value is assigned to storage controls as they are added to the XRC session. It is specified in hours, minutes, and seconds. It can be reported as STORAGE_CONTROL_DEFAULT if this is the assigned default.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.
**Explanation:** This message provides information for the output of the XQUERY command for a “set” report. This message reports the following values:

- **synch** - Specifies the maximum number of concurrent synchronization or resynchronization tasks that can execute per XRC session. This allows the XADDPAIR function to be paced to minimize the processor resources used by the function.

- **prim_sc_synch** - Specifies the maximum number of concurrent synchronization or resynchronization tasks that can execute per XRC session against a primary storage control. This allows the XADDPAIR function to be paced to minimize the processor and path resources used by the function.

- **sec_sc_synch** - Specifies the maximum number of concurrent synchronization or resynchronization tasks that can execute per XRC session against a secondary storage control. This allows the XADDPAIR function to be paced to minimize the processor and path resources used by the function.

- **priority** - Specifies the type of priority to be used by the XADDPAIR function. The options are:
  - **FIFO** - Add volumes in order received on command.
  - **LOAD** - Defer adding volume if primary storage control load is too heavy. If the residual count for a primary storage control indicates the storage control is overloaded with activity, no additional work is started on the storage control. When the activity level has dropped to a lower level, the work is started.

- **suprdump** - Specifies whether or not a software dump is forced if a software-related error occurs. OFF generates a software dump (if required) on error. ON does not generate a software dump on error.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**Explanation:** This message provides information for the output of the XQUERY command for a “set” report. This message reports the following values:

- **sc_buffers** - Specifies the maximum number of virtual buffers that the data mover can allocate per primary storage control in the session. Based on system activity, the data mover can use fewer buffers. Each virtual buffer requires 60K of virtual storage.

- **page_fix** - Specifies the number of megabytes of permanently page-fixed storage that the data mover can use. The more storage that is page-fixed, the less processor cycles are used by the data mover. Any storage used above this limit is page-fixed and page-freed as required.

- **pace** - Specifies the number of tracks read or written as part of synchronization or resynchronization. It is used to pace the data mover impact on the storage control and primary volume resources.

- **copy_type** - Specifies the type of volume initialization that is performed for volume pairs for which no copy type was specified on the XADDPAIR command. The possible values are:
  - **FULL** - Indicates that the complete volume is copied during volume initialization.
  - **QUICK** - Indicates that only allocated space at the time the copy starts is copied during volume initialization.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**Explanation:** This message provides information for the output of the XQUERY command for a SET report. This message reports the following values:

- **reset_frequency** - Specifies the minimum time, since the last storage control session bitmap was reset, before it is again eligible to be reset. When this
value is zero, XRC does not use elapsed time to determine when to reset the storage control session volume bitmap.

reset_tracks –
Specifies the number of changed tracks on a primary volume, since the last reset, before the storage control session bitmap is again eligible for the next reset. When this value is zero, XRC does not use the number of changed tracks to determine when to reset the storage control session volume bitmap.

type
Specifies the type of XRC utility device to be used the first time XRC encounters the secondary volser of XRCUTL on an XADDPAIR command, after the XSET UTILITY command has been issued. The values of type are as follows:

FLOAT The XRC utility device for a session will be randomly selected by the storage control.

FIX The XRC utility device for a session is to be a specific device (fixed).

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted and this message has not been displayed at the system console log or the user ID at the MSGROUTEID parameter, see message ANTT0099.

ANTQ8271I PRIMARY SECONDARY STA CON
--------TIMESTAMP--------

Explanation: This message provides the XQUERY command volume report header information. This header message is associated with ANTQ8271I and ANTQ8273I. The details of the fields are provided by ANTQ8273I.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted and this message has not been issued at the system console log or the user ID at the MSGROUTEID parameter, see message ANTT0099.

ANTQ8273I primary_vol secondary_vol sta con timestamp

Explanation: This message provides the output associated with the header line produced with message ANTQ8272I. The following describes the XQUERY output reported for the XADVANCE function:

• primary_vol – The original volume serial number of the primary source volume.

• secondary_vol – The original volume serial number of the secondary target volume.

• sta – The current status information that is associated with the volume pair. The valid status states are:
  - DUP – The volume pair is in duplex state, successfully recovered.
  - PND – The pending volume pair is being synchronized or re-synchronized.
  - SUS – The volume pair is suspended.

• con – Gives the status of the secondary volume after the XADVANCE operation. YES means that all journal data was successfully applied (if necessary) to the secondary volume, and this volume is consistent to the session consistency time shown in message ANTQ8231I. NO means that this volume is not consistent with the consistency time shown in message ANTQ8231I.

• timestamp – The time associated with the volume pair. The interpretation of the timestamp field is based upon a combination of fields described below. The timestamp is always in universal time, coordinated (UTC) format associated with the application systems connected to the primary storage controls. The field is not a data mover system timestamp. The timestamp field can be any of the following:
  - (blank) – If the value under STA is DUP, a blank timestamp indicates that the volume pair has been advanced to the session timestamp reported by message ANTQ8231I. If the value under STA is something other than DUP, a blank timestamp indicates that the volume pair did not complete volume initialization and no known timestamp for the volume pair is available.
  - timestamp – The timestamp reported is given in UTC format. If the volume pair has a status of SUS, the data on the suspended volume pair is consistent up to the time reported.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: The information reported by this XQUERY report is provided for the volumes requested by the XQUERY command for the XADVANCE operation. It is point-in-time information based on the volume status at the time the command or
ANTQ8274I • PRIMARY SECONDARY STA CON CLP ------TIMESTAMP------

Explanation: This message provides the XQUERY command volume report header information. This header message is associated with ANTQ8275i. The details of the fields are provided by ANTQ8275i.

Source: Extended remote copy (XRC).

System programmer response: If the command has been accepted and this message has not been issued at the system console log or at the user ID at the MSGROUTEID parameter, see message ANTT0099i.

ANTQ8275I primary_vol secondary_vol sta con clp timestamp

Explanation: This message provides the output associated with the header lines produced by message ANTQ8274i for the XQUERY command for an XRECOVER command.

- primary_vol – The original volume serial number of the primary source volume.
- secondary_vol – The original volume serial number of the secondary target volume.
- sta – The current status information associated with the volume pair. The valid status states are:
  - DUP – The volume pair is in duplex state, successfully recovered.
  - PND – The pending volume pair is being synchronized or re-synchronized.
  - SUS – The volume pair is suspended.
- con – The status of the secondary volume after the XRECOVER operation. YES means that this volume is consistent with the session consistency time shown in message ANTQ8231i. If the session consistency time is NO_TIMEAVAILABLE, all CON=YES volumes are consistent. NO_TIMEAVAILABLE indicates that the XRC session had not received a time reference from the application system when the XRC session was active. NO means that this volume is not consistent with the consistency time shown in message ANTQ8231i.
- clp – The status of the secondary volume after the XRECOVER operation. YES means that the secondary volume serial number has been changed to the same as the primary volume serial number. NO means that the secondary volume serial number has not been changed.
- timestamp – The time associated with the volume pair. The interpretation of the timestamp field is based upon a combination of fields described below.

The timestamp is always in universal time, coordinated (UTC) format that is associated with the application systems connected to the primary storage controls. The field is not a data mover system timestamp. The timestamp field can be any of the following:

- (blank) – If the value under STA is DUP, the volume pair has been advanced to the session timestamp reported by ANTQ8231i. If the value under STA is something other than DUP, the volume pair did not complete initialization and no known timestamp for the volume pair is available.
- timestamp – The timestamp reported is given in universal time, coordinated (UTC) format. If the volume pair has a status of SUS, the data on the suspended volume pair is consistent up to the time reported.

Source: Extended remote copy (XRC).

System programmer response: The information reported by this XQUERY report is provided for the volumes requested by the XQUERY command for the XRECOVER operation. It is a point-in-time information based on the volume status at the time the command or operation processes the volume. See Z/OS DFSMS Advanced Copy Services for examples of XQUERY output. If the XQUERY output has not been issued on the system console log or by the user ID at the MSGROUTEID parameter, see message ANTT0099i.

ANTQ8281I -------PRIMARY-------- SECONDARY----

Explanation: This message provides the header information for an XQUERY configuration report. This header message is associated with ANTQ8282i, ANTQ8283i, and ANTQ8284i. The details of the fields are provided by ANTQ8283i.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099i.

ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8283I**  
*pssid pscid pdvcn pcca pvolser sssid sdvcn scca svolser*

**Explanation:** This message provides the output associated with the XQUERY configuration report header information. This report is associated with messages ANTT0099I, ANTT0099I, and ANTT0099I. The reported fields are:

- **pssid** – Identifies the storage subsystem ID associated with the specified device on the primary control.
- **pscsn** – Identifies the primary storage control session name. If the name was omitted, it is reported as "--".
- **pscid** – Identifies the primary storage control session identifier. If it cannot be determined, it is reported as "***".
- **pdvcn** – Identifies the primary device number.
- **pcca** – Identifies the channel connection address of the primary volume.
- **pvolser** – Identifies the primary volume serial number.
- **sssid** – Identifies the storage subsystem ID associated with the specified device on the secondary storage control.
- **sdvcn** – Identifies the secondary device number.
- **scca** – Identifies the channel connection address of the secondary volume.
- **svolser** – Identifies the secondary volume serial number.

If a requested volume is not in the session, all fields except **svolser** are blank.

**System action:** XRC functions are active.

**System programmer response:** If the command has been accepted and this message has not been displayed either at the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8300I  XQUERY STARTED FOR MSESSION(msession_id) MHLQ(mhlq)

Explanation: The XQUERY command that was issued with the MASTER keyword for the session that is indicated by msession_id with a high-level qualifier of mhlq.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output. If the command was accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8303I  ----------------

Explanation: The XQUERY master report header first line.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output. If the command was accepted and this message was not displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8304I  sessionid sessiontype sessionstatus volumestatus initstatus commandstatus journaldeltatime recoverydeltatime

Explanation: The data in the message is explained as follows:

sessionid
Session ID name. This message will present the data for each session using the following order method:

1st order
Interlock status (descending, Y then N)

2nd order
Session status in the following order: ACT, END, RCV, ARV, SUS, UNK

3rd order
Journal delta (ascending)
sessiontype
Type of the current session. Possible session type values are:

C  session is a cluster

sessionstatus
Status of the current session. The following definitions describe the possible session status values:

ACT  Session is active.
ARV  Session has initiated recovery processing.
END  Session is ended.
RCV  Session has completed recovery processing, including clipping all eligible secondaries to their respective primary volume serials.
SUS  Session is suspended.
UNK  Status of session is unknown. The master data set has not been updated within the CTIMEOUT interval.

volumestatus
Status of the current volume. The following definitions describe the possible volume status values:

(bla)  Session has at least one active volume or session is inactive.
AVS  All volumes in session are suspended by command or an error event not affecting the coupled session operation.
ERR  For ERRORLEVEL(SESSION) sessions, all volumes in this session or all volumes in all sessions in a cluster session are suspended due to an error that affects the coupled operation.
SYM  For ERRORLEVEL(SESSION) sessions, one of the following situations caused all volumes in the session or all volumes in all sessions in a cluster session to be suspended:
  • An error or errors occurred on a coupled session or a session in a cluster session that affects coupled operations (sympathetic suspend). Refer to previous XRC messages, particularly ANTC8402W, to determine the errors that occurred.
  • A dump was requested for a coupled session that forced a delay in coupled processing. If an error occurred in a coupled session, causing the dump to be requested, the session in error can show either a volumestatus of ERR or SYM.
NOV  Session is coupled but has no volumes.

initstatus
Recoverability status.

Y  Session can be recovered to a consistent time with other sessions.
N  Session cannot be recovered to a consistent time with other sessions.

commandstatus
Current command status.

PND  Session-level master command is pending for this session.
CAN  Session-level master command has been canceled for this session by command or by error.

(jblank)  No session-level master command is pending.

journaldeltatime
The time difference between the latest journaled data on this session and the master journal time. A delta of 00:00:00.000000 indicates that this session is the pacesetter for determining the master journal time. A divergence in journal times with little divergence of recovery/advance times can indicate a significantly slower primary or journal performance than other sessions. You can reduce the window of nonrecoverable data across the coupled sessions by addressing bottlenecks during that session or by balancing the workload across sessions.

=00:00:00.000000  Session journal time is same as master journal time. This indicates that this session is the pacesetter for the master journal/recoverable time.

+aa:aa:aa.aaaaaa  Session journal time is greater than the master journal time. This is the most common case for all active, interlocked sessions except for the pacesetter.

-bb:bb:bb.bbbbbb  Session journal time is less than the master journal time.

(bblank)  Session has established no journal time, or journal time cannot be determined. This occurs for the following reasons:
  • There are no volumes in session (volumestatus is NOV).
There have never been any updates to volumes in session.

The master session recoverable time indicates NO_TIMEAVAILABLE on message ANTP8308I. In this case, there are no interlocked sessions.

The session is inactive (sessionstatus is neither ACT nor UNK).

**recoverydeltatime**

The time difference between the consistency time on this session and the master recoverable time; it indicates the amount of data that will need to be applied during recovery processing. This applies only to interlocked sessions, which can be recovered to that common recoverable time. A large recovery/advance delta can indicate a significantly slower secondary performance than other sessions. You can reduce the amount of data needed to be applied during recovery processing to bring the coupled sessions to a consistent state by addressing bottlenecks on that session or by balancing the workload across sessions. If a master command has been executed, the delta will appear as zeros, because recovery or advance processing does not apply updates past the command time.

=00:00:00.000000

All data necessary to bring the session to a consistent time with other coupled sessions has been applied.

+aa:aa:aa.aaaaaa

Amount of data to be applied during recovery processing to bring this session to a consistent time with other coupled sessions. This will not apply to non-interlocked sessions. If the session is idle, this value indicates the amount of time the XRECOVER or XADVANCE command will increase the session consistency time to indicate that the session is in a consistent state with the master session.

(blank)

Session is not interlocked and therefore is not recoverable to the master recoverable time.

Source: Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output. If the command was accepted and this message was not displayed on either the system console log or by the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8305I**

**TOTAL=totalsessions**

**ACT=activesessions**

**SUS=suspendedsessions**

**END=inactivesessions**

**ARV=attemptedrecoverysessions**

**RCV=recoveredsessions**

**UNK=unknownstatussessions**

**Explanation:** XQUERY MASTER report summary line indicating the following totals:

- **totalsessions** is the total number of coupled XRC sessions in the report.
- **activesessions** is the number of currently active coupled sessions in the master session.
- **suspendedsessions** is the number of currently suspended coupled XRC sessions.
- **inactivesessions** is the number of currently inactive coupled XRC sessions.
- **attemptedrecoverysessions** is the number of coupled XRC sessions for which a recovery was attempted and not completed.
- **recoveredsessions** is the number of successfully recovered coupled XRC sessions.
- **unknownstatussessions** is the number of coupled XRC sessions for which the status was not known.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output. If the command was accepted and this message was not displayed on either the system console log or by the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8306I**

**MSESSION STATUS=masterstatus**

**Explanation:** This message is issued on the XQUERY MASTER report. The master session indicated on message ANTP8300I has one of the following statuses:

**HOLD** The master session is protected from actions which would cause the master recoverable time to be jeopardized. In this mode, either an error has occurred in one of the coupled sessions, or recovery processing has been initiated on at least one of the sessions. New sessions cannot be coupled nor can any volume pairs be added to existing coupled sessions while the master session is in this mode.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

**System programmer response:** See z/OS DFSMS Advanced Copy Services for examples of XQUERY command output.
command output. If the command was accepted and this message was not displayed on either the system console log or by the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8308I** MSESSION RECOVERABLE TIME(timstamp)

**Explanation:** The timestamp `timestamp` indicates the minimum of the session journal times for all interlocked coupled sessions and the pending master command time. XRC coupled sessions can be recovered or advanced to this time. The `recoverydeltatime` indicated on message ANTQ8304I, which is issued for each interlocked session in the XQUERY MASTER report, is calculated using this master session recoverable time. A `timestamp` of NO_TIME_AVAILABLE indicates that a time does not exist for which XRC coupled sessions can be recovered or advanced.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8309I** INTERLOCKED=interlocked NON-INTERLOCKED=non-interlocked

**Explanation:** This message is issued on the XQUERY MASTER report to indicate the number of interlocked (`interlocked`) sessions and the number of non-interlocked (`non-interlocked`) sessions.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XQUERY command output. If the command has been accepted and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

**ANTQ8310I** PND MASTER CMD=command

**Explanation:** This message is issued on the XQUERY MASTER report when the command `command` is pending against the master session indicated on message ANTQ8300I.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XQUERY command output. If the command was accepted and this message was not displayed on either the system console log or by the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

---

**ANTQ8350I** XSTATUS STARTED FOR CLUSTER(cluster_id) MSESSION(msession_id) MHLQ(mhlq)

**Explanation:** The XSTATUS command issued with the CLUSTER keyword on the clustering-enabled system identified by cluster. The cluster is associated with the master session identified by `msession_id` with a high-level qualifier of `mhlq`.

**Source:** Extended remote copy (XRC).

**System action:** None.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XSTATUS CLUSTER command output

**ANTQ8351I** XSTATUS report_type REPORT - level_number

**Explanation:** Either a TSO user or the system data mover has issued an XSTATUS command for a `report_type` report. The `level_number` specifies the support level of the report.

**Source:** Extended remote copy (XRC).

**System action:** None.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XSTATUS CLUSTER command output

**ANTQ8352I** XSTATUS CLUSTER REPORT COMPLETE FOR MSESSION(msession_id)

**Explanation:** The XSTATUS command issued with the CLUSTER keyword is completed for the session indicated by master session `msession_id`.

**Source:** Extended remote copy (XRC).

**System action:** None.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XSTATUS CLUSTER command output

**ANTQ8353I** SESSION T STA VOL INT JOURNAL DELTA RCV/ADV DELTA

**Explanation:** The XSTATUS CLUSTER report header first line.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](http://www.ibm.com/support/docview.wss?uid=ssg157000009) for examples of XSTATUS CLUSTER command output. If the command is
accepted but this message does not exist at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

<table>
<thead>
<tr>
<th>ANTQ8354I</th>
<th>sessionid sessiontype sessionstatus volumesstatus initstatus journaldeltatime recoverydeltatime</th>
</tr>
</thead>
</table>

**Explanation:** The data in the message is explained as follows:

- **sessionid**
  - Session ID name. This message will present the data for each session using the following order method:
    - **1st order**
      - Interlock status (descending, Y then N)
    - **2nd order**
      - Session status in the following order: ACT, END, RCV, ARV, SUS, UNK
    - **3rd order**
      - Journal delta (ascending)

- **sessiontype**
  - The type of session. Possible session type values are:
    - (blank) XRC session

- **sessionstatus**
  - Status of the current session. The following definitions describe the possible session status values:
    - **ACT** Session is active.
    - **ARV** Session has initiated recovery processing.
    - **END** Session is ended.
    - **RCV** Session has completed recovery processing, including clipping all eligible secondaries to their respective primary volume serials.
    - **SUS** Session is suspended.
    - **UNK** Status of session is unknown. The master data set has not been updated within the CTIMEOUT interval.

- **volumestatus**
  - Status of the current volume. The following definitions describe the possible volume status values:
    - (blank) Session has at least one active volume or session is inactive.
    - **AVS** All volumes in session are suspended by command or an error event not affecting the coupled session operation.

- **initstatus**
  - Recoverability status.
    - **Y** Session can be recovered to a consistent time with other sessions.
    - **N** Session cannot be recovered to a consistent time with other sessions.

- **commandstatus**
  - Current command status.
    - **PND** Session-level master command is pending for this session.
    - **CAN** Session-level master command has been canceled for this session by command or by error.
    - (blank) No session-level master command is pending.

- **journaldeltatime**
  - The time difference between the latest journaled data on this session and the master journal time. A delta of 00:00:00.000000 indicates that this session is the pacesetter for determining the master journal time. A divergence in journal times with little divergence of recovery/advance times can indicate a significantly slower primary or journal performance than other sessions. You can reduce the window of nonrecoverable data across the coupled sessions by addressing

**ERR** For ERRORLEVEL(SESSION) sessions, all volumes in this session or all volumes in all sessions in a cluster session are suspended due to an error that affects the coupled operation.

**SYM** For ERRORLEVEL(SESSION) sessions, one of the following situations caused all volumes in the session or all volumes in all sessions in a cluster session to be suspended:
- An error or errors occurred on a coupled session or a session in a cluster session that affects coupled operations (sympathetic suspend). Refer to previous XRC messages, particularly ANTC8402W, to determine the errors that occurred.
- A dump was requested for a coupled session that forced a delay in coupled processing. If an error occurred in a coupled session, causing the dump to be requested, the session in error can show either a volumesstatus of ERR or SYM.

**NOV** Session is coupled but has no volumes.

**Chapter 13. ANT messages**
bottlenecks during that session or by balancing the workload across sessions.

=00:00:00.000000
Session journal time is same as master journal time. This indicates that this session is the pacesetter for the master journal/recoverable time.

+aa:aa:aa.aaaaaa
Session journal time is greater than the master journal time. This is the most common case for all active, interlocked sessions except for the pacesetter.

-bb:bb:bb.bbbbbb
Session journal time is less than the master journal time.

(blank) Session has established no journal time, or journal time cannot be determined. This occurs for the following reasons:
- There are no volumes in session (volumestatus is NOV).
- There have never been any updates to volumes in session.
- The master session recoverable time indicates NO_TIME_AVAILABLE on message ANTQ8308I. In this case, there are no interlocked sessions.
- The session is inactive (sessionstatus is neither ACT nor UNK).

recoverydeltatime
The time difference between the consistency time on this session and the master recoverable time; it indicates the amount of data that will need to be applied during recovery processing. This applies only to interlocked sessions, which can be recovered to that common recoverable time. A large recovery/advance delta can indicate a significantly slower secondary performance than other sessions. You can reduce the amount of data needed to be applied during recovery processing to bring the coupled sessions to a consistent state by addressing bottlenecks on that session or by balancing the workload across sessions. If a master command has been executed, the delta will appear as zeros, because recovery or advance processing does not apply updates past the command time.

=00:00:00.000000
All data necessary to bring the session to a consistent time with other coupled sessions has been applied.

+aa:aa:aa.aaaaaa
Amount of data to be applied during recovery processing to bring this session to a consistent time with other coupled sessions. This will not apply to non-interlocked sessions. If the session is idle, this value indicates the amount of time the XRECOVER or XADVANCE command will increase the session consistency time to indicate that the session is in a consistent state with the master session.

(blank) Session is not interlocked and therefore is not recoverable to the master recoverable time.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS CLUSTER command output. If the command is accepted but this message does not exist at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8357I MSESSION(master_id) MHLQ(mhlq) STATE(cluster_state)

Explanation: The XSTATUS CLUSTER report line indicating information for the cluster session is in message ANTQ8350I. The master_id indicates the master session ID to which the cluster session is coupled, the mhlq indicates the master high level qualifier used to access the cluster data set, and the cluster_state indicates the state of the cluster session.

The following are the possible cluster_state values:

ACTIVE
The cluster session is active.

DISABLED
Disable the use of cluster session to couple sessions to a master session.

INACTIVE
The cluster session address space is not currently available to process cluster session functions. Issue the MVS MODIFY operation of CREFRESH to activate cluster session.

UNINITIALIZED
The cluster session is not set up for this LPAR.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS CLUSTER command output.
ANTQ8360I  XSTATUS STARTED FOR SYSTEM(system_name)
Explanation: The XSTATUS command was issued with the ADDRSPACE parameter on the system system_name.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS ADDRSPACE command output.

ANTQ8362I  SNAME ANAME ASID TYP CLUSTER MSESSION
Explanation: The XSTATUS ADDRSPACE report header first line.
Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS ADDRSPACE command output.

ANTQ8363I  sessionid addressspacename asid sessiontype clusternamemastersessionname
Explanation: The data in the message is explained as follows:

`sessionid` The name of the XRC session or cluster session.

`addressspacename` The address space name associated with the XRC session or cluster session.

`asid` The address space identifier associated with the XRC session or cluster session.

`sessiontype` The type of session. Possible session type values are:

- CL Cluster session
- XRC XRC session

`clusternamemastersessionname` The name of the cluster session in which an XRC session is coupled to a master session.

`mastersessionname` The name of the master session to which XRC sessions in the cluster session are coupled.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS ADDRSPACE command output. If the command is accepted but this message does not exist at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTQ8364I  CL=clustersessions XRC=xrcsessions GM=gmsessions
Explanation: The XSTATUS ADDRSPACE summary line indicates the following totals:

- `clustersessions` is the total number of cluster sessions in the report.
- `xrcsessions` is the total number of XRC sessions in the report.
- `gmsessions` is the total number of global mirror sessions in the report.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: See z/OS DFSMS Advanced Copy Services for examples of XSTATUS ADDRSPACE command output. If the command is accepted but this message does not exist at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTC8400I  XCOUPLE ADD COMPLETE FOR XRC entity(name), NOW COUPLED TO MSESSION(msession_id) MHLQ(mhlq)
Explanation: In the message text:

`entity` This indicates what kind of XRC entity the message refers to. The valid values are:

- SESSION The message refers to an XRC session.
- CLUSTER The message refers to a XRC cluster.

The XCOUPLE command with ADD was successful for XRC session `session_id`. The session is now coupled to the master session `msession_id` with the high-level qualifier of `mhlq`. Session consistency, error handling, and processing of XSUSPEND and XEND commands are now subject to coupled processing as described under the XCOUPLE command. See z/OS DFSMS Advanced Copy Services for command authorization details.

Source: Extended remote copy (XRC).
System action: XRC functions are active.
System programmer response: If the command has been accepted, and this message has not been displayed at either the system console log or at the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.
ANTC8401I  XCOUPLE DELETE COMPLETE FOR XRC entity(name) IN MSESSION(msession_id) MHLQ(mhlq)

Explanation: In the message text:

entity This indicates what kind of XRC entity the message refers to. The valid values are:

SESSON The message refers to an XRC session.

CLUSTER The message refers to a XRC cluster.

The XCOUPLE command with DELETE has completed for XRC session session_id. To determine if the command was successfully completed, search the system log or the user ID specified by the MSGROUTEID parameter, see message ANTT099I. The command was successful, the session is uncoupled from the master session msession_id with the high-level qualifier of mhlq. Session consistency, error handling, and processing of XSUSPEND and XEND commands are now restored to normal operation. See z/OS DFSMS Advanced Copy Services manual.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services to determine the necessary actions to take for the particular condition encountered.

ANTC8403I XRC SESSION(session_id) PROCESSING command COMMAND REQUESTED BY MSESSION(msession_id)

Explanation: This is an acknowledgment message issued by the XRC session session_id after receiving the request from the master session msession_id to process the command.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: If the command was accepted, and this message was not displayed on the system log or the user ID specified by the MSGROUTEID parameter, see message ANTT099I. If an error message was received processing this command, look at the description and suggested recovery action provided with the return code and reason code specified on the error message. See z/OS DFSMS Advanced Copy Services manual.

ANTC8402W XRC SESSION(session_id) COUPLED TO MSESSION(msession_id) DETECTED condition CONDITION IN session_type(session_id_2), SUSPENDING ALL VOLUMES

Explanation: The XRC session session_id, which is coupled to master session msession_id, has detected the condition condition in session session_id_2 that is couple to the same master session. XRC has suspended all volumes in XRC session session_id to maintain a consistent set of volumes. The master session msession_id enters the HOLD status to indicate that a recovery operation can be required. The HOLD status is described in z/OS DFSMS Advanced Copy Services.

If condition is HOLD_STATUS, one of the sessions coupled to the master session msession_id has detected an error and placed the master session msession_id in HOLD_status to protect the consistency of the sessions.

If condition is ALL_VOLUMES_SUSPENDED, coupled session session_id_2 detected an error and suspended all of the volumes in session session_id_2. See the previous message issued by session session_id for the error that was detected.

If condition is COUPLING_TIMEOUT, session session_id_2 did not update the master data set for the master session msession_id within a given time.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: See z/OS DFSMS Advanced Copy Services to determine the necessary actions to take for the particular condition encountered.

ANTC8404I MSESSION(msession_id) HAS SENT command COMMAND TO COUPLED SESSIONS

Explanation: The master session msession_id has issued the request to XRC coupled sessions to process the command.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: Look for message ANTC8403I from each coupled session that indicates acknowledgment of the command.
ANTC8405I  command STARTED FOR COUPLED XRC SESSION(session_id) IN MSESSION(msession_id)

Explanation: The command command is being processed by the XRC session session_id which is coupled to the master session msession_id. Upon completion of the command by the session (and upon completion of the command by other sessions in the master session), all the secondary volumes will be consistent with the same time.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: When you receive this message, XRC has begun to apply updates from the journal data sets to the secondary volumes. If you issued the XRECOVER command, the secondary volumes are clipped as part of the recovery process. If XRC has accepted the command and this message has not been displayed either on the system console log or by the user ID specified by the MSGROUTEID parameter, see message ANTT0099I.

ANTC8406I  COUPLED XRC entity(name) INTERLOCKED WITH MSESSION(msession_id) MHLQ(mhlq)

Explanation: In the message text:

- **entity**: This indicates what kind of XRC entity the message refers to. The valid values are:
  - SESSION The message refers to an XRC session.
  - CLUSTER The message refers to a XRC cluster.

The coupled XRC session session_id has not interlocked with the master session msession_id whose master high-level qualifier is mhlq. A session is in interlock status when its consistency time is before the master journal time, and its journal time is after the master journal time.

See message ANTO8247I for the explanation of the interlock delay delay_time.

The reason for issuing this message can be:

- The session does not meet the interlock criteria, and the session has at least one nonsuspended volume pair in the session. This session or another coupled session in the master session has detected a delay in mainline data mover processing might cause the non-interlocked state.
- An interlocked session associated with the master session is not active. If you previously ended or suspended all coupled sessions in a master session, when you restart these sessions, you receive this message after you add volumes to each restarted sessions if all coupled interlocked sessions in the master session have not been restarted. If you restart all sessions before you add any volumes to the coupled sessions, you will not receive this message.
- All existing interlocked sessions are idle (not receiving any write updates), and the delay_time for session session_id is greater than 10 seconds.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: Do one of the following:

- In most cases, XRC can self-correct this state. However, if the situation persists, look for message ANTX8117I for this session, or one of the other coupled sessions in the master session, indicating the particular delay that have caused this session to become non-interlocked.
- Remove nonstarted coupled sessions from the master session by issuing the XCOUPLE PURGE command.
ANTC8408I • ANTC8411I

- Update at least one of the idle interlocked sessions. Note that if the entity is CLUSTER, issue XSTATUS CLUSTER command to determine the session_id of the non-interlocked session.

ANTC8408I SESSIONTYPE MIGRATE NOT ALLOWED FOR COUPLED XRC SESSION(session_id), SESSIONTYPE XRC USED

Explanation: The SESSIONTYPE of MIGRATE was specified on an XSTART command for the coupled XRC session session_id. The SESSIONTYPE of MIGRATE cannot be specified for a coupled XRC session. The SESSIONTYPE of XRC was used instead.

Source: Extended remote copy (XRC).

System action: XRC functions are active. Session continues in coupled XRC mode.

System programmer response: To switch to MIGRATE mode, the session must first be removed from participating in a coupled session. Issue an XCOUPLE DELETE command, suspend the session using the XSUSPEND command, and restart the session using the XSTART SESSIONTYPE(MIGRATE) command.

ANTC8409I CLUSTERING FOR CLUSTER(cname) CURRENTLY DISABLED

Explanation: Clustering for the specified cluster name is now disabled.

Source: Extended remote copy (XRC).

System action: XRC sessions on this system are no longer using the cluster for communicating coupling status.

System programmer response: None.

ANTC8410I XCOUPLE PURGE COMPLETE FOR XRC entity(name) IN MSESSION (msession_id) MHLQ(mhlq)

Explanation: In the message text:

entity This indicates what kind of XRC entity the message refers to. The valid values are:

SESSON The message refers to an XRC session.

CLUSTER The message refers to a XRC cluster.

The XCOUPLE command with PURGE has completed for XRC session session_id. To determine if the command was successfully completed, search the system log for any ANTC error messages that indicate a failure to remove coupled information from either the session’s state data set or the msession’s associated master data set. If no error messages were issued for this command, the XCOUPLE PURGE command was successful, and the session is now uncoupled from the master session msession_id with the high-level qualifier of mhlq. Session consistency, error handling, and processing of XSUSPEND and XEND commands are now restored to normal operation.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: This message reports the completion of the XCOUPLE PURGE request. If an error occurs while processing the XCOUPLE request, an ANTC message will be issued indicating that the particular error occurred. See this message for actions to take to allow the XCOUPLE function to complete successfully. If an XCOUPLE function should have occurred but has not, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dump of the associated ANTASnnn address space. You can obtain the dump by issuing MODIFY ANTASnnn,DUMP.

ANTC8411I XCOUPLE RELEASE COMPLETE FOR MSESSION(msession_id) MHLQ(mhlq)

Explanation: The XCOUPLE command with RELEASE was successful. The master session msession_id with high-level qualifier of mhlq is no longer in HOLD status and is now free to continue advancing the consistency time for the coupled XRC sessions in the master session. The session status of all coupled sessions changes to NON-INTERLOCKED, and the volume status for all volumes in the session changes to AVS (see messages ANTQ8246I and ANTQ8304I for information related to these statuses).

For coupled sessions that are not active and for coupled sessions that are not in COUPLE_FAILED status, the release function is effective immediately on seeing this message.

For coupled sessions that are in COUPLE_FAILED status, the release function will be effective when the XCOUPLE ADD command is issued for each session.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: This message reports the successful release of the master session from a HOLD status. If an error occurs while processing the XCOUPLE RELEASE request, message ANTC5410E can have been issued to indicate the particular error that occurred. See this message for actions to take to allow the XCOUPLE RELEASE function to complete successfully. If an XCOUPLE RELEASE function should have occurred but has not, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and SVC dump of the
associated ANTASnnn address space. You can obtain the dump by issuing MODIFY ANTASnnn,DUMP.

**ANTC8412W command CANCEL REQUESTED BY COUPLED XRC SESSION(session_id) FOR MSESSION(msession_id) WITH MHLQ(mhlq)**

**Explanation:** The XRC coupled session `session_id`, which is coupled with other sessions in the session `msession_id` with high-level qualifier of `mhlq`, has sent a request to the other coupled sessions in this master session to request that the `command` command be canceled. See message ANTC5409W for the return and reason codes that indicate why the command was canceled.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The session either received a command (such as XSUSPEND CANCEL or XEND CANCEL) to cancel a pending command, or the session detected an error which caused the session to cancel a pending command. See the “Description and Suggested Recovery Action” section of the return and reason codes issued with message ANTC5409W to determine any actions you need to take.

**ANTC8413W command CANCEL RECEIVED BY COUPLED XRC SESSION(session_id) FOR MSESSION(msession_id) WITH MHLQ(mhlq)**

**Explanation:** The XRC coupled session `session_id`, which is coupled with other sessions in the master session `msession_id` with master high-level qualifier of `mhlq`, has received a request by another coupled session in this master session to request that the `command` command be canceled. See message ANTC5409W for the return and reason codes that indicate why the command was canceled.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** The session either received a command to cancel a pending command for one of the following reasons:

- The other session detected an error which caused that session to cancel a pending command and to request that the other sessions in the master session also cancel the pending command.
- Another coupled session received a cancel command, such as XSUSPEND CANCEL or XEND CANCEL.

See the “Description and Suggested Recovery Action” section of the return and reason codes issued with message ANTC5409W to determine any actions you need to take.

**ANTC8414W COUPLED XRC entity(name) NOT INTERLOCKED WITH MSESSION(msession_id) MHLQ(mhlq)**

**Explanation:** In the message text:

- `entity` This indicates what kind of XRC entity the message refers to. The valid values are:
  - SESSION The message refers to an XRC session.
  - CLUSTER The message refers to a XRC cluster.

The previously interlocked XRC session `session_id` coupled to master session `msession_id` with master high-level qualifier `mhlq`, encountered a condition that made the session non-interlocked. The following conditions can cause a session to become non-interlocked:

- An XCOUPLE RELEASE command was issued.
- An XSUSPEND command caused all of the volume pairs in the session to be suspended.
- The session was restarted after a master XSUSPEND session command.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** This message is issued whenever the status of a coupled session changes from interlocked to non-interlocked. To achieve interlocked status:

- If the session is suspended, start the XRC session by issuing an XSTART command, and issue an XADDPAIR command to add a volume pair to the XRC session.
- If the session is active, issue an XADDPAIR command to add a volume pair to the XRC session.

**ANTC8415I CLUSTER MONITORING NOW ENABLED FOR CLUSTER(cluster_id) MSESSION(msession_id) MHLQ(mhlq)**

**Explanation:** The performance monitor function is now enabled for the specified cluster, which is coupled to the specified master session.

**Source:** Extended remote copy (XRC)

**System action:** Performance data is recorded, if requested.

**System programmer response:** If system action matches the intended configuration, no further action is required.
ANTC8417I  CLUSTERING NOW ENABLED FOR MSESSION(msession_id) MHLQ(mhlq)

Explanation: During startup, the XRC control address space has successfully enabled clustering for the specified master session and master high level qualifier.

Source: Extended remote copy (XRC)

System action: The cluster is added to the specified master session, and the ANTCLNNN address space is started.

System programmer response: If system action matches an intended configuration change, no further action is required. If not, check the ClusterMSession value in the ANTXIN00 Parmlib member. Correct any error and issue command F ANTAS000,CREFRESH to reinitiate cluster setup processing.

ANTC8418I  CLUSTERING FOR CLUSTER(cname) NOW DISABLED

Explanation: Clustering for the specified cluster name is now disabled.

Source: Extended remote copy (XRC)

System action: XRC sessions on this system are no longer using the cluster for communicating coupling status.

System programmer response: None.

ANTC8419W  CLUSTER MONITORING CONDITION FOR SESSION(sessionid) CLUSTER(clusterid) MSESSION(msessionid) MHLQ(mhlq), RC=rc REAS=reas

Explanation: XRC cluster processing for cluster clusterid associated with master session msessionid with high level qualifier of mhlq detected the condition for XRC session sessionid indicated by the return code rc and reason code reas. Refer to the return code rc and reason code reas to determine the condition which occurred for the indicated XRC session.

Source: Extended remote copy (XRC)

System action: XRC functions are active.

System programmer response: See "System data mover return codes" on page 499 for an explanation of the return and reason codes. The description for the return code will indicate any actions that need to be taken for the condition.

ANTL8801I  invoked_operation

Explanation: This message indicates that XRC has recorded this ANTRQST invocation into the system log.

Source: Extended remote copy (XRC).

System action: XRC functions are active.

System programmer response: No action is required. If you do not want to receive this service message, issue MODIFY ANTAS000,NOSYSLOG ON from the operator console.

ANTM8809I  command_echo_data

Explanation: This message echoes command or ANTRQST API invocation information.

System action: The command and/or API request is processed.

Source: System data mover (SDM).

ANTX8900I  MODIFY OPERATION MISSING

Explanation: The MODIFY ANTxxxxx command has been specified without an operation following the ending comma.

Source: Extended remote copy (XRC) or concurrent copy.

System action: The command is not processed.

System programmer response: Specify an operation with the MODIFY command.

ANTX8901I  MODIFY OPERATION(operation) INVALID

Explanation: The operation is not a recognized SDM modify command.

System action: The command is not processed.

Operator response: Reissue command with correct syntax.

System programmer response: Reissue command with correct syntax.

Source: System Data Mover (SDM).

ANTX8902I  operand OPERAND IS MISSING

Explanation: The operation specified with the MODIFY command requires at least one operand. The operand operand is missing.

Source: Extended remote copy (XRC) or concurrent copy.
**System action:** The MODIFY command is rejected.

**System programmer response:** Supply a valid operand to the command.

**Explanation:** *name* is not one of the predefined names, and is not an entry point in the address space's main load module.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY command could not provide the address of the requested name.

**System programmer response:** Verify that *name* is spelled correctly.

**Explanation:** The maximum size allowed for operand *operand* has been exceeded.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY command is rejected.

**System programmer response:** Correct the spelling of the operand.

**Explanation:** The value specified for operand *operand* is not a valid hexadecimal number.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The command is not processed.

**Operator response:** Reissue command with correct syntax.

**System programmer response:** Reissue command with correct syntax.

**Explanation:** An expected parenthesis in a modify command is missing.

**Source:** System data mover (SDM).

**Explanation:** A delimited parameter was entered for an ANT address space MODIFY command, and the ending delimiter is missing.

**System action:** The command is rejected. SDM operations continue.

**System programmer response:** Correct the parameters and reissue the command as needed.

**Source:** System data mover (SDM).

**Explanation:** This message is the result of a MODIFY LISTSESS command. Between one and nine storage control session reports can be displayed on a single line. An individual session report is provided with the format of *tsnnh*, where the following apply:

- **t** Session type, which can be:
  - C = concurrent copy session
  - E = XRC enhanced (multiple reader) session
  - X = XRC session

- **s** Session status, which can be:
  - A = active session
  - Q = quiesced session
  - S = suspended session
  - T = timed-out session

A session can become suspended as a result of a system reset generated, for example, by a system IPL.

- **nn** Storage control session identifier. This is a hexadecimal number ranging from 01 to FF.

- **h** Host connection field, which can be:
  - (blank) = owned by this processor which has access to the storage control session.
  - * = owned by another processor.
  - ? = owned by this processor which can or can not have access to the storage control session. A question mark can mean that the device is offline.

The following actions can be taken based on the status of the storage control session:

- **Active session** – The session is currently active and can be ended only from a device that is in the session.
- **Quiesced session** – The session has been quiesced either by an XSUSPEND command, a cache failure, or by a system reset (caused by the IPL of the owning processor). The session can be resumed or ended from any processor.
- **Suspended session** – The session has been suspended either by an XSUSPEND command, a
cache failure, or by a system reset (caused by the IPL of the owning processor). The session can be resumed or ended from any processor.

- Timed-out session – The session has been ended by the storage control. The timeout interval for the session has expired. The session can not be resumed and is available to be reused.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The command returns the status of all storage control sessions that are on the storage control.

**System programmer response:** None.

ANTX8914I device_number NO SYSTEM DATA MOVER STORAGE CONTROL SESSIONS

**Explanation:** A MODIFY LISTSESS command has been issued, and the storage control associated with the device given by device_number has no XRC sessions.

If device_number is ALL, a MODIFY LISTSESS ALL command has been issued.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The command returns the condition that there are no active XRC sessions at the time the command was issued.

**System programmer response:** None.

ANTX8915I device_number STORAGE CONTROL SESSION session_number TERMINATED

**Explanation:** A MODIFY TERMSESS command has completed successfully. The storage control session indicated by session_number has ended for the storage control associated with device device_number.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY command has successfully ended the storage control session.

**System programmer response:** The specified session is now available.

ANTX8916I device_number STORAGE CONTROL SESSION session_number RECOVERED

**Explanation:** A MODIFY RCVRSESS command has completed successfully. The storage control session indicated by session_number is recovered for the storage control associated with device device_number. The storage control session is now available for use.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The specified session is recovered.

**System programmer response:** None.

ANTX8917I device_number REQUEST NOT SUPPORTED BY STORAGE CONTROL

**Explanation:** A MODIFY command to the storage control associated with the device given by device_number has been issued, but the storage control does not recognize the request.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The requested function could not be performed.

**System programmer response:** Reissue the command to a storage control that supports XRC or concurrent copy.

ANTX8918I device_number STORAGE CONTROL SESSION session_number NOT FOUND

**Explanation:** A MODIFY TERMSESS or RCVRSESS command has been issued, but the device specified by device_number for storage control session session_number is not recognized by the storage control. The session is either not active or the command was issued to a system other than the system that initiated the storage control session.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The requested function cannot be performed.

**System programmer response:** Supply a valid session ID.

ANTX8922I device_number STORAGE CONTROL SESSION session_number i...i s...s

**Explanation:** A MODIFY command has been issued using device device_number to make a request of session session_number. The status of the session is invalid.

i...i will be one of the following:

- IS
- IS NOT

s...s will be one of the following:

- SUSPENDED OR QUIESCED
- AN XRC SESSION
- QUIESCED
- TIMED OUT
- ON AN ESS
- AN ACTIVE SESSION

**Source:** Extended remote copy (XRC).
**ANTX8923I** function STATUS IS state

**Explanation:** A MODIFY command has been issued for the function function. This message provides the current status of the specified function. The state variable provides the status, which is either ON or OFF.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The function status is displayed.

**System programmer response:** None.

**ANTX8924I** operand value IS INVALID

**Explanation:** A MODIFY operand command has been issued incorrectly. operand specifies the command. value gives the value associated with the request and must be ON or OFF.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY command is rejected.

**System programmer response:** Reenter a correct command.

**ANTX8925A** device_number TERMINATE STORAGE CONTROL SESSION session_number? REPLY 'Y' OR 'N'

**Explanation:** This is a prompt for confirmation that the session indicated by session_number associated with the device device_number should be ended with the TERMSESS command.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The command is canceled unless “Y” is specified.

**System programmer response:** Confirm the command with a “Y” response. Any other response cancels the command. If you are issuing the RCVRSESS command from a CLIST or REXX EXEC, place the confirmation on the stack before issuing the command.

**ANTX8926A** device_number RECOVER STORAGE CONTROL SESSION session_number? REPLY 'Y' OR 'N'

**Explanation:** This is a prompt for confirmation that the RCVRSESS command should continue. The RCVRSESS command is attempting to recover the session indicated by session_number associated with the device indicated by device_number.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The command is canceled unless “Y” is specified.

**System programmer response:** Confirm the command with a “Y” response. Any other response cancels the command. If you are issuing the RCVRSESS command from a CLIST or REXX EXEC, place the confirmation on the stack before issuing the command.

**ANTX8927I** requested_device – tass – device_number

**Explanation:** This message is the result of a MODIFY LISTDVCS operation. The device specified in the LISTDVCS command is reported as the requested_device. The session specified on the command is given by tass, where the following apply:

- **t** Session type, which can be:
  - C = concurrent copy session
  - E = XRC enhanced (multiple reader) session
  - X = XRC session

- **a** Session or device status, which can be:
  - A = active session
  - Q = quiesced session
  - S = suspended session
  - T = timed-out session

A session can become suspended as a result of a system reset generated, for example, by a system IPL. A device can become suspended as a result of an XRC command that suspends the session, an XRC command that suspends a volume, or an error.

**ss** Storage control session identifier. This is a hexadecimal number ranging from 01 to FF.

Between one and six device numbers can be displayed on one line. Other devices associated with this session tass are reported as the device_number. The device numbers are given in the form cc(dddd)s, where the following apply:

- **cc** Specifies the channel connection address for the device.
- **dddd** Specifies the device number associated with the channel connection address. "...." indicates that the command is unable to determine the device number.
- **s** Indicates that the device is in suspended state.

**Source:** Extended remote copy (XRC).

**System action:** The channel connection address and device numbers associated with a session are returned by the command.
ANTX8928I  device_number NO DEVICES FOR STORAGE CONTROL SESSION session_number

Explanation: A MODIFY LISTDVC command has been issued to the storage control associated with the device given by device_number for session session_number. This session was shown as active by the MODIFY LISTSESS command. The session was initiated by a system other than the system that issued the LISTDVC command. The system that started the session is the only one that can associate the devices with the session number.

Source: Extended remote copy (XRC) or concurrent copy.

System action: None.

System programmer response: Issue the command from the system that initiated the session.

ANTX8929I  device_number - SESSION=tass RESIDUAL=rrrr NEXTDEV=nnnn MAXSIZE=mmmm SFILESZ=sfilesz TIME(timestamp) TIMEOUT(timeout)

Explanation: A MODIFY SCDATA command has completed successfully. The device specified on the command is given by device_number. The session specified on the command is given by tass, where the following apply:

- t Session type, which can be:
  - C = concurrent copy session
  - E = XRC enhanced (multiple reader) session
  - X = XRC session

- a Session status, which can be:
  - A = active session
  - Q = quiesced session
  - S = suspended session
  - T = timed-out session

A session can become suspended as a result of a system reset generated, for example, by a system IPL.

- ss Storage control session identifier. This is a hexadecimal number ranging from 01 to FF.

The following values are displayed for active, quiesced, and suspended sessions:

- rrrr The current count of record updates pending in the storage control (hexadecimal).
- nnnn The device to be used for the next data mover I/O. When an SCDATA command is issued and the device number is not available, the 2-byte channel connection address is reported in this field. An asterisk (*) after the device number indicates that the device is a fixed utility device.
- mmmm The maximum size record in the storage control (hexadecimal). If there are no updates pending in the storage control, the maximum data track size is reported.
- sfilesz The number of 4K cache segments that are in the storage control sidefile (hexadecimal). The sidefile is the part of cache that contains data associated with data mover activity.
- sfilesz The number of 4K cache segments that...
represent 60% of the capacity of the storage control cache (hexadecimal).

timestamp
The current storage control time value. If no information is available or the session has never been initialized, the field is reported as asterisks. Information is not available for a device that is not part of the session.

timeout
The current storage control timeout interval. If no information is available or the session has never been initialized, the field is reported as asterisks. Information is not available for a device that is not part of the session.

Source: Extended remote copy (XRC).

System action: The primary storage control status is displayed.

System programmer response: None.

ANTX8937I command OPERATION MUST BE EXECUTED FROM address_space_name

Explanation: The command requested by command can only be executed from the address space name given by address_space_name. The command is rejected with this message if it is issued from any other address space.

Source: Extended remote copy (XRC).

System action: Command is not performed by the system.

System programmer response: Reissue the command from the proper address space.

ANTX8938I device_number - UNABLE TO LIST DEVICES FOR SESSION NUMBER session_number

Explanation: A MODIFY LISTDVCS command has been issued to the storage control associated with the device given by device_number for session session_number. The command has been unable to generate a list of devices for the session.

Source: Extended remote copy (XRC).

System action: The command returns the condition that the devices are not available to be listed.

System programmer response: None.

ANTX8939I DUMP OF ADDRESS SPACE AND TRACE DATA SPACE SUPPRESSED BY SUPRDUMP

Explanation: An error has been encountered by the data mover software, and diagnostic information is provided in SYSLOG. However, a software dump is not taken since SUPRDUMP is ON.

Source: Extended remote copy (XRC).

System action: Data mover operations continue.

System programmer response: The MODIFY ANTAS000,SUPRDUMP command is used to control whether or not a software dump is to be taken on an error. In general, it should be set to OFF. However, if numerous occurrences of the same problem are causing excessive dumps, you can want to set SUPRDUMP to ON until the problem is resolved.

ANTX8941I device_number REMOVED FROM STORAGE CONTROL SESSION session_number

Explanation: A MODIY TERMDVC operation completed successfully. The storage device indicated by device_number has been successfully removed from storage control session session_number.

Source: Extended remote copy (XRC) or concurrent copy.

System action: The storage device was successfully removed from the storage control session.

System programmer response: None.

ANTX8942A REMOVE device_number FROM STORAGE CONTROL SESSION session_number? REPLY 'Y' OR 'N'

Explanation: This is a prompt for confirmation that the storage device indicated by device_number should be removed from the storage control session session_number.

Source: Extended remote copy (XRC) or concurrent copy.

System action: XRC cancels the operation unless you specify “Y”.

System programmer response: Confirm the command with a “Y” response. Any other response cancels the command. If you are issuing the TERMDVC command from a CLIST or REXX EXEC, place the confirmation on the stack before issuing the command.

ANTX8943A TERMINATE ALL type SDM SESSIONS? REPLY 'Y' OR 'N'

Explanation: A MODIFY TERMDSESS operation was issued with XRC, SUS, or TIM specified. This is a prompt for confirmation that the operation to end the storage control sessions should continue.

Source: Extended remote copy (XRC) or concurrent copy.

System action: XRC cancels the operation unless you specify “Y”.

System programmer response: Confirm the command with a “Y” response. Any other response
cancels the command. If you are issuing the TERMSESS XRC, SUS, or TIM command from a CLIST or REXX EXEC, specify "N" to bypass confirmation processing.

**ANTX8944A**  TERMINATE STORAGE CONTROL SESSION  
 session_id  ON STORAGE CONTROL  ssid?  
 REPLY  'Y' OR 'N'

**Explanation:** A MODIFY TERMSESS operation was issued with XRC, SUS, or TIM specified. Reply "Y" if session_id on storage control ssid is to be ended, or "N" to bypass TERMSESS processing for this session.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** XRC cancels the operation unless you specify "Y".

**System programmer response:** Confirm the command with a "Y" response to end processing for storage control session session_id. Any other response cancels the command.

**ANTX8945I**  NO STORAGE CONTROL SESSIONS FOR TERMSESS  
 type

**Explanation:** A MODIFY TERMSESS operation was issued with XRC, SUS, or TIM specified. The operation did not encounter any storage control sessions meeting the selection criteria. No storage control sessions have been ended.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The TERMDVC operation has ended without finding any eligible storage control sessions to end.

**System programmer response:** Use the LISTSESS operation to determine if any storage control sessions exist.

**ANTX8946I**  NO ONLINE DEVICES FOR STORAGE CONTROL SESSION  
 session_number  ON STORAGE CONTROL  ssid

**Explanation:** A MODIFY operation found a storage control session, indicated by session_number, that meets the selection criteria on storage control ssid. However, there was no volume in session session_number that was online to the processor from which the MODIFY operation was issued. The storage control session is not affected.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY operation did not affect the storage control session.

**System programmer response:** Use the LISTDVCS operation to find a device that belongs to the storage control session. Bring the device online to the processor where the MODIFY operation is issued. Next, either reissue the command, or issue the command from a processor that has a device that is online to the storage control.

**ANTX8947I**  STORAGE CONTROL SESSION  
 session_number  ON STORAGE CONTROL  ssid TERMINATED

**Explanation:** A TERMSESS XRC, SUS, or TIM operation ended a storage control session, indicated by session_number, on storage control ssid.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The storage control session is ended.

**System programmer response:** None.

**ANTX8948I**  FINISHED TERMSESS  type  
 PROCESSING

**Explanation:** A MODIFY TERMSESS operation was issued with XRC, SUS, or TIM specified. The processing has finished.

**Source:** Extended remote copy (XRC).

**System action:** The TERMSESS operation has ended.

**System programmer response:** None.

**ANTX8949I**  device_number  IS ONLY DEVICE IN STORAGE CONTROL SESSION  
 session_number

**Explanation:** A TERMDVC operation was issued for the last device that is associated with the storage control session session_number. The operation is ended, and the device remains associated with the storage control session.

**Source:** Extended remote copy (XRC).

**System action:** The operation cannot be performed.

**System programmer response:** Issue the TERMSESS operation to end the storage control session, and to remove the last storage device for the XRC session.

**ANTX8950I**  DUMP OF TRACE DATA SPACE REQUESTED

**Explanation:** A request to dump an XRC trace data space is sent to MVS.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY DUMP command requesting a dump is processed. MVS system
messages indicate when the dump has completed.

**System programmer response:** None.

---

**ANTX8951I** PARTIAL DUMP TAKEN

**Explanation:** A dump has been generated, but is incomplete. This is usually caused by the SYS1.DUMPxx data set not being large enough.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MODIFY command runs with a partial dump completed.

**System programmer response:** Allocate a larger SYS1.DUMPxx data set, and then reissue the command to obtain a complete dump.

---

**ANTX8952I** DUMP SUPPRESSED reason

**Explanation:** reason indicates why a dump is not generated. This is usually caused by another dump being active.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The requested function is ended.

**System programmer response:** Wait until the current dump is complete and then try again.

---

**ANTX8953I** FULL DUMP TAKEN

**Explanation:** The dump is completed successfully.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The requested function is complete.

**System programmer response:** None.

---

**ANTX8955I** ACTIVE TRACE BUFFER BEING WRITTEN OUT

**Explanation:** A request to write out the XRC trace data space is sent to MVS.

**Source:** Extended remote copy (XRC).

**System action:** The MODIFY TRACE command requesting that MVS write out the trace data buffer is processed. MVS system messages will indicate when this operation has completed.

**System programmer response:** None.

---

**ANTX8956I** DUMP OF ADDRESS SPACE REQUESTED

**Explanation:** XRC has sent a request to the operating system to generate a dump of the SDM address space.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MVS MODIFY command requesting a dump is complete. MVS system messages indicate when the dump has completed.

**System programmer response:** None.

---

**ANTX8957I** DUMP OF ADDRESS SPACE AND TRACE DATA SPACE REQUESTED

**Explanation:** XRC has sent a request to the operating system to generate a dump of the SDM address space and the associated trace data space.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** The MVS MODIFY command requesting a dump is complete. MVS system messages indicate when the dump has completed.

**System programmer response:** None.

---

**ANTX8958I** STORAGE CONTROL STATE SAVE REQUESTED

**Explanation:** A storage control state save has been requested and is available for diagnostics. SCTRAP is set to ON, and has requested a state save as a result of an LIC error. The state save requires that the storage control supports this function.

**Source:** Extended remote copy (XRC) or concurrent copy.

**System action:** None.

**System programmer response:** If you wish to suppress state saves, issue MODIFY ANTASnnn SCTRAP OFF.

---

**ANTX8959I** STORAGE CONTROL STATE SAVE NOT AVAILABLE

**Explanation:** An error has occurred for which a storage control state save was attempted. The data mover, however, is unable to force the state save.

**Source:** Extended remote copy (XRC).

**System action:** None.

**System programmer response:** You can force the state save at the storage control to capture the condition, if you wish.

---

**ANTX8960I** NO BIT MAPS IN STATE DATA SET

**Explanation:** There are no ESS bit maps in the State Data Set.

**Source:** Extended remote copy (XRC).

**System action:** Modify command has finished executing.
ANTX8961E  DELBMAP ERROR, RC =return_code
          REAS=reason_code

Explanation: An error was encountered in trying to
access the State Data Set. The return code given by
return_code and the reason code given by reason_code
indicate the nature of the error.

Source: Extended remote copy (XRC).

System action: Modify command was not able to
delete bit maps.

System programmer response: See “System data
mover return codes” on page 499 for an explanation of
the return and reason codes. Correct the error and
enter the modify command again.

ANTX8962I  DELBMAP FINISHED PROCESSING

Explanation: DELBMAP has finished deleting bit
maps from the State Data Set.

Source: Extended remote copy (XRC).

System action: Modify command has finished
executing.

System programmer response: None.

ANTX8963E  CANNOT DELETE MEMBER
          member_name FROM STATE DATA SET,
          RC =return_code REAS=reason_code

Explanation: An error was encountered in trying to
delete member member_name from the State Data Set.
The return code given by return_code and the reason
code given by reason_code indicate the nature of the
error.

Source: Extended remote copy (XRC).

System action: Modify command was not able to
delete a member from the State Data Set.

System programmer response: See “System data
mover return codes” on page 499 for an explanation of
the return and reason codes. Correct the error and
enter the modify command again.

ANTX8965I  session_report

Explanation: This message is the result of a MODIFY
DVCDATA command. Between one and nine storage
control session reports can be displayed on a single
line. An individual session report is provided with the
format of tsnh, where the following apply:

  t Session type, which can be:
      C = concurrent copy session
      E = XRC enhanced (multiple reader)
      session
      X = XRC session

  s Session status, which can be:
      A = active session
      Q = quiesced session
      S = suspended session
      T = timed-out session

  nn Storage control session identifier. This is a
  hexadecimal number ranging from 01 to FF.

  h Host connection field, which can be:
      (blank) = owned by this processor which has
      access to the storage control session.
      * = owned by another processor.
      ? = owned by this processor which can or
      cannot have access to the storage control
      session. A question mark can mean that the
      device is offline.

The following actions can be taken based on the status
of the storage control session:

• Active session - The session is currently active and
  can be ended only from a device that is in the
  session.

• Quiesced session - The session has been quiesced
  either by an XSUSPEND command, a cache failure,
  or by a system reset (caused by the IPL of the
  owning processor). The session can be resumed or
  ended from any processor.

• Suspended session - The session has been
  suspended either by an XSUSPEND command, a
  cache failure, or by a system reset (caused by the
  IPL of the owning processor). The session can be
  resumed or ended from any processor.

• Timed-out session - The session had been ended by
  the storage control. The timeout interval for the
  session has expired. The session can not be
  resumed and is available to be reused.

Source: Extended remote copy (XRC) or concurrent
copy.

System action: The command returns the status of all
storage control sessions that are on the storage control.

System programmer response: None.

ANTX8966I  device_number NO SYSTEM DATA
          MOVER STORAGE CONTROL
          SESSIONS

Explanation: A MODIFY DVCDATA command has
been issued, and the storage control associated with
the device given by device_number has no XRC
sessions.

Source: Extended remote copy (XRC) or concurrent
copy.
System action: The command returns the condition that there are no active XRC sessions at the time the command was issued.

System programmer response: None.

ANTX8967I  information MISSING

Explanation: The parameters entered on a MODIFY command to an ANT address space were missing some information. The information insert is free-format and explains what is missing.

System action: The command is rejected. SDM operations continue.

System programmer response: Correct the parameters and reissue the command as needed.

Source: System data mover (SDM).

ANTX8969I  ccstor output

Explanation: This message displays output from the MODIFY ANTMAIN,CCSTOR command:

Status and explanation:

NO CONCURRENT COPY JOBS
No Concurrent Copy (CC) jobs are running at this time.

NO CONCURRENT COPY TRACKS IN THE SIDEFILE DATA SPACE(S)
CC jobs are running, but no changed tracks images are in SDM data spaces.

NO CONCURRENT COPY SIDEFILE DATA SPACE(S)
There are no CC data spaces, which means no CC tracks have been encountered since the last IPL or ANTMAIN restarts.

NAME JOBID ASID % TRACKS
Two jobs are running with the listed name, jobid, and ASID. They are consuming the indicated percentages and number of tracks in the SDM data spaces.

INTERRUPTED WHILE GATHERING STATISTICS
The CCSTOR operation was interrupted by other concurrent copy processing while statistics were being gathered. Reissue the command to obtain statistics.

CCSTOR - vvv nnn
This line identifies the output as coming from the CCSTOR command, as version vvv of the message format. The nnn field identifies the multi-line WTO number.

System action: Operations continue.

Source: System Data Mover (SDM).

ANTX8970I  device_number channel_extender_status

Explanation: A MODIFY SCDATA command has been issued with the option requesting channel extender status for the storage control that is associated with the device given by device_number. The channel_extender_status provides this information.

Source: Extended remote copy (XRC).

System action: None.

System programmer response: None.

ANTX8971I  ** Please use PARMLIB support **

Explanation: A MODIFY command using the name .XMTUN has been issued.

System action: Information only.

System programmer response: Change your procedures to use the parmlib support.

Source: Extended remote copy (XRC).

ANTX8973A  device_number SUSPEND STORAGE CONTROL SESSION session_number?

REPLY 'Y' OR 'N'

Explanation: This is a prompt for confirmation that the session indicated by session_number that is associated with the device device_number should be suspended with the SUSSESS command.

System action: The command is canceled unless “Y” is specified.

System programmer response: Confirm the command with a “Y” response. Any other response cancels the command. If you are issuing the SUSSESS command from a CLIST or REXX EXEC, place the confirmation on the stack before issuing the command.

Source: Extended remote copy (XRC).

ANTX8975I  device_number STORAGE CONTROL SESSION session_number suspend_type

Explanation: A MODIFY SUSSESS command has completed successfully. The storage control session that is indicated by session_number that is associated with device device_number has been suspended. suspend_type will be SUSPENDED for ESS storage controls, QUIESCED for other types of storage controls.

System action: The MODIFY command has successfully suspended the storage control session.

System programmer response: None.

Source: Extended remote copy (XRC).
ANTX8976I  device_number  NO OTHER DEVICES FOR STORAGE CONTROL SESSION

Explanation:  A MODIFY TERMDVC command was issued to the device given by device_number that is associated with the session that is identified by session_number, and the session is suspended. XRC was unable to find another device in the session to use in re-suspending the session. This is most likely because all other devices in the session are offline to the system that TERMDVC is being executed on.

System action:  The session is left in an active state.

System programmer response:  Use the MODIFY SUSSESS command to re-suspend the session.

Source:  Extended remote copy (XRC).

ANTX8977I  device_number - CPID=channel_path_id

PGID=channel_group_id

Explanation:  This message is the result of a MODIFY PATHS command. channel_path_id is a one byte hexadecimal number that gives a channel path id. channel_group_id is an eleven byte hexadecimal number that gives a path group id. Storage controls use the path group id to identify the request path. A channel path id of "**" identifies the initial path group id that z/OS sends to the storage control. A channel_group_id of all zeros indicates that the path group is physically unavailable, or that all devices associated with the channel path were offline when the channel path was varied online.

System action:  The command returns the ids of all the paths that device_number can use.

System programmer response:  None.

Source:  Extended remote copy (XRC).

ANTX8978A  EXECUTE CREFRESH FORCE?  REPLY 'Y' OR 'N'

Explanation:  This is a prompt for confirmation that the cluster session is to be cleared.

System action:  XRC functions are active.

System programmer response:  Confirm the command with a "Y" response. Any other response cancels the command.

Source:  Extended remote copy (XRC).

ANTX8979A  CREFRESH FORCE FINISHED PROCESSING

Explanation:  This message confirms that the cluster session was cleared.

System action:  XRC functions are active.

System programmer response:  Issue the XSTATUS CLUSTER and XSTATUS ADDRSPACE commands to ensure that the cluster session is no longer active.

Source:  Extended remote copy (XRC).
**ANTX8986I**  **TIME OF LAST source STATE SAVE IS timestamp**

**Explanation:** The MVS MODIFY command was issued to either reset the storage control diagnostic state save timestamp or to determine the last time a state save was taken for an XRC logical session. The source indicates either PRIMARY or SECONDARY status was requested on the MVS MODIFY command. The timestamp value is either the last timestamp a state save was taken or is RESET indicating that the appropriate timestamp value has been reset to zero, indicating that a state save has not been taken within the last 24 hours.

**Source:** Extended remote copy (XRC).

**System action:** XRC functions are active.

**System programmer response:** See Appendix A in [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/docview.wss?uid=swg27035643) for details on the use of MVS MODIFY command options SHOW, SHOW2, RESET, and RESET2.

**ANTX8987I**  **OUTSTANDING AUXILIARY SESSIONS**

**Explanation:** An attempt was made through TERMSESS to terminate an XRC enhanced storage control session, but the session still has auxiliary sessions associated with it.

**Source:** Extended remote copy (XRC).

**System action:** The storage control session is not terminated.

**System programmer response:** Do the following steps:
1. Find the outstanding auxiliary session identifiers using a F ANTAS000, LISTSESS nnnn E command.
2. Use TERMSESS to terminate the auxiliary sessions.
3. Repeat the TERMSESS command for the base session.

**ANTX8988E**  **ANTRQST function ERROR, RC=rc REAS=reas**

**Explanation:** The ANTRQST function had an error indicated by the return and reason code.

**System action:** The command is rejected.

**System programmer response:** Take action as documented for the return and reason code. The codes are located in this book’s reference on SDM return and reason codes or the Advanced Copy Services reference section on ANTRQST.

**Source:** System data mover (SDM).

**ANTX8989E**  **command OPERAND operand INVALID**

**Explanation:** A modify command was entered incorrectly. The *operand* is not valid for *command*.

**System action:** The command is rejected.

**Operator response:** Correct command input and reissue.

**System programmer response:** Correct command input and reissue.

**Source:** System data mover (SDM).

**ANTX9990I**  **SUSSESS ALL ALREADY IN PROGRESS**

**Explanation:** Another SUSSESS ALL command was already in progress at the time when command F ANTAS00n,SUSSESS ALL was issued.

**Source:** Extended remote copy (XRC).

**System action:** Modify command ends.

**System programmer response:** Cancel ANTAS000, if condition persists.

**ANTX9991I**

**Explanation:** An attempt was made to remove an XRC fixed utility device from a storage control session via a TERMDVC operation.

**Source:** Extended remote copy (XRC).

**System action:** The TERMDVC operation is not performed.

**System programmer response:** If it is necessary to remove the device from the storage control session, use the TERMSESS operation to terminate the session. Note, this will remove all devices from the storage control session, not just the specified device.

---

**Enterprise storage server FlashCopy messages**
**ANTF0001I** command_name COMMAND
ending_status FOR DEVICE
device_number, COMPLETION CODE: 
hh

**Explanation:** The ending status of the FlashCopy command is presented. The status is determined by conditions encountered during execution. Descriptions of the various commands are below:

- **command_name**
  The name of the FlashCopy command.

- **ending_status**
  - COMPLETED—The command is successfully completed.
  - UNSUCCESSFUL—An error was encountered. Other messages can contain specific error information. Correct the error and reissue the command.

- **device_number**
  The device number specified in the FlashCopy command. This can be:
  - z/OS device number
  - Serial_number-lss-cca of the CKD secondary of a PPRC pair in a FlashCopy remote request
  - Serial_number-lss-lun of a Fixed Block device in an OPEN device request
  - "" if the device number is missing or incorrectly specified in the command

- **hh**
  The highest completion code found during execution.

**Source:** ESS FlashCopy.

**System action:** None.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/knowledgecenter/SS3R7P_2.4.0/com.ibm.zos.zos.zosdfsms.doc/dfsms_advcopy.html) for the command syntax rules. Ensure that the missing or incorrect operands are properly entered, that the required number of characters are given, and that hex values are in the correct format.

**Note:** The parsing routines only validate the operands syntactically. The storage control can reject syntactically correct commands if the operands cannot be resolved for the function requested.

**ANTF0003I** MISSING OR INVALID OPERAND.
TYPE=type

**Explanation:** The parsing routine has found an operand in error. The operand is identified in the type field.

- **type**
  The specific operand type in error:
  - DEVN—Device number
  - SDEVN—Source device number
  - TDEVN—Target device number
  - DDSW—Deleted data set withdraw
  - XTNTLST—Extents lists provided for establish or withdraw
  - MODE—Background copy or not
  - ONLINTGT—Target device online OK

- **SOURCE**—Source device for FB or inband request
- **TARGET**—Target device for FB or inband request
- **REMOTE**—Request is for a remote secondary of a PPRC pair
- **INCRMNT**—Perform change recording
- **TGTPPRIM**—Target PPRC primary device OK
- **OPENDVC**—The request is for FB devices
- **SSID**—Storage Subsystem ID
- **QRYSSID**—Open or remote QUERY subsystem
- **SRCSSER**—Serial number of source ESS
- **SRCCCA**—Source device CCA
- **SRCLUN**—Source device LUN
- **SRCLSS**—Source device LSS number
- **TGTSER**—Serial number of target ESS
- **TGTCACA**—Target device CCA
- **TGTLUN**—Target device LUN
- **TGTLSS**—Target device LSS number
- **QRYSER**—Serial number of QUERY device ESS
- **QRYCCA**—Query device CCA
- **QRYLUN**—Query device LUN
- **QRYLSS**—Query device LSS number

**Source:** ESS FlashCopy.

**System action:** None.

**System programmer response:** Check the console messages for a previous ANTFnnnn message that explains the failure, and take action based on this previous message.

**ANTF0008I** command_name COMMAND FAILED TSO COMMAND PROCESSING

**Explanation:** A missing or incorrect value was specified with the command_name command, or there were other TSO command processing errors.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** See [z/OS TSO/E Messages](https://www.ibm.com/support/knowledgecenter/SSYVK2_1.11.0/com.ibm.zos.zos/zos_message_zos巴斯.txt) for an explanation of the related IKJxxxxx messages. Correct the error and reenter the command. If the command was issued from a CLIST or REXX
EXEC, correct the error and rerun the CLIST or REXX EXEC.

**ANTF0009I** USER userid IS NOT AUTHORIZED TO ISSUE THE ESFC command_name COMMAND

**Explanation:** The Enterprise Storage Subsystem FlashCopy command_name command was issued by user userid, and RACF (or the product providing resource control) has determined that this user is not authorized to use this command. If userid is UNKNOWN, a batch job invoked the command_name command, and the job card did not specify a user ID.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Contact your system administrator if authorization is required. See [Z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for command authorization details.

The system administrator must:

1. Update the IKJTSOxx member of SYS1.PARMLIB, specifying the command_name command with the AUTHCMD NAMES parameter.
2. Issue the TSO command PARMLIB UPDATE(xx) to activate the new IKJTSOxx member.

**ANTF0031I** FLASHCOPY command_name COMMAND TO DEVICE device_number NOT IN ACTIVE FLASHCOPY

**Explanation:** The FlashCopy command_name command was issued and the source and target devices are not in an active FlashCopy relationship. device_number can be:

- z/OS device number
- Serial_number-lss-cca of the CKD secondary of a PPRC pair in a FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block device in an OPEN device request

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Use the FCQUERY command to determine the status of the devices. Verify that the devices are in a FlashCopy relationship, and reissue the command.

**ANTF0011I** FLASHCOPY WITHDRAW device_number NOT IN ACTIVE FLASHCOPY

**Explanation:** The FlashCopy FCWITHDR command was issued and the source and target devices are not in an active FlashCopy relationship. device_number can be:

- z/OS device number
- Serial_number-lss-cca of the CKD secondary of a PPRC pair in a FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block device in an OPEN device request

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Use the FCQUERY command to determine the status of the devices. Verify that the devices are in a FlashCopy relationship, and reissue the command.

**Chapter 13. ANT messages**
ANTF0082I  FLASHCOPY WITHDRAW SOURCE DEVICE sdevn NOT IN SUBSYSTEM OF TARGET DEVICE tdevn

Explanation: The FlashCopy FCWITHDR command was issued and the source device sdevn is not in the same subsystem as the target device tdevn. sdevn can be:

- z/OS device number
- Serial_number-lss-cca of the CKD secondary of a PPRC pair and source in the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block device in an OPEN device request

tdevn can be:

- z/OS device number
- Serial_number-lss-cca of the CKD target of the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block target device in the FlashCopy OPEN request

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Use the FCQUERY command to determine the subsystem identifier (SSID), the subsystem serial number (SERIAL), and the logical subsystem identifier (LSS) of both the source and target devices. Confirm that the correct device numbers are being used, and reenter the command.

ANTF0083I  FLASHCOPY NOT ACTIVE FROM SOURCE DEVICE sdevn TO TARGET DEVICE tdevn

Explanation: The FlashCopy FCWITHDR command was issued and the source device sdevn is not the source device in an active FlashCopy relationship with the target device tdevn. sdevn can be:

- z/OS device number
- Serial_number-lss-lun of the secondary of a PPRC pair and source in the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block device in an OPEN device request

tdevn can be:

- z/OS device number
- Serial_number-lss-cca of the CKD target of the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block target device in the FlashCopy OPEN request

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Ensure that the source device and target device are correct. Use the FCQUERY command to determine if the source device is in an active FlashCopy relationship with the target device. Reenter the command after correcting any errors. This command can fail because the source and target devices are in active FlashCopy relationships, but not with each other. Check to make sure that the source and target devices are not reversed.

ANTF0090I  fcquery_format_message

Explanation: An FCQUERY Formatted request has been made. This is a block message defined by the fcquery_format_message.

The first line of this report is a control line which consists of the following:
timestamp job_number ANTF0090I FCQUERY Formatted connect_message_number C

Note: The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second, header line of this report is a text line which consists of the following:
DEVN SSID LSS CCA CU SERIAL STATUS

The data under this second line header represents the following information:

DEVN Contains the DEVN value or dashes ("----").
SSID Contains the subsystem ID for the device.
LSS Contains the ESS logical subsystem number or dashes if the DEVN is not in an ESS.
CCA Contains the subsystem device address.
CU Contains the subsystem type number (3990, 2105, and so forth).
SERIAL Contains the subsystem serial number.
STATUS Contains the current status of the device:
XRC..... Device is in XRC pair.
PPRC..... Device is in PPRC pair.
CC...... Device is in CC session.
FC...... Device is in FlashCopy (no background copy if on the third line of the report).
FC..xxx% Device is in FlashCopy (background copy active). This appears only on the third line of the report.
SIMPLEX. Device is not in ESS or not in any copy status.

The third line of the report contains information about one device. If the device is not in an ESS, or is not in a
FlashCopy relationship, this line contains available device and subsystem information. If the DEVN identifies the source volume while in a FlashCopy relationship, the DEVN status field will have the device number specified in the FCQUERY DEVN parameter. If the DEVN identifies the target volume while in a FlashCopy relationship, the DEVN status field will contain dashes ("----").

The optional fourth line of the report contains information about the second device if the FCQUERY DEVN identifies a device while in a FlashCopy relationship. If the DEVN identifies a source device, the DEVN status field in this line contains dashes ("----"). If the DEVN identifies a target device, the DEVN status field in this line contains the device number in the DEVN parameter.

Source: ESS FlashCopy.
System action: None.
System programmer response: None.

ANTF0095I  fcquery_unformatted_message

Explanation: An FCQUERY Unformatted request has been made. This is a block message defined by the fcquery_unformatted_message parameter; it consists of the following lines:

- Line 1:
  
  timestamp  job_number  ANTF0091I  FCQUERY
  Unformatted  connect_message_number  C

  Note: The connect_message_number is written to SYSLOG only. The C is written to the console only.

- Line 2:
  
  device_number,ssid,lss,cca,cu,serial,status

- Line 3 (Optional line—if DEVN is in FlashCopy)
  
  device_number,ssid,lss,cca,cu,serial,status

where:

DEVN  Contains the DEVN value or dashes ("----").
SSID  Contains the Subsystem ID for the device.
LSS  Contains the ESS Logical Subsystem number or dashes if the DEVN is not in an ESS.
CCA  Contains the subsystem device address.
CU  Contains the subsystem type number (3990, 2105, ...).
SERIAL  Contains the subsystem serial number.
STATUS  Contains the current status of the device:
  
  XRC.....  Device is in XRC session.
  FC.....  Device is in FlashCopy (no background copy if on the third line of the report).
  FC..xxx%  Device is in FlashCopy (background copy active). This appears only on the third line of the report.
  SIMPLEX.  Device is not in ESS or not in any copy status.

Source: ESS FlashCopy.
System action: None.
System programmer response: None.

ANTF0100I  FLASHCOPY OPERATION ERROR.

    MSG FRMT = f, MSG NMBR = n, REAS: rs

Explanation: The ESS subsystem detected an internal error while processing the FlashCopy request. The request was not completed.

Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: This is generally an error caused by existing conditions or states in the subsystem. If the problem recurs, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. An unformatted GTF I/O trace on the specified device while the problem recurs will probably be required for further diagnosis.

Note: The reasons for the internal error can be correctable by the user. The following list has some of these reasons and a description of the error and possible corrective actions:

- MSG FRMT = 0, MSG NMBR = F, REAS: 56
  
  The FlashCopy request specified a volume that has pinned data. Correct the pinned data situation and resubmit the FlashCopy request.

- MSG FRMT = 0, MSG NMBR = F, REAS: 60
  
  The target device for a FlashCopy request is in a path grouped status. This implies the device is online to a host system (not necessarily to the host issuing this FlashCopy request). Either ensure that the target device is offline to all systems or specify the ONLINTGT(YES) parameter.

- MSG FRMT = 0, MSG NMBR = F, REAS: 82
  
  The subsystem has insufficient resources or too many FlashCopy relationships to complete this FlashCopy request. Resubmit the request when the condition is corrected or relieved.

- MSG FRMT = 0, MSG NMBR = F, REAS: 84
  
  The FlashCopy request specified devices that
are not in the same ESS logical subsystem or the devices are not the same size and format.

MSG FRMT = 0, MSG NMBR = F, REAS: BB
The FlashCopy FCWITHDR request specified DDSW(YES) for a source device which is in an existing full-volume FlashCopy relationship.

ANTF0200I AOM DETECTED I/O ERROR. MSG FRMT = f, MSG NMBR = n, REAS: rs
Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request from FlashCopy processing. The message format f, the message number n, and the reason rs are taken from the sense bytes obtained after the error.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: This message can be received because of a parameter error that would normally result in an ANTF003I message, however, the microcode is at a lower level that does not report the necessary information to determine the parameter that is in error. Verify that all parameters specified are correct for the request being attempted. If all parameters are correct, this is an internal error. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTF0201I NO UCB FOUND FOR DEVICE NUMBER SPECIFIED IN INPUT
Explanation: FlashCopy processing attempted to locate the UCB for the device, but the UCB could not be found.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: Check the device number specified in the FlashCopy command to make sure it is a valid device as defined to the host system. Resubmit the FlashCopy command with a valid device number.

ANTF0202I CHANNEL PROGRAM: READ DEVICE CHARACTERISTICS FAILED
Explanation: FlashCopy processing attempted to read device information from the specified device. The channel program for this request received a unit check.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: Multiple conditions can cause this error. The device is defined to the host but cannot respond to the I/O request. Use the DEVSERV commands to check path and device status from the system console. Correct the conditions and resubmit the command. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTF0207I ASYNCHRONOUS OPERATIONS MGR. REQUEST FAILED RTN: 04 REAS: rs
Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request from FlashCopy processing.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: This is an internal error. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Additional information about AOM return and reason codes can be found in the [z/OS DFSMSdfp Diagnosis] manual.

ANTF0208I ASYNCHRONOUS OPERATIONS MGR. OPERATION FAILED RTN: 08 REAS: rs
Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request from FlashCopy processing.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: This is an internal error. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Additional information about AOM return and reason codes can be found in the [z/OS DFSMSdfp Diagnosis] manual.

ANTF0209I ASYNCHRONOUS OPERATIONS MGR. INTERNAL ERROR RTN: 12 REAS: rs
Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request from FlashCopy processing.
Source: ESS FlashCopy.
System action: The command is rejected.
System programmer response: This is an internal error. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Additional information about AOM return and reason codes can be found in the [z/OS DFSMSdfp Diagnosis] manual.

ANTF0211I CHANNEL PROGRAM: READ CONFIGURATION DATA FAILED
Explanation: FlashCopy processing attempted to read device configuration information from the subsystem for the specified device. The channel program for this
request received a unit check.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Multiple conditions can cause this error. The device is defined to the host but cannot respond to the I/O request. Use the DEVSERV commands to check path and device status from the system console. Correct the conditions and resubmit the command. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTF0212I CHANNEL PROGRAM: SENSE SUBSYSTEM STATUS FAILED

Explanation: FlashCopy processing attempted to read subsystem status information about the specified device. The channel program for this request received a unit check.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Multiple conditions can cause this error. The device is defined to the host but cannot respond to the I/O request. Use the DEVSERV commands to check path and device status from the system console. Correct the conditions and resubmit the command. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTF0213I UNIT IS ALIAS DEVICE, SPECIFIED OPERATION NOT ALLOWED

Explanation: FlashCopy processing detected the specified device is a Parallel Access Volume (PAV) alias device. FlashCopy requests can only be issued to the PAV base device or non-PAV devices.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Ensure that the device specified is the correct device, and resubmit the request.

ANTF0301E FLASHCOPY DEVN DEVICE NOT IN SAME CLUSTER AS OPEN DEVICE

Explanation: The FlashCopy request specified OPENDVCS(YES). The DEVN device is not in the same subsystem cluster as the Open device identified in the request. The DEVN device is used only as an access device to the subsystem cluster that contains the Open (Fixed Block) device. The Open Device must be in the same cluster as the DEVN device.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Ensure that the DEVN device is in the same subsystem cluster as the Open device identified in the FlashCopy request. Reissue the corrected request.

ANTF0302E FUNCTION IS NOT SUPPORTED ON SUBSYSTEM MICROCODE (LIC) LEVEL

Explanation: The Advanced Copy Services request specified a function that is not supported by host software on the subsystem identified in the request. The specified subsystem microcode (LIC) level is less than the minimum microcode level required for the function.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Determine the microcode level (LIC) of the subsystem identified in the request. Ensure that the microcode is at the required level. After making changes or corrections, resubmit the Advanced Copy Services request.
ANTF0303E  UNIT DOES NOT SUPPORT FLASHCOPY OPERATIONS

Explanation: A FlashCopy request was made to the subsystem, but the subsystem reports that the FlashCopy function is inactive or not installed for this unit. One of the following conditions exists on the storage subsystem:

- Source or target devices are not properly specified
- Source and target devices are on different subsystems
- Requested FlashCopy LIC for requested function is not installed on the subsystem

Source: FlashCopy.

System action: Request has failed.

System programmer response: Issue the DEVSERV command to determine the status of the above conditions and correct those conditions. If the LIC is not at a valid functional level, upgrade to the correct level. After conditions have been corrected, reissue the command.

ANTF0304E  OPENDVCS DOES NOT SUPPORT KEYWORD kkkkk

Explanation: The OPENDVCS(YES) function has been specified with keyword kkkkk. These options are mutually exclusive. The request failed.

Source: FlashCopy.

System action: FlashCopy functions are active.

System programmer response: OPENDVCS(YES) is mutually exclusive with the SDEVN, TDEVN, ONLINGT, and EXTENTS parameters. Select the desired option and remove the option that is mutually exclusive. Reissue the command.

ANTF0309E  PPRC SECONDARY REQUIRED FOR REMOTE REQUEST

Explanation: A remote FlashCopy request was specified but the primary FlashCopy volume is not a PPRC secondary volume. The request is rejected.

Source: FlashCopy.

System action: FlashCopy functions are active.

System programmer response: A volume can only be in a single persistent relationship. This request is for a volume that is already in a relationship. The volume specified can be incorrect. If the volume is correct, remove the existing relationship before reissuing the command.

ANTF0310E  TARGET OF REMOTE REQUEST NOT FOUND

Explanation: A remote FlashCopy request was specified but the target was not found. The request is rejected. Probable causes are:

- The target device was specified incorrectly
- The target device is not in the same subsystem as the primary

Source: FlashCopy.

System action: FlashCopy functions are active.

System programmer response: Reissue the command directing the request to a valid PPRC secondary volume.

ANTF0311E  REMOTE REQUEST SSID INVALID

Explanation: A remote FlashCopy request was specified with an SSID that has incompatible options. The command failed.

Source: FlashCopy.

System action: FlashCopy functions are active.

System programmer response: If the remote FlashCopy request is for zSeries® volumes, the SSID must be smaller than X'10'. If the remote FlashCopy request is for Open devices (OPENDVCS(YES) is specified) the SSID must be equal to or greater than X'10'. Reissue the command with the correct specification.

ANTF0312E  PERSISTENT RELATIONSHIP ALREADY EXISTS

Explanation: A persistent FlashCopy request was made for a volume relationship that already exists. The request is rejected.

Source: FlashCopy.

System action: FlashCopy functions are active.

System programmer response: A volume can only be in a single persistent relationship. This request is for a volume that is already in a relationship. The volume specified can be incorrect. If the volume is correct, remove the existing relationship before reissuing the command.

ANTF0330I  FLASHCOPY command SOURCE DEVICE sdevn NOT IN SUBSYSTEM OF TARGET DEVICE tdevn

Explanation: The FlashCopy command was specified with a source device sdevn and the target device tdevn that do not meet the logical subsystem requirement. sdevn can be:

- z/OS device number
The FlashCopy command was issued in an environment that does not have accessibility to FlashCopy Version 2 functions. FlashCopy Version 1 requires that the source and target devices must exist in the same logical subsystem (LSS). If the FlashCopy command was issued in an environment that does have accessibility to FlashCopy Version 2 or greater functions, the source and target devices must exist on the same storage control, any LSS within the storage control.

System action: The command is rejected.
System programmer response: Use the FCQUERY command to determine the status of the source and target devices. Ensure that the devices are in FlashCopy relationships and the channel connection addresses (CCAs) of each device is the source/target of the other device. Verify that the sdevn and tdevn are the correct device numbers and reenter the command.

Explanation: The source device sdevn and target device tdevn specified on the FLASHCOPY FCWITHDR command are in FlashCopy relationships in the same Enterprise Storage Server® (ESS) logical subsystem, but the devices are not in a FlashCopy relationship with each other. sdevn can be:
• z/OS device number
• Serial_number-lss-cca of the CKD source in a FlashCopy remote request
• Serial_number-lss-lun of a Fixed Block device in an OPEN device request

Source: ESS FlashCopy.

System action: The command is rejected.
System programmer response: Use the FCQUERY command to determine the status of the source device. The FlashCopy FCWITHDR command target device must identify the source device in a FlashCopy relationship. Verify that the source and target devices specified on the FCWITHDR command are correct, and reenter the command.

Explanation: The source device sdevn specified on the FLASHCOPY FCWITHDR command is not in a FlashCopy relationship with the target device tdevn. sdevn can be:
• z/OS device number
• Serial_number-lss-cca of the CKD secondary of a PPRC pair and source in the FlashCopy remote request
• Serial_number-lss-lun of a Fixed Block device in an OPEN device request

Source: ESS FlashCopy.
**ANTF0336I**  FLASHCOPY WITHDRAW TARGET DEVICE \textit{tdevn} NOT ACTIVE

**FLASHCOPY TARGET DEVICE**

**Explanation:** The FlashCopy FCWITHDR command specified a target device \textit{tdevn} and the target device is the source device in a FlashCopy relationship. \textit{tdevn} can be:

- z/OS device number
- \textit{Serial\_number-lss-lun} of a Fixed Block device in an OPEN device request

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Use the FCQUERY command to determine the status of the target device. The FlashCopy FCWITHDR command target device must identify the target device in a FlashCopy relationship. Verify that the source and target devices specified on the FCWITHDR command are correct, and reenter the command.

**ANTF0340E**  FLASHCOPY DEVICE IN UNDETERMINED STATUS

**Explanation:** A FlashCopy request detected that the target device is in CE mode or the device status is not known. This could be the result of FlashCopy Establish request that was issued with the REMOTE(YES) keyword and the TARGET device cannot be used as the FlashCopy target because of one of the following conditions:

- The target serial number is not the same as the PPRC secondary device serial number.
- The target lss is not valid for the PPRC secondary subsystem.
- The target cca or lun is not valid for the PPRC secondary subsystem.
- If the Target device is a CKD device, the SSID ssid is not the same as the PPRC secondary device ssid.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** This error is returned from the ESS subsystem when the device is in CE mode, or the status is not known to the ESS. If this is the result of an establish with the REMOTE(YES) keyword, make sure the PPRC Secondary device information is the same as the REMOTE FlashCopy TARGET device information. After making any changes or corrections, resubmit the FlashCopy Establish request. Call hardware support if the condition cannot be cleared.

**ANTF0341E**  FLASHCOPY DEVICE HAS PINNED DATA

**Explanation:** A FlashCopy request specified a device that has pinned data status.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** The pinned data status must be cleared before the FlashCopy request can be completed. Use the DEVSERV command to obtain information about the device. Call hardware support if the condition cannot be cleared.

**ANTF0342E**  FLASHCOPY TARGET IN PATH GROUP - ONLINE TARGET NOT ALLOWED

**Explanation:** A FlashCopy Establish request detected an active path group connection between the target device and a host system, and the ONLINTGT(YES) keyword was not specified.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** The active path group connection to the target device is detected in the ESS subsystem. This indicates the target device can possibly be online to some host system. The online status of the device must be checked from every host system with access to the target device. If the target device is offline to all attached host systems and the path group connection is still active, the ONLINTGT(YES) keyword can be added to the FlashCopy Establish request. Host system console command VARY OFFLINE can also reset the path group connection.

**ANTF0350E**  FLASHCOPY ESTABLISH - FLASHCOPY ALREADY ACTIVE OR NO RESOURCES

**Explanation:** A FlashCopy Establish request detected that a specified device is in a FlashCopy relationship, or the internal ESS subsystem processing detected insufficient resources to complete the Establish of the FlashCopy relationship.

This message can also be issued if one or both of the specified devices specified in a FlashCopy Version 2 Establish request are in an active FlashCopy Version 1 relationship.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** This error is returned from the ESS subsystem when the device is in CE mode, or the status is not known to the ESS. If this is the result of an establish with the REMOTE(YES) keyword, make sure the PPRC Secondary device information is the same as the REMOTE FlashCopy TARGET device information. After making any changes or corrections, resubmit the FlashCopy Establish request. Call hardware support if the condition cannot be cleared.

**ANTF0350E**  FLASHCOPY ESTABLISH - FLASHCOPY ALREADY ACTIVE OR NO RESOURCES
devices completed just before this FlashCopy Establish was requested. Use the FCQUERY request to determine the status of the requested devices. If the devices are not in a FlashCopy relationship, this FlashCopy Establish request can be retried at a later time, when ESS resources can be available.

**ANTF0351E** **FLASHCOPY ESTABLISH - ESS BATTERY NOT AVAILABLE OR INSTALLED**

**Explanation:** A FlashCopy Establish request detected that the ESS subsystem battery feature was inactive or not installed.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** The ESS subsystem battery feature must be installed and active before FlashCopy can be used. Call the service representative to correct the problem.

**ANTF0352E** **FLASHCOPY VOLUMES NOT IN SAME LSS OR DIFFERENT SIZE/FORMAT**

**Explanation:** A FlashCopy Establish request detected that the devices were not in the same Logical Subsystem, or the source device has more cylinders than the target device, or the devices have different formats.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Use the FCQUERY command to make sure the source and target devices are in the same LSS. Use the ESS configuration information or DEVSERV QD, dddd command to make sure the source and target devices have the same format, and the target device has the same number of cylinders, or more, as the source device. After making any needed corrections or changes, reissue the FlashCopy request.

**ANTF0353E** **FLASHCOPY TARGET DEVICE IN CONFLICT WITH COPY SERVICES STATUS**

**Explanation:** A FlashCopy Establish request detected that the specified target device is an XRC Primary volume, a PPRC device (primary or secondary), or a Concurrent Copy source volume.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Use the FCQUERY to determine which copy service is active on the target device (XRC, or PPRC). Make any necessary changes or corrections and reissue the FlashCopy Establish request. If running with appropriate levels of software and microcode support, the target of the FCESTABL command can be the primary of a PPRC pair when TGTPPRIM(YES) is specified.

**ANTF0354E** **FLASHCOPY FEATURE NOT INSTALLED OR ACTIVE**

**Explanation:** A FlashCopy Establish request detected that the FlashCopy feature was not installed or not active.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** Ensure the ESS subsystem has the FlashCopy feature installed and active. It can be necessary to call customer service or a service representative to resolve the problem.

**ANTF0355E** **FLASHCOPY TARGET IN USE BY OTHER COPY OPERATION**

**Explanation:** A FlashCopy Establish request detected that the target device is active in another copy operation.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** The ESS subsystem returns this error when the specified target device is in use by another outboard copy operation (such as an XRC secondary or in use by TDMF™). Verify that the target device is correctly specified and not in use by another outboard copy operation, and reissue the FlashCopy command.

**ANTF0360E** **FLASHCOPY REQUEST RESOURCE SHORTAGE OR HARDWARE CONDITIONS**

**Explanation:** A FlashCopy Establish request detected insufficient resources to complete the establish of the FlashCopy relationship or the internal ESS subsystem processing encountered an error.

**Source:** ESS FlashCopy.

**System action:** The command is rejected.

**System programmer response:** This error is typically seen when a large number of FlashCopy requests are issued in a short amount of time. Use the FCQUERY request to determine the status of the requested devices and other devices on the subsystem. If many devices are in FlashCopy relationships, the FlashCopy Establish request can be retried at a later time, when ESS resources can be available. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center.
ANTF0400E  FLASHCOPY ESTABLISH devtype
DEVN devn NOT ALLOWED WITH FLASHCOPY VERSION 1 ACTIVE

Explanation: An FlashCopy establish request specified a SOURCE or TARGET device with a device number of devn. The device is currently active in a FlashCopy Version 1 relationship, and your request which failed was issued from an environment which supports FlashCopy Version 2.

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: Use the FlashCopy query request to determine the status of the source and target devices. After the FlashCopy Version 1 request has completed for the indicated device, resubmit the request.

ANTF0401E  FLASHCOPY ESTABLISH
PARAMETERS EXTENTS, XTNTLST AND XXTNTLST ARE MUTUALLY EXCLUSIVE

Explanation: A FlashCopy Establish request included EXTENTS and XTNTLST, EXTENTS and XXTNTLST, or XTNTLST and XXTNTLST keywords. Only one of these keywords can be specified at a time in a command.

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: Use the FlashCopy query request to determine the status of the source and target devices. After the FlashCopy Version 1 request has completed for the indicated device, resubmit the request.

ANTF0402E  FLASHCOPY ESTABLISH
PARAMETERS EXTENTS AND MODE(NOCOPY2COPY) ARE MUTUALLY EXCLUSIVE

Explanation: The FlashCopy Establish request was issued with MODE(NOCOPY2COPY) and EXTENTS. EXTENTS is not allowed with MODE(NOCOPY2COPY).

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: If MODE(NOCOPY2COPY) is specified in the FlashCopy Establish request, insure the EXTENTS is omitted. After making any changes or corrections, resubmit the FlashCopy Establish request.

ANTF0403E  FLASHCOPY ESTABLISH
PARAMETERS parameter1 AND parameter2 ARE MUTUALLY EXCLUSIVE

Explanation: The FCESTABL request was issued with mutually exclusive parameters, parameter1 and parameter2. Specifying these parameters on the same request is not allowed.

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: See z/OS DFSMS Advanced Copy Services for proper TSO syntax for the FCESTABL command. After making any changes or corrections, resubmit the request.

ANTF0404E  FLASHCOPY WITHDRAW
PARAMETERS parameter1 AND parameter2 ARE MUTUALLY EXCLUSIVE

Explanation: The FCWITHDR request was issued with mutually exclusive parameters, parameter1 and parameter2. Specifying these parameters on the same request is not allowed.

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: See z/OS DFSMS Advanced Copy Services for proper TSO syntax for the FCWITHDR command. After making any changes or corrections, resubmit the request.

ANTF0405E  FLASHCOPY WITHDRAW
parameter parm PARAMETER NOT SUPPORTED FOR DEVICE devn

Explanation: A FlashCopy withdraw request specified the parameter parm, but the parameter is not supported for the device devn.

Source: ESS FlashCopy.

System action: The request is rejected.

System programmer response: Issue the FlashCopy query request to determine the status of the device. The device can not be associated with an ESS storage subsystem that supports the parameter. See z/OS DFSMS Advanced Copy Services to determine parameters which can be specified on the request. Modify the request appropriately, resubmit the request.

ANTF0406E  FLASHCOPY WITHDRAW
PARAMETERS ARE MISSING OR INCONSISTENT

Explanation: A FlashCopy withdraw request specified parameters that conflict with other parameters, or the required parameters are missing. The following list contains all the sets of parameters that are valid with the FlashCopy withdraw request. Related parameters are listed first, with optional parameters in brackets following the related parameters.

For FlashCopy Version 1 devices, the parameters are:
- SDEVN, TDEVN (cannot be the same device)
For FlashCopy Version 2 devices, the optional parameters are:

- SDEVN, TDEVN [XTNTLST, DDSW(NO)] (can be the same device with XTNTLST)
- SDEVN, DDSW(YES) [XTNTLST, TDEVN] (TDEVN is ignored if specified)
- TDEVN [XTNTLST, DDSW(NO)]

Any other combination will cause the FlashCopy withdraw request to fail with this error message.

**Source:** ESS FlashCopy.

**System action:** The request is rejected.

**System programmer response:** Modify the request to ensure all the parameters specified on the FlashCopy withdraw request are consistent as described above. After any changes or corrections, resubmit the request.

---

**Explanation:** A FlashCopy establish request failed. The size or format of the source device `srcdev` is not compatible with the track size or format of the target device `tgtdev`, or the volume capacity of target device `tgtdev` is not equal to or greater than the source device `srcdev`.

- `srcdev` can be:
  - z/OS device number
  - `Serial_number-lss-cca` of the CKD secondary of a PPRC pair and source in the FlashCopy remote request
  - `Serial_number-lss-lun` of a Fixed Block device in an OPEN device request
- `tgtdev` can be:
  - z/OS device number
  - `Serial_number-lss-cca` of the CKD target of the FlashCopy remote request
  - `Serial_number-lss-lun` of a Fixed Block target device in the FlashCopy OPEN request

**Source:** ESS FlashCopy.

**System action:** The request is rejected.

**System programmer response:** Reduce the number of source extents specified for the FCESTABL or FCWITHDR TSO command. After making any changes or corrections, reissue the FlashCopy command.

---

**Explanation:** A FlashCopy request `reqtype` is invalid. For a FlashCopy establish or withdraw request, if you do not specify the source and target extents on the request, the default is to process all source device tracks. However, this message was issued because you provided identical source and target device numbers on the request, and you did not meet the following conditions:

- For the FlashCopy establish request, the XTNTLST parameter must be specified.
- For the FlashCopy withdraw request, one of the following conditions must be met:
  - The XTNTLST parameter must be specified.
  - The DDSW(YES) parameter must be specified (with or without the XTNTLST parameter).

**Source:** ESS FlashCopy.

**System action:** The request is rejected.

**System programmer response:** Modify the request to either satisfy the conditions that allow the source and target device numbers to be the same, or change the source and target numbers to be different. Resubmit the request.

---

**Explanation:** A FlashCopy Establish request failed for a device specified on the request because storage subsystem resources were not available to complete the request.

**Source:** ESS FlashCopy.

**System action:** FlashCopy Establish request not processed.

**System programmer response:** This message is
issued when the storage subsystem determines that resources are not sufficient to complete the Establish request. Use the FlashCopy query request to determine the status of the source and target devices specified on the FlashCopy establish request. See `z/OS DFSMS Advanced Copy Services` for examples of FlashCopy query output. Resubmit the request. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTF0413E FLASHCOPY ESTABLISH SOURCE TRACK IS AN ACTIVE TARGET TRACK**

**Explanation:** A FlashCopy establish request failed because one or more source tracks contained within the extents specified was found to already be a target track in a FlashCopy relationship.

**Source:** ESS FlashCopy.

**System action:** FlashCopy Establish request not processed.

**System programmer response:** Use the FlashCopy query request to determine the status of the source device specified on the FlashCopy establish request. See `z/OS DFSMS Advanced Copy Services` for examples of FlashCopy query output. Resubmit the FlashCopy establish request when the FlashCopy output for the device indicates that the maximum number of active relationships for the device are no longer being used. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTF0414E FLASHCOPY ESTABLISH TARGET TRACK IS AN ACTIVE TARGET TRACK**

**Explanation:** A FlashCopy establish request failed because one or more target tracks contained within the extents specified was found to already be a target track in a FlashCopy relationship. This could be the result of an attempt to issue an establish specifying devices (source and target) already in an existing relationship. For example, an establish with INCREMENTAL(YES) can have been specified, but the full volume relationship was not initially established as an incremental relationship.

**Source:** ESS FlashCopy.

**System action:** FlashCopy Establish request not processed.

**System programmer response:** Use the FlashCopy query request to determine the status of the target device specified on the FlashCopy establish request. See `z/OS DFSMS Advanced Copy Services` for examples of FlashCopy query output. The FlashCopy query output does not provide information about a track basis, but you can be able to make this determination based on the extents you specified on the establish request. This message can also be received in the case of an establish request which is completed by the ESS after missing interrupt handler processing has been initiated. Resubmit the request. If the intention is to use Incremental FlashCopy, then the original relationship must be withdrawn and established with INCREMENTAL(YES). If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
ANTE015E  FLASHCOPY ESTABLISH TARGET TRACK IS AN ACTIVE SOURCE TRACK

Explanation:  A FlashCopy establish request failed because one or more target tracks contained within the extents specified was found to already be a source track in a FlashCopy relationship.

Source:  ESS FlashCopy.

System action: FlashCopy Establish request not processed.

System programmer response: Use the FlashCopy query request to determine the status of the target device specified on the FlashCopy establish request. See z/OS DFSMS Advanced Copy Services for examples of FlashCopy query output. The FlashCopy query output does not provide information about a track basis, but you can be able to make this determination based on the extents you specified on the establish request. Resubmit the request. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTE016E  FLASHCOPY WITHDRAW MAXIMUM DEVICE RELATIONSHIPS ARE ACTIVE

Explanation:  A FlashCopy withdraw request failed because the maximum number of active FlashCopy relationships has been reached for a device specified on the request. The withdraw request caused existing relationships to be split, and as a result, the maximum number of relationships for the device was reached.

Source:  ESS FlashCopy.

System action: FlashCopy withdraw request not completed.

System programmer response: The FlashCopy withdraw request could not be completed successfully, and as a result some of the extents specified on the request can have been withdrawn and some will not have been withdrawn. IBM cannot ensure the integrity of the data copied for the extents that were withdrawn because they can be associated with the extents that could not be withdrawn. You will need to withdraw all extents for the affected device and submit a FlashCopy establish request to reestablish FlashCopy relationships needed. Use the FlashCopy query request to determine the current status of source and target devices specified on the FlashCopy withdraw request. See z/OS DFSMS Advanced Copy Services for examples of FlashCopy query output.

ANTE017E  FLASHCOPY extype1 EXTR errtype2 extnum1 AND exttype2 EXTER extnum2 ON DEVN devn FC=fc

Explanation: The FlashCopy request exttype1 contained an invalid extent specification for device devn.

exttype1 and exttype2 indicate the extent type of SOURCE or TARGET.

extnum1 and extnum2 indicate the position number of the extent in error as specified on the request. An extent consists of the beginning track and ending track identifiers specified on the request (also called an extent range). For example, the first source extent specified on the request will have the position number of ‘1’, the second source extent specified will have the position number of ‘2’, etc. The first target extent specified on the request will have the position number of ‘1’, the second target extent specified will have the position number of ‘2’, and so forth.

The device number devn indicated in this message will reference the source device number specified on the request unless the invalid extent specified was only found on the target device, in which case devn will indicate the target device number, or dashes (––) if a device number is not available. If the invalid extent specification is found on a single device, either source or target device, exttype2 and extnum2 will contain dashes (––).

The following function codes (fc) indicate the particular invalid specification that was found for the extent or extents:

01 You already specified this extent as a source extent for this request. You have already specified an extent range which includes this extent.

02 You already specified this extent as a target extent for this request. You have already specified an extent range which includes this extent.

03 The extent specification is not 8 characters long.

04 The extent specification contains non-hexadecimal characters.

05 The extent specification is incomplete. Both beginning and ending track identifiers must be specified for an extent.

06 The extent specification is beyond the range of the device.

07 The extent specification is beyond the range of the number of tracks per cylinder.

08 The beginning track identifier is greater than the ending track identifier for the extent.

09 The number of source and target tracks is not equal for the specified extents.

10 The number of source and target extents is not equal.

Source:  ESS FlashCopy.

System action: FlashCopy request not processed.

System programmer response: Make the appropriate changes to the specified request, and resubmit the request. Use the FlashCopy query request to determine...
the current status of the device. See $z/OS DFSMS Advanced Copy Services$ for examples of FlashCopy query output. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTF0418E** FLASHCOPY retype KEYWORD FUNCTION NOT AVAILABLE FOR DEVN devn

**Explanation:** The FlashCopy request retype contained an invalid keyword keyword which is not supported for device number devn.

**Source:** ESS FlashCopy.

**System action:** FlashCopy request not processed.

**System programmer response:** See $z/OS DFSMS Advanced Copy Services$ for requirements needed for the request. The problem could be that the device is associated with a storage subsystem that does not support the function needed by the specified keyword. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTF0419E** FLASHCOPY retype FULL VOLUME SOURCE devn1 LARGER THAN TARGET devn2

**Explanation:** The full volume FlashCopy request retype specified a source device devn1 containing more tracks than the target device devn2. devn1 can be:

- z/OS device number
- Serial_number-lss-cca of the CKD secondary of a PPRC pair and source in the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block device in an OPEN device request

devn2 can be:

- z/OS device number
- Serial_number-lss-cca of the CKD target of the FlashCopy remote request
- Serial_number-lss-lun of a Fixed Block target device in the FlashCopy OPEN request

**Source:** ESS FlashCopy.

**System action:** FlashCopy request not processed.

**System programmer response:** For full volume FlashCopy requests, you must ensure that the number of tracks on the target device is equal to or greater than the number of tracks on the source device. See $z/OS DFSMS Advanced Copy Services$ for additional requirements needed for the request. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**ANTF0420I** FCQUERY FORMATTED VERSION - n

**Explanation:** An FCQUERY request was issued for formatted information. This is a block message showing FlashCopy information for an ESS subsystem which supports advanced FlashCopy features.

The first line of this report is a control line which consists of the following information:

- timestamp job_number ANTFS0420 FCQUERY FORMATTED VERSION - n connect_message_number C

**Note:** The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second line is the header line of this report, and consists of the following header:

```
DEVN SSID LSS CCA CU SERIAL ACT MAX XC PC CC RV SEQNUM
```

The data under this second line represents the following information:

- devn is the DEVN (device name) specified on the FlashCopy query request.
- ssid is the subsystem ID for the device.
- lss is logical subsystem number.
- cca is the subsystem device address.
- cu is the subsystem type number.
- serial is the subsystem serial number.
- act is the current number of FlashCopy relationships that the device has. This value is indicated in decimal format.
- max is the maximum number of FlashCopy relationships that the device can have. This value is indicated in decimal format.
- xc is either ‘S’ indicating that the device is an XRC source volume, or is ‘N’ indicating that the device is not an XRC source volume.
- pc is either ‘P’ indicating that the device is a PPRC primary volume, is ‘S’ indicating that the device is a PPRC secondary volume, or is ‘N’ for neither.
- cc is either ‘S’ indicating that the device is a concurrent copy source volume, or is ‘N’ indicating that the device is not a concurrent copy source volume.
- rv is either ‘Y’ indicating that the FlashCopy relationship is in a revertible state, or is ‘N’ indicating that the FlashCopy relationship is not in a revertible state.
- seqnum is the FlashCopy sequence number. The rv and seqnum values are used to determine required recovery action when the volume is in a Global Mirror session.

**Source:** ESS FlashCopy.

**System action:** None.
System programmer response: See Advanced Copy Services for examples of FlashCopy query output.

**ANTF0421I** FCQUERY Relationship 1

**Explanation:** An FCQUERY TSO command was issued with the SHOWRELS keyword, requesting FlashCopy relationship table information.

The first line of this report is a control line that consists of the following:

```
timestamp job_number ANTF0421I FCQUERY
Relationship - I connect_message_number C
```

**Note:** The `connect_message_number` is written to SYSLOG only. The `C` is written to the console only.

The formatted display is:

```
DEVN SSID LSS CCA CU SERIAL ACT MAX XC PC
  CC RV SE SEQUNUM
devn ssid lss ca cuty serialnumber act max xc pc
  cc rv se sequence
RELATIONSHIP DETAIL STARTING TRACK: aaaaaaa
DEVICE LONG BUSY FOR CG: bbb WRITE INHIBITED: ccc
```

```
PARTNER SOURCE TARGET S F C C P T S F P
  LSS CCA SSID START START 0 V O A R R W E S M
```

```
dd ee ffff ggggggg hhhhhhh i j k l m n o p q r
  NO. OF TRACKS: sssssssss
  TRACKS TO COPY: tttttttttt
  ESTABL: yyyy/mm/dd hh:mm:ss
  LAST INCR: yyyy/mm/dd hh:mm:ss
```

The information displayed is as follows:

- `devn` is the DEVN (device name) specified on the FlashCopy query request.
- `ssid` is the subsystem ID for the device.
- `lss` is logical subsystem number.
- `ca` is the subsystem device address.
- `cuty` is the subsystem type number.
- `serialnumber` is the subsystem serial number.
- `act` is the current number of FlashCopy relationships that the device has. This value is indicated in decimal format.
- `max` is the maximum number of FlashCopy relationships that the device can have. This value is indicated in decimal format.
- `xc` is one of the following values:
  - `S` Indicates that the device is an XRC source volume.
  - `N` Indicates that the device is not an XRC source volume.
- `pc` is one of the following values:
  - `P` Indicates that the device is a PPRC primary volume.

**YES** Indicates that the device is in a long busy state because of a FlashCopy Establish command being issued with ACTION(FREEZE) for consistency group processing and that the FlashCopy Withdraw command with ACTION(THAW) has not yet been issued to the LSS.

**NO** Indicates that the device is not in a long busy because of FlashCopy consistency group processing.

- `ccc` is one of the following values:
  - `YES` Indicates that the device is write&hyphen;inhibited because it is a source of a space efficient FlashCopy relationship and the repository the target is associated with is out of space.
  - `NO` Indicates that the device is not write&hyphen;inhibited because of a space efficient repository out of space condition.

- `dd` is partner LSS for the relationship. If this is a source relationship, the partner LSS is LSS where the target of the relationship resides. If this is a target relationship, the partner LSS is LSS where the source of the relationship resides.

- `ee` is partner device (CCA or LUN) address for the relationship. If this is a source relationship, the partner CCA is the CCA or LUN for the target device of the relationship. If this is a target relationship, the partner CCA is the CCA or LUN for the source device of the relationship.

**S** Indicates that the device is a PPRC secondary volume.

**N** Indicates the device is not a PPRC volume.

- `cc` is one of the following values:
  - `S` Indicates that the device is a concurrent copy source volume.
  - `N` Indicates that the device is not a concurrent copy source volume.

- `rv` is one of the following values:
  - `Y` Indicates that the FlashCopy relationship is in a revertible state.
  - `N` Indicates that the FlashCopy relationship is not in a revertible state.

- `sequence` is the FlashCopy sequence number. The `rv` and `sequence` values are used to determine required recovery action when the volume is in a Global Mirror session.

- `aaaaaaa` is starting track address for the query, as specified in the STARTADDR keyword of the query command, or 00000000 if the STARTADDR keyword was omitted.

- `bbb` is one of the following values:
  - `YES` Indicates that the device is in a long busy state because of a FlashCopy Establish command being issued with ACTION(FREEZE) for consistency group processing and that the FlashCopy Withdraw command with ACTION(THAW) has not yet been issued to the LSS.
  - `NO` Indicates that the device is not in a long busy because of FlashCopy consistency group processing.

- `ccc` is one of the following values:
  - `YES` Indicates that the device is write&hyphen;inhibited because it is a source of a space efficient FlashCopy relationship and the repository the target is associated with is out of space.
  - `NO` Indicates that the device is not write&hyphen;inhibited because of a space efficient repository out of space condition.

- `dd` is partner LSS for the relationship. If this is a source relationship, the partner LSS is LSS where the target of the relationship resides. If this is a target relationship, the partner LSS is LSS where the source of the relationship resides.

- `ee` is partner device (CCA or LUN) address for the relationship. If this is a source relationship, the partner CCA is the CCA or LUN for the target device of the relationship. If this is a target relationship, the partner CCA is the CCA or LUN for the source device of the relationship.

- `fff` is the subsystem ID for the LSS of the partner device in the relationship. If this is a target reference to a backup.
relationship, this is the SSID for the source device. If this is a source relationship, this is the SSID for the target device.

- **gggggggg** is starting track address for the relationship on the source.
- **hhhhhhhh** is starting track address for the relationship on the target.
- **i** is one of the following values:
  - **Y**: Indicates that this is a source relationship.
  - **N**: Indicates that this is a target relationship.
- **j** is one of the following values:
  - **Y**: Indicates that this is a full volume relationship.
  - **N**: Indicates that this is not a full volume relationship.
- **k** is one of the following values:
  - **Y**: Indicates that this is a COPY relationship.
  - **N**: Indicates that this is a NOCOPY relationship.
- **l** is one of the following values:
  - **Y**: Indicates that the background copy is currently active for this relationship.
  - **N**: Indicates that the background copy is not currently active for this relationship.
- **m** is one of the following values:
  - **Y**: Indicates that this is a persistent relationship.
  - **N**: Indicates this is not a persistent relationship.
- **n** is one of the following values:
  - **Y**: Indicates that change recording is active for this relationship (incremental).
  - **N**: Indicates that change recording is not active for this relationship.
- **o** is one of the following values:
  - **Y**: Indicates that the target of the relationship is writable.
  - **N**: Indicates that the target is write&hyphen;inhibited.
- **p** is one of the following values:
  - **N**: Indicates that the target of this relationship is not a space efficient volume.
  - **F**: Indicates that the target of this relationship is space efficient and the relationship will be failed if the repository becomes full.
  - **I**: Indicates that the target of this relationship is space efficient and the source will become write&hyphen;inhibited if the repository becomes full.
- **q** is one of the following values:
  - **Y**: Indicates that the relationship is currently in a failed state.
  - **N**: Indicates that the relationship is not currently in a failed state.
- **r** represents the Preserve Mirror state of the relationship. **r** one of the following values:
  - **N**: Indicates that the relationship was not established as a Preserve Mirror operation because Preserve Mirror was not requested or Preserve Mirror Preferred was specified but could not be accomplished.
  - **P**: Indicates that the relationship was established as a Preserve Mirror operation because of a Preserve Mirror Preferred request.
  - **R**: Indicates that the relationship was established as a Preserve Mirror operation because of a Preserve Mirror Required request.
  - **S**: Indicates that this is a remote relationship established between two PPRC secondary devices as part of a Preserve Mirror operation or the PM relationship type cannot be determined because of a conflict in the source and/or target PPRC copy status.
- **ssssssssss** is the number of contiguous tracks in this relationship.
- **tttttttttt** is the number of tracks yet to be copied for the relationship.
- **ESTABL** displays control unit time stamp when the relationship was first established.
- **LAST INCR** displays the control unit time stamp when the last increment was taken, if change recording was active, or &osq;N/A&csq; if change recording is not active.

The data for each relationship spans three lines. The second and third lines are indented to differentiate from the start of a new relationship table entry.

If there are no relationships to be displayed, the results of the FCQUERY will display the first 4 lines. Instead of relationship detail information after the first dashed line, the following message will be displayed:

NO RELATIONSHIPS FOUND FOR SPECIFIED DEVICE OR STARTING ADDRESS

Source: ESS FlashCopy.

System action: None.

System programmer response: None.

**Explanation:** An FCQUERY request was issued for unformatted information. This is a block message showing FlashCopy information for an ESS subsystem.
that supports advanced FlashCopy features.

The first line of this message consists of the following message:

timestamp job_number ANTF0425I FCQUERY UNFORMATTED VERSION - n
connect_message_number C

Note: The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second line consists of the following information:
devn,ssid,lss,cca,cu,serial,act,max,xc,pc,cc

Where:
- devn is the DEVN (device name) specified on the FlashCopy query request. This field will be reported as REMT if the request was issued with REMOTE(YES), and will be reported as OPEN if the request was issued with OPENDVCS(YES).
- ssid is the subsystem ID for the device.
- lss is logical subsystem number.
- cca is the subsystem device address.
- cu is the subsystem type number.
- serial is the subsystem serial number.
- act is the current number of FlashCopy relationships that the device has. This value is indicated in decimal format.
- max is the maximum number of FlashCopy relationships that the device can have. This value is indicated in decimal format.
- xc is an 'S' indicating that the device is an XRC source volume, 'N' indicating that the device is not an XRC source volume, or '-' if the volume is a fixed block device.
- pc is 'P' indicating that the device is a PPRC primary volume, 'S' indicating that the device is an PPRC secondary volume, 'N' for neither, or '-' if the volume is a fixed block device.
- cc is 'S' indicating that the device is a concurrent copy source volume, 'N' indicating that the device is not a concurrent copy source volume, or '-' if the volume is a fixed block device.

Source: ESS FlashCopy.

System action: None.

System programmer response: Use the PPRC QUERY request (CQUERY or PQUERY) to determine the status of the DEVN device. Ensure that the DEVN device is a PPRC Primary device, and the PPRC QUERY Secondary device information matches the FlashCopy Establish REMOTE SOURCE device information. Verify that the FlashCopy SOURCE and TARGET devices are correctly specified. Resubmit the corrected FlashCopy Establish request.

ANTF0431E FLASHCOPY ESTABLISH REMOTE SOURCE DEVICE NOT PPRC SECONDARY

Explanation: The FlashCopy Establish request was issued with the REMOTE(YES) keyword. The REMOTE FlashCopy SOURCE device is not the PPRC Secondary volume for the PPRC Primary DEVN device. The FlashCopy Establish DEVN device must be the PPRC Primary volume paired with the PPRC Secondary volume specified as the REMOTE FlashCopy SOURCE device. Any one of the following conditions can cause this error:
- The Source serial is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.
- The Source lss is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.
- The Source cca/lun is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.
- The Source cca specified is an alias.
- If the Source device is a CKD device, the SSID ssid is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.

Source: ESS FlashCopy.

System action: The command is rejected.

System programmer response: Use the PPRC QUERY request (CQUERY or PQUERY) to determine the status of the DEVN device. If the DEVN device is a PPRC Primary volume, ensure that the PPRC Secondary device information is the same as the REMOTE FlashCopy SOURCE device information. Resubmit the corrected FlashCopy Establish request.

ANTF0432E FLASHCOPY ESTABLISH REMOTE OR OPEN TARGET DEVICE NOT IN SAME SUBSYSTEM AS SOURCE DEVICE

Explanation: The FlashCopy Establish request was issued with the REMOTE(YES) or OPENDVCS(YES)
keyword. The REMOTE or OPEN FlashCopy SOURCE device subsystem serial is not the same as the TARGET device subsystem serial. The FlashCopy Establish request REMOTE or OPEN SOURCE device must be in the same subsystem as the TARGET device.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy REMOTE or OPEN SOURCE device subsystem serial is the same as the FlashCopy REMOTE or OPEN TARGET device subsystem serial. Resubmit the corrected FlashCopy Establish request.

ANTF0433E  FLASHCOPY ESTABLISH DEVN NOT ALLOWED WITH SDEVN OR TDEVN

Explanation: The FlashCopy Establish request was issued with the DEVN keyword. The SDEVN or TDEVN keyword, or both, have also been entered in the same request. DEVN cannot be specified if the SDEVN or TDEVN keywords are specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Establish request does not contain the DEVN keyword in combination with the SDEVN/TDEVN keywords. Resubmit the corrected FlashCopy Establish request.

ANTF0434E  FLASHCOPY ESTABLISH DEVN SPECIFIED WITHOUT REMOTE OR OPENDVCS

Explanation: The FlashCopy Establish request was issued with the DEVN keyword. The REMOTE(YES) or OPENDVCS(YES) keyword was not specified. The DEVN keyword requires the REMOTE(YES) keyword or the OPENDVCS(YES) keyword to be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure that when the FlashCopy establish request specifies the DEVN keyword, the REMOTE(YES) or OPENDVCS(YES) keyword is specified. After making any changes or corrections, resubmit the FlashCopy establish request.

ANTF0435E  FLASHCOPY ESTABLISH MISSING KEYWORD DEVN WITH REMOTE OR OPENDVCS

Explanation: The FlashCopy Establish request was issued with the REMOTE(YES) or OPENDVCS(YES) keyword specified, but the DEVN keyword was not specified. If the REMOTE(YES) or OPENDVCS(YES) keyword is specified, the DEVN keyword is also required, with the DEVN related keywords.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Establish request specifies the

ANTF0436E  FLASHCOPY ESTABLISH MISSING KEYWORD SSID WITH REMOTE

Explanation: The FlashCopy Establish request was issued with the REMOTE(YES) keyword. When a FlashCopy Establish of REMOTE devices is required, the SSID for the SOURCE device must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Establish request containing the DEVN keyword also specifies the SOURCE and TARGET keywords. Resubmit the corrected FlashCopy Establish request.

ANTF0437E  FLASHCOPY ESTABLISH MISSING KEYWORD SSID WITH REMOTE

Explanation: The FlashCopy Establish request was issued with the SSID keyword but the REMOTE(YES) keyword was omitted. The SSID keyword can only be specified with the REMOTE(YES) keyword. If a FlashCopy Establish of REMOTE devices is required, both the REMOTE(YES) and SSID keywords must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Establish request specifies the
REMOTE(YES) keyword and the SSID keyword with the ssid of the SOURCE device if a FlashCopy Establish of REMOTE CKD devices is required. Resubmit the corrected FlashCopy Establish request.

**ANTF0439E**  FLASHCOPY ESTABLISH REMOTE AND SSID SPECIFIED WITH OPENDVCS(YES)

**Explanation:** The FlashCopy Establish request was issued with the REMOTE(YES) and SSID keywords. The OPENDVCS(YES) keyword was also specified. The REMOTE(YES) and SSID keywords indicate the FlashCopy Establish is for remote CKD devices. The OPENDVCS(YES) keyword indicates that the FlashCopy Establish is for remote Open System Devices. The specified keywords are mutually exclusive.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Ensure that the FlashCopy Establish request specifies the REMOTE(YES) and SSID keywords if a FlashCopy Establish of REMOTE CKD devices is required. The SSID keyword cannot be specified in FlashCopy Establish requests for remote Open System devices. Resubmit the corrected FlashCopy Establish request.

**ANTF0440E**  FLASHCOPY ESTABLISH REMOTE UNABLE TO COMMUNICATE TO SECONDARY SUBSYSTEM

**Explanation:** The FlashCopy Establish request was issued with the REMOTE(YES) keyword. When the request was sent to the Secondary subsystem, an error occurred. Any one of the following conditions, or other conditions, can cause this error.

- The PPRC paths from the Primary subsystem to the Secondary subsystem are inoperative.
- The Primary or Secondary subsystem communication adapters are failing.
- The Secondary subsystem cannot respond to the Primary subsystem.
- The Secondary subsystem has hardware or microcode conditions that prevent communication with the Primary subsystem.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Use the PPRC Query command to determine the status of the DEVN device. If the DEVN device is a PPRC Primary volume, make sure that the PPRC Secondary device information is the same as the REMOTE or OPEN FlashCopy SOURCE device information. Resubmit the corrected FlashCopy Establish request.

**ANTF0441E**  FLASHCOPY ESTABLISH REMOTE OR OPEN TARGET DEVICE INVALID

**Explanation:** The FlashCopy Establish request was issued with the REMOTE(YES) OR OPENDVCS(YES) keyword. The REMOTE OR OPEN FlashCopy TARGET device cannot be used as the FlashCopy target. An error occurred while attempting to access the REMOTE OR OPEN target device. Any one of the following conditions can cause this error.

- The target serial number is not the same as the PPRC Secondary device serial number.
- The target lss is not valid for the PPRC Secondary subsystem
- The target cca or lun is not valid for the PPRC Secondary subsystem
- If the target device is a CKD device, the SSID ssid is not the same as the PPRC Secondary device ssid.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Use the PPRC Query command to determine the status of the DEVN device. If the DEVN device is a PPRC Primary volume, make sure that the PPRC Secondary device information is the same as the REMOTE or OPEN FlashCopy SOURCE device information. Resubmit the corrected FlashCopy Establish request.

**ANTF0442E**  FLASHCOPY ESTABLISH INCREMENTAL MODE MUST BE COPY

**Explanation:** The FlashCopy Establish request was issued with the INCREMENTAL(YES) keyword. The MODE parameter must be COPY. Any other MODE parameter is invalid.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** If INCREMENTAL(YES) is specified in the FlashCopy Establish request, ensure that the MODE keyword has the COPY parameter specified. Resubmit the corrected FlashCopy Establish request.

**ANTF0443E**  FLASHCOPY ESTABLISH EXTENTS, XTNTLST OR XXTNTLST INVALID WITH REMOTE, OPENDVCS, OR INCREMENTAL

**Explanation:** The FlashCopy Establish request was issued with the REMOTE(YES), INCREMENTAL(YES), or OPENDVCS(YES) keyword. When one of these keywords is specified, the FlashCopy Establish applies to the entire volume. Extent specifications with the FlashCopy Establish REMOTE(YES), INCREMENTAL(YES), or OPENDVCS(YES) are not allowed.
ANTF0444E • ANTF0449E

Source: ESS FlashCopy

System action: The request is rejected.

System programmer response: If REMOTE(YES), OPENDVCS(YES), or INCREMENTAL(YES) is specified in the FlashCopy Establish request, ensure the EXTENTS, XTNTLST and XXTNTLST keywords are omitted. After making any changes or corrections, resubmit the FlashCopy Establish request.

ANTF0444E FLASHCOPY ESTABLISH OPEN SOURCE DEVICE SERIAL DOES NOT MATCH DEVN SERIAL

Explanation: The FlashCopy Establish request was issued with the OPENDVCS(YES) keyword. The OPEN FlashCopy SOURCE device subsystem serial is not the same as the access device (DEVN) subsystem serial. The FlashCopy Establish request OPEN SOURCE device must be in the same subsystem as the DEVN device.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure the FlashCopy OPEN SOURCE device subsystem serial is the same as the access device specified by DEVN subsystem serial. After making any changes or corrections, resubmit the FlashCopy Establish request.

ANTF0445E FLASHCOPY ESTABLISH TARGET IS CKD OR IN AN INVALID STATE

Explanation: A FlashCopy establish request failed because OPENDVCS(YES) was specified and the target device was found to be in an invalid state. The invalid state could be:
- The device is in a "not ready" state
- The device is a CKD device
- The device is not configured or not installed

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Verify the target device information was specified. Either correct the specified target device information, or ensure the target device is in a ready state. Resubmit the request. If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTF0449E FLASHCOPY ESTABLISH SOURCE devn CHANGE RECORDING MECHANISM ALREADY ACTIVE

Explanation: A FlashCopy establish request was issued with the INCREMENTAL(YES) keyword. The change recording mechanism is already active for the specified source device. This might be because the specified source is a PPRC primary device established with the INCRESYNC(START) keyword.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: If INCREMENTAL(YES) is required for the relationship and the device is a PPRC primary device, issue a PPRC establish pair command with the INCRESYNC(STOP) keyword and reissue the FlashCopy Establish command. If INCREMENTAL(YES) is not required, reissue the request without INCREMENTAL(YES) or with INCREMENTAL(NO).
Explanation: Use the FlashCopy query request to determine the status of the source device specified on the FlashCopy establish request. See z/OS DFSMS Advanced Copy Services for examples of FlashCopy query output. If the intention is to use incremental FlashCopy, the original relationship must be withdrawn, then established with INCREMENTAL(YES). If the request continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Query request specifies a PPRC Primary volume as the DEVN device. Use the FlashCopy Query request without the REMOTE(YES) keyword, or use the PPRC Query request to verify the status of the DEVN device. Resubmit the corrected FlashCopy Query request.

Explanation: The FlashCopy Query request was issued with the REMOTE(YES) keyword specified but the QRYSSID keyword was not specified. When the REMOTE(YES) keyword is specified, the QRYDVC keyword and parameters must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Query request specifies the QRYSSID keyword when a FlashCopy Query of a REMOTE CKD device is required. The QRYSSID must specify the ssid of the QRYDVC device. After making any changes or corrections, resubmit the FlashCopy Query request.

Explanation: The FlashCopy Query request was issued with the QRYSSID specified but the REMOTE(YES) keyword was omitted. If a FlashCopy Query of a REMOTE CKD device is required, both the REMOTE(YES) keyword and the QRYSSID keyword must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Query request specifies the REMOTE(YES) keyword and the QRYSSID keyword when a FlashCopy Query of a REMOTE CKD device is required. The QRYSSID must not be specified if the request is for REMOTE CKD devices.

Explanation: The FlashCopy Query request was issued with the QRYSSID keyword specified but the REMOTE(YES) and OPENDVCS(YES) keywords were specified. The specified keywords are mutually exclusive.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure the FlashCopy Query request specifies the REMOTE(YES) keyword or the OPENDVCS(YES) keyword, but not both.
Open System devices. After making any changes or corrections, resubmit the FlashCopy Query request.

**Explanation:** The FlashCopy Query request was issued with the REMOTE(YES) keyword. When the request was sent to the Secondary subsystem, an error occurred. Any one of the following conditions, or other conditions, can cause this error:

- The PPRC paths from the Primary subsystem to the Secondary subsystem are inoperative.
- The Primary or Secondary subsystem communication adapters are failing.
- The Secondary subsystem cannot respond to the Primary subsystem.
- The Secondary subsystem has hardware or microcode conditions that prevent communication with the Primary subsystem.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Ensure that the PPRC Secondary subsystem is functioning normally. Ensure that the REMOTE (PPRC Secondary) subsystem is communicating with the PPRC Primary subsystem. If not, correct the communications problems between the Primary and Secondary subsystems. The PPRC Query and Establish Paths commands can be used to restore communications. Resubmit the corrected FlashCopy Query REMOTE request.

**Explanation:** The FlashCopy Query request was issued with the OPENDVCS(YES) keyword. The OPEN FlashCopy QRYDVC device subsystem serial is not the same as the access device (DEVN) subsystem serial. The FlashCopy Query QRYDVC device must be in the same subsystem as the DEVN device.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Make sure the FlashCopy OPEN QRYDVC device subsystem serial is the same as the access device specified by DEVN subsystem serial. After making any changes or corrections, resubmit the FlashCopy Query request.

**Explanation:** The FlashCopy Query request was issued with the REMOTE(YES) keyword. The REMOTE FlashCopy QRYDVC device is not the PPRC Secondary volume for the PPRC Primary DEVN device. The FlashCopy Query DEVN device must be the PPRC Primary volume paired with the PPRC Secondary volume specified as the REMOTE FlashCopy QRYDVC device. Any one of the following conditions can cause this error:

- The query device serial is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.
- The query device lss is not the same as the PPRC Secondary device for the DEVN PPRC Primary device.
- The query device cca/lun is not the same as the PPRC Secondary device.
- If the query device is a CKD device, the SSID ssid is not the same as the PPRC Secondary device ssid.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Use the PPRC CQUERY command to determine the status of the DEVN device. If the DEVN device is a PPRC Primary volume, make sure that the PPRC Secondary device information is the same as the REMOTE FlashCopy QRYDVC device information. Resubmit the corrected FlashCopy Query request.

**Explanation:** The FlashCopy Query request was issued with the OPENDVCS(YES) keyword. The OPEN FlashCopy QRYDVC device subsystem serial is not the same as the access device (DEVN) subsystem serial. The FlashCopy Query QRYDVC device must be in the same subsystem as the DEVN device.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Ensure that the FlashCopy OPEN QRYDVC device subsystem serial is the same as the access device specified by DEVN subsystem serial. After making any changes or corrections, resubmit the FlashCopy Query request.
Explanation: The FlashCopy Withdraw request was issued with the REMOTE(YES) keyword, but the DEVN device devn is not a PPRC Primary volume in an active PPRC pair.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Use the PPRC QUERY request (CQUERY or PQUERY) to determine the status of the DEVN device. Ensure that the DEVN device is a PPRC Primary device, and the PPRC QUERY Secondary device information matches the FlashCopy Withdraw REMOTE SOURCE device information. Verify that the FlashCopy SOURCE and TARGET devices are correctly specified. Resubmit the corrected FlashCopy Withdraw request.

Explanation: The FlashCopy Withdraw request was issued with the REMOTE(YES) or OPENDVCS(YES) keyword. The REMOTE or OPEN FlashCopy SOURCE device subsystem serial is not the same as the TARGET device subsystem serial. The FlashCopy Withdraw request SOURCE device must be in the same REMOTE or OPEN subsystem as the TARGET device.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure the FlashCopy REMOTE or OPEN SOURCE device serial is the same as the FlashCopy REMOTE or OPEN TARGET device serial. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

Explanation: The FlashCopy Withdraw request specified the DEVN keyword. The SDEVN or TDEVN keyword, or both, have also been entered in the same request. DEVN cannot be specified if the SDEVN or TDEVN keywords are specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Withdraw request does not contain the DEVN keyword in combination with the SDEVN/TDEVN keywords. Resubmit the corrected FlashCopy Withdraw request.

Explanation: The FlashCopy Withdraw request specified the DEVN keyword. The REMOTE(YES), OPENDVCS(YES), or ACTION(THAW) keyword was not specified. The DEVN keyword requires the REMOTE(YES), OPENDVCS(YES), or ACTION(THAW) keyword to be specified.

The FlashCopy Withdraw request specified the DEVN keyword. The REMOTE(YES), OPENDVCS(YES), or ACTION(THAW) keyword was not specified. The DEVN keyword requires the REMOTE(YES), OPENDVCS(YES), or ACTION(THAW) keyword to be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure the FlashCopy Withdraw request specifies the
REMOTE(YES) or OPENDVCS(YES) keyword when the DEVN keyword is specified. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

Make sure the FlashCopy Withdraw request specifies the REMOTE(YES), OPENDVCS(YES), or ACTION(THAW) keyword when the DEVN keyword is specified. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

ANTF0465E  FLASHCOPY WITHDRAW MISSING KEYWORD DEVN WITH REMOTE OR OPENDVCS

Explanation: The FlashCopy Withdraw request was issued with the REMOTE(YES) or the OPENDVCS(YES) keyword specified, but the DEVN keyword was not specified. When the REMOTE(YES) or the OPENDVCS(YES) keyword is specified, the DEVN keyword and its related keywords must be specified.

Source: ESS FlashCopy

System programmer response: Make sure that when the FlashCopy Withdraw request specifies the REMOTE(YES) or OPENDVCS(YES) keyword, the DEVN keyword is also specified. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

ANTF0466E  FLASHCOPY WITHDRAW DEVN SPECIFIED BUT SOURCE OR TARGET KEYWORDS ARE MISSING

Explanation: The FlashCopy Withdraw request was issued with the DEVN keyword. The SOURCE or TARGET keyword, or both, were not specified. The DEVN keyword requires that both the SOURCE and TARGET keywords also be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Withdraw request specifies the REMOTE(YES) keyword and the SSID keyword if a FlashCopy Withdraw of REMOTE CKD devices is required. Resubmit the corrected FlashCopy Withdraw request.

ANTF0467E  FLASHCOPY WITHDRAW REMOTE SPECIFIED BUT SSID MISSING

Explanation: The FlashCopy Withdraw request was issued with the REMOTE(YES) keyword. When a FlashCopy Withdraw of REMOTE CKD devices is required, the SSID for the SOURCE device must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Withdraw request specifies the SSID keyword with the ssid of the SOURCE device if a FlashCopy Withdraw of REMOTE CKD devices is required. Resubmit the corrected FlashCopy Withdraw request.

ANTF0468E  FLASHCOPY WITHDRAW SSID SPECIFIED BUT REMOTE MISSING

Explanation: The FlashCopy Withdraw request was issued with the SSID keyword but the REMOTE(YES) keyword was omitted. If a FlashCopy Withdraw of CKD devices is required, both the REMOTE(YES) and SSID keywords must be specified.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Ensure that the FlashCopy Withdraw request specifies the REMOTE(YES) keyword and the SSID keyword if a FlashCopy Withdraw of REMOTE CKD devices is required. Resubmit the corrected FlashCopy Withdraw request.

ANTF0469E  FLASHCOPY WITHDRAW REMOTE AND SSID SPECIFIED WITH OPENDVCS(YES)

Explanation: The FlashCopy Withdraw request was issued with the REMOTE(YES) and SSID keywords. The OPENDVCS(YES) keyword was also supplied. The REMOTE(YES) and SSID keywords indicate the FlashCopy Withdraw is for remote CKD devices. The OPENDVCS(YES) keyword indicates the FlashCopy Withdraw is for remote Open System devices. The specified keywords are mutually exclusive.

Source: ESS FlashCopy

System action: The command is rejected.

System programmer response: Make sure that when the FlashCopy Withdraw request specifies the REMOTE(YES) keyword and the SSID keyword if a FlashCopy Withdraw of REMOTE CKD devices is required. The SSID keyword must not be specified if the request is for REMOTE Open System devices. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

ANTF0470E  FLASHCOPY WITHDRAW DDSW NOT VALID WITH OPENDVCS

Explanation: The FlashCopy Withdraw request specified the DSSW(YES) keyword. The OPENDVCS(YES) keyword was also supplied. The DSSW(YES) keyword and parameter is not allowed with the OPENDVCS(YES) keyword and parameter.

Source: ESS FlashCopy
ANTF0471E  FLASHCOPY WITHDRAW REMOTE UNABLE TO COMMUNICATE WITH SECONDARY SUBSYSTEM

**Explanation:** The FlashCopy Withdraw request was issued with the REMOTE(YES) keyword. When the request was sent to the Secondary subsystem, an error occurred. Any one of the following conditions, or other conditions, can cause this error.

- The PPRC paths from the Primary subsystem to the Secondary subsystem are inoperative.
- The Primary or Secondary subsystem communication adapters are failing.
- The Secondary subsystem cannot respond to the Primary subsystem.
- The Secondary subsystem has hardware or microcode conditions that prevent communication with the Primary subsystem.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Ensure that the PPRC Secondary subsystem is functioning normally. Ensure that the Remote (PPRC Secondary) subsystem is communicating with the PPRC Primary subsystem. If not, correct the communications problems between the Primary and Secondary subsystems. The PPRC Query and Establish Paths commands can be used to restore communications. Resubmit the corrected FlashCopy Withdraw REMOTE request.

ANTF0473E  FLASHCOPY WITHDRAW EXTENTS, XTNTLST OR XXTNTLST INVALID WITH REMOTE, OPENDVCS, OR INCREMENTAL

**Explanation:** The FlashCopy Withdraw request was issued with the REMOTE(YES), or the INCREMENTAL(YES), or the OPENDVCS(YES) keyword. When one of these keywords is specified, the FlashCopy Withdraw applies to the entire volume. Extent specifications with the FlashCopy Establish EXTENTS, XTNTLST and XXTNTLST keywords are not allowed.

**Source:** ESS FlashCopy

**System action:** The request is rejected.

**System programmer response:** If REMOTE(YES), OPENDVCS(YES), or INCREMENTAL(YES) is specified in the FlashCopy Withdraw request, ensure that the EXTENTS, XTNTLST and XXTNTLST keywords are omitted. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

ANTF0474E  FLASHCOPY WITHDRAW DDSW INVALID WITH REMOTE

**Explanation:** The FlashCopy Withdraw request was issued with the REMOTE(YES) keyword. The DDSW keyword is not allowed with REMOTE(YES).

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** If REMOTE(YES) is specified in the FlashCopy Withdraw request, ensure that the DDSW keyword is omitted. Resubmit the corrected FlashCopy Withdraw request.
**Explanation:** The FlashCopy Withdraw request specified the serial number for the FlashCopy source that does not match the serial number for the device specified in the DEVN parameter. When OPENDVCS(YES) is specified, the access device specified in the DEVN parameter must be in the same cluster as the fixed block source device for the FlashCopy Withdraw.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Check the FlashCopy Withdraw request for a valid combination of Incremental relationship and a full volume extent. After making any changes or corrections, resubmit the FlashCopy Withdraw request.

**Explanation:** The state of an existing FlashCopy relationship does not allow the specified withdraw operation.

**Source:** ESS FlashCopy

**System action:** The request is rejected.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/knowledgecenter/SSWSDQ_2.2.15/com.ibm.zos.v2r12.msgs/zosdfsms.doc) for proper TSO syntax for the FCWITHDR command. After making any changes or corrections, resubmit the request.

**Explanation:** A FCWITHDR command was issued with ACTION(REVERT) or ACTION(COMMIT), but the relationship was not in a revertible state.

**Source:** ESS FlashCopy

**System action:** The request is rejected.

**System programmer response:** After making any changes or corrections, resubmit the request.

**Explanation:** The FlashCopy request specified a source or target device that is offline or not accessible.

**Source:** ESS FlashCopy

**System action:** The command is rejected.

**System programmer response:** Check the devices specified in the FlashCopy request and verify that they are available to the host and to the control unit. After making any changes or corrections, resubmit the FlashCopy request.

**Explanation:** One of the following conditions occurred:

- A FlashCopy Establish command was issued for source device `device-info` without the keyword SETGTOK(FAILREL) or SETGTOK(SWI), and the specified target device is a space efficient volume.
• A FlashCopy Establish command was issued for source device `device-info` with background copy requested (MODE(COPY) or MODE(NOCOPYTOCOPY)) and the specified target device is a space efficient volume.

• A FlashCopy Establish command was issued requesting Preserve Mirror required and that the specified target device is a space-efficient volume.

• A FlashCopy Withdraw command was issued for device `device-info` with DDSW(YES), resulting in an attempt to start a background copy for source relationships and the target device is a space-efficient volume.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship to a space efficient target volume, issue the command again with SETGTOK(FAILREL) or SETGTOK(SWI) specified.

If an establish with MODE(COPY) was specified or implied, issue the command again with MODE(NOCOPY).

If a withdraw with DDSW(YES) was specified. Verify that a withdraw without background copy of the source relationships is acceptable and issue the withdraw with DDSW(NO).

**ANTF0492E** FlashCopy Establish command failed for device `device-info`. Specified target is space efficient and extents specified.

Explanation: A FlashCopy Establish command was issued for source device `device-info` and extents were specified. The target volume is a space efficient volume and either SETGTOK(FAILREL) or SETGTOK(SWI) was also specified. Only full volume relationships can have a space efficient volume as the target.

Source: ESS FlashCopy

System action: FlashCopy Establish command fails.

System programmer response: If the intent is to establish a FlashCopy relationship to a space efficient target volume, issue the command again as a full volume request. If the intent is to establish a FlashCopy relationship with extents, issue the command again with a non space efficient volume as the target devices.

**ANTF0493E** FlashCopy Establish attempted to reverse relationship for device `device-info` and initial copy is incomplete.

Explanation: A FlashCopy Establish command was issued to an existing incremental relationship, reversing the source and target volumes. The initial copy for the original relationship has not completed. The `device-info` is for the specified source volume, which is the original target volume of the relationship.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: Wait until the initial copy completes and reissue the command.

**ANTF0494E** FlashCopy establish failed, source or target is space efficient and repository is out of space or offline.

Explanation: A FlashCopy Establish command was issued with a space efficient volume as either the source or the target. The repository for the space efficient volume is currently out of space or offline, so the establish request cannot be completed.

Source: ESS FlashCopy

System action: FlashCopy Establish command fails.

System programmer response: Space must be made available in the repository for the space efficient volumes. Existing relationships need to be withdrawn, or volumes with too much physical storage consumed need to be initialized to free repository space. When repository space has been made available, or the repository is brought online, issue the FlashCopy Establish request again.

**ANTF0495I** FlashCopy establish failed for device `device`, volume resize is in progress.

Explanation: The FlashCopy Establish command cannot complete because the volume is in the process of being re-sized. Devices are restricted from participating in a copy services relationship when being re-sized.

Source: ESS FlashCopy

System action: FlashCopy Establish command fails.

System programmer response: Wait until the volume resize is completed, and issue the failing command again.

**ANTF0496E** FlashCopy establish command failed for device `device-info`. Preserve Mirror requested, but TGTPPRIM(YES) not specified.

Explanation: A FCESTABL command was entered as either a Preserve Mirror Required or Preserve Mirror Preferred option, but the keyword TGTPPRIM(YES) that indicates the target can be a PPRC primary was not specified.

Source: ESS FlashCopy

System action: FlashCopy command fails.
ANTF0497E • ANTF0502E

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, reissue the command with TGTPPRIM(YES).

ANTF0497E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT THE SOURCE DEVICE IS NOT A PPRC PRIMARY.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, and the specified target device is a PPRC primary device, but the specified primary device is not a PPRC primary device.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

ANTF0498E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT THE REMOTE VOLUMES ARE NOT IN THE SAME SFI.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, but the secondary volume to the specified source volume and the secondary volume to the specified target volume are not in the same Storage Facility Image (SFI).

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

ANTF0499E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT THE SOURCE IS NOT FULL DUPLEX.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, but the PPRC pair of the specified source volume is not in a full duplex state.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

ANTF0500E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT THE TARGET IS NOT FULL DUPLEX.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, but the specified target volume is not in a full duplex state.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

ANTF0501E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT SECONDARY CONTROL UNTIL DOES NOT HAVE THE FEATURE INSTALLED.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, but the secondary control unit does not have the microcode installed that supports IBM Remote Pair FlashCopy (preserve mirror operations).

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

ANTF0502E FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info.
PREVERSE MIRROR REQUIRED SPECIFIED, BUT A MIRRORED RELATIONSHIP ALREADY EXISTS AT THE SECONDARY.

Explanation: A FCESTABL command was entered as a Preserve Mirror Required operation, but the inband FlashCopy command failed at the secondary control unit because a preserve mirror relationship already existed. This can occur when the background copy for a previous (non-persistent) mirrored relationship completed at the local site and the relationship no longer exists; however, the background copy has not yet completed at the remote site, so the relationship still exists.

Source: ESS FlashCopy

System action: FlashCopy command fails.

System programmer response: If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.
operation, correct the configuration issue and reissue the command.

**ANTF0503E** FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info. FLASHCOPY TARGET IS A PPRC PRIMARY DEVICE IN A GLOBAL MIRROR SESSION OR THE TARGET’S SECONDARY IS CASCADED.

**Explanation:** The FCESTABL command entered specified a target device that is either of the following two devices:
- A PPRC-XD primary device in a Global Mirror session
- A PPRC primary device whose secondary is a cascaded PPRC-XD device with PRESMR(REQUIRED) specified

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** The FlashCopy needs to be done to a different target that is not a Global Mirror primary. The target device must be specified, or it must be removed from the Global Mirror session before the FlashCopy Establish is reissued.

**ANTF0504E** FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info. COMMAND ISSUED TO PPRC SECONDARY FOR MIRRORED RELATIONSHIP.

**Explanation:** The FWITHDRW command entered specified a device that is a PPRC secondary device, and the relationship that exists is a mirrored relationship established with PRESMR(REQUIRED) or PRESMR(PREFERRED). The mirrored relationship is not allowed.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** Mirrored relationships can only be withdrawn from the local (or PPRC primary) to the secondary through in-band from the primary control unit.

**ANTF0505E** FLASHCOPY QUERY PARAMETERS parameter1 AND parameter2 ARE MUTUALLY EXCLUSIVE.

**Explanation:** The FCQUERY command entered specified 2 parameters, parameter1 and parameter2, that are mutually exclusive.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** Correct the command syntax and reissue the query.

**ANTF0506E** FLASHCOPY command FAILURE OCCURRED AT REMOTE.

**Explanation:** A Flashcopy Establish or Withdraw with PRESERVEMIRROR(REQ) or PRESERVEMIRROR(PREF). The resulting in-band request to establish or withdraw a relationship between the remote devices encountered an error. A previous message indicates the error that occurred at the remote.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails and in most cases the target PPRC pair will be suspended.

**System programmer response:** See the previous message issue that indicates the cause of the failure at the remote. Correct the command syntax and reissue the command.

**ANTF0507E** FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE device-info. PRESERVE MIRROR REQUIRED SPECIFIED, AND THE TARGET PAIR HAS INCREMENTAL RESYNC ACTIVE OR HAS CASCADED RECOVERY OPERATIONS IN PROGRESS.

**Explanation:** A FCESTABL command was entered as a Preserve Mirror Required operation, but the target PPRC primary device that was specified will not allow the operation to complete because either:
- The target is in the process of a PPRC cascading failover/failback recovery operation or
- The target volume is a PPRC primary device that was established with incremental resync started.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** If the intent is to establish a FlashCopy relationship as a Preserve Mirror operation, correct the configuration issue and reissue the command.

**ANTF0508E** FLASHCOPY WITHDRAW COMMAND FOR DEVICE device-info COMPLETED AT LOCAL BUT UNABLE TO SEND TO REMOTE. EXISTING RELATIONSHIP IS PRESERVE MIRROR.

**Explanation:** A FCWITHDR command was involved an existing Preserve Mirror relationship. The command was completed for the local relationship but could not be sent to the remote.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** If possible, you might
withdraw the remote relationship.

**ANTF0509E**  
FLASHCOPY ESTABLISH COMMAND FAILED FOR DEVICE *device-info*.  
EXISTING INCREMENTAL RELATIONSHIP WAS NOT ESTABLISHED AS A PRESERVE MIRROR RELATIONSHIP.

**Explanation:** The FCESTABL command entered specified an increment was to be taken on an existing incremental relationship with PRESMIR(REQUIRED). The existing relationship is not a preserve mirror relationship, so the remote relationship does not exist, therefore an increment cannot be taken at the remote.

**Source:** ESS FlashCopy

**System action:** FlashCopy command fails.

**System programmer response:** Increments with PRESEMIR(REQUIRED) can only be taken on existing incremental preserve mirror relationships. The existing relationship must be withdrawn and the relationship established as a preserve mirror relationship, or use PRESMIR(PREFERRED).

**ANTF8804I**  
command

**Explanation:** This message indicates that FlashCopy has recorded this TSO command into the system log. The command in the message is the TSO command as entered by the user. Any parameters specified through TSO prompts after the command was entered are not reflected in the command echo. This message can be truncated if it is more than 126 characters in length.

**Source:** FlashCopy.

**System action:** FlashCopy functions are active.

**System programmer response:** No action is required. If you do not want to receive this service message, issue MODIFY ANTAS000,NOSYSLOG ON from the operator console.
PPRC ANT messages

ANTP0001I  command_name COMMAND
  ending_status FOR DEVICE
device_number.  COMPLETION CODE: hh

Explanation: The ending status of the PPRC command is presented. The status is determined by conditions encountered during execution.

command_name
  The name of the PPRC command.

ending_status
  • COMPLETED – The command is successfully completed.
  • UNSUCCESSFUL – An error is encountered. Other messages can contain specific error information. A likely cause of this error is that the command was issued either to the wrong path, or to a device that is not valid. Correct the error and reissue the command.

device_number
  The device number of the volume specified in the PPRC command. This can be:
  • z/OS device number
  • Serial_number-iss-lss-lun of a Fixed Block device in an OPEN device request
  • “” if the device number is missing or incorrectly specified in the command

hh  The highest completion code found during execution.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See z/OS DFSMS Advanced Copy Services for the command syntax rules. Ensure that the missing or incorrect operands are properly entered, the required number of characters are given, and that hex values are in the correct format.

Note: The parsing routines only validate the operands syntactically. The storage control can reject syntactically correct operands if the operands cannot be resolved for the function requested. Also, the hardware can reject commands without identifying the specific failing operand. This condition is covered by the ANTP0200I message.

ANTP0004E  xx ERROR ON LINK linkaddress – linkerror

Explanation: An error was encountered while attempting to establish a PPRC path with the specified link address. The error is described by a two digit error code and corresponding link error text.

xx  linkerror

02  INITIALIZATION FAILED
03  TIMEOUT
04  NO RESOURCES AVAILABLE AT PRIM
05  NO RESOURCES AVAILABLE AT SEC
06  SERIAL# MISMATCH
07  SEC SSID MISMATCH
08  ESCON LINK FAILURE
09  ESTABLISH FAILED
0A  PATH ACTIVE TO HOST
0B  PATH TO SAME CLUSTER
10  CONFIGURATION ERROR
14  FCP LINK DOWN
ANTP0007I

15 FCP RETRY EXCEED
16 FCP SEC ADAPTER NOT PPRC CAPABLE
17 FCP SEC ADAPTER NOT AVAILABLE
18 FCP PRIMARY LOGIN EXCEEDED
19 FCP SECONDARY LOGIN EXCEEDED
1A PRIMARY FIBER CHANNEL NOT CONFIG
1B FIBRE DEGRADED
1C FIBRE REMOVED

Source: Peer to Peer Remote Copy (PPRC).

System action: The specified path is not established. If no other paths were successfully established by this command, and no volume pairs were previously established for the LSS pair, all path definitions associated with the LSS pair will be deleted. Otherwise, for the ESS and similar storage subsystems, the path definition will be retained by the subsystem which can automatically establish the path at a future time when the error condition has been resolved.

System programmer response:

02 INITIALIZATION FAILED
Verify that the physical link, including ESCD ports, is correct for the connection you are attempting. Verify the integrity of the fiber-optic links between the requested source and the destination.

03 TIMEOUT
Verify the physical link at the primary storage control. Determine if non-PPRC system activity has degraded link response times during the establishment time.

04 NO RESOURCES AVAILABLE AT PRIM
Verify that the primary storage control does not already have the maximum number of logical paths already established. Verify the configuration and remove any unnecessary channel paths.

05 NO RESOURCES AVAILABLE AT SEC
Verify that the recovery site storage control does not already have the maximum number of logical paths already established. Verify the configuration and remove any unnecessary channel paths.

06 SERIAL# MISMATCH
Verify the serial number of the recovery site storage control.

07 SEC SSID MISMATCH
Verify that the path is available and is properly defined.

08 ESCON LINK FAILURE
Verify that the ESCON Link is online.

09 ESTABLISH FAILED
0A PATH ACTIVE TO HOST
The system adapter has already established a link to the system server on this path.

0B PATH TO SAME CLUSTER
There is already an established path from this primary cluster to the secondary cluster.

10 CONFIGURATION ERROR
Correct the error for the link address and reissue the command.

14 FCP LINK DOWN
Correct the error for the link address and reissue the command.

15 FCP RETRY EXCEED
Correct the error for the link address and reissue the command.

16 FCP SEC ADAPTER NOT PPRC CAPABLE
Correct the error for the link address and reissue the command.

17 FCP SEC ADAPTER NOT AVAILABLE
Correct the error for the link address and reissue the command.

18 FCP PRIMARY LOGIN EXCEEDED
Correct the error for the link address and reissue the command.

19 FCP SECONDARY LOGIN EXCEEDED
Correct the error for the link address and reissue the command.

1A PRIMARY FIBER CHANNEL NOT CONFIG
Do the primary fiber channel configuration and reissue the command.

1B FIBRE DEGRADED
Determine the reason for the high failure rate on the Fibre Channel connection.

1C FIBRE REMOVED
Determine the reason for the high failure rate on the Fibre Channel connection.

If a link shows “STATUS NOT RECOGNIZED”, note the error code and contact the storage subsystem vendor for assistance in diagnosing the problem.

ANTP0007I CSUSPEND OPERATION REJECTED- QUIESCE OPTION HAS BEEN DISABLED

Explanation: The QUIESCE option of the CSUSPEND command has been disabled by APAR OW15247 or APAR OW15248. The suspend function was not performed and the PPRC pair specified in the CSUSPEND command remains in the duplex state.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See APAR OW15247 or APAR OW15248 for instructions about enabling the QUIESCE option of the CSUSPEND command. If the QUIESCE option is enabled, do not issue a
CSUSPEND command with the QUIESCE option to a volume with active SPOOL, PAGE, or CATALOG data sets, or to an active SYSRES volume. Doing so can cause any attached system to enter a deadlock condition, and can require a storage control IML to correct the condition. See the GROUP command, which can provide the desired function.

ANTP0008I  command_name COMMAND FAILED TSO COMMAND PROCESSING

Explanation: A missing or incorrect value was specified with the command_name command, or there were other TSO command processing errors.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: See z/OS TSO/E Messages for an explanation of the related IKJxxxxx messages. Correct the error and reenter the command.

If the command was issued from a CLIST or REXX EXEC, correct the error and rerun the CLIST or REXX EXEC.

ANTP0009I  USER userid IS NOT AUTHORIZED TO ISSUE THE PPRC command_name COMMAND

Explanation: The command_name command was issued by user userid, and RACF (or the product providing resource control) has determined that this user is not authorized to use this command. If userid is “UNKNOWN”, a batch job was used to invoke the cmdname command, and the JOB card did not specify a user ID.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Contact your system administrator if authorization is required. See z/OS DFSMS Advanced Copy Services Messages and z/OS DFSMS Advanced Copy Services for command authorization details.

The system administrator must:
1. Update the IKJTSOxx member of SYS1.PARMLIB, specifying the command_name command with the AUTHCMDS NAMES parameter.
2. Issue the TSO command PARMLIB UPDATE(xx) to activate the new IKJTSOxx member.

ANTP0010I  command_name COMMAND FOR DEVICE device_number PRIMARY SSID primary_ssid SECONDARY SSID secondary_ssid. COMPLETION CODE: hh

Explanation: The ending status of the CGROUP FREEZE or CGROUP RUN command is presented. The status is determined by conditions encountered during execution. The various fields reported are as follows:

command_name
CGROUP FREEZE or CGROUP RUN

ending_status
• COMPLETED – The command is successfully completed.
• UNSUCCESSFUL – An error is encountered. Other messages contain the specific error information.

device_number
The device number of the volume specified in the PPRC command. This can be:
• z/OS device number
• Serial_number-lss-lun of a Fixed Block device in an OPEN device request
• "" if the device number is missing or incorrectly specified in the command

primary_ssid
The source site storage subsystem identifier.

secondary_ssid
The recovery site storage subsystem identifier.
hh The highest completion code encountered during execution of the function.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: If the command failed, check the console messages for a previous ANTPnnnrl message that explains the failure and take action based on this previous message.

ANTP0014I  PPRC CESTPAIR COMMAND OPTION (option) NOT ALLOWED WITH keyword
Explanation: The following keyword combinations cannot be specified in conjunction with the CESTPAIR command:

- OPTION(XD) and CRIT(YES),
- OPTION(XD) and MODE(NOCOPY) when ACTION(FAILOVER) or ACTION(FAILBACK) is also specified.

Source: Peer-to-peer remote copy (PPRC)

System action: The command is rejected.

System programmer response: If you cannot understand the status returned from a CQUERY command to a primary volume, examine the LOGREC at the secondary subsystem to help diagnose the cause of the condition. When contacting IBM for assistance, provide any associated SYS1.LOGREC information.

ANTP0091I  cquery_unformat_volume_message
Explanation: A CQUERY UNFORMAT VOLUME request has been made. This is a block message defined by the cquery_unformat_volume_message and consists of the following lines:

- Line 1
timestamp job_number  ANTP0091I CQUERY UNFORMATTED LVL 2 connect_message_number  C

Note: The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second line of this report is a text line that consists of the following:

- VOLUME REPORT

The rest of the report is described in z/OS DFSMS Advanced Copy Services.

Source: Peer-to-peer remote copy (PPRC)

System action: None.

System programmer response: If you cannot understand the status returned from a CQUERY command to a primary volume, examine the LOGREC at the secondary subsystem to help diagnose the cause of the condition. When contacting IBM for assistance, provide any associated SYS1.LOGREC information.

ANTP0090I  cquery_format_volume_message
Explanation: A CQUERY FORMAT VOLUME request has been made. This is a block message defined by the cquery_format_volume_message and consists of the following:

- Line 1
timestamp job_number  ANTP0090I CQUERY FORMATTED LVL 4 connect_message_number  C

Note: The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second line of this report is a text line that consists of the following:

- VOLUME REPORT

The rest of the report is described in z/OS DFSMS Advanced Copy Services.
For 3990 and RVA storage control device information, the following four fields will be displayed:
- first_cylinder_out_of_synch
- last_cylinder_out_of_synch
- percent_of_copy_completed
- secondary_suspended_timestamp

For 2105 storage control device information, the following four fields will be displayed:
- number_of_tracks_out_of_synch
- total_number_of_tracks_on_the_volume
- percent_of_copy_completed
- secondary_suspended_timestamp

For output examples of the fields, see the chapter titled "Managing Peer to Peer Remote Copy Operations in z/OS DFSMS Advanced Copy Services".

**Notes:**
1. For 3990 and RVA devices, the first_cylinder_out_of_synch and last_cylinder_out_of_synch will be 5 bytes long.
2. For 2105 devices, the number_of_tracks_out_of_synch and total_number_of_tracks_on_the_volume fields will be 5 bytes long when the status of the device is SIMPLEX or DUPLLEX. For all other statuses, these fields will be 7 bytes long.

The first line of this report is a control line that consists of the following:
- timestamp
- job_number
- ANTPO095I CQUERY FORMATTED LVL 2 connect_message_number C

**Note:** The connect_message_number is written to SYSLOG only. The C is written to the console only.

The second line of this report is a text line that consists of the following:
- PATHS REPORT

The rest of the report is described in z/OS DFSMS Advanced Copy Services.

**Source:** Peer-to-peer remote copy (PPRC).

**System action:** None.

**System programmer response:** None.

---

For 2105 storage control device information, the following five fields will be displayed:
- primary_wwnn
- secondary1_wwnn
- secondary2_wwnn
- secondary3_wwnn
- secondary4_wwnn

**Source:** Peer-to-peer remote copy (PPRC).

**System action:** None.

**System programmer response:** If you are unable to understand the status returned from a CQUERY command to a primary volume, examine the LOGREC at the secondary subsystem to help diagnose the cause of the condition. When contacting IBM for assistance, provide any associated SYS1.LOGREC information.

For 2105 storage control device information, the following fields will be displayed:

  primary_wwnn,
  secondary1_wwnn,
  secondary2_wwnn,
  secondary3_wwnn,
  secondary4_wwnn

See the chapter titled Managing Peer to Peer Remote Copy Operations in [z/OS DFSMS Advanced Copy Services] for more information about these fields.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: None.

ANTP0100I  DUPLEX OPERATION ERROR. MSG FRMT = 0, MSG NMBR = F, REAS: hh

Explanation: The storage control has detected an error in the subsystem involving a duplex volume operation. The message format and number from the sense information appear.

hh The reason code from byte 8 of the sense information.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See the appropriate storage hardware reference documentation for sense Format 0 Message F, reason code hh. Correct the error and retry the command.
ANTP0101I ESTAB. PAIR FAILED- NVS SPACE NOT AVAIL. FOR BITMAP

Explanation: Insufficient nonvolatile storage space is available for the application site storage control to create the changed track bitmap for the volume pair.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See the appropriate storage hardware operations documentation for pinned data procedures. Correct the condition and retry the command.

ANTP0102I ESTAB. PAIR FAILED- DEVICES NOT IN SUSPEND MODE

Explanation: The CESTPAIR MODE(RESYNC) command failed to establish the PPRC volume pair. The MODE(RESYNC) parameter is not valid unless the following conditions are met:

• The specified primary and secondary devices are in SUSPEND state
• The device specification of the primary and secondary devices matches that of the primary and secondary devices of an already established PPRC volume pair in SUSPEND state.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Issue the CQUERY command to verify the status of each device. Determine whether the specified primary and secondary device correspond to the same volume pair specification. Then determine which of the following actions to perform next:

• If the volume pair is active (PENDING or DUPLEX state), no action is required.
• If the device specification of the specified primary and secondary devices matches that of the primary and secondary device of an established PPRC volume pair in SUSPEND state, reissue the CESTPAIR command with MODE(RESYNC).
• If one or both devices are already part of a PPRC volume pair with a different device, select a new device and reissue the CESTPAIR command with the correct device specification and MODE(COPY) or MODE(NOCOPY) parameter.

ANTP0104I PPRC FUNCTION FAILED- CONTROL UNIT DETECTED ERROR

Explanation: The secondary volume is actively being used by this or another attached host.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Quiesce activity on the target secondary device (vary it offline to all attached hosts). The target secondary device can not be actively used or be a member of a duplex pair.

ANTP0105I ESTAB. PAIR FAILED- PINNED DATA ON SUSPENDED VOLUME

Explanation: The storage control detects pinned data for a volume and halts the command. A CESTPAIR command was issued to a suspended volume that contains pinned data.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See the appropriate storage hardware operations documentation for pinned data procedures. Correct the condition and retry the command.
ANTP0106I  ESTAB. PAIR FAILED- SECONDARY ADDRESS INCORRECT

Explanation: The storage control cannot resolve the secondary (target) volume's channel connection address (CCA) from the operand given in the command. The CCA secondary address provided on the command is not a valid CCA address for this PPRC pair.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the DEVSERV command to obtain the target CCA address for the secondary of this PPRC pair, and reissue the command.

ANTP0107I  SUSPEND OPERATION REJECTED- SUSPEND STATE EXISTED

Explanation: An attempt to suspend a PPRC copy has been made to a pair that is already suspended.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the CQUERY command to verify the PPRC volume or path status.

ANTP0108I  ATTEMPTED A DUPLEX OPERATION ON A SIMPLEX VOLUME

Explanation: A PPRC operation (CDELPAIR, CSUSPEND, or CRECOVER) has been directed to a volume that is not a member of a PPRC pair.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the CQUERY command to verify the PPRC volume or path status.

ANTP0109I  SUSPEND PRIMARY FAILED- DUPLEX OR PPRC PENDING

Explanation: A suspend operation is attempted to a volume that has a pending duplex or PPRC operation.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the CQUERY command to verify that the volume is in pending status. Reissue the command when the device is no longer in pending status.

ANTP0110I  ESTAB. DUPEX PAIR FAILED- CE MODE OR UNDETERMINED

Explanation: While attempting to establish a PPRC pair, the storage control is in CE mode or the "FC" state (Sense Format F, Message C).

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Take the storage control out of CE mode or correct the FC condition, and then reissue the command.

ANTP0111I  TERMINATE PAIR FAILED- DASD FAST WRITE PENDING

Explanation: The storage control is unable to end a pair while DASD fast write (DFW) is pending.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the DEVSERV command to determine the DASD fast write condition. Reissue the command when the DFW pending condition clears.

Detecting Module: Peer-to-peer remote copy (PPRC).

ANTP0112I  ESTAB. PAIR FAILED- SUBSYSTEM INSTALLING MICROCODE

Explanation: Because a microcode install operation is in progress, the storage control is unable to initiate the operation.

System action: None.

System programmer response: Permit the microcode install operation to complete, and then reissue the command.

ANTP0113I  ESTAB. PATHS FAILED- WOULD EXCEED UNITS/PATHS LIMITS

Explanation: The command has failed because the maximum number of storage control connections or the number of paths to a specific storage control has been reached.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: To determine the established storage controls and paths for the secondary volume, issue the CQUERY command with the PATHS option.

You can also collect path information with ICKDSF (release 16 or above) with the ANALYZE command, specifying the NOSCAN and NODRIVE keywords.

ANTP0114I  COPY OPERATION UNABLE TO COMPLETE- ABNORMAL CONDITION

Explanation: An abnormal condition in either storage subsystem prohibits the completion of the CESTPAIR or CESTPATH copy operation.

Source: Peer-to-peer remote copy (PPRC).

System action: None.
**System programmer response:** Verify the path status by issuing the CQUERY command with the PATHS option. Also look for any SIM messages that indicate a problem with the storage control or device. Correct the problem and retry the copy operation.

**ANTP0115I**  
**Explanation:** The storage control cannot resolve the operands in the command input to match a subsystem ID or serial number.  
**Source:** Peer-to-peer remote copy (PPRC).  
**System action:** None.  
**System programmer response:** Verify that the command input correctly identifies the information for the primary volume and the storage control for the secondary volume. This message can occur if a CESTPAIR command is issued before a path has been established from the specified primary storage control to the specified secondary storage control. For CKD devices, check the configuration charts, system log, and SYS1.LOGREC. Also for CKD devices, the DEVSERV and CQUERY commands can also assist in this verification.

**ANTP0116I**  
**Explanation:** A condition that prohibits initiation of the operation at the secondary volume's storage control has been detected. One of the following conditions exists on the storage control:  
- DASD fast write is not active for the device  
- Cache is not available for the subsystem  
- Cache is not active for the device  
- Nonvolatile storage space not available for the subsystem  
- Primary and secondary device geometry are incompatible  
- LIC support for requested function is not installed  
- Subsystem support for requested function is not installed  
- Target device does not exist on the subsystem  
**Source:** Peer-to-peer remote copy (PPRC).  
**System action:** None.  
**System programmer response:** See the appropriate storage hardware operations documentation for pinned data recovery procedures. Correct the condition and retry the command.

**ANTP0117I**  
**Explanation:** The storage control cannot establish all the paths specified in the CESTPATH command. However, one or more paths have been established.  
**Source:** Peer-to-peer remote copy (PPRC).  
**System action:** The command is partially successful.  
**System programmer response:** To determine the pathing status, issue a CQUERY command, with the PATHS option, to the primary device. See the data returned with the CQUERY command to determine the action required for status other than “established”.  
You can also collect path information with ICKDSF (release 16 or above) with the ANALYZE command, specifying the NOSCAN and NODRIVE keywords.

**Note:** CQUERY PATHS will only display outbound path information. It will not display information about inbound paths. If you attempt to establish an outbound path, and it is already established inbound, the CESTPATH command will fail with ANTP0117I, but the inbound path will not appear in output of a CQUERY PATHS command directed to your local storage subsystem.  
When checking path status for your local storage subsystem, issue the CQUERY PATHS command not only to the local subsystem, but also to all remote storage subsystems to which your local subsystem is connected. This will allow you to see any established paths that are inbound to your local subsystem.

**ANTP0118I**  
**Explanation:** Either the primary or secondary volume has pinned data, preventing establishment of the pair.  
**Source:** Peer-to-peer remote copy (PPRC).  
**System action:** None.  
**System programmer response:** See the appropriate storage hardware operations documentation for pinned data recovery procedures. Correct the condition and retry the command.

**ANTP0119I**  
**Explanation:** The PPRC pair has been suspended. Since the volume is established with the CRIT(YES) option, no writes are permitted to the suspended volume.  
**Source:** Peer-to-peer remote copy (PPRC).  
**System action:** None.  
**System programmer response:** Determine the reason why the volume is suspended. Look for an IEA49xx message on the system console, containing the reason code. Correct the condition and reestablish...
or delete the PPRC pair by issuing the CESTPAIR or CDELPAIR command.

ANTP0120I COMMAND CONFLICTS WITH ESTABLISHED PPRC DEVICE STATE

Explanation: The state (simplex, duplex, pending, or suspend) of the pair is in conflict with the attempted PPRC command.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: To determine the specific PPRC state, issue the CQUERY command to the primary or secondary device.

ANTP0121I DELETE PATHS FAILED- PPRC VOLUMES ARE STILL ACTIVE

Explanation: The CDELPATH command has been issued while the PPRC volumes are still active.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Verify status (with the CQUERY command), and ensure that you are specifying the correct PPRC device. Then issue the CDELPAIR command to end the PPRC pair, and retry the command.

ANTP0122I PRIMARY CU TIMED OUT ATTEMPTING TO COMMUNICATE WITH SECONDARY

Explanation: The primary storage control (CU) timed out while attempting to communicate with the secondary storage control.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Correct the communication problem between the primary storage control and secondary storage control, and then retry the PPRC command.

ANTP0123E ESTABLISH PAIR FAILED- SECONDARY DEVICE HAS ACTIVE PATH GROUP

Explanation: A PPRC Establish Pair request was made to an ESS subsystem, but the ESS reported that the secondary device has a path group connection to some host. A host system can have the secondary device online.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Confirm that the secondary device is not online to any host system attached to the ESS device. Use the DEVSERV command to query the path status of the device form all host systems. Use the VARY OFFLINE command to remove the path group connection. Optionally, if the secondary device is not being accessed by any host system, the ONLINSEC(YES) keyword can be used to complete the Establish pair. Ensure that the secondary device is correctly specified. Reissue the Establish pair command.

ANTP0124E ESTABLISH PAIR FAILED - SYNC/ASYNC STATE CHANGE INVALID

Explanation: A PPRC CESTPAIR command was issued to devices in a PPRC pair state that does not support a conversion to the requested state. This can occur when a PPRC pair is in an active synchronous state and the CESTPAIR request changes the PPRC pair to an asynchronous state. To make this conversion, the active PPRC pair must first be suspended.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the PPRC devices are in the correct state by using the CQUERY command. Suspend the pair, if necessary, make any required changes to the CESTPAIR specification, and reissue the CESTPAIR command.

ANTP0125E ESTAB. PAIR FAILED - DIFFERENT FORMAT/SIZE OR SEC TOO SMALL

Explanation: A PPRC CESTPAIR command specified a secondary device that has a different track format, different track size, or fewer tracks than the primary device.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Modify the request to ensure the primary and secondary device track size and format are the same, and the device size of the secondary is equal to or larger than the primary. For CKD, or MVS attached devices, you can use DEVSERV commands to verify device type and size of the primary and secondary devices. After making any corrections, resubmit the request.

ANTP0130E ESTAB. PATH FAILED - FCP NOT ALLOWED ON FICON ADAPTER

Explanation: The PPRC Establish Path request attempted to create a FCP link on a FICON adapter. Fibre Channel adapters can be configured for FICON communications or FCP communications, but not both communication protocols. PPRC paths require FCP adapters.

Source: Peer-to-peer remote copy (PPRC).
System action: The command is rejected.

System programmer response: Confirm the FCP LINK address(es) are correct. See the storage subsystem Fibre Channel adapter configuration information from both the primary and secondary subsystems to ensure the Fibre Channel adapter numbers are correct. After making any changes or corrections, re-issue the Establish paths request.

**ANTP0131E ESTAB. PATH – SAME SOURCE AND TARGET FCP ADAPTER INVALID**

Explanation: The PPRC Establish Path request specified a FCP path (LINK) address for the secondary subsystem that is the same FCP path address as the primary subsystem. The combination of the primary subsystem WWNN and Fibre Channel adapter in the first two bytes of the path (LINK) address creates a unique WWPN for this Fibre Channel adapter. The same WWPN was created when the secondary subsystem WWNN and Fibre Channel adapter in the last two bytes of the path (LINK) address were combined. A Fibre Channel adapter can be a PPRC source or a PPRC target, but not both.

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.

System programmer response: Verify the path (LINK) address(es) have the correct Fibre Channel adapter numbers. After making any changes or corrections, re-issue the Establish paths request.

**ANTP0132E ESTAB. PATH FAILED – ESCON ADAPTER OR FCP ADAPTER INVALID**

Explanation: The PPRC Establish Path request path (LINK) addresses contained invalid identifiers for either ESCON or FCP adapters. PPRC Establish Path requests must specify all ESCON adapter identifiers or all FCP adapter identifiers.

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.

System programmer response: Verify the path (LINK) address(es) have the correct adapter numbers.

**ANTP0133E PPRC REQUEST FAILED - PATH PROTOCOL MISMATCH**

Explanation: A PPRC request specified FCP paths or WWNNs on the request, but the secondary LSS is connected to the specified primary LSS using ESCON paths. Or the PPRC request specified ESCON paths or storage control serial numbers, but the secondary LSS is connected to the specified primary LSS using FCP paths. The request must be issued using the same protocol existing for the PPRC path when establishing new paths or deleting existing paths.

If you are trying to switch your path(s) in a LSS to LSS association from ESCON to FCP or vice versa and do not want to delete your PPRC pairs, you can use the procedure below. If you do not need to preserve your PPRC pairs, you can simply delete the pairs and existing paths and then establish new paths in the other protocol.

1. Issue a CGROUP FREEZE command to the primary LSS. This will remove all of the ESCON paths and suspend all the PPRC pairs in the LSS to LSS association.

2. Issue a CGROUP RUN command to allow Host application I/O to the primary volumes to resume.

3. Issue the CESTPATH command using the applicable required parameters to re-establish the PPRC paths.

4. Issue the CESTPAIR command with the MODE(RESYNC) option to re-establish the PPRC pairs.

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.

System programmer response: If you are issuing an establish path request to simply change which link addresses are to be used between the two LSSs without intending to change protocol, reissue the establish path request using the same protocol as used by the existing paths. If you are issuing a delete path request for existing paths, reissue the delete path request using the same protocol as used by the existing paths.

**ANTP0134E ESTAB. PATH FAILED – FCP ADAPTER CONNECTION TYPE INVALID**

Explanation: The PPRC Establish Path request specified FCP paths, but the primary subsystem Fibre Channel adapter is not connected point-to-point to another storage subsystem, or is not connected to a Fibre Fabric Switch. PPRC source FCP adapters must be directly connected to another subsystem, or must be connected to a Fibre Fabric Switch. Any other FCP adapter connection type is invalid.

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.

System programmer response: Verify the Establish Path request has the correct FCP adapters specified.

**ANTP0135E SECONDARY DEVICE ADDRESS INVALID — NOT CONFIGURED OR INSTALLED**

Explanation: The PPRC Establish Path request failed because a specified secondary device could not be found on the secondary storage subsystem.

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.
System programmer response: Verify the secondary device address, and resubmit the request.

ANTP0136E  PPRC REQUEST FAILED — PRIMARY SERIALNO OR WWNN NOT VALID

Explanation: A PPRC request specified an invalid storage subsystem serial number (SERIALNO) or World Wide Node Name (WWNN).

Source: Peer-to-peer remote copy (PPRC).

System action: The request is rejected.

System programmer response: Verify the SERIALNO or WWNN specified on the request, and resubmit the request.

ANTP0200I  AOM DETECTED I/O ERROR. MSG FRMT = f, MSG NMBR = n, REAS: rs

Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request from PPRC processing. The message format f, the message number n, and the reason rs are taken from the sense bytes obtained after the error.

f  The first digit (Format) of sense byte 7.

n  The second digit (Message) of sense byte 7.

rs  The reason code from byte 8 of the sense information.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: This message can be received because of a parameter error that would normally result in an ANTF003I message, however, the microcode is at a lower level that does not report the necessary information to determine the parameter that is in error. If all parameters are correct, this is an internal error. If this error recurs, research the problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTP0203I  UNIT DOES NOT SUPPORT PPRC OPERATIONS

Explanation: A PPRC command has been issued to a storage control that does not support the PPRC feature.

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: Issue the command to a storage control with the PPRC Licensed Internal Code installed.

ANTP0204I  VOLUME LABEL IN INPUT DOES NOT MATCH THAT ON VOLUME

Explanation: A CRECOVER command has found a mismatch between the label appearing in the command input and the label on the volume.

Source: Peer-to-peer remote copy (PPRC).

System action: The CRECOVER operation completes, and a return code of 4 is posted.

System programmer response: Verify the volume label using ICKDSF or similar program.

ANTP0205I  CHANNEL PROGRAM: READ VOLUME LABEL FAILED

Explanation: A CRECOVER operation has failed to read a volume label.

Source: Peer-to-peer remote copy (PPRC).

System action: The CRECOVER operation completes, and a return code of 4 is posted.

System programmer response: See the IOS/DASD ERP messages issued to the system console. Take the appropriate action and verify the volume label using ICKDSF or similar program.
ANTP0206I  CHANNEL PROGRAM: WRITE VOLUME LABEL FAILED

Explanation: A CRECOVER operation has failed to write a volume label.

Source: Peer-to-peer remote copy (PPRC).

System action: The CRECOVER operation on the volume completes; however, the volume label is not written. A return code of 4 is posted.

System programmer response: See the IOS/DASD ERP messages issued to the system console. Take the appropriate action and relabel the volume using ICKDSF or similar program.

ANTP0207I  ASYNCHRONOUS OPERATION MGR. REQUEST FAILED RTN: 04 REAS: rs

Explanation: The Asynchronous Operations Manager (AOM) detected an error while handling an I/O request.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: This is an internal error. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. See z/OS DFSMSdfp Diagnosis for a full explanation of AOM return and reason codes and the actions to take.

ANTP0208I  ASYNCHRONOUS OPERATION MGR. OPERATION FAILED RTN: 08 REAS: hh

Explanation: While processing a request, the asynchronous operations manager (AOM) has detected an error. The AOM internal return code is 8, and the internal reason code appears.

hh  The reason code from AOM

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See z/OS DFSMSdfp Diagnosis for a full explanation of AOM return and reason codes and the actions to take.

ANTP0209I  ASYNCHRONOUS OPERATION MGR. OPERATION FAILED RTN: 12 REAS: hh

Explanation: While processing a request, the asynchronous operations manager (AOM) has detected an error. The AOM internal return code is 12, and the internal reason code appears.

hh  The reason code from AOM

Source: Peer-to-peer remote copy (PPRC).

System action: None.

System programmer response: See z/OS DFSMSdfp Diagnosis for a full explanation of AOM return and reason codes and the actions to take.

ANTP0210I  CHANNEL PROGRAM: READ CYLINDER BITMAP FAILED

Explanation: A channel program failed while attempting to read an out-of-sync cylinder bitmap during a CQUERY operation.

Source: Peer-to-peer remote copy (PPRC).

System action: The program displays all CQUERY information accumulated before the error, and sets a return code of 4 for the whole CQUERY operation.

System programmer response: See the IOS/DASD ERP messages issued to the system console. Take the appropriate action and retry the command.

ANTP0211I  CHANNEL PROGRAM: READ CONFIGURATION DATA FAILED

Explanation: PPRC processing attempted to read device configuration information from the subsystem for the specified device. The channel program for this request received a unit check.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Multiple conditions can cause this error. The device is defined to the host but cannot respond to the I/O request. Use the DEVSERV commands to check path and device status from the system console. Correct the conditions and resubmit the command. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

ANTP0212I  CHANNEL PROGRAM: SENSE SUBSYSTEM STATUS FAILED

Explanation: PPRC processing attempted to read subsystem status information about the specified device. The channel program for this request received a unit check.

Source: Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: Multiple conditions can cause this error. The device is defined to the host but cannot respond to the I/O request. Use the DEVSERV commands to check path and device status from the system console. Correct the conditions and resubmit the command. If this error recurs, research problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
ANTP0213I  UNIT IS ALIAS DEVICE, SPECIFIED OPERATION NOT ALLOWED

Explanation:  PPRC processing detected the specified device is a Parallel Access Volume (PAV) alias device. FlashCopy requests can only be issued to the PAV base device or non-PAV devices.

Source:  Peer-to-peer remote copy (PPRC).

System action:  The command is rejected.

System programmer response:  Verify that the device specified is the correct device and resubmit the request.

ANTP0214I  UNIT IS NOT A VALID DEVICE TYPE FOR SPECIFIED OPERATION

Explanation:  PPRC processing detected the specified device is not a direct access storage device (DASD). FlashCopy requests can only be issued to DASD devices in ESS subsystems.

Source:  Peer-to-peer remote copy (PPRC).

System action:  The command is rejected.

System programmer response:  Ensure that the device specified is the correct device, and resubmit the request.

ANTP0215E  PPRC DEVN DEVICE NOT IN SAME CLUSTER AS OPEN DEVICE

Explanation:  A PPRC request specified OPENDVCS(YES). The DEVN device is not in the same subsystem cluster as the Open device identified in the request. The DEVN device is used only as an access device to the subsystem cluster that contains the Open (Fixed Block) device. The Open device must be in the same cluster as the DEVN device.

Source:  Peer-to-peer remote copy (PPRC).

System action:  The command is rejected.

System programmer response:  Ensure that the DEVN device is in the same subsystem cluster as the Open device identified in the PPRC request. Reissue the request.

ANTP0216E  FUNCTION IS NOT SUPPORTED ON SUBSYSTEM

Explanation:  The Advanced Copy Services request specified a function that is not supported by host software on the subsystem identified in the request. The specified subsystem microcode (LIC) level is less than the minimum microcode level required for the function.

Source:  ESS Advanced Copy Services

System action:  The command is rejected.

System programmer response:  Determine the microcode level (LIC) of the subsystem identified in the request. Insure the microcode is at the required level. After making any changes or corrections, resubmit the Advanced Copy Services request.

ANTP0217E  CHANNEL PROGRAM TIMED OUT

Explanation:  WAITTIME expired during execution of a channel program.

Source:  ESS Advanced Copy Services

System action:  SDM aborts the request and returns control back to the program if it is a synchronous request or posts the ECB if it is an asynchronous request.

System programmer response:  Determine if the WAITTIME is too short for the requested action, if there is another application delaying the I/O of the DEVN device, or if there is a problem with the DEVN device. Resubmit the request when the problem is corrected.

ANTP0225E  PPRC CESTPAIR COMMAND FAILED FOR DEVICE DEVICE-INFO, SPECIFIED SECONDARY IS SPACE EFFICIENT.

Explanation:  A PPRC CESTPAIR command was issued for primary device device-info without the keyword SETGTOK(YES), and the specified secondary device is a space efficient volume.

Source:  Peer-to-Peer Remote Copy

System action:  CESTPAIR command fails.

System programmer response:  If the intent is to establish a PPRC pair to a space efficient secondary volume, issue the command again with SETGTOK(YES) specified.

ANTP0227E  PPRC CESTPAIR COMMAND FAILED FOR DEVICE DEVICE-INFO, SPECIFIED SECONDARY IS SOURCE TO A SPACE EFFICIENT RELATIONSHIP.

Explanation:  A PPRC CESTPAIR command was issued for primary device device-info with MODE(COPY) and the specified secondary is already the source of a FlashCopy relationship whose target is a space efficient volume. The PPRC copy process results in all tracks being updated on the secondary device (FlashCopy source) and a full copy to the space efficient target.

Source:  Peer-To-Peer Remote Copy (PPRC)

System action:  CESTPAIR command fails.

System programmer response:  The FlashCopy relationship must be withdrawn before the PPRC establish pair command is completed.
ANTP0230E ESTABLISH PATH primary/secondary WORLD WIDE NODE NAME INVALID

Explanation: The PPRC TSO Command CESTPATH contains a WWNN for the primary or secondary subsystem that is invalid. An invalid WWNN can be caused by any of the following conditions:

- The input character string is more than 13 characters long, but is not exactly 16 characters in length. (A string of 13 characters is treated as an invalid serial number value.)
- The input character string is 16 characters in length, but not all hexadecimal characters.
- The input character string is 16 characters in length, but the first 10 characters are not '5005076300'.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Establish Path request has the correct WWNN values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.

ANTP0231E ESTABLISH PATH WITH WWNN AND SERIAL NUMBER INVALID

Explanation: The PPRC TSO command CESTPATH contains a WWNN for one of the storage subsystems and a serial number for the other storage subsystem. The primary and secondary storage subsystems must both be identified with a WWNN for FCP communications, or must both be identified with a serial number for ESCON communications.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Establish Path request has the correct WWNN values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.

ANTP0232E ESTABLISH PATH SUBSYSTEM TYPES INCOMPATIBLE

Explanation: The PPRC TSO Command CESTPATH contains a Logical Subsystem (LSS) identifier that is not compatible with the other LSS identifier. One LSS contains CKD devices, and the other LSS contains FB (Fixed Block) devices.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Establish Path request has the correct LSS values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.

ANTP0233E PPRC FEATURE NOT INSTALLED OR ACTIVE

Explanation: The PPRC request detected that the PPRC feature was not installed or not active.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Ensure the storage subsystem has the PPRC feature installed and that it is active. It might be necessary to call customer service or a service representative to resolve the problem.

ANTP0234E DELETE PATH primary/secondary WORLD WIDE NODE NAME INVALID

Explanation: The PPRC TSO Command CDELPATH contains a WWNN for the primary or secondary subsystem that is invalid. An invalid WWNN can be caused by any of the following conditions:

- The input character string is more than 13 characters long, but is not exactly 16 characters in length. (A string of 13 characters is treated as an invalid serial number value.)
- The input character string is 16 characters in length, but not all hexadecimal characters.
- The input character string is 16 characters in length, but the first 10 characters are not '5005076300'.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Delete Path request has the correct WWNN values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.

ANTP0235E DELETE PATH WITH WWNN AND SERIAL NUMBER INVALID

Explanation: The PPRC TSO Command CDELPATH contains a WWNN for one of the storage subsystems and a serial number for the other storage subsystem. The primary and secondary storage subsystems must both be identified with a WWNN for FCP communications, or must both be identified with a serial number for ESCON communications.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Delete Path request has the correct WWNN values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.
ANTP0236E • ANTP0242E

ANTP0236E DELETE PATH SUBSYSTEM TYPES INCOMPATIBLE

Explanation: The PPRC TSO Command CDELPATH contains a Logical Subsystem (LSS) identifier that is not compatible with the other LSS identifier. One LSS contains CKD devices, and the other LSS contains FB (Fixed Block) devices.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Delete Path request has the correct LSS values for the primary and secondary storage subsystems. After any changes or corrections, re-issue the request.

ANTP0237E DELETE PATH FIBER CHANNEL PATHS NOT SUPPORTED

Explanation: The PPRC TSO Command CDELPATH request specified a primary subsystem WWNN, but the storage subsystem with the DEVN device does not support Fibre Channel paths.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify the Delete Path request identifies the correct storage subsystem. Verify the storage subsystem has FCP adapters installed and configured, with the related FCP support microcode. After any changes or corrections, re-issuse the request.

ANTP0238E OPENDVCS(YES) AND ID PARAMETERS ARE MUTUALLY EXCLUSIVE

Explanation: The PPRC CRECOVER request was issued with the OPENDVCS(YES) keyword and the ID keyword. The OPENDVCS(YES) keyword indicates this is a fixed block device, but the ID keyword applies only to CKD, or MVS attached, devices. Specifying both OPENDVCS(YES) and ID is not allowed.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: If OPENDVCS(YES) is specified in the request, ensure that ONLINSEC(NO) is specified or ONLINSEC is omitted. After making any changes or corrections, resubmit the request.

ANTP0239E OPENDVCS(YES) SPECIFIED, PRIMARY IS CKD OR IN AN INVALID STATE

Explanation: The PPRC request was issued with the OPENDVCS(YES) keyword. The Primary device, specified in the PRIM keyword was found to be in an invalid state. The invalid state could be:

- The device is in a 'not ready' state.
- The device is a CKD device.
- The device is not configured or not installed.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: If OPENDVCS(YES) is specified in the request, ensure that ONLINSEC(NO) is specified or ONLINSEC is omitted. After making any changes or corrections, resubmit the request.

ANTP0240E OPENDVCS(YES) AND ONLINSEC(YES) PARAMETERS ARE MUTUALLY EXCLUSIVE

Explanation: The PPRC request was issued with the OPENDVCS(YES) keyword and the ONLINSEC(YES) keyword. The OPENDVCS(YES) keyword indicates this is a fixed block device, and the ONLINSEC(YES) keyword applies only to CKD, or MVS attached, devices. Specifying both OPENDVCS(YES) and ONLINSEC(YES) is not allowed.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: If OPENDVCS(YES) is specified in the request, ensure that ONLINSEC(NO) is specified or ONLINSEC is omitted. After making any changes or corrections, resubmit the request.

ANTP0241E OPENDVCS(YES) AND CRIT(YES) PARAMETERS ARE MUTUALLY EXCLUSIVE

Explanation: The PPRC request was issued with the OPENDVCS(YES) keyword and the CRIT(YES) keyword. The OPENDVCS(YES) keyword indicates this is a fixed block device, and the CRIT(YES) keyword applies only to CKD, or MVS attached, devices. Specifying both OPENDVCS(YES) and CRIT(YES) is not allowed.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: If OPENDVCS(YES) is specified in the request, ensure that CRIT(NO) is specified or CRIT is omitted. After making any changes or corrections, resubmit the request.

ANTP0242E OPENDVCS(YES) AND MSGREQ(YES) PARAMETERS ARE MUTUALLY EXCLUSIVE

Explanation: The PPRC request was issued with the OPENDVCS(YES) keyword and the MSGREQ(YES) keyword. Specifying both OPENDVCS(YES) and MSGREQ(YES) is not allowed.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: If OPENDVCS(YES) is specified in the request, ensure that MSGREQ(NO) is specified or MSGREQ is omitted. After making any changes or corrections, resubmit the request.
keyword. The OPENDVCS(YES) keyword indicates this is a fixed block device, and the MSGREQ(YES) keyword applies only to CKD, or MVS attached, devices. Specifying both OPENDVCS(YES) and MSGREQ(YES) is not allowed.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** If OPENDVCS(YES) is specified in the request, ensure that MSGREQ(NO) is specified or MSGREQ is omitted. After making any changes or corrections, resubmit the request.

---

**ANTP0243E  OPENDVCS(YES) AND PACE PARAMETERS ARE MUTUALLY EXCLUSIVE**

**Explanation:** The PPRC request was issued with the OPENDVCS(YES) keyword and the PACE keyword. The OPENDVCS(YES) keyword indicates this is a fixed block device, and the PACE keyword applies only to CKD, or MVS attached, devices. Specifying both OPENDVCS(YES) and PACE is not allowed.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** If OPENDVCS(YES) is specified in the request, ensure that PACE is omitted. After making any changes or corrections, resubmit the request.

---

**ANTP0244E  CESTPAIR PARAMETERS parameter1 AND parameter2 ARE MUTUALLY EXCLUSIVE**

**Explanation:** The PPRC CESTPAIR request was issued with mutually exclusive parameters, parameter1 and parameter2. Specifying these parameters on the same request is not allowed.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** See [Z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/knowledgecenter/SSSHV8_8.1.0/dfsmsdfcadm/a_c_copy_services_f.txt) for proper TSO syntax for the CESTPAIR command. After making any changes or corrections, resubmit the request.

---

**ANTP0250E  FAILBACK OPERATION REJECTED, INCORRECT STATE EXISTS**

**Explanation:** The PPRC CESTPAIR request was issued with ACTION(FAILBACK). The volume where the command was issued is not in the correct state. The volume must be a PPRC primary device in suspended state.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the command was issued to the correct device and reissue if necessary.

---

**ANTP0251E  FAILBACK OPERATION REJECTED DUE TO PAIR MISMATCH**

**Explanation:** The PPRC CESTPAIR request was issued with ACTION(FAILBACK). The command failed because of one of the following conditions:

- The volume specified as primary is not currently a PPRC secondary volume or Cascading PPRC volume
- The storage control contains stored information identifying the associated primary volume for the secondary where the command is being issued. The information identifying the secondary volume identified in the command parameter fields is not the same information that is currently stored for the primary volume.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the command was issued to the correct device and reissue if necessary.

---

**ANTP0252E  FAILBACK OPERATION REJECTED, INCORRECT STATE EXISTS**

**Explanation:** The PPRC CESTPAIR request was issued with ACTION(FAILBACK). The volume where the command was issued is not in the correct state. The volume must be a PPRC primary device in suspended state.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the command was issued to the correct device and reissue if necessary.

---

**ANTP0253E  FAILBACK OPERATION REJECTED DUE TO PAIR MISMATCH**

**Explanation:** The PPRC CESTPAIR request was issued with ACTION(FAILBACK). The storage control contains stored information identifying the associated secondary volume for the primary where the command is being issued. The information identifying the secondary volume identified in the command parameter fields is not the same information that is currently stored for the primary volume.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the
command was issued to the correct device and reissue if necessary.

**ANTP0254E**  
**FAILOVER OR FAILBACK OPERATION REJECTED, STATE ALREADY EXISTS**

**Explanation:** The PPRC CESTPAIR request was issued with ACTION(FAILBACK). The volume where the command was issued is already in the requested state.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the command was issued to the correct device and reissue if necessary.

**ANTP0255E**  
**PPRC ESTABLISH PAIR PRIMARY DEVICE devn CHANGE RECORDING MECHANISM ALREADY ACTIVE**

**Explanation:** A PPRC Establish request was issued with the INCRESYNC(START) keyword. The change recording mechanism is already active for the specified source device. This might be because the specified primary is a FlashCopy source, established with the_INCREMENTAL(YES) keyword.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** If the incremental resync change recording mechanism is required for the PPRC pair and the device is a FlashCopy source, issue a FlashCopy Withdraw command for the incremental relationship and reissue the Establish Pair command. If the incremental resync change recording mechanism is not required for the PPRC pair, reissue the request without INCRESYNC(START).

**ANTP0256E**  
**PPRC ESTABLISH MODE(INCRES) DEVICE devn, INVALID CONFIGURATION**

**Explanation:** A PPRC Establish request was issued with the MODE(INCRES) keyword. The specified primary device is not connected to the specified secondary device through a common secondary or primary. This means that the specified primary device does not have a secondary that is also the primary to the specified secondary.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the specification of primary and secondary devices is correct, and represents the A and C volumes of a cascaded (A-B-C) PPRC relationship. If you intend to override the cascaded PPRC relationship validation, issue the command again with the FORCE(YES) keyword. Be aware that this will copy only a subset of the tracks changed on the A volume.

**ANTP0257E**  
**PPRC ESTABLISH MODE(INCRES) DEVICE devn, CHANGE RECORDING NOT ACTIVE**

**Explanation:** A PPRC Establish request was issued with the MODE(INCRES) keyword. The specified primary device does not have the incremental resync change recording mechanism active.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the specified primary and secondary devices are correct. If the specified primary and secondary devices are the devices that you want to connect, a full copy is required to establish the pair. Reissue the request without the MODE(INCRES) keyword.

**ANTP0301E**  
**ACCESS VOLUME AND OPEN DEVICE ARE INCOMPATIBLE**

**Explanation:** A PPRC OPENDVCS(YES) command has been issued. The data mover is unable to address the Open device number specified using the access volume specified. Probable causes are:

- The Open device is not in the same cluster as the utility device
- The Open device number is invalid

**Source:** Peer-to-peer remote copy (PPRC).

**System action:** PPRC functions are active.

**System programmer response:** Correct the error and reissue the command.

**ANTP0302E**  
**REQUEST FAILED DUE TO INCOMPATIBLE DEVICE SPECIFICATION**

**Explanation:** The DEVN and cca specified are incompatible. The request is not accepted. Probable causes are:

- The device (cca) is not in the same cluster as the specified DEVN
- The DEVN number is invalid

**Source:** Peer-to-peer remote copy (PPRC).

**System action:** PPRC functions are active.

**System programmer response:** Correct the error and reissue the command.

**ANTP7000I - ANTP7099I**

**Explanation:** These messages are reserved for RQUERY command output to either a data set through ANTRQST or to the TSO user through the RQUERY
command. See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for details.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** None.

**System programmer response:** None.

ANTP7100E  GLOBAL MIRROR SUPPORT NOT INSTALLED ON REQUESTED STORAGE CONTROL

**Explanation:** A Global Mirror request (RSESSION, RVOLUME, RQUERY) was issued to a storage control that does not have the feature installed.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the request was issued to the correct device. After making any changes or corrections, resubmit the request.

ANTP7101E  UNEXPECTED I/O ERROR RECEIVED FROM STORAGE CONTROL FOR command REQUEST

**Explanation:** The Global Mirror RSESSION, RVOLUME, or RQUERY request command was issued and the storage control returned an unrecognized error code.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify the command was issued properly. See any other messages (ANTP7129E, ANTP7130E, or ANTP7131E) that can have been issued with diagnostic data. After making any changes or corrections, resubmit the request.

ANTP7102E  INVALID VALUE SPECIFIED FOR PARAMETER parameter FOR command REQUEST

**Explanation:** The Global Mirror RSESSION, RVOLUME, or RQUERY request command was issued with an invalid value specified for the parameter parameter.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the value specified is a valid value (for example, if the parameter that failed is a serial number, verify that the serial number is valid). If necessary, see [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for proper TSO syntax for the issued command. After making any changes or corrections, resubmit the request.

ANTP7103E  PARAMETERS parameter1 AND parameter2 ARE MUTUALLY EXCLUSIVE FOR command REQUEST

**Explanation:** The Global Mirror RSESSION, RVOLUME, or RQUERY request was issued with mutually exclusive parameters, parameter1 and parameter2. Specifying these parameters on the same request is not allowed.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for proper TSO syntax for the issued command. After making any changes or corrections, resubmit the request.

ANTP7104E  REQUIRED KEYWORD keyword MISSING FOR command REQUEST

**Explanation:** The Global Mirror command was issued without required keyword, keyword.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for return and reason code explanations.

ANTP7105E  UNEXPECTED ANTRQST RETURN CODE retc AND REASON CODE reac RECEIVED FOR command REQUEST

**Explanation:** The Global Mirror command was issued and received an unexpected return code retc and reason code reac from the ANTRQST API invocation.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** See [z/OS DFSMS Advanced Copy Services](https://www.ibm.com) for return and reason code explanations.

ANTP7106E  RSESSION MSSERIAL SPECIFIED DOES NOT MATCH SERIAL OF VOLSER STORAGE CONTROL

**Explanation:** The Global Mirror RSESSION request was issued with a storage control serial number that does not match the serial number of the storage control where the volume specified in the VOLSER parameter resides.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.
System programmer response: Verify that the serial number specified and the volser specified are for the intended storage control. After making any changes or corrections, resubmit the request.

**ANTP7107E RSESSION SPECIFIED ONLY ONE OR TWO PERFORMANCE PARAMETERS**

**Explanation:** The Global Mirror RSESSION request was issued with at least one, but not all three performance parameters (CGINTERVAL, CGDRAIN, COORDINTERVAL). Either all performance parameters must be specified or none of the performance parameters can be specified.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the performance parameters specified are correct, specifying either none of the parameters or all of the parameters. After making any changes or corrections, resubmit the request.

**ANTP7108E RSESSION UNDEFINE ISSUED TO LSS WITH VOLUMES ACTIVE**

**Explanation:** The Global Mirror RSESSION UNDEFINE request was issued to an LSS that has volumes in a Global Mirror session.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Before issuing an RSESSION UNDEFINE to an LSS, volumes that have been joined to the session must be removed. After removing all volumes from the session, resubmit the request.

**ANTP7109E GLOBAL MIRROR SESSION ALREADY DEFINED TO LSS OR MAX SESSIONS REACHED**

**Explanation:** The Global Mirror RSESSION DEFINE request was issued to an LSS that already has the specified session defined, or the maximum number of Global Mirror sessions has been reached for the specified LSS.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the request was issued to the correct LSS, or UNDEFINE any unwanted sessions defined to the requested LSS (see hardware documentation for the current allowed maximum number of sessions per LSS). After making any changes or corrections, resubmit the request.

**ANTP7110E RSESSION SNBR SPECIFIED IS INVALID**

**Explanation:** The Global Mirror RSESSION request was issued with a session number that is invalid. For ACTION(DEFINE) the SNBR specified is zero. For ACTION(UNDEFINE), the session number does not match a currently defined session number on the LSS where the command was issued.

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the session number specified is correct. After making any changes or corrections, resubmit the request.

**ANTP7111E RSESSION LSSTYPE DOES NOT MATCH THE LSS IN THE COMMAND**

**Explanation:** The Global Mirror RSESSION request was issued with an LSSTYPE that does not match the LSS type of the LSS specified by the LSSNBR parameter. One of the following occurred:

- The LSS is CKD, but LSSTYPE(FB) was specified
- The LSS is FB, but LSSTYPE(CKD) was specified
- The LSS number specified does not match the LSS number where the I/O was executed

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the correct LSS number and LSS types match. After making any changes or corrections, resubmit the request.

**ANTP7112E RSESSION COMMAND REJECTED DUE TO CONFLICT**

**Explanation:** The Global Mirror RSESSION request was rejected by the storage control because of a conflict between the state and the parameters specified. This could be caused by one of the following:

- MASTER(YES) was specified but the command was issued to a subordinate
- MASTER(NO) was specified but the command was issued to the master
- LSSTYPE(FB) was specified but the LSS specified is CKD
- The LiC does not support this function

**Source:** Peer-To-Peer Remote Copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** Verify that the correct parameters are specified. After making any changes or corrections, resubmit the request.
ANTP7113E  RSESSION COMMAND REJECTED DUE TO STORAGE CONTROL STORAGE ERROR

Explanation: The Global Mirror RSESSION request was rejected by the storage control because nonvolatile structures could not be updated or accessed because of failure, or because the storage control is in single cluster mode.

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: Verify that the controller is not in single cluster mode. After making any changes or corrections, resubmit the request. If the problem persists, contact your service representative.

ANTP7114E  RSESSION PAUSE/STOP FAILED, CONSISTENT DATA COULD NOT BE FORMED

Explanation: The Global Mirror RSESSION PAUSE or STOP request could not complete without compromising a consistent copy of the data so the request failed.

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: Use RQUERY to determine the status of the Global Mirror session and the last consistency group that was formed. Take necessary recovery action, if the session is not in a fatal state. If necessary, contact your service representative.

ANTP7115E  RSESSION REQUEST SPECIFIED INVALID CONFIGURATION INFORMATION

Explanation: The Global Mirror RSESSION request was rejected because of one of the following:
- The specified session ID did not match the existing session ID for the specified master serial number
- Duplicate serial number information was supplied in the SBINFO
- Invalid information was supplied in the SBINFO
- Master information was supplied in the SBINFO
- The master serial number does not match the serial number of the storage control the command is executed on

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: After making any changes or corrections, resubmit the request.

ANTP7116E  RSESSION COMMAND REJECTED, NO PATHS OR ESCON PATHS DETECTED

Explanation: The Global Mirror RSESSION START or RESUME request was rejected by the storage control because of either no paths or ESCON paths detected between the master and at least one subordinate.

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: Verify FCP paths are established between the master ssid(s) specified and the subordinate ssid(s) specified. After making any changes or corrections, resubmit the request. If the problem persists, contact your service representative.

ANTP7117E  RSESSION COMMAND REJECTED DUE TO INVALID STATE

Explanation: The Global Mirror RSESSION START or RESUME request was rejected by the storage control because of a configuration mismatch between the command and the actual configuration on the controller. This can be the result of one of the following:
- A different Master was already running on this controller
- The parameters specified did not match the existing session, and the existing session was not paused
- The existing session is processing a pause or stop request
- The resume was issued to an LSS other than the one on which the session was initially started
- For a resume, the session is not in a paused state

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: Verify that the controller is not in single cluster mode. After making any changes or corrections, resubmit the request. If the problem persists, contact your service representative.

ANTP7118E  RSESSION COMMAND REJECTED, MAXIMUM SESSIONS CONFIGURED ON CONTROLLER

Explanation: The Global Mirror RSESSION START request was rejected by the storage control because the maximum number has been configured for one of the subordinates specified on the request.

Source: Peer-To-Peer Remote Copy (PPRC).
System action: The command is rejected.
System programmer response: Verify that the subordinate(s) specified are not participating in another Global Mirror session. After making any changes or corrections, resubmit the request.
ANTP7119E  RSESSION COMMAND REJECTED DUE TO CONFIGURATION MISMATCH

Explanation: The Global Mirror RSESSION PAUSE or STOP request was rejected by the storage control because of a configuration mismatch between the command and the actual configuration on the controller. This can be the result of one of the following:
- The specified configuration does not exist
- The request was issued to a different LSS than the one where the session was initially started
- The command passed initial validation, however, the topology must be identical to the topology specified on the initial start request

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify that the correct configuration was specified on the request. After making any changes or corrections, resubmit the request.

ANTP7120E  RSESSION COMMAND FAILED, COMMUNICATION PATHS FAILURE

Explanation: The Global Mirror RSESSION request failed because communication paths between the master and at least one subordinate are not functioning, or communications cannot be established between the master and at least one of the subordinates.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify that FCP paths are established between the master ssid(s) specified and the subordinate ssid(s) specified. After making any changes or corrections, resubmit the request.

ANTP7121E  RSESSION COMMAND REJECTED, SERIAL NUMBER OR LSS INFORMATION MISMATCH

Explanation: The Global Mirror RSESSION request failed because serial number specified, or the LSS/SSID information specified does not match the storage control where the command was issued.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7122E  ACCESS DEVICE NOT IN SAME CLUSTER AS FIXED BLOCK LSS FOR command REQUEST

Explanation: The Global Mirror RSESSION, RVOLUME, or RQUERY command command for a fixed block device or LSS failed because the access device is not in the same cluster as the LSS the command was targeting.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7123E  INVALID DEVICE RANGE OR LIST SPECIFIED FOR RVOLUME REQUEST

Explanation: The Global Mirror RVOLUME command failed because the volume list or the volume range was rejected by the controller. For device ranges, the range must be specified in ascending order (the first device in a range is smaller than the second device in a range).

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: Verify that all devices specified are valid, and ranges are specified in ascending order. After making any changes or corrections, resubmit the request.

ANTP7124E  RVOLUME SNBR SPECIFIED IS INVALID

Explanation: The Global Mirror RVOLUME command was rejected by the storage control, indicating that the session ID specified was not valid.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7125E  RVOLUME LSSNBRA SPECIFIED IS INVALID

Explanation: The Global Mirror RVOLUME command was rejected by the storage control, indicating that the LSS number specified was not valid.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.
ANTP7126E  RVOLUME ESSSERIAL SPECIFIED IS INVALID

Explanation: The Global Mirror RVOLUME command was rejected by the storage control, indicating that the storage control serial number specified was not valid.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7127E  RVOLUME DEVICE IN DIFFERENT SESSION OR INVALID PATHS

Explanation: The Global Mirror RVOLUME command was rejected by the storage control, indicating that a device specified in the volume list or the volume range is already associated with different Global Mirror session, or a device specified is the primary of a PPRC pair that was established using ESCON paths.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7128E  RVOLUME SESSION NUMBER MISMATCH

Explanation: The Global Mirror RVOLUME command was rejected by the storage control, indicating that the session ID specified is not defined to the LSS.

Source: Peer-To-Peer Remote Copy (PPRC).

System action: The command is rejected.

System programmer response: After making any changes or corrections, resubmit the request.

ANTP7129E  device_number, serial_number, failing_CCW_command_code, failing_CCW_position, CCW_data_area, full_error_description

Explanation: The Global Mirror function encountered an I/O error. The message text provides the following information:

device_number
The device number to which the I/O is directed.

serial_number
The volume serial number, if available, of the device that encountered the I/O error.

failing_CCW_command_code
The channel command word (CCW) code that encounters the I/O error.

failing_CCW_position
The position in the channel program chain on which the error occurs. If the error occurs at the first CCW in the chain (a Define Extent), the path to the storage control or device can have been dropped. This can indicate an operations error because of the storage path being removed.

CCW_data_area
The parameter list data area of the failing CCW.

full_error_description
A brief description of the cause of the I/O error based on the sense data. The descriptions are as follows:

- NONVOLATILE_STORAGE_NOT_AVAILABLE
  This indicates that nonvolatile storage has been altered. Issue the DEVSERV MVS operator command to determine the status of nonvolatile storage. Do not disable nonvolatile storage for storage controls that have an active session. Correct the problem re-enabling nonvolatile storage and reissuing the command.

- INVALID_COMMAND
  This is due to issuing a command to a storage control that does not have that command capability.

- INVALID_COMMAND_SEQUENCE
  This is either due to an internal error or because a command has been issued to a storage control that does not have that command capability.

- CCW_COUNT_LESS_THAN_REQUIRED
  This is due to an internal error.

- INVALID_PARAMETER
  This is either due to an internal error or because a command has been issued to a storage control that does not have that command capability.

Source: ESS Peer-to-peer remote copy (PPRC).

System action: The command is rejected.

System programmer response: If the problem is an environmental or hardware error, correct the error and resubmit the request. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center.

ANTP7130E  device_number, abbreviated_error_description, failing_CCW_command_code, failing_CCW_position, IOS_completion_code, subchannel_status, sense_data, serial_number, full_error_description

Explanation: When the Global Mirror function
encounters an I/O error, the message text provides the following information:

**device_number**
The device number to which the I/O is directed.

**abbreviated_error_description**
A short error code describing the type of error based on the sense information. The valid codes are:
- **BOC**: Bus out parity check
- **CMD**: Command reject
- **COR**: Correctable data check
- **DCK**: Data check
- **ENV**: Environmental data present
- **EOC**: End of cylinder
- **EQC**: Equipment check
- **FPR**: File protect
- **IMP**: Imprecise ending
- **ITF**: Invalid track format
- **LOG**: First error log
- **M23**: MR23 record
- **MTO**: Message to operator
- **OVR**: Overrun
- **PRM**: Permanent error
- **RIW**: Request inhibit write
- **VIO**: Intent violation
- **WRI**: Write inhibited
- **WRO**: Write operation
- *******: Unknown

**failing_CCW_command_code**
The channel command word (CCW) code that encounters the I/O error.

**failing_CCW_position**
The position in the channel program chain on which the error occurs. If the error occurs at the first CCW in the chain (a Define Extent), the path to the storage control or device can have been dropped. This can indicate an operations error because of the storage path being removed.

**IOS_completion_code**
The return code from IOS.

**subchannel_status**
The channel status word status field received from the subchannel.

**sense_data**
The sense information returned from the operation. See the storage control reference documentation for interpretation of the sense data.

**serial_number**
The volume serial number of the device that encountered the I/O error.

**full_error_description**
A brief description of the cause of the I/O error based on the sense data. See message ANTP7029E for an explanation of these descriptions.

**Source:** ESS Peer-to-peer remote copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** If the problem is an environmental or hardware error, correct the error and resubmit the request. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center.

**Explanation:** Global Mirror has detected an error when requesting a service from the Asynchronous Operations Manager (AOM) function. The message provides the device number to which the I/O is directed, the volume serial number of the device that encounters the I/O error, the return code (SERVRETC_from_AOM), the reason code (SERVREAS_from_AOM), the functional code (SERVFRC_from_AOM), and the abend code (SERVABCO_from_AOM) received from AOM. If the device is offline or unavailable, the volume serial number is reported as "******".

**Source:** ESS Peer-to-peer remote copy (PPRC).

**System action:** The command is rejected.

**System programmer response:** If the problem is an environmental or hardware error, correct the error and resubmit the request. If the problem persists, search the problem reporting databases for a solution. If no solution exists, contact the IBM Support Center.

**Explanation:** This message indicates that PPRC has recorded this TSO command into the system log. The command in the message is the TSO command as entered by the user. Any parameters specified through TSO prompts after the command was entered are not reflected in the command echo.

**Source:** Peer-to-peer remote copy (PPRC).

**System action:** PPRC functions are active.

**System programmer response:** No action is
required. If you do not want to receive this service message, issue MODIFY ANTAS000,NOSYSLOG ON from the operator console.

System data mover return codes

This section defines the return codes issued by the DFSMS system data mover (SDM), and includes extended remote copy (XRC) functions. Some of the return codes in this section might appear as reason codes within related messages. Additionally, some components that interact with SDM use hexadecimal notation.

New information is added to the end of the messages that report return and reason codes to identify first failure data capture information. This support uses only nature of the added information. An example of the messages modified in this way is as follows:

```
ANTC5412E UNABLE TO START CLUSTER MANAGER FOR MSESSION(M) MHLQ(SYS1),
RC=0486 REAS=0486 SRVC=4003
ANTC5420W CLUSTERING FOR CLUSTER(DAVE) MSESSION(M) MHLQ(SYS1) CANNOT BE ENABLED,
RC=0486 REAS=0435 FUNC=0112 SRVC=0112
```

General Recovery Actions:

For all return codes, if the problem persists after you have taken the actions indicated in the related message and the actions described in Table 4 on page 500 then:

1. Search the problem reporting databases for a solution to the problem.
2. Contact the IBM Support Center if you are unable to find a documented solution.
3. Provide the system log and a supervisor call (SVC) dump of both the ANTAS000 and ANTAS001 address spaces, if possible.

Some return code descriptions include a request that you dump additional address spaces, provide a GTF trace, or provide other information to assist the support personnel. The following is an example of all of the responses you will need to dump the local, as well as two other systems:

```
DUMP COMM=(DUMP LOCAL AND 2 OTHER SYSTEMS)
R n1,JOBNAME=(ANTAS*),DSPNAME=('ANTAS*'.SYSANT*),CONT
R n2,SDATA=(ALLNUC,PSA,SQA,CSA,LPA,TRT,SUM,LSQA,RGN),CONT
R n3,PROBDESC=SYSDLQCL,CONT
R n4,REMOTE=(SYSLIST=(sysname2('ANTAS*'),sysname3('ANTAS*')),DSPNAME,SDATA),END
```

On internal errors, the SDM records critical information regarding the error in SYS1.LOGREC. If XRCTRAP is set to ON, the SDM also dumps the failing address space to the SYS1.DUMP data set. The dump, LOGREC, SYSLOG, and any other requested information listed in the description of the return code is sufficient to document a failure that results from an internal error. For codes indicating an internal error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

This section does not document the reason codes for internal error return codes. In most cases the reason code is returned to the SDM by another system component, and has meaning only in the context of how the data mover uses that component.

Some return codes can be due to processing errors in the data mover internals. For many of these errors, one or more volume pairs can have been suspended by the data mover. If XRC pairs are suspended, for example, you can be able to capture the diagnostic result, and then issue an XADDPAIR command to return the affected volume pairs to the XRC session with minimal system impact. If the volume pairs are not suspended, issue an XSUSPEND command for the affected pairs followed by an XADDPAIR.
If any XRC volume pairs continue to cause a problem, you can issue an XDELP AIR command for those pairs, followed by an XADDPAIR command to reinitialize them into the session. If these actions fail to bypass the error, it can be necessary to shut down the session with an XEND command or CANCEL ANTAS001 command, and then reinitialize the session with an XSTART command. All volume pairs would then require a full resynchronization copy with the restart.

Table 4. System Data Mover Return Codes. Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>350</td>
<td>The vary offline function did not complete within the expected time frame for the secondary volume of an XRC pair. Reissue the XADDPAIR command for the volume pair indicated.</td>
</tr>
<tr>
<td>351</td>
<td>Error occurred while you are attempting to vary volume offline. The reason code associated with this return code is generated by IEEVARYD.</td>
</tr>
<tr>
<td>352</td>
<td>An XADDPAIR for a non-xrcutl volume was attempted and REQUIREUTILITY(YES) is specified in the XRC parmlib, but an active storage control session did not exist for the specified (or default) scsession. Reason codes that accompany this return code are for IBM diagnostic use. To correct this error, issue an XADDPAIR command to an XRCUTL volume for the specified (or default) scsession. When successful, reissue XADDPAIR for the non-xrcutl volume.</td>
</tr>
<tr>
<td>353</td>
<td>XADDPAIR for a suspended volume cannot proceed because of the existence of unprocessed updates that occurred before the volume suspension. The system data mover waited for processing to proceed, but did not detect progress for 15 seconds. Wait until session delay is relieved before resubmitting the XADDPAIR command.</td>
</tr>
<tr>
<td>354 to 413</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>414</td>
<td>This error means that you are attempting to start, restart, or recover an XRC session but the MVS image already has the maximum number of XRC sessions that are allowed. Issue an XQUERY command with the session ID of ALL to determine which session (if any) is currently active. You can either suspend or end the active session before you start or recover a session. If the XQUERY report shows that there are no active sessions and this problem persists, it is an internal error. Cancel the ANTASnnn address space to clear the error condition. This return code can also be received with an ANTS5100E message from an internal XSTART command that was issued as part of the ANTASnnn,RESTART command. The ANTASnnn address space had not had time to completely end. In addition, if you ended or suspended a session, you can not have given the address space the time necessary to completely end or suspend the session before issuing the XRECOVER or XADVANCE command. In this case, reissue the command.</td>
</tr>
<tr>
<td>415</td>
<td>The session name specified is not an active XRC session. Issue an XQUERY command with session_id ALL to determine which session (if any) is currently active. This return code can result when the XQUERY command is issued with session_id ALL if an active session is in the process of suspension or ending. Wait until the session has completed suspension processing or has ended before reentering the XQUERY command. If the session does not end, you might need to issue a CANCEL ANTASnnn command to force the address space to end.</td>
</tr>
<tr>
<td>416</td>
<td>The specified session ID is currently active in an XRC session. If this return code appears with message ANTS5100E, the session ID specified in the XSTART command is already active or address space termination for the session has not completed. When the address space no longer exists, reissue the XSTART command. If the return code appears with message ANTR5102E, an XEND or XSUSPEND command must be issued before the XRECOVER command can be processed.</td>
</tr>
<tr>
<td>417</td>
<td>This is an internal error.</td>
</tr>
</tbody>
</table>
SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>418</td>
<td>The volume specified in an XADDPAIR or XDELPAR command, or a volume required by the XRECOVER, XADVANCE, or XSTART command is not found.</td>
</tr>
<tr>
<td></td>
<td>For an XADDPAIR or XDELPAR command, ensure that the volume has been specified properly and that the volume is online to the data mover system. After correcting the problem, reissue the XADDPAIR or XDELPAR command.</td>
</tr>
<tr>
<td></td>
<td>For an XRECOVER or XADVANCE command, ensure that the volume is online to the data mover system. After correcting the problem, reissue the command.</td>
</tr>
<tr>
<td></td>
<td>For an XSTART command (when restarting a session), ensure that the volume is online to the data mover system. The storage control report associated with the restarted XRC session indicates that the storage control session is in a quiesced or suspended state. Ensure that all volumes for the storage control are placed online, then issue an XADDPAIR command to add this volume and other volumes in the quiesced or suspended storage control into the XRC session. If you want the session to be restored but do not want to resynchronize the volumes at this time, you can issue an XSUSPEND command to suspend the session followed by an XSTART command to restart the session. The session will then monitor record updates. If you are unable to place the volume online to the data mover system, you must issue a MODIFY ANTAS000,TERMSESS command for the storage control session to free up resources associated with this volume and other volumes on the storage control. All volumes on the storage control will then require a full initialization.</td>
</tr>
<tr>
<td></td>
<td>If you want to restore the session but do not want to resynchronize the volume pairs at this time, you can vary the volumes online, and then issue an XSUSPEND command to suspend the session followed by an XSTART command the restart the session.</td>
</tr>
<tr>
<td></td>
<td>If the return code appears with message ANTR5102E, verify that the volume to be recovered is online to the recovery system before issuing the XRECOVER or XADVANCE command.</td>
</tr>
<tr>
<td></td>
<td>When associated with the REFRESH command error message ANTX8142E, this indicates that the secondary volser is not online to the SDM system. REFRESH requires an online secondary volume to determine the location of the relocated volume.</td>
</tr>
<tr>
<td>419</td>
<td>The secondary volume of an XRC pair is currently in use. XRC requires exclusive use of the secondary volume. If the volume is allocated to another function, then XRC will not use the volume. Ensure that the secondary volume is available for XRC use (the volume is not allocated), and then reissue the XRC command.</td>
</tr>
<tr>
<td>420</td>
<td>The volume or volumes specified in the XADDPAIR command are not attached to storage controls with the proper level of the XRC Licensed Internal Code (LIC) installed. XRC primary volumes must be attached to storage controls that are XRC-capable and have the LIC installed to support XSUSPEND functions.</td>
</tr>
</tbody>
</table>
### Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>421</td>
<td>Primary and secondary volumes must have the same device type. This error is due to one of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• XADDPAIR command – The primary volume type does not match the secondary volume type. The secondary volume must have the same number of tracks per cylinder and bytes per track as the primary volume. The secondary volume must have a capacity greater than or equal to that of the primary.</td>
</tr>
<tr>
<td></td>
<td>• XRECOVER command – The information in the XRC state data set does not match the device characteristics of the secondary volume serial number being recovered. It can mean that a volume on the recovery system has the same volume serial number as that on the data mover system, but is a different volume. This is likely a configuration problem.</td>
</tr>
<tr>
<td></td>
<td>• XDELPAIR command – Current characteristics on the indicated volume do not match the characteristics the volume had when it was added to the session. The XDELPAIR command completed successfully, but message ANTX5011E with this return code is issued to indicate this condition. This condition can have resulted because the volume was migrated from one location to another (within the same storage control or to a different storage control), or can have been migrated to a different device geometry; for example, from 3380 to 3390.</td>
</tr>
</tbody>
</table>

See [Z/OS DFSMS Advanced Copy Services](https://www.ibm.com/support/manuals/) for allowable device configurations.

If this return code appears with message ANTA5107E, reissue the XADDPAIR command using volumes with the same device type characteristics. Ensure that the number of cylinders on the secondary volume is equal to or greater than the number of cylinders of the primary device. If this return code appears with message ANTR5102E, ensure that the secondary volume being recovered is the same volume which was originally part of the XRC session.

When you contact IBM for assistance, provide a generalized facility trace of the commands issued to the XRC volumes, in addition to the data requested in the beginning of this section. Issue the DEVSERV QDASD command with the UCB option to obtain the device characteristics of the failing primary and secondary volume pair.

When associated with the REFRESH command error message ANTX8142E, this indicates that the number of tracks per cylinder is not the same as the existing secondary volume or the number of cylinders of the relocated secondary is less than the existing secondary volume. REFRESH requires that the existing secondary volume and the relocated secondary volume have compatible attributes.
### SDM Return Codes

</table>
| 422         | The volume specified in an XADDPAIR command, an XDELPARIR command, in conjunction with an XRECOVER command, or for a session restarted with an XSTART command is not found.  
For an XADDPAIR or XDELPARIR command, ensure that the volume has been specified properly and that the volume is online to the data mover system. After correcting the problem, reissue the XADDPAIR or XDELPARIR command.  
For an XRECOVER command, ensure that the volume is online to the data mover system. After correcting the problem, reissue the command.  
For an XSTART command, ensure that the volume is online to the data mover system. The storage control report associated with the restarted session indicates that the storage control session is in a quiesced state. Ensure that all volumes for the storage control are placed online, then issue an XADDPAIR command to add this volume and other volumes in the quiesced storage control into the session. If you want the session to be restored but do not want to resynchronize the volumes at this time, you can issue an XSUSPEND command to suspend the session followed by an XSTART command to restart the session. The session will then monitor record updates. If you are unable to place the volume online to the data mover system, you must issue an MODIFY ANTAS000,TERMSESS command for the storage control session to free up resources associated with this volume and other volumes on the storage control. All volumes on the storage control will then require a full initialization.  
If the return code appears with message ANTR5102E, verify that the volume to be recovered is online to the recovery system before issuing the XRECOVER command |
| 423         | This is an internal error. |
| 424         | XRC is unable to allocate one of the preallocated XRC state, control, or journal data sets. This is probably an installation problem. There are three likely causes:  
* The session ID specified is invalid. In this case, reissue the command with the correct session name.  
* A high-level-qualifier specified on the XSTART or XRECOVER command is invalid. In this case, reissue the command with the correct high level qualifier name.  
* One or more of the data sets are not allocated or are not cataloged on the data mover or recovery system. In this case, ensure that all of these data sets are allocated and cataloged to both the data mover and recovery system. Reissue the failing command.  
When contacting IBM for assistance, provide a list of the XRC state, control, and journal data set names that are cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section. |
| 425         | XRC is unable to deallocate a data set, and the deallocation fails.  
When contacting IBM for assistance, provide a list of the SYS1.XCOPY or hlq.XCOPY data sets that are cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section. |
<p>| 426 to 428  | These are internal errors. |</p>
<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>429</td>
<td>The XSTART or XRECOVER function is unable to allocate the preallocated <code>hlq.XCOPY.session_id.CONTROL</code> data set. The default for <code>hlq</code> is SYS1. Ensure that the <code>hlq.XCOPY.session_id.CONTROL</code> data set is properly allocated and cataloged on the data mover and recovery systems. The reason code associated with this return code is generated by the DYNALLOC facility. See the reason codes from the DYNALLOC section of <a href="https://pubs.opengroup.org/onlinepubs/9699919999/a02asley.html">z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN</a> for reason code information. </tr>
<tr>
<td>430</td>
<td>The XRC XSTART or XRECOVER function is unable to allocate the preallocated <code>hlq.XCOPY.session_id.JRNL01</code> and <code>hlq.XCOPY.session_id.JRNL02</code> data sets. The default for <code>hlq</code> is SYS1. Ensure that the <code>hlq.XCOPY.session_id.JRNL01</code> and <code>hlq.XCOPY.session_id.JRNL02</code> data sets are properly allocated and cataloged on the data mover and recovery systems. The reason code associated with this return code is generated by the DYNALLOC facility. Reason codes of one to 16 indicate which journal data set the allocation is failing on. For reason codes outside of this range, see the DYNALLOC section of <a href="https://pubs.opengroup.org/onlinepubs/9699919999/a02asley.html">z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN</a> for reason code information. When contacting IBM for assistance provide a list and allocation attributes of the <code>hlq.XCOPY</code> data sets cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>431</td>
<td>The XRC XSTART, XCOUPLE with PURGE option, XADVANCE, or XRECOVER function is unable to allocate the preallocated <code>hlq.XCOPY.session_id.STATE</code> data set. The default for <code>hlq</code> is SYS1. Ensure that the <code>hlq.XCOPY.session_id.STATE</code> data set is properly allocated and cataloged on both the data mover and recovery systems. The reason code associated with this return code is generated by the DYNALLOC facility. See the reason codes from the DYNALLOC section of <a href="https://pubs.opengroup.org/onlinepubs/9699919999/a02asley.html">z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN</a> for reason code information. When you contact IBM for assistance, provide a list and allocation attributes of the <code>hlq.XCOPY</code> data sets cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>432</td>
<td>The volume is attached to a storage control that is not XRC-capable. Ensure that the primary volume is online, and attached to an XRC-capable storage control. When contacting IBM for assistance, provide a list and allocation attributes of the SYS1.XCOPY data sets cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section. You can issue a DEVSERV QDASD command to dump the UCB and DCE.</td>
</tr>
<tr>
<td>433</td>
<td>XRC was unable to open one of the <code>hlq.XCOPY</code> state, control, or journal data sets (up to a maximum of 16 journals). Ensure that the data sets have been allocated with the proper attributes. See <a href="https://www.ibm.com/support/knowledgecenter/STQTRD_5.4.0/com.ibm.zos.v5r4.doc/installation/instconcepts/copyserv.html">z/OS DFSMS Advanced Copy Services</a> for the data set attributes. When contacting IBM for assistance, provide a list and allocation attributes of the SYS1.XCOPY data sets cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

**Table 4. System Data Mover Return Codes (continued).** Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>434</td>
<td><strong>XRC is unable to close one of the hlq.XCOPY state, control, or journal data sets (up to a maximum of 16 journals). This should not affect the success of the XEND or XSUSPEND function. You should be able to restart the session again.</strong></td>
</tr>
</tbody>
</table>

When contacting IBM for assistance, provide a list and allocation attributes of the SYS1.XCOPY data sets cataloged on both the data mover and recovery systems, in addition to the data requested in the beginning of this section. This problem also requires a GTF trace to determine where the problem occurred during a close.

| 435         | **A failure has occurred during XRC processing when one of the functions requested did not complete in a reasonable timeframe. If the processor has been in a stopped state, this can be an expected error. If this error occurs while starting a session or restarting a suspended session, it can be that the state, control, or journal data sets are unavailable to the XSTART command. Possibly another processor has reserved the volumes that these data sets reside on. Correct the condition so that the XSTART function can proceed normally. If the condition cannot be immediately corrected, you can issue an XEND command to end the session or an XSUSPEND to return the session to a suspended state. After correcting the condition, you can reissue the XSTART command to start or restart the session.** |

If the problem persists, issue `MODIFY ANTASnnn,DUMP` to collect diagnostic information.

| 436         | **A volume specified with an XADDPAIR command has failed XRC validation for one of the following reasons:**  
|             | • A specified secondary volume is already defined in a session as a primary volume.  
|             | • A specified secondary volume is already defined in a session as another secondary volume.  
|             | • A specified primary volume is already defined in a session as a secondary volume.  

Issue an XQUERY command to determine what volumes are currently defined to the session. To change the status of a volume already in the session, issue an XDELPAIR command to remove the volume pair from the session, then reissue the XADDPAIR command to add the correct volumes. If an incorrect volume pair was specified with an XADDPAIR command, correct the error and reissue the command.

<table>
<thead>
<tr>
<th>437, 438</th>
<th><strong>These are internal errors.</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>439</td>
<td><strong>During XRC processing all journal data sets have been filled. No additional extent space is available on the journal volumes. XRC suspends the session when this condition occurs. The journal data sets are not large enough to support the volume of XRC data being copied. This error requires the XRC session to be suspended and restarted. The error might be due to an insufficient number of journal data sets being allocated. The minimum is 2 and the maximum is 16. You can wish to allocate more journal data sets, or to make the existing ones striped data sets that span up to 16 volumes.</strong></td>
</tr>
</tbody>
</table>

This condition can also occur when updates to the secondary volumes have fallen so far behind the primary system updates that the journals have been filled with unapplied data. In this case, the configuration of the XRC system can be such that the data mover cannot keep up with the primary updates. You might need to reconfigure the system or place fewer volumes under XRC control. You can suspend, reconfigure, and then restart the session.

When contacting IBM for assistance, provide a dump of the journal, state, and control data sets, in addition to the data requested in the beginning of this section.
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>440</td>
<td>SMS was not active on the data mover system at the time an XSTART or XRECOVER command was issued. This might be due to a window condition when SMS was not active at the time the XRC command was issued. If this return code appears with message ANTS5100E, then ensure that SMS is made active before issuing the XSTART command. If the return code is present with message ANTR5102E, activate SMS before reissuing the XRECOVER command.</td>
</tr>
<tr>
<td>441</td>
<td>SMS is not installed on the XRC data mover system. Ensure that SMS is installed on the data mover system where the XRC commands are being issued before reissuing the XSTART or XRECOVER command. The command can have been issued on the wrong system. After verifying that SMS is installed on the proper system, reissue the command.</td>
</tr>
<tr>
<td>442</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>443</td>
<td>This error occurs when an XRC function attempts to communicate to the ANTAS000 address space. This can occur if the control address space, ANTAS000, is canceled and is not active at the time of the error. Ensure that the ANTAS000 address space is active, and then reissue the command.</td>
</tr>
<tr>
<td>444</td>
<td>This error occurs when an attempt is made to process an XRC request and the XRC session is not currently active or is in the process of ending. If the session does not end, the session cleanup phase can be stalled. In this case, issue MODIFY ANTASnnn,RESTART to force a dump and restart the data mover. You can then resynchronize the volumes into the session with XADDPAIR commands.</td>
</tr>
<tr>
<td>445</td>
<td>This error occurs when an XRC function attempts to communicate to the ANTASnnn address space. This can occur if the data mover address space (ANTASnnn) is canceled and is not active at the time of the error.</td>
</tr>
<tr>
<td>446</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>447</td>
<td>An XADDPAIR command was issued which specifies the same volume serial number for both the primary and secondary volumes. You cannot use XRC to copy a volume to itself. Reissue the XADDPAIR command specifying unique volumes for the primary and secondary volumes.</td>
</tr>
<tr>
<td>448</td>
<td>This is an internal error.</td>
</tr>
<tr>

SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
</table>
| 455         | The XRECOVER or XADVANCE command has completed processing for an XRC session that was started with SESSIONTYPE(XRC). All XRECOVER or XADVANCE functions are not complete because there were no members found in the XRC control data set. This might be due to one of the following conditions:  
  • No updates were made to any of the primary volumes while the session was active. Data on all secondary volumes is consistent as of the timestamp reported when the session was suspended or ended. There are no updates that need to be applied to the secondary volumes because the control data set was not initialized. If the XRECOVER command was invoked, you must clip the secondary volumes to match the primary volume serial numbers.  
  • No volumes have ever been added to the session. The XRECOVER or XADVANCE has no work to do and the function is complete.  
  • The CONTROL0 or CONTROL1 member cannot be found in the control data set. Possibly the wrong data set is cataloged on the recovery system. Ensure that the correct data set is cataloged, and then reissue the XRECOVER or XADVANCE command.  
If the members do not exist and the system log indicates that an XRC session was properly started with active updates on the volumes, then contact IBM for assistance. Provide a report on the cataloged data sets on both the data mover system and the recovery system, in addition to the data requested in the beginning of this section. |
| 456         | The XRECOVER or XADVANCE command failed because the state data set indicates that there are no active volumes in the session. Ensure that the state data set has SESSION1, STATE000, and STATE001 members. If none exist, this can indicate either that the wrong data set is cataloged on the recovery system, or that an incorrect HLQ is specified. The error can also occur if the XSTART or XADPAIR commands have never been issued for the session. If the members do not exist and the system log indicates that an XRC session was properly started with active volumes, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a report on the cataloged data sets on both the data mover system and the recovery system, in addition to the data requested in the beginning of this section. |
| 457         | The XRECOVER or XADVANCE command failed because of an I/O error attempting to read the XRC control data set. This error occurs because of a hardware error. The hardware error should have had message ANTX5014E associated with it. XRC recovery cannot take place until the hardware error has been resolved. Data on the secondary volumes is accurate to the last reported timestamp. Additional updates can have been applied, but not reported. Data consistency across the secondary volumes cannot be ensured because of the error. Correct the hardware error and reissue the XRECOVER or XADVANCE command. If no I/O error is indicated then search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a report on the cataloged data sets on both the data mover system and the recovery system and a copy of the control data set, in addition to the data requested in the beginning of this section. |
| 458         | The XRECOVER or XADVANCE command failed because of an I/O error attempting to read the XRC state data set. This error occurs because of a hardware error. The hardware error should have had message ANTX5014E associated with it. XRC recovery cannot take place until the hardware error has been resolved. Data on the secondary volumes is accurate to the last reported timestamp. Additional updates can have been applied, but not reported. Data consistency across the secondary volumes cannot be ensured because of the error. Correct the hardware error and reissue the XRECOVER or XADVANCE command. If no I/O error is indicated then search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a report on the cataloged data sets on both the data mover system and the recovery system and a copy of the state data set, in addition to the data requested in the beginning of this section. |
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>459</td>
<td>The XRECOVER or XADVANCE command failed because of the control data set being invalid. This error occurs when XRC can read the data set, but the data in the data set is invalid. This condition can occur if you have a control data set which follows the XRC naming conventions and has members, CONTROL0 and CONTROL1, but is not used by XRC. This error can occur if an XRECOVER or XADVANCE command is issued for a previous level data mover that was suspended or ended. Ensure that the data mover can recover the environment for which the XRECOVER or XADVANCE command was issued. If the data set is being properly used and the XRECOVER or XADVANCE command is being properly issued, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a report on the cataloged data sets on both the data mover system and the recovery system and a copy of the control data set, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>460</td>
<td>An XSTART, XRECOVER, or XADVANCE command failed because of the state data set being invalid. This error occurs when XRC can read the data set, but the data in the data set is invalid. This condition can occur if you have a state data set which follows the XRC naming conventions and has members, STATE0 and STATE1, but is not used by XRC. If the data set is properly being used then search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a report on the cataloged data sets on both the data mover system and the recovery system and a copy of the state data set, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>461</td>
<td>During processing of an XRECOVER or XADVANCE command, the recover function has determined that the secondary volume cannot be found. This is probably a configuration error. The secondary volume or volumes must be online to the recovery system before issuing the XRECOVER or XADVANCE. Ensure that all volumes to be recovered are online, and then reissue the XRECOVER or XADVANCE command. If XRC abnormally ends during an XRECOVER command, some secondary volume serial numbers can have already been updated. In this case, the XRECOVER command cannot be reissued. Relabel the secondary volumes back to their original volume serial numbers before reissuing the XRECOVER command.</td>
</tr>
<tr>
<td>462, 463</td>
<td>An XDELPAIR command has been issued to remove one or more volumes from the session, but there are no volumes in the session. Issue the XQUERY command with the VOLUME(ALL) option to determine the status of volumes in the session.</td>
</tr>
<tr>
<td>464</td>
<td>The primary volume specified in an XADDPAIR command was determined to be invalid. Ensure that the primary volume is a valid volume that is online to the data mover system, and then reissue the command.</td>
</tr>
<tr>
<td>465</td>
<td>The secondary volume specified in an XADDPAIR command was determined to be invalid. Ensure that the secondary volume is a valid volume that is online to the data mover system, and then reissue the command. If this error is associated with an XADDPAIR command for a suspended pair, use the XQUERY configuration report to determine the secondary volume that was specified when the pair was originally added to the session, then reissue the command.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>466, 467</td>
<td>Either of these indicate a probable I/O error that has occurred when XRC attempted to access the journal, state, or control data sets. Return code 466 indicates a read error, and return code 467 indicates a write error. Other messages can also be present, including an associated ANTX5014E error message providing hardware error diagnostics, and error messages from IOS or data management. Correct the journal error, then suspend the session and restart the data mover. When contacting IBM for assistance, provide a copy of the associated SYS1.LOGREC information and a GTF trace, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>468, 469, 471</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>470, 472</td>
<td>The session is in a state of being ended or suspended. If the session does not suspend or end, the session cleanup process can be stalled. In this case, issue the MODIFY ANTASnnn,DUMP command followed by the CANCEL ANTASnnn command after the dump has completed. It is likely that all volumes in the session will then require a reinitialization.</td>
</tr>
<tr>
<td>473 to 479</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>480</td>
<td>The specified volume was not suspended by XRC. Possibly another error associated with a list of volumes being processed has caused this error. To suspend the volume, reissue theXSUSPEND command. If the volume cannot be suspended, delete the volume pair from the session, then add it back into the session. If this error has been received with a valid active session, issue MODIFY ANTASnnn,DUMP to obtain a dump of the failing session. A dump is required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>481, 482</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>483</td>
<td>An attempt has been made to restart a session, but no storage control session exists on the storage control associated with this data mover. The previously existing session has been ended by the storage control. This might be due to an expired timeout interval for the storage control. If you want the volume pair to be part of the XRC session, reissue the XADDPAIR command for the volume pair. A full-volume synchronization is then required for the volume pair. If this error has been received with a valid active storage control session, issue MODIFY ANTASnnn,DUMP to obtain a dump of the failing condition. Issue MODIFY ANTASnnn,LISTSESS to obtain the storage control information on active sessions and MODIFY ANTASnnn,LISTDVCS to obtain the storage control information for active devices. This information is required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>484, 485</td>
<td>These are internal errors. Issue MODIFY ANTASnnn,DUMP to obtain a dump of the error.</td>
</tr>
<tr>
<td>486, 487</td>
<td>These return codes can indicate that the requested command function is taking longer than expected. Reissue the command. If this error occurs while starting a session or restarting a suspended session, it can be that the state, control, or journal data sets are unavailable to theXSTART command. Possibly another processor has reserved the volumes that these data sets reside on. Correct the condition so that the XSTART function can proceed normally. If the condition cannot be immediately corrected, you can issue anXEND command to end the session or an XSUSPEND to return the session to a suspended state. After correcting the condition, you can reissue the XSTART command to start or restart the session. If the problem persists, issue the F ANTASnnn,DUMP command to collect diagnostic information.</td>
</tr>
<tr>
<td>488</td>
<td>This is an internal error.</td>
</tr>
</tbody>
</table>
Table 4. System Data Mover Return Codes  (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>489</td>
<td>The XADDPAIR command function has determined that the primary volume listed in message ANTA5107E is currently in an active XRC session. Use the XQUERY command to determine which volumes are already part of an XRC session, then reissue the XADDPAIR command with the correct primary volume serial number or SCSESSION identifier.</td>
</tr>
<tr>
<td>490</td>
<td>The XADDPAIR command function has determined that the secondary volume listed in message ANTA5107E is currently in an active XRC session. Use the XQUERY command to determine which volumes are already part of an XRC session, then reissue the XADDPAIR command with the correct secondary volume serial number or SCSESSION identifier.</td>
</tr>
<tr>
<td>491</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>492</td>
<td>This error occurs if XRC encounters an error when it is writing to either the control or state data set. In most cases, the error occurs because the data set did not have sufficient space to contain XRC information. See <a href="https://publib.boulder.ibm.com/infocenter/zos/v2r11/index.jsp">z/OS DFSMS Advanced Copy Services</a> to determine the proper allocation sizes for the XRC control and state data sets. If this error occurs, perform the following procedure:  1. Allocate a new control or state data set.  2. Suspend the session with an XSUSPEND command.  3. Copy the existing control or state data set to the new data set.  4. Delete the existing control or state data set.  5. Rename the new control or state data set to the original control or state data set name.  6. Restart the XRC session by issuing an XSTART command.  7. Resynchronize the suspended volumes by issuing an XADDPAIR command for all of the volumes in the session.  When you contact IBM for assistance, provide a copy of the failing data set, in addition to the data requested at the beginning of this section.</td>
</tr>
<tr>
<td>493</td>
<td>This can mean that secondary updates are not being performed fast enough to keep pace with primary updates. Verify the configuration to ensure that you have not placed too many secondary volumes behind a single storage control. Verify that DASD fast write is enabled for the secondary volumes.</td>
</tr>
<tr>
<td>494 to 497</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>498</td>
<td>The request has failed because the session is currently being ended or suspended. This error can be the result of a previously issued XEND or XSUSPEND command. See previous messages for an explanation of when the previous command was issued. If the active command does not complete in a reasonable timeframe, you can issue MODIFY ANTASnnn,DUMP to capture the proper information for problem diagnosis. You might need to issue CANCEL ANTASnnn to force the address space to end.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
</table>
| 499         | This error occurs if XRC is unable to add any more members to the state data set during XSTART or XADDPAIR command processing. This error can also occur while XRC attempts to add the coupling member to the state data set when it processes an XCOPPLE ADD command. The state data set must have directory space and data set space for a STATE000, STATE001, SESSION01, COUPLE, and space for each primary volume serial number in the XRC session. The primary volume serial number member name is in the form Vxxxxxxx where xxxxxx is the volume serial number of a primary volume. If this error occurs, perform the following procedure:  
  1. Allocate a new state data set with more directory entries defined or additional space allocated for the data set.  
  2. Suspend the session with an XSUSPEND command.  
  3. Copy the existing state data set to the new state data set.  
  4. Delete the existing state data set.  
  5. Rename the new state data set to the original state data set name.  
  6. Restart the XRC session by issuing an XSTART command.  
  7. Resynchronize the suspended volumes by issuing an XADDPAIR command for all of the volumes in the session.  
  8. If XSTART was not the command that originated this reason code, invoke the command that originally caused this reason code. |
| 500 to 603  | These are internal errors. |
| 604         | This hardware-detected error can occur for one of the following reasons:  
  - The specified volume can already be owned by an active XRC session.  
  - An I/O error has occurred while attempting to add the specified volume to the session. For either of the above reasons, issue MODIFY ANTAS000,LISTDVCS to the volume to determine which storage control session number owns the volume to be added. If you do not want the session to be active for the volume, you can force the storage control session to free the volume for use by issuing MODIFY ANTAS000,TERMDVC to the session.  
  - The storage control cache or NVS is unavailable on the primary (source) storage controls. Issue the DEVSERV system command to display the current status of cache and NVS for the subsystem and the primary volume. If the error continues after you have verified that the storage control cache and NVS are available, the storage control can have encountered an uncorrectable error. You might need to re-IML the storage control to correct the problem. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. When contacting IBM for assistance with a problem, provide any associated SYS1.LOGREC information, in addition to the data requested in the beginning of this section. A GTF trace of the operations leading to the error can also be required. |
| 605         | The maximum number of XRC sessions that are supported by a storage control has been reached. If you reissue the XADDPAIR command, this problem can not occur as volumes are deleted from other sessions. This error can occur if you attempt to start too many SCSESSIONS for a single storage control. If this error continues to occur, issue a LISTSESS command to determine which sessions are currently active on the storage control. Issue the TERMSESS command to end sessions that should not be active. If the error persists, see [z/OS DFSMS Advanced Copy Services](https://www.vm.ibm.com/) for information about identifying and restarting suspended sessions. When contacting IBM for assistance, a GTF trace of the operations leading to the error can also be required, in addition to the data requested at the beginning of this section. |
### Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>606</td>
<td>This is a hardware I/O error from an attempt to read a track from the specified primary volume; it can indicate a cache error. See accompanying messages to determine the scope of the error. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>607</td>
<td>This is a hardware I/O error from an attempt to read one or more updates from the primary storage control cache. It can indicate a cache error, a session ending, a storage control session timeout condition, or the loss of the path (or line) from the data mover to the storage control cache. See accompanying messages to determine the scope of the error. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. If a path to the storage control has been lost, the associated storage control session might need to be ended with the TERMSESS command, as the data mover is unable to cleanup the session. Issue the MODIFY LISTSESS command to determine if the storage control session is still active, then end it if necessary.</td>
</tr>
<tr>
<td>608</td>
<td>This is a hardware I/O error from an attempt to add the specified primary volume to the session. The specified volume is owned by another session or the storage control session that this volume is being added to is in a state other than active. Issue MODIFY ANTAS000,LISTDVCS to the volume to determine which storage control session owns the volume. If you do not want the storage control session to be active you can force the storage control session to free the volume for use by issuing MODIFY ANTAS000,TERMDVC to the session. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>609</td>
<td>A hardware I/O error has occurred while deleting the primary volume from the session. You can force the volume pair to end by issuing MODIFY ANTAS000,LISTDVCS to the volume to determine which storage control session owns the volume. If you do not want the storage control session to be active you can force the storage control session to free the volume for use by issuing MODIFY ANTAS000,TERMDVC to the session. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>610</td>
<td>A hardware I/O error has occurred while ending the XRC session. You can force the storage control session to end by first issuing MODIFY ANTAS000,LISTDVCS to a volume in the session to determine the active storage control sessions for the device. Next issue MODIFY ANTAS000,TERMSESS to end the storage control session. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>611 to 614</td>
<td>A hardware I/O error has occurred while writing data to a secondary volume. The volume pair is suspended. Using the sense information provided, correct the error and issue an XADDPAIR command to resynchronize the volume pair back into the XRC session. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>615 to 616</td>
<td>An error has occurred in track synchronization processing. Issue an XDELPAIR command to remove the volume pair from the XRC session. You can issue an XADDPAIR command to add the volume pair back to the session. The volume pair will then require a full initialization. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>617 to 619</td>
<td>These are internal errors.</td>
</tr>
<tr>
<td>620</td>
<td>A hardware I/O error has occurred while attempting to determine the device characteristics of the volume. Correct the error and add the volume pair back into the session.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>621</td>
<td>An I/O error has occurred during I/O to the specified volume. If the error occurred on the primary volume, it is likely that the storage control session has ended. This might have been due to a cache or NVS error, a timeout expiration, or an operator-initiated TERMSESS command. If the error is on a write operation, the error might be due to a cache or NVS error. Correct the error and add the volume pair back into the session. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information.</td>
</tr>
<tr>
<td>622, 623</td>
<td>These are internal errors. When contacting IBM for assistance, also provide a copy of the SYS1.LOGREC data set, in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>624</td>
<td>This is a hardware I/O error. The XRC data mover function encountered an I/O error while attempting to write the volume label on the secondary volume. Use the sense information and SYS1.LOGREC records to determine the cause of the error. Correct the error and restart the function that encountered the error. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. When contacting IBM for assistance, a GTF trace of the operations leading to the error can also be required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>625</td>
<td>The maximum number of XRC sessions that are supported by a storage control has been reached. The session limit includes both concurrent copy and XRC sessions. Issue the LISTSESS command to determine the number of active storage control sessions for the storage control. See z/OS DFSMS Advanced Copy Services for information about determining what sessions are active and restarting suspended sessions. When contacting IBM for assistance, a GTF trace of the operations leading to the error can also be required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>626</td>
<td>The maximum number of XRC sessions for a single volume has been reached. No volume can have more than one active XRC session. This error can be caused when an XADDPAIR command closely follows an XDELPAIR command, but the delete operation is not yet complete. Reissue the XADDPAIR command. If the error persists, issue the LISTDVCS command to determine the number of storage control sessions. When contacting IBM for assistance, a GTF trace of the operations leading to the error can also be required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>627</td>
<td>The maximum number of data mover sessions supported for a single volume has been reached. The session limit includes both concurrent copy (CC) and XRC sessions. 3990 and 9390 Storage Controls allow up to 16 CC sessions, or 15 CC and one XRC session, per volume. ESS storage subsystems allow up to 64 CC sessions, or 63 CC sessions and one XRC session, per volume. Issue the LISTDVCS command to determine the number of storage control sessions. When contacting IBM for assistance, a GTF trace of the operations leading to the error can also be required in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>
<td>628</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>629</td>
<td>This error is due to a nonstandard record zero on the volume. XRC supports only volumes which have a standard record zero. Initialize the volume with standard record zero and add it to the XRC session. If this error occurs and the volume has standard record zero, then search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide a dump of the failing track and records in addition to the data requested in the beginning of this section.</td>
</tr>
</tbody>
</table>
### Table 4. System Data Mover Return Codes (continued)

Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>630</td>
<td>An I/O error has occurred while attempting to read a track for a suspended volume during volume resynchronization. An IOS error message should accompany this error. Correct the error and issue an XADDPAIR command to return the volume pair to the session. The affected volumes will require a full-volume synchronization after and XADDPAIR command is issued. Processing continues for the rest of the volumes in the session if ERRORLEVEL(VOLUME) was specified for the volume pair.</td>
</tr>
<tr>
<td>631</td>
<td>This means a non-timestamped write was encountered during resynchronization processing. The volume pair is suspended. The condition can be corrected by issuing an XADDPAIR command for the volume pair.</td>
</tr>
<tr>
<td>632</td>
<td>This is an internal error. Issue MODIFY ANTAGn, DUMP to obtain a dump of the error.</td>
</tr>
<tr>
<td>633</td>
<td>A list of volumes was given on the specified command. The error occurs when the same volume serial number is specified more than once in the list. Correct the error and respecify the command. A volume serial number can only be specified once in the list.</td>
</tr>
</tbody>
</table>
| 634         | This error is issued when a primary storage control session has been ended. The session might have ended because of any of the following reasons:  
  - A TERMSESS command being issued to the storage control session  
  - The timeout expiring on the storage control session  
  - Cache or NVS being turned off for a storage subsystem  
  - A storage control error  
  - A software error.  
  The error is detected by either XADDPAIR processing or during normal data mover processing. If an SCSESSION exists for the storage control, the scope of the error reported by this message is for a single session.  
  Review other diagnostic messages to determine the cause of the problem. All volumes for the storage control are suspended as a result of this error. Based on the ERRORLEVEL specification, other volumes on other storage controls can also be suspended. After determining the reason for the error and correcting the condition, you can issue an XADDPAIR command to add the suspended volumes back to the session. The suspended volumes will require a full resynchronization. |
| 635         | An I/O error has occurred while attempting to read from a list of sessions that are on a storage control. This can be caused by an LIC error which generates the I/O error. Verify that the LIC level supports remote copy functions. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. If the error persists, obtain a GTF trace for the specified device. |
| 636         | An I/O error has occurred while attempting to read from a list of devices that are on a storage control. This can be caused by an LIC error which generates the I/O error. Verify that the LIC level supports remote copy functions. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. If the error persists, obtain a GTF trace for the specified device. |
| 637         | An I/O error has occurred while attempting to read control information from a storage control. Possibly, an LIC error has generated the I/O error. Verify that the LIC level supports remote copy functions. If the message issued with this return code was accompanied by an ANTX5000E, ANTX5001E, or ANTX5002E message, see those messages for further information. If the error persists, obtain a GTF trace for the specified device. |

<td>Internal error.</td>
</tr>
<tr>
<td>675</td>
<td>The system data mover has attempted to issue I/O to a device, but the I/O was not completed in the allotted time. If the accompanying reason code is 82, the timeout occurred after the I/O had been started. If the accompanying reason code is 83, the error occurred while the I/O was waiting to start. When reading updates from cache, or writing updates to a secondary volume, this return code is issued only when the data mover determines not to retry the condition. Retry will not be attempted if there is a command in progress (XDELPAIR, XSUSPEND, XEND), or if at least one storage control session is exceeding cache SIDEFILE limits. If the timeout occurs while writing updates to a secondary volume, the number of retry attempts is limited to four. The z/OS DEVSERV command can be helpful with problem determination. When the underlying problem is corrected, issue an XADDPAIR command for all of the suspended volumes.</td>
</tr>
<tr>
<td>676</td>
<td>An error occurred during XRC volume synchronization or resynchronization. The volume was suspended. XRC was unable to write data to a secondary volume of an XRC volume pair. The error occurred for a track on the primary volume which had been updated before the initialization of the track on the associated secondary volume. There are two reasons why XRC was unable to perform the I/O request: • Another program was holding a system reserve on the secondary volume. • The I/O request did not complete successfully. Determine the reason XRC was unable to perform the I/O request, fix the problem, and issue the XADDPAIR SUSPEND command.</td>
</tr>
</tbody>
</table>
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>677</td>
<td>The XRC session has detected that a storage control session has been in the long busy condition for 80% of the storage control timeout time. The XRC session will suspend all volumes associated with the storage control session to attempt to free up storage control cache to end the long busy condition.</td>
</tr>
<tr>
<td>678</td>
<td>The XRC session has determined that a storage control session has been in the long busy condition for the storage control timeout time. The storage control session ends and all volumes associated with the storage control session are suspended. This free up the cache resource in the storage control and ends the long busy condition. <strong>Note:</strong> If SILB is enabled in software but not hardware, you will get this return code instead of a return code 647 reason 17 or 18. Please ensure that in the SL column of a XQUERY STORAGECONTROL FEATURES report that it reads YY. If it reads NY or -Y, you will receive a return code of 678.</td>
</tr>
<tr>
<td>679</td>
<td>The XRC has determined that a delay in the delivery of I/O to an active LOGPLUS volume is causing a problem in the formation of consistency groups in the active session. Subsequent messages indicate that the volumes were suspended because of this problem. Determine the reason why the I/O was not received by the LOGPLUS volume(s). Fix the problem and re-ADD the LOGPLUS volumes(s) to the XRC session.</td>
</tr>
<tr>
<td>680</td>
<td>The error is issued if mirror validation detects that the primary device associated with a duplex volume pair does not belong to an XRC storage control session. To return the volume to duplex, issue an XADDPAIR command. The data mover will automatically perform a full copy on the volume. Note that volumes encountering this error are not eligible to be processed by AUTO_READD.</td>
</tr>
<tr>
<td>681</td>
<td>An attempt is made to add a new LOGPLUS session to an LSS, but there are no available storage control session identifiers in the allowed range. Issue an F ANTAS000,LISTSESS command to the primary device number and look for identifiers in the range EA-FF. Terminate any unexpected sessions and issue the XADDPAIR command again. If there are no unexpected sessions, it is necessary to move the LOGPLUS volume to another LSS in order to mirror it with the XRC session.</td>
</tr>

<tbody>
<tr>
<td>1009</td>
<td>An I/O error has occurred during control functions to a volume. The error can be accompanied by an IOS error message or an ANTX5001E error message that provides sense information associated with the error, or an ANTX5002E error message. If this error has occurred when adding or re-adding a volume to the session, correct the error and issue an XADDPAIR command to return the volume to the session. If the error occurs during an XSUSPEND function, reissue the command. If the error persists, obtain a GTF trace for the failing device. When contacting IBM for assistance, provide the GTF and a copy of the associated SYSLOG and SYS1.LOGREC information.</td>
</tr>
<tr>
<td>1010</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>1011</td>
<td>An SSID has been specified that is unknown to XRC. Issue a LISTSESS command for a device on the storage subsystem to determine if there are any active XRC sessions. If not, correct the SSID and reissue the command.</td>
</tr>
<tr>
<td>1012</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>1013</td>
<td>The command is not accepted. There are no volumes in the session, so the requested function cannot be performed.</td>
</tr>
<tr>
<td>1014</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>1015</td>
<td>An I/O error has occurred while attempting to read from a primary storage control or a journal, control, or state data set. Related IOS messages contain the reason for the I/O error. Fix the error and reissue the command.</td>
</tr>
<tr>
<td>1016</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>1017</td>
<td>An XRC volume was not found. If the return code was received as a result of issuing a command, the volume serial number specified for the command can have been specified incorrectly. The volume is not in the XRC session. In this case, reissue the command. If this return code was issued with message ANTX5101E, the XDELPAR command can have been issued using the current volume serial number of a relabeled volume. Reissue the XDELPAR command with the initial volume serial number of the relabeled volume.</td>
</tr>
</tbody>
</table>

This error can occur for an ESS storage subsystem if the volume channel connection address is greater than 255, which is the maximum supported. In this case, ensure that the address is between 0 and 255. For a non-ESS storage subsystem, the channel connection address cannot be greater than 127. In this case, ensure that the address is between 0 and 127. If the volume serial number was specified correctly, issue a DEVSERV QDASD command for the failing volume and obtain the UCB and DCE information for the volume. Use the MODIFY command to dump the ANTASnnn address space, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. You might need to cancel ANTASnnn and restart the XRC session. The cancel will cleanup the XRC control structures and suspend all volume pairs.
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
</table>
| 1018        | This error is issued when a primary storage control session has been ended. The session can have ended for any of the following reasons:  
  • A TERMSESS command being issued to the storage control session  
  • The timeout expiration on a non-ESS storage subsystem session  
  • A storage control error  
  • An error in cache or NVS  
  • A software error.  
  Review other diagnostic messages to determine the cause of the problem. The data mover suspends all volumes for the storage control as a result of this error. Based on the ERRORLEVEL specification, other volumes on other storage controls can also be suspended. After determining the reason for the error, you can issue an XADDPAIR command to add the suspended volumes back to the session. The suspended volumes will require a full resynchronization. |
| 1019 to 1026| These are internal errors. |
| 1027        | XRC supports a maximum of 80 primary storage control sessions. You have attempted to add more than this limit. Reduce the number of SCSESSIONS used for this XRC session. If you require more than 80 primary storage control sessions, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Issue an XDELPAIR command for all volumes behind one or more primary control sessions to reduce the total number of active sessions. |
| 1028 to 1031| These are internal errors. |
| 1032        | This is an internal error. Issue MODIFY ANTAS001,DUMP to obtain a dump of the error. |
| 1033        | An XDELPAIR, XEND, or XSUSPEND command has been issued with the DRAIN or ATTIME keyword specified. The request is rejected. This error is issued if there are no active volumes in the session or if no updates have been made to any storage control in the session since an XSTART command last started or restarted the session. The data mover has no application system time reference to use to determine when the DRAIN or ATTIME should take effect. Issue an XQUERY command to verify the session status. You can reissue the XDELPAIR, XEND, or XSUSPEND command with the IMMEDIATE option to complete the function. |
| 1034        | An XDELPAIR command has been issued for a volume pair with the ATTIME or DRAIN keyword specified. The volume pair is currently suspended. If you wish to delete the volume pair, reissue the XDELPAIR command with the IMMEDIATE keyword. |
| 1035        | The maximum number of XRC sessions that are supported by the data mover has been reached. A single XRC session supports a maximum of 80 storage control sessions. Issue the XQUERY STORAGECONTROL command to see the number of active storage control sessions. Either end any unnecessary sessions or start another data mover to run additional XRC sessions. |
| 1036 to 1045| These are internal errors. Cancel ANTASnnn and restart the XRC session. |
| 1046 to 1048| There is an error with the STATEXnn member in the STATE dataset. |
| 1049 to 4000| These are internal errors. Cancel ANTASnnn and restart the XRC session. |
| 4001        | The data contained in the state data set does not match the session name that is being recovered. Verify that the state data set is properly named and cataloged on the recovery system for the session that you are recovering. Cancel ANTAS000 and ANTASnnn and reissue the command. |
| 4002        | This is an internal error. Cancel ANTASnnn and reissue the command. |

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4043</td>
<td>This error results when an XSTART, XRECOVER, or XADVANCE command is issued after an XRC session has logically completed and before the particular ANTASnnn address space (where the command was issued) has ended. If you are running coupled XRC sessions, issue the XQUERY ALL command, and message ANTO8200I will be displayed for each currently active address space running XRC. Then issue the console command DISPLAY A,ANTAS* to determine all currently active ANTASnnn address spaces. The address space that is listed on the DISPLAY console command that does not show up on any of the ANTO8200I messages is the address space that caused this error. Wait for the following system console messages to be issued (for this particular ANTASnnn address space) before you issue an XRC command: IEF196I IEF352I ADDRESS SPACE UNAVAILABLE IEF352I ADDRESS SPACE UNAVAILABLE. If the above messages do not appear within two minutes, issue CANCEL ANTASnnn to end the particular address space. It can be necessary to also end the ANTAS000 address space to completely end the XRC session.</td>
</tr>
<tr>
<td>4044</td>
<td>XRC has detected that the specified volume is defined as a VM minidisk. XRC does not support VM minidisks. If this error persists, search problem reporting data bases for a solution. If no solution exists, contact the IBM Support Center. Provide the system log and a copy of the ANTASnnn address space.</td>
</tr>
<tr>
<td>4045</td>
<td>An error has been detected while attempting to store a member in the hlq.XCOPY.session_id.STATE or the hlq.XCOPY.session_id.CONTROL data set with the STOW function. Determine why the STOW function failed and correct the error. In most cases, the error occurs because the data set did not have sufficient space to contain XRC information. See <a href="https://www.ibm.com/docs/en/zos-v1r11#_34579187">z/OS DFSMS Advanced Copy Services</a> to determine the proper allocation sizes for the XRC control and state data sets. If this error causes suspension of a session or volumes in the session, the volumes that encountered this error requires complete synchronization after you have corrected the problem. You might also need to issue the appropriate XCOUPLE command if the session was a coupled XRC session. If this error occurs, perform the following procedure: 1. Allocate a new control or state data set. 2. Suspend the session with an XSUSPEND command. 3. Copy the existing control or state data set to the new data set. 4. Delete the existing control or state data set. 5. Rename the new control or state data set to the original control or state data set name. 6. Restart the XRC session by issuing an XSTART command. 7. Resynchronize the suspended volumes by issuing an XADDPAIR command for all of the volumes in the session. When you contact IBM for assistance, provide a copy of the failing control or state data set in addition to the data requested in the beginning of this section.</td>
</tr>
<tr>

</tbody>
</table>
| 4077        | An I/O error occurred while attempting to read from the control data set. Reference any ANT or IOS error messages associated with the I/O error, correct the error if possible, and reissue the failing command. If an uncorrectable error occurred on restart of a suspended coupled session, do the following:  
1. Cancel the session’s ANTAS00n address space, if still running  
2. Create and initialize a new control data set  
3. Uncouple the session with XCOUPLE PURGE  
4. Restart and recouple the session |
| 4078        | An I/O error occurred while attempting to write to the control data set. Reference any ANT or IOS error messages associated with the I/O error, correct the error, and reissue the XRECOVER command. |
| 4079        | The unplanned outage function is not supported by this storage control. |
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4080</td>
<td>This error can occur during either XRC XSTART command processing or during XADDPAIR SUSPENDED processing. The data mover is unable to determine the location of one or more of the primary volumes associated with the volume's associated storage control. This can be because the storage control path is unavailable, a volume channel connection address has changed (the volume has been moved to another device), or the volume is not online to the data mover system. During XSTART processing, message ANTX5011E is issued with this return code if a suspended primary volume encountered one of the above errors during reregistering of suspended sessions. During XADDPAIR SUSPENDED processing, message ANTX5011E is issued with this return code for suspended primary volumes which encountered one of the above errors. This message is only issued for those suspended volumes for which a storage control session identifier cannot be determined (that is, physical session id is not known). Reference the description of return code 4143 for additional information related to the issuance of return code 4080 during XADDPAIR SUSPENDED processing. Correct the error and reissue an XADDPAIR command to return the volume pair or pairs to the session, or an XDelpAIR command to remove the volume pair or pairs from the session. Additionally, if the volume associated with this error is a utility volume, this problem could be due to the unavailability of a primary volume. Check for previously issued messages associated with the storage control session, for ANTX5011E RC=4080 REAS=418, identifying primary volumes which have encountered one of the above indicated errors.</td>
</tr>
<tr>
<td>4081</td>
<td>This occurs after an attempt was made to add a volume to an XRC session when the CCA is greater than the XRC-supported number of volumes.</td>
</tr>
</tbody>
</table>
| 4082        | This return code is issued when one of the following occurs:  
  • An XDelpAIR command has been issued for the specified volume which is currently a FIXED utility device. You must either switch to another FIXED utility device (via an XADDPAIR command) or issue the XSET UTILITY command with the FLOAT option before issuing the XDelpAIR command for the specified volume.  
  • An XADDPAIR command was issued for the specified volume which is currently a FIXED utility device, and the secondary volser specified on the XADDPAIR command is not XRCUTL. You must either switch to another FIXED utility device (via an XADDPAIR command) or issue the XSET UTILITY command with the FLOAT option before attempting to shadow the specified volume. |
| 4083        | These are internal errors. |
| 4084        | The XADDPAIR command could not be processed because of XRC system resource constraints. If you have several XRC volume initializations currently running, wait for one or more of these to complete before resubmitting the XADDPAIR command. You can also use the XRC XSET command to lower the value used for the SYNCH parameter, which will reduce the number of concurrent XRC volume initializations. If the problem persists, issue the F ANTASnnn, DUMP command to collect diagnostic information. |
| 4085        | An XQUERY command was issued while XRC was processing an XRECOVER or XADVANCE command. The XQUERY command is terminated. The XQUERY command cannot be run during XRC recovery functions. The XRC recovery functions automatically provide the XQUERY output related to the XRC recovery command. |
### SDM Return Codes

<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4304</td>
<td>The master data set that is associated with the specified logical session name contains invalid data. The reason code that accompanies this return code indicates the particular reason that the master data set is invalid and what you need to do to fix the problem. You might need to issue the XQUERY SUMMARY command to determine the master session name for the master data set that contains invalid data. If message ANTQ8246I does not contain the master session name, or the message is not issued, you might need to search the system log for a message that indicates the master session name that is associated with the specified logical session.</td>
</tr>
</tbody>
</table>

If this return code occurs during XADVANCE or XRECOVER processing, it is not possible to complete the command in a coupled environment. Issue the XCUPLE PURGE command and then reissue the XADVANCE or XRECOVER command to process the command. Use only information from this session.

The following are the different reason codes indicated with this return code:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The identification information in the master data set directory is invalid. This indicates the master data set was overwritten by a program other than CXRC. The next time an XCUPLE ADD command is issued, the information will be reinitialized.</td>
</tr>
<tr>
<td>3</td>
<td>The master session name contained within the master data set directory does not match the data set name. The data set might have been renamed, or the space that was previously used for a different master data set can have been allocated to this data set when it was created. The next time an XCUPLE ADD command is issued, the information will be reinitialized. If this error occurs because the data set was renamed and the intent was to keep the previous master session information, the data set must be renamed to its previous name. It is not possible to change the master session name by renaming the data set while the data set contains information about coupled sessions. To change the master session name, all sessions must be uncoupled using the XCUPLE PURGE or XCUPLE DELETE commands, and then the sessions might be coupled to the new master session using the XCUPLE ADD command. This error can also occur when processing an XRECOVER or XADVANCE command for a session that was previously coupled in an XRC master session. If the specified session is no longer required to be coupled, delete the couple member from the session state data set and reissue the command.</td>
</tr>
</tbody>
</table>

This return code can refer to the cluster data set.
### Table 4. System Data Mover Return Codes (continued)

Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4304</td>
<td>Reason Code</td>
</tr>
<tr>
<td>4</td>
<td>For an active session, the portion of the master data set used by this session has been overwritten by another session's information or by another program. Determine if another program has written to the master data set or take action to ensure that XRC is the only application permitted to do so, or do both. Recouple the session by issuing the XCOPPEL DELETE command followed by the XCOPPEL ADD command.</td>
</tr>
<tr>
<td>10nn</td>
<td>nn identifies a location within the master data set that contains an incorrect identifier. Some program might have overwritten the information.</td>
</tr>
<tr>
<td></td>
<td>If the sessions currently coupled to the master session are the ones that were originally added (with no intervening XCOPPEL DELETE or XCOPPEL PURGE commands), then the nth session coupled is the one that is causing the problem, and the problem can be alleviated by issuing the XCOPPEL PURGE or DELETE command for that session. If it is not possible to determine which session is responsible, issue the XCOPPEL PURGE command to all previously coupled sessions, and the XCOPPEL ADD command to reinitialize the master data set.</td>
</tr>
<tr>
<td>20nn</td>
<td>nn identifies a location within the master data set that contains an incorrect identifier. Some program might have overwritten the information, or XRC might have had an error.</td>
</tr>
<tr>
<td></td>
<td>If the problem persists, provide a PRINT data set for the master data set and a dump of the ANTASnnn address space which detects the error. If the sessions currently coupled to the master session are the ones originally added (with no intervening XCOPPEL DELETE or XCOPPEL PURGE commands), then the nth session coupled is the one which is causing the problem, and the problem can be alleviated by issuing the XCOPPEL PURGE or DELETE command for that session. If it is not possible to determine which session is responsible, issue XCOPPEL PURGE to all previously coupled sessions, and XCOPPEL ADD to reinitialize the master data set.</td>
</tr>
<tr>
<td></td>
<td>If none of the above actions fixes the problem, you will need to reallocate the master data set. See the <a href="https://www.ibm.com/support/docview.wss?uid=swg21385214">z/OS DFSMS Advanced Copy Services manual</a> for attributes needed in realocating the master data set.</td>
</tr>
<tr>
<td></td>
<td>If you receive this error for a cluster session, issue the following MVS console command to clear the the cluster session, and then restart the cluster session and recouple the XRC sessions through the cluster session:</td>
</tr>
<tr>
<td></td>
<td><strong>F ANTAS000,CREFRESH FORCE</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> After you issue the console command, you can restart the cluster session by issuing the CREFRESH console command with the FORCE option.</td>
</tr>
<tr>
<td>4305</td>
<td>The catalog entry for the master data set associated with the specified master session name indicates that the data set resides on multiple volumes. Reallocate the master data set on a single volume, and try the command again. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4306</td>
<td>The maximum number of coupled sessions for the specified master session has been reached. You can remove one of the sessions in the master session by issuing the XCOPPEL DELETE or XCOPPEL PURGE command.</td>
</tr>
</tbody>
</table>
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4307</td>
<td>A catalog locate error was detected for the master data set that is associated with the specified master session name. The first four numbers of the reason codes are the catalog return code, and the second four numbers of the reason codes are the catalog reason code. See the IDC3009I message in the [z/OS MVS System Messages, Vol 6 (GOS-IEA)] for an explanation of the catalog return and reason codes, take the appropriate action, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4308</td>
<td>The master data set that is associated with the specified master session name has been defined with a user label. Reallocate the master data set without a user label, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4309</td>
<td>An error occurred attempting to read the FORMAT-1 DSCB for the master data set associated with the specified master session name. The reason code provided indicates the particular OBTAIN macro return code received for this error. See the [z/OS DFSMSdfp Diagnosis] for an explanation of the OBTAIN return code, take the appropriate action, and reissue the command. You might need to reallocate the master data set. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4310</td>
<td>The master data set that is associated with the specified master session name was allocated with insufficient space. See the [z/OS DFSMS Advanced Copy Services] manual, “Specifying the Master Data Set,” for the attributes to allocate the master data set, reallocate the master data set, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4311</td>
<td>An error occurred attempting to conditionally acquire the SYSDSN resource for the master data set that is associated with the specified master session name. The indicated reason code is the return code issued by the ENQ macro. See the [z/OS MVS Programming: Assembler Services Reference ABE-HSP] manual, the figure for the “Return Codes for the ENQ Macro with the RET=USE parameter,” to determine the specific error that occurred. Correct the problem, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4312</td>
<td>An error occurred obtaining FORMAT-4 DSCB for the volume containing the master data set associated with the specified master session name. The provided reason code indicates the particular OBTAIN macro return code received for this error. See the [z/OS DFSMSdfp Diagnosis] manual for an explanation of the OBTAIN return code, take the appropriate action, and reissue the command. You might need to reallocate the master data set. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4313</td>
<td>The master data set associated with the specified master session name has been allocated as a physical sequential extended (PSE) data set. The master data set must be allocated as a physical sequential (PS) data set. See the [z/OS DFSMS Advanced Copy Services] manual, “Specifying the Master Data Set,” for the attributes in allocating the master data set, reallocate the master data set, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4314</td>
<td>The master data set that is associated with the specified master session name could not be found in a system catalog. Ensure that the master data set is cataloged and that the data mover has access to the catalog that contains the master data set, and reissue the command. This return code can also refer to the cluster data set.</td>
</tr>
</tbody>
</table>
## Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4315</td>
<td>The master data set that is associated with the specified master session name has not been allocated as a physical sequential (PS) data set. The master data set must be allocated as a physical sequential (PS) data set. See the <a href="https://www.ibm.com">z/OS DFSMS Advanced Copy Services</a> manual, “Specifying the Master Data Set,” for the attributes to allocate the master data set, reallocate the master data set, and reissue the command.</td>
</tr>
<tr>
<td></td>
<td>This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4316</td>
<td>After several attempts, the indicated logical session has failed to conditionally acquire the SYSXRCMS resource for the master data set that is associated with the specified master session name. The SYSXRCMS resource is required by each logical session in order to update the master data set. CXRC processing of another master or local command probably delays the SYSXRCMS resource. Wait a few minutes before reissuing the command that failed. For customers using automation functions, this return code might be issued for those commands that are not first processed by CXRC if master commands are issued by multiple systems at the same time. For this situation, these commands fail only because the first command (of the commands issued at the same time) is busy performing the request.</td>
</tr>
<tr>
<td></td>
<td>Issue the XQUERY <code>master_session_name</code> MASTER command to determine the status of each session that is associated with the master session. The coupled session status of UNK that is indicated on the XQUERY message of ANTQ8304I indicates that the master session could not communicate with the local session. Issue the XQUERY localsessionid command (at the local session system) to determine if the local session (with the UNK status) is active. If a local session is not active, see “Restarting an inactive XRC coupled session” in <a href="https://www.ibm.com">z/OS DFSMS Advanced Copy Services</a> for instructions on how to restart an inactive session. If the local session is active, issue the F ANTASnnn, DUMP console command (at the local session system) to collect diagnostic information, and then contact IBM for assistance in determining the cause of the problem. You can then issue the CANCEL ANTASnnn console command, and restart the inactive session (with the instructions referred to previously in this paragraph).</td>
</tr>
<tr>
<td></td>
<td>This return code can also refer to the cluster data set.</td>
</tr>
<tr>
<td>4317</td>
<td>The specified logical session name is associated with a different master session. Use the XQUERY command to determine the associated master session, issue the XCOPPE DELETE or XCOPPE PURGE command to remove the session from its currently associated master session, and then reissue the command.</td>
</tr>
<tr>
<td>4318</td>
<td>An XEND or XSUSPEND TIMEOUT command has been issued to a session which is coupled to a master session and identified by message ANTC5404E, which should accompany the message where this return code appeared. For coupled sessions, XEND and XSUSPEND TIMEOUT commands are only allowed when all volumes are suspended.</td>
</tr>
<tr>
<td></td>
<td>If the intended result is the ending or suspension of all coupled sessions at the same consistency time, issue the XEND or XSUSPEND TIMEOUT command using the master session name. If it is not possible to use the master session name on the command (for example when at least one coupled session is non-interlocked or has all volumes suspended), first suspend all volumes in this logical session by issuing the XSUSPEND <code>session_id</code> VOLUME(ALL) command, and then reissue the command that failed.</td>
</tr>
<tr>
<td>4319</td>
<td>A command specifying a master session name was issued, and no coupled sessions were found to be associated with this master session name. This condition is not necessarily an error if you have not added any sessions to the master session via the XCOPPE ADD command, or you have purged all coupled sessions from the master session via the XCOPPE PURGE command. You can issue the XQUERY command for each of the individual sessions to determine the status of these sessions. This code can occur when the master data set cannot be accessed. The reason code will specify the cause.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4320</td>
<td>An error has been encountered while accessing the master data set during XCOUPLE DELETE, XCOUPLE RELEASE, or XEND/XSUSPEND master session command processing. One of the following conditions applies:</td>
</tr>
<tr>
<td></td>
<td>1. The master data set has never been initialized. This can occur when no session has been coupled to the master session with an XCOUPLE ADD command. The command is not valid at this time; no action is necessary.</td>
</tr>
<tr>
<td></td>
<td>2. The master data set does not contain information for the master session name specified. This can occur when the master data set has been renamed and does not match the original master session name. Correct the master data set name and reissue the command.</td>
</tr>
<tr>
<td></td>
<td>3. Access to the master data set has been lost because of connectivity problems, or because the data set has been renamed or re-cataloged. Restore access to the master data set and reissue the command.</td>
</tr>
<tr>
<td>4321</td>
<td>A master session command was issued. A local session, indicated in the master data set as being coupled to the master session, did not acknowledge the request to process the command. Issue the XQUERY mastersessionid MASTER command to determine which local session could not process the command. The local session status of UNK that is indicated on the XQUERY message of ANTO8304I indicates that the master session could not communicate with the local session. Issue the XQUERY localsessionid command (at the local session system) to determine if the local session (with the UNK status) is not active. If a local session is not active, see the “Restarting an inactive XRC coupled session” section in <a href="https://www.ibm.com/">z/OS DFSMS Advanced Copy Services</a> for instructions on how to restart an inactive session. If the local session is active, issue the F ANTASnnn, DUMP console command (at the local session system) to collect diagnostic information, and then contact IBM for assistance in determining the cause of the problem. You can then issue the CANCEL ANTASnnn console command, and then restart the inactive session (with the instructions that are referred to previously in this paragraph).</td>
</tr>
<tr>
<td>4322</td>
<td>The control data set was determined to not have a record format of physical sequential (PS). The XCOUPLE ADD command fails. If you are running XRC coupled sessions, the control data set must be a physical sequential data set.</td>
</tr>
<tr>
<td>4323</td>
<td>During processing of an XCOUPLE PURGE command, information for the coupled session could not be found in the STATE data set associated with the session, and the associated master data set was not found. The XCOUPLE PURGE command fails. This condition is not an error if you previously issued the XCOUPLE DELETE or XCOUPLE PURGE command for this session.</td>
</tr>
<tr>
<td>4324</td>
<td>The indicated logical session was unable to complete the specified command in the allotted time; therefore, the command failed. Review the system log where the command was initially issued for other ANT error messages related to the indicated logical session and master session. Issue the XQUERY MASTER command to determine the status of all of the coupled sessions associated with the indicated master session. You can have to reissue the command after making the necessary corrections, as indicated by these other error messages.</td>
</tr>
<tr>
<td></td>
<td>Return code 4324 can also be generated in conjunction with return code 4321, in which case, one or more of the coupled sessions will show UNK state in the XQUERY MASTER report. In this case, the problem is indicated by return code 4321. Return code 4324 is additional confirmation that the command failed.</td>
</tr>
<tr>
<td>4325</td>
<td>During processing of the indicated command, the attempt to enqueue the qname of SYSXRCRLS and the rname of the logical session name failed. The logical session can be active on another system. Each logical session must have a unique name, and can only be active on one system at a time within the same global resource serialization ring. If you are running CXRC, issue the XQUERY MASTER command for each master session that is active in your complex to determine status of the logical session name.</td>
</tr>
</tbody>
</table>
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4326</td>
<td>The XCOUPLE PURGE command failed because neither the state data set for the specified logical session name nor the master data set for the specified master session was found. Reissue the command specifying a logical session name that is currently associated with a master session.</td>
</tr>
<tr>
<td>4327</td>
<td>The XCOUPLE PURGE command was issued specifying a master session name or high-level qualifier to which the logical session is not associated. Issue the XQUERY SUMMARY report to determine the master session name and high-level qualifier with which the specified logical session is associated, and reissue the command.</td>
</tr>
</tbody>
</table>
| 4328        | During XCOUPLE ADD processing during either session restart or command invocation, the indicated logical session's state data set indicated that the session was previously coupled to a master session. The associated master data set currently does not indicate that the logical session is coupled to the master session (this could be due to an XCOUPLE PURGE command having been issued while the logical session was inactive). Either issue the XCOUPLE ADD command to recouple the session to the master session, or issue the XCOUPLE DELETE command to remove the indication from the session's state data set that the session is coupled.  
**Note:** SDM can issue the XCOUPLE DELETE command during XCOUPLE ADD processing if a failure is detected attempting to add a session back into a master session. |
|             | During XCOUPLE ADD for recoupling (either internally as a result of session restart processing, or by executing the command while in a COUPLE FAILED state), the indicated logical session's state data set indicated that the session was previously coupled to a master session. The associated master data set currently does not indicate that the logical session is coupled to the master session (this could be due to an XCOUPLE PURGE command having been issued while the logical session was inactive). Either issue the XCOUPLE ADD command to recouple the session to the master session, or issue the XCOUPLE DELETE command to remove the indication from the session's state data set that the session is coupled.  
**Note:** An XCOUPLE DELETE operation can have been processed internally as part of the XCOUPLE ADD command, which failed. |
| 4330        | While processing an XADDPAIR command, or while attempting to update the master data set during XRC couple processing, the indicated coupled session was found to be in COUPLE_FAILED status. The XADDPAIR command fails or the update to the master data set fails, appropriately. A previous error occurred for the session which put the session in this state. See the return code issued by a previous message (ANTC54xxE) to determine the error that occurred and the action to take.  
If the previous error that occurred was due to an error for the cluster session to which the XRC session was coupled, and it has been determined that restarting mirroring using XRC is the correct recovery technique, after re-starting the cluster session, issue the XCOUPLE command with the ADD parameter to re-add each session that was previously in the cluster session (after the cluster session is re-started, issue the XSTATUS CLUSTER command to determine the sessions that were previously coupled via the cluster session). You can then issue the XCOUPLE command with the RELEASE parameter to release the master session from the HOLD status, and then re-add the volumes to the sessions. |
| 4331        | A command has been specified with an ATTIME value for a coupled session. The time specified has already passed the time that represents the last processed consistency time for the master session with which the coupled session is associated. Reissue the command specifying a future time. |
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4332</td>
<td>A command was issued specifying a master session name. The command is failed. At least one coupled session in this master session was found to not have a consistency time. After a logical session is started, an update to a primary volume in the session must be made before a consistency time can be established for the session. Issue the XQUERY MASTER command to determine which session indicates no JOURNAL DELTA time value, or the VOL status for the session is NOV indicating that there are no volumes in the session. As soon as an update has been processed for the session, reissue the command.</td>
</tr>
<tr>
<td>4333</td>
<td>A command was issued specifying a master session name and requesting that a pending master session command be canceled. The command fails. At least one coupled session in this master session has already processed or begun to process the pending command. The pending command must complete on all coupled sessions associated with the master session.</td>
</tr>
<tr>
<td>4335</td>
<td>A master session command was issued. The command fails. The command cannot be processed because another master session command is currently pending or is being processed by at least one of the coupled sessions in the master session. Issue the XQUERY MASTER command to determine if the current master command has completed, and then reissue the command which was failed. If a specific consistency time is required for all coupled sessions, you might need to restart all sessions and issue a master command with the specified ATTIME value.</td>
</tr>
</tbody>
</table>
| 4336        | An XCOUPLE ADD command was issued to add a session to a master session. The command fails because the master session has a master session command that is pending or has not completed. Issue the XQUERY MASTER command to determine the status of each coupled session that is associated with the master session.  
  • If the query shows a pending command: Before reissuing the XCOUPLE ADD command, you must either wait for the master session command to complete for all the sessions, or you can cancel the command by reissuing it with the CANCEL option. If one of the sessions encounters an error while it is executing the master command, follow the documented instructions for that return code before you attempt to issue the XCOUPLE ADD command again.  
  • If the query does not show a pending command:  
    1. Cancel the data mover address space.  
    2. Issue an XCOUPLE PURGE command to uncouple the session.  
    3. Restart the data mover by using XSTART, and issue the XCOUPLE ADD command again. |
| 4337        | A master session command was issued, and at least one of the coupled sessions that is associated with the master session is not interlocked. In order for a session to become interlocked, all of the following conditions must be met (issue the XQUERY MASTER command to determine these conditions):  
  1. No interlocked session that is associated with the master session can have a session status of END, SUS, or UNK.  
  2. The master session must not be in HOLD status.  
  To interlock a session, you might need to issue the XCOUPLE DELETE or XCOUPLE PURGE command to first remove a coupled session from the master session, and then issue the XCOUPLE ADD command to recouple the session. If the master session is in HOLD status, issue the XCOUPLE RELEASE command to remove this HOLD status. |
| 4338        | XCOUPLE ADD was issued, and the existing sessions are in a suspended or ended state. (This state occurs when any session's address space is not active for primary processing.) Adding a new session while in this state would have the potential to disrupt the ability to recover all volumes to a common consistency time. The XCOUPLE ADD command fails. |
Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4339</td>
<td>The XCOUPLE DELETE was issued for a coupled session, but at least one coupled session in the same master session has begun processing a master command. The command fails. Issue the XQUERY MASTER command to determine when all sessions in the master session have completed processing the master command, and then reissue the XCOUPLE DELETE command.</td>
</tr>
<tr>
<td>4340</td>
<td>An XRECOVER command was issued for a coupled session, but at least one coupled session in the same master session is still active. The command failed. All coupled sessions in the master session must be in an inactive state before you can issue the XRECOVER command. To determine the state of each coupled session in the master session, issue the XQUERY MASTER command, and then issue the XEND or XSUSPEND command for each session that is still active, before reissuing the XRECOVER command. Return code 4340 can also be generated when the message is issued indicating that the XSUSPEND or XEND command processing is complete, but the ANTAS00n address space has not terminated for that session. To determine whether the ANTAS00n address space is active for the session, issue the D GRS,RES=(SYSXRCLS,* ) command.</td>
</tr>
<tr>
<td>4341</td>
<td>An XCOUPLE ADD command has been issued to add a new session to a master session, and at least one coupled session in the master session is in a state of recovery (the session status as shown on message ANTQ8304I indicates either RCV or ARV). Issue the XQUERY MASTER command to determine the status of each coupled session. You must issue the XRECOVER command for each coupled session and allow the recovery to complete before issuing the XCOUPLE ADD to add a new session to the master session. If you do not wish to recover a coupled session in the master session, issue the XCOUPLE DELETE or XCOUPLE PURGE command to remove the session from the master session.</td>
</tr>
<tr>
<td>4342</td>
<td>An XCOUPLE ADD command has been issued to add a logical session to a master session. The command fails because the logical session was started using the SESSIONTYPE(MIGRATE) option. Issue the XEND or XSUSPEND command for the logical session, and then restart the logical session using the SESSIONTYPE(XRC) option on the XSTART command. You can then reissue the XCOUPLE ADD command to add the logical session to the master session.</td>
</tr>
<tr>
<td>4343</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>4344</td>
<td>An XCOUPLE PURGE command was issued for a currently active session. The command failed. Issue the XCOUPLE DELETE command to remove an active coupled session from a master session. Return code 4344 can also be generated when the message indicating that the XSUSPEND or XEND command processing is complete is issued, but the ANTAS00n address space has not terminated for that session. To determine whether the ANTAS00n address space is active for the session, issue the D GRS,RES=(SYSXRCLS,* ) command.</td>
</tr>
<tr>
<td>4345</td>
<td>A master session command was issued, and one or more active coupled sessions, associated with this master session, have the volume status of AVS, ERR, or SYM as indicated on message ANTQ8304I. All coupled sessions that are associated with the master session must have a session status of ACT and a blank volume status when you issue a master session command. The command fails. Issue the XQUERY MASTER command to determine the status of the sessions that are associated with the master session.</td>
</tr>
</tbody>
</table>
### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
</table>
| 4346        | An XRC command was issued which can potentially disrupt the ability to recover coupled XRC sessions in the associated master session to a consistent time. The command fails. The master session is in a HOLD state. Before the command can be processed, you must ensure that all of the coupled sessions in the master session can be recovered to a consistent time by performing at least one of the following actions:  
  1. If coupled XRC sessions are being recovered using the XRECOVER command, all sessions must complete the XRECOVER process.  
  2. If a coupled session in the associated master session is active, but you do not want to recover the session or cannot recover the session, issue the XCOUPLE DELETE command to remove the coupled session from the master session.  
  3. If a coupled session in the associated master session is inactive, you can wish to issue the XCOUPLE PURGE command to remove the session as a coupled session from the master session.  

Once the appropriate actions have been taken to ensure that the coupled sessions associated with the master session can be recovered to a consistent time, issue the XCOUPLE RELEASE command to remove the HOLD status of the master session. IBM recommends that you make backup copies of secondary volumes and journals for all coupled sessions before you use this command. |
| 4347        | A master session command was issued, and one or more coupled sessions, associated with this master session, have no volume pairs in the session. All coupled sessions that are associated with the master session must have at least one volume pair, and at least one primary volume update must have been journaled and written to the secondary volume before you can issue the master session command. The command fails. Issue the XQUERY MASTER command to determine the status of the sessions associated with the master session. |
| 4348        | This is an internal error. |
| 4349        | An XCOUPLE ADD command has been issued to add a logical session to a master session. The command fails because the logical session has a pending XRC command. Issue the XQUERY SUMMARY command for the logical session. Message ANTQ8234I will indicate the command that is pending. Either issue the appropriate command with the CANCEL option to cancel the pending command, or wait for the pending command to complete. |
| 4350        | An XADVANCE command was issued for an active session whose volumes are not all suspended. The command fails. All volumes in the session must be suspended before you can issue the XADVANCE command. You can issue the XQUERY VOLUME command to determine the volume status of volume pairs in the session. Issue the XSUSPEND VOLUME(ALL) command with either the IMMEDIATE, ATTIME, or DRAIN options to suspend all volumes in the session. Then you can reissue the XADVANCE command.  
**Note:** If the session is an active coupled session, and after you suspend the volumes in the session, the session will become non-interlocked with the other coupled sessions that are associated with the master session. |
| 4352        | An XCOUPLE PURGE command was issued specifying a logical session name which is not associated with the specified master session name (the master data set does not indicate that this session is a coupled session in this master session). The COUPLE member has been removed from the session’s state data set. The session is no longer a coupled session. No further action is required. |
| 4353        | The logical session for an XCOUPLE PURGE command was not found in the master data set for a session for which a state data set was not found. |
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4354</td>
<td>An XSUSPEND VOLUME(ALL) CANCEL command was issued specifying a master session name. The command is rejected. You must issue the XSUSPEND VOLUME(ALL) CANCEL command against each individual session in the master session. Issue the XQUERY MASTER command to determine the names of all the sessions associated with the master session.</td>
</tr>
<tr>
<td>4355</td>
<td>A command has been issued with the CANCEL option for a logical session that is currently coupled. The command is failed. The command must be issued with the session’s associated master session name. You cannot CANCEL a pending command for an individual coupled session.</td>
</tr>
<tr>
<td>4356</td>
<td>The master data set associated with the indicated master session name is not on a cylinder boundary. The master data set must be allocated with the primary allocation specified as CYL. See the <a href="https://www.ibm.com/support/knowledgecenter/SSBH00">z/OS DFSMS Advanced Copy Services</a> for the attributes required to allocate the master data set, and reallocate the master data set.</td>

<tr>
<td>4377</td>
<td>Internal error.</td>
</tr>
<tr>
<td>4378</td>
<td>XRC was unable to obtain common storage area (CSA) to process cluster monitor data. If the cluster session was being started, XRC did not start the cluster session because of the shortage of CSA. If the cluster session was already active, and the XRC MVS console command of CREFRFRESH was issued to enable cluster monitoring, XRC was unable to enable cluster monitoring because of the shortage of CSA. It is recommended that you increase the amount of CSA allotted to the system in which XRC is running.</td>
</tr>
<tr>
<td>4379</td>
<td>XRC was unable to obtain a serialization resource to perform cluster session processing. The cluster session is not started or the cluster session is ended. Issue the MVS console command of CREFRFRESH to start the cluster session.</td>
</tr>
<tr>
<td>4380</td>
<td>This is an internal SDM error.</td>
</tr>
<tr>
<td>4381</td>
<td>The XRC command XCOUPLE ADD for a session failed to be coupled to a master session through a cluster session, because XRC determined that the session was already coupled to the master session. Issue the XCOUPLE command with the DELETE or PURGE parameter to uncouple the active or inactive XRC session from the master session respectively, and then re-issue the XCOUPLE ADD command.</td>
</tr>
<tr>
<td>4382</td>
<td>During restarting of an XRC session, XRC determined that the session was previously coupled to a cluster session, but the cluster session is currently disabled. The XRC session is not restarted. Issue the XCOUPLE PURGE command to uncouple the session, or enable the cluster session before restarting the XRC session.</td>
</tr>
<tr>
<td>4383</td>
<td>This is an internal SDM error.</td>
</tr>
<tr>
<td>4384</td>
<td>The XRC parmlib parameter value for MonitorWakeup for the indicated XRC session is different than the MonitorWakeup value for the indicated cluster session. The value used for the XRC session will be the value used by the cluster to ensure that the XRC session gathers monitor data using the same MonitorWakeup interval. The MonitorWakeup value for XRC session will be ignored.</td>
</tr>
</tbody>
</table>
Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4385</td>
<td>The indicated cluster session was unable to contact the indicated XRC session to request monitor data from the XRC session. The cluster session will no longer accumulate cluster monitor data using monitor data from this XRC session. In most cases, the cause of this error is that the XRC session is no longer active. Restarting the XRC session and recoupling the XRC session through the cluster session will reactivate cluster monitoring for the XRC session.</td>
</tr>
<tr>
<td>4386</td>
<td>The indicated XRC session was unable to provide monitor data to the indicated cluster session within an allotted time. This condition will be indicated in the cluster accumulated monitor data indicating that not all XRC sessions coupled through the cluster session have provided individual XRC session monitor data for the monitor interval. The message associated with this return code will be issued on the first occurrence within an hour's worth of cluster monitor intervals, and will then be issued again at the end of the hour's worth of cluster monitor intervals where the reason code will indicate the number of times this condition occurred for the XRC session for the hour's worth of cluster monitor interval. The associated message can be suppressed by specifying the NoMonitorMessage parmlib parameter value of NO.</td>
</tr>
</tbody>
</table>
| 4387        | XRC attempts to start or restart a cluster session, but is unable to start the session. XRC determines that the master session name found in the parmlib member ANTXIN00 does not match the master session name found in the cluster data set, and sessions are currently coupled to the master session found in the cluster data set through the cluster session. If you want to change the master session associated with a cluster session that currently has sessions coupled through the cluster session, take the following steps to uncouple these sessions from the master session first:  
  • Reset the ClusterMSession parameter in the ANTXIN00 parmlib membername back to the master name found in the cluster data set.  
  • Issue the MVS console command 'F ANTAS000,CREFRESH' to restart the cluster session.  
  • Issue the XRC command XSTATUS CLUSTER to determine the names of the XRC sessions coupled through the cluster session.  
  • Uncouple each of the XRC sessions by issuing the XRC command XCOUPLE with the appropriate parameter of DELETE or PURGE. Do the uncoupling according to whether the XRC session is active or inactive respectively. |
| 4399        | An attempt to XCOUPLE ADD a session to a cluster failed because of excessive time spent waiting to obtain serialization. The reason code in the message provides additional information:  
  • 1 - Waiting for Cluster address space to update status.  
  • 2 - Waiting for XCOUPLE ADD in another session to complete.  
  • 3 - Waiting for Cluster to couple to master session  
  Check SYSLOG for XRC error messages related to coupling or clustering. Check for abnormal termination of either the Cluster or data mover address spaces (ANTASnnn or ANTCLnnn). Correct error conditions and restart Cluster if necessary.  
  For reason codes 1 and 3, dump the Cluster address space (ANTCLnnn) for subsequent problem determination. Remove any remaining sessions from the Cluster with XCOUPLE DELETE. Disable the cluster and restart it. If the Cluster address space is not responsive, cancel and restart it. For reason code 2, determine which data mover address space (ANTASnnn) is associated with the XCOUPLE ADD that did not complete. Dump the address space for subsequent problem determination, and then cancel it. The data mover might then be restarted and coupled. |
### SDM Return Codes

*Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.*

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
</table>
| 4500        | **Return Code** 4500  **Description and Suggested Recovery Action**  
XSTART failed because of a transition from MODE(HYPER-PPRC) to MODE(NORMAL)  
using the default value for MODE. This happens when a session was previously started in  
the HYPER-PPRC mode, and then XSTART is entered without the MODE parameter. This  
 might be a result of entering the XSTART command through TSO. This mode is only  
supported in sessions controlled by GDPS.  
If the desired result is to disable the HYPER-PPRC mode, the mode must be disabled  
through GDPS as specified in *GDPS Metro/zGlobal Mirror: Planning and Implementation Guide*, order number ZG24-1757. If the desired result is to have HYPER-PPRC mode enabled, then GDPS must be used to manage the session, and the mode must be configured as specified in *GDPS/XRC VvRr Installation and Customization Guide*, order number ZG24-6704.  |
| 4501        | The XRC session is in MODE(HYPER-PPRC) and the primary volume specified on the  
XADDPAIR command is not a PPRC primary volume.  
Establish a PPRC relationship from the XRC primary volume to its associated HA volume,  
or a FAILOVER mode PPRC relationship, and reissue the XADDPAIR command.  |
| 4502        | The XRC session is in MODE(HYPER-PPRC) and the PPRC relationship found on the  
XRC primary volume does not match the relationship previously recorded for this volume.  
Repair the PPRC relationship to match the previously recorded one, or use XDELPAIR to  
remove the XRC pair followed by XADDPAIR to permit the new PPRC relationship to be  
used.  |
| 4503        | The swap volume storage control session id is different from the primary volume’s SCID.  
Determine if the swap volume is the correct volume according to the configuration, and if  
its reported XRC session is active. If it is an incorrect volume then correct the PPRC  
relationships, so that the primary volume is associated with the desired swap volume. If  
The PPRC relationship is correct, remove the swap volume from any existing XRC sessions, and/or terminate the incorrect XRC controller session. In either case, reissue the  
XADDPAIR command once the existing relationship(s) have been corrected or terminated.  |
| 4504        | The swap volume has an existing SCID that is not in a state where this XRC session can  
attach to it. The volume is (was) in use by XRC on a different z/OS instance.  
If there is an existing XRC session in which the swap volume is a primary device,  
suspend or end the session. If there is no active XRC session use the SUSSESS or  
TERMSESS command to condition the session so it can be picked up by this system, or  
terminate it. Then reissue the XADDPAIR command.  |
| 4505        | During a XDELPAIR operation, the XRC session for the associated swap volume could  
not be removed. XRC functions might still be activated on this device.  |
| 4506        | The primary storage control is not enabled for the PPRC+XRC HyperSwap function.  |
| 4507        | The command or command option requested is only supported in a session that has  
MODE(HYPER-PPRC) active. The session is not in the required mode.  |
| 4508        | The swap volume cannot be incrementally resynchronized to the remote volume after a  
HyperSwap, because the XRC volume pair is not in DUPLEX.  |
| 4509        | The swap volume cannot be incrementally resynchronized to the remote volume after a  
HyperSwap, because the resynchronization bitmaps have not been switched enough times  
to reduce the number of tracks to copy. Check the value of ChangedTracks and/or  
DelayTime specified for the BITMAP section of XRC Parmlib support, and reduce the  
values if necessary.  |
| 4510        | A previous bitmap switch operation at the host volume was not successfully replicated on  
the swap volume. Refer to preceding message ANTX5132W.  |

### SDM Return Codes

Table 4. System Data Mover Return Codes (continued). Use the general recovery actions that precede this table in addition to any recovery actions included with individual return codes.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>4530</td>
<td>The current value of AllowEnhancedReader is NO, and at least one storage control session is in enhanced mode. If this return code is received in response to an XSET command to apply a PARMLIB change, the parameter value is not changed. When received in response to an XADDPAIR command, the XADDPAIR command fails. If the change of AllowEnhancedReader from YES to NO is correct, follow the enhanced multiple reader disablement procedure in <a href="https://www.ibm.com">z/OS DFSMS Advanced Copy Services</a> before continuing with volume resynchronization through the XADDPAIR command. If the parameter change is incorrect, issue the XSUSPEND command with TIMEOUT parameter, update the PARMLIB, and issue the XSTART command again.</td>
</tr>
<tr>
<td>4531</td>
<td>An XADDPAIR command did not specify the PDEVNUM parameter, which is required for MODE(HYPER_PPRC). This is likely to be a GDPS configuration error. For problem solution, see <a href="https://www.ibm.com">GDPS/XRC VvRr Installation and Customization Guide</a>, order number ZG24-6704.</td>
</tr>
<tr>
<td>4532</td>
<td>The number of the storage control sessions (the total of primary and auxiliary) is less than the NumberReaderTasks parameter for the SSID and SCSN containing the volume pair. Either add utility volumes (with secondary volser of XRCUTL) or configure additional alias devices on the utility devices to equal or exceed the NumberReaderTasks parameter; or reduce the NumberReaderTasks if the number of utility plus alias devices is correct. If the RequireUtility parameter is not desired, remove it, activate the new parmlib setting, and issue the XADDPAIR command again.</td>
</tr>
<tr>
<td>4533</td>
<td>XDELPAIR of a utility volume will reduce the number of the available read devices below the value of NumberReaderTasks for the SCSN. The XDELPAIR command is rejected. To reduce the number of auxiliary volumes in the enhanced multiple reader group, the NumberReaderTasks value must be reduced before issuing the XDELPAIR command again.</td>
</tr>
<tr>
<td>4534</td>
<td>During XSTART or XSET PARMLIB, the value of MaxTotalReaderTasks was less than the number of storage control sessions already in the XRC session. Determine the value needed from prior XQUERY STORAGECONTROL reports and update PARMLIB, then reissue the command.</td>
</tr>
<tr>
<td>4535</td>
<td>Processing of XADDPAIR with the SUSPENDED option was rejected, because some utility devices are on enhanced multi-reader capable control units, and have not been converted to enhanced mode. Use the XADDPAIR command for the utility volumes to convert them to enhanced mode according to the procedure of converting to enhanced mode in <a href="https://www.ibm.com">z/OS DFSMS Advanced Copy Services</a> and issue the XADDPAIR SUSPENDED command again.</td>

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Description and Suggested Recovery Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>6018 (X'1782')</td>
<td>For an XRC session, an OPEN error occurred while obtaining the format-1 DSCB for the journal, control, or state data set because of an error reading the VTOC for the volume. The data set can be cataloged but either does not exist on the volume indicated by the catalog, or an I/O error occurred while attempting to read the VTOC. Determine why the error has occurred, correct the error, and reissue the XSTART, XRECOVER, or XADVANCE command to restart the session. For a Snapshot function, an error occurred while obtaining format-1 DSCB for a working space data set.</td>
</tr>
<tr>
<td>6019 (X'1783')</td>
<td>An error has occurred while loading module ANTUGOAD. Verify that the module exits in SYS1.LINKLIB and that it is available to the data mover.</td>
</tr>
<tr>
<td>6020 (X'1784')</td>
<td>An error has occurred while loading module ANTUGOFR. Verify that the module exits in SYS1.LINKLIB and that it is available to the data mover.</td>
</tr>
<tr>
<td>6021 (X'1785')</td>
<td>For an XRC session, an OPEN error occurred while obtaining the format-3 DSCB for the journal, control, or state data set because of an error reading the VTOC for the volume. The data set can be cataloged but either does not exist on the volume indicated by the catalog, or an I/O error occurred while XRC attempted to read the VTOC. Determine why the error has occurred, correct the error, and reissue the XSTART, XRECOVER, or XADVANCE command to restart the session. For a Snapshot function, an error occurred while obtaining format-3 DSCB for a working space data set.</td>
</tr>
<tr>
<td>6022 (X'1786')</td>
<td>An error has occurred while obtaining format-4 DSCB for a working space data set. The reason code is set to the return code from the OBTAIN macro.</td>
</tr>
<tr>
<td>6023 to 6032 (X'1787' to X'1790')</td>
<td>These are internal SDM errors.</td>
</tr>
<tr>
<td>6033 (X'1791')</td>
<td>A Snapshot operation failed. See <a href="#">SDM reason codes from IXFP errors</a> on page 551 for an explanation of the associated reason code. This can be a DFSMSdss internal error, an SDM internal error, an IXFP internal error, or a configuration error.</td>
</tr>
<tr>
<td>6034 (X'1792')</td>
<td>This is an internal SDM error.</td>
</tr>
<tr>
<td>6035 (X'1793')</td>
<td>A QUERY DEVICE operation failed. The reason code is described in <a href="#">SDM reason codes from IXFP errors</a> on page 551. This can be a DFSMSdss internal error, an SDM internal error, an IXFP internal error, or a configuration error.</td>
</tr>
<tr>
<td>6036 to 6143 (X'1794' to X'17FF')</td>
<td>These are internal SDM errors.</td>
</tr>
<tr>
<td>6144 (X'1800')</td>
<td>All working space data set space on the RVA subsystem that contains the source data set is currently in use by other Snapshot requests. Allocate one or more additional working space data sets on the RVA subsystem according to the allocation guidelines for working space data sets and then resubmit the failing job.</td>
</tr>
<tr>
<td>6145 (X'1801')</td>
<td>Insufficient working space data set space was available on the RVA subsystem that contains the source data set to satisfy the Snapshot request. Either resubmit the failing job after another DFSMSdss job using concurrent copy on the source RVA releases the working space data set space, or increase the working space data set space, and resubmit the failing job.</td>
</tr>
<tr>
<td>6146 (X'1802')</td>
<td>The Snapshot operation failed because not enough working space was available to the ANTMAIN system data mover address space. The space was not available because of an allocation or ENQUEUE conflict with the working space data sets (WSDS) within SYS1.ANTMAIN.Sysn,Sysn.SNAPnnnn. This problem can occur when a WSDS is allocated during the time that the DFSMSdss job is attempting to use it. To prevent this condition, preallocate the WSDS or allocate it during a different job.</td>

</tbody>
</table>

ANTRQST return codes and reason codes

The ANTRQST macro is used by application programs to invoke the z/OS System Data Mover (SDM) application programming interface (API). The following error return codes and reason codes are taken from the ANTRQSTL macro. Each return code is equated to a decimal value, which is followed by a comment indicating the corresponding hexadecimal value.

Return codes indicate the general types of conditions and might be coupled with reason codes that further qualify these conditions. Typically, a reason code has the qualifier _REASON_ imbedded in its name, and follows the corresponding return code.

For more information about the ANTRQST and ANTRQSTL macros, see Appendix D of [z/OS DFSMS Advanced Copy Services](#).

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro

```
RQST_SUCCESSFUL EQU 0000 X'0000'
*  
RQST_PC_NUMBER_ZERO EQU 7000 X'1B58'
*  
*  Meaning: The PC number used to invoke ANTCDPI is zero.
*  
*  Action: Make sure ANTAS000 is started.
*  
```
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_ANTRQSTL_EYECATCHER_ABEND EQU 7001 X'1B59'
*    Meaning:  ANTCMPI ABENDed while referencing the
*             ANTRQSTL. The reason code will contain the ABEND
*             code.
*    Action:  Make sure the address of the ANTRQSTL is
*             not modified before ANTCMPI is invoked. If problem
*             persists contact IBM.
*RQST_ANTRQSTL_EYECATCHER_INVALID EQU 7002 X'1B5A'
*    Meaning:  The ANTRQSTL had an incorrect beginning
*             eye-catcher.
*    Action:  Make sure the address of the ANTRQSTL is
*             not modified before ANTCMPI is invoked. If problem
*             persists contact IBM.
*RQST_ANTRQSTL_LASTBYTE_ABEND EQU 7003 X'1B5B'
*    Meaning:  ANTCMPI ABENDed while referencing the
*             last byte in the ANTRQSTL. The reason code will
*             contain the ABEND code.
*    Action:  Make sure the address of the ANTRQSTL is
*             not modified before ANTCMPI is invoked. If problem
*             persists contact IBM.
*RQST_ANTRQSTL_ECB_ABEND EQU 7004 X'1B5C'
*    Meaning:  ANTCMPI ABENDed while referencing the
*             field pointed to by the ANTRQST ECB parameter. The
*             reason code will contain the ABEND code.
*    Action:  Make sure the address of the ECB field is
*             correct.
*RQST_ANTRQSTL_RETINFO_ABEND EQU 7005 X'1B5D'
*    Meaning:  ANTCMPI ABENDed while referencing the
*             field pointed to by the ANTRQST RETINFO parameter.
*             The reason code will contain the ABEND code.
*    Action:  Make sure the address of the RETINFO field
*             is correct.
*RQST_RQTBL_ADDRESS_ZERO EQU 7006 X'1B5E'
*    Meaning:  The pointer to the System Data Mover
*             request conversion table was zero.
*    Action:  Contact IBM.
*RQST_RQTBL_EYECATCHER_ABEND EQU 7007 X'1B5F'
*    Meaning:  ANTCMPI ABENDed while referencing the
*             System Data Mover request conversion table
*             eye-catcher. The reason code will contain the
*             ABEND code.
*    Action:  Contact IBM.
**SDM Return Codes**

*Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)*

- **RQST_RQTBLEYECATCHER_INVALID** EQU 7008 X'1B60'
  - Meaning: The System Data Mover request conversion table had an incorrect eye-catcher.
  - Action: Contact IBM.

- **RQST_ANTRQSTLREQUESTNOINVALID** EQU 7009 X'1B61'
  - Meaning: The request is not currently supported by ANTRQST.
  - Action: Upgrade to the ANTRQST level which supports the request. Execute REQUEST=LEVEL to find the current ANTRQST level.

- **RQST_CALLER_NOT_AUTHORIZED** EQU 7010 X'1B62'
  - Meaning: Caller not authorized to execute request.
  - Action: Make sure caller is an authorized program, or has read access to the FACILITY class profile of STGADMIN.ANT.XRC.COMMANDS for XRC requests, STGADMIN.ANT.PPRC.COMMANDS for PPRC requests, or STGADMIN.ANT.SNAPSHOT.COMMANDS for Snapshot requests, or STGADMIN.ANT.ESFC.COMMANDS for FlashCopy requests.

- **RQST_CALLERSSTOKENINVALID** EQU 7011 X'1B63'
  - Meaning: Unable to get STOKEN for caller's address space. The reason code will contain the ALESERV EXTRACT return code.
  - Action: Contact IBM.

- **RQST_ANTRQSTLALETSTOKENINVALID** EQU 7012 X'1B64'
  - Meaning: Unable to get STOKEN for the ALET specified on the ANTRQST macro. The reason code will contain the ALESERV EXTRACT return code.
  - Action: Make sure a valid ALET is supplied. If problem persists contact IBM.

- **RQST_SDADDRESSSPACEINACTIVE** EQU 7013 X'1B65'
  - Meaning: System Data Mover address space is not active.
  - Action: Make sure ANTAS000 is started.

- **RQST_INVALIDASYNCH_VALUE** EQU 7014 X'1B66'
  - Meaning: The value supplied in the ASYNCH parameter is invalid. If the ASYNCH parameter is used its value must be NO or YES.
  - Action: Supply a correct ASYNCH value.

<td>Meaning: Unable to get the STOKEN for a System Data Mover request router address space. The reason code will contain the ALESERV EXTRACT return code.</td>
<td></td>
</tr>
<tr>
<td>Action: Contact IBM.</td>
<td></td>
</tr>
<tr>
<td>RQST_ANTRQSTL_EYECATCHER_NOW_INVALID</td>
<td>EQU 7034 X'1B7A'</td>
</tr>
<tr>
<td>Meaning: The ANTRQSTL passed into a System Data Mover request router/handler no longer has a valid eye-catcher.</td>
<td></td>
</tr>
<tr>
<td>Action: Make sure fields in the ANTRQSTL have not been changed while waiting for completion of the request.</td>
<td></td>
</tr>
<tr>
<td>RQST_ANTRQSTL_NO_LONGER_AVAILABLE</td>
<td>EQU 7035 X'1B7B'</td>
</tr>
<tr>
<td>Meaning: A System Data Mover request router/handler was no longer able to access the ANTRQST.</td>
<td></td>
</tr>
<tr>
<td>Action: Make sure the space the ANTRQSTL resides in has not been FREEMAINed.</td>
<td></td>
</tr>

### SDM Return Codes

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RQST_SDM_ADDRESS_SPACE_NOT_STARTED</strong> EQU 7036 X'1B7C'</td>
<td>* Meaning: A System Data Mover address space is not active. * Action: Make sure ANTA001 is started. *</td>
</tr>
<tr>
<td><strong>RQST_HANDLER_EYECATCHER_INVALID</strong> EQU 7037 X'1B7D'</td>
<td>* Meaning: Invalid parameter list passed to a System Data Mover request handler. The reason code will tell which field in the parameter list was bad. * Action: Contact IBM. *</td>
</tr>
<tr>
<td><strong>RQST_ANTAS000_STOKEN_NOT_ADDED</strong> EQU 7038 X'1B7E'</td>
<td>* Meaning: A System Data Mover request handler running in ANTA001 was unable to add the STOKEN for ANTA000 to the access list for ANTA001. * Action: Contact IBM. *</td>
</tr>
<tr>
<td><strong>RQST_WAITTIME_EXPIRED</strong> EQU 7039 X'1B7F'</td>
<td>* Meaning: The value supplied in the WAITTIME parameter has been reached. System Data Mover has returned to the caller. * Action: Determine if the requested action has been suspended, or if the requested action normally takes longer than the WAITTIME value. If increasing the WAITTIME value does not correct the problem contact IBM. *</td>
</tr>
<tr>
<td><strong>RQST_SNAPSHOT_SERVICE_ERROR</strong> EQU 7040 X'1B80'</td>
<td>* Meaning: A request has been made to a SnapShot subsystem handler, and an error had been detected. * Action: Contact IBM. *</td>
</tr>
<tr>
<td><strong>RQST_SDM_ADDRESS_SPACE_TERMINATED</strong> EQU 7041 X'1B81'</td>
<td>* Meaning: A System Data Mover address space has terminated. If the request is synchronous 7041 will be placed in the RETINFO field. If the request is asynchronous 7041 will be the post code. * Action: Resubmit the request after the System Data Mover address space has been restarted. *</td>
</tr>
<tr>
<td><strong>RQST_COPY_SERVICE_ABEND</strong> EQU 7042 X'1B82'</td>
<td>* Meaning: The System Data Mover service that moves the results of the request back into the caller's ANTRQSTL has abended. The reason code contains the ABEND code. * Action: Make sure the areas pointed to by the ANTRQSTL have not been freed. If the problem persists contact IBM. *</td>
</tr>
</tbody>
</table>
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_VERIFICATION_SERVICE_ABEND EQU 7043 X'1BB3'
*  
* Meaning: A System Data Mover service that verifies
* values in the ANTRQSTL has had an unexpected abend.
* The reason code contains the ABEND code.
*  
* Action: Contact IBM.
*  
RQST_VERIFICATION_INVALID_ATTIME_FORMAT EQU 7044 X'1BB4'
*  
* Meaning: The value specified in the ATTIME
* parameter did not have a format of YYYY.DDD
* HH:MM:SS.TMIDIJU.
*  
* Action: Specify the proper format.
*  
RQST_VERIFICATION_INVALID_ATTIME_YEAR EQU 7045 X'1BB5'
*  
* Meaning: The year specified in the ATTIME
* parameter is greater than 2041. The CONVTOD system
* macro will not handle years greater than 2041.
*  
* Action: Contact IBM.
*  
RQST_VERIFICATION_INVALID_ATTIME_DIGITS EQU 7046 X'1BB6'
*  
* Meaning: Some of the digits in the ATTIME
* parameter are non-numeric.
*  
* Action: Correct the non-numeric digits.
*  
RQST_VERIFICATION_INVALID_ATTIME_CONVTOD EQU 7047 X'1BB7'
*  
* Meaning: The system CONVTOD service had an error
* converting the ATTIME parameter. The reason code
* contains the error code.
*  
* Action: Make the indicated correction.
*  
RQST_VERIFICATION_INVALID_TIMEOUT_FORMAT EQU 7048 X'1BB8'
*  
* Meaning: The value specified in the TIMEOUT
* parameter did not have a format of "hh.mm.ss".
*  
* Action: Specify the proper format.
*  
RQST_VERIFICATION_INVALID_TIMEOUT_NBRS EQU 7049 X'1BB9'
*  
* Meaning: The value of the TIMEOUT parameter has
* "hh" greater than 18, "mm" greater than 59, or "ss"
* greater than 59.
*  
* Action: Correct the invalid value.
*  
RQST_VERIFICATION_INVALID_TIMEOUT_DIGITS EQU 7050 X'1BBA'
*  
* Meaning: Some of the digits in the TIMEOUT
* parameter are non-numeric.
*  
* Action: Correct the non-numeric digits.
RQST_VERIFICATION_INVALID_TIMEOUT_VALUE  EQU  7051  X'1B8B'
  *  Meaning: The value of the TIMEOUT parameter is
  *  greater then "18.00.00".
  *  Action: Specify a smaller value.

RQST_VERIFICATION_INVALID_ETYPE_VALUE  EQU  7052  X'1B8C'
  *  Meaning: The value specified in the ETYPE
  *  parameter is not one of the listed keywords
  *  Action: Specify a correct keyword value.

RQST_VERIFICATION_INVALID_ERRORLEVEL  EQU  7053  X'1B8D'
  *  Meaning: The value specified for the ERRLVL
  *  parameter is not correct. Either the first
  *  character is not ALPHA (A-Z,$,#,@), or the rest of
  *  the characters are not ALPHNUM (A-Z,0-9,$,#,@).
  *  Action: Correct the invalid character(s).

RQST_VERIFICATION_INVALID_SESSIONID  EQU  7054  X'1B8E'
  *  Meaning: The value specified for the SID parameter
  *  is not correct. Either the first character is not
  *  ALPHA (A-Z,$,#,@), or the rest of the characters
  *  are not ALPHNUM (A-Z,0-9,$,#,@).
  *  Action: Correct the invalid character(s).

RQST_VERIFICATION_INVALID_PVOLSER  EQU  7055  X'1B8F'
  *  Meaning: The value specified for the PVOLSER
  *  parameter is not correct. One of the characters is
  *  not ALPHNUM (A-Z,0-9,$,#,@).
  *  Action: Correct the invalid character(s).

RQST_VERIFICATION_INVALID_HLQ  EQU  7056  X'1B90'
  *  Meaning: The value specified for the HLQ parameter
  *  is not correct. Either the first character is not
  *  ALPHA (A-Z,$,#,@), or the rest of the characters
  *  are not ALPHNUM (A-Z,0-9,$,#,@).
  *  Action: Correct the invalid character(s).

RQST_VERIFICATION_ATTIME_MISSING  EQU  7057  X'1B91'
  *  Meaning: ETYPE(ATTIME) has been specified but the
  *  ATTIME parameter has not been specified.
  *  Action: Supply a value with the ATTIME parameter.
**SDM Return Codes**

*Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)*

RQST_VERIFICATION_INVALID_MASTERSID EQU 7058 X'1B92'
*  
* Meaning: The value specified for the MID parameter
* is not correct. Either the first character is not
* ALPHA (A-Z,$,#,@), or the rest of the characters
* are not ALPHNUM (A-Z,0-9,$,#,@).
*  
* Action: Correct the invalid character(s).

RQST_VERIFICATION_INVALID_MHLQ EQU 7059 X'1B93'
*  
* Meaning: The value specified for the MHLQ parameter
* is not correct. Either the first character is not
* ALPHA (A-Z,$,#,@), or the rest of the characters
* are not ALPHNUM (A-Z,0-9,$,#,@).
*  
* Action: Correct the invalid character(s).

RQST_VERIFICATION_INVALID_COPY_VALUE EQU 7060 X'1B94'
*  
* Meaning: The value specified for the COPY parameter
* is not correct. The value must be FUL or
* QIK.
*  
* Action: Correct the invalid value.

RQST_VERIFICATION_INVALIDUTILITY_VALUE EQU 7061 X'1B95'
*  
* Meaning: The value specified for the UTILITY parameter
* is not correct. The value must be FIX or
* FLT.
*  
* Action: Correct the invalid value.

RQST_VERIFICATION_INVALID_ONLINE_VALUE EQU 7062 X'1B96'
*  
* Meaning: The value specified for the ONLINE parameter
* is not correct. The value must be YES or
* NO.
*  
* Action: Correct the invalid value.

RQST_VERIFICATION_INVALID_DVCBLOCK_VALUE EQU 7063 X'1B97'
*  
* Meaning: The value specified for the DVCBLOCK parameter
* is not correct. The value must be ON,
* OFF, or WPx where x is a hex value of 0-F.
*  
* Action: Correct the invalid value.

RQST_VERIFICATION_INVALID_SCSSESSION EQU 7064 X'1B98'
*  
* Meaning: For a request the value specified
* in the SCSSESSION parameter is not alphabetic (A-Z).
*  
* Action: Specify a correct value.

RQST_VERIFICATION_ESSSERIAL_REQUIRED EQU 7065 X'1B99'
*  
* Meaning: The ESSSERIAL keyword is required.
*  
* Action: Provide the keyword.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_VERIFICATION_LSSNBR_REQUIRED EQU 7066 'X'1B9A'
*  
*  Meaning: The LSSNBR keyword is required.
*  
*  Action: Provide the keyword.
*  
RQST_VERIFICATION_INVALID_ACTION_VALUE EQU 7067 'X'1B9B'
*  
*  Meaning: The value specified for the ACTION
*  parameter is not correct. The value depends on
*  the REQUEST type.
*  
*  Action: Correct the invalid value.
*  
RQST_VERIFICATION_INVALID_LSSTYPE_VALUE EQU 7068 'X'1B9C'
*  
*  Meaning: The value specified for the LSSTYPE
*  parameter is not correct. The value must be
*  FB or CKD.
*  
*  Action: Correct the invalid value.
*  
RQST_VERIFICATION_INVALID_VOLSER EQU 7069 'X'1B9D'
*  
*  Meaning: The value specified for the VOLSER
*  parameter is not correct. Either the volume is
*  not online, or one of the characters is not
*  ALPHNUM (A-Z,0-9,$,#,@).
*  
*  Action: Correct the invalid value.
*  
RQST_VERIFICATION_SNBR_ZERO EQU 7070 'X'1B9E'
*  
*  Meaning: The value specified for the SNBR
*  parameter is zero.
*  
*  Action: Specify a non-zero value.
*  
RQST_VERIFICATION_INVALID_DISP_VALUE EQU 7071 'X'1B9F'
*  
*  Meaning: The value specified for the DISP
*  parameter is not correct.
*  
*  Action: Correct the invalid value.
*  
RQST_VERIFICATION_INVALID_FORMAT_VALUE EQU 7072 'X'1BA0'
*  
*  Meaning: The value specified for the FORMAT
*  parameter is not correct.
*  
*  Action: Correct the invalid value.
*  
RQST_VERIFICATION_INVALID_OPENDVCS_VALUE EQU 7073 'X'1BA1'
*  
*  Meaning: The value specified for the OPENDVCS
*  parameter is not correct.
*  
*  Action: Correct the invalid value.
**SDM Return Codes**

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

<table>
<thead>
<tr>
<th>Code Description</th>
<th>Code Value</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>RQST_VERIFICATION_INVALID_ONLINSEC_VALUE</td>
<td>7074 X'1BA2'</td>

<td>7081 X'1BA9'</td>
<td>Correct the invalid value.</td>
</tr>
</tbody>
</table>
RQST_VERIFICATION_MISSING_DEVICE_SPEC EQU 7083 X'1BAB'  
*  
* Meaning: When a 'YES' value is specified for the  
* OPENDVCS or REMOTE keys, the macro invocation must  
* also include the DEVN, SRCSERIAL, SRCLSS, SRCDVC,  
* TGTSERIAL, TGTLSS, and TGTDVC keys.  
*  
* Action: Specify the missing keys on the macro invocation.  
*  
RQST_VOLLIST_ERROR_DETECTED EQU 7096 X'1BB8'  
*  
* Meaning: An error has been detected in executing  
* a volume list. For example, trying to add a volume  
* pair in which one of the volumes is offline.  
*  
* Action: Examine the messages returned in the  
* MESSAGES field to determine the volume that was  
* in error.  
*  
RQST_ROUTER_UNEXPECTED_ABEND EQU 7097 X'1BB9'  
*  
* Meaning: Unexpected ABEND in System Data Mover  
* request router. The reason code will contain the  
* ABEND code.  
*  
* Action: Contact IBM.  
*  
RQST_HANDLER1_UNEXPECTED_ABEND EQU 7098 X'1BBA'  
*  
* Meaning: Unexpected ABEND in a System Data Mover  
* level 1 request handler. The reason code will  
* contain the ABEND code.  
*  
* Action: Contact IBM.  
*  
RQST_HANDLER2_UNEXPECTED_ABEND EQU 7099 X'1BBB'  
*  
* Meaning: Unexpected ABEND in a System Data Mover  
* level 2 request handler. The reason code will  
* contain the ABEND code.  
*  
* Action: Contact IBM.  
*  
RQST_XCONTIME_TIME_ABEND EQU 7100 X'1BBC'  
*  
* Meaning: For an XCONTIME request, a System Data  
* Mover request router/handler ABENDed while  
* referencing the field pointed to by the ANTRQST  
* TIME parameter. The reason code will contain the  
* ABEND code.  
*  
* Action: Make sure that the TIME parameter points  
* to a valid location in memory, and that if an ALET  
* was specified on the ANTRQST macro its value is  
* correct.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XCONTIME_SESSIONID_INVALID EQU 7101 X'1BBD'
* Meaning: For an XCONTIME request, the XRC system
* id pointed to by the ANTRQST SID parameter was
* invalid.
* Action: Make sure the system id supplied by the
* SID parameter matches the id of a valid XRC
* session.

RQST_XCONTIME_HLQ_INVALID EQU 7102 X'1BBE'
* Meaning: For an XCONTIME request, the high-level
* qualifier of an XRC state data set provided by the
* ANTRQST HLQ parameter was invalid.
* Action: Make sure the name supplied by the HLQ
* parameter matches the high-level qualifier of an
* XRC state data set.

RQST_XCONTIME_CONSISTENCY_TIME_ZERO EQU 7103 X'1BBF'
* Meaning: For an XCONTIME request, the consistency
* time being maintained by XRC is zero.
* Action: Consistency time is initialized to zero,
* and does not change until an application update
* takes place to a primary volume in an XRC session.

RQST_XCONTIME_NO_STORAGE EQU 7104 X'1BC0'
* Meaning: For an XCONTIME request, XRC was unable
* to acquire working storage.
* Action: Contact IBM.

RQST_XCONTIME_NO_DEFAULTS EQU 7105 X'1BC1'
* Meaning: For an XCONTIME request, the table that
* contains the skeleton name of the state data set
* could not be found.
* Action: Contact IBM.
### Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

- **RQST_XCONTIME_ALLOCATION_FAILURE**
  - EQU 7106 X'1BC2'
  - Meaning: For an XCONTIME request, XRC was unable to allocate the state data set. This can be for one of three reasons:
    1. The state data set has not been pre-allocated.
    2. The high-level qualifier supplied in the HLQ parameter is invalid.
    3. The session id supplied in the SID parameter is invalid.
  - Action: For reason 1, pre-allocate the state data set. For reasons 2 and 3 correct the invalid value.

- **RQST_XCONTIME_OPEN_FAILURE**
  - EQU 7107 X'1BC3'
  - Meaning: For an XCONTIME request, XRC was unable to open the state data set.
  - Action: Contact IBM.

- **RQST_XCONTIME_DECBB_CREATION_FAILURE**
  - EQU 7108 X'1BC4'
  - Meaning: For an XCONTIME request, XRC was unable to create a DECB control block for the state data set.
  - Action: Contact IBM.

- **RQST_XCONTIME_FIND_FAILURE**
  - EQU 7109 X'1BC5'
  - Meaning: For an XCONTIME request, the member in the state data set containing the consistency time could not be found.
  - Action: If XRC has never been started then an XSTART will need to be done to create the member. If an XSTART has been done contact IBM.

- **RQST_XCONTIME_INVALID_STATE_DATASET**
  - EQU 7110 X'1BC6'
  - Meaning: For an XCONTIME request, the data in the state data set is not in the proper format.
  - Action: Contact IBM.

- **RQST_XCONTIME_READ_FAILURE**
  - EQU 7111 X'1BC7'
  - Meaning: For an XCONTIME request, XRC was unable to read the state data set.
  - Action: Contact IBM.
### Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>RQST_XCONTIME_ERROR_LOADING_EXITS EQU 7112 X'1BC8'</td>
<td>For an XCONTIME request, XRC was unable to load the DCB exits used in reading the state data set.</td>
<td>Contact IBM.</td>
</tr>
<tr>
<td>RQST_XCONTIME_SAVED_CONSISTENCY_TIME EQU 7113 X'1BC9'</td>
<td>For an XCONTIME request, ANTAS001 was not active, so the consistency time being returned is from an XRC data set. If the time is from the control data set the reason code will be 0. If the time is from the state data set the reason code will be 4. If the time is from the master data set the reason code will be 8.</td>
<td>No action required.</td>
</tr>
<tr>
<td>RQST_XCONTIME_VOLUME_NOT_DUPELEXED EQU 7114 X'1BCA'</td>
<td>For an XCONTIME request the consistency time being returned is from ANTAS001 and is valid, but at least one of the volume pairs (not counting the utility volume) is not duplexed.</td>
<td>No action required.</td>
</tr>
<tr>
<td>RQST_PESTPATH_ERROR EQU 7120 X'1BD0'</td>
<td>For a PESTPATH request a System Data Mover request handler detected an error. Byte nine of the RETINFO field will contain the length of the following error message. Starting at byte ten will be a message that describes the error. Bytes ten through thirteen contain the ending part of an ANTP0xxxx message identifier (ex. - 108I for message identifier ANTP0108I).</td>
<td>Take the action described in the documentation for the message identifier.</td>
</tr>
<tr>
<td>RQST_PESTPATH_INVALID_CGROUP_VALUE EQU 7121 X'1BD1'</td>
<td>For a PESTPATH request the value supplied in the CGROUP parameter is invalid. If the CGROUP parameter is used the value must be NO or YES.</td>
<td>Supply a correct CGROUP value.</td>
</tr>
<tr>
<td>RQST_PESTPATH_INVALID_RESETHP_VALUE EQU 7122 X'1BD2'</td>
<td>For a PESTPATH request the value supplied in the RESETHP parameter is invalid. If the RESETHP parameter is used the value must be NO or YES.</td>
<td>Supply a correct RESETHP value.</td>
</tr>
</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PESTPATH_MISSING_PLSS EQU 7125 X'1BD5' *
* Meaning: For a PESTPATH request the specified
* device is in a storage subsystem that requires the
* PLSS parameter, but the PLSS parameter was not
* specified.
* Action: Supply a correct PLSS parameter.
*
RQST_PESTPATH_INVALID_PLSS EQU 7126 X'1BD6' *
* Meaning: For a PESTPATH request the specified
* device is in a storage subsystem that does not use
* the PLSS parameter, but the PLSS parameter was
* specified.
* Action: Remove the PLSS parameter.
*
RQST_PESTPATH_TOO_MANY_LINKS EQU 7127 X'1BD7' *
* Meaning: For a PESTPATH request the number of
* LINKS path addresses specified is greater than the
* number of path addresses supported by the primary
* subsystem.
* Action: Specify the correct number of LINKS path
* addresses for the selected primary subsystem.
*
RQST_PESTPATH_PATH_COUNT_INVALID EQU 7128 X'1BD8' *
* Meaning: For a PESTPATH request the LINKS
* parameter was specified. The request failed
* because the path address count field contained a
* hexadecimal value less than 1 or greater than 8.
* Action: Supply a correct path address count value.
*
RQST_PESTPATH_PATH_LENGTH_INVALID EQU 7129 X'1BD9' *
* Meaning: For a PESTPATH request the LINKS
* parameter was specified. The request failed
* because the path address length value for one or
* more paths was not equal to 4 (X'0004').
* Action: Supply a correct path address length value
* in the path address length field(s).
*
RQST_PESTPATH_LINKS_ABEND EQU 7130 X'1BDA' *
* Meaning: For a PESTPATH request a System Data
* Mover request router/handler ABENDed while
* referencing the field pointed to by the ANTRQST
* LINKS parameter. The reason code will contain the
* ABEND code.
* Action: Make sure that the LINKS parameter points
* to a valid location in memory, and that if an ALET
* was specified on the ANTRQST macro the value is
* correct.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PDELPAIR_ERROR EQU 7140 X'1BE4'
* * Meaning: For a PDELPAIR request a System Data
* Mover request handler detected an error. Byte nine
* of the RETINFO field will contain the length of the
* following error message. Starting at byte ten will
* be a message that describes the error. Bytes ten
* through thirteen contain the ending part of an
* ANTP0xxxx message identifier (ex. - 108I for
* message identifier ANTP0108I).
* * Action: Take the action described in the
* documentation for the message identifier.
* *
RQST_PDELPAIR_INVALID_PARAMETER EQU 7141 X'1BE5'
* * Meaning: For a PDELPAIR request, one of the
* parameters is invalid.
* * Action: Check the reason code to the invalid
* parameter.
* *
RQST_PDELPAIR_REASON_PLSS_INVALID EQU 0004 X'0004'
* * Meaning: For a PDELPAIR request the specified
* primary lss is invalid.
* * Action: Check to be sure the primary lss is
* correct and reissue the command.
* *
RQST_PDELPAIR_REASON_SLSS_INVALID EQU 0008 X'0008'
* * Meaning: For a PDELPAIR request the specified
* secondary lss is invalid.
* * Action: Check to be sure the secondary lss is
* correct and reissue the command.
* *
RQST_PDELPAIR_REASON_PCCA_INVALID EQU 0012 X'000C'
* * Meaning: For a PDELPAIR request the specified
* primary cca is invalid.
* * Action: Check to be sure the primary cca is
* correct and reissue the command.
* *
RQST_PDELPAIR_REASON_SCCA_INVALID EQU 0016 X'0010'
* * Meaning: For a PDELPAIR request the specified
* secondary cca is invalid.
* * Action: Check to be sure the primary cca is
* secondary and reissue the command.
* *
RQST_PDELPAIR_MISSING_PLSS EQU 7145 X'1BE9'
* * Meaning: For a PDELPAIR request the specified
* device is in a storage subsystem that requires the
* PLSS parameter, but the PLSS parameter was not
* specified.
* * Action: Supply a correct PLSS parameter.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PDELPAIR_INVALID_PLSS EQU 7146 X'1BEA'
*  
  Meaning: For a PDELPAIR request the specified device is in a storage subsystem that does not use the PLSS parameter, but the PLSS parameter was specified.
*  
  Action: Remove the PLSS parameter.
*  
RQST_PDELPATH_ERROR EQU 7160 X'1BF8'
*  
  Meaning: For a PDELPATH request a System Data Mover request handler detected an error. Byte nine of the RETINFO field will contain the length of the following error message. Starting at byte ten will be a message that describes the error. Bytes ten through thirteen contain the ending part of an ANTP0xxxx message identifier (ex. - 108I for message identifier ANTP0108I).
*  
  Action: Take the action described in the documentation for the message identifier.
*  
RQST_PDELPATH_MISSING_PLSS EQU 7165 X'1BFD'
*  
  Meaning: For a PDELPATH request the specified device is in a storage subsystem that requires the PLSS parameter, but the PLSS parameter was not specified.
*  
  Action: Supply a correct PLSS parameter.
*  
RQST_PDELPATH_INVALID_PLSS EQU 7166 X'1BFE'
*  
  Meaning: For a PDELPATH request the specified device is in a storage subsystem that does not use the PLSS parameter, but the PLSS parameter was specified.
*  
  Action: Remove the PLSS parameter.
*  
RQST_PSUSPEND_ERROR EQU 7180 X'1C0C'
*  
  Meaning: For a PSUSPEND request a System Data Mover request handler detected an error. Byte nine of the RETINFO field will contain the length of the following error message. Starting at byte ten will be a message that describes the error. Bytes ten through thirteen contain the ending part of an ANTP0xxxx message identifier (ex. - 108I for message identifier ANTP0108I).
*  
  Action: Take the action described in the documentation for the message identifier.
RQST_PSUSPEND_INVALID_PRIMARY_VALUE  EQU 7181 X'1C0D'
*  
*  Meaning: For a PSUSPEND request the value supplied
*  in the PRIMARY parameter is invalid. If the
*  PRIMARY parameter is used its value must be NO or
*  YES.
*  
*  Action: Supply a correct PRIMARY value.
*  
RQST_PSUSPEND_INVALIDQUIESCE_VALUE  EQU 7182 X'1C0E'
*  
*  Meaning: For a PSUSPEND request the value supplied
*  in the QUIESCE parameter is invalid. If the
*  QUIESCE parameter is used its value must be NO or
*  YES.
*  
*  Action: Supply a correct PRIMARY value.
*  
RQST_PSUSPEND_MISSINGPLSS  EQU 7185 X'1C11'
*  
*  Meaning: For a PSUSPEND request the specified
*  device is in a storage subsystem that requires the
*  PLSS parameter, but the PLSS parameter was not
*  specified.
*  
*  Action: Supply a correct PLSS parameter.
*  
RQST_PSUSPEND_INVALIDPLSS  EQU 7186 X'1C12'
*  
*  Meaning: For a PSUSPEND request the specified
*  device is in a storage subsystem that does not use
*  the PLSS parameter, but the PLSS parameter was
*  specified.
*  
*  Action: Remove the PLSS parameter.
*  
RQST_PESTPAIR_ERROR  EQU 7200 X'1C20'
*  
*  Meaning: For a PESTPAIR request a System Data
*  Mover request handler detected an error. Byte nine
*  of the RETINFO field will contain the length of the
*  following error message. Starting at byte ten will
*  be a message that describes the error. Bytes ten
*  through thirteen contain the ending part of an
*  ANTP0xxxx message identifier (ex. - 108I for
*  message identifier ANTP0108I).
*  
*  Action: Take the action described in the
*  documentation for the message identifier.
*  
RQST_PESTPAIR_INVALIDCRIT_VALUE  EQU 7201 X'1C21'
*  
*  Meaning: For a PESTPAIR request the value supplied
*  in the CRIT parameter is invalid. If the CRIT
*  parameter is used the value must be NO or YES.
*  
*  Action: Supply a correct CRIT value.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PESTPAIR_INVALID_MODE_VALUE EQU 7202 X'1C22'
*  
*    Meaning: For a PESTPAIR request the value supplied
*    in the MODE parameter is invalid. If the MODE
*    parameter is used the value must be COPY, NOCOPY,
*    or RESYNC.
*    
*    Action: Supply a correct MODE value.
*    
RQST_PESTPAIR_INVALID_MSGREQ_VALUE EQU 7203 X'1C23'
*  
*    Meaning: For a PESTPAIR request the value supplied
*    in the MSGREQ parameter is invalid. If the MSGREQ
*    parameter is used the value must be NO or YES.
*    
*    Action: Supply a correct MSGREQ value.
*    
RQST_PESTPAIR_INVALID_ONLINSEC_VALUE EQU 7204 X'1C24'
*  
*    Meaning: For a PESTPAIR request the value supplied
*    in the ONLINSEC parameter is invalid. If the
*    ONLINSEC parameter is used the value must be NO or
*    YES.
*    
*    Action: Supply a correct ONLINSEC value.
*    
RQST_PESTPAIR_MISSING_PLSS EQU 7205 X'1C25'
*  
*    Meaning: For a PESTPAIR request the specified
*    device is in a storage subsystem that requires the
*    PLSS parameter, but the PLSS parameter was not
*    specified.
*    
*    Action: Supply a correct PLSS parameter.
*    
RQST_PESTPAIR_INVALID_PLSS EQU 7206 X'1C26'
*  
*    Meaning: For a PESTPAIR request the specified
*    device is in a storage subsystem that does not use
*    the PLSS parameter, but the PLSS parameter was
*    specified.
*    
*    Action: Remove the PLSS parameter.
*    
RQST_PESTPAIR_MISSING_SLSS EQU 7207 X'1C27'
*  
*    Meaning: For a PESTPAIR request the specified
*    device is in a storage subsystem that requires the
*    SLSS parameter, but the SLSS parameter was not
*    specified.
*    
*    Action: Supply a correct SLSS parameter.
*    
RQST_PESTPAIR_INVALID_SLSS EQU 7208 X'1C28'
*  
*    Meaning: For a PESTPAIR request the specified
*    device is in a storage subsystem that does not use
*    the SLSS parameter, but the SLSS parameter was
*    specified.
*    
*    Action: Remove the SLSS parameter.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PESTPAIR_INVALID_OPTION_VALUE  EQU  7209  X'1C29'
  *
  * Meaning: For a PESTPAIR request the OPTION keyword
  * was specified. The OPTION field contains an invalid
  * value. The only allowable values are 'SYNC' and
  * 'XD'. These values must begin in the first byte of
  * the OPTION field, and followed by blanks on right.
  * If the OPTION field contains binary zeros, the
  * OPTION keyword is treated as if the OPTION keyword
  * was omitted.
  *
  * Action: Make any necessary changes to the OPTION
  * field value and resubmit the request.
  *
RQST_PESTPAIR_OPT_XD_NOT_AVAILABLE  EQU  7210  X'1C2A'
  *
  * Meaning: For a PESTPAIR request the OPTION keyword
  * was specified with the OPTION field set to 'XD'
  * (Extended Distance PPRC). The feature information
  * from the ESS subsystem indicates that the PPRC
  * Extended Distance function is not installed or not
  * active for the specified device.
  *
  * Action: Verify the correct device has been
  * specified. Insure the ESS subsystem that contains
  * the device has the Extended Distance LIC installed
  * and active.
  *
RQST_PESTPAIR_OPT_XD_CRIT_YES_INVALID  EQU  7211  X'1C2B'
  *
  * Meaning: For a PESTPAIR request the OPTION keyword
  * was specified with the OPTION field set to 'XD'
  * (Extended Distance PPRC). The PESTPAIR request also
  * has the CRIT(YES) keyword and parameter specified.
  * PPRC PESTPAIR CRIT(YES) and OPTION(XD) cannot be
  * used together in a PESTPAIR request.
  *
  * Action: Verify the correct values for CRIT and
  * OPTION have been specified. Make any necessary
  * changes and resubmit the request.
  *

</tr>
</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

- **RQST_FAILBACK_REAS_INVALID_STATE**  EQU 0008 X'0008'
  * Meaning: For PPRC Failback Mode, the addressed volume is not a Peer-to-Peer Remote Copy primary in a suspended state, or a Cascading Peer-to-Peer Remote Copy volume whose primary state and secondary state is suspended.
  * Action: Check the state of the addressed volume and re-submit the command after making any corrections.

- **RQST_PESTPAIR_IO_ERROR**  EQU 7218 X'1C32'
  * Meaning: An IO error was detected by SDM while processing a PESTPAIR request. Bytes 5-8 of the RETINFO field will contain an error reason code that will provide more details about the error. These codes are documented below, and will have names that start with RQST_PESTPAIR_IO_ERROR_xxx.
  * Action: Take the action shown in the reason code documentation.

- **RQST_PESTPAIR_IO_ERROR_CHGREC_STARTED**  EQU 0004 X'0004'
  * Meaning: INCRESYNC=START was specified, but a change recording mechanism is already started for the specified device.
  * Action:

- **RQST_PESTPAIR_IO_ERR_CHGREC_NOT_STRTD**  EQU 0008 X'0008'
  * Meaning: An establish pair with MODE=INCRES was specified, but the change recording mechanism was not started for the specified device.
  * Action: Start change recording for the specified device and reissue the command.

- **RQST_PESTPAIR_IO_ERROR_NOT_AC_VOLS**  EQU 0012 X'000C'
  * Meaning: An establish pair with MODE=INCRES was specified, but the primary and secondary specified are not the A and C volumes in an A-B-C cascading relationship and FORCE=YES was not specified.
  * Action: Check the device information and re-submit the command after making any changes.

- **RQST_PESTPAIR_IO_ERROR_SETGTOK_MISSING**  EQU 0016 X'0010'
  * Meaning: A PPRC establish pair request specified a space efficient volume as the secondary, but SETGTOK=YES was not specified.
  * Action: Check the device information and re-submit the command after making any changes.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PESTPAIR_IO_ERROR_VOLUME_RESIZING  EQU 0020  X'0014'
*  *  Meaning: A PPRC establish pair request specified a volume
*  *  that is currently in the process of being resized.
*  *  Devices are restricted from participating in a copy
*  *  services relationship when being resized.
*  *  Action: Wait until the volume rsize has completed and
*  *  reissue the request
*  *
RQST_PESTPAIR_IO_ERROR_SEC_SEFLC_SOURCE  EQU 0024  X'0018'
*  *  Meaning: A PPRC establish pair request specified a secondary
*  *  that is currently the source of a space efficient FlashCopy
*  *  relationship and MODE(COPY).
*  *  Action: Withdraw the FlashCopy relationship before doing
*  *  the establish.
*  *
RQST_PESTPAIR_INVALID  EQU 7219  X'1C33'
*  *  Meaning: An error was detected by SDM while processing
*  *  a PESTPAIR request. Bytes 5-8 of the RETINFO field
*  *  will contain an error reason code that will provide
*  *  more details about the error. These codes are
*  *  documented below, and will have names that start with
*  *  RQST_PESTPAIR_INVALID_xxx.
*  *  Action: Take the action shown in the reason code
*  *  documentation.
*  *
RQST_PESTPAIR_INVALID_INCRESYNC_VALUE  EQU 0004  X'0004'
*  *  Meaning: For a PESTPAIR request, the value supplied in
*  *  the INCRESYNC parameter is invalid or the feature code
*  *  that is required for Incremental Resync functions is not
*  *  installed on the target device. If the INCRESYNC
*  *  parameter is used the value must be START, STOP or NOCOPY.
*  *  Action: Supply a correct INCRESYNC value or ensure the
*  *  correct feature code is installed on the target device.
*  *
RQST_PESTPAIR_INVALID_MODE_INCRES  EQU 0008  X'0008'
*  *  Meaning: For a PESTPAIR request the MODE keyword was
*  *  specified with a value of 'INCRES' along with one of
*  *  the following mutually exclusive keyword/parameter
*  *  combinations:
*  *  - ACTION(FAILOVER)
*  *  - ACTION(FAILBACK)
*  *  - INCRESYNC(START)
*  *  - INCRESYNC(STOP)
*  *  - INCRESYNC(NOCOPY)
*  *  None of the above keyword/parameter pairs can be
*  *  specified when specifying MODE(INCRES) in a
*  *  PESTPAIR request.
*  *  Action: Verify the correct values for MODE, ACTION
*  *  and INCRESYNC have been specified. Make any necessary
*  *  changes and resubmit the request.
*  *
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PESTPAIR_INVALID_FORCE_VALUE EQU 0012 '0012'
*  
* Meaning: For a PESTPAIR request the value supplied
* in the FORCE parameter is invalid. If the
* FORCE parameter is used the value must be NO
* or YES.
*  
* Action: Supply a correct FORCE value.
*  
RQST_PESTPAIR_REAS_INVALID_XRCONSEC EQU 0016 '0016'
*  
* Meaning: For a PESTPAIR request the value supplied
* in the XRCONSEC parameter is invalid. If the
* XRCONSEC parameter is used the value must be NO or
* YES.
*  
* Action: Supply a correct XRCONSEC value.
*  
RQST_PESTPAIR_REAS_XRCIR_NO_SUPPORT EQU 0020 '0020'
*  
* Meaning: For a PESTPAIR request the XRCONSEC is
* specified, but the hardware does not support
* XRC Incremental Resync.
*  
* Action: Check hardware to see if XRC Incremental
* Resync is supported. Make necessary changes and
* resubmit the request.
*  
RQST_PESTPAIR_REAS_INVALID_AUTORESC EQU 0024 '0024'
*  
* Meaning: For a PESTPAIR request the value supplied
* in the AUTORESYNC parameter is invalid. If the
* AUTORESYNC parameter is used the value must be NO or
* YES.
*  
* Action: Supply a correct AUTORESYNC value.
*  
RQST_PRECOVER_ERROR EQU 7220 '1C34'
*  
* Meaning: For a PRECOVER request a System Data
* Mover request handler detected an error. Byte nine
* of the RETINFO field will contain the length of the
* following error message. Starting at byte ten will
* be a message that describes the error. Bytes ten
* through thirteen contain the ending part of an
* ANTPOxxxx message identifier (ex. - 108I for
* message identifier ANTP0108I).
*  
* Action: Take the action described in the
* documentation for the message identifier.
*  
RQST_PRECOVER_MISSING_PLSS EQU 7225 '1C39'
*  
* Meaning: For a PRECOVER request the specified
* device is in a storage subsystem that requires the
* PLSS parameter, but the PLSS parameter was not
* specified.
*  
* Action: Supply a correct PLSS parameter.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

```
RQST_PRECOVER_INVALID_PLSS  EQU  7226  X'1C3A'
  *  Meaning: For a PRECOVER request the specified
  *    device is in a storage subsystem that does not use
  *    the PLSS parameter, but the PLSS parameter was
  *    specified.
  *  Action: Remove the PLSS parameter.
  *
RQST_PRECOVER_MISSING_SLSS   EQU  7227  X'1C3B'
  *  Meaning: For a PRECOVER request the specified
  *    device is in a storage subsystem that requires the
  *    SLSS parameter, but the SLSS parameter was not
  *    specified.
  *  Action: Supply a correct SLSS parameter.
  *
RQST_PRECOVER_INVALID_SLSS   EQU  7228  X'1C3C'
  *  Meaning: For a PRECOVER request the specified
  *    device is in a storage subsystem that does not use
  *    the SLSS parameter, but the SLSS parameter was
  *    specified.
  *  Action: Remove the SLSS parameter.
  *
RQST_PRECOVER_OLD_VOLSER_INVALID  EQU  7229  X'1C3D'
  *  Meaning: For a PRECOVER request the specified
  *    OLDVOLSER contains an invalid volume serial value.
  *    The volume serial value must be valid alphanumeric
  *    characters, left justified in the field and padded
  *    on the right with blanks if necessary.
  *  Action: Insure the OLDVOLSER contains valid
  *    alphanumeric characters and is left justified with
  *    trailing blanks if needed.
  *
RQST_PRECOVER_NEW_VOLSER_INVALID EQU  7230  X'1C3E'
  *  Meaning: For a PRECOVER request the specified
  *    NEWVOLSER contains an invalid volume serial value.
  *    The volume serial value must be valid alphanumeric
  *    characters, left justified in the field and padded
  *    on the right with blanks if necessary.
  *  Action: Insure the NEWVOLSER contains valid
  *    alphanumeric characters and is left justified with
  *    trailing blanks if needed.
  *
```
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_PQUERY_ERROR EQU 7240 X'1C48'
*  * Meaning: For a PQQUERY request a System Data Mover
* request handler detected an error. Byte nine of
* the RETINFO field will contain the length of the
* following error message. Starting at byte ten will
* be a message that describes the error. Bytes ten
* through thirteen contain the ending part of an
* ANTP0xxxx message identifier (ex. - 108I for
* message identifier ANTP0108I).
*  * Action: Take the action described in the
* documentation for the message identifier.
*  
RQST_PQUERY_INVALID_OSERIAL EQU 0004 X'0004'
*  * Meaning: For a PQQUERY request, the serial number
* does not match the serial number of the devn.
*  * Action: Check the QRYSERIAL and be sure it
* matches the serial number of the devn and
* resubmit the command.
*  
RQST_PQUERY_QRYSIZE_TOO_SMALL EQU 7241 X'1C49'
*  * Meaning: A PQQUERY request was made, and the size
* of the QRYINFO field was not large enough to hold
* all of the unformatted status information. As much
* information as possible was placed into the QRYINFO
* field.
*  * Action: The total amount of space needed is
* returned in the reason code.
*  
RQST_PQUERY_INVALID_PATHS_VALUE EQU 7242 X'1C4A'
*  * Meaning: For a PQQUERY request the value supplied
* in the PATHS parameter is invalid. If the PATHS
* parameter is used the value must be NO or YES.
*  * Action: Supply a correct PATHS value.
*  
RQST_PQUERY_QRYSIZE_ZERO EQU 7243 X'1C4B'
*  * Meaning: For a PQQUERY request the value supplied
* in the QRYSIZE parameter is zero.
*  * Action: Supply a non-zero QRYSIZE value.
*  
RQST_PQUERY_QRYINFO_ABEND EQU 7244 X'1C4C'
*  * Meaning: For a PQQUERY request a System Data Mover
* request router/handler ABENDED while referencing
* the field pointed to by the ANTRQST QRYINFO
* parameter. The reason code will contain the ABEND
* code.
*  * Action: Make sure that the QRYINFO parameter
* points to a valid location in memory, and that if
* an ALET was specified on the ANTRQST macro the
* value is correct.

</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

```
RQST_SDVCINFO_BASICSIZE_TOO_SMALL EQU 7301 '1C85'
  *
  * Meaning: For a SDVCINFO request the number
  * supplied in the BASICSIZE parameter is too small.
  * The value must be at least as large as the length
  * of PSL10_HEADER plus one.
  *
  * Action: Provide a larger BASICINFO area.
  *
RQST_SDVCINFO_BASICINFO_ABEND EQU 7302 '1C86'
  *
  * Meaning: For a SDVCINFO request a System Data
  * Mover request router/handler ABENDed while
  * referencing the field pointed to by the ANTRQST
  * BASICINFO parameter. The reason code will contain
  * the ABEND code.
  *
  * Action: Make sure that the BASICINFO parameter
  * points to a valid location in memory, and that if
  * an ALET was specified on the ANTRQST macro the
  * value is correct.
  *
RQST_SDVCINFO_EXTNDSIZE_TOO_SMALL EQU 7303 '1C87'
  *
  * Meaning: For a SDVCINFO request the number
  * supplied in the EXTNDSIZE parameter is too small.
  * The value must be at least as large as the length
  * of PSL11_HEADER plus one.
  *
  * Action: Provide a larger EXTNDINFO area.
  *
RQST_SDVCINFO_EXTNDINFO_ABEND EQU 7304 '1C88'
  *
  * Meaning: For a SDVCINFO request a System Data
  * Mover request router/handler ABENDed while
  * referencing the field pointed to by the ANTRQST
  * EXTNDINFO parameter. The reason code will contain
  * the ABEND code.
  *
  * Action: Make sure that the EXTNDINFO parameter
  * points to a valid location in memory, and that if
  * an ALET was specified on the ANTRQST macro the
  * value is correct.
  *
RQST_SDVCINFO_INFORMATION_TRUNCATED EQU 7305 '1C89'
  *
  * Meaning: For a SDVCINFO request the number
  * supplied in the BASICSIZE parameter and/or the
  * number supplied in the EXTNDSIZE parameter was too
  * small. PSL10_DATA_TRUNC and PSL11_DATA_TRUNC will
  * indicate which size parameters were too small.
  *
  * Action: To have all of the information returned
  * that is available make sure the value of BASICSIZE
  * is at least as large as the number returned in
  * PSL10_DATA_USED, and the value of EXTNDSIZE is at
  * least as large as the number returned in
  * PSL11_DATA_USED.
  *
```
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_SQRYDVCS_SNAPSHOT_ERROR EQU 7320 X'1C98'
*  
* Meaning: For a SQRYDVCS request a SnapShot subsystem detected an error. Bytes five through eight of the RETINFO field contain the SnapShot subsystem error code.
*  
* Action: Take the action described in the documentation for the SnapShot subsystem.
*  
RQST_SQRYDVCS_ACCESS_INVALID EQU 7321 X'1C99'
*  
* Meaning: For a SQRYDVCS request the value supplied in the ACCESS parameter is invalid. If the ACCESS parameter is used the value must be NO, R, or RW.
*  
* Action: Supply a correct ACCESS value.
*  
RQST_SQRYDVCS_BEGINCYLO_INVALID EQU 7322 X'1C9A'
*  
* Meaning: For a SQRYDVCS request the value supplied in the BEGINCYLO parameter is invalid. If the BEGINCYLO parameter is used the value must be YES or NO.
*  
* Action: Supply a correct BEGINCYLO value.
*  
RQST_SQRYDVCS_DEVTYPE_INVALID EQU 7323 X'1C9B'
*  
* Meaning: For a SQRYDVCS request the value supplied in the DEVTYPE parameter is invalid. If the DEVTYPE parameter is used the value must be NO, 3380, or 3390.
*  
* Action: Supply a correct DEVTYPE value.
*  
RQST_SQRYDVCS_PARTITION_INVALID EQU 7324 X'1C9C'
*  
* Meaning: For a SQRYDVCS request the value supplied in the PARTITION parameter is invalid. If the PARTITION parameter is used the value must be NO, TEST, or PROD.
*  
* Action: Supply a correct PARTITION value.
*  
RQST_SQRYDVCS_QRYSIZE_TOO_SMALL EQU 7325 X'1C9D'
*  
* Meaning: For a SQRYDVCS request the number supplied in the QRYSIZE parameter or in the QRYSIZE parameter was too small. The value must be at least as large as the length of PSL30_HEADER plus one.
*  
* Action: To have all of the information returned that is available make sure the value of QRYSIZE parameter or the QRYSIZE parameter is at least as large as the number returned in PSL30_DATA_USED.

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_SRELEASE_SNAPSHOT_ERROR EQU 7360 X'1CC0'
*  
* Meaning: For a SRELEASE request a SnapShot subsystem detected an error. Bytes five through eight of the RETINFO field contain the SnapShot subsystem error code.
*  
* Action: Take the action described in the documentation for the SnapShot subsystem.
*  
RQST_SRELEASE_EXTNBR_ZERO EQU 7361 X'1CC1'
*  
* Meaning: For a SRELEASE request the number supplied in the EXTNBR parameter is zero. At least one extent pair must be provided.
*  
* Action: Provide at least one extent pair.
*  
RQST_SRELEASE_EXTINFO_ABEND EQU 7362 X'1CC2'
*  
* Meaning: For a SRELEASE request a System Data Mover request router/handler ABENDed while referencing the field pointed to by the ANTRQST EXTINFO parameter. The reason code will contain the ABEND code.
*  
* Action: Make sure that the EXTINFO parameter points to a valid location in memory.
*  
RQST_SSNAP_SNAPSHOT_ERROR EQU 7380 X'1CD4'
*  
* Meaning: For a SSNAP request a SnapShot subsystem detected an error. Bytes five through eight of the RETINFO field contain the SnapShot subsystem error code.
*  
* Action: Take the action described in the documentation for the SnapShot subsystem.
*  
RQST_SSNAP_TRELOCATE_INVALID EQU 7381 X'1CD5'
*  
* Meaning: For a SQRYDVCS request the value supplied in the TRELOCATE parameter is invalid. If the TRELOCATE parameter is used the value must be NO or YES.
*  
* Action: Supply a correct TRELOCATE value.
*  
RQST_SSNAP_SEXTNBR_ZERO EQU 7382 X'1CD6'
*  
* Meaning: For a SSNAP request the number supplied in the SEXTNBR parameter is zero. At least one extent pair must be provided.
*  
* Action: Provide at least one extent pair.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_SSNAP_TEXTNBR_ZERO EQU 7383 X'1CD7'
  * Meaning: For a SSNAP request the number supplied
  * in the TEXTNBR parameter is zero. At least one
  * extent pair must be provided.
  * Action: Provide at least one extent pair.

RQST_SSNAP_SEXTINFO_ABEND EQU 7384 X'1CD8'
  * Meaning: For a SSNAP request a System Data Mover
  * request router/handler ABENDed while referencing
  * the field pointed to by the ANTRQST SEXTINFO
  * parameter. The reason code will contain the ABEND
  * code.
  * Action: Make sure that the SEXTINFO parameter
  * points to a valid location in memory.

RQST_SSNAP_TEXTINFO_ABEND EQU 7385 X'1CD9'
  * Meaning: For a SSNAP request a System Data Mover
  * request router/handler ABENDed while referencing
  * the field pointed to by the ANTRQST TEXTINFO
  * parameter. The reason code will contain the ABEND
  * code.
  * Action: Make sure that the TEXTINFO parameter
  * points to a valid location in memory.

RQST_CCSTOR_ERROR EQU 7390 X'1CDE'
  * Meaning: For a CCSTOR request the System Data
  * Mover detected an error. Bytes 5-8 of the RETINFO
  * field will contain an error reason code. These
  * codes are documented below, and will have names
  * that start with RQST_CCSTOR_REAS_xxx.
  * Action: Take the action shown in the reason code
  * documentation.

RQST_LISTWS_ERROR EQU 7391 X'1CDF'
  * Meaning: For a LISTWS request the System Data
  * Mover detected an error. Bytes 5-8 of the RETINFO
  * field will contain an error reason code. These
  * codes are documented below, and will have names
  * that start with RQST_LISTWS_REAS_xxx.
  * Action: Take the action shown in the reason code
  * documentation.

RQST_REFRESHWS_ERROR EQU 7392 X'1CE0'
  * Meaning: For a REFRESHWS request the System Data
  * Mover detected an error. Bytes 5-8 of the RETINFO
  * field will contain an error reason code. These
  * codes are documented below, and will have names
  * that start with RQST_REFRESHWS_REAS_xxx.
  * Action: Take the action shown in the reason code
  * documentation.
### Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>RQST_RELEASEWS_ERROR EQU 7393 X'1CE1'</td>
<td>For a RELEASEWS request the System Data Mover detected an error. Bytes 5-8 of the RETINFO field will contain an error reason code. These codes are documented below, and will have names that start with RQST_RELEASEWS_REAS_xxx.</td>
<td>Take the action shown in the reason code documentation.</td>
</tr>
<tr>
<td>RQST_RELEASEWS_REAS_INVALID_LLQ EQU 0004 X'0004'</td>
<td>The value specified for the LLQ parameter is not correct. Either the first character is not ALPHA (A-Z,$,#,@), or the rest of the characters are not ALPHNUM (A-Z,0-9,$,#,@).</td>
<td>Correct the invalid character(s).</td>
</tr>
<tr>
<td>RQST_SETPARMLIB_ERROR EQU 7394 X'1CE2'</td>
<td>For a SETPARMLIB request the System Data Mover detected an error. Bytes 5-8 of the RETINFO field will contain an error reason code. These codes are documented below, and will have names that start with RQST_SETPARMLIB_REAS_xxx.</td>
<td>Take the action shown in the reason code documentation.</td>
</tr>
<tr>
<td>RQST_SETPARMLIB_REAS_INVALID_PRMLIB_ACTN EQU 0004 X'0004'</td>
<td>The value specified for the PACTION parameter is not correct. The value must be A or V.</td>
<td>Correct the invalid value.</td>
</tr>
<tr>
<td>RQST_XADD_ERROR EQU 7400 X'1CE8'</td>
<td>For an XADD request the System Data Mover level 2 request handler detected an error. Bytes 9-12 of the RETINFO field will contain an error return code. Bytes 13-16 of the RETINFO field will contain an error reason code. These error return and reason codes are documented in the manual(s) that describe the System Data Mover.</td>
<td>Take the action listed in the System Data Mover documentation.</td>
</tr>
<tr>
<td>RQST_XADD_INVALID_SUSPENDED_VALUE EQU 7402 X'1CEA'</td>
<td>For an XADD request the value specified in the SUSPENDED parameter is invalid.</td>
<td>Specify a correct value.</td>
</tr>
</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XADD_INVALID_DONOTBLOCK_VALUE EQU 7403 '1CEB'
*  
* Meaning: For an XADD request the value specified
* in the DONOTBLOCK parameter is invalid.
*  
* Action: Specify a correct value.
*  
RQST_XADD_INVALID_SCSSESSION EQU 7404 '1CEC'
*  
* Meaning: For an XADD request the value specified
* in the SCSESSION parameter is not alphabetic (A-Z).
*  
* Action: Specify a correct value.
*  
RQST_XADD_INVALID_PRIMARY_VOLSER EQU 7405 '1CED'
*  
* Meaning: For an XADD request the value specified
* in the PVOLSER parameter has one of the following
* errors:
*  
* o Both the SUSPENDED and PVOLSER parameters have
*   values in them.
*  
* o One of the characters is not ALPHNUM
*   (A-Z,0-9,$,#,@).
*  
* Action: Specify a correct value.
*  
RQST_XADD_INVALID_SECONDARY_VOLSER EQU 7406 '1CEE'
*  
* Meaning: For an XADD request the value specified
* in the SVOLSER parameter is not ALPHNUM
*   (A-Z,0-9,$,#,@).
*  
* Action: Specify a correct value.
*  
RQST_XADD_PDEVNUM_MISSING_REQ_KEYWORD EQU 7407 '1CEF'
*  
* Meaning: For an XADD request the parameter PDEVNUM
* requires that SDEVNUM is specified.
* IBM INTERNAL USE ONLY.
*  
* Action: Specify values for keywords and resubmit.
*  
RQST_XADD_INVALID_SECONDARY_DEVNUM EQU 7408 '1CF0'
*  
* Meaning: For an XADD request the value specified
* in the SDEVNUM parameter is not either
* UTIL or an EBCDIC equivalent of hex digits indicating
* either the primary device number is a utility device address
* or the secondary device number.
*  
* Action: Specify a correct value.
*  

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XADD_SWAPDEV_MISSING_REQ_KEYWORD EQU 7409 X'1CF1'
*   * Meaning: For an XADD request the parameter SWAPDEV
*   * requires that PDEVNUM and SDEVNUM are specified.
*   * IBM INTERNAL USE ONLY.
*   * Action: Specify values for keywords and resubmit.
*  
RQST_XADD_INVALID_SWAP_DEVNUM EQU 7410 X'1CF2'
*   * Meaning: For an XADD request the value specified
*   * in the SWAPDEV parameter is not an EBCDIC equivalent of hex
*   * digits indicating the swap device number.
*   * Action: Specify a correct value.
*  
RQST_XDEL_ERROR EQU 7420 X'1CFC'
*   * Meaning: For an XDEL request the System Data Mover
*   * level 2 request handler detected an error. Bytes
*   * 9-12 of the RETINFO field will contain an error
*   * return code. Bytes 13-16 of the RETINFO field will
*   * contain an error reason code. These error return
*   * and reason codes are documented in the manual(s)
*   * that describe the System Data Mover.
*   * Action: Take the action listed in the System Data
*   * Mover documentation.
*  
RQST_XDEL_INVALID_PRIMARY_DEVNUM EQU 7421 X'1CFD'
*   * Meaning: For an XDEL request the value specified
*   * in the first 4 chars of the PDEVNUM parameter is not
*   * an EBCDIC equivalent of hex values 0000-FFFF indicating
*   * the primary device number.
*   * Action: Specify a correct value.
*  
RQST_XEND_ERROR EQU 7440 X'1D10'
*   * Meaning: For an XEND request the System Data Mover
*   * level 2 request handler detected an error. Bytes
*   * 9-12 of the RETINFO field will contain an error
*   * return code. Bytes 13-16 of the RETINFO field will
*   * contain an error reason code. These error return
*   * and reason codes are documented in the manual(s)
*   * that describe the System Data Mover.
*   * Action: Take the action listed in the System Data
*   * Mover documentation.
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XSTATUS_ERROR EQU 7460 X'1D24'
*  * Meaning: For an XSTATUS request the System Data
*  * Mover level 2 request handler detected an error.
*  * Bytes 9-12 of the RETINFO field will contain an
*  * error return code. Bytes 13-16 of the RETINFO
*  * field will contain an error reason code. These
*  * error return and reason codes are documented in the
*  * manual(s) that describe the System Data Mover.
*  * Action: Take the action listed in the System Data
*  * Mover documentation.
*  *
RQST_XSTATUS_QRYSIZE_TOO_SMALL EQU 7461 X'1D25'
*  * Meaning: An XSTATUS request was made, and the size
*  * of the QRYINFO field was not large enough to hold
*  * all of the unformatted status information. As much
*  * information as possible was placed into the QRYINFO
*  * field.
*  * Action: The total amount of space needed is
*  * returned in the reason code.
*  *
RQST_XSTATUS_QRYSIZE_BIG_ENOUGH EQU 7462 X'1D26'
*  * Meaning: An XSTATUS request was made, and the size
*  * of the QRYINFO field was large enough to hold all
*  * of the unformatted status information.
*  * Action: The total amount of space used is returned
*  * in the reason code.
*  *
RQST_XSTATUS_QRYSIZE_ZERO EQU 7463 X'1D27'
*  * Meaning: For an XSTATUS request the value supplied
*  * in the QRYSIZE parameter is zero.
*  * Action: Supply a non-zero QRYSIZE value.
*  *
RQST_XSTATUS_QRYINFO_ABEND EQU 7464 X'1D28'
*  * Meaning: For an XSTATUS request a System Data Mover
*  * request router/handler ABENDED while referencing
*  * the field pointed to by the ANTRQST QRYINFO
*  * parameter. The reason code will contain the ABEND
*  * code.
*  * Action: Make sure that the QRYINFO parameter
*  * points to a valid location in memory, and that if
*  * an ALET was specified on the ANTRQST macro the
*  * value is correct.
*  *
RQST_XSTATUS_INSUFFICIENT_STORAGE EQU 7465 X'1D29'
*  * Meaning: Unable to GETMAIN enough storage to save
*  * the statistics.
*  * Action: If the system is not running low on storage
*  * contact IBM.
*  *

<td>For an XSET request the value specified in the RFREQUENCY parameter has &quot;hh&quot; greater than 18, &quot;mm&quot; greater than 59, or &quot;ss&quot; greater than 59.</td>
<td>Correct the invalid value.</td>
</tr>
</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XSET_RFREQUENCY_TOO_SMALL EQU 7532 '1D6C'
  * Meaning: For an XSET request the value specified
  * in the RFREQUENCY parameter is too small.
  * Action: Specify a correct value.

RQST_XSET_INVALID_PRIMARY_VOLSER EQU 7533 '1D6D'
  * Meaning: The value specified for the PVOLSER
  * parameter is not correct. One of the characters is
  * not ALPHNUM (A-Z,0-9,$,#,@).
  * Action: Correct the invalid character(s).

RQST_XSET_INVALID_PARMLIB_MEMBER EQU 7534 '1D6E'
  * Meaning: The value specified for the PMEMBER
  * parameter is not correct. One of the characters is
  * not ALPHNUM (A-Z,0-9,$,#,@).
  * Action: Correct the invalid character(s).

RQST_XSET_INVALID_PARMLIB_ACTION EQU 7535 '1D6F'
  * Meaning: The value specified for the PACTION
  * parameter is not correct. The value must be A or V.
  * Action: Correct the invalid value.

RQST_XSET_INVALID_PARMLIB_DSNAME EQU 7536 '1D70'

RQST_XSET_INVALID_REFRESH_VALUE EQU 7537 '1D71'
  * Meaning: For an XSET request the value specified
  * in the REFRESH parameter is invalid.
  * Action: Specify YES or NO.

RQST_XSET_INVALID_SUSLBUSY_VALUE EQU 7538 '1D72'
  * Meaning: For an XSET request the value specified
  * in the SUSLBUSY parameter is invalid.
  * Action: Specify YES or NO.

RQST_XSTART_ERROR EQU 7540 '1D74'
  * Meaning: For an XSTART request the System Data
  * Mover level 2 request handler detected an error.
  * Bytes 9-12 of the RETINFO field will contain an
  * error return code. Bytes 13-16 of the RETINFO
  * field will contain an error reason code. These
  * error return and reason codes are documented in the
  * manual(s) that describe the System Data Mover.
  * Action: Take the action listed in the System Data
  * Mover documentation.

<td></td>
</tr>
<tr>
<td>RQST_DEVICE_SUBSYSTEM_INVALID</td>
<td>EQU 7600 X'1DB0'</td>
</tr>
<tr>
<td>* Meaning: For an Enterprise Storage Subsystem function request, the device specified is not in an Enterprise Storage Subsystem. * Action: Supply a device number in an Enterprise Storage Subsystem.</td>
<td></td>
</tr>
</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_DEVICES_NOT_IN_SAME_LSS EQU 7601 X'1DB1'
*  * Meaning: For an Enterprise Storage Subsystem
*  * function request, the devices specified in the
*  * SDEVN and TDEVN parameters are not in the same
*  * logical subsystem.
*  * Action: Supply a source device number and a target
*  * device number that are in the same logical
*  * subsystem in an Enterprise Storage Subsystem.
*  *

RQST_DEVICES_NOT_IN_SAME_ESS EQU 7602 X'1DB2'
*  * Meaning: For an Enterprise Storage Subsystem
*  * function request, the devices specified in the
*  * SDEVN and TDEVN parameters are not in the same
*  * ESS.
*  * Action: Supply a source device number and a target
*  * device number that are in the same Enterprise Storage
*  * Subsystem.
*  *

RQST_SHARK_SERVICE_ERROR EQU 7603 X'1DB3'
*  * Meaning: A request has been made to a ESSRVCS
*  * subsystem handler, and an error had been detected.
*  * Action: Contact IBM.
*  *

RQST_FCESTABLISH_ERROR EQU 7610 X'1DBA'
*  * Meaning: For an FCESTABLISH request a System Data
*  * Mover request handler detected an error. Byte nine
*  * of the RETINFO field will contain the length of the
*  * following error message. Starting at byte ten may
*  * be a message that describes the error. Bytes ten
*  * through thirteen contain the ending part of an
*  * ANTF0xxxx message identifier (ex. - 108I for
*  * message identifier ANTF0108I). The reason code
*  * will contain the device number of the device that
*  * returned the error in the first two bytes, and the
*  * return code from the I/O request in the last two
*  * bytes.
*  * Action: Take the action described in the
*  * documentation for the message identifier.
*  *

RQST_FCESTABLISH_REAS_F0430E EQU 0004 X'0004'
*  * Meaning: The FlashCopy request was issued
*  * with the REMOTE keyword, but the DEVN device
*  * is not a PPRC primary volume in an active
*  * PPRC pair.
*  * Action: Ensure that the DEVN device is a
*  * PPRC primary device and the PPRC QUERY
*  * secondary device information matches the
*  * FlashCopy Establish REMOTE source device
*  * information. Verify that the FlashCopy
*  * SOURCE and TARGET devices are correctly
*  * specified. Resubmit the corrected FlashCopy
*  * Establish request.
*  *
RQST_FCESTABLISH_REAS_F0431E EQU 0008 X'0008'
* Meaning: The FlashCopy request was issued with
* the REMOTE keyword. The REMOTE FlashCopy source
* device is not the PPRC secondary volume for the
* PPRC Primary DEVN device. The FlashCopy Establish
* DEVN device must be the PPRC Primary volume paired
* with the PPRC Secondary volume specified as the
* REMOTE FlashCopy Source device.
* Action: Use the PPRC Query to determine the status
* of the DEVN device. If the DEVN device is a PPRC
* Primary volume, ensure that the PPRC Secondary
* device information is the same as the REMOTE
* FlashCopy Source device information. Resubmit
* the corrected FlashCopy Establish request.
*
RQST_FCESTABLISH_REAS_F0432E EQU 0012 X'000C'
* Meaning: The FlashCopy request was issued with
* the REMOTE keyword. The REMOTE FlashCopy Source
* device subsystem serial is not the same as the
* Target device subsystem serial.
* Action: Ensure that the FlashCopy REMOTE Source
* device subsystem serial is the same as the FlashCopy
* REMOTE Target subsystem serial. Resubmit the
* corrected FlashCopy Establish request.
*
RQST_FCESTABLISH_REAS_F0434E EQU 0016 X'0010'
* Meaning: The FlashCopy request was issued with
* the DEVN keyword. The REMOTE keyword was not
* specified. The DEVN keyword requires that the
* REMOTE keyword also be specified.
* Action: Ensure that the FlashCopy request
* containing the DEVN keyword also specifies the
* REMOTE keyword. Resubmit the corrected FlashCopy
* request.
*
RQST_FCESTABLISH_REAS_F0435E EQU 0020 X'0014'
* Meaning: The FlashCopy request was issued with
* the REMOTE keyword. The REMOTE keyword was not
* specified. The REMOTE keyword requires that the
* DEVN keyword also be specified.
* Action: Ensure that the FlashCopy request
* containing the REMOTE keyword also specifies the
* DEVN keyword. Resubmit the corrected FlashCopy
* request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_REAS_F0437E EQU 0024 X'0018'
* * Meaning: The FlashCopy request was issued with
* * the REMOTE keyword. When a FlashCopy Establish
* * of REMOTE is specified, then the SSID for the
* * Source device must be specified.
* * Action: Ensure that the FlashCopy request
* * specifies the SSID keyword with the SSID of the
* * Source device. Resubmit the corrected FlashCopy
* * request.
* * RQST_FCESTABLISH_REAS_F0438E EQU 0028 X'001C'
* * * Meaning: The FlashCopy request was issued with
* * the SSID keyword. The REMOTE keyword was not
* * specified. The SSID keyword requires that the
* * REMOTE keyword also be specified.
* * Action: Ensure that the FlashCopy request
* * containing the SSID keyword also specifies the
* * REMOTE keyword. Resubmit the corrected FlashCopy
* * request.
* * RQST_FCESTABLISH_REAS_F0439E EQU 0032 X'0020'
* * * Meaning: The FlashCopy request was issued with
* * the REMOTE, SSID, and OPENDVCS keywords. The
* * REMOTE and SSID keywords indicate the FlashCopy
* * request is for remote CKD devices. The OPENDVCS
* * keyword indicates that the FlashCopy request is
* * for remote open system devices. The specified
* * keywords are mutually exclusive.
* * Action: Ensure that the FlashCopy request specifies
* * the REMOTE and SSID keywords if a FlashCopy request
* * of REMOTE CKD devices is required. The SSID keyword
* * cannot be specified in FlashCopy requests for REMOTE
* * open system devices. Resubmit the corrected
* * FlashCopy request.
* * RQST_FCESTABLISH_REAS_F0440E EQU 0036 X'0024'
* * * Meaning: The FlashCopy request was issued with the
* * REMOTE keyword. When the request was sent to the
* * secondary subsystem, an error occurred. Any one of
* * the following conditions could cause this error.
* * The PPRC paths are inactive
* * The Primary or Secondary subsystem communication
* * adapters are failing
* * The Secondary subsystem cannot respond to the
* * Primary subsystem
* * The Secondary subsystem has hardware or microcode
* * conditions that prevent communication with the
* * Primary subsystem
* * Action: Ensure that the PPRC Secondary subsystem
* * is functioning normally. Ensure that the REMOTE
* * subsystem is communicating with the PPRC Primary
* * subsystem. If not, correct the communication
* * problem and resubmit the FlashCopy request.

Chapter 13. ANT messages 601
SDM Return Codes

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_REAS_F0441E EQU 0040 X'0028'
*  
* Meaning: The Flashcopy request was issued with the
* Remote keyword. The REMOTE FlashCopy Source device
* cannot be used as the FlashCopy source.
*  
* Actions: Use the PPRC query command to determine the
* status of the DEVN device. If the DEVN device is a
* PPRC primary device, make sure that the PPRC Secondary
* device information is the same as the Remote FlashCopy
* Source device information. Resubmit the corrected
* FlashCopy request.
*  
RQST_FCESTABLISH_REAS_F0442E EQU 0044 X'002C'
*  
* Meaning: The FlashCopy request was issued with the
* INCREMENTAL keyword. The MODE parameter must be
* COPY. Any other mode is invalid.
*  
* Actions: If INCREMENTAL is specified in the FlashCopy
* request, ensure that the MODE keyword has the COPY
* parameter specified. Resubmit the corrected
* FlashCopy request.
*  
RQST_FCESTABLISH_REAS_F0446E EQU 0048 X'0030'
*  
* Meaning: The FlashCopy request was issued with the
* INCREMENTAL, MODE=ASYNC or ACTION(FRR) keyword. The
* device the request was issued to is in an invalid
* state which inhibits the request from completing.
*  
* Actions: Ensure that the Source and Target devices
* are correct and that the Source device does not have
* any other INCREMENTAL relations active if INCREMENTAL(YES)
* or MODE(ASYNC) were specified. If ACTION(FRR) was specified,
* then there must be an active revertible relationship
* active. Modify the request and resubmit.
*  
RQST_FCESTABLISH_REAS_F0444E EQU 0052 X'0034'
*  
* Meaning: The FlashCopy request was issued with the
* OPENDVCS keyword. The control unit serial number
* in the SRCSERIAL does not match the control unit
* serial number of the DEVN keyword.
*  
* Actions: Ensure that the correct serial number is
* specified and the correct DEVN is being used.
* Resubmit the corrected FlashCopy request.
*  
RQST_FCESTABLISH_REAS_F0490E EQU 0056 X'0038'
*  
* Meaning: The FCESTABLISH request could not
* complete because the specified device is in
* an offline or inaccessible state.
*  
* Action: Modify the request to ensure that the
* device specified is available for use. After
* making any changes, resubmit the request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_REAS_F0407E EQU 0060 X'003C'
*  *  Meaning: For an FCESTABLISH request, the size
*  or format of the source device is not compatible
*  with the track size or format of the target
*  device. Or the volume capacity of the target device
*  is not equal to or greater than the source device.
*  *  Action: Modify the request to ensure the source
*  and target device track size and format are the same
*  or larger than the source. After making the
*  corrections, resubmit the request.
*  *
RQST_FCESTABLISH_MAX_EXTENTS EQU 0064 X'0040'
*  *  Meaning: For an FCESTABLISH request, Extents
*  were specified and the count was greater than the
*  maximum value of 110.
*  *  Action: Modify the request to ensure the extents
*  are less than 110 and resubmit the request.
*  *
RQST_FCESTABLISH_REAS_FRR_BITMAP EQU 0068 X'0044'
*  *  Meaning: An Establish FlashCopy command attempted
*  to reverse the order of the FlashCopy relation, and
*  the target bitmap was not all zeros.
*  *  Action: Specify ACTION=FRR if attempting to
*  reverse the FlashCopy relationship.
*  *
RQST_FCESTABLISH_REAS_CHGREC_STARTED EQU 0072 X'0048'
*  *  Meaning: A Establish FlashCopy command was issued
*  with INCREMENTAL=YES, but the source volume specified
*  already had a change recording mechanism started for
*  a different purpose (e.g. Metro/Global Mirror
*  Incremental Resync).
*  *  Action: Stop the change recording mechanism on the
*  source volume.
*  *
RQST_FCESTABLISH_REAS_SETG TOK_MISSING EQU 0076 X'004C'
*  *  Meaning: A FlashCopy establish request specified a
*  space efficient volume as the target, but
*  SETG TOK=YES was not specified.
*  Or a FlashCopy establish request specified background
*  copy to a space efficient target.
*  *  Action: supply SETG TOK or change volume to non
*  space efficient target volume.
*  *
RQST_FCESTABLISH_REAS_NO_REVERSE EQU 0084 X'0054'
*  *  Meaning: A FlashCopy establish request
*  attempted to reverse the direction of a
*  full-volume incremental relationship, but
*  the initial copy had not yet completed
*  *  Action: wait until the initial copy
*  completes, then respecify request
*  *
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_REAS_VOLUME_RESIZING EQU 0092 X'005C'
*   Meaning: A FlashCopy establish request specified a volume
*   that is currently in the process of being resized.
*   Devices are restricted from participating in a copy
*   services relationship when being resized.
*   Action: Wait until the volume rsize has completed and
*   reissue the request
*
RQST_FCESTABLISH_MODE_INVALID EQU 7611 X'1DBB'
*   Meaning: For an FCESTABLISH request the value
*   supplied in the MODE parameter is invalid. If the
*   MODE parameter is used the value must be COPY, or
*   NOCOPY.
*   Action: Supply a correct MODE value.
*
RQST_FCESTABLISH_MSGREQ_INVALID EQU 7612 X'1DBC'
*   Meaning: For an FCESTABLISH request the value
*   supplied in the MSGREQ parameter is invalid. If
*   the MSGREQ parameter is used the value must be NO
*   or YES.
*   Action: Supply a correct MSGREQ value.
*
RQST_FCESTABLISH_ONLINTGT_INVALID EQU 7613 X'1DBD'
*   Meaning: For an FCESTABLISH request the value
*   supplied in the ONLINTGT parameter is invalid. If
*   the ONLINTGT parameter is used the value must be NO
*   or YES.
*   Action: Supply a correct ONLINTGT value.
*
RQST_FCESTABLISH_SRCEXTENTS_ABEND EQU 7614 X'1DBE'
*   Meaning: For an FCESTABLISH request the value
*   supplied in the SRCEXTENTS parameter is invalid or
*   caused an abend when referencing the SRCEXTENTS
*   parameter list.
*   Action: Make sure that the SRCEXTENTS parameter
*   points to a valid location in memory, and that if
*   an ALET was specified on the ANTRQST macro, the
*   ALET value is correct.
*
RQST_FCESTABLISH_TGTEXTENTS_ABEND EQU 7615 X'1DBF'
*   Meaning: For an FCESTABLISH request the value
*   supplied in the TGTEXTENTS parameter is invalid or
*   caused an abend when referencing the TGTEXTENTS
*   parameter list.
*   Action: Make sure that the TGTEXTENTS parameter
*   points to a valid location in memory, and that if
*   an ALET was specified on the ANTRQST macro, the
*   ALET value is correct.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_SRCEXTENTS_COUNT_ERROR   EQU 7616 X'1DC0'
*  *   Meaning: For an FCESTABLISH request the value
*     supplied in the SRCEXTENTS count field is invalid.
*     The SRCEXTENTS count field must have a value from
*     1 to 110 for Volume FlashCopy Devices. The
*     SRCEXTENTS count field must have a value from 1
*     to the allowable maximum for Data Set FlashCopy
*     devices.
*     *   Action: Supply a correct SRCEXTENTS count field
*     *   value. This error can also be caused if the
*     *   SRCEXTENTS parameter points to an invalid storage
*     *   location.
*     *
RQST_FCESTABLISH_TGTEXTENTS_COUNT_ERROR   EQU 7617 X'1DC1'
*  *   Meaning: For an FCESTABLISH request the value
*     supplied in the TGTEXTENTS count field is invalid.
*     The TGTEXTENTS count field must have a value from
*     1 to 110 for Volume FlashCopy Devices. The
*     TGTEXTENTS count field must have a value from 1
*     to the allowable maximum for Data Set FlashCopy
*     devices.
*     *   Action: Supply a correct TGTEXTENTS count field
*     *   value. This error can also be caused if the
*     *   TGTEXTENTS parameter points to an invalid storage
*     *   location.
*     *
RQST_FCESTABLISH_DEVICE_IN_FC   EQU 7618 X'1DC2'
*  *   Meaning: For an FCESTABLISH request the source or
*     target device is currently in active FlashCopy.
*   *
RQST_FCESTABLISH_DEVICE_NOT_DS_FC   EQU 7619 X'1DC3'
*  *   Meaning: For an FCESTABLISH request the source or
*     target device are the same, but the
*     device is not Dataset Level FlashCopy capable.
*   *
   *   Action: Use the FCQUERY to determine the status
   *   of the source and target devices. Verify the source
   *   and target devices are correctly specified. After
   *   any changes or corrections, re-submit the
   *   FCESTABLISH request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>RQST_FCQUERY_ERROR</td>
<td>For an FCQUERY request a System Data Mover request handler detected an error. Byte nine of the RETINFO field will contain the length of the following error message. Starting at byte ten may be a message that describes the error. Bytes ten through thirteen contain the ending part of an ANTF0xxxx message identifier (ex. - 108I for message identifier ANTF0108I). The reason code will contain the device number of the device that returned the error in the first two bytes, and the return code from the I/O request in the last two bytes.</td>
</tr>
<tr>
<td>RQST_FCQUERY_REAS_F0450E</td>
<td>The FlashCopy request was issued with the REMOTE keyword, but the DEVN device is not a PPRC primary volume in an active PPRC pair.</td>
</tr>
<tr>
<td>RQST_FCQUERY_REAS_F0457E</td>
<td>The FlashCopy request was issued with the REMOTE keyword. The REMOTE FlashCopy source device is not the PPRC secondary volume for the PPRC Primary DEVN device. The FlashCopy Establish DEVN device must be the PPRC Primary volume paired with the PPRC Secondary volume specified as the REMOTE FlashCopy Source device.</td>
</tr>
</tbody>
</table>

* Action: Take the action described in the documentation for the message identifier.

* Action: Ensure that the DEVN device is a PPRC primary device and the PPRC QUERY secondary device information matches the FlashCopy Establish REMOTE source device information. Verify that the FlashCopy SOURCE and TARGET devices are correctly specified. Resubmit the corrected FlashCopy Establish request.

* Action: Use the PPRC Query to determine the status of the DEVN device. If the DEVN device is a PPRC Primary volume, ensure that the PPRC Secondary device information is the same as the REMOTE FlashCopy Source device information. Resubmit the corrected FlashCopy Establish request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCQUERY_REAS_F0456E EQU 0012 X'000C'
*  
*  Meaning: The FlashCopy request was issued with the
*  REMOTE keyword. When the request was sent to the
*  secondary subsystem, an error occurred. Any one of
*  the following conditions could cause this error.
*  *  The PPRC paths are inactive
*  *  The Primary or Secondary subsystem communication
*  adapters are failing
*  *  The Secondary subsystem cannot respond to the
*  Primary subsystem
*  *  The Secondary subsystem has hardware or microcode
*  *  conditions that prevent communication with the
*  Primary subsystem
*  *  Action: Ensure that the PPRC Secondary subsystem
*  *  is functioning normally. Ensure that the REMOTE
*  *  subsystem is communicating with the PPRC Primary
*  *  subsystem. If not, correct the communication
*  *  problem and resubmit the FlashCopy request.
*  
RQST_FCQUERY_REAS_F0490E EQU 0016 X'0010'
*  
*  Meaning: The FCQUERY request could not
*  *  complete because the specified device is in
*  *  an offline or inaccessible state.
*  *  Action: Modify the request to ensure that the
*  *  device specified is available for use. After
*  *  making any changes, resubmit the request.
*  
RQST_FCQUERY_QRYSIZE_ZERO EQU 7621 X'1DC5'
*  
*  Meaning: For an FCQUERY request the value supplied
*  *  in the QRYSIZE parameter is zero.
*  *  Action: Supply a non-zero QRYSIZE value.
*  
RQST_FCQUERY_QRYINFO_TOO_SMALL EQU 7622 X'1DC6'
*  
*  Meaning: An FCQUERY request was made, and the size
*  *  of the QRYINFO field was not large enough to hold
*  *  all of the unformatted status information. As much
*  *  information as possible was placed into the QRYINFO
*  *  field.
*  *  Action: The total amount of space needed is
*  *  returned in the reason code.
*  
RQST_FCQUERY_QRYINFO_LARGE_ENOUGH EQU 7623 X'1DC7'
*  
*  Meaning: An FCQUERY request was made, and the size
*  *  of the QRYINFO field was large enough to hold all
*  *  of the unformatted status information.
*  *  Action: The total amount of space used is returned
*  *  in the reason code.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCQUERY_EXTENTLEN_ZERO  EQU  7624  X'1DC8'
  *
  * Meaning: For an FCQUERY request the value supplied
  * in the EXTENTLEN parameter is zero or omitted and
  * the SRCEXTENTS and / or TGTEXTENTS parameter is
  * specified. EXTENTLEN value must be non-zero.
  *
  * Action: Supply a non-zero EXTENTLEN value.
  *
RQST_FCQUERY_BITMAPLEN_ZERO  EQU  7625  X'1DC9'
  *
  * Meaning: For an FCQUERY request the value supplied
  * in the BITMAPLEN parameter is zero or omitted and
  * the SRCBITMAP and / or TGTBITMAP parameter is
  * specified. BITMAPLEN value must be non-zero.
  *
  * Action: Supply a non-zero BITMAPLEN value.
  *
RQST_FCQUERY_EXTENTLEN_TOO_SMALL  EQU  7626  X'1DCA'
  *
  * Meaning: An FCQUERY request was made, and the
  * EXTENTLEN value was too small for the length of the
  * Source/Target Extent lists.
  *
  * Action: The needed amount of space is returned in
  * the reason code.
  *
RQST_FCQUERY_BITMAPLEN_TOO_SMALL  EQU  7627  X'1DCB'
  *
  * Meaning: An FCQUERY request was made, and the
  * BITMAPLEN value was too small for the length of the
  * Source/Target Bitmaps. The bitmap area(s) are filled
  * with truncated bitmap data.
  *
  * Action: The needed amount of space is returned in
  * the reason code.
  *
RQST_FCQUERY_QRYINFO_ABEND  EQU  7630  X'1DCE'
  *
  * Meaning: For an FCQUERY request a System Data
  * Mover request router/handler ABENDED while
  * referencing the field pointed to by the ANTRQST
  * QRYINFO parameter. The reason code will contain
  * the ABEND code.
  *
  * Action: Make sure that the QRYINFO parameter
  * points to a valid location in memory, and that if
  * an ALET was specified on the ANTRQST macro the
  * value is correct. Also verify the QRYSIZE value is
  * correct.
  *

</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCWITHDRAW_ERROR EQU 7640 X'1DD8'
* Meaning: For an FCWITHDRAW request a System Data
  * Mover request handler detected an error. Byte nine
  * of the RETINFO field will contain the length of the
  * following error message. Starting at byte ten may
  * be a message that describes the error. Bytes ten
  * through thirteen contain the ending part of an
  * ANTF0xxx message identifier (ex. - 108I for
  * message identifier ANTF0108I). The reason code
  * may contain the I/O service return and reason code
  * in the first two bytes, and additional sense byte
  * information from the I/O request in the last two
  * bytes.
  * Action: If message information is returned, take
  * the action supplied in the documentation for that
  * message identifier. If the reason code contains
  * x'0804' in the first two bytes, the AOM service
  * detected an I/O error. The remaining two bytes
  * may have sense information that is described in
  * current message manuals. If the error information
  * is not available, contact IBM hardware support for
  * assistance.
  *
RQST_FCWITHDRAW_REAS_F0460E EQU 0004 X'0004'
* Meaning: The FlashCopy request was issued
  * with the REMOTE keyword, but the DEVN device
  * is not a PPRC primary volume in an active
  * PPRC pair.
  * Action: Ensure that the DEVN device is a
  * PPRC primary device and the PPRC QUERY
  * secondary device information matches the
  * FlashCopy Establish REMOTE source device
  * information. Verify that the FlashCopy
  * SOURCE and TARGET devices are correctly
  * specified. Resubmit the corrected FlashCopy
  * Establish request.
  *
RQST_FCWITHDRAW_REAS_F0461E EQU 0008 X'0008'
* Meaning: The FlashCopy request was issued with
  * the REMOTE keyword. The REMOTE FlashCopy source
  * device is not the PPRC secondary volume for the
  * PPRC Primary DEVN device. The FlashCopy Establish
  * DEVN device must be the PPRC Primary volume paired
  * with the PPRC Secondary volume specified as the
  * REMOTE FlashCopy Source device.
  * Action: Use the PPRC Query to determine the status
  * of the DEVN device. If the DEVN device is a PPRC
  * Primary volume, ensure that the PPRC Secondary
  * device information is the same as the REMOTE
  * FlashCopy Source device information. Resubmit
  * the corrected FlashCopy Establish request.

</table>
**SDM Return Codes**

*Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)*

**RQST_FCWITHDRAW_REAS_F0471E**

EQU 0032 X'0020'

* Meaning: The FlashCopy request was issued with the
  * REMOTE keyword. When the request was sent to the
  * secondary subsystem, an error occurred. Any one of
  * the following conditions could cause this error.
  * The PPRC paths are inactive
  * The Primary or Secondary subsystem communication
  * adapters are failing
  * The Secondary subsystem cannot respond to the
  * Primary subsystem
  * The Secondary subsystem has hardware or microcode
  * conditions that prevent communication with the
  * Primary subsystem
  *
  * Action: Ensure that the PPRC Secondary subsystem
  * is functioning normally. Ensure that the REMOTE
  * subsystem is communicating with the PPRC Primary
  * subsystem. If not, correct the communication
  * problem and resubmit the FlashCopy request.

**RQST_FCWITHDRAW_REAS_F0472E**

EQU 0036 X'0024'

* Meaning: The Flashcopy request was issued with the
  * Remote keyword. The REMOTE FlashCopy Source device
  * cannot be used as the FlashCopy source.
  *
  * Actions: Use the PPRC query command to determine the
  * status of the DEVN device. If the DEVN device is a
  * PPRC primary device, make sure that the PPRC Secondary
  * device information is the same as the Remote FlashCopy
  * Source device information. Resubmit the corrected
  * FlashCopy request.

**RQST_FCWITHDRAW_REAS_F0463E**

EQU 0040 X'0028'

* meaning: The FlashCopy request was issued with the
  * DEVN keyword. The SDEVN or TDEVN keyword, or both,
  * have also been entered in the same request. DEVN
  * cannot be specified if the SDEVN or TDEVN keywords
  * are specified.
  *
  * Actions: Ensure that the FlashCopy request does not
  * contain the DEVN keyword in combination with the
  * SDEVN or TDEVN keywords. Resubmit the corrected
  * FlashCopy request.

**RQST_FCWITHDRAW_REAS_F0480E**

EQU 0044 X'002C'

* Meaning: The FlashCopy request specified source and
  * target devices in a full volume INCREMENTAL relationship
  * or a full volume relationship to a space efficient target.
  * The extents specified did not specify a single, full-
  * volume, extent. A FlashCopy Withdraw of an INCREMENTAL
  * FlashCopy relationship or a space efficient relationship
  * can include a single, full-volume extent.
  *
  * Actions: Check the FlashCopy request for a valid
  * combination of full volume relationship and a full
  * volume extent. Resubmit the corrected FlashCopy
  * request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCWITHDRAW_REAS_F0481E EQU 0048 X'0030'
  *
  * Meaning: The FlashCopy Withdraw request specified the
  * source device and DSW=YES to a device that is in a
  * full volume relationship. The extents specified was
  * not a single, full-volume extent. A FlashCopy
  * Withdraw of a full volume FlashCopy relationship can
  * include a single, full-volume extent.
  *
  * Actions: Check the FlashCopy Withdraw request for a
  * valid combination of full volume relationship and a
  * full volume extent. Resubmit the corrected FlashCopy
  * request.
  *
RQST_FCWITHDRAW_REAS_F0490E EQU 0052 X'0034'
  *
  * Meaning: The FCWITHDRAW request could not
  * complete because the specified device is in
  * an offline or inaccessible state.
  *
  * Action: Modify the request to ensure that the
  * device specified is available for use. After
  * making any changes, resubmit the request.
  *
RQST_FCWITHDRAW_INVALID_STATE EQU 0056 X'0038'
  *
  * Meaning: For an FCWITHDRAW request, the state
  * of an existing FlashCopy relation does not allow
  * the operation.
  *
  * Action: Issue the FlashCopy query to the device
  * and be sure there is an existing incremental
  * relationship active. Modify the request and
  * resubmit the request.
  *
RQST_FCWITHDRAW_NON_REVERTIBLE EQU 0060 X'003C'
  *
  * Meaning: For the FCWITHDRAW request, the existing
  * relationship is not revertible.
  *
  * Action: Issue a FlashCopy query and determine
  * if the specified device is in a revertible state.
  * Modify the request and resubmit the command.
  *
RQST_FCWITHDRAW_MISSING_SDEVN_TDEVN EQU 0064 X'0040'
  *
  * Meaning: For the FCWITHDRAW request, either the
  * SDEVN/TDEVN or both keywords were missing. If
  * ACTION=COMMIT or ACTION=REVERT, then both SDEVN
  * and TDEVN must be specified.
  *
  * Action: Check to see if both SDEVN and TDEVN
  * were specified for the request. Make any
  * necessary changes and resubmit the request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

<table>
<thead>
<tr>
<th>Code Number</th>
<th>Code Value</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| RQST_FCWITHDRAW_BG_COPY_TO_SE_TARGET | EQU 0068 X'0044' | * Meaning: A FlashCopy withdraw request would result in a background copy to a space efficient target (e.g. DSW). Background copy is not allowed to a space efficient target volume.  
* Action: Change keyword to DSW(NO) |
| RQST_FCWITHDRAW_SRCEXTENTS_INVALID | EQU 7641 X'1DD9' | * Meaning: For an FCWITHDRAW request the SRCEXTENTS parameter list contains an invalid extent value.  
* Each extent value must not be greater than the device maximum values. Each begin extent value must be lower or equal to its related end extent value.  
* Action: Verify the contents of the SRCEXTENTS parameter list. Insure each extent value does not exceed the device maximum extent values. Insure the extent values are correctly paired - source begin extent first followed by source end extent.  
* After making any changes or corrections, re-submit the request. |
| RQST_FCWITHDRAW_TGTEXTENTS_INVALID | EQU 7642 X'1DDA' | * Meaning: For an FCWITHDRAW request the TGTEXTENTS parameter list contains an invalid extent value.  
* Each extent value must not be greater than the device maximum values. Each begin extent value must be lower or equal to its related end extent value.  
* Action: Verify the contents of the TGTEXTENTS parameter list. Insure each extent value does not exceed the device maximum extent values. Insure the extent values are correctly paired - target begin extent first followed by target end extent.  
* After making any changes or corrections, re-submit the request. |
| RQST_FCWITHDRAW_BITMAPLEN_ZERO | EQU 7643 X'1DDB' | * Meaning: For an FCWITHDRAW request with SRCBITMAP and / or TGTBITMAP parameter specified, the BITMAPLEN parameter value was zero or omitted. If the SRCBITMAP and / or TGTBITMAP parameter is specified, the BITMAPLEN parameter is required, and must be a non-zero value.  
* Action: Supply a correct BITMAPLEN value. |

</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCWITHDRAW_DEVICE_NOT_DS_FC EQU 7654 X'1DE6'
*  
* Meaning: For an FCWITHDRAW request the source device and target device are the same, but the device is not Data Set FlashCopy capable.
*  
* Action: Use the FCQUERY to determine the status of the source and target device(s). Verify the source and target device(s) are correctly specified. After any changes or corrections, re-submit the FCWITHDRAW request.
*  
RQST_FCWITHDRAW_SOURCE_NOT_FC_SOURCE EQU 7655 X'1DE7'
*  
* Meaning: For an FCWITHDRAW request the Source device is currently an active Flashcopy target device.
*  
* Action: Use the FCQUERY request to verify the FlashCopy status of the source and target devices. Insure the source and target devices are correctly specified. After making any corrections or changes re-submit the FCWITHDRAW request.
*  
RQST_FCWITHDRAW_TARGET_NOT_FC_TARGET EQU 7656 X'1DE8'
*  
* Meaning: For an FCWITHDRAW request the Target device is currently an active Flashcopy source device.
*  
* Action: Use the FCQUERY request to verify the FlashCopy status of the source and target devices. Insure the source and target devices are correctly specified. After making any corrections or changes re-submit the FCWITHDRAW request.
*  
RQST_FCWITHDRAW_DDSW_INVALID EQU 7657 X'1DE9'
*  
* Meaning: For an FCWITHDRAW request the DDSW parameter area was not set to 'YES', 'NO ' or binary zero.
*  
* Action: Insure the DDSW parameter area is set to the correct value and resubmit the request.
*  
RQST_FCWITHDRAW_SPACEREL_INVALID EQU 7659 X'1DEB'
*  
* Meaning: For an FCWITHDRAW request the SPACEREL parameter area was not set to 'YES', 'NO ' or binary zero.
*  
* Action: Insure the SPACEREL parameter area is set to the correct value and resubmit the request.

- The total amount of space used is returned in the reason code.
- Contact IBM.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_XSCSTATS_QRYINFO_ABEND EQU 7666 X'1DF2'
* Meaning: For an XSCSTATS request a System Data Mover
* request router/handler ABENDED while referencing
* the field pointed to by the ANTRQST QRYINFO
* parameter. The reason code will contain the ABEND
* code.
* Action: Make sure that the QRYINFO parameter
* points to a valid location in memory, and that if
* an ALET was specified on the ANTRQST macro the
* value is correct.
*
RQST_XSCSTATS_SCSESSION_MISSING EQU 7667 X'1DF3'
* Meaning: ETYPE(SINGLE) has been entered and
* required parameter SCSESSION parameter has not been
* specified.
* Action: Specify a valid SCSESSION parameter
*
RQST_XSCSTATS_SSID_MISSING EQU 7668 X'1DF4'
* Meaning: ETYPE(SINGLE) has been entered and
* required parameter SSID parameter has not been
* specified.
* Action: Specify a valid SSID parameter
*
RQST_XSCSTATS_NO_ONLINE_DEVICES EQU 7669 X'1DF5'
* Meaning: The storage control subsystem identified
* by the SSID parameter does not have any devices varied
* online. At least one device must be online in order
* for statistics from the storage control to be gathered.
* Action: Vary a device online.
*
RQST_XSCSTATS_SCSESSION_NOT_FOUND EQU 7670 X'1DF6'
* Meaning: The storage control session id supplied in
* the SCSESSION parameter is not on the storage control.
* Action: Supply a valid storage control session id.
*
RQST_XSCSTATS_SSID_NOT_FOUND EQU 7671 X'1DF7'
* Meaning: The storage control subsystem id supplied in
* the SSID parameter does not match the SSIDs of the
* storage controls attached to the system.
* Action: Supply a valid storage control subsystem id.
*
RQST_INSUFFICIENT_STORAGE EQU 7672 X'1DF8'
* Meaning: Unable to allocate enough storage to perform
* the specified function.
* Action: Ensure that the region size of the ANTRQSTL and
* ANTRQSTLH address spaces is not limited by IEFUSI.

Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_QFRVOLS_VOLUME_COUNT_ZERO  EQU  7712  X'1E20'
*  *
*  Meaning: The ANTRQST QFRVOLS request VOLLIST parameter
*  area Volume Count field is zero. This indicates there
*  are no volumes to be checked for capability of Fast
*  Replication.
*  *
*  Action: Verify the VOLLIST parameter identifies the
*  ANQFRVRL macro parameter area storage. Insure the
*  volume count field has the correct count of volumes to
*  be checked. After any changes or corrections, re-submit
*  the request.
*  *
RQST_QFRVOLS_CTL_VOL_DVC_MISSING  EQU  7713  X'1E21'
*  *
*  Meaning: The ANTRQST QFRVOLS request VOLLIST parameter
*  area has neither the Control Volume nor the Control
*  Device specified.
*  *
*  Action: Verify the VOLLIST parameter identifies the
*  ANQFRVRL macro parameter area storage. Insure the
*  Control Volume or Control Device is correctly
*  specified. After any changes or corrections,
*  re-submit the request.
*  *
RQST_QFRVOLS_CTL_VOL_DVC_INVALID  EQU  7714  X'1E22'
*  *
*  Meaning: The ANTRQST QFRVOLS request VOLLIST parameter
*  area has both the Control Volume or Control Device
*  specified. Either the Control Volume is specified,
*  or the Control Device is specified, but not both.
*  *
*  Action: Verify the VOLLIST parameter identifies the
*  ANQFRVRL macro parameter area storage. Insure the
*  Control Volume or Control Device is correctly
*  specified, and the unused control parameter is set
*  to zero. After any changes or corrections,
*  re-submit the request.
*  *
RQST_QFRVOLS_CTL_NOT_CAPABLE  EQU  7715  X'1E23'
*  *
*  Meaning: The ANTRQST QFRVOLS request VOLLIST parameter
*  area identifies a Control Volume or Control Device
*  that is not in an RVA subsystem or in an ESS
*  subsystem that supports FlashCopy.
*  *
*  Action: Verify the VOLLIST parameter identifies the
*  ANQFRVRL macro parameter area storage. Insure the
*  Control Volume or Control Device is correctly
*  specified, and the unused control parameter is set
*  to zero. After any changes or corrections,
*  re-submit the request.

</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_RESESSION_REAS_NOT_MASTER EQU 0004 X'0004'
*  * Meaning: For action START the storage control serial
*  * number of the volume specified in VOLSER does not
*  * match the value of MSSERIAL.
*  * Action: Make sure the volume specified in VOLSER
*  * belongs to the controller specified in MSSERIAL.
*  *
RQST_RESESSION_REAS_SBINFO_COUNT_INVALID EQU 0008 X'0008'
*  * Meaning: The number specified as the count of subordinate
*  * ESSes is invalid. It must be between 1 and 16.
*  * Action: Correct the invalid value.
*  *
RQST_RESESSION_REAS_ALL_PRFFLDS_REQUIRED EQU 0012 X'0014'
*  * Meaning: The performance parameters (CGINTERVAL,
*  * CGDRAIN, COORDINTERVAL) must be entered as a
*  * group. At least one of the parameters was entered
*  * and at least one of the parameters was not.
*  * Action: Enter all of the parameters, or do not
*  * enter any of the parameters.
*  *
RQST_RESESSION_REAS_SBINFO_ABEND EQU 0016 X'0010'
*  * Meaning: For an RSESSION request a System Data Mover
*  * request router/handler ABENDed while referencing
*  * the field pointed to by the ANTRQST SBINFO
*  * parameter. The description code (bytes 9-12 of the
*  * RETINFO field) will contain the ABEND code.
*  * Action: Make sure that the SBINFO parameter
*  * points to a valid location in memory, and that if
*  * an ALET was specified on the ANTRQST macro the
*  * value is correct.
*  *
RQST_RESESSION_REAS_MSSERIAL_REQUIRED EQU 0020 X'0014'
*  * Meaning: The MSSERIAL keyword is required.
*  * Action: Provide the keyword.
*  *
RQST_RESESSION_REAS_INVALID_MASTER_VALUE EQU 0028 X'001C'
*  * Meaning: The value specified for the MASTER
*  * parameter is not correct. The value must be
*  * YES or NO.
*  * Action: Correct the invalid value.
*  *
RQST_RESESSION_REAS_INVALID_FORCE_VALUE EQU 0032 X'0020'
*  * Meaning: The value specified for the FORCE
*  * parameter is not correct. The value must be
*  * YES or NO.
*  * Action: Correct the invalid value.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_RSESSION_IO_ERROR EQU 7721 X'1E29'
*   Meaning: For an RSESSION request the System Data
*   Mover detected an I/O error. Bytes 5-8 of the RETINFO
*   field will contain an error reason code. These
*   codes are documented below, and will have names
*   that start with RQST_RSESSION_REAS_xxx.
*   Action: Take the action shown in the reason code
*   documentation.

RQST_RSESSION_REAS_INVALID_UCODE_LEVEL EQU 0004 X'0004'
*   Meaning: At least one of the storage control clusters
*   the command was executed on does not have the level
*   of microcode which supports Global Mirror.
*   Action: Make sure the correct level of microcode
*   is on all clusters.

RQST_RSESSION_REAS_INVALID_INTERFACE EQU 0008 X'0008'
*   Meaning: A previous command has been issued to the
*   storage control which prevents Global Mirror
*   commands from executing successfully.
*   Action: Restore the storage control environment
*   so Global Mirror commands can be executed.

RQST_RSESSION_REAS_VOLUMES_ACTIVE EQU 0012 X'000C'
*   Meaning: An UNDEFINE action has been requested but
*   there are still volumes joined to the session.
*   Action: Remove the volumes then submit the UNDEFINE
*   action again.

RQST_RSESSION_REAS_SESSION_OPEN EQU 0016 X'0010'
*   Meaning: A DEFINE action has been requested. Either
*   the specified session is already defined, or the
*   maximum number of sessions allowed on the LSS has
*   been reached.
*   Action: Specify a correct session number, or UNDEFINE
*   a session then submit the DEFINE action again.

RQST_RSESSION_REAS_INVALID_IO_CODE EQU 0020 X'0014'
*   Meaning: An action executed in error, but the error
*   information returned by the storage control is not
*   known by ANTRQST.
*   Action: ****************

| * Meaning: For action STOP the formation of a consistency group   |            |           |
| * was in progress, but terminating the Global Mirror session would |            |           |
| * jeopardize the integrity of a previously consistent copy of the |            |           |
| * data on the FlashCopy target volumes.                           |            |           |
| * Action: Resubmit the command.                                   |            |           |
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_RSESSION_REAS_SERIALNO_MISMATCH EQU 0052 X'0034'
*  
*  Meaning: One of the following errors has been detected:
*  - A serial number (MSERIAL or SBINFO) does not match an 
  existing storage control.
*  - An SSID in SBINFO does not match an existing 
  storage control.
*  - The Master serial number (MSERIAL) is the same as 
  a serial number supplied in the SBINFO parameter
*  - A sub ordinance serial number occurs more then 
  than once in SBINFO.
*  - The Master serial number does not match the serial 
  number of the storage control the command is executed 
  on.
*  
*  Action: Correct the invalid value
*

RQST_RSESSION_REAS_NO_FCP_PATHS EQU 0056 X'0038'
*  
*  Meaning: There is not a PPRC link between the Master 
  ESS and each of the Subordinate ESSes, or at least 
  one of the links is ESCON instead of Fibre Channel.
*  
*  Action: Establish the proper links with the PPRC 
  PESTPATH command.
*

RQST_RSESSION_REAS_WRONG_DEVICE EQU 0060 X'003C'
*  
*  Meaning: One of the following errors has been detected:
*  - For action START there is a Global Mirror session already 
  running with a different session number.
*  - For action RESUME there does not exist a Global Mirror 
  session with a matching session number.
*  - For action RESUME the SBINFO parameter does not match 
  the SBINFO parameter used with the START action.
*  - For action RESUME the command was not issued to the same 
  LSS that the START action was issued to.
*  - For action RESUME the Global Mirror session is not in 
  a Paused state.
*  
*  Action: Correct the invalid value.
*

RQST_RSESSION_REAS_MAX_ACTIVE_SESSIONS EQU 0064 X'0040'
*  
*  Meaning: A START action was executed and either the 
  master ESS or one of the subordinate ESSes is already 
  participating in a Global Mirror logical session.
*  
*  Action: Make sure the ESS is part of the right Global 
  Mirror logical session.

</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_RVOLUME_REAS_VOLRANGE_COUNT_INVALID EQU 0008 X'0008'
* 
* Meaning: The number specified as the count of address
* ranges in the list is invalid. It must be between 0 and
* 255.
* 
* Action: Correct the invalid value.
* 
RQST_RVOLUME_REAS_VOLLIST_ABEND EQU 0012 X'000C'
* 
* Meaning: For an RVOLUME request a System Data Mover
* request router/handler ABENDED while referencing
* the field pointed to by the ANTRQST VOLLIST
* parameter. The description code (bytes 9-12 of the
* RETINFO field) will contain the ABEND code.
* 
* Action: Make sure that the VOLLIST parameter
* points to a valid location in memory, and that if
* an ALET was specified on the ANTRQST macro the
* value is correct.
* 
RQST_RVOLUME_REAS_VOLRANGE_ABEND EQU 0016 X'0010'
* 
* Meaning: For an RVOLUME request a System Data Mover
* request router/handler ABENDED while referencing
* the field pointed to by the ANTRQST VOLRANGE
* parameter. The description code (bytes 9-12 of the
* RETINFO field) will contain the ABEND code.
* 
* Action: Make sure that the VOLRANGE parameter
* points to a valid location in memory, and that if
* an ALET was specified on the ANTRQST macro the
* value is correct.
* 
RQST_RVOLUME_IO_ERROR EQU 7724 X'1E2C'
* 
* Meaning: For an RVOLUME request the System Data
* Mover detected an error. Bytes 5-8 of the RETINFO
* field will contain an error reason code. These
codes are documented below, and will have names
* that start with RQST_RVOLUME_REAS_xxx.
* 
* Action: Take the action shown in the reason code
* documentation.
* 
RQST_RVOLUME_REAS_IO_FAILURE EQU 0004 X'0004'
* 
* Meaning: An I/O operation was unsuccessful.
* 
* Action: Examine the sense information returned in
* RETINFO to determine the cause of the error.
* 
RQST_RVOLUME_REAS_LSS_MISMATCH EQU 0008 X'0008'
* 
* Meaning: The value supplied in the LSSTYPE parameter
* does not match the type of the LSS the command
* will be executed on.
* 
* Action: Correct the invalid value.

---

**RQST_RVOLUME_REAS_INVALID_SERIALNO**

EQU 0012 X'000C'

* Meaning: The value supplied in the ESSSERIAL parameter does not match the serial number of the storage control the command was executed on.
* Action: Correct the invalid value.

**RQST_RVOLUME_REAS_INVALID_DEVICE_RANGE**

EQU 0016 X'0010'

* Meaning: One of the pairs of device numbers in the VOLRANGE parameter does not have the first number smaller than the second number.
* Action: Correct the invalid value.

**RQST_RVOLUME_REAS_INVALID_PARAMETER**

EQU 0020 X'0014'

* Meaning: An action executed in error, but the error information returned by the storage control is not known by ANTRQST.
* Action: Correct the invalid value.

**RQST_RVOLUME_REAS_INVALID_STATE**

EQU 0024 X'0018'

* Meaning: For action REMOVE a volume is not in the correct state.
* Action: Wait until the volume is in the correct state then resubmit the request.

**RQST_RVOLUME_REAS_INVALID_INTERFACE**

EQU 0028 X'001C'

* Meaning: A previous command has been issued to the storage control which prevents Global Mirror commands from executing successfully.
* Action: Restore the storage control environment so Global Mirror commands can be executed.

---

**RQST_RVOLUME_REAS_INVALID_SESSION**

EQU 0032 X'0020'

* Meaning: For action JOIN a volume already belongs to another Extended Distance Consistency session.
* Action: Correct the invalid value.

---

**RQST_RVOLUME_REAS_INVALID_SESSION**

EQU 0036 X'0024'

* Meaning: For action JOIN the session number value does not match an already defined session.
* Action: Correct the invalid value.

---

**RQST_RVOLUME_REAS_INVALID_IO_CODE**

EQU 0040 X'0028'

* Meaning: An action executed in error, but the error information returned by the storage control is not known by ANTRQST.
* Action: Correct the invalid value.

</tbody>
</table>
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_EXTENTS_TRACK_COUNT_INVALID  EQU 7740  X'1E3C'
*  *  Meaning: The ANTRQST request specified source and
target extents. During parameter checking, SDM
detected that the total number of source tracks
in a source extent were not the same as the total
number of target tracks in the related target
extent.
*  *  Action: Verify the ANTRQST SRCEXTENTS and
TGTEXTENTS track values are correctly specified.
After any changes or corrections, re-submit the
request.
*  *
RQST_FCESTABLISH_SRCEXTENTS_INVALID  EQU 7741  X'1E3D'
*  *  Meaning: The ANTRQST request specified the
SRCEXTENTS parameter. Parameter checking found
the track values were invalid. Either the
beginning track was greater than the ending
track, or the track location had values that
were greater than the device capabilities.
*  *  Action: Verify the ANTRQST SRCEXTENTS parameter
has begin track values less than or equal to
end track values, and the track values are not
greater than the device maximum track values.
After any changes or corrections, re-submit the
request.
*  *
RQST_FCESTABLISH_TGTEXTENTS_INVALID  EQU 7742  X'1E3E'
*  *  Meaning: The ANTRQST request specified the
TGTEXTENTS parameter. Parameter checking found
the track values were invalid. Either the
beginning track was greater than the ending
track, or the track location had values that
were greater than the device capabilities.
*  *  Action: Verify the ANTRQST TGTEXTENTS parameter
has begin track values less than or equal to
end track values, and the track values are not
greater than the device maximum track values.
After any changes or corrections, re-submit the
request.
*  *
RQST_SOURCE_TARGET_EXTENT_COUNT_MISMATCH  EQU 7743  X'1E3F'
*  *  Meaning: The ANTRQST request specified source and
target extents. During parameter checking, SDM
detected that the count of source extents is not
the same as the count of target extents.
*  *  Action: Verify the ANTRQST SRCEXTENTS and
TGTEXTENTS track values are correctly specified.
After any changes or corrections, re-submit the
request.
*  *
### SDM Return Codes

*Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)*

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RQST SOURCE AND TARGET DEVICE MISSING</strong> EQU 7744 X'1E40'</td>
<td>The ANTRQST Advanced FlashCopy Withdraw request did not specify the source or target device, or the source and target device number fields are set to the null value (binary zero). Either the source device or target device must be specified, or both may be specified.</td>
<td>Verify the source and/or target device is correctly specified. After any changes or corrections, re-submit the request.</td>
</tr>
<tr>
<td><strong>RQST DDSW SOURCE DEVICE MISSING</strong> EQU 7745 X'1E41'</td>
<td>The ANTRQST Advanced FlashCopy Withdraw request specified the DDSW parameter, but the source device was omitted or the source device field was set to the null value (binary zero).</td>
<td>Verify the source device is specified. Verify the DDSW parameter is specified correctly. After any changes or corrections, re-submit the request.</td>
</tr>
<tr>
<td><strong>RQST NOT DDSW TARGET DEVICE MISSING</strong> EQU 7746 X'1E42'</td>
<td>The ANTRQST Advanced FlashCopy Withdraw request did not specify DDSW(YES), and the target device was omitted or the target device field was set to the null value (binary zero).</td>
<td>Verify the target device is specified when the DDSW parameter is set to NO or to the null value (binary zero) or omitted. Also verify the DDSW parameter is specified correctly. After any changes or corrections, re-submit the request.</td>
</tr>
<tr>
<td><strong>RQST SOURCE LARGER THAN TARGET INVALID</strong> EQU 7747 X'1E43'</td>
<td>The ANTRQST Advanced FlashCopy Establish or Withdraw request specified the source and target devices, but did not specify extents. The request defaults to a full source volume extent. The target device has fewer cylinders than the source device. The request is invalid for the specified source and target devices.</td>
<td>Verify the source and target devices are correctly specified. Verify the request is for full volume, and if not, specify the desired source and target extents. After any changes or corrections, re-submit the request.</td>
</tr>
</tbody>
</table>
RQST_SOURCE_TARGET_DEVICES_INCOMPATIBLE EQU 7748 X'1E44'
*  Meaning: The ANTRQST Advanced FlashCopy Establish
*  request specified the source and target devices,
*  but the devices are not the same type, or do not
*  have the same track format, or do not have the
*  same number of bytes per track. This can occur
*  if one of the devices is a 3380TCM type and the
*  other device is a 3390 type.
*  Action: Verify the source and target devices are
*  correctly specified. Ensure the devices are the
*  same type and have the same track size and
*  format. After making any changes or corrections,
*  re-submit the request.
*
RQST_SOURCE_TARGET_CANNOT_BE_SAME EQU 7749 X'1E45'
*  Meaning: The ANTRQST Advanced FlashCopy Establish
*  or Withdraw request specified the source and
*  target devices as the same device. If the device
*  is not Advanced FlashCopy capable, or the source
*  extents indicate ALL tracks (full volume), the
*  request is rejected.
*  Action: Verify the source and target devices are
*  correctly specified. Ensure the device is capable
*  of Advanced FlashCopy, and the source and target
*  extents are specified correctly (not ALL tracks).
*  After making any changes or corrections,
*  re-submit the request.
*
RQST_FCESTABLISH_INCREMENTAL_INVALID EQU 7750 X'1E46'
*  Meaning: The ANTRQST Advanced FlashCopy Establish
*  request specified the INCREMENTAL parameter, but
*  the parameter field contains an invalid value.
*  The valid values for the FlashCopy INCREMENTAL
*  parameter field are 'YES', 'YTW', 'NO ' or binary
*  zeros (not including the single quotation marks).
*  Action: Verify the INCREMENTAL parameter field
*  contains a valid value.
*  After making any changes or corrections,
*  re-submit the request.
*
RQST_FCESTABLISH_SETGTOK_INVALID EQU 7751 X'1E47'
*  Meaning: The ANTRQST Advanced FlashCopy Establish
*  request specified the SETGTOK parameter, but
*  the parameter field contains an invalid value.
*  The valid values for the FlashCopy SETGTOK
*  parameter field are 'YES', 'NO ', or
*  binary zeros (not including the
*  single quotation marks).
*  Action: Verify the SETGTOK parameter field
*  contains a valid value.
*  After making any changes or corrections,
*  re-submit the request.
Table 6. ANTRQST return code and reason code definitions from ANTRQSTL macro (continued)

RQST_FCESTABLISH_REMOTE_INVALID EQU 7753 X'1E49'
*  
*  Meaning: The ANTRQST Advanced FlashCopy Establish request specified the REMOTE parameter, but the parameter field contains an invalid value. The valid values for the FlashCopy REMOTE parameter field are 'YES' or 'NO' or binary zeros (not including the single quotation marks).
*  
*  Action: Verify the REMOTE parameter field contains a valid value. After making any changes or corrections, re-submit the request.
*  
RQST_FCESTABLISH_TGTPPRIM_INVALID EQU 7754 X'1E4A'
*  
*  Meaning: The ANTRQST Advanced FlashCopy Establish request specified the TGTPPRIM parameter, but the parameter field contains an invalid value. The valid values for the FlashCopy TGTPPRIM parameter field are 'YES' or 'NO' or binary zeros (not including the single quotation marks).
*  
*  Action: Verify the TGTPPRIM parameter field contains a valid value. After making any changes or corrections, re-submit the request.
*  
RQST_INVALID_OPENDVCS_VALUE EQU 7800 X'1E78'
*  
*  Meaning: The ANTRQST PPRC or FlashCopy request specified the OPENDVCS parameter, but the value of the OPENDVCS parameter was not YES or NO. The request is rejected.
*  
*  Action: Verify the OPENDVCS parameter field has binary zeros, 'YES' or 'NO'. After any changes or corrections, re-submit the request.
*  
RQST_FLASHCOPY_REQUEST_NOT_SUPPORTED EQU 7900 X'1EDC'
*  
*  Meaning: The Advanced Copy Services request specified a function that is not supported by host software on the subsystem identified in the request. The specified subsystem microcode (LIC) level is less than the minimum microcode level required for the function.
*  
*  Action: Determine the microcode level (LIC) of the subsystem identified in the request. Ensure that the microcode is at the required level. After making changes or corrections, resubmit the Advanced Copy Services request.
Chapter 14. AOM messages

<table>
<thead>
<tr>
<th>AOM000I</th>
<th>ASYNCHRONOUS I/O OPERATION (COMPLETED IN ERROR</th>
<th>FAILED)</th>
<th>SUBSYSTEM ssss, DEVICE dddd</th>
</tr>
</thead>
</table>

**Explanation:** A host-initiated asynchronous I/O operation completed in error or failed. The task that issued the request is no longer active.

In the message text:

- *ssss* Indicates the subsystem on which the operation completed.
- *dddd* Indicates the address of the device.

**COMPLETED IN ERROR**

The asynchronous operation completed, but during the operation sense data was offloaded to an attached host with the environmental data present bit set. This sense data indicates the errors that occurred with the asynchronous operation.

**FAILED**

The asynchronous operation failed. An I/O error message on the console accompany this error. There also be environmental sense data present to contribute to an understanding of the error.

**System action:** The system continues processing.

**Operator response:** Notify the system programmer.

**System programmer response:** Examine a merged LOGREC from all hosts attached to the storage control. For the **COMPLETED IN ERROR** situation, examine the environmental data to determine what the specific error was and if it pertained to an area on the volume within an allocated data set. From this information, determine the severity of the error. Note that there be a collection of environmental sense data caused by this one asynchronous operation. After completing this examination, take the appropriate actions to correct the specific data set or entire volume error. If all errors were not in allocated space on the volume, the impact of the error be minimal. After completing these corrections, the volume should be ready for use. Note that the asynchronous operation need not be repeated because it completed. The state of the subsystem or volume should be as desired.

For the **FAILED** situation, examine the sense data associated with the specific error, as well as any I/O messages that have appeared on the system console. Examine environmental sense data to determine the reason for the asynchronous operations failure. After completing this examination, take the appropriate actions to correct the problem. Attempt to reissue the asynchronous operation using the IDCAMS utility.

<table>
<thead>
<tr>
<th>AOM001I</th>
<th>DESTAGE FAILED FOR SUBSYSTEM ssss, DEVICE dddd</th>
</tr>
</thead>
</table>

**Explanation:** An error occurred when a Halt EOD (SVC 91) requested that all 3990 Model 3 and Model 6 devices in the system be destaged.

In the message text:

- *ssss* Indicates the identification of the subsystem on which destage was attempted.
- *ddddd* Indicates the number of a device attached to the subsystem.

**System action:** The system continues processing.

**Operator response:** Notify the system programmer. If the device associated with this message is attached via the IBM 3990 Model 3 Storage Control, see *IBM 3990/9390 Operations and Recovery Guide* for detailed recovery actions.

**System programmer response:** Run an IDCAMS LISTDATA DSTATUS job to find all the devices that have pinned data. One of these devices caused the destage to fail.

Appendix. Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer and z/OS ISPF User's Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer/Library Server versions of z/OS books in the Internet library at:

http://www.ibm.com/systems/z/os/zos/bkserv/
Notices

This information was developed for products and services offered in the USA.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

Trademarks
